The soil of this island, in some places, is light and black, evidently composed of decayed vegetables, the dung of birds, and sand. There are other places again, where nothing but marine productions, such as broken coral stones, and shells, are to be seen. These are deposited in long narrow ridges, lying in a parallel direction with the sea-coast, not unlike a ploughed field; and must have been thrown up by the waves, though, at this time, they do not reach within a mile of some of these places. This seems to furnish an incontestable proof, that the island has been produced by accessions from the sea, and is in a state of increase; for not only the broken pieces of coral, but many of the shells, are too heavy and too large to have been brought by any birds, from the beach, to the places where they now lie. Not a drop of fresh water was anywhere to be found, though frequently dug for. We met with several ponds of salt water, which had no visible communication with the sea, and must, therefore, in all probability, be filled by the water filtrating through the sand, in high tides. One of the lost men found some salt on the south-east part of the island. But, though this was an article of which we were in want, a man who could lose himself as he did, and not know whether he was travelling east, west, north, or south, was not to be depended upon as a fit guide to conduct us to the place.

There were not the smallest traces of any human being having ever been here before us; and, indeed, should any one be so unfortunate as to be accidentally driven upon the island, or left there, it is hard to say that he could be able to prolong existence. There is, indeed, abundance of birds and fish; but no visible means of allaying thirst, nor any vegetable that could supply the place of bread, or correct the bad effects of an animal diet; which in all probability would soon prove fatal alone. On the few cocoa-trees upon the island, the number of which did not exceed thirty, very little fruit was found; and, in general, what was found was either not fully grown, or had the juice salt, or blackish. So that a ship touching here, must expect nothing but fish and turtle; and of these an abundant supply may be depended upon.

On some parts of the land were a few low trees. Mr. Anderson gave me an account, also, of two small shrubs, and of two or three small plants; all which we had seen on Palmerston's Island, and Otakootaia. There was also a species of *sida* or Indian mallow; a sort of purslain; and another small plant that seemed from its leaves a *mesembryanthemum*; with two species of grass. But each of these vegetable productions was in so small a quantity, and grew with so much languor, that one is almost surprised that the species do not become extinct. Under the low trees above-mentioned, sat infinite numbers of tern, or egg-birds. These are black above, and white below, with a white arch on the forehead; and are rather larger than the common noddy. Most of them had lately hatched their young; which lay under the old ones, upon the bare ground. The rest had eggs; of which they only lay one, larger than that of a pigeon, bluish and speckled with black. There were also a good many common boobies; a sort that are almost like a gannet; and a sooty or chocolate coloured one, with a white belly. To this list we must add men-of-war-birds; tropic birds; curlews; sand-pipers; a small land-bird like a hedge-sparrow; land-crabs; small lizards; and rats.

As we kept our Christmas here, I called this discovery Christmas Island. I judge it to be about fifteen or twenty leagues in circumference. It seemed to be of a semicircular form; or like the moon in the last quarter, the two horns being the north and south points; which bear from each other nearly north by east, and south by west, four or five leagues distant. This west side, or the little isle at the entrance into the lagoon, upon which we observed the eclipse, lies in the latitude of $1^{\circ} 59'$ north, and in the longitude of $202^{\circ} 30'$ east, determined

by a considerable number of lunar observations, which differed only 7' from the time-keeper; it being so much less. The variation of the compass was $6^{\circ} 22\frac{1}{2}'$ E.; and the dip of the north end of the needle $11^{\circ} 54'$. Christmas Island, like most others in this ocean, is bounded by a reef of coral rocks, which extends but a little way from the shore. Farther out than this reef, on the west side, is a bank of sand, extending a mile into the sea. On this bank is good anchorage, in any depth between eighteen and thirty fathoms. In less than the first-mentioned depth, the reef would be too near; and in more than the last, the edge of the bank would not be at a sufficient distance. During the time we lay here, the wind blew constantly a fresh gale at east, or east by south, except one or two days. We had, always, a great swell from the northward, which broke upon the reef, in a prodigious surf. We had found this swell before we came to the island; and it continued for some days after we left it.

CHAPTER XI.—SOME ISLANDS DISCOVERED.—ACCOUNT OF THE NATIVES OF ATOOI, WHO CAME OFF TO THE SHIPS, AND THEIR BEHAVIOUR ON GOING ON BOARD.—ONE OF THEM KILLED.—PRECAUTIONS USED TO PREVENT INTERCOURSE WITH THE FEMALES.—A WATERING-PLACE FOUND.—RECEPTION UPON LANDING.—EXCURSION INTO THE COUNTRY.—A MORAI VISITED AND DESCRIBED.—GRAVES OF THE CHIEFS, AND OF THE HUMAN SACRIFICES THERE BURIED.—ANOTHER ISLAND, CALLED ONEEHOW, VISITED.—CEREMONIES PERFORMED BY THE NATIVES, WHO GO OFF TO THE SHIPS.—REASONS FOR BELIEVING THAT THEY ARE CANNIBALS.—A PARTY SENT ASHORE, WHO REMAIN TWO NIGHTS.—ACCOUNT OF WHAT PASSED ON LANDING.—THE SHIPS LEAVE THE ISLANDS, AND PROCEED TO THE NORTH.

On the 2nd of January, at day-break, we weighed anchor, and resumed our course to the north; having fine weather, and a gentle breeze at east, and east-south-east, till we got into the latitude of $7^{\circ} 45'$ N. and the longitude of 205° E., where we had one calm day. This was succeeded by a north-east by east, and east-north-east wind. At first it blew faint, but freshened as we advanced to the north. We continued to see birds every day, of the sorts last mentioned; sometimes in greater numbers than others; and between the latitude of 10° and 11° , we saw several turtle. All these are looked upon as signs of the vicinity of land. However, we discovered none till day-break, in the morning of the 18th, when an island made its appearance, bearing north-east by east, and, soon after, we saw more land bearing north, and entirely detached from the former. Both had the appearance of being high land. At noon, the first bore north-east by east, half east, by estimation about eight or nine leagues distant; and an elevated hill, near the east end of the other, bore north, half west. Our latitude, at this time, was $21^{\circ} 12'$ N.; and longitude $200^{\circ} 41'$ E. We had now light airs and calms, by turns; so that at sunset, we were not less than nine or ten leagues from the nearest land. On the 19th, at sunrise, the island first seen, bore east several leagues distant. This being directly to windward, which prevented our getting near it, I stood for the other, which we could reach; and not long after discovered a third island in the direction of west-north-west, as far distant as land could be seen. We had now a fine breeze at east by north; and I steered for the east end of the second island; which at noon extended from north, half east, to west-north-west, a quarter west, the nearest part being about two leagues distant. At this time, we were in some doubt whether or no the land before us was inhabited; but this doubt was soon cleared up, by seeing some canoes coming off from the shore, toward the ships. I immediately brought-to, to give them time to join us. They had from three to six men each; and, on their approach, we were agreeably surprised to find, that they spoke the language of Otaheite, and of the other islands we had lately visited. It required but very little address, to get them to come alongside; but no entreaties could prevail upon any of them to come on board. I tied some brass medals to a rope, and gave them to those in one of the canoes who, in return, tied some small mackerel to the rope as an equivalent. This was repeated; and some small nails, or bits of iron, which they valued more than any other article, were given them. For these they exchanged more fish, and a sweet-potato; a sure sign that they had some notion of bartering; or, at least, of returning one present for another. They had nothing else in their canoes, except some large gourd shells, and a kind of fishing-

net ; but one of them offered for sale the piece of stuff that he wore round his waist, after the manner of the other islands. These people were of a brown colour ; and, though of the common size, were stoutly made. There was little difference in the cast of their colour, but a considerable variation in their features ; some of their visages not being very unlike those of Europeans. The hair of most of them was cropt pretty short ; others had it flowing loose ; and with a few, it was tied in a bunch on the crown of the head. In all, it seemed to be naturally black ; but most of them had stained it, as is the practice of the Friendly Islanders, with some stuff which gave it a brown or burnt colour. In general they wore their beards. They had no ornaments about their persons, nor did we observe that their ears were perforated ; but some were punctured on the hands, or near the groin, though in a small degree ; and the bits of cloth which they wore were curiously stained with red, black, and white colours. They seemed very mild ; and had no arms of any kind, if we except some small stones, which they had evidently brought for their own defence ; and these they threw overboard, when they found that they were not wanted.

Seeing no signs of an anchoring place at this eastern extreme of the island, I bore away to leeward, and ranged along the south-east side, at the distance of half a league from the shore. As soon as we made sail, the canoes left us ; but others came off as we proceeded along the coast, bringing with them roasting pigs and some very fine potatoes, which they exchanged, as the others had done, for whatever was offered to them. Several small pigs were purchased for a sixpenny nail, so that we again found ourselves in a land of plenty ; and just at the time when the turtle, which we had so fortunately procured at Christmas Island, were nearly expended. We passed several villages ; some seated near the sea, and others farther up the country. The inhabitants of all of them crowded to the shore, and collected themselves on the elevated places to view the ships. The land upon this side of the island rises in a gentle slope from the sea to the foot of the mountains, which occupy the centre of the country, except at one place near the east end, where they rise directly from the sea, and seemed to be formed of nothing but stone, or rocks lying in horizontal strata. We saw no wood but what was up in the interior part of the island, except a few trees about the villages ; near which, also, we could observe several plantations of plantains and sugar-canes, and spots that seemed cultivated for roots.

We continued to sound without striking ground with a line of fifty fathoms, till we came abreast of a low point which is about the middle of this side of the island, or rather nearer the north-west end. Here we met with twelve and fourteen fathoms, over a rocky bottom. Being past this point, from which the coast trended more northerly, we had twenty, then sixteen, twelve, and at last five fathoms, over a sandy bottom. The last soundings were about a mile from the shore. Night now put a stop to any farther researches ; and we spent it standing off and on. The next morning we stood in for the land, and were met with several canoes filled with people ; some of whom took courage and ventured on board.

In the course of my several voyages, I never before met with the natives of any place so much astonished as these people were upon entering a ship. Their eyes were continually flying from object to object ; the wildness of their looks and gestures fully expressing their entire ignorance about everything they saw, and strongly marking to us, that till now they had never been visited by Europeans, nor been acquainted with any of our commodities except iron, which, however, it was plain they had only heard of, or had known it in some small quantity brought to them at some distant period. They seemed only to understand that it was a substance much better adapted to the purposes of cutting, or of boring of holes, than anything their own country produced. They asked for it by the name of *hamaité*, probably referring to some instrument, in the making of which iron could be usefully employed ; for they applied that name to the blade of a knife, though we could be certain that they had no idea of that particular instrument ; nor could they at all handle it properly. For the same reason they frequently called iron by the name of *toe*, which in their language signifies a hatchet, or rather a kind of adze. On asking them what iron was, they immediately answered, “ We do not know ; you know what it is, and we only understand it as *toe*. or

hamaite." When we showed them some beads, they asked first, "What they were; and then whether they should eat them?" But on their being told that they were to be hung in their ears, they returned them as useless. They were equally indifferent as to a looking-glass which was offered them, and returned it for the same reason; but sufficiently expressed their desire for *hamaite* and *toe*, which they wished might be very large. Plates of earthenware, china cups, and other such things, were so new to them that they asked if they were made of wood; but wished to have some, that they might carry them to be looked at on shore. They were in some respects naturally well bred; or at least fearful of giving offence, asking where they should sit down, whether they might spit upon the deck, and the like. Some of them repeated a long prayer before they came on board; and others afterward sung and made motions with their hands, such as we had been accustomed to see in the dances of the islands we had lately visited. There was another circumstance in which they also perfectly resembled those other islanders. At first, on their entering the ship, they endeavoured to steal everything they came near; or rather to take it openly, as what we either should not resent, or not hinder. We soon convinced them of their mistake; and if they, after some time, became less active in appropriating to themselves whatever they took a fancy to, it was because they found that we kept a watchful eye over them.

At nine o'clock, being pretty near the shore, I sent three armed boats, under the command of Lieutenant Williamson, to look for a landing-place and for fresh water. I ordered him, that if he should find it necessary to land in search of the latter, not to suffer more than one man to go with him out of the boats. Just as they were putting off from the ship, one of the natives having stolen the butcher's cleaver, leaped overboard, got into his canoe, and hastened to the shore, the boats pursuing him in vain.

SCENE IN THE FRIENDLY ISLANDS.

The order not to permit the crews of the boats to go on shore was issued, that I might do everything in my power to prevent the importation of a fatal disease into this island, which I knew some of our men laboured under, and which, unfortunately, had been already communicated by us to other islands in these seas. With the same view, I ordered all female visitors to be excluded from the ships. Many of them had come off in the canoes. Their size, colour, and features did not differ much from those of the men; and though their countenances were remarkably open and agreeable, there were few traces of delicacy to be seen either in their faces or other proportions. The only difference in their dress, was their having a piece of cloth about the body, reaching from near the middle to half-way down the thighs, instead of the *maro* worn by the other sex.

While the boats were occupied in examining the coast, we stood on and off with the ships, waiting for their return.

About noon Mr. Williamson came back, and reported that he had seen a large pond behind a beach near one of the villages, which the natives told him contained fresh water; and that there was anchoring-ground before it.

He also reported that he had attempted to land in another place, but was prevented by the natives, who, coming down to the boats in great numbers, attempted to take away the oars, muskets, and, in short, everything that they could lay hold of; and pressed so thick upon him that he was obliged to fire, by which one man was killed. But this unhappy circumstance I did not know till after we had left the island; so that all my measures were directed as if nothing of the kind had happened. Mr. Williamson told me, that after the man fell, his countrymen took him up, carried him off, and then retired from the boat; but still they made signals for our people to land, which he declined. It did not appear to Mr. Williamson, that the natives had any design to kill, or even to hurt, any of his party; but they seemed excited by mere curiosity to get from them what they had, being at the same time ready to give in return anything of their own. After the boats were on board, I despatched one of them to lie in the best anchoring-ground; and as soon as she had got to this station, I bore down with the ships, and anchored in twenty-five fathoms water; the bottom a fine grey sand. The east point of the road, which was the low point before mentioned, bore S. 51° E.; the west point, N. 65° W.; and the village, behind which the water was said to be, N.E. by E., distant one mile. But little more than a quarter of a mile from us there were breakers, which I did not see till after the Resolution was placed. The Discovery anchored to the eastward of us, and farther from the land. The ships being thus stationed, between three and four o'clock I went ashore with three armed boats, and twelve marines, to examine the water, and to try the disposition of the inhabitants, several hundred of whom were assembled on a sandy beach before the village; behind it was a narrow valley, the bottom of which was occupied by the piece of water.

The very instant I leaped on shore, the collected body of the natives all fell flat upon their faces, and remained in that very humble posture, till, by expressive signs, I prevailed upon them to rise. They then brought a great many small pigs, which they presented to me, with plantain trees, using much the same ceremonies that we had seen practised, on such occasions, at the Society and other islands; and a long prayer being spoken by a single person, in which others of the assembly sometimes joined, I expressed my acceptance of their proffered friendship, by giving them, in return, such presents as I had brought with me from the ship for that purpose. When this introductory business was finished, I stationed a guard upon the beach, and got some of the natives to conduct me to the water, which proved to be very good, and in a proper situation for our purpose. It was so considerable, that it may be called a lake; and it extended farther up the country than we could see. Having satisfied myself about this very essential point, and about the peaceable disposition of the natives, I returned on board; and then gave orders that everything should be in readiness for landing and filling our water-casks in the morning, when I went ashore with the people employed in that service, having a party of marines with us for a guard, who were stationed on the beach.

As soon as we landed, a trade was set on foot for hogs and potatoes, which the people of the island gave us in exchange for nails and pieces of iron, formed into something like chisels. We met with no obstruction in watering; on the contrary, the natives assisted our men in rolling the casks to and from the pool, and readily performed whatever we required. Every thing thus going on to my satisfaction, and considering my presence on the spot as unnecessary, I left the command to Mr. Williamson, who had landed with me, and made an excursion into the country, up the valley, accompanied by Mr. Anderson and Mr. Webber; the former of whom was as well qualified to describe with the pen, as the latter was to represent with his pencil, every thing we might meet with worthy of observation. A numerous train of natives followed us; and one of them, whom I had distinguished for his activity in keeping the rest in order, I made choice of as our guide. This man, from time to time, proclaimed

our approach; and every one whom we met fell prostrate upon the ground, and remained in that position till we had passed. This, as I afterward understood, is the mode of paying their respect to their own great chiefs. As we ranged down the coast from the east, in the ships, we had observed at every village one or more elevated white objects, like pyramids or rather obelisks; and one of these, which I guessed to be at least fifty feet high, was very conspicuous from the ship's anchoring station, and seemed to be at no great distance up this valley. To have a nearer inspection of it, was the principal object of my walk. Our guide perfectly understood that we wished to be conducted to it. But it happened to be so placed that we could not get at it, being separated from us by the pool of water. However, there being another of the same kind within our reach, about half a mile off, upon our side of the valley, we set out to visit that. The moment we got to it, we saw that it stood in a burying-ground, or *morai*; the resemblance of which, in many respects, to those we were so well acquainted with at other islands in this ocean, and particularly Otaheite, could not but strike us; and we also soon found that the several parts that compose it were called by the same names. It was an oblong space, of considerable extent, surrounded by a wall of stone, about four feet high. The space inclosed was loosely paved with smaller stones; and at one end of it stood what I call the pyramid, but, in the language of the island, is named *kenananoo*; which appeared evidently to be an exact model of the larger one, observed by us from the ships. It was about four feet square at the base, and about twenty feet high. The four sides were composed of small poles interwoven with twigs and branches, thus forming an indifferent wicker-work, hollow or open within, from bottom to top. It seemed to be rather in a ruinous state; but there were sufficient remaining marks to show that it had originally been covered with a thin, light, grey cloth; which these people, it should seem, consecrate to religious purposes; as we could see a good deal of it hanging in different parts of the *morai*; and some of it had been forced upon me when I first landed. On each side of the pyramid were long pieces of wicker-work, called *hereanee*, in the same ruinous condition; with two slender poles, inclining to each other, at one corner, where some plantains were laid upon a board, fixed at the height of five or six feet. This they called *herairemy*; and informed us that the fruit was an offering to their god, which makes it agree exactly with the *whatta* of Otaheite. Before the *kenananoo* were a few pieces of wood, carved into something like human figures, which, with a stone near two feet high, covered with pieces of cloth called *hoko*, and consecrated to *Tongarooa*, who is the god of these people, still more and more reminded us of what we used to meet with in the *morais* of the islands we had lately left*. Adjoining to these, on the outside of the *morai*, was a small shed, no bigger than a dog-kennel, which they called *hareepahoo*; and before it was a grave, where, as we were told, the remains of a woman lay.

MORAI AT ATOOI, WITH PYRAMIDS.

On the farther side of the area of the *morai*, stood a house or shed about forty feet long, ten broad in the middle, each end being narrower, and about ten feet high. This, which though much longer, was lower than their common dwelling-places, we were informed was called *hemanaa*. The entrance into it was at the middle of the side, which was in the *morai*. On the farther side of this house, opposite the entrance, stood two wooden images cut out of one piece, with pedestals, in all about three feet high; neither very indifferently designed nor executed. These were said to be *Eatooa no Veheina*, or representations of goddesses. On the head of one of them was a carved helmet, not unlike those worn by the ancient warriors; and on that of the other, a cylindrical cap, resembling the head-dress at Otaheite.

* See the description of the *morai*, in Otaheite, where the human sacrifice was offered, at which Captain Cook was present.

called *tomou*; and both of them had pieces of cloth tied about the loins, and hanging a considerable way down. At the side of each was also a piece of carved wood with bits of the cloth hung on them in the same manner; and between or before the *tomous* lay a quantity of fern in a heap. It was obvious that this had been deposited there piece by piece, and at different times; for there was of it, in all states, from what was quite decayed to what was still fresh and green.

In the middle of the house, and before the two images, was an oblong space, inclosed by a low edging of stone, and covered with shreds of the cloth so often mentioned. This, on inquiry, we found was the grave of seven chiefs, whose names were enumerated, and the place was called *Heneene*. We had met already with so many striking instances of resemblance between the burying-place we were now visiting and those of islands we had lately come from in the South Pacific, that we had little doubt in our minds that the resemblance existed also in the ceremonies practised here, and particularly in the horrid one of offering human sacrifices. Our suspicions were too soon confirmed, by direct evidence. For, on coming out of the house, just on one side of the entrance, we saw a small square place, and another still less near it; and on asking what these were? our guide immediately informed us, that in the one was buried a man who had been sacrificed; a *Taata* (*Tanata* or *Tangata*, in this country) *taboo* (*tafoo*, as here pronounced); and in the other a hog, which had also been made an offering to the divinity. At a little distance from these, near the middle of the *morai*, were three more of these square inclosed places, with two pieces of carved wood at each, and upon them a heap of fern. These, we were told, were the graves of three chiefs; and before them was an oblong inclosed space, to which our conductor also gave the name of *Tangata-taboo*; telling us, so explicitly, that we could not mistake his meaning, that three human sacrifices had been buried there; that is, one at the funeral of each chief. It was with most sincere concern, that I could trace, on such undoubted evidence, the prevalence of these bloody rites throughout this immense ocean, amongst people disjoined by such a distance, and even ignorant of each other's existence, though so strongly marked as originally of the same nation. It was no small addition to this concern to reflect that every appearance led us to believe that the barbarous practice was very general here. The island seemed to abound with such places of sacrifice as this which we were now visiting, and which appeared to be one of the most inconsiderable of them; being far less conspicuous than several others which we had seen as we sailed along the coast, and particularly than that on the opposite side of the water in this valley; the white *henananoo*, or pyramid, of which we were now almost sure, derived its colour only from pieces of the consecrated cloth laid over it. In several parts within the inclosure of this burying-ground, were planted trees of the *cordia sebestina*, some of the *morinda citrifolia*, and several plants of the *ete*, or *jejee* of Tongataboo, with the leaves of which the *hemanaa* was thatched; and as I observed that this plant was not made use of in thatching their dwelling-houses, probably it is reserved entirely for religious purposes.

Our road to and from the *morai*, which I have described, lay through the plantations. The greatest part of the ground was quite flat, with ditches full of water intersecting different parts, and roads that seemed artificially raised to some height. The interspaces were, in general, planted with *taro*, which grows here with great strength, as the fields are sunk below the common level, so as to contain the water necessary to nourish the roots. This water probably comes from the same source which supplies the large pool from which we filled our casks. On the drier spaces were several spots where the cloth-mulberry was planted in regular rows; also growing vigorously, and kept very clean. The cocoa-trees were not in so thriving a state, and were all low; but the plantain-trees made a better appearance, though they were not large. In general the trees round this village, and which were seen at many of those which we passed before we anchored, are the *cordia sebestina*; but of a more diminutive size than the product of the southern isles. The greatest part of the village stands near the beach, and consists of above sixty houses there; but, perhaps, about forty more stand scattered about, farther up the country, toward the burying-place.

After we had examined very carefully everything that was to be seen about the *morai*, and Mr. Webber had taken drawings of it, and of the adjoining country, we returned by

a different route. I found a great crowd assembled at the beach; and a brisk trade for pigs, fowls, and roots going on there, with the greatest good order; though I did not observe any particular person who took the lead amongst the rest of his countrymen. At noon, I went on board to dinner, and then sent Mr. King to command the party on shore. He was to have gone upon that service in the morning, but was then detained in the ship to make lunar observations. In the afternoon I landed again, accompanied by Captain Clerke, with a view to make another excursion up the country. But before this could be put in execution, the day was too far spent, so that I laid aside my intention for the present, and it so happened that I had not another opportunity. At sunset, I brought everybody on board, having procured in the course of the day nine tons of water; and, by exchanges, chiefly for nails and pieces of iron, about seventy or eighty pigs, a few fowls, a quantity of potatoes, and a few plantains and *taro* roots. These people merited our best commendations in this commercial intercourse, never once attempting to cheat us, either ashore or alongside the ships. Some of them, indeed, as already mentioned, at first betrayed a thievish disposition, or rather, they thought that they had a right to everything they could lay their hands upon; but they soon laid aside a conduct which, we convinced them, they could not persevere in with impunity.

Amongst the articles which they brought to barter this day, we could not help taking notice of a particular sort of cloak and cap, which, even in countries where dress is more particularly attended to, might be reckoned elegant. The first are nearly of the size and shape of the short cloaks worn by the women of England, and by the men in Spain, reaching to the middle of the back, and tied loosely before. The ground of them is a net-work upon which the most beautiful red and yellow feathers are so closely fixed that the surface might be compared to the thickest and richest velvet, which they resemble, both as to the feel and the glossy appearance. The manner of varying the mixture is very different; some having triangular spaces of red and yellow alternately; others, a kind of crescent; and some that were entirely red, had a broad yellow border, which made them appear, at some distance, exactly like a scarlet cloak edged with gold lace. The brilliant colours of the feathers, in those that happened to be new, added not a little to their fine appearance; and we found that they were in high estimation with their owners; for they would not at first part with one of them for anything that we offered, asking no less a price than a musket. However, some were afterward purchased for very large nails. Such of them as were of the best sort were scarce; and it should seem that they are only used on the occasion of some particular ceremony or diversion; for the people who had them always made some gesticulations which we had seen used before by those who sung. The cap is made almost exactly like a helmet, with the middle part, or crest, sometimes of a hand's breadth; and it sits very close upon the head, having notches to admit the ears. It is a frame of twigs and osiers, covered with a net-work, into which are wrought feathers, in the same manner as upon the cloaks, though rather closer and less diversified, the greater part being red, with some black, yellow, or green stripes on the sides, following the curve direction of the crest. These, probably, complete the dress, with the cloaks, for the natives sometimes appeared in both together.

We were at a loss to guess from whence they could get such a quantity of these beautiful feathers; but were soon informed as to one sort; for they afterward brought great numbers of skins of small red birds for sale, which were often tied up in bunches of twenty or more, or had a small wooden skewer run through their nostrils. At the first, those that were bought consisted only of the skin from behind the wings forward; but we afterward got many with the hind part, including the tail and feet. The first, however, struck us at once with the origin of the fable formerly adopted, of the birds of paradise wanting legs, and sufficiently explained that circumstance. Probably the people of the islands east of the Moluccas, from whence the skins of the birds of paradise are brought, cut

dise are brought, cut

off their feet for the very reason assigned by the people of Atooi for the like practice, which was, that they hereby can preserve them with greater ease, without losing any part which they reckon valuable. The red-bird of our island was judged by Mr. Anderson to be a species of *merops*, about the size of a sparrow, of a beautiful scarlet colour, with a black tail and wings, and an arched bill twice the length of the head, which, with the feet, was also of a reddish colour. The contents of the heads were taken out, as in the birds of paradise; but it did not appear that they used any other method to preserve them than by simple drying, for the skins, though moist, had neither a taste nor smell that could give room to suspect the use of anti-putrescent substances*.

In the night and all the morning of the 22d, it rained almost continually. The wind was at S.E., S.S.E., and S., which brought in a short chopping sea; and as there were breakers little more than two cables' length from the stern of our ship, her situation was none of the safest. The surf broke so high against the shore that we could not land in our boats; but the day was not wholly lost, for the natives ventured in their canoes to bring off to the ships hogs and roots, which they bartered as before. One of our visitors on this occasion, who offered some fish-hooks to sale, was observed to have a very small parcel to the string of one of them, which he separated with great care, and reserved for himself, when he parted with the hook. Being asked what it was? He pointed to his belly and spoke something of its being dead, at the same time saying it was bad, as if he did not wish to answer any more questions about it. On seeing him so anxious to conceal the contents of this parcel, he was requested to open it, which he did with great reluctance, and some difficulty, as it was wrapped up in many folds of cloth. We found that it contained a thin bit of flesh about two inches long, which, to appearance, had been dried, but was now wet with salt water. It struck us that it might be human flesh, and that these people might, perhaps, eat their enemies, as we knew that this was the practice of some of the natives of the South Sea islands. The question being put to the person who produced it, he answered, that the flesh was part of a man. Another of his countrymen, who stood by him, was then asked whether it was their custom to eat those killed in battle? and he immediately answered in the affirmative.

There were some intervals of fair weather in the afternoon; and the wind then inclined to the east and north-east; but, in the evening, it veered back again to the south-south-east, and the rain also returned, and continued all night. Very luckily, it was not attended with much wind. We had, however, prepared for the worst, by dropping the small bower anchor: and striking our top-gallant-yards.

At seven o'clock the next morning, a breeze of wind springing up at north-east, I took up the anchors with a view of removing the ship farther out. The moment that the last anchor was up, the wind veered to the east, which made it necessary to set all the sail we could, in order to clear the shore: so that before we had tolerable sea-room, we were driven some distance to leeward. We made a stretch off, with a view to regain the road; but having very little wind and a strong current against us, I found that it was not to be effected, I therefore despatched Messrs. King and Williamson ashore, with three boats, for water, and

* It is a matter of real curiosity to observe how very extensively the predilection for red feathers is spread throughout all the islands of the Pacific Ocean: and the additional circumstance mentioned in this paragraph will probably be looked upon, by those who amuse themselves in tracing the wonderful migrations of the same family or tribe, as a confirmation of that hypothesis (built, indeed, on other instances of resemblance), which considers New Guinea, and its neighbouring East India islands, from whence the Dutch bring their birds of paradise, as originally peopled by the same race, which Captain Cook found at every island from New Zealand to this new group, to which Atooi belongs.

What Mr. Sonnerat tells us about the bird of paradise agrees perfectly with the account here given of the preserved red-birds. Speaking of the *Papous*, he proceeds thus: "Il nous présentèrent plusieurs espèces d'oiseaux,

aussi élégants par leur forme, que brillants par l'éclat de leurs couleurs. La dépouille des oiseaux sert à la parure des chefs, qui la portent attachée à leurs bonnets en forme d'aigrettes. Mais en préparant les peaux, ils coupent les pieds. Les Hollandais, qui trafiquent sur ces côtes, y achètent de ces peaux ainsi préparées, les transportent en Perse, à Surate, dans les Indes, où ils les vendent fort chères aux habitants riches, qui en font des aigrettes pour leurs turbans, et pour le casque des guerriers, et qui en parent leur chevaux. C'est de là qu'est venu l'opinion, qu'une de ces espèces d'oiseaux (l'oiseau de paradis) 'n'a point de pattes.' Les Hollandais ont accrédité ces fables, qui, en jetant du merveilleux sur l'objet dont ils trafiquoient, étoient propres à le rendre plus précieux, et à en rehausser la valeur."—Voyage à la Nouvelle Guinée, p. 154.

to trade for refreshments. At the same time I sent an order to Captain Clerke to put to sea after me, if he should see that I could not recover the road. Being in hopes of finding one, or perhaps a harbour, at the west end of the island, I was the less anxious about getting back to my former station. But as I had sent the boats thither, we kept to windward as much as possible; notwithstanding which, at noon, we were three leagues to leeward. As we drew near the west end of the island, we found the coast to round gradually to the north-east, without forming a creek, or cove, to shelter a vessel from the force of the swell, which rolled in from the north, and broke upon the shore in a prodigious surf; so that all hopes of finding a harbour here vanished.

Several canoes came off in the morning, and followed us as we stood out to sea, bartering their roots and other articles. Being very averse to believe these people to be cannibals, notwithstanding the suspicious circumstance which had happened the day before, we took occasion now to make some more inquiries about this. A small wooden instrument, beset with shark's teeth, had been purchased; and from its resemblance to the saw or knife used by the New Zealanders, to dissect the bodies of their enemies, it was suspected to have the same use here. One of the natives being asked about this, immediately gave the name of the instrument, and told us that it was used to cut out the fleshy part of the belly, when any person was killed. This explained and confirmed the circumstance above-mentioned, of the person pointing to his belly. The man, however, from whom we had this information, being asked if his countrymen eat the part thus cut out? denied it strongly; but, upon the question being repeated, showed some degree of fear, and swam to his canoe. Just before he reached it, he made signs, as he had done before, expressive of the use of the instrument. And an old man, who sat foremost in the canoe, being then asked, whether they eat the flesh? answered in the affirmative, and laughed seemingly at the simplicity of such a question. He affirmed the fact, on being asked again; and also said that it was excellent food, or, as he expressed it, "savoury eating."

At seven o'clock in the evening, the boats returned with two tons of water, a few hogs, a quantity of plantains, and some roots. Mr. King informed me, that a great number of the inhabitants were at the watering or landing-place. He supposed that they had come from all parts of the island. They had brought with them a great many fine fat hogs to barter; but my people had not commodities with them equal to the purchase. This, however, was a great loss; for we had already got as many on board as we could well manage for immediate use; and, wanting the materials, we could not have salted them. Mr. King also told me, that a great deal of rain had fallen ashore, whereas, out at sea, we had only a few showers; and that the surf had run so high, that it was with great difficulty our men landed, and got back into the boats. We had light airs and calms, by turns, with showers of rain all night; and at day-break, in the morning of the 24th, we found, that the currents had carried the ship to the north-west and north; so that the west end of the island, upon which we had been, called Atooi by the natives, bore east, one league distant; another island called Oreehoua, west by south; and the high land of a third island, called Onecheow, from south-west by west, to west-south-west. Soon after a breeze sprung up at north; and, as I expected that this would bring the Discovery to sea, I steered for Onecheow, in order to take a nearer view of it, and to anchor there, if I should find a convenient place. I continued to steer for it, till past 11 o'clock, at which time we were about two leagues from it. But not seeing the Discovery, and being doubtful whether they could see us, I was fearful lest some ill consequence might attend our separating so far, I therefore gave up the design of visiting Onecheow for the present, and stood back to Atooi, with an intent to anchor again in the road, to complete our water. At two o'clock in the afternoon, the northerly wind died away, and was succeeded by variable light airs and calms, that continued till eleven at night, with which we stretched to the south-east, till day-break in the morning of the 25th, when we tacked and stood in for Atooi road, which bore about north from us; and, soon after, we were joined by the Discovery.

We fetched in with the land about two leagues to leeward of the road, which, though so near, we never could recover; for what we gained at one time, we lost at another; so that, by the morning of the 29th, the currents had carried us westward, within three leagues of

Oneeheow. Being tired with plying so unsuccessfully, I gave up all thoughts of getting back to Atooi, and came to the resolution of trying whether we could not procure what we wanted at the other island, which was within our reach. With this view, I sent the Master in a boat to sound the coast; to look out for a landing-place; and, if he should find one, to examine if fresh water could be conveniently got in its neighbourhood. To give him time to execute his commission, we followed, under an easy sail, with the ships. As soon as we were abreast, or to the westward of the south point of Oneeheow, we found thirty, twenty-five, and twenty fathoms water, over a bottom of coral sand, a mile from the shore. At ten o'clock the Master returned, and reported that he had landed in one place, but could find no fresh water; and that there was anchorage all along the coast. Seeing a village a little farther to leeward, and some of the islanders, who had come off to the ships, informing us, that fresh water might be got there, I ran down, and came to an anchor before it, in twenty-six fathoms water, about three quarters of a mile from the shore. The south-east point of the island bore S., 65° E., three miles distant; the other extreme of the island bore north by east, about two or three miles distant; a peaked hill, inland, N. E., a quarter E.; and another island, called Tahoor, which was discovered the preceding evening, bore S., 61° W., distant seven leagues.

Six or seven canoes had come off to us before we anchored, bringing some small pigs and potatoes, and a good many yams and mats. The people in them resembled those of Atooi, and seemed to be equally well acquainted with the use of iron, which they asked for also by the names of *hamaite* and *toe*; parting readily with all their commodities for pieces of this precious metal. Several more canoes soon reached the ships after they had anchored; but the natives in these seemed to have no other object than to pay us a formal visit. Many of them came readily on board, crouching down upon the deck, and not quitting that humble posture till they were desired to get up. They had brought several females with them, who remained alongside in the canoes, behaving with far less modesty than their countrywomen of Atooi; and at times all joining in a song, not remarkable for its melody, though performed in very exact concert, by beating time upon their breasts with their hands. The men who had come on board did not stay long; and before they departed, some of them requested our permission to lay down, on the deck, locks of their hair.

These visitors furnished us with an opportunity of agitating again, this day, the curious inquiry whether they were cannibals; and the subject did not take its rise from any question of ours, but from a circumstance that seemed to remove all ambiguity. One of the islanders who wanted to get in at the gun-room port was refused; and at the same time asked whether, if he should come in, we would kill and eat him? accompanying this question with signs so expressive, that there could be no doubt about his meaning. This gave a proper opening to retort the question as to this practice; and a person behind the other, in the canoe, who paid great attention to what was passing, immediately answered, that if we were killed on shore, they would certainly eat us. He spoke with so little emotion, that it appeared plainly to be his meaning that they would not destroy us for that purpose; but that their eating us would be the consequence of our being at enmity with them. I have availed myself of Mr. Anderson's collections for the decision of this matter; and am sorry to say, that I cannot see the least reason to hesitate in pronouncing it to be certain, that the horrid banquet of human flesh is as much relished here, amidst plenty, as it is in New Zealand.

In the afternoon I sent Lieutenant Gore, with three armed boats, to look for the most convenient landing-place; and, when on shore, to search for fresh water. In the evening he returned, having landed at the village above mentioned, and acquainted me that he had been conducted to a well half a mile up the country; but, by his account, the quantity of water it contained was too inconsiderable for our purpose, and the road leading to it exceedingly bad.

On the 30th I sent Mr. Gore ashore again, with a guard of marines, and a party to trade with the natives for refreshments. I intended to have followed soon after, and went from the ship with that design; but the surf had increased so much by this time, that I was fearful if I got ashore I should not be able to get off again. This really happened to our

people who had landed with Mr. Gore, the communication between them and the ships by our own boats being soon stopped. In the evening they made a signal for the boats, which were sent accordingly; and, not long after, they returned with a few yams and some salt. A tolerable quantity of both had been procured in the course of the day; but the surf was so great, that the greatest part of both these articles had been lost in conveying them to the boats. The officer and twenty men, deterred by the danger of coming off, were left ashore all night; and by this unfortunate circumstance, the very thing happened which, as I have already mentioned, I wished so heartily to prevent, and vainly imagined I had effectually guarded against. The violence of the surf, which our own boats could not act against, did not hinder the natives from coming off to the ships in their canoes. They brought refreshments with them, which were purchased in exchange for nails and pieces of iron hoops; and I distributed a good many pieces of ribbon and some buttons, as bracelets, amongst the women in the canoes. One of the men had the figure of a lizard punctured upon his breast, and upon those of others were the figures of men badly imitated. These visitors informed us that there was no chief, or *Hairee*, of this island, but that it was subject to Teneconoo, a chief of Atooi; which island, they said, was not governed by a single chief, but that there were many to whom they paid the honour of *moe*, or prostration; and, among others, they named Otaciao and Terarotoa. Amongst other things which these people now brought off was a small drum, almost like those of Otaheite.

About ten or eleven o'clock at night the wind veered to the south, and the sky seemed to forebode a storm. With such appearances, thinking that we were rather too near the shore, I ordered the anchors to be taken up, and having carried the ships into forty-two fathoms, came to again in that safer station. The precaution, however, proved to be unnecessary; for the wind soon after veered to N.N.E., from which quarter it blew a fresh gale, with squalls, attended with very heavy showers of rain. This weather continued all the next day, and the sea ran so high that we had no manner of communication with our party on shore; and even the natives themselves durst not venture out to the ships in their canoes. In the evening I sent the master in a boat up to the south-east head, or point of the island, to try if he could land under it. He returned with a favourable report, but it was too late, now, to send for our party till the next morning; and thus they had another night to improve their intercourse with the natives.

Encouraged by the master's report, I sent a boat to the south-east point, as soon as daylight returned, with an order to Mr. Gore, that if he could not embark his people from the spot where they now were, to march them up to the point. As the boat could not get to the beach, one of the crew swam ashore and carried the order. On the return of the boat, I went myself with the pinnace and launch up to the point, to bring the party on board; taking with me a ram-goat and two ewes, a boar and sow-pig of the English breed, and the seeds of melons, pumpkins, and onions; being very desirous of benefiting these poor people, by furnishing them with some additional articles of food. I landed with the greatest ease, under the west side of the point, and found my party already there, with some of the natives in company. To one of them, whom Mr. Gore had observed assuming some command over the rest, I gave the goats, pigs, and seeds. I should have left these well-intended presents at Atooi had we not been so unexpectedly driven from it.

While the people were engaged in filling four water-casks from a small stream occasioned by the late rain, I walked a little way up the country attended by the man above-mentioned, and followed by two others carrying the two pigs. As soon as we got upon a rising ground, I stopped to look round me; and observed a woman, on the other side of the valley where I landed, calling to her countryman who attended me. Upon this the chief began to mutter something which I supposed was a prayer; and the two men who carried the pigs continued to walk round me all the time, making at least a dozen circuits before the other had finished his orison. This ceremony being performed, we proceeded; and presently met people coming from all parts, who, on being called to by the attendants, threw themselves prostrate on their faces, till I was out of sight. The ground through which I passed was in a state of nature, very stony, and the soil seemed poor. It was, however, covered with shrubs and plants, some of which perfumed the air with a more delicious fragraney than I had met

at any other of the islands visited by us in this ocean. Our people who had been obliged to remain so long on shore, gave me the same account of those parts of the island which they had traversed. They met with several salt ponds, some of which had a little water remaining, but others had none; and the salt that was left in them was so thin, that no great quantity could have been procured. There was no appearance of any running stream; and though they found some small wells, in which the fresh water was tolerably good, it seemed scarce. The habitations of the natives were thinly scattered about; and, it was supposed, that there could not be more than five hundred people upon the island, as the greatest part were seen at the marketing-place of our party, and few found about the houses by those who walked up the country. They had an opportunity of observing the method of living amongst the natives, and it appeared to be decent and cleanly. They did not, however, see any instance of the men and women eating together; and the latter seemed generally associated in companies by themselves. It was found that they burnt here the oily nuts of the *doe* *done* for lights in the night, as at Otaheite; and that they laked their hogs in ovens; but, contrary to the practice of the Society and Friendly Islands, split their carcases through their whole length. They met with a positive proof of the existence of the *taboo* (or, as they pronounce it, the *tafoo*), for one woman fed another who was under that interdiction. They also observed some other mysterious ceremonies; one of which was performed by a woman, who took a small pig, and threw it into the surf till it was drowned, and then tied up a bundle of wood, which she also disposed of in the same manner. The same woman, at another time, beat with a stick upon a man's shoulders, who sat down for that purpose. A particular veneration seemed to be paid here to owls, which they have very tame; and it was observed to be a pretty general practice amongst them to pull out one of their teeth*; for which old custom, when asked the reason, the only answer that could be got was, that it was *teeha*, which was also the reason assigned for another of their practices, the giving a lock of their hair.

After the water-tasks had been filled and conveyed into the boat, and we had purchased from the natives a few roots, a little salt, and some salted fish, I returned on board with all the people, intending to visit the island the next day. But about seven o'clock in the evening the anchor of the *Resolution* started, and she drove off the bank. As we had a whole cable out, it was some time before the anchor was at the bows; and then we had the launch to hoist up alongside, before we could make sail. By this unlucky accident we found ourselves, at day-break next morning, three leagues to the leeward of our last station; and foreseeing that it would require more time to recover it than I chose to spend, I made the signal for the *Discovery* to weigh and join us. This was done about noon; and we immediately stood away to the northward in prosecution of our voyage. Thus, after spending more time about these islands than was necessary to have answered all our purposes, we were obliged to leave them before we had completed our water, and got from them such a quantity of refreshments as their inhabitants were both able and willing to have supplied us with. But, as it was, our ship procured from them provisions sufficient for three weeks at least; and Captain Clerke, more fortunate than us, got of their vegetable productions a supply that lasted his people upward of two months. The observations I was enabled to make, combined with those of Mr. Anderson, who was a very useful assistant on all such occasions, will furnish materials for the next chapter.

* It is very remarkable that, in this custom, which one island, and Dampier's natives on the west side of New Holland, at such an immense distance, should be found to agree.

CHAPTER XII.—THE SITUATION OF THE ISLANDS NOW DISCOVERED.—THEIR NAMES.—CALLED THE SANDWICH ISLANDS.—ATOOI DESCRIBED.—THE SOIL.—CLIMATE.—VEGETABLE PRODUCTIONS.—BIRDS.—FISH.—DOMESTIC ANIMALS.—PERSONS OF THE INHABITANTS.—THEIR DISPOSITION.—DRESS.—ORNAMENTS.—HABITATIONS.—FOOD.—COOKERY.—AMUSEMENTS.—MANUFACTURES.—WORKING-TOOLS.—KNOWLEDGE OF IRON ACCOUNTED FOR.—CANOES.—AGRICULTURE.—ACCOUNT OF ONE OF THEIR CHIEFS.—WEAPONS.—CUSTOMS AGREEING WITH THOSE OF TONGATABOO AND OTAHEITE.—THEIR LANGUAGE THE SAME.—EXTENT OF THIS NATION THROUGHOUT THE PACIFIC OCEAN.—REFLECTIONS ON THE USEFUL SITUATION OF THE SANDWICH ISLANDS.

It is worthy of observation, that the islands in the Pacific Ocean, which our late voyages have added to the geography of the globe, have been generally found lying in groups or clusters; the single intermediate islands, as yet discovered, being few in proportion to the others; though, probably, there are many more of them still unknown, which serve as steps between the several clusters. Of what number this newly-discovered archipelago consists must be left for future investigation. We saw five of them, whose names, as given to us by the natives, are Woahoo, Atooi, Oneeheow, Oreehoua, and Tahoorā. The last is a small elevated island, lying four or five leagues from the south-east point of Oneeheow, in the direction of south, 69° W. We were told that it abounds with birds, which are its only inhabitants. We also got some information of the existence of a low uninhabited island in the neighbourhood, whose name is Tammata pappā. Besides these six, which we can distinguish by their names, it appeared, that the inhabitants of those with whom we had intercourse were acquainted with some other islands, both to the eastward and westward. I named the whole group the Sandwich Islands, in honour of the Earl of Sandwich. Those that I saw are situated between the latitude of $21^{\circ} 30'$ and $22^{\circ} 15' N.$, and between the longitude of $199^{\circ} 20'$ and $201^{\circ} 30'$ East. Of Woahoo, the most easterly of these islands seen by us, which lies in the latitude of $21^{\circ} 36'$, we could get no other intelligence but that it is high land and is inhabited.

We had opportunities of knowing some particulars about Oneeheow, which have been mentioned already. It lies several leagues to the westward of our anchoring-place at Atooi; and is not above fifteen leagues in circuit. Its chief vegetable produce is yams, if we may judge from what was brought to us by the natives. They have salt, which they call *patai*; and is produced in salt ponds. With it they cure both fish and pork; and some salt fish which we got from them kept very well, and were found to be very good. This island is mostly low land, except the part facing Atooi, which rises directly from the sea to a good height; as does also the south-east point of it, which terminates in a round hill. It was on the west side of this point where our ships anchored. Of Oreehoua we know nothing more than that it is a small elevated island, lying close to the north side of Oneeheow.

Atooi, which is the largest, being the principal scene of our operations, I shall now proceed to lay before my readers what information I was able to collect about it, either from actual observation while on shore, or from conversation with its inhabitants, who were perpetually on board the ships while we lay at anchor; and who, in general, could be tolerably well understood by those of us who had acquired an acquaintance with the dialects of the South Pacific Islands. It is, however, to be regretted that we should have been obliged so soon to leave a place which, as far as our opportunities of knowing reached, seemed to be highly worthy of a more accurate examination. Atooi, from what we saw of it, is at least ten leagues in length from east to west; from whence its circuit may nearly be guessed, though it appears to be much broader at the east than at the west point, if we may judge from the double range of hills which appeared there. The road, or anchoring-place, which we occupied, is on the south-west side of the island, about six miles from the west end, before a village which has the name of Wymoa. As far as we sounded, we found that the bank has a fine grey sand at the bottom, and is free from rocks, except a little to the eastward of the village, where there spits out a shoal on which are some rocks and breakers; but they are not far from shore. This road would be entirely sheltered from the trade-wind

we found that the
cept a little to the
rocks and breakers:
from the trade-wind

if the height of the land over which it blows did not alter its direction, and make it follow that of the coast; so that it blows at north-east on one side of the island, and at east-south-east, or south-east, on the other, falling obliquely upon the shore. Thus the road, though situated on the lee side of the island, is a little exposed to the trade-wind; but, notwithstanding this defect, is far from being a bad station, and much superior to those which necessity obliges ships daily to use, in regions where the winds are both more variable and more boisterous; as at Teneriffe, Madeira, the Azores, and elsewhere. The landing, too, is more easy than at most of those places; and, unless in very bad weather, always practicable. The water to be got in the neighbourhood is excellent, and easy to be conveyed to the boats. But no wood can be cut at any distance convenient enough to bring it from, unless the natives could be prevailed upon to part with the few *elooa* trees (for so they call the *Cordia sebastina*), that grow about their villages, or a sort called *doee dooe*, that grow farther up the country.

The land, as to its general appearance, does not, in the least, resemble any of the islands we have hitherto visited within the tropic, on the south side of the equator; if we except its hills near the centre, which are high, but slope gently to the sea, or lower lands. Though it be destitute of the delightful borders of Otaheite, and of the luxuriant plains of Tongataboo, covered with trees, which at once afford a friendly shelter from the scorching sun, and an enchanting prospect to the eye, and food for the natives, which may be truly said to drop from the trees into their mouths, without the laborious task of rearing; though, I say, Atooi be destitute of these advantages, its possessing a greater quantity of gently-rising land renders it, in some measure, superior to the above favourite islands, as being more capable of improvement. The height of the land within, the quantity of clouds which we saw, during the whole time we staid, hanging over it, and frequently on the other parts, seems to put it beyond all doubt, that there is a sufficient supply of water; and that there are some running streams which we did not see, especially in the deep valleys, at the entrance of which the villages commonly stand. From the wooded part to the sea, the ground is covered with an excellent sort of grass, about two feet high, which grows sometimes in tufts, and, though not very thick at the place where we were, seemed capable of being converted into plentiful crops of fine hay. But not even a shrub grows naturally on this extensive space.

In the break, or narrow valley, through which we had our road to the *mora*, the soil is of a brownish black colour, somewhat loose; but as we advanced upon the high ground, it changed to a reddish brown, more stiff and clayey, though, at this time, brittle from its dryness. It is most probably the same all over the cultivated parts; for what adhered to most of the potatoes bought by us, which, no doubt, came from very different spots, was of this sort. Its quality, however, may be better understood from its products than from its appearance. For the vale, or moist ground, produces *taro*, of a much larger size than any we had ever seen; and the higher ground furnishes sweet potatoes, that often weigh ten, and sometimes twelve or fourteen pounds; very few being under two or three. The temperature of the climate may be easily guessed from the situation of the island. Were we to judge of it from our experience, it might be said to be very variable; for, according to the generally received opinion, it was now the season of the year when the weather is supposed to be most settled, the sun being at its greatest annual distance. The heat was, at this time, very moderate; and few of those inconveniences which many tropical countries are subject to, either from heat or moisture, seem to be experienced here, as the habitations of the natives are quite close; and they salt both fish and pork, which keep well, contrary to what has usually been observed to be the case, when this operation is attempted in hot countries. Neither did we find any dews of consequence, which may, in some measure, be accounted for, by the lower part of the country being destitute of trees.

The rock that forms the sides of the valley, and which seems to be the same with that seen by us at different parts of the coast, is a greyish-black ponderous stone; but honey-combed, with some very minute shining particles, and some spots of a rusty colour interspersed. The last gives it often a reddish cast, when at a distance. It is of an immense depth, but seems divided into *strata*, though nothing is interposed. For the large pieces always broke off to a determinate thickness, without appearing to have adhered to those below them

Other stones are probably much more various than in the southern islands. For, during our short stay, besides the *lapis lydius*, which seems common all over the South Sea, we found a species of cream-coloured whetstone, sometimes variegated with blacker or whiter veins, as marble; or in pieces, as *breccia*; and common writing-slate, as well as a coarser sort; but we saw none of them in their natural state; and the natives brought some pieces of a coarse whitish pumice-stone. We got also a brown sort of *hematites*, which, from being strongly attracted by the magnet, discovered the quantity of metal that it contained, and seems to belong to the second species of *Concreted*, though Linnæus has placed it amongst his *intractabilia*. But its variety could not be discovered; for what we saw of it, as well as the slates and whetstones, was cut artificially.

Besides the vegetable articles bought by us as refreshments, amongst which were, at least, five or six varieties of plantains, the island produces bread-fruit, though it seems to be scarce, as we saw only one tree, which was large, and had some fruit upon it. There are also a few cocoa-palms; yams, as we were told, for we saw none; the *kappe* of the Friendly Islands, or Virginian *arum*; the *etooa* tree, and sweet-smelling *gardenia*, or *cape jasmine*. We saw several trees of the *dooe dooe*, so useful at Otaheite, as bearing the oily nuts which are stuck upon a kind of skewer and burnt as candles. Our people saw them used, in the same manner, at Oneeheow. We were not on shore at Atooi but in the day-time, and then we saw the natives wearing these nuts, hung on strings, round the neck. There is a species of *sida*, or Indian mallow, somewhat altered by the climate, from what we saw at Christmas Island; the *Morinda citrifolia*, which is called *none*; a species of *convolvulus*; the *ara*, or intoxicating pepper; and great numbers of gourds. These last grow to a very large size, and are of a vast variety of shapes, which probably is effected by art. Upon the dry sand, about the village, grew a plant that we had never seen in these seas, of the size of a common thistle, and prickly, like that; but bearing a fine flower, almost resembling a white poppy. This, with another small one, were the only uncommon plants which our short excursion gave us an opportunity of observing.

The scarlet birds, already described, which were brought for sale, were never met with alive; but we saw a single small one, about the size of a canary-bird, of a deep crimson colour; a large owl; two large brown hawks, or kites; and a wild duck. The natives mentioned the names of several other birds; amongst which we knew the *atoo*, or blueish heron; and the *torata*, a sort of whimbrel, which are known by the same names at Otaheite; and it is probable that there are a great many sorts, judging by the quantity of fine yellow, green, and very small, velvet-like, black feathers used upon the cloaks, and other ornaments, worn by the inhabitants. Fish, and other marine productions, were, to appearance, not various; as, besides the small mackerel, we only saw common mullets; a sort of a dead white, or chalky colour; a small, brownish rock-fish, spotted with blue; a turtle, which was penned up in a pond; and three or four sorts of fish salted. The few shell-fish that we saw were chiefly converted into ornaments, though they neither had beauty nor novelty to recommend them. The hogs, dogs, and fowls, which were the only tame or domestic animals that we found here, were all of the same kind that we met with at the South Pacific islands. There were also small lizards; and some rats, resembling those seen at every island at which we had as yet touched.

The inhabitants are of a middling stature, firmly made, with some exceptions, neither remarkable for a beautiful shape, nor for striking features, which rather express an openness and good-nature, than a keen, intelligent disposition. Their visage, especially amongst the women, is sometimes round; but others have it long; nor can we say that they are distinguished, as a nation, by any general cast of countenance. Their colour is nearly of a nut-brown, and it may be difficult to make a nearer comparison, if we take in all the different hues of that colour; but some individuals are darker. The women have been already mentioned, as being little more delicate than the men in their formation; and I may say that, with a very few exceptions, they have little claim to those peculiarities that distinguish the sex in other countries. There is, indeed, a more remarkable equality in the size, colour, and figure of both sexes, than in most places I have visited. However, upon the whole, they are far from being ugly, and appear to have few natural deformities of any kind.

ormities of any kind.

Their skin is not very soft, nor shining; perhaps for want of oiling, which is practised at the southern islands; but their eyes and teeth are, in general, very tolerable. The hair for the greatest part, is straight, though in some frizzling; and though its natural colour be commonly black, it is stained, as at the Friendly and other islands. We saw but few instances of corpulence; and these oftener among the women than the men; but it was chiefly amongst the latter that personal defects were observed, though, if any of them can claim a share of beauty, it was most conspicuous amongst the young men.

They are vigorous, active, and most expert swimmers; leaving their canoes upon the most trifling occasion; diving under them, and swimming to others though at a great distance. It was very common to see women, with infants at the breast, when the surf was so high that they could not land in the canoes, leap overboard, and without endangering their little ones, swim to the shore, through a sea that looked dreadful. They seem to be blest with a frank, cheerful disposition; and were I to draw any comparisons, I should say, that they are equally free from the fickle levity which distinguishes the natives of Otaheite, and the sedate cast observable amongst many of these of Tongataboo. They seem to live very sociably in their intercourse with one another; and, except the propensity to thieving, which seems

WOMAN OF THE SANDWICH ISLANDS.

SANDWICH ISLANDER IN HIS FULL DRESS CAP AND CLOAK.

innate in most of the people we have visited in this ocean, they were exceedingly friendly to us. And it does their sensibility no little credit, without flattering ourselves, that when they saw the various articles of our European manufacture, they could not help expressing their surprise, by a mixture of joy and concern, that seemed to apply the case, as a lesson of humility, to themselves; and, on all occasions, they appeared deeply impressed with a consciousness of their own inferiority; a behaviour which equally exempts their national character from the preposterous pride of the more polished Japanese, and of the ruder Greenlander. It was a pleasure to observe with how much affection the women managed their infants, and how readily the men lent their assistance to such a tender office; thus sufficiently distinguishing themselves from those savages who esteem a wife and child as things rather necessary than desirable, or worthy of their notice.

From the numbers which we saw collected at every village, as we sailed past, it may be supposed that the inhabitants of this island are pretty numerous. Any computation that we make can be only conjectural. But that some notion may be formed, which shall not greatly err on either side, I should suppose that, including the straggling houses, there might be, upon the whole island, sixty such villages, as that before which we anchored; and that, allowing five persons to each house, there would be, in every village, five hundred; or thirty thousand upon the island. This number is, certainly, not exaggerated; for we had some-

times three thousand persons, at least, upon the beach ; when it could not be supposed that above a tenth part of the inhabitants were present.

The common dress, both of the women and of the men, has been already described. The first have often much larger pieces of cloth wrapped round them, reaching from just below the breasts to the hams, or lower ; and several were seen with pieces thrown loosely about the shoulders, which covered the greatest part of the body ; but the children, when very young are quite naked. They wear nothing upon the head ; but the hair, in both sexes, is cut in different forms ; and the general fashion, especially among the women, is to have it long before and short behind. The men often had it cut, or shaved, on each side, in such a manner, that the remaining part, in some measure, resembles the crest of their caps or helmets formerly described. Both sexes, however, seem very careless about their hair, and have nothing like combs to dress it with. Instances of wearing it, in a singular manner, were sometimes met with among the men, who twist it into a number of separate parcels like the tails of a wig, each about the thickness of a finger ; though the greatest part of these, which are so long that they reach far down the back, we observed, were artificially fixed upon the head, over their own hair*.

FASHIONS OF HAIR AMONG THE SANDWICH ISLANDERS

It is remarkable that, contrary to the general practice of the islands we had hitherto discovered in the Pacific Ocean, the people of the Sandwich Islands have not their ears perforated, nor have they the least idea of wearing ornaments in them. Both sexes, nevertheless, adorn themselves with necklaces made of bunches of small black cord, like our hat-string, often above a hundred-fold, exactly like those of Wateoo ; only that instead of the two little balls, on the middle before, they fix a small bit of wood, stone, or shell, about two inches long, with a broad hook, turning forward at its lower part, well polished. They have, likewise, necklaces of many strings of very small shells, or of the dried flowers of the Indian mallow. And, sometimes, a small human image of bone, about three inches long,

BRACELET.

neatly polished, is hung round the neck. The women also wear bracelets of a single shell, pieces of black wood, with bits of ivory interspersed, and well polished, fixed by a string drawn very close through them ; or others of hogs' teeth, laid parallel to each other, with the concave part outward, and the points cut off, fastened together as the former ; some of which, made only of large boars' tusks, are very elegant. The men, sometimes, wear plumes of the tropic-bird's feathers, stuck in their heads ; or those of cocks, fastened round neat polished sticks, two feet long, commonly decorated at the lower part with *cora* ; and, for the same purpose, the skin of a white dog's tail is sewed over a stick, with its tuft at the end. They also frequently wear on the head a kind of ornament, of a finger's thickness, or more, covered with red and yellow feathers, curiously varied, and tied behind ; and on the arm, above the elbow, a kind of broad shell-work, grounded upon net-work.

The men are frequently punctured, though not in any particular part, as the Otahiteians, and those of Tongataboo. Sometimes there are a few marks upon their hand, or arms, and

* The print of Horn Island, which we meet with in Mr. Dalrymple's account of Le Maire and Schouten's voyages, represents some of the natives of that island

with such long tails, hanging from their heads, as are here described. See Dalrymple's Voyage to the South Pacific, vol. ii. p. 59.

near the groin; but frequently we could observe none at all; though a few individuals had more of this sort of ornament than we had usually seen at other places, and ingeniously executed in a great variety of lines and figures, on the arms and forepart of the body; on which latter some of them had the figure of the *taame*, or breast-plate, of Otaheite, though we did not meet with the thing itself amongst them.

Though they seem to have adopted the mode of living in villages, there is no appearance of defence, or fortification, near any of them; and the houses are scattered about without any order, either with respect to their distances from each other, or their position in any particular direction. Neither is there any proportion as to their size; some being large and commodious, from forty to fifty feet long, and twenty or thirty broad, while others of them are mere hovels. Their figure is not unlike oblong corn or hay stacks; or, perhaps a better idea may be conceived of them, if we suppose the roof of a barn placed on the ground in such a manner, as to form a high, acute ridge, with two very low sides, hardly discernible at a distance. The gable, at each end corresponding to the sides, makes these habitations perfectly close all round; and they are well thatched with long grass, which is laid on slender poles, disposed with some regularity. The entrance is made indifferently, in the end or side, and is an oblong hole, so low, that one must rather creep than walk in; and is often shut up by a board of planks, fastened together, which serves as a door, but having no hinges, must be removed occasionally. No light enters the house, but by this opening; and though such close habitations may afford a comfortable retreat in bad weather, they seem but ill-adapted to the warmth of the climate. They are, however, kept remarkably clean; and their floors are covered with a large quantity of dried grass, over which they spread mats to sit and sleep upon. At one end stands a kind of bench, about three feet high, on which their household utensils are placed. The catalogue is not long. It consists of gourd shells, which they convert into vessels that serve as bottles to hold water, and as baskets to contain their victuals, and other things, with covers of the same; and of a few wooden bowls and trenchers, of different sizes. Judging from what we saw growing, and from what was brought to market, there can be no doubt that the greatest part of their vegetable food consists of sweet potatoes, *taro*, and plantains; and that bread-fruit and yams are rather to be esteemed rarities. Of animal food, they can be in no want; as they have abundance of hogs, which run, without restraint, about the houses; and if they eat dogs, which is not improbable, their stock of these seem to be very considerable. The great number of fishing-hooks found among them, showed, that they derive no inconsiderable supply of animal food from the sea. But it should seem, from their practice of salting fish, that the openness of their coast often interrupts the business of catching them; as it may be naturally supposed, that no set of people would ever think of preserving quantities of food artificially, if they could depend upon a daily, regular supply of it, in its fresh state. This sort of reasoning, however, will not account for their custom of salting their pork, as well as their fish, which are preserved in gourd-shells. The salt, of which they use a great quantity for this purpose, is of a red colour, not very coarse, and seems to be much the same with what our stragglers found at Christmas Island. It has its colour,

HUTS OF THE SANDWICH ISLANDERS.

doubtless, from a mixture of the mud, at the bottom of the part where it is formed, for some of it that had adhered in lumps, was of a sufficient whiteness and purity.

They bake their vegetable food with heated stones, as at the Southern Islands; and, from the vast quantity which we saw dressed at one time, we suspected that the whole village, or, at least, a considerable number of people, joined in the use of a common oven. We did not see them dress any animal food at this island; but Mr. Gore's party, as already mentioned, had an opportunity of satisfying themselves, that it was dressed in Oneheow in the same sort of ovens; which leaves no doubt of the being also the practice in Atooi, especially as we met with no utensils there that could be applied to the purpose of stewing or boiling. The only artificial dish we met with, was a *taro* pudding; which, though a disagreeable mess from its sourness, was greedily devoured by the natives. They eat off a kind of wooden plates, or trenchers; and the women, as far as we could judge from one instance, if restrained from feeding at the same dish with the men, as at Otaheite, are at least permitted to eat in the same place near them.

Their amusements seem pretty various; for, during our stay, several were discovered. The dances, at which they use the feathered cloaks and caps, were not seen; but from the motions which they made with their hands, on other occasions, when they sung, we could form some judgment that they are, in some degree at least, similar to those we had met with at the Southern Islands, though not executed so skilfully. Neither had they amongst them either flutes or reeds; and the only two musical instruments which we observed, were of an exceeding rude kind. One of them does not produce a melody exceeding that of a child's rattle. It consists of what may be called a conic cap inverted, but scarcely hollowed at the base, above a foot high, made of a coarse sedge-like plant; the upper part of which, and the edges, are ornamented with beautiful red feathers; and to the point, or lower part, is fixed a gourd-shell, larger than the fist. Into this is put something to rattle; which is done by holding the instrument by the small part, and shaking, or rather moving it, from place to place briskly, either to different sides, or backward and forward, just before the face, striking the breast with the other hand at the same time. The other musical instrument (if either of them deserve that name) was a hollow vessel of wood, like a platter, combined with the use of two sticks, on which one of our gentlemen saw a man performing. He held one of the sticks, about two feet long, as we do a fiddle, with one hand, and struck it with the other, which was smaller, and resembled a drum-stick, in a quicker or slower measure; at the same time beating with his foot upon the hollow vessel, that lay inverted upon the ground, and thus producing a tune that was by no means disagreeable. This music was accompanied by the vocal performance of some women, whose song had a pleasing and tender effect.

We observed great numbers of small polished rods, about four or five feet long, somewhat thicker than the rammer of a musket, with a tuft of long white dog's hair fixed on the small end. These are, probably, used in their diversions. We saw a person take one of them in his hand, and holding it up, give a smart stroke, till he brought it into an horizontal position, striking with the foot, on the same side, upon the ground, and with his other hand beating his breast at the same time. They play at bowls, with pieces of whetstone mentioned before, of about a pound weight, shaped somewhat like a small cheese, but rounded at the sides and edges, which are very nicely polished; and they have other bowls of the same sort, made of a heavy reddish brown clay, neatly glazed over with a composition of the same colour, or of a coarse, dark grey slate. They also use, in the manner that we throw quoits, small, flat, rounded pieces of the writing slate, of the diameter of the bowls, but scarcely a quarter of an inch thick, also well polished. From these circumstances one would be induced to think that their games are rather trials of skill than of strength.

In every thing manufactured by these people, there appears to be an uncommon degree of neatness and ingenuity. Their cloth, which is the principal manufacture, is made from the *morus papyrifera*; and, doubtless, in the same manner as at Otaheite and Tongataboo; for we bought some of the grooved sticks, with which it is beaten. Its texture, however, though thicker, is rather inferior to that of the cloth of either of the other places; but in colouring, or staining it, the people of Atooi display a superiority of taste, by the endless variation of figures which they execute. One would suppose, on seeing a number of their pieces, that

f their pieces, that

they had borrowed their patterns from some mercer's shop, in which the most elegant productions of China and Europe are collected; besides some original patterns of their own. Their colours, indeed, except the red, are not very bright; but the regularity of the figures and stripes is truly surprising; for, as far as we knew, they have nothing like stamps or prints to make the impressions. In what manner they produce their colours we had not opportunities of learning; but besides the party-coloured sorts, they have some pieces of plain white cloth, and others of a single colour, particularly dark brown and light blue. In general, the pieces which they brought to us, were about two feet broad, and four or five feet long, being the form and quantity that they use for their common dress, or *maro*; and even these we sometimes found were composed of pieces sewed together; an art which we did not find to the southward, but is strongly, though not very neatly, performed here. There is also a particular sort that is thin, much resembling oil-cloth; and which is actually either oiled or soaked in some kind

PATTERNS OF DRESSES.

of varnish, and seems to resist the action of water pretty well. They fabricate a great many white mats, which are strong, with many red stripes, rhombuses, and other figures interwoven on one side; and often pretty large. These, probably, make a part of their dress occasionally; for they put them on their backs when they offered them for sale. But they make others coarser, plain and strong, which they spread over their floors to sleep upon.

They stain their gourd-shells prettily with undulated lines, triangles, and other figures of a black colour. Instances of which we saw practised at New Zealand. And they seem to possess the art of varnishing; for some of these stained gourd-shells are covered with a kind of lacker; and, on other occasions, they use a strong size, or gluey substance, to fasten their things together. Their wooden dishes and bowls, out of which they drink their *ava*, are of the *etooa*-tree, or *cordia*, as neat as if made in our turning-lathe, and perhaps better polished. And amongst their articles of handicraft may be reckoned small square fans of mat or wicker-work, with handles tapering from them of the same or of wood, which are neatly wrought with small cords of hair, and fibres of the cocoa-nut core intermixed. The great variety of fishing-hooks are ingeniously made, some of bone, others of wood pointed with bone, and many of pearl shell. Of the last, some are like a sort that we saw at Tongataboo, others simply curved, as the common sort at Otaheite, as well as the wooden ones. The bones are mostly small and composed of two pieces; and all the different sorts have a bar, either on the inside like ours, or on the outside opposite the same part; but others have both, the outer one being farthest from the point. Of this last sort, one was procured nine inches long, of a single piece of bone, which, doubtless, belonged to some large fish. The elegant form and polish of this could not, certainly, be outdone by any European artist, even if he should add all his knowledge in design, to the number and convenience of his tools. They polish their stones by constant friction, with pumice-stone in water; and such of their working instruments or tools as I saw resembled those of the Southern Islands. Their hatchets, or rather adzes, were exactly of the same pattern, and either made of the same sort of blackish stone, or of a clay-coloured one. They have also little instruments made of a single shark's tooth, some of which

are fixed to the fore-part of a dog's jaw-bone, and others to a thin wooden handle of the same shape, and at the other end there is a bit of string fastened through a small perforation. These serve as knives occasionally, and are, perhaps, used in carving.

The only iron tools, or rather bits of iron, seen amongst them, and which they had before our arrival, were a piece of iron hoop about two inches long, fitted into a wooden handle *, and another edge-tool, which our people guessed to be made of the point of a broad-sword. Their having the actual possession of these, and their so generally knowing the use of this metal, inclined some on board to think that we had not been the first European visitors of these islands. But, it seems to me, that the very great surprise expressed by them on seeing our ships, and their total ignorance of the use of fire-arms, cannot be reconciled with such a notion. There are many ways by which such people may get pieces of iron, or acquire the knowledge of the existence of such a metal, without ever having had an immediate connexion with nations that use it. It can hardly be doubted that it was unknown to all the inhabitants of this sea, before Magellan led the way into it; for no discoverer, immediately after his voyage, ever found any of this metal in their possession; though, in the course of our late voyages, it has been observed, that the use of it was known at several islands, to which no former European ships had ever, as far as we know, found their way. At all the places where Mendana touched in his two voyages, it must have been seen and left, and this would extend the knowledge of it, no doubt, to all the various islands with which those whom he had visited had any immediate intercourse. It might even be carried farther; and where specimens of this article could not be procured, descriptions might, in some measure, serve to make it known when afterward seen. The next voyage to the southward of the line in which any intercourse was had with the natives of this ocean, was that of Quiros, who landed at Sagittaria, the Island of Handsome People, and at Tierra del Espiritu Santo; at all which places, and at those with whom they had any communication, it must of consequence have been made known. To him succeeded, in this navigation, Le Maire and Schouten, whose connexions with the natives commenced much farther to the eastward, and ended at Cocos and Horn Islands. It was not surprising that, when I visited Tongataboo in 1773, I should find a bit of iron there, as we knew that Tasman had visited it before me; but let us suppose, that he had never discovered the Friendly Islands, our finding iron amongst them would have occasioned much speculation; though we have mentioned before † the method by which they had gained a renewal of their knowledge of this metal, which confirms my hypothesis. For Necootaboo-taboo, or Boscawen's Island, where Captain Wallis's ships left it, and from whence Paulaho received it, lies some degrees to the N.W. of Tongataboo. It is well known that Roggewein lost one of his ships on the Pernicious Islands, which, from their situation, are probably not unknown to, though not frequently visited by, the inhabitants of Otaheite and the Society Islands. It is equally certain, that these last people had a knowledge of iron, and purchased it with the greatest avidity when Captain Wallis discovered Otaheite; and this knowledge could only have been acquired through the mediation of those neighbouring islands where it had been originally left. Indeed, they acknowledge that this was actually the case, and they have told us since, that they held it in such estimation before Captain Wallis's arrival, that a chief of Otaheite who had got two nails into his possession, received no small emolument by letting out the use of these to his neighbours for the purpose of boring holes, when their own methods failed or were thought too tedious ‡. The men of the Society Islands whom we found at Wateoo had been driven thither long after the knowledge and use of iron had been introduced amongst their countrymen; and though, probably, they had no specimen of it with them, they would naturally and with ease communicate at that island their knowledge of this valuable material by description. From

* Captain King purchased this, and has it now in his possession.

† See Vol. II. p. 142.

‡ A similar instance of profitable revenue, drawn from the use of nails by the chiefs of the Caroline Islands, is mentioned by father Cantova: "Si, par hasard, un vaisseau étranger laisse dans leurs isles quelques vieux mor-

ceaux de fer, ils appartiennent de droit aux Tamoels, qui en font faire des outils, le mieux qu'il est possible. Ces outils sont un fond dont le Tamoel tire un revenu considérable, car il les donne à louage, et ce louage se paye assez cher." P. 314.

the people of Watecoo again, those of Hervey's Island might derive that desire to possess some of it, of which we had proofs during our short intercourse with them.

The consideration of these facts sufficiently explains how the knowledge of iron has been conveyed throughout this ocean to islands which never have had an immediate intercourse with Europeans; and it may easily be conceived, that wherever the history of it only has been reported, or a very small quantity of it has been left, the greater eagerness will be shown by the natives to get copious supplies of it. The application of these particulars to the instance now under consideration is obvious. The people of Atooi and Oneeheow, without having ever been visited by Europeans before us, might have received it from intermediate islands, lying between them and the Ladrões, which have been frequented by the Spaniards almost ever since the date of Magellan's voyage. Or, if the distant western situation of the Ladrões should render this solution less probable, is there not the extensive continent of America to windward, where the Spaniards have been settled for more than two hundred years, during which long period of time shipwrecks must have frequently happened on its coasts? It cannot be thought at all extraordinary, that part of such wrecks containing iron should, by the easterly trade wind, be from time to time cast upon islands scattered about this vast ocean. The distance of Atooi from America is no argument against this supposition. But even if it were, it would not destroy it. This ocean is traversed every year by Spanish ships; and it is obvious that, besides the accident of losing a mast and its appendages, casks with iron hoops, and many other things containing iron, may be thrown or may fall overboard during so long a passage, and thus find their way to land. But these are not mere conjectures and possibilities, for one of my people actually did see some wood in one of the houses at Wymoa, which he judged to be fir. It was worm-eaten, and the natives gave him to understand, that it had been driven ashore by the waves of the sea; and we had their own express testimony, that they had got the considerable specimens of iron found amongst them from some place to the eastward.

From this digression (if it can be called so), I return to the observations made during our stay at Atooi, and some account must now be given of their canoes. These, in general, are about twenty-four feet long, and have the bottom for the most part formed of a single piece or log of wood, hollowed out to the thickness of an inch, or an inch and a half, and brought to a point at each end. The sides consist of three boards, each about an inch thick, and neatly fitted and lashed to the bottom part. The extremities, both at head and stern, are a little raised, and both are made sharp, somewhat like a wedge, but they flatten more abruptly, so that the two side-boards join each other side by side for more than a foot. But the annexed cut will explain their construction more accurately than my description in words. As they are not more than fifteen or eighteen inches broad, those that go single (for they sometimes join them as at the other islands), have out-riggers, which are shaped and fitted with more judgment than any I had before seen. They are rowed by paddles, such as we had generally met with; and some of them have a light triangular sail, like those of the Friendly Islands, extended to a mast and boom. The ropes used for their boats, and the smaller cords for their fishing-tackle, are strong and well made.

What we saw of their agriculture furnished sufficient proofs that they are not novices in that art. The vale ground has already been mentioned as one continued plantation of taro, and a few other things, which have all the appearance of being well attended to. The potato fields and spots of sugar-cane or plantains on the higher grounds are planted with the same regularity, and always in some determinate figure, generally as a square or oblong; but neither these nor the others are inclosed with any kind of fence, unless we reckon the ditches in the low grounds such, which, it is more probable, are intended to convey water to the taro. The greater quantity and goodness of these articles may also, perhaps, be as much attributed to skilful culture, as to natural fertility of soil, which seems better adapted to them than to bread-fruit and cocoa-nut trees; the few which we saw of those latter not being in a thriving state, which will sufficiently account for the preference given to the culture of the other article, though more labour be required to produce them. But, notwithstanding this skill in agriculture, the general appearance of the island showed that it was capable of much more extensive improvement, and of maintaining at least three times

the number of the inhabitants that are at present upon it; for the far greater part of it that now lies quite waste, seemed to be as good a soil as those parts of it that are in cultivation. We must therefore conclude, that these people, from some cause which we were not long enough amongst them to be able to trace, do not increase in that proportion which would make it necessary to avail themselves of the extent of their island, toward raising a greater quantity of its vegetable production for their subsistence.

Though I did not see a chief of any note, there were, however, several, as the natives informed us, who reside upon Atooi, and to whom they prostrate themselves as a mark of submission, which seems equivalent to the *moe, moea*, paid to the chiefs of the Friendly Islands, and is called here *hamoea* or *moe*. Whether they were at first afraid to show themselves, or happened to be absent, I cannot say; but after I had left the island, one of these great men made his appearance, and paid a visit to Captain Clerke on board the *Discovery*. He came off in a double canoe, and, like the king of the Friendly Islands, paid no regard to the small canoes that happened to lie in his way, but ran against or over them, without endeavouring in the least to avoid them. And it was not possible for these poor people to avoid him, for they could not manage their canoes, it being a necessary mark of their submission, that they should lie down till he had passed. His attendants helped him into the ship, and placed him on the gangway. Their care of him did not cease then, for they stood round him holding each other by the hands; nor would they suffer any one to come near him but Captain Clerke himself. He was a young man, clothed from head to foot, and accompanied by a young woman supposed to be his wife. His name was said to be Tamahano. Captain Clerke made him some suitable presents, and received from him in return a large bowl supported by two figures of men, the carving of which, both as to the design and execution, showed some degree of skill. This bowl, as our people were told, used to be filled with the *kava*, or *ava* (as it is called at Otaheite), which liquor they prepare and drink here, as at the other islands in this ocean. Captain Clerke could not prevail upon this great man to go below, nor to move from the place where his attendants had first fixed him. After staying some time in his ship, he was carried again into his canoe, and returned to the island, receiving the same honours from all the natives as when he came on board. The next day several messages were sent to Captain Clerke, inviting him to return the visit ashore, and acquainting him that the chief had prepared a large present on that occasion. But being anxious to get to sea and join the *Resolution*, the captain did not think it advisable to accept of the invitation.

The very short and imperfect intercourse which we had with the natives put it out of our power to form any accurate judgment of the mode of government established amongst them; but from the general resemblance of customs, and particularly from what we observed of the honours paid to their chiefs, it seems reasonable to believe that it is of the same nature with that which prevails throughout all the islands we had hitherto visited, and probably their wars amongst themselves are equally frequent. This, indeed, might be inferred from the number of weapons which we found them possessed of, and from the excellent order these were kept in. But we had direct proof of the fact from their own confession; and, as we understood, these wars are between the different districts of their own island, as well as between it and their neighbours at Oneeheow and Orrehoua, we need scarcely assign any other cause besides this, to account for the appearance, already mentioned, of their population bearing no proportion to the extent of their ground capable of cultivation.

Besides their spears or lances, made of a fine chesnut-coloured wood beautifully polished, some of which are barbed at one end, and flattened to a point at the other, they have a sort of weapon which we had never seen before, and not mentioned by any navigator as used by the natives of the South Sea. It is somewhat like a dagger, in general about a foot and a half long, sharpened at one or both ends, and secured to the hand by a string. Its use is to stab at close fight, and it seems well adapted to the purpose. Some of these may be called double daggers, having a handle in the middle, with which they are better enabled to strike different ways. They have also bows and arrows; but, both from their apparent scarcity and their slender make, it may almost be presumed that they never use them in battle. The knife or saw formerly mentioned, with which they dissect the dead bodies, may also be ranked

amongst their weapons, as they both strike and cut with it when closely engaged. It is a small flat wooden instrument of an oblong shape, about a foot long, rounded at the corners, with a handle almost like one sort of the *patoos* of New Zealand; but its edges are entirely surrounded with sharks' teeth strongly fixed to it and pointing outward, having commonly a hole in the handle through which passes a long string, which is wrapped several times round the wrist. We also suspected that they use slings on some occasions, for we got some pieces of the *hæmatites*, or blood-stone, artificially made of an oval shape, divided longitudinally, with a narrow groove in the middle of the convex part. To this the person who had one of them applied a cord of no great thickness, but would not part with it, though he had no objection to part with the stone, which must prove fatal when thrown with any force, as it weighed a pound. We likewise saw some oval pieces of whetstone, well polished, but somewhat pointed toward each end, nearly resembling in shape some stones which we had seen at New Caledonia in 1774, and used there in their slings.

DAGGERS AND FLESH KNIVES.

What we could learn of their religious institutions, and the manner of disposing of their dead, which may properly be considered as closely connected, has been already mentioned. And as nothing more strongly points out the affinity between the manners of these people and of the Friendly and Society Islands, I must just mention some other circumstances to place this in a strong point of view, and, at the same time, to show how a few of the infinite modifications of which a few leading principles are capable, may distinguish any particular nation. The people of Tongataboo inter their dead in a very decent manner, and they also inter their human sacrifices; but they do not offer or expose any other animal or even vegetable to their gods, as far as we know. Those of Otaheite do not inter their dead, but expose them to waste by time and putrefaction, though the bones are afterwards buried; and, as this is the case, it is very remarkable that they should inter the entire bodies of their human sacrifices. They also offer other animals and vegetables to their gods, but are by no means attentive to the state of the sacred places where those solemn rites are performed; most of their *morais* being in a ruinous condition, and bearing evident marks of neglect. The people of Atooi, again, inter both their common dead and human sacrifices as at Tongataboo; but they resemble those of Otaheite in the slovenly state of their religious places, and in offering vegetables and animals to their gods.

The *taboo* also prevails in Atooi in its full extent, and seemingly with much more rigour than even at Tongataboo. For the people here always asked, with great eagerness and signs of fear to offend, whether any particular thing which they desired to see, or we were unwilling to show, was *taboo*, or, as they pronounced the word, *tafoo*? The *moia*, *raa*, or forbidden articles at the Society Islands, though doubtless the same thing, did not seem to be so strictly observed by them, except with respect to the dead, about whom we thought them more superstitious than any of the others were. But these are circumstances with which we are not as yet sufficiently acquainted to be decisive about; and I shall only just observe, to show the similitude in other matters connected with religion, that the priests, or *tahounas*, here, are as numerous as at the other islands, if we may judge from our being able, during our stay, to distinguish several saying their *poore*, or prayer.

But whatever resemblance we might discover in the general manners of the people of Atooi to those of Otaheite, these of course were less striking than the coincidence of language. Indeed, the languages of both places may be said to be almost word for word the same. It

is true that we sometimes remarked particular words to be pronounced exactly as we had found at New Zealand and the Friendly Islands; but though all the four dialects are indisputably the same, these people in general have rather the strong guttural pronunciation of the former, nor a less degree of it which also distinguishes the latter; and they have not only adopted the soft mode of the Otaheiteans in avoiding harsh sounds, but the whole idiom of their language, using not only the same affixes and suffixes to their words, but the same measure and cadence in their songs, though in a manner somewhat less agreeable. There seems, indeed, at first hearing, some disagreement to the ear of a stranger, but it ought to be considered that the people of Otaheite, from their frequent connexions with the English, had learned, in some measure, to adapt themselves to our scanty knowledge of their language, by using not only the most common, but even corrupted, expressions in conversation with us; whereas, when they conversed among themselves and used the several parts necessary to propriety of speech, they were scarcely at all understood by those amongst us who had made the greatest proficiency in their vocabulary. A catalogue of words was collected at Atooi by Mr. Anderson, who lost no opportunity of making our voyage useful to those who amuse themselves in tracing the migrations of the various tribes or families that have peopled the globe, by the most convincing of all arguments, that drawn from affinity of language. How shall we account for this nation's having spread itself in so many detached islands, so widely disjoined from each other, in every quarter of the Pacific Ocean? We find it from New Zealand in the south, as far as the Sandwich Islands to the north, and, in another direction, from Easter Island to the Hebrides; that is, over an extent of sixty degrees of latitude, or twelve hundred leagues north and south, and eighty-three degrees of longitude, or sixteen hundred and sixty leagues east and west! How much farther in either direction its colonies reach is not known; but what we know already, in consequence of this and our former voyage, warrants our pronouncing it to be, though perhaps not the most numerous, certainly by far the most extensive, nation upon earth.

Had the Sandwich Islands been discovered at an early period by the Spaniards, there is little doubt that they would have taken advantage of so excellent a situation, and have made use of Atooi or some other of the islands as a refreshing place, in the ships that sail annually from Acapulco for Manilla. They lie almost midway between the first place and Guam, one of the Ladrones, which is at present their only port in traversing this vast ocean; and it would not have been a week's sail out of their common route to have touched at them, which could have been done without running the least hazard of losing the passage, as they are sufficiently within the verge of the easterly trade-wind. An acquaintance with the Sandwich Islands would have been equally favourable to our Buccaneers, who used sometimes to pass from the coast of America to the Ladrones, with a stock of food and water scarcely sufficient to preserve life. Here they might always have found plenty, and have been within a month's sure sail of the very part of California which the Manilla ship is obliged to make, or else have returned to the coast of America, thoroughly refitted, after an absence of two months. How happy would Lord Anson have been, and what hardships would he have avoided, if he had known that there was a group of islands half way between America and Tinian, where all his wants could have been effectually supplied, and in describing which, the elegant historian of that voyage would have presented his reader with a more agreeable picture than I have been able to draw in this chapter!

CHAPTER XIII.—OBSERVATIONS MADE AT THE SANDWICH ISLANDS, ON THE LONGITUDE, VARIATION OF THE COMPASS, AND TIDES.—PROSECUTION OF THE VOYAGE.—REMARKS ON THE MILDNESS OF THE WEATHER, AS FAR AS THE LATITUDE 44° NORTH.—PAUCITY OF SEA BIRDS, IN THE NORTHERN HEMISPHERE.—SMALL SEA ANIMALS DESCRIBED.—ARRIVAL ON THE COAST OF AMERICA.—APPEARANCE OF THE COUNTRY.—UNFAVOURABLE WINDS, AND BOISTEROUS WEATHER.—REMARKS ON MARTIN DE AGUILAR'S RIVER, AND JUAN DE FUCA'S PRETENDED STRAIT.—AN INLET DISCOVERED, WHERE THE SHIPS ANCHOR.—BEHAVIOUR OF THE NATIVES.

AFTER the Discovery had joined us, we stood away to the northward, close hauled, with a gentle gale from the E.; and nothing occurring in this situation worthy of a place in my narrative, the reader will permit me to insert here the nautical observations which I had opportunities of making relative to the islands we had left; and which we had been fortunate enough to add to the geography of this part of the Pacific Ocean.

The longitude of the Sandwich Islands was determined by seventy-two sets of lunar observations; some of which were made while we were at anchor in the road of Wymoa, others before we arrived and after we left it, and reduced to it by the watch or time-keeper. By the mean result of these observations, the longitude of the road is 200° 13' 0" E.

Time-keeper {	Greenwich rate,	202	0	0
	Uliclea rate,	200	21	0
The latitude of the road, by the mean of two meridian observations of the sun		21	56	15 N.

The observations for the variation of the compass did not agree very well among themselves. It is true, they were not all made exactly in the same spot. The different situations, however, could make very little difference. But the whole will be best seen by casting an eye on the following table.

Time.	Latitude.	Longitude.	Compass.	East Variation.	Mean variation.

The tides at the Sandwich Islands are so inconsiderable, that with the great surf which broke against the shore, it was hardly possible to tell at any time whether we had high or low water, or whether it ebbed or flowed. On the south side of Atooi, we generally found a current setting to the westward or north-westward; but when we were at anchor off Ooneheow, the current set nearly N. W. and S. E., six hours one way, and six the other, and so strong as to make the ships tend, though the wind blew fresh. This was certainly a regular tide, and as far as I could judge, the flood came from the N. W.

I now return to the progress of our voyage. On the 7th, being in the latitude of 29° N. and in the longitude of 200° E., the wind veered to S. E. This enabled us to steer N. E. and E.; which course we continued till the 12th, when the wind had veered round by the south and west, to north-east and east north-east. I then tacked, and stood to the northward, our latitude being 30° N. and our longitude 206° 15' E. Notwithstanding our advanced latitude, and its being the winter season, we had only begun, for a few days past, to feel a sensation of cold in the mornings and evenings. This is a sign of the equal and lasting influence of the sun's heat, at all seasons, to 30° on each side the line. The disproportion is known to become very great after that. This must be attributed, almost entirely, to the

direction of the rays of the sun, independent of the bare distance, which is by no means equal to the effect. On the 19th, being now in the latitude of 37° N., and in the longitude of 206° E., the wind veered to south-east; and I was enabled again to steer to the east, inclining to the north. We had, on the 25th, reached the latitude of $42^{\circ} 30'$, and the longitude of 219° ; and then we began to meet with the rock-weed, mentioned by the writer of Lord Anson's voyage, under the name of sea-leek, which the Manilla ships generally fall in with. Now and then a piece of wood also appeared. But if we had not known that the continent of North America was not far distant, we might, from the few signs of the vicinity of land hitherto met with, have concluded, that there was none within some thousand leagues of us. We had hardly seen a bird, or any other oceanic animal, since we left Sandwich Islands.

On the 1st of March, our latitude being now $44^{\circ} 49'$ N., and our longitude 228° E., we had one calm day. This was succeeded by a wind from the north, with which I stood to the east close hauled, in order to make the land. According to the charts, it ought not to have been far from us. It was remarkable that we should still be attended with such moderate and mild weather, so far to the northward, and so near the coast of an extensive continent, at this time of the year. The present season either must be uncommon for its mildness, or we can assign no reason why Sir Francis Drake should have met with such severe cold, about this latitude, in the month of June*. Viscaino, indeed, who was near the same place in the depth of winter, says little of the cold, and speaks of a ridge of snowy mountains, somewhere on the coast, as a thing rather remarkable†. Our seeing so few birds, in comparison of what we met with in the same latitudes to the south of the line, is another singular circumstance, which must either proceed from a scarcity of the different sorts, or from a deficiency of places to rest upon. From hence we may conclude, that beyond 40° in the southern hemisphere, the species are much more numerous, and the isles where they inhabit also more plentifully scattered about, than anywhere between the coast of California and Japan, in or near that latitude.

During a calm, on the morning of the 2nd, some parts of the sea seemed covered with a kind of slime, and some small sea animals were swimming about. The most conspicuous of which were gelatinous, or *medusa* kind, almost globular; and another sort smaller, that had a white or shining appearance, and were very numerous. Some of these last were taken up, and put into a glass cup, with some salt water, in which they appeared like small scales, or bits of silver, when at rest, in a prone situation. When they began to swim about, which they did with equal ease, upon their back, sides, or belly, they emitted the brightest colours of the most precious gems, according to their position with respect to the light. Sometimes they appeared quite pellucid, at other times assuming various tints of blue, from a pale saphirine to a deep violet colour, which were frequently mixed with a ruby, or opaline redness; and glowed with a strength sufficient to illuminate the vessel and water. These colours appeared most vivid when the glass was held to a strong light; and mostly vanished on the subsiding of the animals to the bottom, when they had a brownish cast. But, with candle light, the colour was chiefly a beautiful pale green, tinged with a burnished gloss; and, in the dark, it had a faint appearance of glowing fire. They proved to be a new species of *oniscus*, and, from their properties, were, by Mr. Anderson (to whom we owe this account of them), called *Oniscus fulgens*; being probably an animal which has a share in producing some sorts of that lucid appearance, often observed near ships at sea, in the night. On the same day two large birds settled on the water, near the ship. One of these was the *Procellaria maxima* (the *quebrantahuesos*), and the other, which was little more than half the size, seemed to be of the albatross kind. The upper part of the wings, and tip of the tail, were black, with the rest white; the bill yellowish; upon the whole, not unlike the sea-gull, though larger.

On the 6th, at noon, being in the latitude of $44^{\circ} 10'$ N., and the longitude of $234\frac{1}{2}^{\circ}$ E., we saw two seals and several whales; and at day-break the next morning, the long-looked-

* See the account of Sir Francis's voyage, in Campbell's edition of Harris, vol. i. p. 18, and other collections.

† See Torquemada's Narrative of Viscaino's Expedition.

in 1602 and 1603, in the second volume of Vanegas' History of California, English translation, from p. 229 to p. 308.

for coast of New Albion * was seen, extending from north-east to south-east, distant ten or twelve leagues. At noon our latitude was $44^{\circ} 33' N.$, and our longitude $235^{\circ} 20' E.$; and the land extended from north-east half north, to south-east by south, about eight leagues distant. In this situation we had seventy-three fathoms water over a muddy bottom, and about a league farther off found ninety fathoms. The land appeared to be of a moderate height, diversified with hills and valleys, and almost everywhere covered with wood. There was, however, no very striking object on any part of it, except one hill, whose elevated summit was flat. This bore east from us, at noon. At the northern extreme the land formed a point, which I called *Cape Foulweather*, from the very bad weather that we soon after met with. I judge it to lie in the latitude of $44^{\circ} 55' N.$, and in the longitude of $235^{\circ} 54' E.$ We had variable light airs and calms till eight o'clock in the evening, when a breeze sprung up at south-west. With it I stood to the north-west, under an easy sail, waiting for daylight to range along the coast. But at four, next morning, the wind shifted to north-west, and blew in squalls, with rain. Our course was north-east, till near ten o'clock, when, finding that I could make no progress on this tack, and seeing nothing like a harbour, I tacked and stood off south-west. At this time, Cape Foulweather bore north-east by north, about eight leagues distant. Toward noon the wind veered more to the westward, and the weather became fair and clear, so that we were enabled to make lunar observations. Having reduced all those we had made since the 19th of last month to the present ones, by the time-keeper, amounting, in the whole, to seventy-two sets, their mean result determined the longitude to be $235^{\circ} 15' 26' E.$, which was $14^{\circ} 11'$ less than what the time-keeper gave. This longitude is made use of for settling that of the coast, and I have not a doubt of its being within a very few miles of the truth.

Our difficulties now began to increase. In the evening the wind came to the north-west, blowing in squalls with hail and sleet; and the weather being thick and hazy, I stood out to sea till near noon the next day, when I tacked and stood in again for the land, which made its appearance at two in the afternoon, bearing east north-east. The wind and weather continued the same; but, in the evening, the former veered more to the west, and the latter grew worse, which made it necessary to tack and stand off till four the next morning, when I ventured to stand in again. At four in the afternoon we saw the land, which, at six, extended from north-east half east, to south-east by south, about eight leagues distant. In this situation we tacked and sounded; but a line of a hundred and sixty fathoms did not reach the ground. I stood off till midnight, then stood in again; and at half past six, we were within three leagues of the land, which extended from north by east half east, to south half east; each extreme about seven leagues distant. Seeing no signs of a harbour, and the weather being still unsettled, I tacked and stretched off south-west, having then fifty-five fathoms water over a muddy bottom.

That part of the land, which we were so near when we tacked, is of a moderate height, though, in some places, it rises higher within. It was diversified with a great many rising grounds and small hills; many of which were entirely covered with tall straight trees; and others, which were lower, and grew in spots like coppices; but the interspaces and sides of many of the rising grounds were clear. The whole, though it might make an agreeable summer prospect, had now an uncomfortable appearance, as the bare grounds toward the coast were all covered with snow, which seemed to be of a considerable depth between the little hills and rising grounds; and, in several places toward the sea, might easily have been mistaken, at a distance, for white cliffs. The snow on the rising grounds was thinner spread; and farther inland, there was no appearance of any; from whence we might, perhaps, conclude that what we saw toward the sea had fallen during the night, which was colder than any we had experienced since our arrival on the coast; and we had sometimes a kind of sleet. The coast seemed everywhere almost straight, without any opening or inlet; and it appeared to terminate in a kind of white sandy beach; though some on board thought that appearance was owing to the snow. Each extreme of the land that was now before us seemed to shoot out into a point. The northern one was the same which we had first seen on the 7th; and on that account I called it *Cape Perpetua*. It lies in the

* This part of the west side of North America was so named by Sir Francis Drake.

latitude of $44^{\circ} 6' N.$, and in the longitude of $235^{\circ} 52' E.$ The southern extreme before us, I named *Cape Gregory**. Its latitude is $43^{\circ} 30'$, and its longitude $235^{\circ} 57' E.$ It is a remarkable point: the land of it rising almost directly from the sea to a tolerable height, while that on each side of it is low.

I continued standing off till one in the afternoon. Then I tacked and stood in, hoping to have the wind off from the land in the night. But in this I was mistaken; for at five o'clock it began to veer to the west and south-west; which obliged me, once more, to stand out to sea. At this time Cape Perpetua bore north-east by north; and the farthest land we could see to the south of Cape Gregory bore south by east, perhaps ten or twelve leagues distant. If I am right in this estimation, its latitude will be $43^{\circ} 10'$, and its longitude $235^{\circ} 55'$ east, which is nearly the situation of Cape Blanco, discovered or seen by Martin d'Aguilar, on the 19th of January, 1603. It is worth observing, that, in the very latitude where we now were, geographers have been pleased to place a large entrance or strait, the discovery of which they take upon them to ascribe to the same navigator: whereas nothing more is mentioned in the account of his voyage, than his having seen, in this situation, a large river, which he would have entered, but was prevented by the currents†.

The wind, as I have observed, had veered to the south-west in the evening; but it was very unsettled, and blew in squalls with snow showers. In one of these, at midnight, it shifted at once to west north-west, and soon increased to a very hard gale, with heavy squalls, attended with sleet or snow. There was no choice now; and we were obliged to stretch to the southward, in order to get clear of the coast. This was done under courses, and two close-reefed topsails; being rather more sail than the ships could safely bear: but it was necessary to carry it to avoid the more pressing danger of being forced on shore. This gale continued till eight o'clock in the morning of the 13th; when it abated, and I stood in again for the land. We had been forced a considerable way backward; for at the time of our tacking, we were in the latitude of $42^{\circ} 45'$, and in the longitude of $233^{\circ} 30'$. The wind continued at west, and north-west; storms, moderate weather, and calms, succeeding each other by turns, till the morning of the 21st; when, after a few hours' calm, a breeze sprung up at south-west. This bringing with it fair weather, I steered north-easterly, in order to fall in with the land, beyond that part of it where we had already so unprofitably been tossed about for the last fortnight. In the evening, the wind veered to the westward; and at eight o'clock, the next morning, we saw the land, extending from north-east to east, nine leagues distant. At this time we were in the latitude of $47^{\circ} 5'$ north, and in the longitude of $235^{\circ} 10'$ east.

I continued to stand to the north with a fine breeze at west, and west north-west, till near seven o'clock in the evening, when I tacked to wait for daylight. At this time we were in forty-eight fathoms' water, and about four leagues from the land, which extended from north to south east half east, and a small round hill, which had the appearance of being an island, bore north three quarters east, distant six or seven leagues, as I guessed; it appears to be of a tolerable height, and was but just to be seen from the deck. Between this island or rock, and the northern extreme of the land, there appeared to be a small opening, which flattered us with the hopes of finding a harbour. These hopes lessened as we drew nearer; and, at last, we had some reason to think, that the opening was closed by low land. On this account I called the point of land to the north of it *Cape Flattery*. It lies in the latitude of $48^{\circ} 15'$ north, and in the longitude of $235^{\circ} 3'$ east. There is a round hill of a moderate height over it; and all the land upon this part of the coast is of a moderate and pretty equal height, well covered with wood, and had a very pleasant and fertile appearance. It is in this very latitude where we now were, that geographers have placed the pretended strait of Juan de Fuca. We saw nothing like it; nor is there the least probability that ever any such thing existed‡.

I stood off to the southward till night, when I tacked and steered to the north-west, with

* In our calendar, the 7th of March is distinguished by the name of Perpetua M. and the 12th by that of Gregory B.

a gentle breeze at south-west, intending to stand in for the land as soon as daylight should appear. But, by that time, we were reduced to two courses and close-reefed topsails, having a very hard gale, with rain, right on shore; so that, instead of running in for the land, I was glad to get an offing, or to keep that which we had already got. The south-west wind was, however, but of short continuance; for in the evening it veered again to the west. Thus we had perpetually strong west and north-west winds to encounter. Sometimes in an evening the wind would become moderate, and veer to the southward; but this was always a sure prelude to a storm, which blew the hardest at south south-east, and was attended with rain and sleet. It seldom lasted above four or six hours, before it was succeeded by another gale from the north-west, which generally brought with it fair weather. It was by the means of these southerly blasts that we were enabled to get to the north-west at all.

At length, at nine o'clock in the morning of the 29th, as we were standing to the north-east, we again saw the land, which, at noon, extended from north-west by west to east south-east, the nearest part about six leagues distant. Our latitude was now 49° 29' north, and our longitude 232° 29' east. The appearance of the country differed much from that of the parts which we had before seen, being full of high mountains, whose summits were covered with snow; but the valleys between them, and the grounds on the sea-coast, high as well as low, were covered to a considerable breadth with high straight trees, that formed a beautiful prospect, as of one vast forest. The south-east extreme of the land formed a low point, off which are many breakers, occasioned by sunken rocks. On this account it was called *Point Breakers*. It lies in the latitude of 49° 15' north, and in the longitude of 233° 20' east; and the other extreme, in about the latitude of 50°, and the longitude of 232°. I named this last *Woody Point*. It projects pretty much out to the south-west, and is high land. Between these two points, the shore forms a large bay, which I called *Hope Bay*; hoping, from the appearance of the land, to find in it a good harbour. The event proved, that we were not mistaken.

As we drew nearer the coast, we perceived the appearance of two inlets; one in the north-west, and the other in the north-east corner of the bay. As I could not fetch the former, I bore up to the latter, and passed some breakers, or sunken rocks, that lay a league or more from the shore. We had nineteen and twenty fathoms' water half a league without them; but as soon as we had passed them, the depth increased to thirty, forty, and fifty fathoms, with a sandy bottom; and farther in we found no ground with the greatest length of line. Notwithstanding appearances, we were not yet sure that there were any inlets; but as we were in a deep bay, I resolved to anchor, with a view to endeavour to get some water, of which, by this time, we were in great want. At length, as we advanced, the existence of the inlet was no longer doubtful. At five o'clock we reached the west point of it, where we were becalmed for some time. While in this situation I ordered all the boats to be hoisted out to tow the ships in. But this was hardly done before a fresh breeze sprung up again at north-west, with which we were enabled to stretch up into an arm of the inlet, that was observed by us to run in to the north-east. There we were again becalmed, and obliged to anchor in eighty-five fathoms' water, and so near the shore as to reach it with a hawser. The wind failed the *Discovery* before she got within the arm, where she anchored, and found only seventy fathoms.

We no sooner drew near the inlet, than we found the coast to be inhabited; and at the place where we were first becalmed three canoes came off to the ship. In one of these were two men, in another six, and in the third ten. Having come pretty near us, a person in one of the two last stood up, and made a long harangue, inviting us to land, as we guessed by his gestures. At the same time, he kept strewing handfuls of feathers towards us*; and some of his companions threw handfuls of red dust or powder in the same manner. The person who played the orator wore the skin of some animal, and held in each hand something which rattled as he kept shaking it. After tiring himself with his repeated exhortations, of which we did not understand a word, he was quiet; and then others took it, by turns, to say something, though they acted their part neither so long, nor with so much vehemence as the other. We observed that two or three had their hair quite strewed over

* The natives of this coast, twelve degrees farther south, his arrival. See an account of his voyage in *Campbell's* also brought feathers as presents to Sir Francis Drake on edit. of Harris, vol. i. p. 13.

with small white feathers, and others had large ones stuck into different parts of the head. After the tumultuous noise had ceased, they lay at a little distance from the ship, and conversed with each other in a very easy manner; nor did they seem to show the least surprise or distrust. Some of them now and then got up, and said something after the manner of their first harangues; and one sang a very agreeable air, with a degree of softness and melody which we could not have expected; the word *hacla*, being often repeated as the burden of the song. The breeze which soon after sprung up bringing us nearer to the shore, the canoes began to come off in greater numbers; and we had, at one time, thirty-two of them near the ship, carrying from three to seven or eight persons each, both men and women. Several of these stood up in their canoes haranguing, and making gestures after the manner of our first visitors. One canoe was remarkable for a singular head, which had a bird's eye and bill, of an enormous size, painted on it; and a person who was in it, who seemed to be a chief, was no less remarkable for his uncommon appearance; having many feathers hanging from his head, and being painted in an extraordinary manner*. He held in his hand a carved bird of wood, as large as a pigeon, with which he rattled as the person first mentioned had done; and was no less vociferous in his harangue, which was attended with some expressive gestures.

Though our visitors behaved very peacefully, and could not be suspected of any hostile intention, we could not prevail upon any of them to come on board. They showed great readiness, however, to part with anything they had, and took from us whatever we offered them in exchange; but were more desirous of iron than of any other of our articles of commerce; appearing to be perfectly acquainted with the use of that metal. Many of the canoes followed us to our anchoring-place; and a group of about ten or a dozen of them remained alongside the Resolution most part of the night. These circumstances gave us a reasonable ground of hope, that we should find this a comfortable station to supply all our wants, and to make us forget the hardships and delays experienced during a constant succession of adverse winds and boisterous weather, almost ever since our arrival upon the coast of America.

The ships having happily found so excellent shelter in an inlet, the coasts of which appeared to be inhabited by a race of people whose inoffensive behaviour promised a friendly intercourse, the next morning, after coming to anchor, I lost no time in endeavouring to find a commodious harbour, where we might station ourselves during our continuance in

the sound. Accordingly, I sent three armed boats, under the command of Mr. King, upon this service; and soon after I went myself, in a small boat, on the same search. I had very little trouble in finding what we wanted. On the north-west of the arm we were now in, and not far from the ships, I met with a convenient snug cove well suited to our purpose. Mr. King was equally successful; for he returned about noon, with an account of a still better harbour which he had seen and examined, lying on the north-west side of the land. But as it would have required more time to carry the ships thither than to the cove where I had been, which was immediately within our reach, this reason operated to determine my choice in favour of the latter situation. But being apprehensive that we should not be able to transport our ships to it, and to moor them properly, before night came on, I thought it best to remain where we were till next morning; and, that no time might be lost, I employed the remainder of the day to some useful purposes, ordering the sails to be unbent, the topmasts to be struck, and the foremast of the Resolution to be unrigged, in order to fix a new bill, one of the old ones being decayed.

A great many canoes, filled with the natives, were about the ships all day; and a trade commenced betwixt us and them, which was carried on with the strictest honesty on both sides. The articles which they offered to sale were skins of various animals, such as bears, wolves, foxes, deer, racoons, polecats, martins; and, in particular, of the sea otters, which are found at the islands east of Kamtschatka. Besides the skins in their native shape, they also brought garments

made of them, and another sort of clothing made of the bark of a tree, or some plant like hemp; weapons, such as bows, arrows, and spears; fish-hooks, and instruments of various kinds; wooden vizors of many different monstrous figures; a sort of woollen stuff, or blanketing; bags filled with red ochre; pieces of carved work; beads; and several other little ornaments of thin brass or iron, shaped like a horse-shoe, which they hang at their noses; and several chisels, or pieces of iron fixed to handles. From their possessing which metals, we could infer that they had either been visited before by some civilised nation, or had connexions with tribes on their continent who had communication with them. But the most extraordinary of all the articles which they brought to the ships for sale were human skulls, and hands not yet quite stripped of the flesh, which they made our people plainly understand they had eaten, and, indeed, some of them had evident marks that they had been upon the fire. We had but too much reason to suspect, from this circumstance, that the horrid practice of feeding on their enemies is as prevalent here as we had found it to be at New Zealand and other South Sea Islands. For the various articles which they brought, they took in exchange knives, chisels, pieces of iron and tin, nails, looking-glasses, buttons, or any kind of metal. Glass beads they were not fond of; and cloth of every sort they rejected.

We employed the next day in hauling our ships into the cove, where they were moored head and stern, fastening our hawsers to the trees on shore. On heaving up the anchor of the Resolution, we found, notwithstanding the great depth of water in which it was let go, that there were rocks at the bottom. These had done some considerable damage to the cable; and the hawsers that were carried out, to warp the ship into the cove, also got foul of rocks; from which it appeared that the whole bottom was strewed with them. The ship being again very leaky in her upper works, I ordered the carpenters to go to work to caulk her, and to repair such other defects as on examination we might discover.

NOOTKA SOUND CANOE.

The fame of our arrival brought a great concourse of the natives to our ships in the course of this day. We counted above a hundred canoes at one time, which might be supposed to contain, at an average, five persons each; for few of them had less than three on board; great numbers had seven, eight, or nine; and one was manned with no less than seventeen. Amongst these visitors, many now favoured us with their company for the first time, which we could guess from their approaching the ships with their orations and other ceremonies. If they had any distrust or fear of us at first, they now appeared to have laid it aside; for they came on board the ships, and mixed with our people with the greatest freedom. We soon discovered, by this nearer intercourse, that they were as light-fingered as any of our friends in the islands we had visited in the course of the voyage. And they were far more dangerous thieves; for, possessing sharp iron instruments, they could cut a hook from a tackle, or any other piece of iron from a rope, the instant that our backs were turned. A large hook, weighing between twenty and thirty pounds, several smaller ones, and other articles of iron, were lost in this manner. And, as to our boats, they stripped them of every bit of iron that was worth carrying away, though we had always men left in them as a guard. They were dexterous enough in effecting their purposes; for one fellow would contrive to amuse the boat-keeper at one end of a boat, while another was pulling out the iron work at the other. If we missed a thing immediately after it had been stolen, we found little difficulty in detecting the thief, as they were ready enough to impeach one another. But the guilty person generally relinquished his prize with reluctance; and sometimes we found it necessary to have recourse to force.

The ships being securely moored, we began our other necessary business the next day. The observatories were carried ashore, and placed upon an elevated rock on one side of the cove, close to the Resolution. A party of men, with an officer, was sent to cut wood, and to clear a place for the conveniency of watering. Others were employed to brew spruce-beer, as pine trees abounded here. The forge was also set up, to make the iron-work wanting for the repairs of the foremast. But, besides one of the bils being defective, the larboard trestle-tree, and one of the cross-trees, were sprung.

A considerable number of the natives visited us daily; and every now and then we saw new faces. On their first coming, they generally went through a singular mode of introducing themselves. They would paddle, with all their strength, quite round both ships, a chief, or other principal person, in the canoe, standing up with a spear, or some other weapon, in his hand, and speaking, or rather hallooing all the time. Sometimes the orator of the canoe would have his face covered with a mask, representing either a human visage, or that of some animal; and, instead of a weapon, would hold a rattle in his hand, as before described*. After making this circuit round the ships, they would come alongside, and begin to trade without further ceremony. Very often, indeed, they would first give us a song, in which all in the canoe joined, with a very pleasing harmony.

During these visits they gave us no other trouble than to guard against their thievish tricks. But, in the morning of the 4th, we had a serious alarm. Our party on shore, who were employed in cutting wood and filling water, observed that the natives all around them were arming themselves in the best manner they could; those who were not possessed of proper weapons, preparing sticks and collecting stones. On hearing this I thought it prudent to arm also; but being determined to act upon the defensive, I ordered all our workmen to retreat to the rock, upon which we had placed our observatories; leaving the natives in quiet possession of the ground where they had assembled, which was within a stone's throw of the Resolution's stern. Our fears were ill-grounded: these hostile preparations were not directed

* The medicine man, at once, priest, physician, and conjuror, is here described. A very curious and minute account of the inhabitants of Nootka Sound was published in America several years ago, and reprinted in England, written by John R. Jewitt, an English sailor, belonging to an American ship which was seized by the natives, who massacred all the crew with the exception of Jewitt and one other of his companions. Jewitt, who possessed an education far superior to sailors generally, and who won

much favour from the natives by his skill in working in iron, being by trade a smith, has given one of the best accounts of savage life which we possess. In subsequent pages we shall have occasion again to refer to it. The manners and customs of the Indians of Nootka Sound appear to be very similar to those of the Indians eastward of the Rocky Mountains, of whom some interesting particulars have recently been made public by Mr. Catlin, in his "Letters on the North American Indians."—Ed.

against us, but against a body of their own countrymen, who were coming to fight them; and our friends of the Sound, on observing our apprehensions, used their best endeavours to convince us that this was the case. We could see that they had people looking out, on each point of the cove, and canoes frequently passed between them and the main body assembled near the ships. At length the adverse party, in about a dozen large canoes, appeared off the south point of the cove, where they stopped, and lay drawn up in line of battle, a negotiation having commenced. Some people in canoes, in conducting the treaty, passed between the two parties, and there was some speaking on both sides. At length, the difference whatever it was, seemed to be compromised; but the strangers were not allowed to come alongside the ships, nor to have any trade or intercourse with us. Probably we were the cause of the quarrel; the strangers, perhaps, being desirous to share in the advantages of a trade with us; and our first friends, the inhabitants of the Sound, being determined to engross us entirely to themselves. We had proofs of this on several other occasions; nay, it appeared that even those who lived in the Sound were not united in the same cause; for the weaker were frequently obliged to give way to the stronger party, and plundered of everything, without attempting to make the least resistance.

We resumed our work in the afternoon, and the next day, rigged the foremast; the head of which being rather too small for the cap, the carpenter went to work to fix a piece on one side, to fill up the vacant space. In cutting into the mast-head for this purpose, and examining the state of it, both cheeks were found to be so rotten that there was no possibility of repairing them; and it became necessary to get the mast out, and to fix new ones upon it. It was evident that one of the cheeks had been defective at the first, and that the unsound part had been cut out, and a piece put in, which had not only weakened the mast-head, but had, in a great measure, been the occasion of rotting every other part of both cheeks. Thus, when we were almost ready to put to sea, we had all our work to do over again; and what was still more provoking, an additional repair was to be undertaken, which would require some time to be completed. But as there was no remedy, we immediately set about it. It was fortunate for the voyage that these defects were discovered when we were in a place where the materials requisite were to be procured. For, amongst the drift-wood in the cove where the ships lay, were some small seasoned trees very fit for our purpose. One of these was pitched upon; and the carpenters began, without loss of time, to make out of it two new cheeks. In the morning of the 7th, we got the foremast out, and hauled it ashore; and the carpenters of the ships were set to work upon it. Some parts of the lower standing rigging having been found to be very much decayed, as we had time now to put them in order, while the carpenters were repairing the foremast, I ordered a new set of main-rigging to be fitted, and a more perfect set of fore-rigging to be selected out of the best parts of the old.

From the time of our putting into the Sound till now, the weather had been exceedingly fine, without either wind or rain. That comfort, at the very moment when the continuance of it would have been of most service, was withdrawn. In the morning of the 8th, the wind freshened at south-east, attended with thick hazy weather and rain. In the afternoon the wind increased; and toward the evening it blew very hard indeed. It came, in excessively heavy squalls, from over the high land on the opposite shore, right into the cove; and, though the ships were very well moored, put them in some danger. These tempestuous blasts succeeded each other pretty quick; but they were of short duration; and in the intervals between them we had a perfect calm. According to the old proverb, "misfortunes seldom come single;" the mizen was now the only mast on board the Resolution that remained rigged, with its topmast up. The former was so defective that it could not support the latter during the violence of the squalls, but gave way at the head under the rigging. About eight o'clock the gale abated; but the rain continued with very little intermission for several days; and, that the carpenters might be enabled to proceed in their labours, while it prevailed, a tent was erected over the foremast, where they could work with some degree of convenience. The bad weather which now came on did not, however, hinder the natives from visiting us daily; and, in such circumstances, their visits were very advantageous to us. For they frequently brought us a tolerable supply of fish, when we could not catch any ourselves with

hook and line; and there was not a proper place near us where we could draw a net. The fish which they brought us were either sardines, or what resembled them much, a small kind of bream, and sometimes small cod.

On the 11th, notwithstanding the rainy weather, the main-rigging was fixed and got over head; and our employment, the day after, was to take down the mizen-mast, the head of which proved to be so rotten that it dropped off while in the slings. In the evening we were visited by a tribe of natives whom we had never seen before; and who, in general, were better looking people than most of our old friends, some of whom attended them. I prevailed upon these visitors to go down into the cabin for the first time; and observed, that there was not a single object that fixed the attention of most of them for a moment; their countenances marking that they looked upon all our novelties with the utmost indifference. This, however, was not without exception; for a few of the company showed a certain degree of curiosity.

In the afternoon of the next day I went into the woods with a party of our men, and cut down a tree for a mizen-mast. On the day following it was brought to the place where the carpenters were employed upon the foremast. In the evening the wind, which had been for some time westerly, veered to the south-east, and increased to a very hard gale, with rain, which continued till eight o'clock the next morning, when it abated, and veered again to the west. The foremast being by this time finished, we hauled it alongside; but the bad weather prevented our getting it in till the afternoon, and we set about rigging it with the greatest expedition, while the carpenters were going on with the mizen-mast on shore. They had made very considerable progress in it on the 16th, when they discovered that the stick upon which they were at work was sprung, or wounded, owing, as supposed, to some accident in cutting it down. So that all our labour was thrown away; and it became necessary to get another tree out of the woods, which employed all hands above half a day. During these various operations several of the natives, who were about the ships, looked on with an expressive silent surprise, which we did not expect, from their general indifference and inattention.

On the 18th a party of strangers, in six or eight canoes, came into the cove, where they remained looking at us for some time, and then retired without coming alongside either ship. We supposed that our old friends, who were more numerous at this time about us than these new visitors, would not permit them to have an intercourse with us. It was evident, upon this and several other occasions, that the inhabitants of the adjoining parts of the Sound engrossed us entirely to themselves; or if at any time they did not hinder strangers from trading with us, they contrived to manage the trade for them in such a manner that the price of their commodities was always kept up, while the value of ours was lessening every day. We also found that many of the principal natives who lived near us, carried on a trade with more distant tribes in the articles they had procured from us; for we observed that they would frequently disappear for four or five days at a time, and then return with fresh cargoes of skins and curiosities, which our people were so passionately fond of that they always came to a good market. But we received most benefit from such of the natives as visited us daily. These, after disposing of all their little trifles, turned their attention to fishing, and we never failed to partake of what they caught. We also got from these people a considerable quantity of very good animal oil, which they had reserved in bladders. In this traffic some would attempt to cheat us, by mixing water with the oil; and, once or twice, they had the address to carry their imposition so far as to fill their bladders with mere water, without a single drop of oil. It was always better to bear with these tricks than to make them the foundation of a quarrel; for our articles of traffic consisted, for the most part, of mere trifles; and yet we were put to our shifts to find a constant supply even of these. Beads, and such other toys, of which I had some left, were in little estimation. Nothing would go down with our visitors but metal; and brass had by this time supplanted iron, being so eagerly sought after, that before we left this place hardly a bit of it was left in the ships, except what belonged to our necessary instruments. Whole suits of clothes were stripped of every button, bureaux of their furniture, and copper kettles, tin canisters, candlesticks, and the like, all went to wreck; so that our American friends here got a greater

medley and variety of things from us than any other nation whom we had visited in the course of the voyage.

After a fortnight's bad weather, the 19th proving a fair day, we availed ourselves of it to get up the topmasts and yards, and to fix up the rigging. And, having now finished most of our heavy work, I set out the next morning to take a view of the Sound. I first went to the west point, where I found a large village, and before it a very snug harbour, in which were from nine to four fathoms' water, over a bottom of fine sand. The people of this village, who were numerous, and to most of whom I was well known, received me very courteously, every one pressing me to go into his house, or rather his apartment; for several families live under the same roof. I did not decline the invitation; and my hospitable friends whom I visited spread a mat for me to sit upon, and showed me every other mark of civility. In most of the houses were women at work, making dresses of the plant or bark before mentioned, which they executed exactly in the same manner that the New Zealanders manufacture their cloth. Others were occupied in opening sardines. I had seen a large quantity of them brought on shore from canoes, and divided by measure amongst several people, who carried them up to their houses, where the operation of curing them by smoke-drying is performed. They hang them on small rods, at first about a foot from the fire; afterwards they remove them higher and higher, to make room for others, till the rods on which the fish hang reach the top of the house. When they are completely dried they are taken down and packed close in bales, which they cover with mats. Thus they are kept till wanted; and they are not a disagreeable article of food. Cod, and other large fish, are also cured in the same manner by them; though they sometimes dry these in the open air, without fire.

From this village I proceeded up the west side of the Sound. For about three miles I found the shore covered with small islands, which are so situated as to form several convenient harbours, having various depths of water, from thirty to seven fathoms, with a good bottom. Two leagues within the Sound, on this west side, there runs in an arm in the direction of north north-west; and two miles farther is another nearly in the same direction, with a pretty large island before it. I had no time to examine either of these arms; but have reason to believe that they do not extend far inland, as the water was no more than brackish at their entrances. A mile above the second arm, I found the remains of a village. The logs or framings of the houses were standing; but the boards that had composed their sides and roofs did not exist*. Before this village were some large fishing weirs; but I saw nobody attending them. These weirs were composed of pieces of wicker-work made of small rods, some closer than others, according to the size of the fish intended to be caught in them. These pieces of wicker-work (some of whose superficies are at least twenty feet by twelve), are fixed up edgewise in shallow water, by strong poles or pickets that stand firm in the ground. Behind this ruined village is a plain of a few hours' extent, covered with the largest pine-trees that I ever saw. This was the more remarkable, as the elevated ground, in most other parts of this west side of the Sound, was rather naked.

From this place I crossed over to the other, or east side of the Sound, passing an arm of it that runs in north north-east, to appearance not far. I now found what I had before conjectured, that the land under which the ships lay was an island; and that there were many smaller ones lying scattered in the Sound on the west side of it. Opposite the north end of our large island, upon the mainland, I observed a village, and there I landed. The inhabitants of it were not so polite as those of the other I had just visited. But this cold reception seemed, in a great measure, if not entirely, owing to one surly chief, who would not let me enter their houses, following me wherever I went; and several times, by expressive signs, marking his impatience that I should be gone. I attempted in vain to soothe him by presents; but though he did not refuse them, they did not alter his behaviour. Some of the young women, better pleased with us than was their inhospitable chief, dressed

* The natives are accustomed to move from station to station, for the convenience of fishing. At each station they are accustomed to frequent they erect the frames of their houses, but the boards forming the outer covering

are carried about with them. It was therefore only a dismantled, not a ruined, village which was seen by Captain Cook.—Ed.

themselves expeditiously in their best apparel, and assembling in a body welcomed us to their village, by joining in a song, which was far from harsh or disagreeable. The day being now far spent, I proceeded for the ships round the north end of the large island; meeting in my way with several canoes laden with sardines, which had been just caught somewhere in the east corner of the Sound. When I got on board I was informed, that while I was absent the ships had been visited by some strangers, in two or three large canoes, who by signs made our people understand that they had come from the south-east, beyond the bay. They brought several skins, garments, and other articles, which they bartered. But what was most singular, two silver table-spoons were purchased from them, which, from their peculiar shape, we supposed to be of Spanish manufacture. One of these strangers wore them round his neck by way of ornament. These visitors also appeared to be more plentifully supplied with iron than the inhabitants of the Sound.

The mizen-mast being finished, it was got in and rigged on the 21st; and the carpenters were set to work to make a new fore-topmast, to replace the one that had been carried away some time before. Next morning, about eight o'clock, we were visited by a number of strangers in twelve or fourteen canoes. They came into the cove from the southward; and as soon as they had turned the point of it, they stopped, and lay drawn up in a body above half an hour, about two or three hundred yards from the ships. At first we thought that they were afraid to come nearer; but we were mistaken in this, and they were only preparing an introductory ceremony. On advancing toward the ships, they all stood up in their canoes, and began to sing. Some of their songs, in which the whole body joined, were in a slow, and others in quicker time; and they accompanied their notes with the most regular motions of their hands; or beating in concert, with their paddles, on the sides of the canoes; and making other very expressive gestures. At the end of each song they remained silent a few seconds, and then began again, sometimes pronouncing the word *hoee!* forcibly, as a chorus. After entertaining us with this specimen of their music, which we listened to with admiration, for above half an hour, they came alongside the ships and bartered what they had to dispose of. Some of our old friends of the Sound were now found to be amongst them; and they took the whole management of the traffic between us and the strangers, much to the advantage of the latter.

Our attendance on these visitors being finished, Captain Clerke and I went in the forenoon with two boats to the village at the west point of the Sound. When I was there the day before, I had observed that plenty of grass grew near it, and it was necessary to lay in a quantity of this as food for the few goats and sheep which were still left on board. The inhabitants received us with the same demonstrations of friendship which I had experienced before; and the moment we landed, I ordered some of my people to begin their operation of cutting. I had not the least imagination that the natives could make any objection to our furnishing ourselves with what seemed to be of no use to them, but was necessary for us. However, I was mistaken, for the moment that our men began to cut, some of the inhabitants interposed and would not permit them to proceed, saying they must "*makook*;" that is, must first buy it. I was now in one of the houses, but as soon as I heard of this, I went to the field, where I found about a dozen of the natives, each of whom laid claim to some part of the grass that grew in this place. I bargained with them for it, and having completed the purchase, thought we were now at liberty to cut wherever we pleased; but here, again, it appeared that I was under a mistake, for the liberal manner in which I had paid the first pretended proprietors, brought fresh demands upon me from others, so that there did not seem to be a single blade of grass that had not a separate owner; and so many of them were to be satisfied, that I very soon emptied my pockets. When they found that I really had nothing more to give, their importunities ceased, and we were permitted to cut wherever we pleased, and as much as we chose to carry away.

Here I must observe, that I have nowhere in my several voyages met with any uncivilised nation or tribe who had such strict notions of their having a right to the exclusive property of everything that their country produces, as the inhabitants of this Sound. At first they wanted our people to pay for the wood and water that they carried on board, and had I been upon the spot when these demands were made, I should certainly have complied with

ly welcomed us to the beach. The day was a fine one; the large island; and just caught some of the large canoes, who they bartered. But they, which, from these strangers appeared to be more

them. Our workmen, in my absence, thought differently, for they took but little notice of such claims, and the natives, when they found that we were determined to pay nothing, at last ceased to apply. But they made a merit of necessity, and frequently afterward took occasion to remind us that they had given us wood and water out of friendship *.

During the time I was at this village, Mr. Webber, who had attended me thither, made drawings of everything that was curious, both within and without doors. I had also an opportunity of inspecting more narrowly the construction of the houses, household furniture, and utensils, and the striking peculiarities of the customs and modes of living of the inhabitants. These shall be described in another place in the best manner I can, calling in to my assistance the observations of Mr. Anderson. When we had completed all our operations at this village, the natives and we parted very good friends, and we got back to the ships in the afternoon. The three following days were employed in getting ready to put to sea, the sails were bent, the observatories and instruments, brewing vessels, and other things, were moved from the shore; some small spars for different uses, and pieces of timber which might be occasionally sawn into boards, were prepared and put on board, and both ships were cleared and put into a sailing condition.

Everything being now ready, in the morning of the 26th I intended to have put to sea, but both wind and tide being against us, was obliged to wait till noon, when the S.W. wind was succeeded by a calm; and the tide turning in our favour, we cast off the moorings, and with our boats towed the ships out of the cove. After this, we had variable light airs and calms till four in the afternoon, when a breeze sprung up northerly with very thick hazy weather. The mercury in the barometer fell unusually low; and we had every other fore-runner of an approaching storm, which we had reason to expect would be from the southward; this made me hesitate a little, as night was at hand, whether I should venture to sail or wait till the next morning. But my anxious impatience to proceed upon the voyage, and the fear of losing this opportunity of getting out of the Sound, making a greater impression on my mind than any apprehension of immediate danger, I determined to put to sea at all events.

Our friends, the natives, attended us till we were almost out of the Sound, some on board the ships, and others in their canoes. One of their chiefs, who had some time before attached himself to me, was amongst the last who left us. Having, before he went, bestowed upon him a small present, I received in return a beaver skin of much greater value. This called upon me to make some addition to my present, which pleased him so much, that he insisted upon my acceptance of the beaver-skin cloak which he then wore, and of which I knew he was particularly fond. Struck with this instance of generosity, and desirous that he should be no sufferer by his friendship to me, I presented to him a new broad-sword with a brass hilt, the possession of which made him completely happy. He, and also many others of his countrymen, importuned us much to pay them another visit, and, by way of encouragement, promised to lay in a good stock of skins. I make no doubt, that whoever comes after me to this place, will find the natives prepared accordingly, with no inconsiderable supply of an article of trade, which they could observe we were eager to possess, and which we found could be purchased to great advantage.

Such particulars about the country and its inhabitants as came to our knowledge during our short stay, and have not been mentioned in the course of the narrative, will furnish materials for the two following chapters.

* Similar to the behaviour of the natives of Nootka on this occasion was that of another tribe of Indians farther north, in latitude 57° 18', to the Spaniards, who had preceded Captain Cook only three years in a voyage to explore the coast of America, northward of California. See the

journal of that voyage, writ by the second pilot of the fleet, and published by the Honourable Mr. Duques Barriogton, to whom the literary world owes so many obligations.—Miscellanies, p. 505, 506.

CHAPTER II.—THE NAME OF THE SOUND, AND DIRECTIONS FOR SAILING INTO IT.—ACCOUNT OF THE ADJACENT COUNTRY.—WEATHER.—CLIMATE.—TREES.—OTHER VEGETABLE PRODUCTIONS.—QUADRUPEDS, WHOSE SKINS WERE BROUGHT FOR SALE.—SEA ANIMALS.—DESCRIPTION OF A SEA-OTTER.—BIRDS.—WATER-FOWL.—FISH.—SHELL-FISH, &c.—REPTILES.—INSECTS.—STONES, &c.—PERSONS OF THE INHABITANTS.—THEIR COLOUR.—COMMON DRESS AND ORNAMENTS.—OCCASIONAL DRESSES, MONSTROUS DECORATIONS OF WOODEN MASKS.—THEIR GENERAL DISPOSITIONS.—SONGS.—MUSICAL INSTRUMENTS.—THEIR EAGERNESS TO POSSESS IRON AND OTHER METALS.

On my arrival in this inlet, I had honoured it with the name of King George's Sound, but I afterward found that it is called Nootka by the natives. The entrance is situated in the E. corner of Hope Bay, in the latitude of $49^{\circ} 33' N.$, and in the longitude of $233^{\circ} 12' E.$ The E. coast of that bay, all the way from Breaker's Point to the entrance of the Sound, is covered by a chain of sunken rocks, that seemed to extend some distance from the shore, and near the Sound are some islands and rocks above water. We enter this Sound between two rocky points that lie E.S.E., and W.N.W. from each other, distant between three and four miles. Within these points the Sound widens considerably, and extends in to the northward four leagues at least, exclusive of the several branches towards its bottom, the termination of which we had not an opportunity to ascertain. But, from the circumstance of finding that the water freshened where our boats crossed their entrance, it is probable that they had almost reached its utmost limits. And this probability is increased by the hills that bounded it toward the land being covered with thick snow, when those toward the sea, or where we lay, had not a speck remaining on them, though, in general, they were much higher. In the middle of the Sound are a number of islands of various sizes. The depth of water in the middle of the Sound, and even close home to some parts of its shore, is from forty-seven to ninety fathoms, and perhaps more. The harbours and anchoring-places within its circuit are numerous; but we had no time to survey them. The cove in which our ships lay is on the east side of the Sound, and on the east side of the largest of the islands. It is covered from the sea, but has little else to recommend it, being exposed to the south-east winds, which we found to blow with great violence; and the devastation they make sometimes was apparent in many places.

The land bordering upon the sea-coast is of a middling height and level; but within the Sound it rises almost everywhere into steep hills, which agree in their general formation, ending in round or blunted tops, with some sharp, though not very prominent, ridges on their sides. Some of these hills may be reckoned high, while others of them are of a very moderate height; but even the highest are entirely covered to their tops with the thickest woods, as well as every flat part toward the sea. There are sometimes spots upon the sides of some of the hills which are bare; but they are few in comparison of the whole, though they sufficiently point out the general rocky disposition of these hills. Properly speaking, they have no soil upon them, except a kind of compost, produced from rotten mosses and trees, of the depth of two feet or more. Their foundations are, therefore, to be considered as nothing more than stupendous rocks, of a whitish or grey cast, where they have been exposed to the weather; but, when broken, they appeared to be of a bluish-grey colour, like that universal sort which were found at Kerguelen's Land. The rocky shores are a continued mass of this; and the little coves in the Sound have beaches composed of fragments of it, with a few other pebbles. All these coves are furnished with a great quantity of fallen wood lying in them, which is carried in by the tide; and with rills of fresh water, sufficient for the use of a ship, which seem to be supplied entirely from the rains and fogs that hover about the tops of the hills. For few springs can be expected in so rocky a country, and the fresh water found farther up the Sound most probably arose from the melting of the snow; there being no room to suspect that any large river falls into the Sound, either from strangers coming down it, or from any other circumstance. The water of these rills is perfectly clear, and dissolves soap easily.

The weather, during our stay, corresponded pretty nearly with that which we had

The water of these

that which we had

experienced off the coast. That is, when the wind was anywhere between north and west, the weather was fine and clear; but if to the southward of west, hazy with rain. The climate, as far as we had any experience of it, is infinitely milder than that on the east coast of America, under the same parallel of latitude. The mercury in the thermometer never, even in the night, fell lower than 42°; and very often in the day it rose to 60°. No such thing as frost was perceived in any of the low ground; on the contrary, vegetation had made a considerable progress; for I met with grass that was already above a foot long. The trees which chiefly compose the woods are the Canadian pine, white cypress, *Cupressus thyoides*, the wild pine, with two or three other sorts of pine less common. The first two make up almost two-thirds of the whole; and, at a distance, might be mistaken for the same tree, as they both run up into pointed spire-like tops; but they are easily distinguished on coming nearer from their colour, the cypress being of a much paler green, or shade, than the other. The trees, in general, grow with great vigour, and are all of a large size.

There is but little variety of other vegetable productions, though, doubtless, several had not yet sprung up at the early season when we visited the place, and many more might be hid from the narrow sphere of our researches. About the rocks, and verge of the woods, we found strawberry plants, some raspberry, currant, and gooseberry bushes, which were all in a most flourishing state; with a few small black alder-trees. There are likewise a species of sow-thistle; goose-grass; some crow's-foot, which has a very fine crimson flower; and two sorts of *Anthriscum*; one with a large orange flower, and the other with a blue one. We also found in these situations, some wild rose-bushes, which were just budding; a great quantity of young leeks with triangular leaves; a small sort of grass, and some water-cresses, which grow about the sides of the rills; besides great abundance of *Andromeda*. Within the woods, besides two sorts of underwood shrubs unknown to us, are mosses and ferns. Of the first of which, are seven or eight different sorts; of the last not above three or four; and the species of both are mostly such as are common to Europe and America.

As the season of the year was unfavourable to our gaining much knowledge of the vegetable productions of this country, so our own situation while there put it out of our power to learn much about its animals; for as the want of water made it necessary that we should enter the Sound at first, the unforeseen accidents which happened afterward, though they lengthened our stay, were rather unfavourable to our obtaining any knowledge of this kind. The emergency of the case required that every person should be constantly employed in the necessary business of the ships, which was the capital object, as the season was advancing very fast, and the success of the voyage depended upon their diligence and alacrity in expediting the various tasks assigned to them. Hence it happened that excursions of every kind, either on the land or by water, were never attempted. And as we lay in a cove on an island, no other animals were ever seen alive in the woods there, than two or three racoons, martins, and squirrels. Besides these, some of our people who one day landed on the continent near the south-east side of the entrance of the Sound, observed the prints of a bear's feet near the shore. The account, therefore, that we can give of the quadrupeds is taken from the skins which the natives brought to sell; and these were often so mutilated, with respect to the distinguishing parts, such as the paws, tails, and heads, that it was impossible even to guess at the animals to whom they belonged; though others were so perfect, or at least, so well known, that they left no room to doubt about them.

Of these the most common were bears, deer, foxes, and wolves. The bear-skins were in great numbers; few of them very large; but in general, of a shining black colour. The deer-skins were scarcer, and they seem to belong to that sort called the fallow-deer by the historians of Carolina; though Mr. Pennant thinks it quite a different species from ours, and distinguishes it by the name of Virginian deer*. The foxes are in great plenty, and of several varieties; some of their skins being quite yellow, with a black tip to the tail; others of a deep or reddish yellow, intermixed with black; and a third sort, of a whitish grey or ash-colour, also intermixed with black. Our people used to apply the name of fox or wolf indiscriminately, when the skins were so mutilated as to leave room for a doubt. But we got, at last, an entire wolf's skin with the head on; and it was grey. Besides the common sort of mar-

* See *Virginian deer*: Pennant's Hist. Quad. vol. i. No. 46; and Arctic Zool. No. 6.

tin, the pine-martin is also here ; and another, whose skin is of a lighter brown colour than either, with coarser hair ; but is not so common, and is, perhaps, only a mere variety arising from age, or some other accidental circumstance. The ermine is also found at this place, but is rare and small ; nor is the hair remarkably fine, though the animal appeared to be perfectly white, and squirrels are of the common sort ; but the latter is rather smaller than ours, and has a deeper rusty colour running along the back.

VIRGINIAN DEER.

We were clear as to the existence of all the animals already mentioned ; but there are two others besides, which we could not distinguish with sufficient certainty. Of the first of these we saw none of the skins, but what were dressed or tanned like leather. The natives wear them on some occasions ; and from the size as well as thickness, they were generally concluded to belong to the elk, or moose-deer ; though some of them, perhaps, might belong to the buffalo. The other animal, which seems by no means rare, was guessed to be a species of the wild cat or *lynx*. The length of the skins without the head, which none of them had, was about two feet two inches. They are covered with a very fine wool or fur, of a very light brown or whitish yellow colour, intermixed with long hairs, which on the back, where they are shortest, are blackish ; on the sides, where they are longer, of a silver white ; and on the belly, where they are longest, of the colour of the wool ; but the whitish or silver hairs are often so predominant, that the whole animal acquires a cast of that kind. The tail is only three inches long, and has a black tip. The whole skin being by the natives called *aconshee* ; that, most probably, is their name for this animal. Hogs, dogs, and goats have not as yet found their way to this place. Nor do the natives seem to have any knowledge of our brown rats, to which, when they saw one on board the ships, they applied the name they give to squirrels. And though they called our goats *cineetha*, this, most probably, is their name for a young deer or fawn.

The sea animals seen off the coast were whales, porpoises, and seals. The last of these seem only of the common sort, judging from the skins which we saw here ; their colour being either silvery, yellowish, plain, or spotted with black. The porpoise is the *phocena*. I have chosen to refer to this class the sea-otter, as living mostly in the water. It might have been sufficient to have mentioned that this animal abounds here, as it is fully described in different books, taken from the accounts of the Russian adventurers in their expeditions eastward from Kamtschatka, if there had not been a small difference in one that we saw. We for some time entertained doubts, whether the many skins which the natives brought, really belonged to this animal ; as our only reason for being of that opinion was founded on the size, colour, and fineness of the fur ; till a short while before our departure, when a whole one, that had been just killed, was purchased from some strangers who came to barter ; and of this Mr. Webber made a drawing. It was rather young, weighing only twenty-five pounds, of a shining or glossy black colour ; but many of the hairs being tipped with white, gave it a greyish cast at first sight. The face, throat, and breast, were of a yellowish white, or very light brown colour, which, in many of the skins, extended the whole length of the belly. It had six cutting teeth in each jaw ; two of those of the lower jaw being very minute, and placed without, at the base of the two middle ones. In these circumstances it seems to

er brown colour than

two others besides, the first of these we saw. The natives were generally concluded to belong to the species of which none of them had seen the fur, of a very dark brown on the back, whereof a silver white; and at the whitish or silver of that kind. The tail was pointed by the natives called dogs, and goats have any knowledge they applied the name to, most probably, is

is. The last of these we saw; their colour being the same as the *phocaena*. I have seen it. It might have been described in different editions eastward from where we saw. We for some time thought, really belonged to the size, colour, and shape of a whole one, that had been bartered; and of this we saw twenty-five pounds of it with white, gave it a yellowish white, or very pale length of the belly, being very minute, and in circumstances it seems to

disagree with those found by the Russians; and also in not having the outer toes of the hind feet skirted with a membrane. There seemed also a greater variety in the colour of the skins than is mentioned by the describers of the Russian sea-otters. These changes of colour certainly take place at the different gradations of life. The very young ones had brown hair, which was coarse, with very little fur underneath; but those of the size of the entire animal which came into our possession, and just described, had a considerable quantity of that substance; and both in that colour and state the sea-otters seem to remain till they have attained their full growth. After that they lose their black colour, and assume a deep brown or sooty colour; but have then a greater quantity of very fine fur, and scarcely any long hairs. Others, which we suspected to be still older, were of a chestnut brown; and a few skins were seen that had even acquired a perfectly yellow colour. The fur of these animals, as mentioned in the Russian accounts, is certainly softer and finer than that of any others we know of; and therefore the discovery of this part of the continent of North America, where so valuable an article of commerce may be met with, cannot be a matter of indifference*.

Birds, in general, are not only rare as to the different species, but very scarce as to numbers; and these few are so shy, that in all probability they are continually harassed by the natives; perhaps to eat them as food, certainly to get possession of their feathers, which they use as ornaments. Those which frequent the woods are crows and ravens, not at all different from our English ones; a bluish jay or magpie; common wrens, which are the only singing-bird that we hear; the Canadian, or migrating thrush; and a considerable number of brown eagles, with white heads and tails, which, though they seem principally to frequent the coast, come into the Sound in bad weather, and sometimes perch upon the trees. Amongst some other birds, of which the natives either brought fragments or dried skins, we could distinguish a small species of hawk, a heron, and the *alepon* or large-crested American king-fisher. There are also some which I believe are not mentioned, or at least vary very considerably from the accounts given of them by any writers who have treated professedly on this part of natural history. The first two of these are species of wood-peckers. One less than a thrush, of a black colour above, with white spots on the wings, a crimson head, neck, and breast, and a yellowish olive-coloured belly; from which last circumstance it might, perhaps, not improperly be called the yellow-bellied wood-pecker. The other is a larger, and much more elegant bird, of a dusky brown colour on the upper part, richly waved with black, except about the head; the belly of a reddish cast, with round black spots; a black spot on the breast; and the under side of the wings and tail of a plain scarlet colour, though blackish above; with a crimson streak running from the angle of the mouth, a little down the neck on each side. The third and fourth are a small bird of the finch kind, about the size of a linnet, of a dark dusky colour, whitish below, with a black head and neck, and white bill; and a sand-piper of the size of a small pigeon, of a dusky brown colour, and white below, except the throat and breast, with a broad white band across the wings. There are also humming-birds, which yet seem to differ from the numerous sorts of this delicate animal already known, unless they be a mere variety of the *Tachycineta columbis* of Linnæus. These perhaps inhabit more to the southward, and spread northward as the season advances; because we saw none at first, though near the time of our departure the natives brought them to the ships in great numbers.

The birds which frequent the waters and the shores are not more numerous than the others. The quebrantahuesos, gulls, and shags, were seen off the coast, and the last two also frequent the Sound; they are of the common sorts, the shags being our cormorant or water-crow. We saw two sorts of wild ducks, one black with a white head, which were in considerable flocks, the other white with a red bill, but of a larger size; and the greater *lumme* or diver, found in our northern countries. There were also seen once or twice some swans flying across the Sound to the northward; but we knew nothing of their haunts. On the shores, besides the sand-piper described above, we found another about the size of a lark, which bears a great affinity to the burre, and a plover differing very little from our common sea-lark.

* Mr. Cox, on the authority of Mr. Pallas, informs us that the old and middle-aged sea-otter skins are sold at Kacha, by the Russians to the Chinese, from 80 to 100 rubles a skin; that is, from 16l. to 20l. each. See "Coxe's Russian Discoveries," p. 13.

Fish are more plentiful in quantity than birds, though the variety is not very great; and yet, from several circumstances, it is probable that even the variety is considerably increased at certain seasons. The principal sorts which we found in great numbers, are the common herring, but scarcely exceeding seven inches in length, a smaller sort which is the same with the anchovy or sardine, though rather larger; a white or silver-coloured bream, and another of a gold-brown colour, with many narrow longitudinal blue stripes. The herrings and sardines, doubtless, come in large shoals and only at stated seasons, as is common with that sort of fish. The bream of both sorts may be reckoned the next to these in quantity, and the full-grown ones weighed at least a pound. The other fish, which are all scarce, are a small brown kind of *sculpin*, such as is found on the coast of Norway, another of a brownish red cast; frost-fish, a large one, somewhat resembling the bull-head, with a tough skin, destitute of scales; and now and then, toward the time of our leaving the Sound, the natives brought a small brownish cod spotted with white, and a red fish of the same size, which some of our people said they had seen in the Straits of Magellan, besides another differing little from the hake. There are also considerable numbers of those fish called the *chimera*, or little sea-wolves by some, which is akin to and about the size of the *pezegallo*, or elephant-fish. Sharks likewise sometimes frequent the Sound, for the natives have some of their teeth in their possession; and we saw some pieces of ray, or skate, which seemed to have been pretty large. The other marine animals that ought to be mentioned here, are a small cruciated *medusa*, or blubber; star-fish, which differ somewhat from the common ones; two small sorts of crabs; and two others which the natives brought; one of them of a thick, tough, gelatinous consistence, and the other a sort of membranaceous tube or pipe, both which are probably taken from the rocks. And we also purchased from them once a very large cuttle-fish.

There is abundance of large muscles about the rocks, many sea-ears, and we often saw shells of pretty large plain *chama*. The smaller sorts are some *trochi* of two species, a curious *murex*, rugged wilks, and a snail, all which are probably peculiar to this place, at least I do not recollect to have seen them in any country near the same latitude in either hemisphere. There are, besides these, some small plain cockles, limpets, and some strangers who came into the Sound wore necklaces of a small bluish *colute*, or *panamæ*. Many of the muscles are a span in length, and some have pretty large pearls, which, however, are both badly shaped and coloured. We may conclude that there is red coral in the Sound, or somewhere upon the coast, some thick pieces or branches having been seen in the canoes of the natives.

The only animals of the reptile kind observed here, and found in the woods, were brown snakes two feet long, with whitish stripes on the back and sides, which are harmless, as we often saw the natives carry them alive in their hands; and brownish water-lizards, with a tail exactly like that of an eel, which frequented the small standing pools about the rocks. The insect tribe seem to be more numerous. For though the season which is peculiarly fitted to their appearing abroad was only beginning, we saw four or five different sorts of butterflies, none of which were uncommon, a good many humble-bees, some of our common gooseberry-moths, two or three sorts of flies, a few beetles, and some mosquitoes, which probably may be more numerous and troublesome, in a country so full of wood, during the summer, though at this time they did little mischief.

As to the mineral substances in this country, though we found both iron and copper here there is little reason to believe that either of them belong to the place. Neither were the ores of any metal seen, if we except a coarse, red, earthy or ochry substance, used by the natives in painting themselves, which probably may contain a little iron, with a white and black pigment used for the same purpose. But we did not procure specimens of them, and therefore cannot positively determine what are their component parts. Besides the stone or rock that constitutes the mountains and shores, which sometimes contains pieces of very coarse quartz, we found amongst the natives things made of a hard black granite, though not remarkably compact or fine-grained; a greyish whetstone, the common oil-stone of our carpenters, in coarser and finer pieces, and some black bits which are little inferior to the hone-stone. The natives also use the transparent leafy glimmer, or Muscovy glass, a brown leafy or martial sort: and they sometimes brought to us pieces of rock crystal, tolerably

APRIL, 1778

not very great; and considerably increased. The herring-like fish, which is the same with the herring, and another. The herrings and the herring-like fish is common with that. These in quantity, and are all scarce, are another of a brownish red, with a tough skin. The Sound, the natives of the same size, which besides another differing called the *chimera*, of the *pezegallo*, or the natives have some of the skate, which seemed to be mentioned here, are what from the common thought; one of them of anaceous tube or pipe, passed from them once a

years, and we often saw of two species, a curious fish at this place, at least I do not see in either hemisphere. Strangers who came into the bay of the muscles are both badly shaped, or somewhere upon the natives.

The woods, were brown and harmless, as were the water-lizards, with a pool about the rocks. On which is peculiarly five different sorts of some of our common mosquitoes, which all of wood, during the

iron and copper here. Neither were the substance, used by the iron, with a white and specimens of them, and

Besides the stone or contains pieces of very black granite, though not common oil-stone of our little inferior to the luscovy glass, a brown rock crystal, tolerably

transparent. The first two are probably found near the spot, as they seemed to be in considerable quantities, but the latter seems to be brought from a greater distance, or is very scarce, for our visitors always parted with it reluctantly. Some of the pieces were octangular, and had the appearance of being formed into that shape by art.

The persons of the natives are in general under the common stature, but not slender in proportion, being commonly pretty full or plump, though not muscular. Neither doth the soft fleshiness seem ever to swell into corpulence, and many of the older people are rather spare or lean. The visage of most of them is round and full, and

sometimes, also, broad, with large prominent cheeks; and above these the face is frequently much depressed, or seems fallen in quite across between the temples, the nose also flattening at its base, with pretty wide nostrils, and a rounded point. The forehead rather low, the eyes small, black, and rather languishing than sparkling, the mouth round with large round thickish lips, the teeth tolerably equal and well set, but not remarkably white. They have either no beards at all, which was most commonly the case, or a small thin one upon the point of the chin, which does not arise from any natural defect of hair on that part, but from plucking it out more or less; for some of them, and particularly the old men, have not only considerable beards all over the chin, but whiskers or mustachios, both on the upper lip and running from thence toward the lower jaw obliquely downward*. Their eyebrows are also scanty

NATIVES OF NOOTKA SOUND.

* One of the most curious singularities observable in the natural history of the human species, is the supposed defect in the habit and temperature of the bodies of the American Indians, exemplified in their having no beards, while they are furnished with a profusion of hair on their heads. M. de Pauw, the ingenious author of "Recherches sur les Américains," Dr. Robertson, in his "History of America," and, in general, the writers for whose authority we ought to have the highest deference, adopt this as an indisputable matter of fact. May we not be permitted to request those who espouse their sentiments, to reconsider the question, when we can produce Captain Cook's evidence on the opposite side, at least so far as relates to the American tribes whom he had intercourse with at Nootka? Nor is Captain Cook singular in his report. What he saw on the west-coast Captain Carver also met with among the American Indians far up in the country. His words are as follow:—"From minute inquiries and a curious inspection, I am able to declare (however respectable I may hold the authority of these historians in other points) that their assertions are erroneous, and proceeding from a want of a thorough knowledge of the customs of the Indians. After the age of puberty, their bodies in their natural state are covered in the same manner as those of the Europeans. The men, indeed, esteem a beard very becoming, and take great pains to get rid of it; nor is there any ever to be perceived on their faces, except when they grow old, and become inattentive to appearances. The Nootkese, and the remote nations, pluck them out with bent pieces of hard wood formed into a kind of nippers; while those who have communication with Europeans, procure from them wire, which they twist into a screw or worm; applying this to the part, they press the rings together, and with a sudden twist draw out all the hairs that are inclosed in them."—"Carver's Travels," p. 224,

225. The remark made by Mr. Marsden, who also quotes Carver, is worth attending to, that the vizor or mask of Montezuma's armour, preserved at Brussels, has remarkably large whiskers; and that those Americans could not have imitated this ornament unless nature had presented them with the model. From Captain Cook's observation on the west coast of North America, combined with Carver's in the inland parts of that continent, and confirmed by the Mexican vizor as above, there seems abundant reason to agree with Mr. Marsden, who thus modestly expresses himself:—"Were it not for the numerous and very respectable authorities, from which we are assured that the natives of America are naturally beardless, I should think that the common opinion on that subject had been hastily adopted; and that their appealing thus at a mature age, was only the consequence of an early practice, similar to that observed among the Sumatrans. Even now, I must confess that it would remove some degree of doubt from my mind, could it be ascertained that no such custom prevails."—"Marsden's History of Sumatra," p. 39, 40.

[This question is best decided by the evidence of an Indian chief, the celebrated Joseph Brant, or Thayendanegea, the chief of the Six Nations, and the ally of the British in the American War of Independence. He was a remarkable man, and had received a fair education, of which he made good use. The question was proposed to him by a Mr. McCausland, soon after the close of the American War. The following was the chief's reply:—

"Niagara, April 19, 1793.

"The men of the Six Nations have all beards by nature; as have likewise all other Indian nations of North America, which I have seen. Some Indians allow a part of the beard upon the chin and upper lip to grow, and a few of the Mohawks shave with razors, in the same manner as Europeans; but the generality pluck out the hairs of the

and always narrow, but the hair of the head is in great abundance, very coarse and strong, and without a single exception black, straight, and long, or hanging down over the shoulders. The neck is short; the arms and body have no particular mark of beauty or elegance in their formation, but are rather clumsy; and the limbs in all are very small in proportion to the other parts, and crooked or ill made, with large feet badly shaped, and projecting ankles. This last defect seems, in a great measure, to arise from their sitting so much on their hams or knees, both in their canoes and houses.

Their colour we could never positively determine, as their bodies were incrustated with paint and dirt; though, in particular cases, when these were well rubbed off, the whiteness of the skin appeared almost to equal that of Europeans, though rather of that pale effete cast which distinguishes those of our southern nations. Their children, whose skins had never been stained with paint, also equalled ours in whiteness. During their youth, some of them have no disagreeable look, if compared to the generality of the people; but this seems to be entirely owing to the particular animation attending that period of life, for after attaining a certain age, there is hardly any distinction. Upon the whole, a very remarkable sameness seems to characterise the countenances of the whole nation, a dull phlegmatic want of expression, with very little variation, being strongly marked in all of them. The women are nearly of the same size, colour, and form, with the men, from whom it is not easy to distinguish them, as they possess no natural delicacies sufficient to render their persons agreeable; and hardly any one was seen, even amongst those who are in the prime of life, who had the least pretensions to be called handsome.

Their common dress is a flaxen garment, or mantle, ornamented on the upper edge by a narrow strip of fur, and at the latter edge, by fringes or tassels. It passes under the left arm, and is tied over the right shoulder by a string before and one behind, near its middle, by which means both arms are free, and it hangs evenly, covering the left side, but leaving the right open, except from the loose part of the edges falling upon it, unless when the mantle is fastened by a girdle (of coarse matting or woollen) round the waist, which is often done. Over this, which reaches below the knees, is worn a small cloak of the same substance, likewise fringed at the lower part. In shape this resembles a round dish-cover, being quite close, except in the middle, where there is a hole just large enough to admit the head, and then, resting upon the shoulders, it covers the arms to the elbows, and the body as far as the waist. Their head is covered with a cap of the figure of a truncated cone, or like a flower-pot, made of fine matting, having the top frequently ornamented with a round or pointed knob, or a bunch of leathern tassels, and there is a string that passes under the chin to prevent its blowing off.

Besides the above dress, which is common to both sexes, the men frequently throw over their other garments the skin of a bear, wolf, or sea-otter, with the hair outward, and tie it

DRESS OF NATIVES OF NOOTKA SOUND.

heard by the roots, as soon as they begin to appear; and as they continue this practice all their lives, they appear to have no beard, or, at most, only a few straggling hairs, which they have neglected to pluck out. I am, however, of opinion, that if the Indians were to shave, they would never have beards altogether so thick as the Europeans; and there are some to be met with who have actually very little beard.—JOSEPH BRANT THUYENDANEGIA.

Jewitt, the English sailor who has been mentioned in a previous note, page 264, says that the people of Nootka Sound "have no beard, completely extirpating it, as well as the hair from their bodies,—Maquina (the head chief, or king) being the only exception, who suffered his beard to grow on his upper lip, in the manner of mustachios, which was considered as a mark of dignity."—Ed.

SCENE ON THE CANTON RIVER.

as a cloak near the upper part, wearing it sometimes before and sometimes behind. In rainy weather they throw a coarse mat about their shoulders. They have also woollen garments, which, however, are little in use. The hair is commonly worn hanging down loose; but some, when they have no cap, tie it in a bunch on the crown of the head. Their dress, upon the whole, is convenient, and would by no means be inelegant, were it kept clean. But as they rub their bodies constantly over with a red paint, of a clayey or coarse ochry substance, mixed with oil, their garments, by this means, contract a rancid offensive smell, and a greasy nastiness, so that they make a very wretched dirty appearance; and what is still worse, their heads and their ^{ears} swarm with vermin, which, so depraved is their taste for cleanliness, we used to see them pick off with great composure and eat.

Though their bodies are always covered with red paint, their faces are often stained with a black, a bright red, or a white colour, by way of ornament. The last of these gives them a ghastly, disgusting aspect. They also strew the brown martial mica upon the paint, which makes it glitter*, the ears of many of them are perforated in the lobe, where they make a pretty large hole; and two others higher up on the outer edge. In these holes they hang bits of bone; quills fixed upon a leathern thong; small shells; bunches of woollen tassels; or pieces of thin copper, which our beads could never supplant. The septum of the nose in many is also perforated, through which they draw a piece of soft cord; and others wear, at the same place, small thin pieces of iron, brass, or copper, shaped almost like a horse-shoe, the narrow opening of which receives the septum, so as that the two points may gently pinch it; and the ornament thus hangs over the upper lip. The rings of our brass buttons, which they eagerly purchased, were appropriated to this use†. About their wrists they wear bracelets or bunches of white bugle beads, made of a conic shelly substance‡; bunches of thongs, with tassels; or a broad black shining horny substance, of one piece. And about their ankles they also frequently wear many folds of leathern thongs, or the sinews of animals twisted to a considerable thickness.

* The following passage is extracted from Jewitt's Narrative:—"On extraordinary occasions the king and principal chiefs used to strew over their faces, after painting, a fine black shining powder, procured from some mineral, as Maquina told me it was got from the rocks. This they call *Pelpeth*, and value it highly, as, in their opinion, it serves to set off their looks to great advantage, glittering, especially in the sun, like silver. This article is brought them in bags by the *Neuchemass*, a very savage nation, who live a long way to the north, from whom they likewise receive a superior kind of red paint, a species of very fine and rich ochre, which they hold in much estimation. Notwithstanding this custom of painting themselves, they make it an invariable practice, both in summer and winter to bathe once a day, and sometimes oftener; but as the paint is put on with oil, it is not much decomposed thereby, and whenever they wash it off, they repair to some piece of fresh water, and scour themselves with sand or rushes."

† The women, "though fond of ornamenting their persons, are by no means so partial to paint as the men, merely colouring their eyebrows black, and drawing a bright red stripe from each corner of the mouth towards the ear."—Ed.

‡ Those who cannot afford more expensive ornaments, substitute for them, usually, a smooth round stick, often projecting eight or nine inches beyond the face on each side, the length being apportioned to the self-supposed consequence of the wearer; this is made fast, or secured in its place by little wedges on each side of it. The English sailors jestingly term these uncouth appendages "spit-sail-yards."—Ed.

§ This is the well known *Wampum*, which is used in Tartary, as well as among the North American Indians, as an ornament, and as a circulating medium. Among those tribes with whom a European traffic has been esta-

blished, artificial bugles have very generally been substituted for the shells of which it should properly be composed, and its value, except as a matter of mere ornament and ceremony, is little regarded. Jewitt states that at Nootka Sound it was termed *Ife-waw*. He says, "This *Ife-waw*, as they term it, is a kind of shell, of a dazzling whiteness, and as smooth as ivory. It is of a cylindrical form, in a slight degree curved, about the size of a goose-quill, hollow, three inches in length, and gradually tapering to a point, which is broken off by the natives as it is taken from the water. This they afterwards string upon threads of bark, and sell it by the fathom. It forms a kind of circulating medium among these nations, five fathoms being considered as the price of a slave, their most valuable species of property. It is principally obtained from the *Aitizarts*, a people living about thirty or forty miles to the northward, who collect it from the reefs and sunken rocks with which their coast abounds, though it is also brought in considerable quantity from the south. Their mode of taking it has been thus described to me:—"To one end of a pole is fastened a piece of plank, in which a considerable number of pine pegs are inserted, made sharp at the ends. Above the plank, in order to sink it, a stone or some weight is tied, and the other end of the pole suspended to a long rope. This is let down perpendicularly by the *Ife-waw* fishers in those places where that substance is found, which are usually from fifty to sixty fathoms deep. On finding the bottom, they raise the pole up a few feet, and let it fall. This they repeat a number of times as if sounding, when they draw it up, and take off the *Ife-waw*, which is found adhering to the points. This method of procuring it is very laborious and fatiguing, especially as they seldom take more than two or three of these shells at a time, and frequently none."—Ed.

could not but be struck with the singularity of this scene; and perhaps there were few on board who now lamented our having failed in our endeavours to find a northern passage homeward, last summer. To this disappointment we owed our having it in our power to revisit the Sandwich Islands, and to enrich our voyage with a discovery which, though the last, seemed, in many respects, to be the most important that had hitherto been made by Europeans throughout the extent of the Pacific Ocean.

[Here Captain Cook's Journal ends. The remaining transactions of the voyage are related by Captain King.]

BOOK V.

CAPTAIN KING'S JOURNAL OF THE TRANSACTIONS ON RETURNING TO THE SANDWICH ISLANDS.

CHAPTER I.—DESCRIPTION OF KARAKAKOOA BAY.—VAST CONCOURSE OF THE NATIVES.—POWER OF THE CHIEFS OVER THE INFERIOR PEOPLE.—VISIT FROM KOAH, A PRIEST AND WARRIOR.—THE MORAI AT KAKOOA DESCRIBED.—CEREMONIES AT THE LANDING OF CAPTAIN COOK.—OBSERVATORIES ERECTED.—POWERFUL OPERATION OF THE TABOO.—METHOD OF SALTING PORK IN TROPICAL CLIMATES.—SOCIETY OF PRIESTS DISCOVERED.—THEIR HOSPITALITY AND MUNIFICENCE.—RECEPTION OF CAPTAIN COOK.—ARTIFICE OF KOAH.—ARRIVAL OF TERREEBOO, KING OF THE ISLAND.—SINGULAR CEREMONY.—VISIT FROM THE KING.—RETURNED BY CAPTAIN COOK.

KARAKAKOOA Bay is situated on the west side of the island of Owhyhee, in a district called Akona. It is about a mile in depth, and bounded by two low points of land at the distance of half a league, and bearing south south-east and north north-west from each other. On the north point, which is flat and barren, stands the village of Kowrowa; and in the bottom of the bay, near a grove of tall cocoa-nut trees, there is another village of a more considerable size, called Kakooa: between them runs a high rocky cliff, inaccessible from the sea-shore. On the south side, the coast, for about a mile inland, has a rugged appearance; beyond which the country rises with a gradual ascent, and is overspread with cultivated inclosures and groves of cocoa-nut trees, where the habitations of the natives are scattered in great numbers. The shore, all around the bay, is covered with a black coral rock, which makes the landing very dangerous in rough weather; except at the village of Kakooa, where there is a fine sandy beach, with a *Morai*, or burying-place, at one extremity, and a small well of fresh water at the other. This bay appearing to Captain Cook a proper place to refit the ships, and lay in an additional supply of water and provisions, we moored on the north side, about a quarter of a mile from the shore, Kowrowa bearing north-west. As soon as the inhabitants perceived our intention of anchoring in the bay, they came off from the shore in astonishing numbers, and expressed their joy by singing and shouting, and exhibiting a variety of wild and extravagant gestures. The sides, the decks, and rigging of both ships were soon completely covered with them; and a multitude of women and boys, who had not been able to get canoes, came swimming round us in shoals; many of whom not finding room on board, remained the whole day playing in the water.

Among the chiefs who came on board the *Resolution*, was a young man, called Parcea, whom we soon perceived to be a person of great authority. On presenting himself to Captain Cook, he told him, that he was *Jakanee** to the king of the island, who was at that

* We afterward met with several others of the same denomination; but whether it be an office, or some degree of affinity, we could never learn with certainty.

g man, called Pareca,
presenting himself to
island, who was at that

an office, or some degree of

time engaged on a military expedition at Mowee, and was expected to return within three or four days. A few presents from Captain Cook attached him entirely to our interests, and he became exceedingly useful to us in the management of his countrymen, as we had soon occasion to experience. For we had not been long at anchor, when it was observed that the *Discovery* had such a number of people hanging on one side, as occasioned her to heel considerably; and that the men were unable to keep off the crowds which continued pressing into her. Captain Cook, being apprehensive that she might suffer some injury, pointed out the danger to Pareca, who immediately went to their assistance, cleared the ship of its incumbrances, and drove away the canoes that surrounded her.

The authority of the chiefs over the inferior people appeared, from this incident, to be of the most despotic kind. A similar instance of it happened the same day on board the *Resolution*; where the crowd being so great as to impede the necessary business of the ship, we were obliged to have recourse to the assistance of Kaneena, another of their chiefs, who had likewise attached himself to Captain Cook. The inconvenience we laboured under being made known, he immediately ordered his countrymen to quit the vessel; and we were not a little surprised to see them jump overboard, without a moment's hesitation; all except one man, who loitering behind, and showing some unwillingness to obey, Kaneena took him up in his arms, and threw him into the sea. Both these chiefs were men of strong and well-proportioned bodies, and of countenances remarkably pleasing. Kaneena especially, whose portrait was drawn by Mr. Webber, was one of the finest men I ever saw. He was about six feet high, had regular and expressive features, with lively, dark eyes; his carriage was easy, firm, and graceful.

KANEENA IN HIS HELMET.

It has been already mentioned, that during our long cruise off this island, the inhabitants had always behaved with great fairness and honesty in their dealings, and had not shown the slightest propensity to theft; which appeared to us the more extraordinary, because those with whom we had hitherto held any intercourse were of the lowest rank, either servants or fishermen. We now found the case exceedingly altered. The immense crowd of islanders, which blocked up every part of the ships, not only afforded frequent opportunity of pilfering without risk of discovery, but our inferiority in number held forth a prospect of escaping with impunity in case of detection. Another circumstance, to which we attributed this alteration in their behaviour, was the presence and encouragement of their chiefs; for generally tracing the booty into the possession of some men of consequence, we had the strongest reason to suspect that these depredations were committed at their instigation.

Soon after the *Resolution* had got into her station, our two friends, Pareca and Kaneena, brought on board a third chief, named Koah, who, we were told, was a priest, and had been, in his youth, a distinguished warrior. He was a little old man, of an emaciated figure; his eyes exceedingly sore and red, and his body covered with a white leprous scurf, the effects of an immoderate use of the *ava*. Being led into the cabin, he approached Captain Cook with great veneration, and threw over his shoulders a piece of red cloth, which he had brought along with him. Then stepping a few paces back, he made an offering of a small pig, which he held in his hand, whilst he pronounced a discourse that lasted for a considerable time. This ceremony was frequently repeated during our stay at Owhyhee, and

appeared to us, from many circumstances, to be a sort of religious adoration *. Their idols we found always arrayed with red cloth, in the same manner as was done to Captain Cook; and a small pig was their usual offering to the *Eatooas*. Their speeches, or prayers, were uttered too with a readiness and volubility that indicated them to be according to some formulary.

When this ceremony was over, Koah dined with Captain Cook, eating plentifully of what was set before him; but, like the rest of the inhabitants of the islands in these seas, could scarcely be prevailed on to taste a second time our wine or spirits. In the evening, Captain Cook, attended by Mr. Bayly and myself, accompanied him on shore. We landed at the beach, and were received by four men, who carried wands tipped with dogs' hair, and marched before us, pronouncing with a loud voice a short sentence, in which we could only distinguish the word *Orono*†. The crowd which had been collected on the shore retired at our approach; and not a person was to be seen, except a few lying prostrate on the ground, near the huts of the adjoining village.

Before I proceed to relate the adoration that was paid to Captain Cook, and the peculiar ceremonies with which he was received on this fatal island, it will be necessary to describe the Morai, situated, as I have already mentioned, at the south side of the beach at Kakaooa. It was a square solid pile of stones, about forty yards long, twenty broad, and fourteen in height. The top was flat and well paved, and surrounded by a wooden rail, on which were fixed the skulls of the captives, sacrificed on the death of their chiefs. In the centre of the area stood a ruinous old building of wood, connected with the rail on each side by a stone wall, which divided the whole space into two parts. On the side next the country were five poles, upward of twenty feet high, supporting an irregular kind of scaffold; on the opposite side, toward the sea, stood two small houses, with a covered communication.

We were conducted by Koah to the top of this pile by an easy ascent, leading from the beach to the north-west corner of the area. At the entrance, we saw two large wooden images, with features violently distorted, and a long piece of carved wood, of a conical form inverted, rising from the top of their heads; the rest was without form, and wrapped round with red cloth. We were here met by a tall young man with a long beard, who presented Captain Cook to the images; and after chanting a kind of hymn, in which he was joined by Koah, they led us to that end of the Morai where the five poles were fixed. At the foot of them were twelve images ranged in a semicircular form, and before the middle figure stood a high stand or table exactly resembling the *Whata*‡ of Otaheite, on which lay a putrid hog, and under it pieces of sugar-cane, cocoa-nuts, bread-fruit, plantains, and sweet potatoes. Koah having placed the Captain under this stand, took down the hog, and held it toward him; and after having a second time addressed him in a long speech, pronounced with much vehemence and rapidity, he let it fall on the ground, and led him to the scaffolding, which they began to climb together, not without great risk of falling. At this time we saw, coming in solemn procession, at the entrance of the top of the Morai, ten men carrying a live hog, and a large piece of red cloth. Being advanced a few paces, they stopped and prostrated themselves; and Kaieekeea, the young man above-mentioned, went to them, and receiving the cloth, carried it to Koah, who wrapped it round the Captain, and afterward offered him the hog, which was brought by Kaieekeea with the same

* Mr. Ellis gives the following explanation of the singular honours that were paid to Captain Cook at Owhyhee:—"Among the kings who governed Hawaii, or an extensive district in the island, during what may, in its chronology, be called the fabulous age, was Rono, or Orono; who, on some account, became offended with his wife, and murdered her; but afterwards lamented the act so much, as to induce a state of mental derangement. In this state he travelled through all the islands, boxing and wrestling with every one he met. He subsequently set sail in a singularly-shaped canoe for Tahiti, or a foreign country. After his departure, he was deified by his countrymen, and annual games of boxing and wrestling were instituted to his honour. As soon as Captain Cook arrived, it was supposed and reported that the god Rono

was returned; the priests clothed him with the sacred cloth worn only by the god, conducted him to their temples, sacrificed animals to propitiate his favour, and hence the people prostrated themselves before him as he walked through the villages."—*Ido*.

† Captain Cook generally went by this name amongst the natives of Owhyhee; but we could never learn its precise meaning. Sometimes they applied it to an invisible being, who, they said, lived in the heavens. We also found that it was a title belonging to a personage of great rank and power in the island, who resembles pretty much the *Delai Lama* of the Tartars, and the ecclesiastical emperor of Japan.

ceremony. Whilst Captain Cook was aloft, in this awkward situation, swathed round with red cloth, and with difficulty keeping his hold amongst the pieces of rotten scaffolding, Kaireekkea and Koah began their office, chanting sometimes in concert, and sometimes alternately. This lasted a considerable time; at length Koah let the hog drop, when he and the Captain descended together. He then led him to the images before mentioned, and having said something to each in a sneering tone, snapping his fingers at them as he passed, he brought him to that in the centre, which, from its being covered with red cloth, appeared to be in greater estimation than the rest. Before this figure he prostrated himself, and kissed it, desiring Captain Cook to do the same; who suffered himself to be directed by Koah throughout the whole of this ceremony.

We were now led back into the other division of the Morai, where there was a space, ten or twelve feet square, sunk about three feet below the level of the area. Into this we descended, and Captain Cook was seated between two wooden idols, Koah supporting one of his arms, whilst I was desired to support the other. At this time, arrived a second procession of natives, carrying a baked hog, and a pudding, some bread-fruit, cocoa-nuts, and other vegetables. When they approached us, Kaireekkea put himself at their head, and presenting the pig to Captain Cook in the usual manner, began the same kind of chant as before, his companions making regular responses. We observed, that after every response, their parts became gradually shorter, till, toward the close, Kaireekkea's consisted of only two or three words, which the rest answered by the word *Orono*.

When this offering was concluded, which lasted a quarter of an hour, the natives sat down, fronting us, and began to cut up the baked hog, to peel the vegetables, and break the cocoa-nuts; whilst others employed themselves in brewing the *ava*; which is done, by chewing it in the same manner as at the Friendly Islands. Kaireekkea then took part of the kernel of a cocoa-nut, which he chewed, and wrapping it in a piece of cloth rubbed with it the Captain's face, head, hands, arms, and shoulders. The *ava* was then handed round, and after we had tasted it, Koah and Pareea began to pull the flesh of the hog in pieces, and to put it into our mouths. I had no great objection to being fed by Pareea, who was very cleanly in his person; but Captain Cook, who was served by Koah, recollecting the putrid hog, could not swallow a morsel; and his reluctance, as may be supposed, was not diminished, when the old man, according to his own mode of civility, had chewed it for him.

When this last ceremony was finished, which Captain Cook put an end to as soon as he decently could, we quitted the Morai, after distributing amongst the people some pieces of iron and other trifles, with which they seemed highly gratified. The men with wands conducted us to the boats, repeating the same words as before. The people again retired, and the few that remained, prostrated themselves as we passed along the shore. We immediately went on board, our minds full of what we had seen, and extremely well satisfied with the good dispositions of our new friends. The meaning of the various ceremonies with which we had been received, and which, on account of their novelty and singularity, have been related at length, can only be the subject of conjectures, and those uncertain and partial: they were, however, without doubt, expressive of high respect on the part of the natives; and, as far as related to the person of Captain Cook, they seemed approaching to adoration.

The next morning I went on shore with a guard of eight marines, including the corporal and lieutenant, having orders to erect the observatory in such a situation as might best enable me to superintend and protect the waterers, and the other working parties that were to be on shore. As we were viewing a spot conveniently situated for this purpose, in the middle of the village, Pareea, who was always ready to show both his power and his goodwill, offered to pull down some houses that would have obstructed our observations. However, we thought it proper to decline this offer, and fixed on a field of sweet potatoes adjoining to the Morai, which was readily granted us; and the priests, to prevent the intrusion of the natives, immediately consecrated the place, by fixing their wands round the wall by which it was inclosed.

This sort of religious interdiction they call *taboo*; a word we heard often repeated during

our stay amongst these islanders, and found to be of very powerful and extensive operation. A more particular explanation of it will be given in the general account of these islands, under the article of religion; at present it is only necessary to observe, that it procured us even more privacy than we desired. No canoes ever presumed to land near us; the natives sat on the wall, but none offered to come within the *tabooed* space, till he had obtained our permission. But though the men, at our request, would come across the field with provisions, yet not all our endeavours could prevail on the women to approach us. Presents were tried, but without effect; Pareea and Koah were tempted to bring them, but in vain; we were invariably answered, that the *Eatooa* and *Terreeoboo* (which was the name of their king) would kill them. This circumstance afforded no small matter of amusement to our friends on board, where the crowds of people, and particularly of women, that continued to flock thither, obliged them almost every hour to clear the vessel, in order to have room to do the necessary duties of the ship. On these occasions, two or three hundred women were frequently made to jump into the water at once, where they continued swimming and playing about, till they could again procure admittance.

From the 19th to the 24th, when Pareea and Koah left us to attend *Terreeoboo*, who had landed on some other part of the island, nothing very material happened on board. The caulkers were set to work on the sides of the ships, and the rigging was carefully overhauled and repaired. The salting of hogs for sea-store was also a constant, and one of the principal objects of Captain Cook's attention. As the success we met with in this experiment, during our present voyage, was much more complete than it had been in any former attempt of the same kind, it may not be improper to give an account of the detail of the operation. It has generally been thought impracticable to cure the flesh of animals by salting, in tropical climates; the progress of putrefaction being so rapid, as not to allow time for the salt to take (as they express it) before the meat gets a taint, which prevents the effect of the pickle. We do not find that experiments relative to this subject have been made by the navigators of any nation before Captain Cook. In his first trials, which were made in 1774, during his second voyage to the Pacific Ocean, the success he met with, though very imperfect, was yet sufficient to convince him of the error of the received opinion. As the voyage in which he was now engaged was likely to be protracted a year beyond the time for which the ships had been victualled, he was under the necessity of providing, by some such means, for the subsistence of the crews, or of relinquishing the further prosecution of his discoveries. He therefore lost no opportunity of renewing his attempts, and the event answered his most sanguine expectations.

The hogs which we made use of for this purpose were of various sizes, weighing from four to twelve stone*. The time of slaughtering was always in the afternoon; and as soon as the hair was scalded off, and the entrails removed, the hog was divided into pieces of four or eight pounds each, and the bones of the legs and chine taken out; and, in the larger sort, the ribs also. Every piece then being carefully wiped and examined, and the veins cleared of the coagulated blood, they were handed to the salters whilst the flesh remained still warm. After they had been well rubbed with salt, they were placed in a heap, on a stage raised in the open air, covered with plauks, and pressed with the heaviest weights we could lay on them. In this situation they remained till the next evening, when they were again well wiped and examined, and the suspicious parts taken away. They were then put into a tub of strong pickle, where they were always looked over once or twice a day, and if any piece had not taken the salt, which was readily discovered by the smell of the pickle, they were immediately taken out, re-examined, and the sound pieces put to fresh pickle. This, however, after the precautions before used, seldom happened. After six days, they were taken out, examined for the last time, and being again slightly pressed, they were packed in barrels, with a thin layer of salt between them. I brought home with me some barrels of this pork, which was pickled at Owhyhee in January 1779, and was tasted by several persons in England, about Christmas 1780, and found perfectly sound and wholesome†.

* 14 lb.

† Since these papers were prepared for the press, I have been informed by Mr. Vancouver, who was one of my Mid-

shipmen in the *Discovery*, and was afterwards appointed Lieutenant of the *Martin* sloop of war, that he tried the method here recommended, both with English and Spanish

rewarded, we had generally a greater supply than we could make use of. On these occasions, Koah, who never failed in his attendance on us, used to beg such as we did not want, and they were always given to him. It one day happened, that a pig was presented us by a man whom Koah himself introduced as a chief, who was desirous of paying his respects, and we recollected the pig to be the same that had been given to Koah just before. This leading us to suspect some trick, we found, on further inquiry, the pretended chief to be an ordinary person; and on connecting this with other circumstances, we had reason to suspect that it was not the first time we had been the dupes of the like imposition.

Things continued in this state till the 24th, when we were a good deal surprised to find that no canoes were suffered to put off from the shore, and that the natives kept close to their houses. After several hours' suspense, we learned that the bay was *tabooed*, and all intercourse with us interdicted, on account of the arrival of Terreebooo. As we had not foreseen an accident of this sort, the crews of both ships were obliged to pass the day without their usual supply of vegetables. The next morning, therefore, they endeavoured, both by threats and promises, to induce the natives to come alongside; and as some of them were at last venturing to put off, a chief was observed attempting to drive them away. A musket was immediately fired over his head, to make him desist, which had the desired effect, and refreshments were soon after purchased as usual. In the afternoon, Terreebooo arrived, and visited the ships in a private manner, attended only by one canoe, in which were his wife and children. He staid on board till near ten o'clock, when he returned to the village of Kowrowa.

The next day, about noon, the king, in a large canoe, attended by two others, set out from the village and paddled toward the ships in great state. Their appearance was grand and magnificent. In the first canoe was Terreebooo and his chiefs, dressed in their rich feathered cloaks and helmets, and armed with long spears and daggers; in the second came the venerable Kaoo, the chief of the priests, and his brethren, with their idols displayed on red cloth. These idols were busts of a gigantic size, made of wicker-work, and curiously covered with small feathers of various colours, wrought in the same manner with their cloaks. Their eyes were made of large pearl oysters, with a black nut fixed in the centre; their mouths were set with a double row of the fangs of dogs, and, together with the rest of their features, were strangely distorted. The third canoe was filled with hogs and various sorts of vegetables. As they went along, the priests in the centre canoe sung their hymns with great solemnity; and after paddling round the ships, instead of going on board, as was expected, they made toward the shore at the beach where we were stationed.

As soon as I saw them approaching, I ordered out our little guard to receive the king; and Captain Cook, perceiving that he was going on shore, followed him and arrived nearly at the same time. We conducted them into the tent, where they had scarcely been seated, when the king rose up, and in a very graceful manner threw over the Captain's shoulders the cloak he himself wore, put a feathered helmet on his head, and a curious fan into his hand. He also spread at his feet five or six other cloaks, all exceedingly beautiful, and of the greatest value. His attendants then brought four very large hogs, with sugar-canes, coconuts, and bread-fruit; and this part of the ceremony was concluded by the king's exchanging

TERREEBOOO'S CANOE.

names with Captain Cook, which amongst all the islanders of the Pacific Ocean is esteemed the strongest pledge of friendship. A procession of priests, with a venerable old personage at their head, now appeared, followed by a long train of men leading large hogs, and others carrying plantains, sweet potatoes, &c. By the looks and gestures of Kairekekea, I immediately knew the old man to be the chief of the priests before mentioned, on whose bounty we had so long subsisted. He had a piece of red cloth in his hands, which he wrapped round Captain Cook's shoulders, and afterward presented him with a small pig in the usual form. A seat was then made for him, next to the king; after which, Kairekekea and his followers began their ceremonies, Kaoo and the chiefs joining in the responses.

I was surprised to see, in the person of this king, the same infirm and emaciated old man, that came on board the *Resolution* when we were off the north-east side of the island of Mowee; and we soon discovered amongst his attendants most of the persons who at that time had remained with us all night. Of this number were the two younger sons of the king, the eldest of whom was sixteen years of age, and his nephew Maiha-Maiha, whom at first we had some difficulty in recollecting, his hair being plastered over with a dirty brown paste and powder, which was no mean heightening to the most savage face I ever beheld.

As soon as the formalities of the meeting were over, Captain Cook carried Terreebooo, and as many chiefs as the pinnace could hold, on board the *Resolution*. They were received with every mark of respect that could be shown them; and Captain Cook, in return for the feathered cloak, put a linen shirt on the king, and girt his own hanger round him. The ancient Kaoo, and about half a dozen more old chiefs, remained on shore, and took up their abode at the priests' houses. During all this time, not a canoe was seen in the bay, and the natives either kept within their huts, or lay prostrate on the ground. Before the king left the *Resolution*, Captain Cook obtained leave for the natives to come and trade with the ships as usual; but the women, for what reason we could not learn, still continued under the effects of the *taboo*; that is, were forbidden to stir from home, or to have any communication with us.

CHAPTER II.—FARTHER ACCOUNT OF TRANSACTIONS WITH THE NATIVES.—THEIR HOSPITALITY.—PROPENSITY TO THEFT.—DESCRIPTION OF A BOXING-MATCH.—DEATH OF ONE OF OUR SEAMEN.—BEHAVIOUR OF THE PRIESTS AT HIS FUNERAL.—THE WOOD-WORK AND IMAGES ON THE MORAI PURCHASED.—THE NATIVES INQUISITIVE ABOUT OUR DEPARTURE.—THEIR OPINION ABOUT THE DESIGN OF OUR VOYAGE.—MAGNIFICENT PRESENTS OF TERREEBOOO TO CAPTAIN COOK.—THE SHIPS LEAVE THE ISLAND.—THE *RESOLUTION* DAMAGED IN A GALE, AND OBLIGED TO RETURN.

The quiet and inoffensive behaviour of the natives having taken away every apprehension of danger, we did not hesitate to trust ourselves amongst them at all times, and in all situations. The officers of both ships went daily up the country in small parties, or even singly, and frequently remained out the whole night. It would be endless to recount all the instances of kindness and civility which we received upon those occasions. Wherever we went, the people flocked about us, eager to offer every assistance in their power, and highly gratified if their services were accepted. Various little arts were practised to attract our notice, or to delay our departure. The boys and girls ran before, as we walked through their villages, and stopped us at every opening where there was room to form a group for dancing. At one time, we were invited to accept a draught of cocoa-nut milk, or some other refreshment, under the shade of their huts; at another, we were seated within a circle of young women, who exerted all their skill and agility to amuse us with songs and dances.

The satisfaction we derived from their gentleness and hospitality was, however, frequently interrupted by that propensity to stealing which they have in common with all the other islanders of these seas. This circumstance was the more distressing, as it sometimes obliged us to have recourse to acts of severity, which we should willingly have avoided, if the necessity of the case had not absolutely called for them. Some of their most expert swimmers

were one day discovered under the ships, drawing out the filling nails of the sheathing, which they performed very dexterously by means of a short stick, with a flint stone fixed in the end of it. To put a stop to this practice, which endangered the very existence of the vessels, we at first fired small-shot at the offenders; but they easily got out of our reach by diving under the ship's bottom. It was therefore found necessary to make an example, by flogging one of them on board the *Discovery*.

About this time, a large party of gentlemen, from both ships, set out on an excursion into the interior parts of the country, with a view of examining its natural productions. An account of this journey will be given in a subsequent part of our narrative. It is, therefore, only necessary at present to observe, that it afforded Kaoa a fresh opportunity of showing his attention and generosity. For as soon as he was informed of their departure, he sent a large supply of provisions after them, together with orders that the inhabitants of the country through which they were to pass should give them every assistance in their power.

And, to complete the delicacy and disinterestedness of his conduct, even the people he employed could not be prevailed on to accept the smallest present. After remaining out six days, our officers returned, without having been able to penetrate above twenty miles into the island; partly from want of proper guides, and partly from the impracticability of the country.

The head of the *Resolution's* rudder being found exceedingly shaken, and most of the pintles either loose or broken, it was unhung, and sent on shore, on the 27th in the morning, to undergo a thorough repair. At the same time, the carpenters were sent into the country, under conduct of some of Kaoa's people, to cut planks for the head rail-work, which was also entirely decayed and rotten. On the 28th, Captain Clerke, whose ill health confined him, for the most part, on board, paid Terreebooo his first visit, at his hut on shore. He was received with the same formalities as were observed with Captain Cook; and, on his coming away, though the visit was quite unexpected, he received a present of thirty large hogs, and as much fruit and roots as his crew could consume in a week.

As we had not yet seen anything of their sports or athletic exercises, the natives, at the request of some of our officers, entertained us this evening with a boxing-match. Though these games were much inferior, as well in point of solemnity and magnificence, as in the skill and powers of the combatants, to what we had seen exhibited at the Friendly Islands; yet, as they differed in some particulars, it may not be improper to give a short account of them. We found a vast concourse of people assembled on a level spot of ground, at a little distance from our tents. A long space was left vacant in the midst of them, at the upper end of which sat the judges, under three standards, from which hung slips of cloth of various colours, the skins of two wild geese, a few small birds, and bunches of feathers. When the sports were ready to begin, the signal was given by the judges, and immediately two combatants appeared. They came forward slowly, lifting up their feet very high behind, and drawing their hands along the soles. As they approached, they frequently eyed each other from head to foot, in a contemptuous manner, casting several arch looks at the spectators, straining their muscles, and using a variety of affected gestures. Being advanced within reach of each other, they stood with both arms held out straight before their faces, at which part all their blows were aimed. They struck, in what appeared to our eyes an awkward manner, with a full swing of the arm; made no attempt to parry, but eluded their adversary's attack by an inclination of the body, or by retreating. The battle was quickly decided; for if either of them was knocked down, or even fell by accident, he was considered as vanquished, and the victor expressed his triumph by a variety of gestures, which usually excited, as was intended, a loud laugh among the spectators. He then waited for a second antagonist; and if again victorious, for a third, till he was, at last, in his turn defeated. A singular rule observed in these combats is, that whilst any two are preparing to fight, a third person may step in, and choose either of them for his antagonist, when the other is obliged to withdraw. Sometimes three or four followed each other in this manner, before the match was settled. When the combat proved longer than usual, or appeared too unequal, one of the chiefs generally stepped in, and ended it by putting a stick between the combatants. The same good-humour was preserved throughout, which we before so much admired in the

Friendly Islanders. As these games were given at our desire, we found it was universally expected that we should have borne our part in them; but our people, though much pressed by the natives, turned a deaf ear to their challenge, remembering full well the blows they got at the Friendly Islands.

This day died William Watman, a seaman of the gunner's crew; an event which I mention the more particularly, as death had hitherto been very rare amongst us. He was an old man, and much respected on account of his attachment to Captain Cook. He had formerly served as a marine twenty-one years; after which he entered as a seaman on board the *Resolution* in 1772, and served with Captain Cook in his voyage toward the South Pole. At their return, he was admitted into Greenwich Hospital, through the Captain's interest, at the same time with himself; and being resolved to follow throughout the fortunes of his benefactor, he also quitted it along with him, on his being appointed to the command of the present expedition. During the voyage, he had frequently been subject to slight fevers, and was a convalescent when we came into the bay, where, being sent on shore for a few days, he conceived himself perfectly recovered, and, at his own desire, returned on board; but the day following, he had a paralytic stroke, which in two days more carried him off.

At the request of the king of the island, he was buried on the Morai, and the ceremony was performed with as much solemnity as our situation permitted. Old Kaoo and his brethren were spectators, and preserved the most profound silence and attention whilst the service was reading. When we began to fill up the grave, they approached it with great reverence, threw in a dead pig, some cocoa-nuts, and plantains; and, for three nights afterward, they surrounded it, sacrificing hogs, and performing their usual ceremonies of hymns and prayers, which continued till daybreak. At the head of the grave, we erected a post, and nailed upon it a square piece of board, on which was inscribed the name of the deceased, his age, and the day of his death. This they promised not to remove; and we have no doubt, but that it will be suffered to remain, as long as the frail materials of which it is made will permit.

The ships being in great want of fuel, the Captain desired me, on the 2d of February, to treat with the priests for the purchase of the rail that surrounded the top of the Morai. I must confess I had, at first, some doubt about the decency of this proposal, and was apprehensive that even the bare mention of it might be considered by them as a piece of shocking impiety. In this, however, I found myself mistaken. Not the smallest surprise was expressed at the application, and the wood was readily given, even without stipulating for anything in return. Whilst the sailors were taking it away, I observed one of them carrying off a carved image; and, on further inquiry, I found that they had conveyed to the boats the whole* semicircle. Though this was done in the presence of the natives, who had not shown any mark of resentment at it, but had even assisted them in the removal, I thought it proper to speak to Kaoo on the subject; who appeared very indifferent about the matter, and only desired that we would restore the centre image I have mentioned before, which he carried into one of the priest's houses.

Terreoboo, and his chiefs, had, for some days past, been very inquisitive about the time of our departure. This circumstance had excited in me a great curiosity to know what opinion this people had formed of us, and what were their ideas respecting the cause and objects of our voyage. I took some pains to satisfy myself on these points; but could never learn anything farther, than that they imagined we came from some country where provisions had failed; and that our visit to them was merely for the purpose of filling our bellies. Indeed, the meagre appearance of some of our crew, the hearty appetites with which we sat down to their fresh provisions, and our great anxiety to purchase and carry off as much as we were able, led them, naturally enough, to such a conclusion. To these may be added, a circumstance which puzzled them exceedingly, our having no women with us; together with our quiet conduct, and unwarlike appearance. It was ridiculous enough to see them stroking the sides and patting the bellies of the sailors (who were certainly much improved in the sleekness of their looks, during our short stay in the island,) and telling them, partly by

* See description of the Morai in the preceding chapter.

signs, and partly by words, that it was time for them to go; but if they would come again the next bread-fruit season, they should be better able to supply their wants. We had now been sixteen days in the bay; and if our enormous consumption of hogs and vegetables be considered, it need not be wondered, that they should wish to see us take our leave. It is very probable, however, that Terreeoboo had no other view in his inquiries, at present, than a desire of making sufficient preparation for dismissing us with presents suitable to the respect and kindness with which he had received us. For, on our telling him we should leave the island on the next day but one, we observed, that a sort of proclamation was immediately made through the villages, to require the people to bring in their hogs and vegetables, for the king to present to the Orono on his departure.

We were this day much diverted, at the beach, by the buffooneries of one of the natives. He held in his hand an instrument of the sort we have already described*; some bits of sea-weed were tied round his neck; and round each leg, a piece of strong netting, about nine inches deep, on which a great number of dog's teeth were loosely fastened in rows. His style of dancing was entirely burlesque, and accompanied with strange grimaces, and pantomimical distortions of the face; which, though at times inexpressibly ridiculous, yet, on the whole, was without much meaning or expression. Mr. Webber thought it worth his while to make a drawing of this person, as exhibiting a tolerable specimen of the natives; the manner in which the maro is tied; the figure of the instrument before-mentioned, and of the ornaments round the legs, which, at other times, we also saw used by their dancers. In the evening, we were again entertained with wrestling and boxing matches; and we displayed, in return, the few fireworks we had left. Nothing could be better calculated to excite the admiration of these islanders, and to impress them with an idea of our great superiority, than an exhibition of this kind. Captain Cook has already described the extraordinary effects of that which was made at Hapsee; and though the present was, in every respect, infinitely inferior, yet the astonishment of the natives was not less.

DANCE OF OWIHIE.

I have before mentioned, that the carpenters from both ships had been sent up the country to cut planks, for the head-rail work of the Resolution. This was the third day since their departure; and having received no intelligence from them, we began to be very anxious for their safety. We were communicating our apprehensions to old Kaoo, who appeared as much concerned as ourselves, and were concerting measures with him for sending after them, when they arrived all safe. They had been obliged to go farther into the country than was expected, before they met with trees fit for their purpose; and it was this circumstance, together with the badness of the roads, and the difficulty of bringing back the timber, which had detained them so long. They spoke in high terms of their guides, who both supplied them with provisions, and guarded their tools with the utmost fidelity.

The next day being fixed for our departure, Terreeoboo invited Captain Cook and myself to attend him, on the 3d, to the place where Kaoo resided. On our arrival, we found the

ground covered with parcels of cloth, a vast quantity of red and yellow feathers tied to the fibres of cocoa-nut husks, and a great number of hatchets, and other pieces of iron-ware, that had been got in barter from us. At a little distance from these lay an immense quantity of vegetables of every kind; and near them was a large herd of hogs. At first, we imagined the whole to be intended as a present for us, till Kaireekkea informed me that it was a gift or tribute from the people of that district to the king; and, accordingly, as soon as we were seated, they brought all the bundles and laid them severally at Terreecoboo's feet, spreading out the cloth, and displaying the feathers and iron-ware before him. The king seemed much pleased with this mark of their duty; and having selected about a third part of the iron-ware, the same proportion of feathers, and a few pieces of cloth, these were set aside by themselves; and the remainder of the cloth, together with all the hogs and vegetables, were afterwards presented to Captain Cook and myself. We were astonished at the value and magnitude of this present, which far exceeded everything of the kind we had seen, either at the Friendly or Society Islands. Boats were immediately sent to carry them on board; the large hogs were picked out to be salted for sea-store, and upwards of thirty smaller pigs, and the vegetables, were divided between the two crews.

The same day, we quitted the Morai, and got the tents and astronomical instruments on board. The charm of the *taboo* was now removed; and we had no sooner left the place, than the natives rushed in and searched eagerly about, in expectation of finding something of value that we might have left behind. As I happened to remain the last on shore, and waited for the return of the boat, several came crowding about me, and having made me sit down by them, began to lament our separation. It was, indeed, not without difficulty I was able to quit them. And here I hope I may be permitted to relate a trifling occurrence, in which I was principally concerned. Having had the command of the party on shore, during the whole time we were in the bay, I had an opportunity of becoming better acquainted with the natives, and of being better known to them, than those whose duty required them to be generally on board. As I had every reason to be satisfied with their kindness in general, so I cannot too often, nor too particularly, mention the unbounded and constant friendship of their priests. On my part, I spared no endeavours to conciliate their affections, and gain their esteem; and I had the good fortune to succeed so far, that, when the time of our departure was made known, I was strongly solicited to remain behind, not without offers of the most flattering kind. When I excused myself, by saying that Captain Cook would not give his consent, they proposed that I should retire into the mountains, where, they said, they would conceal me till after the departure of the ships; and, on my farther assuring them that the Captain would not leave the bay without me, Terreecoboo and Koo waited upon Captain Cook, whose son they supposed I was, with a formal request that I might be left behind. The Captain, to avoid giving a positive refusal to an offer so kindly intended, told them that he could not part with me at that time, but that he should return to the island next year, and would then endeavour to settle the matter to their satisfaction.

Early in the morning of the 4th, we unmoored, and sailed out of the bay, with the Discovery in company, and were followed by a great number of canoes. Captain Cook's design was to finish the survey of Owhyhee, before he visited the other islands, in hopes of meeting with a road better sheltered than the bay we had just left; and in case of not succeeding here, he purposed to take a view of the south-east part of Mowee, where the natives informed us we should find an excellent harbour. We had calm weather all this and the following day, which made our progress to the northward very slow. We were accompanied by a great number of the natives in their canoes; and Terreecoboo gave a fresh proof of his friendship to Captain Cook, by a large present of hogs and vegetables, that was sent after him.

In the night of the 5th, having a light breeze off the land, we made some way to the northward; and in the morning of the 6th, having passed the westernmost point of the island, we found ourselves abreast of a deep bay, called by the natives Toe-yahyah. We had great hopes that this bay would furnish us with a safe and commodious harbour, as we saw to the north-east several fine streams of water; and the whole had the appearance of being well sheltered. These observations agreeing with the accounts given us by Keah, who

accompanied Captain Cook, and had changed his name, out of compliment to us, into Britannee, the pinnace was hoisted out, and the master, with Britannee for his guide, was sent to examine the bay, whilst the ships worked up after them. In the afternoon the weather became gloomy, and the gusts of wind that blew off the land were so violent, as to make it necessary to take in all the sails, and bring-to under the mizen stay-sail. All the canoes left us at the beginning of the gale; and Mr. Bligh, on his return, had the satisfaction of saving an old woman and two men, whose canoe had been upset by the violence of the wind, as they were endeavouring to gain the shore. Besides these distressed people, we had a great many women on board, whom the natives had left behind in their hurry to shift for themselves.

The master reported to Captain Cook, that he had landed at the only village he saw on the north side of the bay, where he was directed to some wells of water, but found they would by no means answer our purpose; that he afterward proceeded farther into the bay, which runs inland to a great depth, and stretches toward the foot of a very conspicuous high mountain, situated on the north-west end of the island; but that instead of meeting with safe anchorage, as Britannee had taught him to expect, he found the shores low and rocky, and a flat bed of coral rocks running along the coast, and extending upward of a mile from the land, on the outside of which, the depth of water was twenty fathoms, over a sandy bottom; and that, in the mean time, Britannee had contrived to slip away, being afraid of returning, as we imagined, because his information had not proved true and successful.

In the evening, the weather being more moderate, we again made sail; but about midnight it blew so violently, as to split both the fore and maintopsails. On the morning of the 7th, we bent fresh sails, and had fair weather and a light breeze. At noon, the latitude, by observation, was $20^{\circ} 1'$ north, the west point of the island bearing south, 7° east, and the north-west point north, 38° east. As we were, at this time, four or five leagues from the shore, and the weather very unsettled, none of the canoes would venture out, so that our guests were obliged to remain with us, much indeed to their dissatisfaction; for they were all sea-sick, and many of them had left young children behind them. In the afternoon, though the weather was still squally, we stood in for the land, and being about three leagues from it, we saw a canoe, with two men paddling toward us, which we immediately conjectured had been driven off the shore by the late boisterous weather; and therefore stopped the ship's way, in order to take them in. These poor wretches were so entirely exhausted with fatigue, that had not one of the natives on board, observing their weakness, jumped into the canoe to their assistance, they would scarcely have been able to fasten it to the rope we had thrown out for that purpose. It was with difficulty we got them up the ship's side, together with a child, about four years old, which they had lashed under the thwarts of the canoe, where it had lain with only its head above water. They told us, they had left the shore the morning before, and had been, from that time, without food or water. The usual precautions were taken in giving them victuals, and the child being committed to the care of one of the women, we found them all next morning perfectly recovered.

At midnight, a gale of wind came on, which obliged us to double reef the topsails, and get down the top-gallant yards. On the 8th, at daybreak, we found that the foremast had again given way, the fishes which were put on the head, in King George's or Nootka Sound, on the coast of America, being sprung, and the parts so very defective, as to make it absolutely necessary to replace them, and, of course, to unstep the mast. In this difficulty Captain Cook was for some time in doubt, whether he should run the chance of meeting with a harbour in the islands to leeward, or return to Karakakooa. That bay was not so remarkably commodious, in any respect, but that a better might probably be expected, both for the purpose of repairing the masts, and for procuring refreshments, of which it was imagined that the neighbourhood of Karakakooa had been already pretty well drained. On the other hand, it was considered as too great a risk to leave a place that was tolerably sheltered, and which, once left, could not be regained, for the mere hopes of meeting with a better; the failure of which might perhaps have left us without resource. We therefore continued standing on toward the land, in order to give the natives an opportunity of releasing their friends on board from their confinement; and, at noon, being within a mile of the

shore, a few canoes came off to us, but so crowded with people, that there was not room in them for any of our guests; we therefore hoisted out the pinnace to carry them on shore; and the mainmast, who went with them, had directions to examine the south coasts of the bay for water; but returned without finding any.

The winds being variable, and a current setting strong to the northward, we made but little progress in our return; and at eight o'clock in the evening of the 9th, it began to blow very hard from the south-east, which obliged us to close reef the topsails; and at two in the morning of the 10th, in a heavy squall, we found ourselves close in with the breakers that lie to the northward of the west point of Owhyhee. We had just room to haul off and avoid them, and fired several guns to apprise the Discovery of the danger. In the forenoon, the weather was more moderate, and a few canoes came off to us, from which we learned, that the late storms had done much mischief, and that several large canoes had been lost. During the remainder of the day we kept beating to windward, and, before night, we were within a mile of the bay; but not choosing to run on while it was dark, we stood off and on till daylight next morning, when we dropped anchor nearly in the same place as before.

CHAPTER III.—SUSPICIOUS BEHAVIOUR OF THE NATIVES, ON OUR RETURN TO KARAKAKOOA BAY.—THEFT ON BOARD THE DISCOVERY, AND ITS CONSEQUENCES.—THE PINNACE ATTACKED, AND THE CREW OBLIGED TO QUIT HER.—CAPTAIN COOK'S OBSERVATIONS ON THE OCCASION.—ATTEMPT AT THE OBSERVATORY.—THE CUTTER OF THE DISCOVERY STOLEN.—MEASURES TAKEN BY CAPTAIN COOK FOR ITS RECOVERY.—GOES ON SHORE, TO INVITE THE KING ON BOARD.—THE KING BEING STOPPED BY HIS WIFE AND THE CHIEFS, A CONTEST ARISES.—NEWS ARRIVE OF ONE OF THE CHIEFS BEING KILLED BY ONE OF OUR PEOPLE.—PERMENT ON THIS OCCASION.—ONE OF THE CHIEFS THREATENS CAPTAIN COOK, AND IS SHOT BY HIM.—GENERAL ATTACK BY THE NATIVES.—DEATH OF CAPTAIN COOK.—ACCOUNT OF THE CAPTAIN'S SERVICES, AND A SKETCH OF HIS CHARACTER.

WE were employed the whole of the 11th and part of the 12th in getting out the foremast, and sending it with the carpenters on shore. Besides the damage which the head of the mast had sustained, we found the heel exceedingly rotten, having a large hole up the middle of it, capable of holding four or five cocoa-nuts. It was not, however, thought necessary to shorten it; and fortunately, the logs of red toa-wood, which had been cut at Eimeo, for anchor-stocks, were found fit to replace the sprung parts of the fishes. As these repairs were likely to take up several days, Mr. Bayly and myself got the astronomical apparatus on shore, and pitched our tents on the Morai; having with us a guard of a corporal and six marines. We renewed our friendly correspondence with the priests, who, for the greater security of the workmen and their tools, tabooed the place where the mast lay, sticking their wands round it, as before. The sailmakers were also sent on shore, to repair the damages which had taken place in their department during the late gales. They were lodged in a house adjoining to the Morai, that was lent us by the priests. Such were our arrangements on shore. I shall now proceed to the account of those other transactions with the natives which led, by degrees, to the fatal catastrophe of the 14th.

Upon coming to anchor, we were surprised to find our reception very different from what it had been on our first arrival; no shouts, no bustle, no confusion; but a solitary bay, with only here and there a canoe stealing close along the shore. The impulse of curiosity, which had before operated to so great a degree, might now indeed be supposed to have ceased; but the hospitable treatment we had invariably met with, and the friendly footing on which we parted, gave us some reason to expect that they would again have flocked about us with great joy on our return. We were forming various conjectures upon the occasion of this extraordinary appearance, when our anxiety was at length relieved by the return of a boat, which had been sent on shore, and brought us word, that Terreebooo was absent, and had left the bay under the taboo. Though this account appeared very satisfactory to most of us, yet others were of opinion, or rather, perhaps, have been led, by subsequent events, to

imagine, that there was something at this time very suspicious in the behaviour of the natives; and that the interdiction of all intercourse with us, on pretence of the king's absence, was only to give him time to consult with his chiefs in what manner it might be proper to treat us. Whether these suspicions were well founded, or the account given by the natives was the truth, we were never able to ascertain. For though it is not improbable that our sudden return, for which they could see no apparent cause, and the necessity of which we afterward found it very difficult to make them comprehend, might occasion some alarm; yet the unsuspicious conduct of Terreeboob, who, on his supposed arrival, the next morning, came immediately to visit Captain Cook, and the consequent return of the natives to their former friendly intercourse with us, are strong proofs that they neither meant nor apprehended any change of conduct.

In support of this opinion, I may add the account of another accident, precisely of the same kind, which happened to us on our first visit, the day before the arrival of the king. A native had sold a hog on board the *Resolution*, and taken the price agreed on, when Pareea passing by, advised the man not to part with the hog without an advanced price. For this he was sharply spoken to, and pushed away; and the taboo being soon after laid on the bay, we had at first no doubt but that it was in consequence of the offence given to the chief. Both these accidents serve to show how very difficult it is to draw any certain conclusion from the actions of people with whose customs, as well as language, we are so imperfectly acquainted; at the same time, some idea may be formed from them of the difficulties, at the first view, perhaps, not very apparent, which those have to encounter who, in all their transactions with these strangers, have to steer their course amidst so much uncertainty, where a trifling error may be attended with even the most fatal consequences. However true or false our conjectures may be, things went on in their usual quiet course, till the afternoon of the 13th.

Toward the evening of that day, the officer who commanded the watering-party of the *Discovery* came to inform me, that several chiefs had assembled at the well near the beach, driving away the natives whom he had hired to assist the sailors in rolling down the casks to the shore. He told me, at the same time, that he thought their behaviour extremely suspicious, and that they meant to give him some farther disturbance. At his request, therefore, I sent a marine along with him, but suffered him to take only his side-arms. In a short time the officer returned, and, on his acquainting me that the islanders had armed themselves with stones and were growing very tumultuous, I went myself to the spot, attended by a marine with his musket. Seeing us approach, they threw away their stones, and, on my speaking to some of the chiefs, the mob were driven away, and those who chose it were suffered to assist in filling the casks. Having left things quiet here, I went to meet Captain Cook, whom I saw coming on shore, in the pinnace. I related to him what had just passed; and he ordered me, in case of their beginning to throw stones or behave insolently, immediately to fire a ball at the offenders. I accordingly gave orders to the corporal, to have the pieces of the sentinels loaded with ball, instead of small-shot.

Soon after our return to the tents, we were alarmed by a continued fire of muskets from the *Discovery*, which we observed to be directed at a canoe, that we saw paddling toward the shore in great haste, pursued by one of our small boats. We immediately concluded that the firing was in consequence of some theft, and Captain Cook ordered me to follow him with a marine armed, and to endeavour to seize the people as they came on shore. Accordingly we ran toward the place where we supposed the canoe would land, but were too late; the people having quitted it, and made their escape into the country before our arrival. We were at this time ignorant that the goods had been already restored; and as we thought it probable, from the circumstances we had at first observed, that they might be of importance, we were unwilling to relinquish our hopes of recovering them. Having therefore inquired of the natives which way the people had fled, we followed them till it was near dark, when judging ourselves to be about three miles from the tents, and suspecting that the natives, who frequently encouraged us in the pursuit, were amusing us with false information, we thought it in vain to continue our search any longer, and returned to the beach.

During our absence, a difference of a more serious and unpleasant nature had happened. The officer, who had been sent in the small boat, and was returning on board with the goods which had been restored, observing Captain Cook and me engaged in the pursuit of the offenders, thought it his duty to seize the canoe, which was left drawn up on the shore. Unfortunately, this canoe belonged to Pareea, who arriving, at the same moment, from on board the *Discovery*, claimed his property, with many protestations of his innocence. The officer refusing to give it up, and being joined by the crew of the pinnace, which was waiting for Captain Cook, a scuffle ensued, in which Pareea was knocked down by a violent blow on the head with an oar. The natives, who were collected about the spot, and had hitherto been peaceable spectators, immediately attacked our people with such a shower of stones as forced them to retreat with great precipitation, and swim off to a rock, at some distance from the shore. The pinnace was immediately ransacked by the islanders; and, but for the timely interposition of Pareea, who seemed to have recovered from the blow, and forgot it at the same instant, would soon have been entirely demolished. Having driven away the crowd, he made signs to our people, that they might come and take possession of the pinnace, and that he would endeavour to get back the things which had been taken out of it. After their departure, he followed them in his canoe, with a midshipman's cap, and some other trifling articles of the plunder, and with much apparent concern at what had happened, asked, if the *Orono* would kill him, and whether he would permit him to come on board the next day? On being assured that he should be well received, he joined noses (as their custom is) with the officers, in token of friendship, and paddled over to the village of Kowrowa.

When Captain Cook was informed of what had passed, he expressed much uneasiness at it, and as we were returning on board, "I am afraid," said he, "that these people will oblige me to use some violent measures; for," he added, "they must not be left to imagine that they have gained an advantage over us." However, as it was too late to take any steps this evening, he contented himself with giving orders, that every man and woman on board should be immediately turned out of the ship. As soon as this order was executed, I returned on shore; and our former confidence in the natives being now much abated by the events of the day, I posted a double guard on the *Morai*, with orders to call me if they saw any men lurking about the beach. At about eleven o'clock, five islanders were observed creeping round the bottom of the *Morai*; they seemed very cautious in approaching us, and, at last, finding themselves discovered, retired out of sight. About midnight, one of them venturing up close to the observatory, the sentinel fired over him; on which the men fled, and we passed the remainder of the night without further disturbance.

Next morning, at daylight, I went on board the *Resolution* for the timekeeper, and, in my way, was hailed by the *Discovery*, and informed that their cutter had been stolen during the night from the buoy where it was moored. When I arrived on board, I found the marines arming, and Captain Cook loading his double-barrelled gun. Whilst I was relating to him what had happened to us in the night, he interrupted me with some eagerness, and acquainted me with the loss of the *Discovery's* cutter, and with the preparations he was making for its recovery. It had been his usual practice, whenever anything of consequence was lost at any of the islands in this ocean, to get the king, or some of the principal Erees, on board, and to keep them as hostages till it was restored. This method, which had been always attended with success, he meant to pursue on the present occasion; and, at the same time, had given orders to stop all the canoes that should attempt to leave the bay, with an intention of seizing and destroying them, if he could not recover the cutter by peaceable means. Accordingly the boats of both ships, well manned and armed, were stationed across the bay; and, before I left the ship, some great-guns had been fired at two large canoes, that were attempting to make their escape.

It was between seven and eight o'clock when we quitted the ship together; Captain Cook in the pinnace, having Mr. Phillips and nine marines with him; and myself in the small boat. The last orders I received from him were, to quiet the minds of the natives on our side of the bay, by assuring them they should not be hurt; to keep my people together; and to be on my guard. We then parted: the captain went toward Kowrowa, where the king resided; and I proceeded to the beach. My first care, on going ashore, was to give

strict orders to the marines to remain within their tent, to load their pieces with ball, and not to quit their arms. Afterward I took a walk to the huts of old Kaoo and the priests, and explained to them, as well as I could, the object of the hostile preparations, which had exceedingly alarmed them. I found that they had already heard of the cutter's being stolen, and I assured them, that though Captain Cook was resolved to recover it, and to punish the authors of the theft, yet that they, and the people of the village on our side, need not be under the smallest apprehension of suffering any evil from us. I desired the priests to explain this to the people, and to tell them not to be alarmed, but to continue peaceable and quiet. Kaoo asked me, with great earnestness, if Terrecoboo was to be hurt? I assured him, he was not; and both he and the rest of his brethren seemed much satisfied with this assurance.

In the mean time, Captain Cook having called off the launch, which was stationed at the north point of the bay, and taken it along with him, proceeded to Kowrowa, and landed with the lieutenant and nine marines. He immediately marched into the village, where he was received with the usual marks of respect; the people prostrating themselves before him, and bringing their accustomed offerings of small hogs. Finding that there was no suspicion of his design, his next step was to inquire for Terrecoboo and the two boys, his sons, who had been his constant guests on board the Resolution. In a short time the boys returned along with the natives, who had been sent in search of them, and immediately led Captain Cook to the house where the king had slept. They found the old man just awoke from sleep; and after a short conversation about the loss of the cutter, from which Captain Cook was convinced that he was in no wise privy to it, he invited him to return in the boat, and spend the day on board the Resolution. To this proposal the king readily consented, and immediately got up to accompany him.

Things were in this prosperous train, the two boys being already in the pinnace, and the rest of the party having advanced near the water-side, when an elderly woman called Kaneekabareea, the mother of the boys, and one of the king's favourite wives, came after him, and, with many tears and entreaties, besought him not to go on board. At the same time, two chiefs who came along with her laid hold of him, and insisting that he should go no farther, forced him to sit down. The natives, who were collecting in prodigious numbers along the shore, and had probably been alarmed by the firing of the great-guns and the appearances of hostility in the bay, began to throng round Captain Cook and their king. In this situation, the lieutenant of marines observing that his men were huddled close together in the crowd, and thus incapable of using their arms, if any occasion should require it, proposed to the captain to draw them up along the rocks, close to the water's edge; and the crowd readily making way for them to pass, they were drawn up in a line, at the distance of about thirty yards from the place where the king was sitting. All this time the old king remained on the ground, with the strongest marks of terror and dejection in his countenance; Captain Cook, not willing to abandon the object for which he had come on shore, continuing to urge him in the most pressing manner, to proceed; whilst, on the other hand, whenever the king appeared inclined to follow him, the chiefs, who stood round him, interposed at first with prayers and entreaties, but afterward, having recourse to force and violence, insisted on his staying where he was. Captain Cook, therefore, finding that the alarm had spread too generally, and that it was in vain to think any longer of getting him off without bloodshed, at last gave up the point; observing to Mr. Phillips, that it would be impossible to compel him to go on board, without the risk of killing a great number of the inhabitants.

Though the enterprise which had carried Captain Cook on shore had now failed, and was abandoned, yet his person did not appear to have been in the least danger, till an accident happened, which gave a fatal turn to the affair. The boats which had been stationed across the bay, having fired at some canoes that were attempting to get out, unfortunately had killed a chief of the first rank. The news of his death arrived at the village where Captain Cook was, just as he had left the king, and was walking slowly toward the shore. The ferment it occasioned was very conspicuous; the women and children were immediately sent off; and the men put on their war-mats, and armed themselves with

spears and stones. One of the natives, having in his hands a stone, and a long iron spike (which they call a *pahoa*), came up to the captain, flourishing his weapon, by way of defiance, and threatening to throw the stone. The captain desired him to desist; but the man persisting in his insolence, he was at length provoked to fire a load of small-shot. The man having his mat on, which the shot were not able to penetrate, this had no other effect than to irritate and encourage them. Several stones were thrown at the marines; and one of the Erees attempted to stab Mr. Phillips with his *pahoa*, but failed in the attempt, and received from him a blow with the butt end of his musket. Captain Cook now fired his second barrel, loaded with ball, and killed one of the foremost of the natives. A general attack with stones immediately followed, which was answered by a discharge of musketry from the marines and the people in the boats. The islanders, contrary to the expectations of every one, stood the fire with great firmness; and before the marines had time to reload, they broke in upon them with dreadful shouts and yells. What followed was a scene of the utmost horror and confusion.

Four of the marines were cut off amongst the rocks in their retreat, and fell a sacrifice to the fury of the enemy; three more were dangerously wounded; and the lieutenant, who had received a stab between the shoulders with a *pahoa*, having fortunately reserved his fire, shot the man who had wounded him just as he was going to repeat his blow. Our unfortunate commander, the last time he was seen distinctly, was standing at the water's edge, and calling out to the boats to cease firing, and to pull in. If it be true, as some of those who were present have imagined, that the marines and boatmen had fired without his orders, and that he was desirous of preventing any further bloodshed, it is not improbable that his humanity, on this occasion, proved fatal to him. For it was remarked, that whilst he faced the natives, none of them had offered him any violence, but that having turned about to give his orders to the boats, he was stabbed in the back, and fell with his face into the water. On seeing him fall, the islanders set up a great shout, and his body was immediately dragged on shore, and surrounded by the enemy, who snatching the daggers out of each other's hands, showed a savage eagerness to have a share in his destruction.

Thus fell our great and excellent commander! After a life of so much distinguished and successful enterprise, his death, as far as regards himself, cannot be reckoned premature; since he lived to finish the great work for which he seems to have been designed; and was rather removed from the enjoyment, than cut off from the acquisition of glory. How sincerely his loss was felt and lamented by those who had so long found their general security in his skill and conduct, and every consolation, under their hardships, in his tenderness and humanity, it is neither necessary nor possible for me to describe; much less shall I attempt to paint the horror with which we were struck, and the universal dejection and dismay which followed so dreadful and unexpected a calamity. The reader will not be displeased to turn from so sad a scene, to the contemplation of his character and virtues, whilst I am paying my last tribute to the memory of a dear and honoured friend, in a short history of his life and public services.

Captain James Cook was born near Whitby, in Yorkshire, in the year 1727; and, at an early age, was put apprentice to a shopkeeper in a neighbouring village. His natural inclination not having been consulted on this occasion, he soon quitted the counter from disgust, and bound himself for nine years, to the master of a vessel in the coal trade. At the breaking out of the war in 1755, he entered into the King's service on board the *Eagle*, at that time commanded by Captain Hamer, and afterward by Sir Hugh Palliser, who soon discovered his merit, and introduced him on the quarter-deck. In the year 1758, we find him master of the *Northumberland*, the flag-ship of Lord Colville, who had then the command of the squadron stationed on the coast of America. It was here, as I have often heard him say, that, during a hard winter, he first read Euclid, and applied himself to the study of mathematics and astronomy, without any other assistance than what a few books and his own industry afforded him. At the same time that he thus found means to cultivate and improve his mind and to supply the deficiencies of an early education, he was engaged in most of the busy and active scenes of the war in America. At the siege of Quebec, Sir Charles Saunders committed to his charge the execution of services of the first importance in the naval department. He

piloted the boats to the attack of Montmorency; conducted the embarkation to the Heights of Abraham; examined the passage, and laid buoys for the security of the large ships in proceeding up the river. The courage and address with which he acquitted himself in these services, gained him the warm friendship of Sir Charles Saunders and Lord Colville, who continued to patronise him during the rest of their lives with the greatest zeal and affection. At the conclusion of the war, he was appointed, through the recommendation of Lord Colville and Sir Hugh Palliser, to survey the Gulf of St. Lawrence, and the coasts of Newfoundland. In this employment he continued till the year 1767, when he was fixed on by Sir Edward Hawke, to command an expedition to the South Seas; for the purpose of observing the transit of Venus, and prosecuting discoveries in that part of the globe.

From this period, as his services are too well known to require a recital here, so his reputation has proportionably advanced to a height too great to be affected by my panegyric. Indeed, he appears to have been most eminently and peculiarly qualified for this species of enterprise. The earliest habits of his life, the course of his services, and the constant application of his mind, all conspired to fit him for it, and gave him a degree of professional knowledge which can fall to the lot of very few. The constitution of his body was robust, inured to labour, and capable of undergoing the severest hardships. His stomach bore, without difficulty, the coarsest and most ungrateful food. Indeed, temperance in him was scarcely a virtue; so great was the indifference with which he submitted to every kind of self-denial. The qualities of his mind were of the same hardy, vigorous kind with those of his body. His understanding was strong and perspicacious; his judgment, in whatever related to the services he was engaged in, quick and sure. His designs were bold and manly; and both in the conception, and in the mode of execution, bore evident marks of a great original genius. His courage was cool and determined, and accompanied with an admirable presence of mind in the moment of danger. His manners were plain and unaffected. His temper might perhaps have been justly blamed as subject to hastiness and passion, had not these been disarmed by a disposition the most benevolent and humane.

Such were the outlines of Captain Cook's character; but its most distinguishing feature was that unremitting perseverance in the pursuit of his object, which was not only superior to the opposition of dangers and the pressure of hardships, but even exempt from the want of ordinary relaxation. During the long and tedious voyages in which he was engaged, his eagerness and activity were never in the least abated. No incidental temptation could detain him for a moment; even those intervals of recreation, which sometimes unavoidably occurred, and were looked for by us with a longing, that persons who have experienced the fatigues of service will readily excuse, were submitted to by him with a certain impatience, whenever they could not be employed in making further provision for the more effectual prosecution of his designs.

It is not necessary, here, to enumerate the instances in which these qualities were displayed, during the great and important enterprises in which he was engaged. I shall content myself with stating the result of those services, under the two principal heads to which they may be referred, those of geography and navigation, placing each in a separate and distinct point of view. Perhaps no science ever received greater additions from the labour of a single man than geography has done from those of Captain Cook. In his first voyage to the South Seas, he discovered the Society Islands; determined the insularity of New Zealand; discovered the straits which separate the two islands, and are called after his name; and made a complete survey of both. He afterward explored the eastern coast of New Holland, hitherto unknown; an extent of twenty-seven degrees of latitude, or upward of two thousand miles. In his second expedition he resolved the great problem of a southern continent; having traversed that hemisphere between the latitudes of 40° and 70°, in such a manner as not to leave a possibility of its existence, unless near the pole, and out of the reach of navigation. During this voyage he discovered New Caledonia, the largest island in the Southern Pacific, except New Zealand; the island of Georgia; and an unknown coast, which he named Sandwich Land, the Thule of the southern hemisphere; and having twice visited the tropical seas, he settled the situations of the old, and made several new discoveries.

But the voyage we are now relating is distinguished above all the rest by the extent and importance of its discoveries. Besides several smaller islands in the Southern Pacific, he discovered, to the north of the equinoctial line, the group called the Sandwich Islands; which, from their situation and productions, bid fairer for becoming an object of consequence, in the system of European navigation, than any other discovery in the South Sea. He afterward explored what had hitherto remained unknown of the western coast of America, from the latitude of 43° to 70° north, containing an extent of three thousand five hundred miles; ascertained the proximity of the two great continents of Asia and America; passed the straits between them, and surveyed the coast, on each side, to such a height of northern latitude as to demonstrate the impracticability of a passage in that hemisphere, from the Atlantic into the Pacific Ocean, either by an eastern or a western course. In short, if we except the sea of Amur, and the Japanese Archipelago, which still remain imperfectly known to Europeans, he has completed the hydrography of the habitable globe.

As a navigator, his services were not perhaps less splendid; certainly not less important and meritorious. The method which he discovered, and so successfully pursued, of preserving the health of seamen, forms a new era in navigation, and will transmit his name to future ages amongst the friends and benefactors of mankind. Those who are conversant in naval history need not be told at how dear a rate the advantages which have been sought through the medium of long voyages at sea have always been purchased. That dreadful disorder which is peculiar to this service, and whose ravages have marked the tracks of discoverers with circumstances almost too shocking to relate, must, without exercising an unwarrantable tyranny over the lives of our seamen, have proved an insuperable obstacle to the prosecution of such enterprises. It was reserved for Captain Cook to show the world, by repeated trials, that voyages might be protracted to the unusual length of three or even four years, in unknown regions, and under every change and rigour of climate, not only without affecting the health, but even without diminishing the probability of life in the smallest degree. The method he pursued has been fully explained by himself in a paper which was read before the Royal Society, in the year 1776*; and whatever improvements the experience of the present voyage has suggested are mentioned in their proper places.

With respect to his professional abilities, I shall leave them to the judgment of those who are best acquainted with the nature of the services in which he was engaged. They will readily acknowledge, that to have conducted three expeditions of so much danger and difficulty, of so unusual a length, and in such a variety of situation, with uniform and inviolable success, must have required not only a thorough and accurate knowledge of his business, but a powerful and comprehensive genius, fruitful in resources, and equally ready in the application of whatever the higher and inferior calls of the service required.

Having given the most faithful account I have been able to collect, both from my own observation, and the relations of others, of the death of my ever-honoured friend, and also of his character and services, I shall now leave his memory to the gratitude and admiration of posterity; accepting, with a melancholy satisfaction, the honour, which the loss of him hath procured me, of seeing my name joined with his; and of testifying that affection and respect for his memory, which, whilst he lived, it was no less my inclination, than my constant study to show him.

* Sir Godfrey Copley's gold medal was adjudged to him on that occasion.

CHAPTER IV.—TRANSACTIONS AT OWHYHEE SUBSEQUENT TO THE DEATH OF CAPTAIN COOK.—GALLANT BEHAVIOUR OF THE LIEUTENANT OF MARINES.—DANGEROUS SITUATION OF THE PARTY AT THE MORAI.—BRAVERY OF ONE OF THE NATIVES.—CONSULTATION RESPECTING FUTURE MEASURES.—DEMAND OF THE BODY OF CAPTAIN COOK.—EVASIVE AND INSIDIOUS CONDUCT OF KOAH, AND THE CHIEFS.—INSOLENT BEHAVIOUR OF THE NATIVES.—PROMOTION OF OFFICERS.—ARRIVAL OF TWO PRIESTS WITH PART OF THE BODY.—EXTRAORDINARY BEHAVIOUR OF TWO BOYS.—BURNING OF THE VILLAGE OF KAKOGA.—UNFORTUNATE DESTRUCTION OF THE DWELLINGS OF THE PRIESTS.—RECOVERY OF THE BONES OF CAPTAIN COOK.—DEPARTURE FROM KARAKAKOOA BAY.

It has been already related that four of the marines who attended Captain Cook were killed by the islanders on the spot. The rest, with Mr. Phillips, their lieutenant, threw themselves into the water, and escaped, under cover of a smart fire from the boats. On this occasion, a remarkable instance of gallant behaviour, and of affection for his men, was shown by that officer. For he had scarcely got into the boat, when, seeing one of the marines, who was a bad swimmer, struggling in the water, and in danger of being taken by the enemy, he immediately jumped into the sea to his assistance, though much wounded himself; and after receiving a blow on the head from a stone, which had nearly sent him to the bottom, he caught the man by the hair, and brought him safe off. Our people continued for some time to keep up a constant fire from the boats (which during the whole transaction were not more than twenty yards from the land), in order to afford their unfortunate companions, if any of them should still remain alive, an opportunity of escaping. These efforts, seconded by a few guns, that were fired at the same time from the *Resolution*, having forced the natives at last to retire, a small boat, manned by five of our young midshipmen, pulled toward the shore, where they saw the bodies, without any signs of life, lying on the ground; but judging it dangerous to attempt to bring them off with so small a force, and their ammunition being nearly expended, they returned to the ships, leaving them in possession of the islanders, together with ten stand of arms.

As soon as the general consternation, which the news of this calamity occasioned throughout both crews had a little subsided, their attention was called to our party at the Morai, where the mast and sails were on shore, with a guard of only six marines. It is impossible for me to describe the emotions of my own mind, during the time these transactions had been carrying on at the other side of the bay. Being at the distance only of a short mile from the village of Kowrowa, we could see distinctly an immense crowd collected on the spot where Captain Cook had just before landed. We heard the firing of the musketry, and could perceive some extraordinary bustle and agitation in the multitude. We afterwards saw the natives flying, the boats retire from the shore, and passing and repassing, in great stillness, between the ships. I must confess that my heart soon misgave me. Where a life so dear and valuable was concerned, it was impossible not to be alarmed, by appearances both new and threatening. But, besides this, I knew that a long and uninterrupted course of success, in his transactions with the natives of these seas, had given the Captain a degree of confidence, that I was always fearful might, at some unlucky moment, put him too much off his guard; and I now saw all the dangers to which that confidence might lead, without receiving much consolation from considering the experience that had given rise to it.

My first care on hearing the muskets fired, was, to assure the people, who were assembled in considerable numbers round the wall of our consecrated field, and seemed equally at a loss with ourselves how to account for what they had seen and heard, that they should not be molested; and that, at all events, I was desirous of continuing on peaceable terms with them. We remained in this posture, till the boats had returned on board, when Captain Clerke, observing, through his telescope, that we were surrounded by the natives, and apprehending they meant to attack us, ordered two four-pounders to be fired at them. Fortunately these guns, though well aimed, did no mischief, and yet gave the natives a convincing proof of their power. One of the balls broke a cocoa-nut tree in the middle, under which a party of them were sitting; and the other shivered a rock, that stood in an

exact line with them. As I had, just before, given them the strongest assurances of their safety, I was exceedingly mortified at this act of hostility; and, to prevent a repetition of it, immediately despatched a boat to acquaint Captain Clerke, that at present I was on the most friendly terms with the natives; and that, if occasion should hereafter arise for altering my conduct towards them, I would hoist a jack as a signal for him to afford us all the assistance in his power.

We expected the return of the boat with the utmost impatience; and after remaining a quarter of an hour under the most torturing anxiety and suspense, our fears were at length confirmed, by the arrival of Mr. Bligh, with orders to strike the tents as quickly as possible, and to send the sails that were repairing, on board. Just at the same moment, our friend Kaireekkea, having also received intelligence of the death of Captain Cook from a native, who had arrived from the other side of the bay, came to me, with great sorrow and dejection in his countenance, to inquire if it was true. Our situation was at this time extremely critical and important; not only our own lives, but the event of the expedition, and the return of at least one of the ships, being involved in the same common danger. We had the mast of the *Resolution*, and the greater part of our sails, on shore, under the protection of only six marines: their loss would have been irreparable; and though the natives had not as yet shown the smallest disposition to molest us, yet it was impossible to answer for the alteration which the news of the transaction at Kowrowa might produce. I therefore thought it prudent to dissemble my belief of the death of Captain Cook, and to desire Kaireekkea to discourage the report; lest either the fear of our resentment, or the successful example of their countrymen, might lead them to seize the favourable opportunity which at this time offered itself of giving us a second blow. At the same time, I advised him to bring old Kaoo, and the rest of the priests, into a large house that was close to the Morai; partly out of regard to their safety, in case it should have been found necessary to proceed to extremities; and partly to have him near us, in order to make use of his authority with the people, if it could be instrumental in preserving peace.

Having placed the marines on the top of the Morai, which formed a strong and advantageous post, and left the command with Mr. Bligh, giving him the most positive directions to act entirely on the defensive, I went on board the *Discovery*, in order to represent to Captain Clerke the dangerous situation of our affairs. As soon as I quitted the spot, the natives began to annoy our people with stones; and I had scarcely reached the ship, before I heard the firing of the marines. I therefore returned instantly on shore, where I found things growing every moment more alarming. The natives were arming, and putting on their mats; and their numbers increased very fast. I could also perceive several large bodies marching toward us, along the cliff which separates the village of Kakooa from the north side of the bay, where the village of Kowrowa is situated.

They began, at first, to attack us with stones from behind the walls of their inclosures, and finding no resistance on our part, they soon grew more daring. A few resolute fellows having crept along the beach under cover of the rocks, suddenly made their appearance at the foot of the Morai, with a design, as it seemed, of storming it on the side next the sea, which was its only accessible part; and were not dislodged till after they had stood a considerable number of shot, and seen one of their party fall. The bravery of one of these assailants well deserves to be particularly mentioned; for having returned to carry off his companion, amidst the fire of our whole party, a wound which he received made him quit the body and retire; but in a few minutes, he again appeared, and being again wounded, he was obliged a second time to retreat. At this moment I arrived at the Morai, and saw him return the third time, bleeding and faint; and being informed of what had happened, I forbade the soldiers to fire, and he was suffered to carry off his friend; which he was just able to perform, and then fell down himself and expired.

About this time, a strong reinforcement from both ships having landed, the natives retreated behind their walls; which giving me access to our friendly priests, I sent one of them to endeavour to bring their countrymen to some terms, and to propose to them, that if they would desist from throwing stones, I would not permit our men to fire. This truce was agreed to, and we were suffered to launch the mast, and carry off the sails and our

astronomical apparatus unmolested. As soon as we had quitted the Morai, they took possession of it, and some of them threw a few stones, but without doing us any mischief.

It was half an hour past eleven o'clock when I got on board the *Discovery*, where I found no decisive plan had been adopted for our future proceedings. The restitution of the boat, and the recovery of the body of Captain Cook, were the objects which, on all hands, we agreed to insist on; and it was my opinion that some vigorous steps should be taken, in case the demand of them was not immediately complied with. Though my feelings, on the death of a beloved and honoured friend, may be suspected to have had some share in this opinion, yet there were certainly other reasons, and those of the most serious kind, that had considerable weight with me. The confidence which their success in killing our chief, and forcing us to quit the shore, must naturally have inspired; and the advantage, however trifling, which they had obtained over us the preceding day; would, I had no doubt, encourage them to make some further dangerous attempts; and the more especially, as they had little reason, from what they had hitherto seen, to dread the effects of our fire-arms. Indeed, contrary to the expectations of every one, this sort of weapon had produced no signs of terror in them. On our side, such was the condition of the ships, and the state of discipline amongst us, that had a vigorous attack been made on us in the night, it would have been impossible to answer for the consequences. In these apprehensions, I was supported by the opinion of most of the officers on board; and nothing seemed to me so likely to encourage the natives to make the attempt, as the appearance of our being inclined to an accommodation, which they could only attribute to weakness or fear. In favour of more conciliatory measures, it was justly urged, that the mischief was done, and irreparable; that the natives had a strong claim to our regard on account of their former friendship and kindness; and the more especially, as the late melancholy accident did not appear to have arisen from any premeditated design; that, on the part of Terreeboob, his ignorance of the theft, his readiness to accompany Captain Cook on board, and his having actually sent his two sons into the boat, must free him from the smallest degree of suspicion; that the conduct of his women and the Erees might easily be accounted for, from the apprehensions occasioned by the armed force with which Captain Cook came on shore, and the hostile preparations in the bay; appearances so different from the terms of friendship and confidence in which both parties had hitherto lived, that the arming of the natives was evidently with a design to resist the attempt, which they had some reason to imagine would be made, to carry off their king by force, and was naturally to be expected from a people full of affection and attachment to their chiefs. To these motives of humanity, others of a prudential nature were added: that we were in want of water, and other refreshments; that our foremast would require six or eight days' work before it could be stepped; that the spring was advancing apace; and that the speedy prosecution of our next northern expedition ought now to be our sole object; that therefore to engage in a vindictive contest with the inhabitants might not only lay us under the imputation of unnecessary cruelty, but would occasion an unavoidable delay in the equipment of the ships.

In this latter opinion Captain Clerke concurred; and though I was convinced that an early display of vigorous resentment would more effectually have answered every object both of prudence and humanity, I was not sorry that the measures I had recommended were rejected. For though the contemptuous behaviour of the natives, and their subsequent opposition to our necessary operations on shore, arising, I have no doubt, from a misconstruction of our lenity, compelled us at last to have recourse to violence in our own defence; yet I am not so sure that the circumstances of the case would, in the opinion of the world, have justified the use of force on our part in the first instance. Cautionary rigour is at all times invidious, and has this additional objection to it, that the severity of a preventive course, when it best succeeds, leaves its expediency the least apparent.

During the time we were thus engaged in concerting some plan for our future conduct, a prodigious concourse of natives still kept possession of the shore; and some of them came off in canoes, and had the boldness to approach within pistol-shot of the ships, and to insult us by various marks of contempt and defiance. It was with great difficulty we could restrain the sailors from the use of their arms on these occasions; but as pacific measures

had been resolved on, the canoes were suffered to return unmolested. In pursuance of this plan, it was determined that I should proceed toward the shore, with the boats of both ships well manned and armed, with a view to bring the natives to a parley, and, if possible, to obtain a conference with some of the chiefs. If this attempt succeeded, I was to demand the dead bodies, and particularly that of Captain Cook; to threaten them with our vengeance in case of a refusal; but, by no means, to fire unless attacked; and not to land on any account whatever. These orders were delivered to me before the whole party, and in the most positive manner.

I left the ships about four o'clock in the afternoon; and, as we approached the shore, I perceived every indication of a hostile reception. The whole crowd of natives was in motion; the women and children retiring; the men putting on their war mats, and arming themselves with long spears and daggers. We also observed, that, since the morning, they had thrown up stone breast-works along the beach, where Captain Cook had landed, probably in expectation of an attack at that place; and, as soon as we were within reach, they began to throw stones at us with slings, but without doing any mischief. Concluding, therefore, that all attempts to bring them to a parley would be in vain, unless I first gave them some ground for mutual confidence; I ordered the armed boats to stop, and went on, in the small boat, alone, with a white flag in my hand, which, by a general cry of joy from the natives, I had the satisfaction to find was instantly understood. The women immediately returned from the side of the hill, whither they had retired; the men threw off their mats; and all sat down together by the water-side, extending their arms, and inviting me to come on shore. Though this behaviour was very expressive of a friendly disposition, yet I could not help entertaining some suspicions of its sincerity. But when I saw Koah, with a boldness and assurance altogether unaccountable, swimming off toward the boat, with a white flag in his hand, I thought it necessary to return this mark of confidence, and therefore received him into the boat, though armed; a circumstance which did not tend to lessen my suspicions. I must confess, I had long harboured an unfavourable opinion of this man. The priests had always told us, that he was of a malicious disposition, and no friend of ours; and the repeated detections of his fraud and treachery had convinced us of the truth of their representations. Add to all this, the shocking transaction of the morning, in which he was seen acting a principal part, made me feel the utmost horror at finding myself so near him; and as he came up to me with feigned tears, and embraced me, I was so distrustful of his intentions, that I could not help taking hold of the point of the pahooah, which he held in his hand, and turning it from me. I told him, that I had come to demand the body of Captain Cook; and to declare war against them unless it was instantly restored. He assured me this should be done as soon as possible; and that he would go himself for that purpose; and, after begging of me a piece of iron, with much assurance, as if nothing extraordinary had happened, he leaped into the sea, and swam ashore, calling out to his countrymen, that we were all friends again.

We waited near an hour, with great anxiety for his return; during which time the rest of the boats had approached so near the shore, as to enter into conversation with a party of the natives at some distance from us; by whom they were plainly given to understand, that the body had been cut to pieces and carried up the country; but of this circumstance I was not informed till our return to the ships. I began now to express some impatience at Koah's delay, upon which the chiefs pressed me exceedingly to come on shore; assuring me, that if I would go myself to Terreecahoo, the body would certainly be restored to me. When they found they could not prevail on me to land, they attempted, under a pretence of wishing to converse with more ease, to decoy our boat among some rocks, where they would have had it in their power to cut us off from the rest. It was no difficult matter to see through these artifices; and I was, therefore, strongly inclined to break off all further communication with them, when a chief came to us who was the particular friend of Captain Clerke, and of the officers of the *Discovery*, on board which ship he had sailed when we last left the bay, intending to take his passage to Mowee. He told us he came from Terreecahoo to acquaint us that the body was carried up the country; but that it should be brought to us the next morning. There appeared a great deal of sincerity in his manner; and being asked if he

told a falsehood, he hooked his two fore-fingers together, which is understood amongst these islanders as the sign of truth, in the use of which they are very scrupulous.

As I was now at a loss in what manner to proceed, I sent Mr. Vancouver to acquaint Captain Clerke with all that had passed; that my opinion was, they meant not to keep their word with us, and were so far from being sorry at what had happened, that, on the contrary, they were full of spirits and confidence on account of their late success, and sought only to gain time, till they could contrive some scheme for getting us into their power. Mr. Vancouver came back with orders for me to return on board; having first given the natives to understand, that if the body was not brought the next morning, the town should be destroyed. When they saw that we were going off, they endeavoured to provoke us by the most insulting and contemptuous gestures. Some of our people said, they could distinguish several of the natives parading about in the clothes of our unfortunate comrades; and, among them, a chief brandishing Captain Cook's hanger, and a woman holding the scabbard. Indeed, there can be no doubt but that our behaviour had given them a mean opinion of our courage; for they could have but little notion of the motives of humanity that directed it.

In consequence of the report I made to Captain Clerke, of what I conceived to be the present temper and disposition of the islanders, the most effectual measures were taken to guard against any attack they might make in the night. The boats were moored with top-chains; additional sentinels were posted on both ships; and guard-boats were stationed to row round them, in order to prevent the natives from cutting the cables. During the night we observed a prodigious number of lights on the hills, which made some of us imagine they were removing their effects back into the country, in consequence of our threats. But I rather believed them to have been the sacrifices that were performing on account of the war in which they imagined themselves about to be engaged; and most probably the bodies of our slain countrymen were at that time burning. We afterward saw fires of the same kind, as we passed the island of Morotoi; and which, we were told by some natives then on board, were made on account of the war they had declared against a neighbouring island. And this agrees with what we learned amongst the Friendly and Society Isles, that, previous to any expedition against an enemy, the chiefs always endeavoured to animate and inflame the courage of the people by feasts and rejoicings in the night.

We remained the whole night undisturbed, except by the howlings and lamentations which were heard on shore; and early the next morning, Koah came alongside the *Resolution*, with a present of cloth and a small pig, which he desired leave to present to me. I have mentioned before, that I was supposed by the natives to be the son of Captain Cook; and as he, in his lifetime, had always suffered them to believe it, I was probably considered as the chief after his death. As soon as I came on deck, I questioned him about the body; and, on his returning me nothing but evasive answers, I refused to accept his presents; and was going to dismiss him with some expressions of anger and resentment, had not Captain Clerke, judging it best at all events to keep up the appearance of friendship, thought it more proper that he should be treated with the usual respect. This treacherous fellow came frequently to us during the course of the forenoon, with some trifling present or other; and as I always observed him eyeing every part of the ship with great attention, I took care he should see we were well prepared for our defence.

He was exceedingly urgent, both with Captain Clerke and myself, to go on shore, laying all the blame of the detention of the bodies on the other chiefs; and, assuring us that everything might be settled to our satisfaction, by a personal interview with Terreeboob. However, his conduct was too suspicious to make it prudent to comply with this request; and, indeed, a fact came afterward to our knowledge, which proved the entire falsehood of his pretensions. For we were told, that immediately after the action in which Captain Cook was killed, the old king had retired to a cave in the steep part of the mountain, that hangs over the bay, which was accessible only by the help of ropes, and where he remained for many days, having his victuals let down to him by cords.

When Koah returned from the ships, we could perceive that his countrymen, who had been collected by break of day in vast crowds on the shore, thronged about him with great

eagerness, as if to learn the intelligence he had acquired, and what was to be done in consequence of it. It is very probable, that they expected we should attempt to put our threat in execution; and they seemed fully resolved to stand their ground. During the whole morning, we heard canoes blowing in different parts of the coast; large parties were seen marching over the hills; and, in short, appearances were so alarming, that we carried out a stream anchor, to enable us to haul the ship abreast of the town, in case of an attack; and stationed boats off the north point of the bay, to prevent a surprise from that quarter. The breach of their engagement to restore the bodies of the slain, and the warlike posture in which they at this time appeared, occasioned fresh debates amongst us concerning the measures next to be pursued. It was at last determined, that nothing should be suffered to interfere with the repair of the mast, and the preparations for our departure; but that we should, nevertheless, continue our negotiations for the recovery of the bodies.

The greatest part of the day was taken up in getting the fore-mast into a proper situation on deck, for the carpenters to work upon it; and in making the necessary alterations in the commissions of the officers. The command of the expedition having devolved on Captain Clerke, he removed on board the *Resolution*, appointed Lieutenant Gore to be Captain of the *Discovery*, and promoted Mr. Harvey, a midshipman, who had been with Captain Cook in his two last voyages, to the vacant Lieutenantcy. During the whole day, we met with no interruption from the natives; and, at night, the launch was again moored with a top chain, and guard-boats stationed round both ships as before.

About eight o'clock, it being very dark, a canoe was heard paddling toward the ship; and as soon as it was seen, both the sentinels on deck fired into it. There were two persons in the canoe, and they immediately roared out "Tinnee" (which was the way in which they pronounced my name), and said they were friends, and had something for me belonging to Captain Cook. When they came on board, they threw themselves at our feet, and appeared exceedingly frightened. Luckily neither of them was hurt, notwithstanding the balls of both pieces had gone through the canoe. One of them was the person, whom I have before mentioned under the name of the Taboo man, who constantly attended Captain Cook with the circumstances of ceremony I have already described; and who, though a man of rank in the island, could scarcely be hindered from performing for him the lowest offices of a menial servant. After lamenting, with abundance of tears, the loss of the *Orono*, he told us that he had brought us a part of his body. He then presented to us a small bundle wrapped up in cloth, which he brought under his arm; and it is impossible to describe the horror which seized us, on finding in it a piece of human flesh, about nine or ten pounds weight. This, he said, was all that remained of the body; that the rest was cut to pieces, and burnt; but that the head and all the bones, except what belonged to the trunk, were in the possession of Terreeboob, and the other Erees: that what we saw had been allotted to Koo, the chief of the priests, to be made use of in some religious ceremony; and that he had sent it as a proof of his innocence and attachment to us. This afforded an opportunity of informing ourselves, whether they were cannibals; and we did not neglect it. We first tried, by many indirect questions, put to each of them apart, to learn in what manner the rest of the bodies had been disposed of; and finding them very constant in one story, that after the flesh had been cut off, it was all burnt, we at last put the direct question, whether they had not ate some of it? They immediately showed as much horror at the idea as any European would have done, and asked, very naturally, if that was the custom amongst us? They afterwards asked us, with great earnestness and apparent apprehension, "when the *Orono* would come again? and what he would do to them on his return?" The same inquiry was frequently made afterward by others; and this idea agrees with the general tenor of their conduct toward him, which showed that they considered him as a being of a superior nature.

We pressed our two friendly visitors to remain on board till morning, but in vain. They told us, that if this transaction should come to the knowledge of the king or chiefs, it might be attended with the most fatal consequences to their whole society; in order to prevent which, they had been obliged to come off to us in the dark; and that the same precaution would be necessary in returning on shore. They informed us further, that the chiefs were eager to revenge the death of their countrymen; and, particularly, cautioned us against trusting Koo,

who they said was our mortal and implacable enemy ; and desired nothing more ardently, than an opportunity of fighting us ; to which the blowing of the conchs we had heard in the morning was meant as a challenge. We learned from these men, that seventeen of their countrymen were killed in the first action at Kowrowa, of whom five were chiefs ; and that Kaneena and his brother, our very particular friends, were unfortunately of that number. Eight, they said, were killed at the observatory ; three of whom were also of the first rank. About eleven o'clock, our two friends left us, and took the precaution to desire that our guard-boat might attend them, till they had passed the Discovery, lest they should again be fired upon, which might alarm their countrymen on shore, and expose them to the danger of being discovered. This request was complied with ; and we had the satisfaction to find, that they got safe and undiscovered to land.

During the remainder of this night, we heard the same loud howling and lamentations as in the preceding one. Early in the morning, we received another visit from Koah. I must confess, I was a little piqued to find, that, notwithstanding the most evident marks of treachery in his conduct, and the positive testimony of our friends the priests, he should still be permitted to carry on the same farce, and to make us at least appear to be the dupes of his hypocrisy. Indeed our situation was become extremely awkward and unpromising ; none of the purposes for which this pacific course of proceeding had been adopted, having hitherto been in the least forwarded by it. No satisfactory answer whatever had been given to our demands ; we did not seem to be at all advanced toward a reconciliation with the islanders ; they still kept in force on the shore, as if determined to resist any attempts we might make to land ; and yet the attempt was become absolutely necessary, as the completing our supply of water would not admit of any longer delay. However, it must be observed, in justice to the conduct of Captain Clerke, that it was very probable, from the great numbers of the natives, and from the resolution with which they seemed to expect us, an attack could not have been made without some danger ; and that the loss of a very few men might have been severely felt by us, during the remaining course of our voyage. Whereas the delaying the execution of our threats, though, on the one hand, it lessened their opinion of our prowess, had the effect of causing them to disperse, on the other. For this day about noon, finding us persist in our inactivity, great bodies of them, after blowing their conchs, and using every mode of defiance, marched off over the hills and never appeared afterward. Those, however, who remained, were not the less daring and insolent. One man had the audacity to come within musket-shot ahead of the ship ; and, after slinging several stones at us, he waved Captain Cook's hat over his head, whilst his countrymen on shore were exulting, and encouraging his boldness. Our people were all in a flame at this insult, and coming in a body on the quarter-deck, begged they might no longer be obliged to put up with these repeated provocations ; and requested me to obtain permission for them, from Captain Clerke, to avail themselves of the first fair occasion of revenging the death of their commander. On my acquainting him with what was passing, he gave orders for some great-guns to be fired at the natives on shore ; and promised the crew, that if they should meet with any molestation at the watering-place the next day, they should then be left at liberty to chastise them.

It is somewhat remarkable, that, before we could bring our guns to bear, the islanders had suspected our intentions, from the stir they saw in the ship, and had retired behind their houses and walls. We were therefore obliged to fire, in some measure at random ; notwithstanding which, our shot produced all the effects that could have been desired. For, soon after, we saw Koah paddling toward us, with extreme haste, and on his arrival, we learned that some people had been killed, and amongst the rest Mailha-mailha, a principal chief, and a near relation of the king*.

Soon after the arrival of Koah, two boys swam off from the Morai toward the ships, having each a long spear in his hand ; and after they had approached pretty near, they began to chant a song, in a very solemn manner : the subject of which, from their often mentioning the word Orono, and pointing to the village where Captain Cook was killed, we

* The word *matee*, is commonly used, in the language of these islands, to express either killing or wounding ; and we were afterward told, that this chief had only re-

ceived a slight blow on the face from a stone, which had been struck by one of the balls.

concluded to be the late calamitous disaster. Having sung in a plaintive strain for about twelve or fifteen minutes, during the whole of which time they remained in the water, they went on board the *Discovery*, and delivered their spears; and, after making a short stay, returned on shore. Who sent them, or what was the object of this ceremony, we were never able to learn. At night, the usual precautions were taken for the security of the ships; and as soon as it was dark, our two friends, who had visited us the night before, came off again. They assured us, that though the effects of our great-guns this afternoon had terrified the chiefs exceedingly, they had by no means laid aside their hostile intentions, and advised us to be on our guard.

The next morning, the boats of both ships were sent ashore for water; and the *Discovery* was warped close to the beach, in order to cover that service. We soon found that the intelligence which the priests had sent us was not without foundation; and that the natives were resolved to take every opportunity of annoying us, when it could be done without much risk. Throughout all this group of islands, the villages for the most part are situated near the sea; and the adjacent ground is inclosed with stone walls about three feet high. These, we at first imagined, were intended for the division of property; but we now discovered, that they served, and probably were principally designed, for a defence against invasion. They consist of loose stones, and the inhabitants are very dexterous in shifting them, with great quickness, to such situations as the direction of the attack may require. In the sides of the mountain, which hangs over the bay, they have also little holes, or caves, of considerable depth, the entrance of which is secured by a fence of the same kind. From behind both these defences the natives kept perpetually harassing our waterers with stones; nor could the small force we had on shore, with the advantage of muskets, compel them to retreat.

In this exposed situation our people were so taken up in attending to their own safety, that they employed the whole forenoon in filling only one ton of water. As it was therefore impossible to perform this service, till their assailants were driven to a greater distance, the *Discovery* was ordered to dislodge them, with her great-guns; which being effected by a few discharges, the men landed without molestation. However, the natives soon after made their appearance again, in their usual mode of attack; and it was now found absolutely necessary to burn down some straggling houses near the wall, behind which they had taken shelter. In executing these orders, I am sorry to add, that our people were hurried into acts of unnecessary cruelty and devastation. Something ought certainly to be allowed to their resentment of the repeated insults, and contemptuous behaviour of the islanders, and to the natural desire of revenging the loss of their commander. But at the same time, their conduct served strongly to convince me, that the utmost precaution is necessary in trusting, though but for a moment, the discretionary use of arms, in the hands of private seamen or soldiers on such occasions. The rigour of discipline, and the habits of obedience, by which their force is kept directed to its proper objects, lead them naturally enough to conceive, that whatever they have the power, they have also the right, to do. Actual disobedience being almost the only crime for which they are accustomed to expect punishment, they learn to consider it as the only measure of right and wrong; and hence are apt to conclude, that what they can do with impunity, they may do with justice and honour. So that the feelings of humanity, which are inseparable from us all, and that generosity toward an unresisting enemy, which, at other times, is the distinguishing mark of brave men, become but weak restraints to the exercise of violence, when opposed to the desire they naturally have of showing their own independence and power.

I have already mentioned, that orders had been given to burn only a few straggling huts, which afforded shelter to the natives. We were therefore a good deal surprised to see the whole village on fire; and before a boat that was sent to stop the progress of the mischief could reach the shore, the houses of our old and constant friends the priests were all in flames. I cannot enough lament the illness that confined me on board this day. The priests had always been under my protection; and, unluckily, the officers who were then on duty, having been seldom on shore at the *Morai*, were not much acquainted with the circumstances

of the place. Had I been present myself, I might probably have been the means of saving their little society from destruction.

Several of the natives were shot, in making their escape from the flames; and our people cut off the heads of two of them, and brought them on board. The fate of one poor islander was much lamented by us all. As he was coming to the well for water, he was shot at by one of the marines. The ball struck his calibash, which he immediately threw from him and fled. He was pursued into one of the caves I have before described, and no lion could have defended his den with greater courage and fierceness; till at last, after having kept two of our people at bay for a considerable time, he expired, covered with wounds. It was this accident, that first brought us acquainted with the use of these caverns. At this time, an elderly man was taken prisoner, bound, and sent on board in the same boat with the heads of his two countrymen. I never saw horror so strongly pictured as in the face of this man, nor so violent a transition to extravagant joy, as when he was untied, and told he might go away in safety. He showed us he did not want gratitude, as he frequently afterwards returned with presents of provisions; and also did us other services.

Soon after the village was destroyed, we saw, coming down the hill, a man, attended by fifteen or twenty boys, holding pieces of white cloth, green boughs, plantains, &c., in their hands. I knew not how it happened, that this peaceful embassy, as soon as they were within reach, received the fire of a party of our men. This, however, did not stop them. They continued their procession; and the officer on duty came up in time to prevent a second discharge. As they approached nearer, it was found to be our much-esteemed friend Kaireekoa, who had fled on our first setting fire to the village, and had now returned, and desired to be sent on board the *Resolution*. When he arrived, we found him exceedingly grave and thoughtful. We endeavoured to make him understand the necessity we were under of setting fire to the village, by which his house, and those of his brethren, were unintentionally consumed. He expostulated a little with us on our want of friendship, and on our ingratitude. And, indeed, it was not till now that we learned the whole extent of the injury we had done them. He told us, that, relying on the promises I had made them, and on the assurances they had afterwards received from the men, who had brought us the remains of Captain Cook, they had not removed their effects back into the country, with the rest of the inhabitants, but had put everything that was valuable of their own, as well what they had collected from us, into a house close to the Morai, where they had the mortification to see it all set on fire by ourselves. On coming on board, he had seen the heads of his countrymen lying on the deck, at which he was exceedingly shocked, and desired, with great earnestness, that they might be thrown overboard. This request Captain Clerke instantly ordered to be complied with. In the evening, the watering party returned on board, having met with no farther interruption. We passed a gloomy night; the cries and lamentations we heard on shore being far more dreadful than ever. Our only consolation was, the hope that we should have no occasion, in future for a repetition of such severities. It is very extraordinary, that amidst all these disturbances, the women of the island, who were on board, never offered to leave us, nor discovered the smallest apprehensions, either for themselves or their friends ashore. So entirely unconcerned did they appear, that some of them, who were on deck when the town was in flames, seemed to admire the sight, and frequently cried out, that it was *matiai*, or very fine.

The next morning Koah came off as usual to the ships. As there existed no longer any necessity for keeping terms with him, I was allowed to have my own way. When he approached toward the side of the ship, singing his song, and offering me a hog and some plantains, I ordered him to keep off, cautioning him never to appear again without Captain Cook's bones, lest his life should pay the forfeit of his frequent breach of promise. He did not appear much mortified with his reception, but went immediately on shore, and joined a party of his countrymen, who were pelting the waterers with stones. The body of the young man, who had been killed the day before, was found this morning lying at the entrance of the cave; and some of our people went and threw a mat over it. Soon after which they saw some men carrying him off on their shoulders, and could hear them singing, as they marched, a mournful song.

The natives, being at last convinced that it was not the want of ability to punish them, which had hitherto made us tolerate their provocations, desisted from giving us any farther molestation; and, in the evening, a chief called Eappo, who had seldom visited us, but whom we knew to be a man of the very first consequence, came with presents from Terreebooboo to sue for peace. These presents were received, and he was dismissed with the same answer which had before been given, that, until the remains of Captain Cook should be restored, no peace would be granted. We learned from this person, that the flesh of all the bodies of our people, together with the bones of the trunks, had been burnt; that the limb bones of the marines had been divided amongst the inferior chiefs; and that those of Captain Cook had been disposed of in the following manner: the head to a great chief, called Kahoo-opeon; the hair to Maia-maia; and the legs, thighs, and arms to Terreebooboo. After it was dark, many of the inhabitants came off with roots and other vegetables; and we also received two large presents of the same articles from Kaireckeea. The 19th was chiefly taken up in sending and receiving the messages which passed between Captain Clerke and Terreebooboo. Eappo was very pressing, that one of our officers should go on shore; and in the mean time, offered to remain as an hostage on board. This request, however, it was not thought proper to comply with; and he left us with a promise of bringing the bones the next day. At the beach, the waterers did not meet with the least opposition from the natives; who, notwithstanding our cautious behaviour, came amongst us again, without the smallest appearance of diffidence or apprehension.

Early in the morning of the 20th, we had the satisfaction of getting the fore-mast stepped. It was an operation attended with great difficulty, and some danger; our ropes being so exceedingly rotten, that the purchase gave way several times. Between ten and eleven o'clock, we saw a great number of people descending the hill, which is over the beach, in a kind of procession, each man carrying a sugar-cane or two on his shoulders, and bread-fruit, taro, and plantains in his hand. They were preceded by two drummers, who, when they came to the water-side, sat down by a white flag, and began to beat their drums, while those who had followed them, advanced one by one; and, having deposited the presents they had brought, retired in the same order. Soon after, Eappo came in sight, in his long feathered cloak, bearing something with great solemnity in his hands; and having placed himself on a rock, he made signs for a boat to be sent him.

Captain Clerke, conjecturing that he had brought the bones of Captain Cook, which proved to be the fact, went himself in the pinnace, to receive them; and ordered me to attend him in the cutter. When we arrived at the beach, Eappo came into the pinnace, and delivered to the captain the bones wrapped up in a large quantity of fine new cloth, and covered with a spotted cloak of black and white feathers. He afterward attended us to the Resolution, but could not be prevailed upon to go on board; probably not choosing, from a sense of decency, to be present at the opening of the bundle. We found in it both the hands of Captain Cook entire, which were well known from a remarkable scar on one of them, that divided the thumb from the fore-finger, the whole length of the metacarpal bone; the skull, but with the scalp separated from it, and the bones that form the face wanting; the scalp, with the hair upon it cut short, and the ears adhering to it; the bones of both arms, with the skin of the fore-arms hanging to them; the thigh and leg-bones joined together, but without the feet. The ligaments of the joints were entire; and the whole bore evident marks of having been in the fire, except the hands, which had the flesh left upon them, and were cut in several places, and crammed with salt, apparently with an intention of preserving them. The scalp had a cut in the back part of it, but the skull was free from any fracture. The lower jaw and feet, which were wanting, Eappo told us, had been seized by different chiefs, and that Terreebooboo was using every means to recover them.

The next morning, Eappo, and the king's son, came on board, and brought with them the remaining bones of Captain Cook; the barrels of his gun, his shoes, and some other trifles that belonged to him. Eappo took great pains to convince us, that Terreebooboo, Maiha-maiha, and himself, were most heartily desirous of peace; that they had given us the most convincing proof of it in their power; and that they had been prevented from giving it sooner by the other chiefs, many of whom were still our enemies. He lamented, with the greatest sorrow,

the death of six chiefs we had killed, some of whom, he said, were amongst our best friends. The cutter, he told us, was taken away by Pareea's people; very probably in revenge for the blow that had been given him; and that it had broken up the next day. The arms of the marines, which we had also demanded, he assured us, had been carried off by the common people, and were irrecoverable; the bones of the chief alone having been preserved, as belonging to Terreeoboo and the Erees. Nothing now remained but to perform the last offices to our great and unfortunate commander. Eappo was dismissed with orders to taboo all the bay; and, in the afternoon, the bones having been put into a coffin, and the service read over them, they were committed to the deep with the usual military honours. What our feelings were on this occasion, I leave the world to conceive; those who were present know, that it is not in my power to express them*.

During the forenoon of the 22nd, not a canoe was seen paddling in the bay; the taboo, which Eappo had laid on it the day before, at our request, not being yet taken off. At length Eappo came off to us. We assured him, that we were now entirely satisfied; and that, as the Orono was buried, all remembrance of what had passed was buried with him. We afterward desired him to take off the taboo, and to make it known, that the people might bring their provisions as usual. The ships were soon surrounded with canoes, and many of the chiefs came on board, expressing great sorrow at what happened, and their satisfaction at our reconciliation. Several of our friends, who did not visit us, sent presents of large hogs, and other provisions. Amongst the rest came the old treacherous Koah, but was refused admittance. As we had now everything ready for sea, Captain Clerke imagining that if the news of our proceedings should reach the islands to leeward before us, it might have a bad effect, gave orders to unmoor. About eight in the evening we dismissed all the

* The account which the natives have given to the Missionaries of this unfortunate affair, exactly tallies with that given by Captain King. They do not refer it to any previous offence, but ascribe it to the sudden announcement of the death of the chief who had been shot in the canoe, which was taken by them as a direct declaration of hostilities. Ledyard, who formed one of the party of marines who accompanied Captain Cook, confirms Captain King's account of the manner of his death, but considers that the natives had previously been much exasperated by many petty quarrels, and especially by the desecration of the Moral in carrying off the railing for firewood; an act which he, in direct contradiction to Captain King, represents as having been done in opposition to the wishes of the natives, and to have been accompanied with violence, both of words and actions.

The mutilation of Captain Cook's body was at first considered as a proof of disgusting revenge, but it was in fact only an evidence of the high honour to which he had been held. Mr. Ellis, who took great pains to ascertain all the facts attending this melancholy occurrence, was informed by one of the natives, who was present at the time, that after Cook's death "they all wailed. His bones were separated—the flesh was scraped off and burnt, as was the practice in regard to their own chiefs when they died. They thought he was the god Rono, worshipped him as such, and, after his death, revered his bones."

It has already been mentioned that the extraordinary honours paid to Cook, at the Sandwich Islands, were rendered in the belief that he was their god Rono, or Orono. "But," says Mr. Ellis, "when in the attack made upon him, they saw his blood running, and heard his groans, they said, 'No this is not Rono.' Some, however, after his death, still supposed him to be Rono, and expected he would appear again. Some of his bones, his ribs, and breast-bone, were considered sacred, as part of Rono, and deposited in a heiau (temple) dedicated to Rono, on the opposite side of the island. There religious homage was paid to them, and from thence they were annually carried in procession to several other heiaus, or borne by the priests round the island, to collect the offer-

ings of the people, for the support of the worship of the god Rono. The bones were preserved in a small basket of wicker-work, completely covered over with red feathers; which in those days were considered to be the most valuable articles the natives possessed.

"The Missionaries in the Society Islands had, by means of some Sandwich Islanders, been long acquainted with the circumstance of some of Captain Cook's bones being preserved in one of their temples, and receiving religious worship; and since the time of my arrival, in company with the deputation from the London Missionary Society, in 1822, every endeavour has been made to learn, though without success, whether they were still in existence, and where they were kept. All those of whom inquiry has been made, have uniformly asserted, that they were formerly kept by the priests of Rono, and worshipped, but have never given any satisfactory information as to where they are now. Whenever we have asked the king, or Hevaheva the chief priest, or any of the chiefs, they have either told us they were under the care of those who had themselves said they knew nothing about them, or that they were now lost.

"The best conclusion we may form is, that part of Captain Cook's bones were preserved by the priests, and were considered sacred by the people, probably till the abolition of idolatry in 1819: that, at that period they were committed to the secret care of some chief, or deposited by the priests who had charge of them, in a cave, unknown to all besides themselves. The manner in which they were then disposed of, will, it is presumed, remain a secret, till the knowledge of it is entirely lost. The priests and chiefs always appear unwilling to enter into conversation on the subject, and desirous to avoid the recollection of the unhappy circumstance.

"From the above account, as well as every other statement given by the natives, it is evident that the death of Captain Cook was unprepared for, and resulted from the dread of his anger; a sense of danger, or the momentary impulse of passion, exciting them to revenge the death of the chief who had been shot."—Edo.

amongst our best friends, probably in revenge for the next day. The arms of the natives were carried off by the natives, having been preserved, but to perform the last duty with orders to take the coffin, and the service of military honours. What those who were present

in the bay; the taboo, being yet taken off. At last, entirely satisfied; and was buried with him. It is known, that the people crowded with canoes, and opened, and their satisfaction us, sent presents of delicious Koah, but was Captain Clerke imagining forward before us, it might have we dismissed all the

support of the worship of the gods preserved in a small basket covered over with red feathers; considered to be the most valued treasure.

The Society Islands had, by means of the missionaries, been long acquainted with the bones of Captain Cook's bones being simple, and receiving religious notice of my arrival, in company with the London Missionary Society, as been made to learn, though they were still in existence, and of those of whom inquiry has been asserted, that they were from Rono, and worshipped, but without any information as to where we have asked the king, or any of the chiefs, they have under the care of those who had nothing about them, or that

natives; and Eappo, and the friendly Kaireekeea, took an affectionate leave of us. We immediately weighed anchor, and stood out of the bay. The natives were collected on the shore in great numbers; and, as we passed along, received our last farewells with every mark of affection and good-will.

CHAPTER V.—DEPARTURE FROM KARAKAKOOA IN SEARCH OF A HARBOUR ON THE SOUTH-EAST SIDE OF MOWEE.—DRIVEN TO LEEWARD BY THE EASTERLY WINDS AND CURRENT.—PASS THE ISLAND OF TAHOOROWA.—DESCRIPTION OF THE SOUTH-WEST SIDE OF MOWEE.—RUN ALONG THE COASTS OF RANAI AND MOROTOI TO WOAHOO.—DESCRIPTION OF THE NORTH-EAST COAST OF WOAHOO.—UNSUCCESSFUL ATTEMPT TO WATER.—PASSAGE TO ATOOI.—ANCHOR IN WYMOA BAY.—DANGEROUS SITUATION OF THE WATERING-PARTY ON SHORE.—CIVIL DISSENSIONS IN THE ISLANDS.—VISIT FROM THE CONTENDING CHIEFS.—ANCHOR OFF ONEEHOW.—FINAL DEPARTURE FROM THE SANDWICH ISLANDS.

We got clear of the land about ten; and, hoisting in the boats, stood to the northward, with the intention of searching for a harbour on the south-east side of Mowee, which we had heard frequently mentioned by the natives. The next morning we found ourselves driven to the leeward by a heavy swell from the north-east; and a fresh gale springing up from the same quarter carried us still farther to the westward. At midnight we tacked, and stood to the south for four hours, in order to keep clear of the land; and, at daybreak, we found ourselves standing toward a small barren island, called Tahoorowa, which lies seven or eight miles to the south-west of Mowee. All prospect of examining more nearly the south-east parts of Mowee being now destroyed, we bore away, and ran along the south-east side of Tahoorowa. As we were steering close round its western extremity, with an intention of fetching the west side of Mowee, we suddenly shoaled our water, and observed the sea breaking on some detached rocks, almost right a-head. This obliged us to keep away a league and a half, when we again steered to the northward; and, after passing over a bank with nineteen fathoms' water, stood for a passage between Mowee and an island called Ranai. At noon, the latitude was, by observation, $20^{\circ} 42'$ north, and the longitude $203^{\circ} 22'$ east; the southern extremity of Mowee bearing east south-east, quarter east; the southern extremity of Ranai west north-west, quarter west; Morotai, north-west and by north; and the western extremity of Tahoorowa, south by east, seven miles distant. Our longitude was accurately deduced from observations made by the timekeeper before and after noon, compared with the longitude found by a great many distances of the moon from the sun and stars, which were also observed the same day. In the afternoon, the weather being calm, with light airs from the west, we stood on to the north north-west; but, at sunset, observing a shoal which appeared to stretch to a considerable distance from the west point of Mowee, toward the middle of the passage, and the weather being unsettled, we tacked, and stood toward the south.

The south-west side of this island, which we now had passed without being able to get near the shore, forms the same distant view with the north-east, as seen on our return from the north, in November 1778; the mountainous parts, which are connected by a low, flat isthmus, appearing at first like two separate islands. This deception continued on the south-west side, till we approached within eight or ten leagues of the coast, which, bending inward to a great depth, formed a fine capacious bay. The westernmost point, off which the shoal we have just mentioned runs, is made remarkable by a small hillock, to the southward of which there is a fine sandy bay, with several huts on the shore, and a number of cocoa-nut trees growing about them.

During the course of the day, we were visited by several of the natives, who came off to sell provisions; and we soon found that they had heard of our late unfortunate transactions at Owhyhee. They were very curious to learn the particulars from a woman who had concealed herself on board the Resolution, in order to take her passage to Atooi; inquiring eagerly after Pareea, and some other chiefs, and appearing much shocked at the death of Kanene and his brother. We had, however, the satisfaction to find, that in whatever light

the woman might have represented this business, it had no bad effect on their behaviour which was remarkably civil and submissive.

The weather continued variable during the night; but in the morning of the 25th, having the wind at east, we ran along the south side of Ranai till near noon; after which, we had calms and baffling winds till evening, when we steered, with a light easterly breeze, for the west part of Morotoi. In the course of the day, the current, which from the time we left Karakakooa Bay had set from the north-east, changed its direction to the south-east. During the night the wind was again variable; but early next morning it settled at east, and blew so fresh as to oblige us to double-reef the topsails. At seven, on hauling round the west point of Morotoi, we opened a small bay, at the distance of about two leagues, with a fine sandy beach; but seeing no appearance of fresh water, we stood on to the north, in order to get to the windward of Woahoo, an island which we had seen at our first visit, in January 1778. At two in the afternoon, we saw the land bearing west by north, eight leagues distant; and having tacked as soon as it was dark, we again bore away at daylight on the 27th; and at half past ten were within a league of the shore, near the middle of the north-east side of the island.

The coast to the northward is formed of detached hills, rising perpendicularly from the sea, with ragged and broken summits; the sides covered with wood, and the valleys between them of a fertile and well cultivated appearance. To the southward we saw an extensive bay, bounded by a low point of land to the south-east, which was covered with cocoa-nut trees; and off it stood a high insulated rock, about a mile from the shore. The haziness of the weather prevented our seeing distinctly the land to the southward of the point; we could only perceive that it was high and broken.

As the wind continued to blow very fresh, we thought it dangerous to entangle ourselves with a lee-shore; and therefore did not attempt to examine the bay, but hauled up, and steered to the northward, in the direction of the coast. At noon we were abreast of the north point of the island, about two leagues from the land, which is low and flat, and has a reef stretching off it to the distance of near a mile and a half. The latitude, by observation, $21^{\circ} 50'$ north, longitude $202^{\circ} 15'$ east; the extreme parts of the island in sight bearing south south-east, quarter east, and south-west by south, three-quarters west. Between the north point and a distant headland, which we saw to the south-west, the land bends inward considerably, and appeared likely to afford a good road. We therefore directed our course along the shore, at the distance of about a mile, carrying regular soundings from twenty to thirteen fathoms. At a quarter past two, the sight of a fine river, running through a deep valley, induced us to come to an anchor in thirteen fathoms water, with a sandy bottom; the extreme points of the bay bearing south-west by west half west, and north-east by east three-quarters east; and the mouth of the river south-east half east, one mile distant. In the afternoon, I attended the two captains on shore, where we found but few of the natives, and those mostly women; the men, they told us, were gone to Morotoi to fight Talyterree; but that their chief Perreecorance, who had staid behind, would certainly visit us as soon as he heard of our arrival.

We were much disappointed to find the water had a brackish taste for two hundred yards up the river, owing to the marshy ground through which it empties itself into the sea. Beyond this it was perfectly fresh, and formed a fine running stream, along the side of which I walked till I came to the conflux of two small rivulets, that branched off to the right and left of a remarkably steep and romantic mountain. The banks of this river, and indeed the whole we saw of the north-west part of Woahoo, are well cultivated, and full of villages; and the face of the country is uncommonly beautiful and picturesque. As the watering at this place would have been attended with great labour, I was sent to examine the coast to leeward; but not being able to land on account of a reef of coral, which stretched along the shore to the distance of half a mile, Captain Clerke determined, without farther loss of time, to proceed to Atooi. At eight in the morning we weighed, and stood to the northward. All daylight on the 28th, when we bore away for that island, which we were in sight of by noon; and, about sunset, were off its eastern extremity, which shows itself in a fine green, flat point.

It being too late to run for the road on the south-west side of the island, where we had been the last year, we passed the night in plying on and off, and at nine the next morning came to an anchor in twenty-five fathoms' water, and moored with the best bower in thirty-eight fathoms, the bluff-head on the west side of the villago bearing north-east by north three-quarters east, two miles distant; the extremes of the island, north-west by west three-quarters west, and south-east by east half east; the island of Onecheow west by south half west. In running down to the road, from the south-east point of the island, we saw the appearance of shoal water in several places, at a considerable distance from the land; and when we were about two miles to the eastward of the anchoring-place, and two or three miles from the shore, we got into four and a half fathoms' water, although our soundings had usually been seven and eight fathoms. We had no sooner anchored in our old station, than several canoes came alongside of us; but we could observe, that they did not welcome us with the same cordiality in their manner, and satisfaction in their countenances, as when we were here before. As soon as they got on board, one of the men began to tell us, that we had left a disorder amongst their women of which several persons of both sexes had died. He was himself afflicted with the venereal disease, and gave a very full and minute account of the various symptoms with which it had been attended. As there was not the slightest appearance of that disorder amongst them on our first arrival, I am afraid it is not to be denied that we were the authors of this irreparable mischief.

Our principal object here was to water the ships with the utmost expedition; and I was sent on shore early in the afternoon, with the pinnace and launch laden with casks. The manner of the Resolution accompanied me to trade for provisions; and we had a guard of five marines. We found a considerable number of people collected upon the beach, who received us at first with great kindness; but as soon as we had got the casks on shore, began to be exceedingly troublesome. Former experience having taught me how difficult it was to repress this disposition, without having recourse to the authority of their chiefs, I was very sorry to find, that they were all at another part of the island. Indeed we soon felt the want of their assistance; for it was with great difficulty I was able to form a circle, according to our usual practice, for the convenience and security of the trading party; and had no sooner done it, and posted guards to keep off the crowd, than I saw a man laying hold of the bayonet of one of the soldiers' muskets, and endeavouring, with all his force, to wrench it out of his hand. On my coming up to them, the native let go his hold and retired; but returned in a moment with a spear in one hand, and dagger in the other; and his countrymen had much ado to restrain him from trying his prowess with the soldier. This fray was occasioned by the latter's having given the man a slight prick with his bayonet, in order to make him keep without the line.

I now perceived, that our situation required great circumspection and management; and accordingly gave the strictest orders, that no one should fire, nor have recourse to any other act of violence, without positive commands. As soon as I had given these directions, I was called to the assistance of the watering party, where I found the natives equally inclined to mischief. They had demanded from our people a large hatchet for every cask of water; and this not being complied with, they would not suffer the sailors to roll them down to the boats. I had no sooner joined them, than one of the natives advanced up to me with great insolence, and made the same claim. I told him that, as a friend, I was very willing to present him with a hatchet, but that I should certainly carry off the water without paying anything for it; and I immediately ordered the pinnace men to proceed in their business, and called three marines from the traders to protect them.

Though this show of spirit succeeded so far as to make the natives desist from any open attempt to interrupt us, they still continued to behave in the most teasing and provoking manner. While some of them, under pretence of assisting the men in rolling down the casks, turned them out of their course, and gave them a wrong direction, others were stealing the hats from off the sailors' heads, pulling them backward by their clothes, or tripping up their heels; the whole crowd all this time shouting and laughing, with a strange mixture of chidishness and malice. They afterward found means to steal the cooper's bucket, and took away his bag by force; but the objects they were most eager to possess

themselves of, were the muskets of the marines, who were every instant complaining of their attempts to force them out of their hands. Though they continued, for the most part, to pay great deference and respect to me, yet they did not suffer me to escape without contributing my share to their stock of plunder. One of them came up to me with a familiar air, and with great management diverted my attention, whilst another, wrenching the hanger which I held carelessly in my hand, from me, ran off with it like lightning.

It was in vain to think of repelling this insolence by force; guarding, therefore, against its effects, in the best manner we were able, we had nothing to do but to submit patiently to it. My apprehensions were, however, a little alarmed, by the information I soon after received from the serjeant of marines, who told me, that, turning suddenly round, he saw a man behind me holding a dagger in the position of striking. In this he might possibly be mistaken; yet our situation was certainly alarming and critical, and the smallest error on our side might have been fatal to us. As our people were separated into three small parties, one at the lake, filling casks, another rolling them down to the shore, and the third, at some distance, purchasing provisions, it had once occurred to me, that it might be proper to collect them all together, and to execute and protect one duty at a time. But on second thoughts, I judged it more advisable to let them continue as they were. In case of a real attack, our whole force, however advantageously disposed, could have made but a poor resistance. On the other hand, I thought it of some consequence to show the natives, that we were under no fears; and, what was still more material, the crowd was, by this means, kept divided, and a considerable part of them fully employed in bartering provisions.

It is probable that their dread of the effects of our arms, was the principal cause of their backwardness in attacking us; and, indeed, the confidence we appeared to place in this advantage, by opposing only five marines to their whole force, must have raised in them a very high idea of our superiority. It was our business to keep up this opinion as much as possible; and in justice to the whole party, I must observe, that no men could possibly behave better, for the purpose of strengthening these impressions. Whatever could be taken in jest, they bore with the utmost temper and patience; and whenever any serious attempt was made to interrupt them, they opposed it with bold looks and menaces. By this management, we succeeded so far, as to get all the casks down to the water side, without any material accident. While we were getting them into the launch, the natives, perceiving the opportunity of plundering would soon be over, became every moment more daring and insolent. On this occasion, I was indebted to the serjeant of marines for suggesting to me, the advantage that would arise from sending off his party first into the boats; by which means, the muskets of the soldiers, which, as I have already mentioned, were the objects the islanders had principally in view, would be removed out of their reach; and in case of an attack, the marines themselves might be employed more effectually in our defence, than if they were on shore.

We had now got everything into the boats, and only Mr. Anderson the gunner, a seaman of the boat's crew, and myself, remained on shore. As the pinnace lay beyond the surf, through which we were obliged to swim, I told them to make the best of their way to it, and that I should follow them.

With this order I was surprised to find them both refuse to comply; and the consequence was a contest amongst us who should be the last on shore. It seems, that some hasty words I had just before used to the sailor, which he thought reflected on his courage, was the cause of this odd fancy in him; and the old gunner, finding a point of honour started, thought he could not well avoid taking a part in it. In this ridiculous situation we might have remained some time, had not our dispute been soon settled by the stones that began to fly about us, and by the cries of the people from the boats, to make haste, as the natives were following us into the water with clubs and spears. I reached the side of the pinnace first, and finding Mr. Anderson was at some distance behind, and not yet entirely out of danger, I called out to the marines to fire one musket. In the hurry of executing my orders, they fired two; and when I got into the boat, I saw the natives running away, and one man, with a woman sitting by him, left behind on the beach. attempts to rise, without being able; and it was with much regret, I perceived him to be wounded in the groin. The natives soon after returned, and surrounded the wounded man, brandishing their spears and daggers at us, with an air of threatening and defiance; but before we reached the ships, we saw some persons, whom we supposed to be the chiefs, now arrived, driving them away from the shore.

During our absence, Captain Clerke had been under the greatest anxiety for our safety. And these apprehensions were considerably increased, from his having entirely mistaken the drift of the conversation he had held with some natives who had been on board. The frequent mention of the name of Captain Cook, with other strong and circumstantial descriptions of death and destruction, made him conclude, that the knowledge of the unfortunate events at Owwhyhee had reached them, and that these were what they alluded to; whereas all they had in view was, to make known to him the wars that had arisen, in consequence of the goats that Captain Cook had left at Oneeheow, and the slaughter of the poor goats themselves during the struggle for the property of them. Captain Clerke, applying this earnestness of conversation, and these terrible representations, to our calamitous transactions at Owwhyhee, and to an indication of revenge, kept his telescope fixed upon us, and the moment he saw the smoke of the muskets, ordered the boats to be manned and armed, and to put off to our assistance.

The next morning I was again ordered on shore with the watering party. The risk we had run the preceding day determined Captain Clerke to send a considerable force from both ships for our guard, amounting in all to forty men under arms. This precaution, however, was now unnecessary; for we found the beach left entirely to ourselves, and the ground between the landing-place and the lake, *tabooed*, with small white flags. We concluded, from this appearance, that some of the chiefs had certainly visited this quarter; and that, not being able to stay, they had kindly and considerably taken this step for our greater security and convenience. We saw several men armed with long spears and daggers on the other side of the river on our right; but they did not offer to give us the least molestation. Their women came over, and sat down on the banks close by us, and at noon we prevailed on some of the men to bring hogs and roots for our people, and to dress them for us. As soon as we had left the beach, they came down to the sea side, and one of them threw a stone at us; but his conduct seeming to be highly disapproved of by all the rest, we did not think it proper to show any resentment.

The next day we completed our watering without meeting with any material difficulty. On our return to the ships, we found that several chiefs had been on board, and had made excuses for the behaviour of their countrymen, attributing their riotous conduct to the quarrels which subsisted at that time amongst the principal people of the island, and which had occasioned a general want of order and subordination amongst them. The government of Atooi was in dispute between Toneoneo, who had the supreme power when we were here last year, and a boy named Teavee. They are both, by different fathers, the grandsons of Perecoranne, king of Woahoo, who had given the government of Atooi to the former, and that of Oneeheow to the latter. The quarrel had arisen about the goats we had left at Oneeheow the last year: the right of property in which was claimed by Toneoneo, on the pretence of that island's being a dependency of his. The friends of Teavee insisting on the right of possession, both parties prepared to maintain their pretensions by force; and a few days before our arrival, a battle had been fought, in which Toneoneo had been worsted. The consequence of this victory was likely to affect Toneoneo in a much deeper manner than by the mere loss of the objects in dispute; for the mother of Teavee, having married a second husband, who was a chief of Atooi, and at the head of a powerful faction there, he thought that the present opportunity was not to be neglected of driving Toneoneo entirely out of the island, and of advancing his son-in-law to the government. I have already had occasion to mention that the goats, which had increased to the number of six, and would probably in a few years have stocked all these islands, were destroyed in the contest.

On the 4th, the mother and sister of the young prince and his father-in-law, with many other chiefs of that party, came on board the Resolution, and made several curious and valuable presents to Captain Clerke. Amongst the former, were some fish-hooks, which

they assured us were made of the bones of our old friend Terreeboob's father, who had been killed in an unsuccessful descent upon the island of Woahoo; and a fly-flap, presented to him by the prince's sister, the handle of which was a human bone, that had been given her as a trophy by her father-in-law. Young Teavee was not of the company, being engaged, as we were told, in performing some religious ceremonies, in consequence of the victory he had obtained, which were to last twenty days.

This and the two following days were employed on shore in completing the Discovery's water; and the carpenters were busy on board, in caulking the ships, and in making other preparations for our next cruise. The natives desisted from giving us any further disturbance; and we procured from them a plentiful supply of pork and vegetables. At this time, an Indian brought a piece of iron on board the Discovery, to be fashioned into the shape of *pahooa*. It was carefully examined both by the officers and men, and appeared to be the bolt of some large ship timbers. They were not able to discover to what nation it belonged; but from the pale colour* of the iron, and its not corresponding in shape to our bolts, they concluded that it certainly was not English. This led them to make a strict inquiry of the native, when and where he got it; and if they comprehended him right, it had been taken out of a piece of timber, larger than the cable bit, to which he pointed. This piece of wood, they farther understood from him, to have been driven upon their island, since we were here in January 1778.

On the 7th, we were surprised with a visit from Toneoneo. When he heard the dowager princess was in the ship, it was with great difficulty we could prevail on him to come on board, not from any apprehension that he appeared to entertain of his safety, but from an unwillingness to see her. Their meeting was with sulky and lowering looks on both sides. He staid but a short time, and seemed much dejected; but we remarked, with some surprise, that the women, both at his coming and going away, prostrated themselves before him; and that he was treated by all the natives on board with the respect usually paid to those of his rank. Indeed, it must appear somewhat extraordinary, that a person who was at this time in a state of actual hostility with Teavee's party, and was even prepared for another battle, should trust himself almost alone within the power of his enemies. It is therefore to be observed, that the civil dissensions, which are very frequent throughout all the South Sea Islands, seem to be carried on without much acrimony or bloodshed; and that the deposed governor still continues to enjoy the rank of an Eree, and is left to make use of such means as may arise for the regaining his lost consequence. But I shall have occasion to speak more particularly on this subject in the next chapter; in which the best account will be given, which we were able to collect, of the political state of those countries.

On the 8th, at nine in the morning, we weighed, and sailed toward Onceheow; and at three in the afternoon, anchored in twenty fathoms water, nearly on the same spot as in the year 1778. We moored with the other anchor in twenty-six fathoms' water. The high bluff, on the south end of the island, bore east south-east; the north point of the road, north half east; and a bluff head to the south of it, north-east by north. During the night we had a strong gale from the eastward; and, in the morning of the 9th, found the ship had driven a whole cable's length, and brought both anchors almost ahead. We shortened in the best bower cable; but the wind blowing too fresh to unmoor, we were obliged to remain this and the two following days, with the anchors still ahead.

On the 12th, the weather being moderate, the master was sent to the north-west side of the island to look for a more convenient place for anchoring. He returned in the evening, having found, close round the west point of the road where we now lay, which is also the westernmost point of the island, a fine bay, with good anchorage, in eighteen fathoms' water, a clear sandy bottom, not a mile from the beach, on which the surf beats, but not so as to hinder landing. The direction of the points of the bay were north by east, and south by west; and, in that line, the soundings seven, eight, and nine fathoms. On the north side of the bay was a small village; and a quarter of a mile to the eastward, were four small

wells of good water; the road to them level, and fit for rolling casks. Mr. Bligh went afterward so far to the north as to satisfy himself, that Oreehoua was a separate island from Onecheow; and that there was a passage between them; which, before, we only conjectured to exist. In the afternoon we hoisted in all the boats, and made ready for going to sea in the morning.

CHAPTER VI.—GENERAL ACCOUNT OF THE SANDWICH ISLANDS.—THEIR NUMBER, NAMES, AND SITUATION.—OWHYHEE.—ITS EXTENT AND DIVISION INTO DISTRICTS.—ACCOUNT OF ITS COASTS, AND THE ADJACENT COUNTRY.—VOLCANIC APPEARANCES.—SNOWY MOUNTAINS.—THEIR HEIGHT DETERMINED.—ACCOUNT OF A JOURNEY INTO THE INTERIOR PARTS OF THE COUNTRY.—MOWEE.—TAHOOROWA.—MOROTOI.—RANAI.—WOAHOO.—ATOOTI.—ONECHEOW.—OREEHOUA.—TAHOORA.—CLIMATE.—WINDS.—CURRENTS.—TIDES.—ANIMALS AND VEGETABLES.—ASTRONOMICAL OBSERVATIONS.

As we are now about to take our final leave of the Sandwich Islands, it will not be improper to introduce here some general account of their situation and natural history, and of the manners and customs of the inhabitants. This subject has indeed been, in some measure, pre-occupied by persons far more capable of doing it justice than I can pretend to be. Had Captain Cook and Mr. Anderson lived to avail themselves of the advantages which we enjoyed by a return to these islands, it cannot be questioned, that the public would have derived much additional information from the skill and diligence of two such accurate observers. The reader will therefore lament with me our common misfortune, which hath deprived him of the labours of such superior abilities, and imposed on me the task of presenting him with the best supplementary account the various duties of my station permitted me to furnish*.

This group consists of eleven islands, extending in latitude from $18^{\circ} 54'$ to $22^{\circ} 15'$ north; and in longitude from $199^{\circ} 36'$ to $205^{\circ} 06'$ east. They are called by the natives; 1. Owhyhee. 2. Mowee. 3. Ranai, or Oranai. 4. Morotinee, or Morokinnee. 5. Kahowrowee, or Tahoorowa. 6. Morotoi, or Morokoi. 7. Woahoo, or Oahoo. 8. Atooi, Atowi, or Towi, and sometimes Kowi†. 9. Necheehow, or Onecheow. 10. Oreehoua, or Reehoua; and, 11. Tahooraa; and are all inhabited, except Morotinee and Tahooraa. Besides the islands above enumerated, we are told by the Indians, that there is another called Modoopapapa‡, or Komodoopapapa, lying to the west south-west of Tahooraa, which is low and sandy, and visited only for the purpose of catching turtle and sea-fowl; and, as I could never learn that they knew of any others, it is probable that none exist in their neighbourhood.

They were named by Captain Cook the Sandwich Islands in honour of the Earl of Sandwich, under whose administration he had enriched geography with so many splendid and important discoveries; a tribute justly due to that noble person for the liberal support these voyages derived from his power, in whatever could extend their utility, or promote their success; for the zeal with which he seconded the views of that great navigator; and if I may be allowed to add the voice of private gratitude, for the generous protection, which, since the death of their unfortunate commander, he has afforded all the officers that served under him.

* "The descriptions which Captain Cook's voyages contained, were, I am convinced, faithful transcripts of the first impressions made on the minds of Captain Cook and his companions, and in every respect correct, so far as their partial observation extended. A residence of eight years in the Society and Sandwich Islands, has afforded me an opportunity of becoming familiar with many of the scenes and usages described in their Voyages, and I have often been struck with the fidelity with which they are uniformly portrayed. In the inferences they draw, and the reasons they assign, they are sometimes mistaken; but in the description of what they saw and heard, there is through-

out a degree of accuracy, seldom if ever exceeded in accounts equally minute and extended. Still their acquaintance with the islands and the people was superficial, and the state of society which they witnessed was different from what generally existed." Ellis's Polynesian Researches, vol. iv., 12mo ed., p. 2.

† It is to be observed, that, among the windward islands, the *k* is used instead of the *t* as *Morokoi* instead of *Morotoi*, &c. [The orthography of all these names varies from that adopted by the missionaries.—Ed.]

‡ *Modoo* signifies island; *papapa*, flat. This island is called Tammatapappa, by Captain Cook, vol. ii. p. 244.

Owhyhee, the easternmost, and by much the largest of these islands, is of a triangular shape, and nearly equilateral. The angular points make the north, east, and south extremities, of which the northern is in latitude $20^{\circ} 17'$ north, longitude $204^{\circ} 02'$ east: the eastern in latitude $19^{\circ} 34'$ north, longitude $205^{\circ} 00'$ east: and the southern extremity in latitude $18^{\circ} 54'$ north, longitude $204^{\circ} 15'$ east. Its greatest length, which lies in a direction nearly north and south, is $28\frac{1}{2}$ leagues; its breadth is 24 leagues; and it is about 255 geographical, or 293 English miles, in circumference. The whole island is divided into six large districts; Amakooa and Aheedoo, which lie on the north-east side; Apooa and Kaoo, on the south-east; Akoona and Kooarra, on the west.

The districts of Amakooa and Aheedoo are separated by a mountain, called Mouna Kaah (or the mountain Kaah), which rises in three peaks, perpetually covered with snow, and may be clearly seen at 40 leagues' distance. To the north of this mountain the coast consists of high and abrupt cliffs, down which fall many beautiful cascades of water. We were once flattered with the hopes of meeting with a harbour round a bluff head, in latitude $20^{\circ} 10'$ north, and longitude $204^{\circ} 28'$ east; but on doubling the point, and standing close in, we found it connected by a low valley with another high head to the north-west. The country rises inland with a gentle ascent, is intersected by deep narrow glens, or rather chasms, and appeared to be well cultivated and sprinkled over with a number of villages. The snowy mountain is very steep, and the lower part of it covered with wood.

The coast of Aheedoo, which lies to the south of Mouna Kaah, is of a moderate height and the interior parts appear more even than the country to the north-west, and less broken by ravines. Off these two districts we cruised for almost a month; and, whenever our distance from shore would permit it, were sure of being surrounded by canoes laden with all kinds of refreshments. We had frequently a very heavy sea, and great swell on this side of the island, and as we had no soundings, and could observe much foul ground off the shore, we never approached nearer the land than two or three leagues, excepting on the occasion already mentioned.

The coast to the north-east of Apooa, which forms the eastern extremity of the island, is low, and flat; the acclivity of the inland parts is very gradual, and the whole country covered with cocoa-nut and bread-fruit trees. This, as far as we could judge, is the finest part of the island, and we were afterward told that the king had a place of residence here. At the south-west extremity the hills rise abruptly from the sea-side, leaving but a narrow border of low ground toward the beach. We were pretty near the shore at this part of the island, and found the sides of the hills covered with a fine verdure; but the country seemed to be very thinly inhabited. On doubling the east point of the island, we came in sight of another snowy mountain, called Mouna Roa (or the extensive mountain), which continued to be a very conspicuous object all the while we were sailing along the south-east side. It is flat at the top, making what is called by mariners table-land: the summit was constantly buried in snow, and we once saw its sides also slightly covered for a considerable way down; but the greatest part of this disappeared again in a few days.

According to the tropical line of snow, as determined by Mr. Condamine, from observations taken on the Cordilleras, this mountain must be at least 16,020 feet high, which exceeds the height of the Pico de Teyde, or Peak of Teneriffe, by 724 feet, according to Dr. Heberden's computation, or 3680, according to that of the Chevalier de Borda. The peaks of Mouna Kaah appeared to be about half a mile high; and as they are entirely covered with snow, the altitude of their summits cannot be less than 18,400 feet. But it is probable that both these mountains may be considerably higher. For, in insular situations, the effects of the warm sea air must necessarily remove the line of snow, in equal latitudes, to a greater height than where the atmosphere is chilled on all sides by an immense tract of perpetual snow*.

The coast of Kaoo presents a prospect of the most horrid and dreary kind: the whole country appearing to have undergone a total change from the effects of some dreadful con-

vulsion, the ground is everywhere covered with cinders, and intersected in many places with black streaks, which seem to mark the course of a lava that has flowed, not many ages back, from the mountain Roa to the shore. The southern promontory looks like the mere dregs of a volcano. The projecting head-land is composed of broken and craggy rocks, piled irregularly on one another and terminating in sharp points.

Notwithstanding the dismal aspect of this part of the island, there are many villages scattered over it; and it certainly is much more populous than the verdant mountains of Apooa. Nor is this circumstance hard to be accounted for. As these islanders have no cattle, they have consequently no use for pasturage, and therefore naturally prefer such ground as either lies more convenient for fishing, or is best suited to the cultivation of yams and plantains. Now, amidst these ruins, there are many patches of rich soil, which are carefully l'd out in plantations, and the neighbouring sea abounds with a variety of most excellent fish, with which, as well as with other provisions, we were always plentifully supplied. Off this part of the coast, we could find no ground at less than a cable's length from the shore, with a hundred and sixty fathoms of line, excepting in a small bight to the eastward of the south point, where we had regular soundings of fifty and fifty-eight fathoms over a bottom of fine sand. Before we proceed to the western districts, it may be necessary to remark, that the whole coast side of the island, from the northern to the southern extremity, does not afford the smallest harbour, or shelter for shipping.

The south-west parts of Akona are in the same state with the adjoining district of Kaoo; but farther to the north, the country has been cultivated with great pains, and is extremely populous. In this part of the island is situate Karukakooa Bay, which has been already described. Along the coast nothing is seen but large masses of slag, and the fragments of black scorched rocks; behind which, the ground rises gradually for about two miles and a half, and appears to have been formerly covered with loose burnt stones. These the natives have taken the pains of clearing away, frequently to the depth of three feet and upward; which labour, great as it is, the fertility of the soil amply repays. Here, in a rich ashy mould, they cultivate sweet potatoes, and the cloth-plant. The fields are inclosed with stone fences, and are interspersed with groves of cocoa-nut trees. On the rising ground beyond these, the bread-fruit trees are planted, and flourish with the greatest luxuriance.

Koaara extends from the westernmost point to the northern extremity of the island; the whole coast between them forming an extensive bay, called Toe-yah-yah, which is bounded to the north by two very conspicuous hills. Toward the bottom of this bay there is foul, corally ground, extending upward of a mile from the shore, without which the soundings are regular, with good anchorage, in twenty fathoms. The country, as far as the eye could reach, seemed fruitful and well inhabited, the soil being in appearance of the same kind with the district of Kaoo; but no fresh water is to be got here.

I have hitherto confined myself to the coasts of this island, and the adjacent country, which is all that I had an opportunity of being acquainted with from my own observation. The only account I can give of the interior parts, is from the information I obtained from a party who set out on the afternoon of the 26th of January, on an expedition up the country, with an intention of penetrating as far as they could; and principally of reaching, if possible, the snowy mountains.

Having procured two natives to serve them as guides, they left the village about four o'clock in the afternoon, directing their course a little to the southward of the east. To the distance of three or four miles from the bay, they found the country as before described; the hills afterward rose with a more sudden ascent, which brought them to the extensive plantations, that terminate the view of the country, as seen from the ships. These plantations consist of the tarrow* or eddy root, and the sweet potato, with plants of the cloth-

* Both the sweet potatoes, and the tarrow, are here planted four feet from each other; the former was earthed up almost to the top of the stalk, with about half a bushel of light mould; the latter is left bare to the root, and the mould round it is made in the form of a basin, in order to

hold the rain-water, as this root requires a certain degree of moisture. It has been before observed, that the tarrow, at the Friendly and Society Islands, was always planted in low and moist situations, and generally where there was the convenience of a rivulet to flood it. It was

tree, neatly set out in rows. The walls that separate them are made of the loose burnt stones which are got in clearing the ground; and being entirely concealed by sugar-canes, planted close on each side, make the most beautiful fences that can be conceived. The party stopped for the night at the second hut they found amongst the plantations, where they judged themselves to be about six or seven miles from the ships. They described the prospect from this spot as very delightful; they saw the ships in the bay before them; to the left a continued range of villages, interspersed with groves of cocoa-nut trees spreading along the sea-shore; a thick wood stretching out of sight behind them; and to the right, an extent of ground laid out in regular and well-cultivated plantations, as far as the eye could reach.

Near this spot, at a distance from any other dwelling, the natives pointed out to them the residence of a hermit, who, they said, had formerly been a great chief and warrior, but had long ago quitted the shores of the island, and now never stirred from his cottage. They prostrated themselves as they approached him, and afterwards presented to him a part of such provisions as they had brought with them. His behaviour was easy and cheerful; he scarce showed any marks of astonishment at the sight of our people, and though pressed to accept some of our curiosities, he declined the offer, and soon withdrew to his cottage. He was described as by far the oldest person any of the party had ever seen, and judged to be, by those who computed his age at the lowest, upward of 100 years old.

As our people had imagined the mountain not to be more than ten or twelve miles from the bay, and consequently, that they should reach it with ease early the next morning, an error into which its great height had probably led them, they were now much surprised to find the distance scarce perceptibly diminished. This circumstance, together with the uninhabited state of the country they were going to enter, made it necessary to procure a supply of provisions; and for that purpose they despatched one of their guides back to the village. Whilst they were waiting his return, they were joined by some of Kaoo's servants, whom that benevolent old man had sent after them, as soon as he heard of their journey, laden with refreshments, and authorised, as their route lay through his grounds, to demand and take away whatever they might have occasion for.

Our travellers were much astonished to find the cold here so intense; but having no thermometer with them, could judge of it only by their feelings; which, from the warm atmosphere they had left, must have been a very fallacious measure. They found it, however, so cold that they could get but little sleep, and the natives none at all; both parties being disturbed the whole night by continued coughing. As they could not at this time be at any very considerable height, the distance from the sea being only six or seven miles, and part of the road on a very moderate ascent, this extraordinary degree of cold must be ascribed to the easterly wind blowing fresh over the snowy mountains. Early on the 27th they set out again, and filled their calabashes at an excellent well, about half a mile from their hut. Having passed the plantations, they came to a thick wood, which they entered by a path made for the convenience of the natives, who go thither to fetch the wild or horse plantain, and to catch birds. Their progress now became very slow, and attended with much labour; the ground being either swampy, or covered with large stones; the path narrow, and frequently interrupted by trees lying across it, which it was necessary to climb over, the thickness of the under-wood on both sides making it impossible to pass round them. In these woods they observed, at small distances, pieces of white cloth fixed on poles, which they supposed to be landmarks for the division of property, as they only met with them where the wild plantains grew. The trees, which are of the same kind with those we called the spice-tree at New Holland, were lofty and straight, and from two to four feet in circumference.

After they had advanced about ten miles in the wood, they had the mortification to find themselves on a sudden within sight of the sea, and at no great distance from it; the path having turned imperceptibly to the southward, and carried them to the right of the mountain.

imagined that this mode of culture was absolutely necessary; but we now found, that, with the precaution above mentioned, it succeeds equally well in a drier situation: indeed, we all remarked, that the tarrow of the

Sandwich Islands is the best we had ever tasted. The plantains are not admitted in these plantations, but grow amongst the bread-fruit trees.

which it was their object to reach. Their disappointment was greatly increased by the uncertainty they were now under of its true bearings, since they could not, at this time, get a view of it from the top of the highest trees. They, therefore, found themselves obliged to walk back six or seven miles to an unoccupied hut, where they had left three of the natives, and two of their own people, with the small stock that remained of their provisions. Here they spent the second night; and the air was so very sharp and so little to the liking of their guides, that, by the morning, they had all taken themselves off, except one.

The want of provisions now making it necessary to return to some of the cultivated parts of the island, they quitted the wood by the same path they had entered it; and, on their arrival at the plantations, were surrounded by the natives, of whom they purchased a fresh stock of necessaries; and prevailed upon two of them to supply the place of the guides that were gone away. Having obtained the best information in their power, with regard to the direction of their road, the party, being now nine in number, marched along the skirts of the wood for six or seven miles, and then entered it again by a path that bore to the eastward. For the first three miles they passed through a forest of lofty spice-trees, growing on a strong rich loam; at the back of which they found an equal extent of low shrubby trees, with much thick underwood, on a bottom of loose burnt stones. This led them to a second forest of spice-trees, and the same rich brown soil, which was again succeeded by a barren ridge of the same nature with the former. This alternate succession may, perhaps, afford matter of curious speculation to naturalists. The only additional circumstance I could learn relating to it, was that these ridges appeared, as far as they could be seen, to run in directions parallel to the sea-shore, and to have Mouna Roa for their centre.

In passing through the woods, they found many canoes half finished, and here and there a hut; but saw none of the inhabitants. Having penetrated near three miles into the second wood, they came to two huts, where they stopped, exceedingly fatigued with the day's journey, having walked not less than twenty miles, according to their own computation. As they had met with no springs from the time they left the plantation-ground, and began to suffer much from the violence of their thirst, they were obliged, before the night came on, to separate into parties, and go in search of water; and at last found some left by rain in the bottom of an unfinished canoe; which, though of the colour of red wine, was to them no unwelcome discovery. In the night, the cold was still more intense than they had found it before; and, though they had wrapped themselves up in mats and cloths of the country, and kept a large fire between the two huts, they could yet sleep but very little; and were obliged to walk about the greatest part of the night. Their elevation was now probably pretty considerable, as the ground on which they had travelled, had been generally on the ascent.

On the 29th, at daybreak, they set out, intending to make their last and utmost effort to reach the snowy mountain; but their spirits were much depressed, when they found they had expended the miserable pittance of water, they had found the night before. The path, which extended no farther than where canoes had been built, was now at an end; and they were therefore obliged to make their way as well as they could; every now and then climbing up into the highest trees to explore the country round. At eleven o'clock, they came to a ridge of burnt stones, from the top of which they saw the snowy mountain, appearing to be about twelve or fourteen miles from them. It was here deliberated whether they should proceed any further, or rest satisfied with the view they now had of Mouna Roa. The road, ever since the path ceased, had become exceedingly fatiguing; and every moment they advanced, was growing still more so. The deep chinks, with which the ground was everywhere broken, being slightly covered with moss, made them stumble at almost every step; and the intermediate space was a surface of loose burnt stones, which broke under their feet like potsherds. They threw stones into several of these chinks; which, by the noise they made, seemed to fall to a considerable depth, and the ground sounded hollow under their feet. Besides these discouraging circumstances, they found their guides so averse to going on, that they believed, whatever their own determinations might have been, they could not have prevailed on them to remain out another night. They, therefore, at last agreed to return to the ships, after taking a view of the country from the highest trees which the place afforded. From this elevation they saw themselves surrounded on all sides with wood toward

the sea ; they could not distinguish, in the horizon, the sky from the water ; and between them and the snowy mountain, was a valley about seven or eight miles broad, above which the mountain appeared only as a hill of a moderate size.

They rested this night at a hut in the second wood, and on the 30th, before noon, they had got clear of the first, and found themselves about nine miles to the north-east of the ships, toward which they directed their march through the plantations. As they passed along, they did not observe a single spot of ground, that was capable of improvement, left unplanted ; and, indeed, it appeared, from their account, hardly possible for the country to be cultivated to greater advantage for the purposes of the inhabitants, or made to yield them a larger supply of necessaries for their subsistence. They were surprised to meet with several fields of bay ; and on inquiring to what uses it was applied, were told it was designed to cover the young taro grounds, in order to preserve them from being scorched by the sun. They saw a few scattered huts amongst the plantations, which served for occasional shelter to the labourers ; but no villages at a greater distance than four or five miles from the sea. Near one of them, about four miles from the bay, they found a cave forty fathoms long, three broad, and of the same height. It was open at both ends ; the sides were fluted, as if wrought with a chisel, and the surface glazed over, probably by the action of fire. Having given this account of the most material circumstances that occurred on the expedition to the snowy mountain, I shall now return to the other islands that remain to be described.

The island next in size, and nearest in situation, to Owhyhee, is MOWEE ; which lies at the distance of eight leagues north north-west from the former, and is 140 geographical miles in circumference. A low isthmus divides it into two circular peninsulas, of which that to the east is called Whamadooa, and is double the size of the western peninsula, called Owhy-rookoo. The mountains in both rise to an exceeding great height, having been seen by us at the distance of upward of thirty leagues. The northern shores, like those of Owhyhee, afford no soundings ; and the country presents the same appearance of verdure and fertility. To the south-east, between this and the adjacent isles, we had regular depths, with a hundred and fifty fathoms, with a sandy bottom. From the west point, which is low, runs a shoal, stretching out toward Ranai, to a considerable distance ; and to the southward of this is a fine spacious bay, with a sandy beach, shaded with cocoa-nut trees. It is probable that good anchorage might be found here, with shelter from the prevailing winds, and that the beach affords a convenient place for landing. The country behind presents a most romantic appearance. The hills rise almost perpendicularly, in a great variety of peaked forms ; and their steep sides, and the deep chasms between them, are covered with trees, amongst which those of the bread-fruit were observed particularly to abound. The tops of these hills are entirely bare, and of a reddish brown colour. We were informed by the natives, that there is a harbour to the southward of the east point, which they affirmed to be superior to that of Karakakooa ; and we were also told, that, on the north-west side, there was another harbour, called Keepoo-keepoo.

Tahoorowa is a small island lying off the south-west part of Mowee, from which it is distant three leagues. This island is destitute of wood, and the soil seems to be sandy and barren. Between Tahowrowa and Mowee, lies the small uninhabited island Morrotiunee.

Morotoi is only two leagues and a half from Mowee to the west north-west. The south-western coast, which was the only part near which we approached, is very low ; but the land rises backward to a considerable height ; and, at the distance from which we saw it, appeared to be entirely without wood. Its produce, we were told, consists chiefly of yams. It may, probably, have fresh water ; and, on the south and west sides, the coast forms several bays, that promise good shelter from the trade winds.

Ranai is about three leagues distant from Mowee and Morotoi, and lies to the south-west of the passage between these islands. The country to the south is high and craggy ; but the other parts of the island had a better aspect, and appeared to be well inhabited. We were told that it produces very few plantains and bread-fruit trees ; but that it abounds in roots, such as yams, sweet potatoes, and taro.

Woahoo lies to the north-west of Morotoi, at the distance of about seven leagues. As far as we could judge, from the appearance of the north-east and north-west parts (for we saw

* The
Islands is

nothing of the southern side), it is by far the finest island of the whole group. Nothing can exceed the verdure of the hills, the variety of wood and lawn, and rich cultivated valleys, which the whole face of the country displayed. Having already given a description of the bay, formed by the north and west extremities, in which we came to anchor, I have only to observe, that in the bight of the bay, to the south of the anchoring-place, we found rocky foul ground, two miles from the shore. Should the ground tackling of a ship be weak, and the wind blow strong from the north, to which quarter the road is entirely open, this circumstance might be attended with some danger; but with good cables there would be little risk, as the ground from the anchoring-place, which is opposite to the valley through which the river runs to the north point, is a fine sand.

Atooi lies to the north-west of Woahoo, and is distant from it about twenty-five leagues. The face of the country to the north-east and north-west is broken and ragged; but to the south it is more even; the hills rise with a gentle slope from the sea-side, and, at some distance back, are covered with wood. Its productions are the same with those of the other islands; but the inhabitants far surpass all the neighbouring islanders in the management of their plantations. In the low grounds, adjoining to the bay where we lay at anchor, these plantations were divided by deep and regular ditches; the fences were made with a neatness approaching to elegance, and the roads through them were thrown up and finished, in a manner that would have done credit to any European engineer.

Oneeheow lies five leagues to the westward of Atooi. The eastern coast is high, and rises abruptly from the sea, but the rest of the island consists of low ground; excepting a round bluff head on the south-east point. It produces abundance of yams, and of the sweet root called *Tee*; but we got from it no other sort of provisions.

Oreehoua and Tahora are two small islands in the neighbourhood of Oneeheow. The former is a single high hummock, joined by a reef of coral rocks, to the northern extremity of Oneeheow. The latter lies to the south-east, and is uninhabited.

The climate of the Sandwich Islands differs very little from that of the West India Islands, which lie in the same latitude. Upon the whole, perhaps, it may be rather more temperate. The thermometer on shore in Karakakooa Bay never rose higher than 88°, and that but one day; its mean height, at noon, was 83°. In Wymoa Bay, its mean height at noon was 76°, and when out at sea, 75°. The mean height of the thermometer at noon, in Jamaica, is about 86°, at sea 80°.*

Whether they be subject to the same violent winds and hurricanes, we could not discover, as we were not there in any of the stormy months. However, as the natives gave us no positive testimony of the fact, and no traces of their effects were anywhere visible, it is probable that, in this respect, they resemble the Society and Friendly Islands, which are in a great measure free from these dreadful visitations. During the four winter months that we remained amongst these islands, there was more rain, especially in the interior parts, than usually falls during the dry season in the islands of the West Indies. We generally saw clouds collecting round the tops of the hills, and producing rain to leeward; but after they are separated from the land by the wind, they disperse, and are lost, and others succeed in their place. This happened daily at Owlyhee: the mountainous parts being generally enveloped in a cloud; successive showers falling in the inland country; with fine weather, and a clear sky, at the sea-shore.

The winds in general were, from east south-east to north-east; though th's sometimes varied a few points each way to the north and south; but these were light, and of short duration. In the harbour of Karakakooa, we had a constant land and sea breeze every day and night.

The currents seemed very uncertain, sometimes setting to windward, and at other times to leeward, without any regularity. They did not appear to be governed by the winds, nor any other cause that I can assign: they frequently set to windward against a fresh breeze. The tides are very regular, flowing and ebbing six hours each. The flood comes from the

* The mean height of the thermometer in the Sandwich Islands is stated by Mr. Ellis at 75°, the extreme heat 88°, the least 61°; these being the result of one year's accurate observations.—Ed.

eastward; and it is high-water at the full and change of the moon, forty-five minutes past three, apparent time. Their greatest rise is two feet seven inches; and we always observed the water to be four inches higher when the moon was above the horizon than when it was below.

The quadrupeds in these, as in all the other islands that have been discovered in the South Sea, are confined to three sorts—dogs, hogs, and rats. The dogs are of the same species with those of Otaheite, having short crooked legs, long backs, and pricked ears. I did not observe any variety in them, except in their skins; some having long and rough hair, and others being quite smooth. They are about the size of a common turnspit, exceedingly sluggish in their nature, though perhaps this may be more owing to the manner in which they are treated, than to any natural disposition in them. They are, in general, fed and left to herd with the hogs; and I do not recollect one instance in which a dog was made a companion, in the manner we do in Europe. Indeed, the custom of eating them is an insuperable bar to their admission into society; and, as there are neither beasts of prey in the island, nor objects of chase, it is probable that the social qualities of the dog, its fidelity, attachment, and sagacity, will remain unknown to the natives.

The number of dogs in these islands did not appear to be nearly equal in proportion to those in Otaheite. But, on the other hand, they abound much more in hogs; and the breed is of a larger and weightier kind. The supply of provisions of this kind, which we got from them, was really astonishing. We were near four months, either cruising off the coast, or in harbour at Owhyhee. During all this time, a large allowance of fresh pork was constantly served to both crews; so that our consumption was computed at about sixty puncheons of five hundred-weight each. Besides this, and the incredible waste which, in the midst of such plenty, was not to be guarded against, sixty puncheons more were salted for sea store. The greatest part of this supply was drawn from the island of Owhyhee alone, and yet we could not perceive that it was at all drained, or even that the abundance had any way decreased.

The birds of these islands are as beautiful as any we have seen during the voyage, and are numerous, though not various. There are four which seem to belong to the *Trochill*, or honey suckers, of Linnæus; one of which is something larger than a bullfinch; its colour is a fine glossy black, the rump-vent and thighs a deep yellow. It is called by the natives *hookoo*. Another is of an exceeding bright scarlet colour; the wings black, and edged with white, and the tail black; its native name is *cecece*. A third, which seems to be either a young bird, or a variety of the foregoing, is variegated with red, brown, and yellow. The fourth is entirely green, with a tinge of yellow, and is called *akaicarooa*. There is a species of thrush, with a grey breast; and a small bird of the flycatcher kind; a rail, with very short wings and no tail, which on that account we named *Rallus ecaudatus*. Ravens are found here, but they are very scarce; their colour is dark brown, inclining to black, and their note is different from the European. Here are two small birds, both of one genus, that are very common; one is red, and generally seen about the cocoa-nut trees, particularly when they are in flower, from whence it seems to derive great part of its subsistence; the other is green: the tongues of both are long and ciliated, or fringed at the tip. A bird with a yellow head, which, from the structure of its beak, we called a perroquet, is likewise very common. It, however, by no means belongs to that tribe, but greatly resembles the yellow cross-bill, *Loria flavicans* of Linnæus. Here are also owls, plovers of two sorts, one very like the whistling plover of Europe; a large white pigeon; a bird with a long tail, whose colour is black, the vent and feathers under the wing (which is much longer than is usually seen in the generality of birds, except the birds of paradise) are yellow; and the common water or darker hen.

Their vegetable productions are nearly the same with the rest of the South Sea Islands. I have before mentioned, that the taro root is much superior to any we had before tasted, and that we attributed this excellence to the dry method of cultivating it. The bread-fruit trees thrive here, not in such abundance, but produce double the quantity of fruit they do on the rich plains of Otaheite. The trees are nearly of the same height, but the branches begin to strike out from the trunk much lower, and with greater luxuriance.

Their sugar-canes are also of a very unusual size. One of them was brought to us at Atooi, measuring eleven inches and a quarter in circumference, and having fourteen feet eatable.

At Onechcow, they brought us several large roots of a brown colour, shaped like a yam, and from six to ten pounds in weight. The juice, which it yields in great abundance, is very sweet, and of a pleasant taste, and was found to be an excellent substitute for sugar. The natives are very fond of it, and use it as an article of their common diet; and our people also found it very palatable and wholesome. We could not learn to what species of plant it belonged, having never been able to procure the leaves; but it was supposed by our botanists to be the root of some kind of fern.

Agreeably to the practice of Captain Cook, I shall subjoin an

abstract of the astronomical observations which were made at the observatory in Karakakooa Bay, for determining its latitude and longitude, and for finding the rate and error of the timekeeper. To these are subjoined the mean variation of the compass, the dip of the magnetic needle, and a table of the latitude and longitude of the Sandwich Islands.

TARO, OR SWEET POTATOE.

The latitude of the observatory deduced from meridian zenith distances of the sun, eleven stars to the south, and four stars to the north of the zenith		19° 28' 0" north
The longitude of the observatory, deduced from 253 sets of lunar observations; each set consisting of six observed distances of the sun from the moon, or stars; fourteen of the above sets were only taken at the observatory, 105 sets being taken whilst cruising off Owhyhee; and 134 sets, when at Atooi and Onechcow; all these being reduced to the observatory, by means of the timekeeper		204 0 0 east.
The longitude of the observatory, by the timekeeper, on the 19th January, 1779, according to its rate, as found at Greenwich		214 7 15 east.
The longitude of the observatory, by the timekeeper, on the 19th January, 1779, according to its rate, corrected at different places, and last at Samanoodia Harbour, in Oonalaschka		203 37 22 east.
The daily rate of the timekeeper losing on mean time, was 9".6; and on the 2d February, 1779, it was 14 ^h 41' 1" slow for mean time.		
The variation of the compass by azimuths, observed on shore with four different compasses		8 6 0 east.

CHAPTER VII.—GENERAL ACCOUNT OF THE SANDWICH ISLANDS CONTINUED.—OF THE INHABITANTS.—THEIR ORIGIN.—PERSONS.—PERNICIOUS EFFECTS OF THE AVA.—NUMBERS.—DISPOSITION AND MANNERS.—REASONS FOR SUPPOSING THEM NOT CANNIBALS.—DRESS AND ORNAMENTS.—VILLAGES AND HOUSES.—FOOD.—OCCUPATIONS AND AMUSEMENTS.—ADDICTED TO GAMING.—THEIR EXTRAORDINARY DEXTERITY IN SWIMMING.—ARTS AND MANUFACTURES.—CURIOUS SPECIMENS OF THEIR SCULPTURE.—KIPPAREE, OR METHOD OF PAINTING CLOTH.—MATS.—FISHING-HOOKS.—CORDAGE.—SALT-PANS.—WARLIKE INSTRUMENTS.

THE inhabitants of the Sandwich Islands are undoubtedly of the same race with those of New Zealand, the Society and Friendly Islands, Easter Island, and the Marquesas; a race that possesses, without any intermixture, all the known lands between the latitudes of 47° south and 20° north, and between the longitudes of 184° and 260° east. This fact, which, extraordinary as it is, might be thought sufficiently proved by the striking similarity of their manners and customs, and the general resemblance of their persons, is established, beyond all controversy, by the absolute identity of their language. From what continent they originally emigrated, and by what steps they have spread through so vast a space, those who are curious in disquisitions of this nature may perhaps not find it very difficult to conjecture. It has been already observed that they bear strong marks of affinity to some of the Indian tribes that inhabit the Ladrões and Caroline Islands; and the same affinity may again be traced amongst the Battas and the Malays. When these events happened, is not so easy to ascertain; it was probably not very lately, as they are extremely populous, and have no tradition of their own origin but what is perfectly fabulous; whilst, on the other hand, the unadulterated state of their general language, and the simplicity which still prevails in their customs and manners, seem to indicate that it could not have been at any very distant period.

The natives of these islands are, in general, above the middle size, and well made; they walk very gracefully, run nimbly, and are capable of bearing great fatigue; though, upon the whole, the men are somewhat inferior, in point of strength and activity, to the Friendly Islanders, and the women less delicately limbed than those of Otaheite. Their complexion is rather darker than that of the Otaheiteans, and they are not altogether so handsome a people. However, many of both sexes had fine open countenances; and the women, in particular, had good eyes and teeth, and a sweetness and sensibility of look, which rendered them very engaging. Their hair is of a brownish black, and neither uniformly straight, like that of the Indians of America, nor uniformly curling, as amongst the African negroes, but varying, in this respect, like the hair of Europeans. One striking peculiarity in the features of every part of this great nation, I do not remember to have seen anywhere mentioned; which is, that even in the handsomest faces, there is always a fulness of the nostril, without any flatness or spreading of the nose, that distinguishes them from Europeans. It is not improbable that this may be the effect of their usual mode of salutation, which is performing by pressing the ends of their noses together.

The same superiority that is observable in the persons of the Erees, through all the other islands, is found also here. These whom we saw were, without exception, perfectly well formed; whereas the lower sort, besides their general inferiority, are subject to all the variety of make and figure that is seen in the populace of other countries. Instances of deformity are more frequent here than in any of the other islands. Whilst we were cruising off Owhyhee, two dwarfs came on board, one an old man, four feet two inches high, but exactly proportioned, and the other a woman, nearly of the same height. We afterward saw three natives who were hump-backed, and a young man, born without hands or feet. Squinting is also very common amongst them; and a man who, they said, had been born blind, was brought to us to be cured. Besides these particular imperfections, they are, in general, very subject to boils and ulcers, which we attributed to the great quantity of salt they eat with their flesh and fish. The Erees are very free from these complaints; but many of them suffer still more dreadful effects from the immoderate use of the *ava*. Those who were

OF THE INHABITANTS.—NUMBERS.—CANNIBALS.—DRESS AND AMUSEMENTS.—FISHING.—ARTS AND MANUFACTURES, OR METHOD OF PREPARING.—PANS.—WARLIKE

the race with those of the Marquesas; a race of the latitudes of 47°

This fact, which, striking similarity of customs, is established. From what continent so vast a space, those it very difficult to of affinity to some of the same affinity may events happened, is not extremely populous, and whilst, on the other simplicity which still not have been at any

and well made; they stigmata; though, upon activity, to the Friendly Islands. Their complexion rather so handsome as the women, in look, which rendered them uniformly straight, like the African negroes, being peculiarity in the have seen anywhere says a fulness of the them from Europeans. of salutation, which

through all the other option, perfectly well subject to all the countries. Instances of that we were cruising two inches high, but t. We afterward saw without hands or feet. said, had been bornfections, they are, in quantity of salt they complaints; but many of ea. Those who were

the most affected by it had their bodies covered with a white scurf, their eyes red and inflamed, their limbs emaciated, the whole frame trembling and paralytic, accompanied with a disability to raise the head. Though this drug does not appear universally to shorten life, as was evident from the cases of Terreeoboo, Kaoo, and some other chiefs, who were very old men; yet it invariably brings on an early and decrepit old age. It is fortunate that the use of it is made one of the peculiar privileges of the chiefs. The young son of Terreeoboo, who was about twelve years old, used to boast of his being admitted to drink *ava*, and showed us, with great triumph, a small spot in his side that was growing scaly.

There is something very singular in the history of this pernicious drug. When Captain Cook first visited the Society Islands, it was very little known among them. On his second voyage, he found the use of it very prevalent at Ulietea; but it had still gained very little ground at Otaheite. When we were last there, the dreadful havoc it had made was beyond belief, insomuch that the Captain scarce knew many of his old acquaintances. At the Friendly Islands, it is also constantly drunk by the chiefs, but so much diluted with water, that it does not appear to produce any bad effects. At Atooi, also, it is used with great moderation, and the chiefs are, in consequence, a much finer set of men there than in any of the neighbouring islands. We remarked, that by discontinuing the use of this root, the noxious effects of it soon wore off. Our good friend Kaireekkea and old Kaoo, were persuaded by us to refrain from it; and they recovered amazingly during the short time we afterwards remained in the island.

It may be thought extremely difficult to form any probable conjectures respecting the population of islands, with many parts of which we are but imperfectly acquainted. There are, however, two circumstances, that take away much of this objection: the first is, that the interior parts of the country are entirely uninhabited; so that, if the number of the inhabitants along the coast be known, the whole will be pretty accurately determined. The other is, that there are no towns of any considerable size, the habitations of the natives being pretty equally dispersed in small villages, round all their coasts. It is on this ground, that I shall venture at a rough calculation of the number of persons in this group of islands.

The bay of Karakakooa, in Owhyhee, is three miles in extent, and contains four villages of about eighty houses each; upon an average, in all three hundred and twenty; besides a number of straggling houses; which may make the whole amount to three hundred and fifty. From the frequent opportunities I had of informing myself on this head, I am convinced, that six persons to a house is a very moderate allowance; so that, on this calculation, the country about the bay contains two thousand one hundred souls. To these may be added fifty families, or three hundred persons, which I conceive to be nearly the number employed in the interior parts of the country, amongst their plantations; making in all two thousand four hundred. If, therefore, this number be applied to the whole extent of coast round the island, deducting a quarter for the uninhabited parts, it will be found to contain one hundred and fifty thousand. By the same mode of calculation, the rest of the islands will be found to contain the following numbers:—

Owhyhee	150,000
Mowee	65,400
Woahoo	60,200
Atooi	54,000
Morotoi	36,000
Oneechow	10,000
Ranai	20,400
Oreehoua	4,000
Total of inhabitants	400,000

I am pretty confident that, in this calculation, I have not exceeded the truth in the total amount. If we compare the numbers supposed to be in Owhyhee, with the population of Otaheite, as settled by Dr. Foster, this computation will be found very low. The proportion of coast in the latter island is, to that of Owhyhee, only as one to three: the

number of inhabitants in Otaheite, he states to be one hundred and twenty-one thousand five hundred; though, according to his own principles, it should be double that amount. Again, if we compare it with the medium population of the countries in Europe, the proportion will be in favour of the latter nearly as two to one.

Notwithstanding the irreparable loss we suffered from the sudden resentment and violence of these people, yet, in justice to their general conduct, it must be acknowledged, that they are of the most mild and affectionate disposition; equally remote from the extreme levity and fickleness of the Otaheiteans, and the distant gravity and reserve of the inhabitants of the Friendly Islands. They appear to live in the utmost harmony and friendship with one another. The women, who had children, were remarkable for their tender and constant attention to them; and the men would often lend their assistance in those domestic offices, with a willingness that does credit to their feelings. It must, however, be observed, that they fall very short of the other islanders, in that best test of civilisation, the respect paid to the women. Here they are not only deprived of the privilege of eating with the men, but the best sorts of food are *taboed*, or forbidden them. They are not allowed to eat pork, turtle, several kinds of fish, and some species of the plantains; and we were told that a poor girl got a terrible beating for having eaten on board our ship one of these interdicted articles. In their domestic life, they appear to live almost entirely by themselves, and though we did not observe any instances of personal ill-treatment, yet it was evident they had little regard or attention paid them.

The great hospitality and kindness with which we were received by them, have been already frequently remarked; and, indeed, they make the principal part of our transactions with them. Whenever we came on shore, there was a constant struggle who should be most forward in making us little presents, bringing refreshments, or showing some other mark of their respect. The whole people never failed of receiving us with tears of joy; seemed highly gratified with being allowed to touch us, and were constantly making comparisons between themselves and us, with the strongest marks of humility. The young women were not less kind and engaging, and, till they found, notwithstanding our utmost endeavours to prevent it, that they had reason to repent of our acquaintance, attached themselves to us without the least reserve. In justice, however, to the sex, it must be observed, that these ladies were probably all of the lower class of the people; for I am strongly inclined to believe, that, excepting the few whose names are mentioned in the course of our narrative, we did not see any woman of rank during our stay amongst them.

Their natural capacity seems, in no respect, below the common standard of mankind. Their improvements in agriculture, and the perfection of their manufactures, are certainly adequate to the circumstances of their situation, and the natural advantages they enjoy. The eager curiosity with which they attended the armourer's forge, and the many expedients they had invented, even before we left the islands, for working the iron they had procured from us, into such forms as were best adapted to their purposes, were strong proofs of docility and ingenuity. Our unfortunate friend, Kaneena, possessed a degree of judicious curiosity, and a quickness of conception, which was rarely met with amongst these people. He was very inquisitive after our customs and manners; asked after our king; the nature of our government; our numbers; the method of building our ships; our houses; the produce of our country; whether we had wars; with whom, and on what occasions, and in what manner they were carried on; who was our God; and many other questions of the same nature, which indicated an understanding of great comprehension.

We met with two instances of persons disordered in their minds, the one a man at Owlyhee, the other a woman at Oneehow. It appeared, from the particular attention and respect paid to them, that the opinion of their being inspired by the Divinity, which obtains among most of the nations of the East, is also received here.

Though the custom of eating the bodies of their enemies be not known, by positive evidence, to exist in any of the South Sea Islands, except New Zealand, yet it is extremely probable, that it was originally prevalent in them: all. The sacrificing human victims, which seems evidently to be a relic of this horrid practice, still obtains universally amongst these islanders; and it is easy to conceive, why the New Zealanders should retain the repast, which was

twenty-one thousand double that amount. in Europe, the pro-

ntment and violence acknowledged, that they in the extreme levity of the inhabitants of friendship with one tender and constant those domestic offices, er, be observed, that ion, the respect paid ating with the men, allowed to eat pork, were told that a poor of these interdicted by themselves, and it was evident they

e one a man at Owly- ticular attention and ivinity, which obtains

, by positive evidence, s extremely probable, victims, which seems onget these islanders ; he repeat, which was

probably the last act of these shocking rites, longer than the rest of their tribe, who were situated in more mild and fruitful climates. As the inhabitants of the Sandwich Islands certainly bear a nearer resemblance to those of New Zealand, both in their persons and dispositions, than to any other people of this family, so it was strongly suspected, by Mr. Anderson, that, like them, they still continue to feast on human flesh. The evidence on which he founds this opinion has been stated very fully in the eleventh chapter of the third book * ; but, as I always entertained great doubts of the justice of his conclusions, it may not be improper to take this occasion of mentioning the grounds on which I venture to differ from him. With respect to the information derived from the natives themselves, I shall only observe, that great pains were taken, by almost every officer on board, to come at the knowledge of so curious a circumstance ; and that, except in the two instances mentioned by Mr. Anderson, we found them invariably denying the existence of any such custom amongst them. It must be allowed, that Mr. Anderson's knowledge of their language, which was superior to that of any other person in either ship, ought certainly to give his opinion great weight ; at the same time, I must beg leave to remark, that, being present when he examined the man who had the small piece of salted flesh wrapped in cloth, it struck me very forcibly, that the signs he made use of meant nothing more, than that it was intended to be ate, and that it was very pleasant or wholesome to the stomach. In this opinion I was confirmed by a circumstance which came to our knowledge, after the death of my worthy and ingenious friend, viz. that almost every native of these islands carried about with him, either in his calabash, or wrapped up in a piece of cloth, and tied about his waist, a small piece of raw pork, lightly salted, which they considered as a great delicacy, and used now and then to taste of. With respect to the confusion the young lad was in (for he was not more than sixteen or eighteen years of age,) no one could have been surprised at it who had seen the eager and earnest manner in which Mr. Anderson questioned him.

The argument drawn from the instrument made with shark's teeth, and which is nearly of the same form with those used at New Zealand for cutting up the bodies of their enemies, is much more difficult to controvert. I believe it to be an undoubted fact, that this knife, if it may be so called, is never used by them in cutting the flesh of other animals. However, as the custom of offering human sacrifices, and of burning the bodies of the slain, is still prevalent here, it is not improbable that the use of this instrument is retained in those ceremonies. Upon the whole, I am strongly inclined to think, and particularly from this last circumstance, that the horrid practice in question has but lately ceased amongst these and other islands of the South Sea. Omai, when pressed on this subject, confessed, that, in the rage and fury of revenge, they would sometimes tear the flesh of their enemies, that were slain, with their teeth ; but positively denied that they ever eat it. This was certainly approaching as near the fact as could be ; but, on the other hand, the denial is a strong proof that the practice is actually ceased ; since in New Zealand, where it still exists, the inhabitants never made the smallest scruple of confessing it.

The inhabitants of these islands differ from those of the Friendly Isles, in suffering, almost universally, their beards to grow. There were, indeed, a few, amongst whom was the old king, that cut it off entirely ; and others that wore it only upon the upper lip. The same variety in the manner of wearing the hair is also observable here, as among the other islanders of the South Sea ; besides which, they have a fashion, as far as we know, peculiar to themselves. They cut it close on each side the head, down to the ears, leaving a ridge, of about a small hand's breadth, running from the forehead to the neck ; which, when the hair is thick and curling, has the form of the crest of the ancient helmet. Others wear large quantities of false hair, flowing down their backs in long ringlets, like the figure of the inhabitants of Horn Island, as seen in Dalrymple's Voyages ; and others, again, tie it into a single round bunch on the top of the head, almost as large as the head itself ; and some into five or six distinct bunches. They daub their hair with a grey clay, mixed with powdered shells, which they keep in balls, and chew into a kind of soft paste, when they have occasion to make use of it. This keeps the hair smooth ; and, in time, changes it to a pale yellow colour.

* See Vol. II. pp. 224. 239—240.

Both sexes wear necklaces, made of strings of small variegated shells; and an ornament, in the form of the handle of a cup, about two inches long, and half an inch broad, made of wood, stone, or ivory, finely polished, which is hung about the neck, by fine threads, of twisted hair, doubled sometimes an hundred fold. Instead of this ornament, some of them wear, on their breast, a small human figure, made of bone, suspended in the same manner. The fan, or fly-flap, is also an ornament used by both sexes. The most ordinary kind are made of the fibres of the cocoa-nut, tied loose, in bunches, to the top of a smooth polished handle. The tail-feathers of the cock, and of the tropic-bird, are also used in the same manner; but the most valuable are those which have the handle made of the arm or leg bones of an enemy slain in battle, and which are preserved with great care, and handed down, from father to son, as trophies of inestimable value.

NECKLACE AND PENDANT.

The custom of tattowing the body, they have in common with the rest of the natives of the South Sea Islands; but it is only at New Zealand and the Sandwich Islands that they tallow the face. There is also this difference between the two last, that, in the former, it is done in elegant spiral volutes, and in the latter, in straight lines, crossing each other at right angles. The hands and arms of the women are also very neatly marked, and they have a singular custom amongst them, the meaning of which we could never learn, that of tattowing the tip of the tongues of the females. From some information we received, relative to the custom of tattowing, we were inclined to think that it is frequently intended as a sign of mourning on the death of a chief, or any other calamitous event. For we were often told, that such a particular mark was in memory of such a chief; and so of the rest. It may be here, too, observed, that the lowest class are often tattowed with a mark that distinguishes them as the property of the several chiefs to whom they belong*.

The dress of the men generally consists only of a piece of thick cloth, called the *maro*, about ten or twelve inches broad, which they pass between the legs, and tie round the waist. This is the common dress of all ranks of people. Their mats, some of which are beautifully manufactured, are of various sizes, but mostly about five feet long and four broad. These they throw over their shoulders, and bring forward before; but they are seldom used, except in time of war, for which purpose they seem better adapted than for ordinary use, being of a thick and cumbersome texture, and capable of breaking the blow of a stone, or any blunt

FLY-FLAP.

* This is a singular circumstance, worthy of notice. We know that the New Zealanders affix an accurate copy of their *Amoco*, the tattowing of the face, to formal deeds, grants of lands, as their most binding signature, or evidence

of the act; and this practice of tattowing the slave with the master's mark may lead us to the true origin of heraldic signs, which not improbably originated in the sheep-folds.—Ed.

weapon. Their feet are generally bare, except when they have occasion to travel over the burnt stones, when they secure them with a sort of sandal, made of cords, twisted from the fibres of the cocon-nut. Such is the ordinary dress of these islanders ; but they have another, appropriated to their chiefs, and used on ceremonious occasions, consisting of a feathered cloak and helmet, which, in point of beauty and magnificence, is perhaps nearly equal to that of any nation in the world. As this dress has been already described with great accuracy and minuteness, I have only to add, that these cloaks are made of different lengths, in proportion to the rank of the wearer, some of them reaching no lower than the middle, others trailing on the ground. The inferior chiefs have also a short cloak, resembling the former, made of the long tail-feathers of the cock, the tropic and man-of-war birds, with a broad border of the small red and yellow feathers, and a collar of the same. Others again are made of feathers entirely white, with variegated borders. The helmet has a strong lining of wicker-work, capable of breaking the blow of any warlike instrument, and seems evidently designed for that purpose. These feathered dresses seemed to be exceedingly scarce, appropriated to persons of the highest rank, and worn by the men only. During the whole time we lay in Karakakooa Bay, we never saw them used but on three occasions : in the curious ceremony of Terreeboob's first visit to the ships ; by some chiefs who were seen among the crowd on shore when Captain Cook was killed ; and afterward when Eappo brought his bones to us.

The exact resemblance between this habit, and the cloak and helmet formerly worn by the Spaniards, was too striking not to excite our curiosity to inquire whether there were any probable grounds for supposing it to have been borrowed from them. After exerting every means in our power of obtaining information on this subject, we found that they had no immediate knowledge of any other nation whatever; nor any tradition remaining among them of these islands having been ever visited before by such ships as ours. But notwithstanding the result of these inquiries, the uncommon form of this habit appears to me a sufficient proof of its European origin; especially when added to another circumstance, that it is a singular deviation from the general resemblance in dress which prevails amongst all the branches of this tribe dispersed through the South Sea. We were driven indeed, by this conclusion, to a supposition of the shipwreck of some Buccaneer or Spanish ship in the neighbourhood of these islands. But when it is recollected, that the course of the Spanish trade from Acapulco to the Manillas is but a few degrees to the southward of the Sandwiel Islands, in their passage out, and to the northward, on their return, this supposition will not appear in the least improbable.

The common dress of the women bears a close resemblance to that of the men. They wrap round the waist a piece of cloth, that reaches half-way down the thighs; and sometimes, in the cool of the evening, they appeared with loose pieces of fine cloth thrown over their shoulders, like the women of Otaheite. The *pau* is another dress very frequently worn by the younger part of the sex. It is made of the thinnest and finest sort of cloth, wrapt several times round the waist, and descending to the leg; so as to have exactly the appearance of a full short petticoat. Their hair is cut short behind, and turned up before, as is the fashion among the Otaheiteans and New Zealanders; all of whom differ, in this respect, from the women of the Friendly Islands, who wear their hair long. We saw, indeed, one woman in Karakakoon Bay, whose hair was arranged in a very singular manner; it was turned up behind, and brought over the forehead, and then doubled back, so as to form a sort of shade to the face, like a small bonnet.

Their necklaces are made of shells, or of a hard, shining red berry. Besides which, they wear wreaths of dried flowers of the Indian mallow; and another beautiful ornament called *crave*, which is generally put about the neck, but is sometimes tied like a garland round the hair, and sometimes worn in both these ways at once. It is a ruff of the thickness of a finger, made, in a curious manner, of exceedingly small feathers, woven so close together as to form a surface as smooth as that of the richest velvet. The ground was generally of a red colour, with alternate circles of green, yellow, and black. Their bracelets, which were also of great variety, and very peculiar kinds, have been already described. At Atooi, some of the women wore little figures of the turtle, neatly formed of wood or ivory, tied on their fingers

in the manner we wear rings. Why this animal is thus particularly distinguished, I leave to the conjectures of the curious. There is also an ornament made of shells, fastened in rows on a ground of strong netting, so as to strike each other when in motion; which both men and women, when they dance, tie either round the arm or the ankle, or below the knee. Instead of shells, they sometimes make use of dogs' teeth, and a hard red berry resembling that of the holly.

There remains to be mentioned another ornament, if such it may be called. It is a kind of mask, made of a large gourd, with holes cut in it for the eyes and nose. The top was stuck full of small green twigs, which, at a distance, had the appearance of an elegant waving plume: and from the lower part hung narrow strips of cloth, resembling a beard. We never saw these masks worn but twice, and both times by a number of people together in

MAKES IN A BOAT.

a canoe, who came to the side of the ship laughing and drolling, with an air of masquerading. Whether they may not likewise be used as a defence for the head against stones, for which they seem best designed, or in some of their public games, or be merely intended for the purposes of mummery, we could never inform ourselves.

It has already been remarked, in a few instances, that the natives of the Sandwich Islands approach nearer to the New Zealanders, in their manners and customs, than to either of their less distant neighbours of the Society or Friendly Islands. This is in nothing more observable, than in their method of living together in small towns or villages, containing from about one hundred to two hundred houses, built pretty close together, without any order, and having a winding path leading through them. They are generally flanked toward the sea, with loose detached walls, which probably are meant both for the purposes of shelter and defence. The figure of their houses has been already described. They are of different sizes, from eighteen feet by twelve, to forty-five by twenty-four. There are some of a larger kind; being fifty feet long and thirty broad, and quite open at one end. These, they told us, were designed for travellers or strangers, who were only making a short stay.

In addition to the furniture of their houses, which has been accurately described by Captain Cook, I have only to add, that at one end are mats on which they sleep, with wooden pillows, or sleeping stools, exactly like those of the Chinese. Some of the better sort of houses have a court-yard before them, neatly railed in, with smaller houses built round it, for their servants. In this area they generally eat, and sit during the day-time. In the sides of the hills, and among the steep rocks, we also observed several holes or caves, which appeared to be inhabited; but as the entrance was defended with wicker-work, and we also found, in the only one that was visited, a stone fence running across it within,

we imagine they are principally designed for places of retreat, in case of an attack from an enemy.

The food of the lower class of people consists principally of fish and vegetables; such as yams, sweet potatoes, tarrow, plantains, sugar-canes, and bread-fruit. To these, the people of a higher rank add the flesh of hogs and dogs, dressed in the same manner as at the Society Islands. They also eat fowls of the same domestic kind with ours; but they are neither plentiful nor much esteemed by them. It is remarked by Captain Cook, that the bread-fruit and yams appeared scarce amongst them, and were reckoned great rarities. We found this not to be the case on our second visit; and it is therefore most probable, that, as these vegetables were generally planted in the interior parts of the country, the natives had not had time to bring them down to us, during the short stay we made in Wymoa Bay. Their fish they salt, and preserve in gourd-shells; not, as we at first imagined, for the purpose of providing against any temporary scarcity, but from the preference they give to salted meats. For we also found that the *Erees* used to pickle pieces of pork in the same manner, and esteemed it a great delicacy.

Their cookery is exactly of the same sort with that already described in the accounts that have been published of the other South Sea Islands: and though Captain Cook complains of the sourness of their tarrow puddings, yet, in justice to the many excellent meals they afforded us in Karakakooa Bay, I must be permitted to rescue them from this general censure, and to declare, that I never ate better, even in the Friendly Islands. It is, however, remarkable, that they had not got the art of preserving the bread-fruit, and making the sour paste of it called *Maihee*, as at the Society Islands; and it was some satisfaction to us, in return for their great kindness and hospitality, to have it in our power to teach them this useful secret. They are exceedingly cleanly at their meals; and their mode of dressing both their animal and vegetable food was universally allowed to be greatly superior to ours. The chiefs constantly begin their meal with a dose of the extract of pepper-root, brewed after the usual manner. The women eat apart from the men, and are *tubooed*, or forbidden, as has been already mentioned, the use of pork, turtle, and particular kinds of plantains. However, they would eat pork with us in private; but we could never prevail upon them to touch the two last articles.

The way of spending their time appears to be very simple, and to admit of little variety. They rise with the sun; and, after enjoying the cool of the evening, retire to rest a few hours after sunset. The making of canoes and mats forms the occupations of the *Erees*; the women are employed in manufacturing cloth; and the *Tootoos* are principally engaged in the plantations and fishing. Their idle hours are filled up with various amusements. Their young men and women are fond of dancing; and, on more solemn occasions, they have boxing and wrestling matches, after the manner of the Friendly Islands; though, in all these respects, they are much inferior to the latter.

Their dances have a much nearer resemblance to those of the New Zealanders, than of the Otahiteans or Friendly Islanders. They are preaced with a slow, solemn song, in which all the party join, moving their legs, and gently striking their breasts, in a manner and with attitudes that are perfectly easy and graceful; and so far they are the same with the dances of the Society Islands. When this has lasted about ten minutes, both the tune and the motions gradually quicken, and end only by their inability to support their fatigue; which part of the performance is the exact counterpart of that of the New Zealanders; and (as it is among them) the person who uses the most violent action, and holds out the longest, is applauded as the best dancer. It is to be observed, that, in this dance, the women only take a part, and that the dancing of the men is nearly of the same kind with what we saw of the small parties at the Friendly Islands; and which may, perhaps, with more propriety, be called the accompaniment of songs, with corresponding and graceful motions of the whole body. Yet, as we were spectators of boxing exhibitions of the same kind with those we were entertained with at the Friendly Islands, it is probable that they had likewise their grand ceremonious dances, in which numbers of both sexes assisted. Their music is also of a ruder kind, having neither flutes nor reeds, nor instruments of any other sort, that we saw, except drums of various sizes. But their songs, which they sung

in parts*, and accompany with a gentle motion of the arms, in the same manner as the Friendly Islanders, had a very pleasing effect.

It is very remarkable, that the people of these islands are great gamblers. They have a game very much like our draughts; but, if one may judge from the number of squares, it is much more intricate. The board is about two feet long, and is divided into two hundred and thirty-eight squares of which there are fourteen in a row, and they make use of black and white pebbles, which they move from square to square. There is another game, which consists in hiding a stone under a piece of cloth, which one of the party spreads out, and rumples in such a manner, that the place where the stone lies is difficult to be distinguished. The antagonist, with a stick, then strikes the part of the cloth where he imagines the stone to be, and as the chances are, upon the whole, considerably against his hitting it, odds of all degrees, varying with the opinion of the skill of the parties, are laid on the side of him who hides.

Besides these games, they frequently amuse themselves with racing-matches between the boys and girls: and here again they wager with great spirit. I saw a man in a most violent rage, tearing his hair, and beating his breast, after losing three hatchets at one of these races which he had just before purchased from us with half his substance.

Swimming is not only a necessary art, in which both their men and women are more expert than any people we had hitherto seen, but a favourite diversion amongst them. One particular mode, in which they sometimes amused themselves with this exercise in Karakakoa Bay, appeared to us most perilous and extraordinary, and well deserving a distinct relation. The surf, which breaks on the coast round the bay, extends to the distance of about one hundred and fifty yards from the shore, within which space the surges of the sea, accumulating from the shallowness of the water, are dashed against the beach with prodigious violence. Whenever, from stormy weather, or any extraordinary swell at

* As this circumstance, of their singing in parts, has been much doubted by persons eminently skilled in music, and would be exceedingly curious if it was clearly ascertained, it is to be lamented that it cannot be more positively authenticated. Captain Burney, and Captain Phillips of the *Marines*, who both have a tolerable knowledge of music, have given it as their opinion that they did sing in parts; that is to say, that they sung together in different notes, which formed a pleasing harmony. These gentlemen have fully testified, that the Friendly Islanders undoubtedly studied their performances before they were exhibited to public; that they had an idea of different notes being useful in harmony; and also, that they rehearsed their compositions in private, and threw out the inferior voices before they ventured to appear before those who were supposed to be judges of their skill in music.

In their regular concerts each man had a bamboo, which was of a different length, and gave a different tone: these they beat against the ground, and each performer, assisted by the note given by this instrument, repeated the same note, accompanying it by words, by which means it was rendered sometimes short and sometimes long. In this manner they sung in chorus, and not only produced octaves to each other, according to their different species of voice, but fell on concords, such as were not disagreeable to the ear.

Now, to overturn this fact by the reasoning of persons who did not hear those performances, is rather an arduous task. And yet there is great improbability that any uncivilised people should, by accident, arrive at this degree of perfection in the art of music, which we imagine can only be attained by dint of study, and knowledge of the system and theory upon which musical composition is founded. Such miserable jargon as our country psalm-singers practise, which may be justly deemed the lowest class of counterpoint, or singing in several parts, cannot be acquired in the coarse manner in which it is performed in

the churches, without considerable time and practice. It is, therefore, scarcely credible, that a people semi-barbarous should naturally arrive at any perfection in that art which it is much doubted whether the Greeks and Romans, with all their refinements in music, ever attained, and which the Chinese, who have been longer civilised than any people on the globe, have not yet found out.

If Captain Burney (who, by the testimony of his father, perhaps the greatest musical theorist of this or any other age, was able to have done it) had written down, in European notes, the concords that these people sung, and if these concords had been such as European ears could tolerate, there would have been no longer doubt of the fact; but, as it is, it would, in my opinion, be a rash judgment to venture to affirm that they did or did not understand counterpoint; and therefore I fear that this curious matter must be considered as still remaining undecided.

[That the natives did sing in parts, and that although their knowledge was far from scientific, and depended wholly on the delicacy of ear which they possess, their songs were both pleasing and eloquent, is confirmed by the testimony of subsequent voyagers and resident missionaries. That their taste or their knowledge has been much improved by the introduction of English or American psalmody, is, and we are sorry to be obliged to say so, very doubtful. The sarcasm of Dr. Douglas, in the above note, when he refers to the church music of his day, is not wholly inapplicable to present times, but a better taste fortunately begins to prevail, and England may at length free herself from the stigma which, since the days of the Commonwealth, has too deservedly attached itself to her, that of being the most unmusical nation of Europe, and, instead of marring the native melodies of the natives of the South Seas, may help them to improve the harmonies of which they possessed some knowledge, however imperfect, when first we became acquainted with them.]—Ed.

sea, the impetuosity of the surf is increased to its utmost height, they choose that time for this amusement, which is performed in the following manner:—Twenty or thirty of the natives, taking each a long narrow board, rounded at the ends, set out together from the shore. The first wave they meet they plunge under, and suffering it to roll over them, rise again beyond it, and make the best of their way, by swimming, out into the sea. The second wave is encountered in the same manner with the first; the great difficulty consisting in seizing the proper moment of diving under it, which, if missed, the person is caught by the surf, and driven back again with great violence; and all his dexterity is then required to prevent himself from being dashed against the rocks. As soon as they have gained, by these repeated efforts, the smooth water beyond the surf, they lay themselves at length on their board, and prepare for their return. As the surf consists of a number of waves, of which every third is remarked to be always much larger than the others, and to flow higher on the shore, the rest breaking in the intermediate space, their first object is to place themselves on the summit of the largest surge, by which they are driven along with amazing rapidity toward the shore. If by mistake they should place themselves on one of the smaller waves, which breaks before they reach the land, or should not be able to keep their plank in a proper direction on the top of the swell, they are left exposed to the fury of the next, and, to avoid it, are obliged again to dive and regain the place from which they set out. Those who succeed in their object of reaching the shore, have still the greatest danger to encounter. The coast being guarded by a chain of rocks, with here and there a small opening between them, they are obliged to steer their board through one of these, or, in case of failure, to quit it before they reach the rocks, and, plunging under the wave, make the best of their way back again. This is reckoned very disgraceful, and is also attended with the loss of the board, which I have often seen, with great terror, dashed to pieces at the very moment the islander quitted it. The boldness and address with which we saw them perform these difficult and dangerous manœuvres was altogether astonishing, and is scarcely to be credited*. An accident, of which I was a near spectator, shows at how early a period they are so far familiarised to the water, as both to lose all fears of it, and to set its dangers at defiance. A canoe being overset, in which was a woman with her children, one of them an infant, who, I am convinced was not more than four years old, seemed highly delighted with what had happened, swimming about at its ease, and playing a hundred tricks, till the canoe was put to rights again.

Besides the amusements I have already mentioned, the young children have one which was much played at, and showed no small degree of dexterity. They take a short stick, with a peg sharpened at both ends, running through one extremity of it, and extending about an inch on each side; and throwing up a ball made of green leaves moulded together, and secured with twine, they catch it on the point of the peg; and immediately throwing it up again from the peg, they turn the stick round, and thus keep catching it on each peg alternately, without missing it, for a considerable time. They are not less expert at another game of the same nature, tossing up in the air and catching in their turns a number of these balls; so that we frequently saw little children thus keep in motion five at a time. With this latter play the young people likewise divert themselves at the Friendly Islands.

The great resemblance which prevails in the mode of agriculture and navigation amongst all the inhabitants of the South Sea Islands, leaves me very little to add on those heads. Captain Cook has already described the figure of the canoes we saw at Atooi. Those of the other islands were precisely the same; and the largest we saw was a double canoe belonging to Terreebooo, which measured seventy feet in length, three and a half in depth, and twelve in breadth; and each was hollowed out of one tree.

The progress they have made in sculpture, their skill in painting cloth and the manufacturing of mats, have been all particularly described. The most curious specimens of the former which we saw during our second visit, are the bowls in which the chiefs drink *ava*. These are usually about eight or ten inches in diameter, perfectly round, and beautifully polished. They are supported by three, and sometimes four small human figures, in various

attitudes. Some of them rest on the hands of their supporters, extended over the head; others on the head and hands, and some on the shoulders. The figures, I am told, are accurately proportioned and neatly finished, and even the anatomy of the muscles in supporting the weight well expressed.

Their cloth is made of the same materials and in the same manner as at the Friendly and Society Islands. That which is designed to be painted is of a thick and strong texture, several folds being beat and incorporated together; after which it is cut in breadths about two or three feet wide, and is painted in a variety of patterns, with a comprehensiveness and regularity of design that bespeaks infinite taste and fancy. The exactness with which the most intricate patterns are continued is the more surprising, when we consider that they have no stamps, and that the whole is done by the eye with pieces of bamboo cane dipped in paint, the hand being supported by another piece of the cane, in the manner practised by our painters. Their colours are extracted from the same berries and other vegetable substances as at Otahite, which have been already described by former voyagers. The business of painting belongs entirely to the women, and is called *kipparee*; and it is remarkable, that they always gave the same name to our writing. The young women would often take the pen out of our hands, and show us that they knew the use of it as well as we did; at the same time telling us that our pens were not so good as theirs. They looked upon a sheet of written paper, as a piece of cloth striped after the fashion of our country; and it was not without the utmost difficulty, that we could make them understand, that our figures had a meaning in them which theirs had not.

Their mats are made of the leaves of the *pandanus*, and, as well as their cloths, are beautifully worked in a variety of patterns, and stained of different colours. Some have a ground of pale green, spotted with squares, or rhomboids of red; others are of a straw colour, spotted with green; and others are worked with beautiful stripes, either in straight or waving lines of red and brown. In this article of manufacture, whether we regard the strength, fineness, or beauty, they certainly excel the whole world.

Their fishing-hooks are made of mother-of-pearl, bone, or wood, pointed and barbed with small bones, or tortoise-shell. They are of various sizes and forms; but the most common are about two or three inches long, and made in the shape of a small fish, which serves as a bait, having a bunch of feathers tied to the head or tail. Those with which they fish for sharks are of a very large size, being generally six or eight inches long. Considering the materials of which these hooks are made, their strength and neatness are really astonishing; and in fact we found them upon trial much superior to our own. The line which they use for fishing, for making nets, and for other domestic purposes, is of different degrees of fineness, and is made of the bark of the *touta*, or cloth tree, neatly and evenly twisted, in the same manner as our common twine; and may be continued to any length. They have a finer sort, made of the bark of a small shrub called *areemah*; and the finest is made of human hair; but this last is chiefly used for things of ornament. They also make cordage of a stronger kind, for the rigging of their canoes, from the fibrous coatings of the cocoa-nuts. Some of this we purchased for our own use, and found it well adapted to the smaller kinds of running-rigging. They likewise make another sort of cordage, which is flat, and exceedingly strong, and used principally in lashing the roofing of their houses, or whatever they wish to fasten tight together. This last is not twisted like the former sorts, but is made of the fibrous strings of the cocoa-nut's coat, plaited with the fingers, in the manner our sailors make their points for the reefing of sails.

The gourds, which grow to so enormous a size, that some of them are capable of containing from ten to twelve gallons, are applied to all manner of domestic purposes; and in order to fit them the better to their respective uses, they have the ingenuity to give them different forms, by tying bandages round them during their growth. Thus, some of them are of a long cylindrical form, as best adapted to contain their fishing tackle; others are of a dish form, and these serve to hold their salt and salted provisions, their puddings, vegetables, &c.; which two sorts have neat close covers, made likewise of the gourd; others again are exactly the shape of a bottle with a long neck, and in these they keep their water. They have likewise a method of scoring them with a heated instrument, so as to give them the appearance of being painted, in a variety of neat and elegant designs.

Amongst their arts, we must not forget that of making salt, with which we were amply supplied, during our stay at these islands, and which was perfectly good of its kind. Their salt-pans are made of earth, lined with clay; being generally six or eight feet square, and about eight inches deep. They are raised upon a bank of stones near the high-water mark, from whence the salt water is conducted to the foot of them, in small trenches, out of which they are filled, and the sun quickly performs the necessary process of evaporation. The salt we procured at Atooi and Oneehew, on our first visit, was of a brown and dirty sort; but that which we afterward got in Karakakooa Bay was white, and of a most excellent quality, and in great abundance. Besides the quantity we used in salting pork, we filled all our empty casks, amounting to sixteen puncheons, in the Resolution only.

Their instruments of war are spears; daggers, called pahooas; clubs, and slings. The spears are of two sorts, and made of a hard solid wood, which has much the appearance of mahogany. One sort is from six to eight feet in length, finely polished, and gradually increasing in thickness from the extremity till within about half a foot of the point, which tapers suddenly, and is furnished with four or six rows of barbs. It is not improbable, that these might be used in the way of darts. The other sort, with which we saw the warriors at Owhyhee and Atooi most armed, are twelve or fifteen feet long, and instead of being barbed, terminate toward the point, like their daggers. The dagger, or pahooa, is made of heavy black wood, resembling ebony. Its length is from one to two feet, with a string passing through the handle, for the purpose of suspending it to the arm. The clubs are made indifferently of several sorts of wood. They are of rude workmanship, and of a variety of shapes and sizes. The slings have nothing singular about them; and in no respect differ from our common slings, except that the stone is lodged on a piece of matting instead of leather.

CHAPTER VIII.—GENERAL ACCOUNT OF THE SANDWICH ISLANDS CONTINUED.—GOVERNMENT.—PEOPLE DIVIDED INTO THREE CLASSES.—POWER OF EREE-TABOO.—GENEALOGY OF THE KINGS OF OWHYHEE AND MOWEE.—POWER OF THE CHIEFS.—STATE OF THE INFERIOR CLASS. PUNISHMENT OF CRIMES.—RELIGION.—SOCIETY OF PRIESTS.—THE OPOPO.—THEIR IDOLS. SONGS CHANTED BY THE CHIEFS, BEFORE THEY DRINK AWA.—HUMAN SACRIFICES.—CUSTOM OF KNOCKING OUT THE FORE-TEETH.—NOTIONS WITH REGARD TO A FUTURE STATE.—MARRIAGES.—REMARKABLE INSTANCE OF JEALOUSY.—FUNERAL RITES.

THE people of these islands are manifestly divided into three classes. The first are the *Erees*, or chiefs, of each district; one of whom is superior to the rest, and is called at Owhyhee *Eree-taboo*, and *Eree Moea*. By the first of these words they express his absolute authority; and by the latter, that all are obliged to prostrate themselves (or put themselves to sleep, as the word signifies) in his presence. The second class are those who appear to enjoy a right of property, without authority. The third are the *toutours*, or servants, who have neither rank nor property. It is not possible to give anything like a systematical account of the subordination of these classes to each other, without departing from that strict veracity, which, in works of this nature, is more satisfactory than conjectures, however ingenious. I will therefore content myself with relating such facts as we were witnesses to ourselves, and such accounts as we thought could be depended upon; and shall leave the reader to form, from them, his own ideas of the nature of their government.

The great power and high rank of Terreeoboo, the *Eree-taboo* of Owhyhee, was very evident, from the manner in which he was received at Karakakooa on his first arrival. All the natives were seen prostrated at the entrance of their houses, and the canoes, for two days before, were *tabooed*, or forbidden to go out till he took off the restraint. He was, at this time, just returned from Mowee, for the possession of which he was contending in favour of his son Teewarao, who had married the daughter and only child of the late king of that island, against Taheeterree, his surviving brother. He was attended in this expedition by many of his warriors; but whether their service was voluntary, or the condition on which they hold their rank and property, we could not learn. That he collects tribute from the

subordinate chiefs, we had a very striking proof in the instance of Kaoo, which has been already related in our transactions of the 2d and 3d of February.

I have before mentioned, that the two most powerful chiefs of these islands are Terreeoboo of Owlyhee, and Perreoranee of Woahoo; the rest of the smaller isles being subject to one or other of these; Mowee, and its dependencies, being, at this time, claimed, as we have just observed, by Terreeoboo for Teewarro his son and intended successor; Atooi and Onceheow being governed by the grandsons of Perreoranee.

The following genealogy of the Owlyhee and Mowee kings, which I collected from the priests, during our residence at the Morai in Karakakooa Bay, contains all the information I could procure relative to the political history of these islands. This account reaches to four chiefs, predecessors of the present; all of whom they represent to have lived to an old age. Their names and successions are as follow:

First, Poorahoo Awlykaia was king of Owlyhee, and had an only son, called Neerooagooa. At this time Mowee was governed by Mokoakea; who also an only son, named Papikaneou. Secondly, Neerooagooa had three sons, the eldest named Kahavee; and Papikaneou, of the Mowee race, had an only son, named Kaowreeka. Thirdly, Kahavee had an only son, Kayenewee a mummow; and Kaowreeka, the Mowee king, had two sons, Maiha-maiha, and Taheeteree; the latter of whom is now, by one party, acknowledged chief of Mowee. Fourthly, Kayenewee a mummow had two sons, Terreeoboo and Kaihoaa; and Maiha-maiha, king of Mowee, had no son, but left a daughter, called Roaho. Fifthly, Terreeoboo, the present king of Owlyhee, had a son named Teewarro, by Rora-rora, the widow of Maiha-maiha, late king of Mowee; and this son has married Roaho, his half sister, in whose right he claims Mowee and its appendages.

Taheeteree, the brother of the late king, supported by a considerable party, who were not willing that the possessions should go into another family, took up arms, and opposed the rights of his niece. When we were first off Mowee, Terreeoboo was there with his warriors to support the claims of his wife, his son, and daughter-in-law, and had fought a battle with the opposite party, in which Taheeteree was worsted. We afterward understood, that matters had been compromised, and that Taheeteree is to have the possession of the three neighbouring islands during his life; that Teewarro is acknowledged the chief of Mowee, and will also succeed to the kingdom of Owlyhee on the death of Terreeoboo; and also to the sovereignty of the three islands, contiguous to Mowee, on the death of Taheeteree. Teewarro has been lately married to his half sister; and should he die without issue, the government of these islands descends to Maiha-maiha, whom we have often had occasion to mention, he being the son of Kaihoaa, the deceased brother of Terreeoboo. Should he also die without issue, they could not tell who would succeed; for the two youngest sons of Terreeoboo, one of whom he appears to be exceedingly fond of, being born of a woman of no rank, would, from this circumstance, be debarred all right of succession. We had not an opportunity of seeing queen Rora-rora, whom Terreeoboo had left behind at Mowee; but we have already had occasion to take notice, that he was accompanied by Kane Kaberaia, the mother of the two youths, to whom he was very much attached. From this account of the genealogy of the Owlyhee and Mowee monarchs, it is pretty clear that the government is hereditary: which also makes it very probable, that the inferior titles, and property itself, descend in the same course. With regard to Perreoranee, we could only learn, that he is an *Eree-taboo*; that he was invading the possession of Taheeteree, but on what pretence we were not informed; and that his grandsons governed the islands to leeward.

The power of the *Erees* over the inferior classes of people appears to be very absolute. Many instances of this occurred daily during our stay amongst them, and have been already related. The people, on the other hand, pay them the most implicit obedience; and this state of servility has manifestly had a great effect in debasing both their minds and bodies. It is, however, remarkable, that the chiefs were never guilty, as far at least as came within my knowledge, of any acts of cruelty or injustice, or even of insolent behaviour toward them; though, at the same time, they exercised their power over one another in the most haughty and oppressive manner. Of this I shall give two instances. A chief of the lower order had

behaved with great civility to the master of the ship, when he went to examine Karakakooa bay, the day before the ship first arrived there; and, in return, I afterward carried him on board, and introduced him to Captain Cook, who invited him to dine with us. While we were at table, Parcea entered, whose face but too plainly manifested his indignation, at seeing our guest in so honourable a situation. He immediately seized him by the hair of the head, and was proceeding to drag him out of the cabin, when the captain interfered; and, after a great deal of altercation, all the indulgence we could obtain, without coming to a quarrel with Parcea, was, that our guest should be suffered to remain, being seated upon the floor, whilst Parcea filled his place at the table. At another time, when Terrecoboo first came on board the Resolution, Maiba-maiba, who attended him, finding Parcea on deck, turned him out of the ship in the most ignominious manner; and yet Parcea, we certainly knew, to be a man of the first consequence.

How far the property of the lower class is secured against the rapacity and despotism of the great chiefs, I cannot say; but it should seem, that it is sufficiently protected against private theft, or mutual depredation. For not only their plantations, which are spread over the whole country, but also their houses, their hogs, and their cloth, were left unguarded, without the smallest apprehensions. I have already remarked, that they not only separate their possessions by walls in the plain country, but that, in the woods likewise, wherever the horse-plantains grow, they make use of small white flags, in the same manner, and for the same purpose of discriminating property, as they do bunches of leaves at Otahiti. All which circumstances, if they do not amount to proofs, are strong indications that the power of the chiefs, where property is concerned, is not arbitrary; but, at least, so far circumscribed and ascertained, as to make it worth the while for the inferior orders to cultivate the soil, and to occupy their possessions distinct from each other. With respect to the administration of justice, all the information we could collect was very imperfect and confined. Whenever any of the lowest class of people had a quarrel amongst themselves, the matter in dispute was referred to the decision of some chief, probably the chief of the district, or the person to whom they appertained. If an inferior chief had given cause of offence to one of a higher rank, the feelings of the latter at the moment seemed the only measure of his punishment. If he had the good fortune to escape the first transports of his superior's rage, he generally found means, through the mediation of some third person, to compound for his crime by a part or the whole of his property and effects. These were the only facts that came to our knowledge on this head.

The religion of these people resembles, in most of its principal features, that of the Society and Friendly Islands. Their Morais, their Whattas, their idols, their sacrifices, and their sacred songs, all of which they have in common with each other, are convincing proofs, that their religious notions are derived from the same source. In the length and number of their ceremonies, this branch indeed far exceeds the rest; and though in all these countries, there is a certain class of men, to whose care the performance of their religious rites is committed; yet we had never met with a regular society of priests, till we discovered the cloisters of Kakooa in Karakakooa Bay. The head of this order was called Orono*; a title which we imagined to imply something highly sacred, and which, in the person of Omeeah, was honoured almost to adoration. It is probable, that the privilege of entering into this order (at least as to the principal offices in it,) is limited to certain families. Omeeah, the Orono, was the son of Kaoo, and the uncle of Kaireekera; which last presided, during the absence of his grandfather, in all religious ceremonies at the Morai. It was also remarked, that the child of Omeeah, an only son, about five years old, was never suffered to appear without a number of attendants, and such other marks of care and solicitude, as we saw no other like instance of. This seemed to indicate, that his life was an object of the greatest moment, and that he was destined to succeed to the high rank of his father. It has been mentioned, that the title of Orono, with all its honours, was given to Captain Cook; and it is also certain, that they regarded us, generally, as a race of people superior to themselves; and used often

* The meaning of this word has been before explained, in note, page 372. These priests were attached to the service of Orono, and hence the title of their chief.—Ed.

to say, that great Eatooa dwelled in our country. The little image, which we have before described, as the favourite idol on the Morai in Karakakooa Bay, they call *Koonoorakaiee*, and said it was Terreeboob's god; and that he also resided amongst us.

There are found an infinite variety of these images, both on the Morais, and within and without their houses, to which they gave different names; but it soon became obvious to us in how little estimation they were held, from their frequent expressions of contempt of them, and from their even offering them to sale for trifles. At the same time, there seldom failed to be some one particular figure in favour, to which, whilst this performance lasted, all their adoration was addressed. This consisted in arraying it in red cloth; beating their drums, and singing hymns before it; laying bunches of red feathers, and different sorts of vegetables, at its feet; and exposing a pig, or a dog, to rot on the whatta that stood near it. In a bay to the southward of Karakakooa, a party of our gentlemen were conducted to a large house, in which they found the black figure of a man, resting on his fingers and toes, with his head inclined backward; the limbs well formed and exactly proportioned, and the whole beautifully polished. This figure the natives called *Mave*; and round it were placed thirteen others of rude and distorted shapes, which they said were the Eatocs of several deceased chiefs, whose names they recounted. The place was full of whattas, on which lay the remains of their offerings. They likewise give a place in their houses to many ludicrous and some obscene idols, like the Priapus of the ancients.

It hath been remarked, by former voyagers, that both among the Society and Friendly Islanders, an adoration is paid to particular birds; and I am led to believe, that the same custom prevails here; and that, probably, the raven is the object of it, from seeing two of these birds tame at the village of Kakooa, which they told me were Eatooas; and, refusing everything I offered for them, cautioned me, at the same time, not to hurt or offend them. Amongst their religious ceremonies may be reckoned the prayers and offerings made by the priests before their meals. Whilst the ava is chewing, of which they always drink before they begin their repast, the person of the highest rank takes the lead, in a sort of hymn, in which he is presently joined by one, two, or more of the company; the rest moving their bodies, and striking their hands gently together, in concert with the singers. When the ava is ready, cups of it are handed about, to those who do not join in the song, which they keep in their hands till it is ended; when, uniting in one loud response, they drink off their cup. The performers of the hymn are then served with ava, who drink it after a repetition of the same ceremony; and, if there be present one of a very superior rank, a cup is, last of all presented to him, which, after chanting some time alone, and being answered by the rest, and pouring a little out on the ground, he drinks off. A piece of the flesh that is dressed is next cut off, without any selection of the part of the animal; which, together with some of the vegetables, being deposited at the foot of the image of the Eatooa, and a hymn chanted, their meal commences. A ceremony of much the same kind is also performed by the chiefs, whenever they drink ava, between their meals.

Human sacrifices are more frequent here, according to the account of the natives themselves, than in any other islands we visited. These horrid rites are not only had recourse to upon the commencement of war and preceding great battles, and other signal enterprises; but the death of any considerable chief calls for a sacrifice of one or more *Tortoises*, according to his rank; and we were told, that ten men were destined to suffer on the death of Terreeboob. What may (if anything possibly can) lessen, in some small degree, the horror of this practice, is, that the unhappy victims have not the most distant intimation of their fate. Those who are fixed upon to fall, are set upon with clubs wherever they happen to be; and, after being despatched, are brought dead to the place where the remainder of the rites are completed. The reader will here call to his remembrance the skulls of the captives that had been sacrificed at the death of some great chief, and which were fixed on the rails round the top of the Morai at Kakooa. We got a farther piece of intelligence upon this subject at the village of Kowrowa; where, on our inquiring into the use of a small piece of ground, inclosed with a stone fence, we were told that it was an *Here-cere*, or burying-ground of a chief; and there, added our informer, pointing to one of the corners, lie the *tangata* and *waheene taboo*, or the man and woman who were sacrificed at his funeral.

To this class of their customs may also be referred that of knocking out their fore-teeth. Scarce any of the lower people, and very few of the chiefs, were seen, who had not lost one or more of them; and we always understood, that this voluntary punishment, like the cutting off the joints of the finger at the Friendly Islands, was not inflicted on themselves from the violence of grief on the death of their friends, but was designed as a propitiatory sacrifice to the *Eatooa*, to avert any danger or mischief to which they might be exposed.

We were able to learn but little of their notions with regard to a future state. Whenever we asked them, whither the dead were gone? we were always answered, that the breath, which they appeared to consider as the soul, or immortal part, was gone to the *Eatooa*; and, on pushing our inquiries farther, they seemed to describe some particular place, where they imagined the abode of the deceased to be; but we could not perceive, that they thought, in this state, either rewards or punishments awaited them.

Having promised the reader, in the first chapter, an explanation of what was meant by the word *taboo*, I shall, in this place, lay before him the particular instances that fell under our observation, of its application and effects. On our inquiring into the reasons of the interdiction of all intercourse between us and the natives, the day preceding the arrival of Terrecoboo, we were told, that the bay was *tabooed*. The same restriction took place at our request, the day we interred the bones of Captain Cook. In these two instances the natives paid the most implicit and scrupulous obedience; but whether on any religious principle, or merely in deference to the civil authority of their chiefs, I cannot determine. When the ground near our observatories, and the place where our masts lay, were *tabooed*, by sticking small wands round them, this operated in a manner not less efficacious. But though this mode of consecration was performed by the priests only, yet still, as the men ventured to come within the space, when invited by us, it should seem, that they were under no religious apprehensions; and that their obedience was limited to our refusal only. The women could, by no means, be induced to come near us; but this was probably on account of the Morai adjoining; which they are prohibited, at all times, and in all the islands of those seas, from approaching. Mention hath been already made, that women are always *tabooed*, or forbidden to eat certain kind of meats. We also frequently saw several at their meals, who had the meat put into their mouths by others; and, on our asking the reason of this singularity, were told that they were *tabooed*, or forbidden to feed themselves. This prohibition, we understood, was always laid on them, after they had assisted at any funeral, or touched a dead body, and also on other occasions. It is necessary to observe, that, on these occasions, they apply the word *taboo* indifferently both to persons and things. Thus they say, the natives were *tabooed*, or the bay was *tabooed*, and so of the rest. This word is also used to express anything sacred, or eminent, or devoted. Thus the king of Owhyhee was called *Eree-taboo*; a human victim *tangata-taboo*; and, in the same manner, among the Friendly Islands, Tonga, the island where the king resides, is named *Tonga-taboo*.

Concerning their marriages, I can afford the reader little farther satisfaction than informing him that such a relation or compact exists amongst them. I have already had occasion to mention, that at the time Terrecoboo had left his queen Rora-rora at Mowee, he was attended by another woman, by whom he had children, and to whom he was very much attached; but how far polygamy, properly speaking, is allowed, or how far it is mixed with concubinage, either with respect to the king, the chiefs, or among the inferior orders, too few facts came to our knowledge to justify any conclusions. It hath also been observed, that, except Kainee Kabareea, and the wife of the Orono, with three women whom I shall have occasion hereafter to mention, we never saw any female of high rank. From what I had an opportunity of observing of the domestic concerns of the lowest class, the house seemed to be under the direction of one man and woman, and the children in the like state of subordination as in civilised countries.

It will not be improper in this place to take notice, that we were eye-witnesses of a fact, which, as it was the only instance we saw of anything like jealousy among them, shows at the same time that not only fidelity but a degree of reserve is required from the married women of consequence. At one of the entertainments of boxing, Omeeah was observed to

rise from his place two or three times, and to go up to his wife with strong marks of displeasure, ordering her, as it appeared to us from his manner, to withdraw. Whether it was, that being very handsome he thought she drew too much of our attention; or without being able to determine what other reason he might have for his conduct, it is but justice to say that there existed no real cause of jealousy. However, she kept her place; and when the entertainment was over joined our party, and soliciting some trifling presents, was given to understand that we had none about us, but that if she would accompany us toward our tent she should return with such as she liked best. She was accordingly walking along with us, which Onceah observing, followed in a violent rage, and seizing her by the hair began to inflict with his fists a severe corporal punishment. This sight, especially as we had innocently been the cause of it, gave us much concern, and yet we were told that it would be highly improper to interfere between man and wife of such high rank. We were, however, not left without the consolation of seeing the natives at last interpose; and had the farther satisfaction of meeting them together the next day, in perfect good humour with each other; and what is still more singular, the lady would not suffer us to remonstrate with her husband on his treatment of her, which we were much inclined to do, and plainly told us that he had done no more than he ought.

Whilst I was ashore at the observatory at Karakakooa Bay, I had twice an opportunity of seeing a considerable part of their funeral rites. Intelligence was brought me of the death of an old chief in a house near our observatories, soon after the event happened. On going to the place, I found a number of people assembled and seated round a square area, fronting the house in which the deceased lay, whilst a man in a red-feathered cap advanced from an interior part of the house to the door, and putting out his head, at almost every moment uttered a most lamentable howl, accompanied with the most singular grimaces and violent distortions of his face that can be conceived. After this had passed a short time, a large mat was spread upon the area, and two men and thirteen women came out of the house and seated themselves down upon it, in three equal rows, the two men and three of the women being in front. The necks and hands of the women were decorated with feathered ruffs, and broad green leaves, curiously scalloped, were spread over their shoulders. At one corner of this area, near a small hut, were half a dozen boys waving small white banners, and the tufted wands or *taboo* sticks which have been often mentioned in the former chapters, who would not permit us to approach them. This led me to imagine that the dead body might be deposited in this little hut; but I afterward understood that it was in the house where the man in the red cap opened the rites, by playing his tricks at the door. The company just mentioned being seated on the mat, began to sing a melancholy tune, accompanied with a slow and gentle motion of the body and arms. When this had continued some time, they raised themselves on their knees, and in a posture between kneeling and sitting, began by degrees to move their arms and their bodies with great rapidity, the tune always keeping pace with their motions. As these last exertions were too violent to continue long, they resumed at intervals their slower movements; and after this performance had lasted an hour, more mats were brought and spread upon the area, and four or five elderly women, amongst whom I was told was the dead chief's wife, advanced slowly out of the house, and seating themselves in the front of the first company, began to cry and wail most bitterly, the women in the three rows behind joining them, whilst the two men inclined their heads over them in a very melancholy and pensive attitude. At this period of the rites, I was obliged to leave them to attend at the observatory, but returning within half an hour found them in the same situation. I continued with them till late in the evening, and left them proceeding with little variation, as just described, resolving, however, to attend early in the morning to see the remainder of the ceremony. On my arrival at the house, as soon as it was day, I found to my mortification the crowd dispersed and everything quiet, and was given to understand that the corpse was removed, nor could I learn in what manner it was disposed of. I was interrupted in making farther inquiries for this purpose by the approach of three women of rank, who, whilst their attendants stood near them with their fly-flaps, sat down by us, and entering into conversation, soon made me comprehend that our presence was a hindrance to the performance of some necessary rites. got out of sight before I heard their cries and lamentations; and meeting them a few hours afterward, I found they had painted the lower part of their faces perfect black.

The other opportunity I had of observing these ceremonies was in the case of an ordinary person, when, on hearing some mournful female cries issue from a miserable-looking hut, I ventured into it, and found an old woman with her daughter weeping over the body of an elderly man who had but just expired, being still warm. The first step they took was to cover the body with cloth, after which, lying down by it, they drew the cloth over themselves, and then began a mournful kind of song, frequently repeating, *Aueh medoah! Aueh tane! Oh my father! Oh my husband!* A younger daughter was also at the same time lying prostrate in a corner of the house, covered over with black cloth, repeating the same words. On leaving this melancholy scene, I found at the door a number of their neighbours collected together, and listening to their cries with profound silence. I was resolved not to miss this opportunity of seeing in what manner they dispose of the body; and therefore, after satisfying myself before I went to bed that it was not then removed, I gave orders that the sentries should walk backward and forward before the house, and in case they suspected any measures were taking for the removal of the body, to give me immediate notice. However, the sentries had not kept a good look-out, for in the morning I found the body was gone. On inquiring what they had done with it? they pointed toward the sea, indicating most probably thereby that it had been committed to the deep, or perhaps that it had been carried beyond the bay, to some burying-ground in another part of the country. The chiefs are interred in the Morais, or *Heree-eres*, with the men sacrificed on the occasion by the side of them; and we observed that the Morai where the chief had been buried, who, as I have already mentioned, was killed in the cave after so stout a resistance, was hung round with red cloth.

TRANSACTIONS DURING THE SECOND EXPEDITION TO THE NORTH, BY THE WAY OF KAMTSCHATKA: AND ON THE RETURN HOME, BY THE WAY OF CANTON AND THE CAPE OF GOOD HOPE.

CHAPTER I.—DEPARTURE FROM ONEHEOW.—FRUITLESS ATTEMPT TO DISCOVER MODOOPAPAPPA.—COURSE STEERED FOR AWATSKA BAY.—OCCURRENCES DURING THAT PASSAGE.—SUDDEN CHANGE FROM HEAT TO COLD.—DISTRESS OCCASIONED BY THE LEAKING OF THE RESOLUTION.—VIEW OF THE COAST OF KAMTSCHATKA.—EXTREME RIGOUR OF THE CLIMATE.—LOSE SIGHT OF THE DISCOVERY.—THE RESOLUTION ENTERS THE BAY OF AWATSK.—PROSPECT OF THE TOWN OF ST. PETER AND ST. PAUL.—PARTY SENT ASHORE.—THEIR RECEPTION BY THE COMMANDING OFFICER OF THE PORT.—MESSAGE DESPATCHED TO THE COMMANDER AT BULCHERETSK.—ARRIVAL OF THE DISCOVERY.—RETURN OF THE MESSENGERS FROM THE COMMANDER.—EXTRAORDINARY MODE OF TRAVELLING.—VISIT FROM A MERCHANT, AND A GERMAN SERVANT BELONGING TO THE COMMANDER.

On the 10th of March, at seven in the morning, we weighed anchor, and passing to the north of Tahoorā, stood on to the south-west, in hopes of falling in with the island of MODOOPAPAPPA, which, we were told by the natives, lay in that direction, about five hours' sail from Tahoorā. At four in the afternoon, we were overtaken by a stout canoe, with ten men, who were going from Onecheow to Tahoorā, to kill tropic and man-of-war birds, with which that place was said to abound. It has been mentioned before, that the feathers of these birds are in great request, being much used in making their cloaks, and other ornamental parts of their dress. At eight, having seen nothing of the island, we hauled the wind to the northward, till midnight, and then tacked, and stood on a wind to the south-east, till daylight next morning,

at which time Tahoorā bore east north-east, five or six leagues distant. We afterwards steered west south-west, and made the Discovery's signal to spread four miles upon our starboard beam. At noon, our latitude was $21^{\circ} 27'$, and our longitude $193^{\circ} 42'$; and having stood on till five in the same direction, we made the Discovery's signal to come under our stern, and gave over all hopes of seeing Mōdoopapappa. We conceived that it might probably lie in a more southerly direction from Tahoorā than that in which we had steered; though, after all, it is possible, that we might have passed it in the night, as the islanders described it to be very small, and almost even with the surface of the sea.

The next day we steered west; it being Captain Clerke's intention to keep as near as possible in the same parallel of latitude, till we should make the longitude of Awatska Bay, and afterwards to steer due north for the harbour of St. Peter and St. Paul in that bay; which was also appointed for our rendezvous, in case of separation. This track was chosen on account of its being, as far as we knew, unexplored; and we were not without hopes of falling in with some new islands on our passage. We had scarcely seen a bird since our losing sight of Tahoorā, till the 18th in the afternoon, when being in the latitude of $21^{\circ} 12'$, and the longitude of $194^{\circ} 45'$, the appearance of a great many boobies, and some man-of-war birds, made us keep a sharp look-out for land. Toward evening the wind lessened, and the north-east swell, which, on the 16th and 17th, had been so heavy, as to make the ships labour exceedingly, was much abated. The next day, we saw no appearance of land; and at noon, we steered a point more to the southward, viz. west by south, in the hopes of finding the trade-winds (which blew almost invariably from the east by north) fresher as we advanced within the tropic. It is somewhat singular, that though we saw no birds in the forenoon, yet toward evening we had again a number of boobies and man-of-war birds about us. This seemed to indicate, that we had passed the land from whence the former flights had come, and that we were approaching some other low island.

The wind continued very moderate, with fine weather, till the 23d, when it freshened from the north-east by east, and increased to a strong gale, which split some of our old sails, and made the running rigging very frequently give way. This gale lasted twelve hours; it then became more moderate, and continued so, till the 25th at noon, when we entirely lost it, and had only a very light air. On the 26th in the morning, we thought we saw land to the west south-west, but, after running about sixteen leagues in that direction we found our mistake; and night coming on, we again steered west. Our latitude, at this time, was $19^{\circ} 45'$, which was the greatest southing we made in this run; or longitude was 183° , and variation $12^{\circ} 45'$ E. We continued in this course, with little alteration in the wind, till the 29th, when it shifted to the south-east and south south-east, and, for a few hours in the night, it was in the west; the weather being dark and cloudy, with much rain. We had met, for some days past, several turtles, one of which was the smallest I ever saw, not exceeding three inches in length. We were also accompanied by man-of-war birds, and boobies of an unusual kind, being quite white, (except the tip of the wing, which was black), and easily mistaken, at first sight, for gannets.

The light winds which we had met with for some time past, with the present unsettled state of the weather, and the little appearance of any change for the better, induced Captain Clerke to alter his plan of keeping within the tropical latitudes; and accordingly, at six this evening, we began to steer north-west by north, at which time our latitude was $20^{\circ} 23'$, and our longitude $180^{\circ} 40'$. During the continuance of the light winds, which prevailed almost constantly ever since our departure from the Sandwich Islands, the weather was very close, and the air hot and sultry; the thermometer being generally at 80° , and sometimes at 83° . All this time, we had a considerable swell from the north-east; and in no period of the voyage did the ships roll and strain so violently. In the morning of the 1st of April, the wind changed from the south-east to the north-east by east, and blew a fresh breeze, till the morning of the 4th, when it altered two points more to the east, and by noon increased to a strong gale, which lasted till the afternoon of the 5th, attended with hazy weather. It then again altered its direction to the south-east, became more moderate, and was accompanied by heavy showers of rain. During all this time we kept steering to the north-west, against a slow, but regular current from that quarter, which caused a constant variation

We afterwards sailed six miles upon our track the 19th 42'; and on the 20th signal to come on board, we conceived that it was the night, as the wind was very fresh.

We kept as near as we could of Awatska Bay, and in that bay; track was chosen without hopes of a bird since our latitude of 21° 12', and some man-of-war birds were seen, whence the former

when it freshened, some of our old gale lasted twelve hours, when we were in that direc-

Our latitude, at noon, or longitude, little alteration in the east, and, for a while, cloudy, with a fresh breeze, of which was the only accompaniment by the tip of the

present unsettled weather; induced Captain Cook, accordingly, at six o'clock, when the latitude was 20° 23', which prevailed, the weather was very fresh, and sometimes at noon increased to a fresh breeze, till by noon increased to a fresh breeze. It was accompanied by a constant variation

from our reckoning by the log, of fifteen miles a day. On the 4th, being then in the latitude 20° 17', and longitude 173° 30', we passed prodigious quantities of what sailors call Portuguese men-of-war (*holothuria physalis*), and were also accompanied by a great number of sea-birds, amongst which we observed, for the first time, the albatross and shearwater.

On the 6th, at noon, we lost the trade-wind, and were suddenly taken aback, with the wind from the north north-west. At this time, our latitude was 20° 50', and our longitude 170° 1'. As the old running-ropes were constantly breaking in the late gales, we reeved what new ones we had left, and made such other preparations, as were necessary for the very different climate which we were now shortly to encounter. The fine weather we met with between the tropics, had not been idly spent. The carpenters found sufficient employment in repairing the boats. The best bower-cable had been so much damaged by the foul ground in Karakakooa Bay, and whilst we were at anchor off Oneeheow, that we were obliged to cut forty fathoms from it; in converting of which, with other old cordage, into gun-yarn, and applying it to different uses, a considerable part of the people were kept constantly employed by the boatswain. The airing of sails and other stores, which from the leakiness of the decks and sides of the ships, were perpetually subject to be wet, had now become a frequent as well as a laborious and troublesome part of our duty.

Besides these cares, which had regard only to the ships themselves, there were others, which had for their object the preservation of the health of the crews, that furnished a constant occupation to a great number of our hands. The standing orders established by Captain Cook, of airing the bedding, placing fires between decks, washing them with vinegar, and smoking them with gunpowder, were observed without any intermission. For some time past, even the operation of mending the sailors' old jackets had risen into a duty both of necessity and importance. It may be necessary to inform those who are unacquainted with the disposition and habits of seamen, that they are so accustomed in ships of war to be directed in the care of themselves by their officers, that they lose the very idea of foresight, and contract the thoughtlessness of infants. I am sure, that if our people had been left to their own discretion alone, we should have had the whole crew naked, before the voyage had been half finished. It was natural to expect that their experience, during our voyage to the north last year, would have made them sensible of the necessity of paying some attention to these matters; but if such reflections ever occurred to them, their impression was so transitory, that upon our return to the tropical climates, their fur jackets, and the rest of their cold country clothes, were kicked about the decks as things of no value; though it was generally known, in both ships, that we were to make another voyage toward the pole. They were, of course, picked up by the officers; and, being put into casks, restored about this time to their owners.

In the afternoon, we observed some of the sheathing floating by the ship; and, on examination, found that twelve or fourteen feet had been washed off from under the larboard bow, where we supposed the leak to have been, which, ever since our leaving Sandwich Islands, had kept the people almost constantly at the pumps, making twelve inches water an hour. This day we saw a number of small crabs, of a pale blue colour; and had again the company a few albatrosses and shearwaters. The thermometer, in the night-time, sank eleven degrees; and although it still remained as 59°, yet we suffered much from the cold; our feelings being, as yet, by no means reconciled to that degree of temperature. The wind continued blowing fresh from the north, till the eighth, in the morning, when it became more moderate, with fair weather, and gradually changed its direction to the east, and afterward to the south.

On the ninth, at noon, our latitude was 32° 16', our longitude 166° 49', and the variation 3° 30' E. And on the tenth, having crossed the track of the Spanish galleons from the Manillas to Acapulco, we expected to have fallen in with the island of Rica de Plata, which, according to De Lisle's chart, in which the route of those ships is laid down, ought to have been in sight; its latitude, as there given, being 33° 30' N., and its longitude 166° E. Notwithstanding we were so far advanced to the northward, we saw this day a tropic bird, and also several other kinds of sea-birds; such as puffins, sea-parrots, shearwaters, and albatrosses. On the eleventh, at noon, we were in latitude 35° 30', longitude 165° 45'.

and during the course of the day had sea-birds, as before, and passed several bunches of sea-weed. About the same time, the *Discovery* passed a log of wood; but no other signs of land were seen.

The next day the wind came gradually round to the east, and increased to so strong a gale as obliged us to strike our top-gallant yards, and brought us under the lower sails, and the main top-sail close reefed. Unfortunately we were upon that tack which was the most disadvantageous for our leak. But, as we had always been able to keep it under with the hand-pumps, it gave us no great uneasiness till the 13th, about six in the afternoon, when we were greatly alarmed by a sudden inundation, that deluged the whole space between decks. The water, which had lodged in the coal-hole, not finding a sufficient vent into the well, had forced up the platforms over it, and in a moment set everything afloat. Our situation was indeed exceedingly distressing; nor did we immediately see any means of relieving ourselves. A pump through the upper decks into the coal-hole could answer no end, as it would very soon have been choked up by the small coals; and, to bale the water out with buckets was become impracticable, from the number of bulky materials that were washed out of the gunner's store-room into it, and which, by the ship's motion, were tossed violently from side to side. No other method was therefore left, but to cut a hole through the bulk-head (or partition) that separated the coal-hole from the fore-hold, and by that means to make a passage for the body of water into the well. However, before that could be done, it was necessary to get the casks of dry provisions out of the fore-hold, which kept us employed the greatest part of the night; so that the carpenters could not get at the partition till the next morning. As soon as a passage was made, the greatest part of the water emptied itself into the well, and enabled us to get out the rest with buckets. But the leak was now so much increased, that we were obliged to keep one half of the people constantly pumping and baling till the noon of the 15th. Our men bore with great cheerfulness this excessive fatigue, which was much increased by their having no dry place to sleep in; and on this account we began to serve their full allowance of grog.

The weather now becoming more moderate, and the swell less heavy, we were enabled to clear away the rest of the casks from the fore-hold, and to open a sufficient passage for the water to the pumps. This day we saw a greenish piece of drift-wood, and fancying the water coloured, we sounded, but got no bottom with a hundred and sixty fathoms of line. Our latitude, at noon this day, was $41^{\circ} 52'$, longitude $161^{\circ} 15'$; variation $6^{\circ} 30'$ east; and the wind soon after veering to the northward, we altered our course three points to the west. On the 16th, at noon, we were in the latitude of $42^{\circ} 12'$, and in the longitude of $160^{\circ} 5'$; and as we were now approaching the place where a great extent of land is said to have been seen by De Gama, we were glad of the opportunity which the course we were steering gave of contributing to remove the doubts, if any should be still entertained respecting the falsehood of this pretended discovery. For it is to be observed, that no one has ever yet been able to find who John de Gama was, when he lived, or what year this pretended discovery was made. According to Mr. Muller, the first account given to the public was, in a chart published by Texeira, a Portuguese geographer, in 1644, who places it in ten or twelve degrees to the north-east of Japan, between the latitudes of 44° and 45° ; and announces it to be land seen by John de Gama, the Indian, in a voyage from China to New Spain. On what grounds the French geographers have since removed it five degrees to the eastward, does not appear; except we suppose it to have been in order to make room for another discovery of the same kind made by the Dutch, called Company's Land; of which we shall have occasion to speak hereafter.

During the whole day, the wind was exceedingly unsettled, being seldom steady to two or three points, and blowing in fresh gusts, which were succeeded by dead calms. There were not unpromising appearances; but, after standing off and on the whole of this day without seeing anything of the land, we again steered to the northward, not thinking worth our while to lose time in search of an object, the opinion of whose existence had been already pretty generally exploded. Our people were employed the whole of the 16th in getting their wet things to dry, and in airing the ships below.

We now began to feel very sharply the increasing inclemency of the northern climate.

DEATH OF CAPTAIN COOK.

the morning of the 18th, our latitude being $45^{\circ} 40'$, and our longitude $160^{\circ} 25'$, we had snow and sleet, accompanied with strong gales from the south-west. This circumstance will appear very remarkable, if we consider the season of the year, and the quarter from which the wind blew. On the 19th, the thermometer in the daytime remained at the freezing point, and at four in the morning fell to 29° . If the reader will take the trouble to compare the degree of heat during the hot sultry weather we had at the beginning of this month, with the extreme cold which we now endured, he will conceive how severely so rapid a change must have been felt by us. In the gale of the 18th, we had split almost all the sails we had bent, which being our second-best suit, we were now reduced to make use of our last and best set. To add to Captain Clerke's difficulties, the sea was in general so rough, and the ships so leaky, that the sail-makers had no place to repair the sails in, except his apartments, which, in his declining state of health, was a serious inconvenience to him.

On the 20th, at noon, being in latitude $49^{\circ} 45' N.$, and longitude $161^{\circ} 15' E.$, and eagerly expecting to fall in with the coast of Asia, the wind shifted suddenly to the north, and continued in the same quarter the following day. However, although it retarded our progress, yet the fair weather it brought was no small refreshment to us. In the forenoon of the 21st we saw a whale, and a land-bird; and, in the afternoon, the water looking muddy, we sounded, but got no ground with a hundred and forty fathoms of line. During the three preceding days we saw large flocks of wild-fowl, of a species resembling ducks. This is usually considered as a proof of the vicinity of land; but we had no other signs of it, since the 16th, in which time we had run upwards of a hundred and fifty leagues. On the 22nd, the wind shifted to the north-east, attended with misty weather. The cold was exceedingly severe, and the ropes were so frozen, that it was with difficulty we could force them through the blocks. At noon, the latitude, by account, was $51^{\circ} 39'$, longitude $160^{\circ} 7'$; and on comparing our present position with that given to the southern parts of Kamtschatka in the Russian charts, Captain Clerke did not think it prudent to run on toward the land all night. We therefore tacked at ten; and having sounded, had ground, agreeably to our conjectures, with seventy fathoms of line.

On the 23rd, at six in the morning, being in latitude $52^{\circ} 10'$, and longitude $160^{\circ} 67'$, on the fog clearing away, the land appeared in mountains covered with snow, and extending from north three-quarters east, to south-west: a high conical rock, bearing south-west three quarters west, at three or four leagues' distance. We had no sooner taken this imperfect view, than we were again covered with a thick fog. Being now, according to our measures, only eight leagues from the entrance of Awatska Bay, as soon as the weather cleared up we stood in to take a nearer view of the land; and a more dismal and dreary prospect I never beheld. The coast appears straight and uniform, having no inlets or bays: the ground from the shore rises in hills of a moderate elevation, behind which are ranges of mountains, whose summits were lost in the clouds. The whole scene was entirely covered with snow, except the sides of some of the cliffs, which rose too abruptly from the sea for the snow to lie upon them.

The wind continued blowing very strong from the north-east, with thick hazy weather and sleet, from the 24th till the 25th. During the whole time, the thermometer was never higher than $30\frac{1}{2}^{\circ}$. The ship appeared to be a complete mass of ice; the shrouds were so encrusted with it, as to measure in circumference more than double their usual size; and, in short, the experience of the oldest seaman among us had never met with anything like the continued showers of sleet, and the extreme cold, which we now encountered. Indeed, the severity of the weather, added to the great difficulty of working the ships, and the labour of keeping the pumps constantly going, rendered the service too hard for many of the crew, some of whom were frost-bitten, and others laid up with bad colds. We continued all this time standing four hours on each tack, having generally soundings of sixty fathoms when about three leagues from the land; but none at twice that distance. On the 25th, we had a transient view of the entrance of Awatska Bay; but, in the present state of the weather, we were afraid of venturing into it. Upon our standing off again, we lost sight of the *Discovery*; but, as we were now so near the place of rendezvous, this gave us no

great uneasiness. On the 28th, in the morning, the weather at last cleared, and the wind fell to a light breeze from the same quarter as before. We had a fine warm day, and as we now began to expect a thaw, the men were employed in breaking the ice from off the rigging, masts, and sails, in order to prevent its falling on our heads. At noon, being in the latitude of $52^{\circ} 44'$, and in the longitude of 159° , the entrance of Awatska Bay bore north-west, distant three or four leagues; and about three in the afternoon a fair wind sprang up from the southward, with which we stood in, having regular soundings from twenty-two to seven fathoms.

The mouth of the bay opens in a north-north-west direction. The land on the south side is of a moderate height; to the northward it rises into a bluff head, which is the highest part of the coast. In the channel between them, near the north-east side, lie three remarkable rocks; and farther in, near the opposite coast, a single detached rock of a considerable size. On the north head there is a look-out house, which, when the Russians expect any of their ships upon the coast, is used as a light-house. There was a flag-staff on it, but we saw no sign of any person being there. Having passed the mouth of the bay, which is about four miles long, we opened a large circular basin of twenty-five miles in circumference, and a half-past four came to an anchor in six fathoms' water, being afraid of running foul on a shoal or some sunk rocks, which are said by Muller * to lie in the channel of the harbour of St. Peter and St. Paul. The middle of the bay was full of loose ice, drifting with the tide, but the shores were still entirely blocked up with it. Great flocks of wild-fowl were seen of various species; likewise ravens, eagles and large flights of Greenland pigeons. We examined every corner of the bay with our glasses, in search of the towns of St. Peter and St. Paul, which, according to the accounts given us at Onalashka, we had conceived to be a place of some strength and consideration. At length we discovered, on a narrow point of land to the

north-north-east, a few miserable log-houses and some conical huts, raised on poles, amounting in all to about thirty, which from their situation, notwithstanding all the respect we wish to entertain for a Russian *ostrog*, we were under the necessity of concluding to be Petropawlska. However, in justice to the generous and hospitable treatment we found here, I

beg leave to anticipate the reader's curiosity, by assuring him that our disappointment proved to be more of a laughable than a serious nature. For in this wretched extremity of the earth, situated beyond everything that we conceived to be most barbarous and inhospitable, and as it were out of the very reach of civilisation, barricaded with ice and covered with summer snow, in a poor miserable port far inferior to the meanest of our fishing-towns, we met with feelings of humanity, joined to a greatness of mind and elevation of sentiment, which would have done honour to any nation or climate.

During the night, much ice drifted by us with the tide, and at daylight I was sent with the boats to examine the bay, and deliver the letters we had brought from Oonalashka to the Russian commander. We directed our course toward the village I have just mentioned; and having proceeded as far as we were able, with the boats, we got upon the ice, which extended near half a mile from the shore. Mr. Webber and two of the seamen accompanied me, whilst the master took the pinnace and cutter to finish the survey, leaving the jolly-boat behind to carry us back. I believe the inhabitants had not yet seen either the ship or the boats, for even after we had got on the ice we could not perceive any signs of a living creature in the town. By the time we had advanced a little way on the ice, we observed a few men hurrying backward and forward, and presently after a sledge drawn by dogs, with one of the inhabitants in it, came down to the sea-side, opposite to us. Whilst we were gazing at this unusual sight, and admiring the great civility of this stranger which we imagined had brought him to our assistance, the man, after viewing us for some time very attentively, turned short round and went off with great speed toward the ostrog. We were not less chagrined than disappointed at this abrupt departure, as we began to find our journey over the ice attended not only with great difficulty but even with danger. We sunk at every step almost knee-deep in the snow, and though we found tolerable footing at the bottom, yet the weak parts of the ice not being discoverable, we were constantly exposed to the risk of breaking through it. This accident at last actually happened to myself; for stepping on quickly over a suspicious spot, in order to press with less weight upon it, I came upon a second, before I could stop myself, which broke under me, and in I fell. Luckily I rose clear of the ice, and a man that was a little way behind with a boat-hook throwing it to me, I laid it across some loose pieces near me, and by that means was enabled to get upon firm ice again.

As we approached the shore we found the ice, contrary to our expectations, more broken than it had been before. We were, however, again comforted by the sight of another sledge coming toward us, but instead of proceeding to our relief the driver stopped short, and began to call out to us. I immediately held up to him Ismyloff's letters; upon which he turned about and set off back again full speed, followed, I believe, not with the prayers of any of our party. Being at a great loss what conclusions to draw from this unaccountable behaviour, we continued our march toward the ostrog with great circumspection, and when we had arrived within a quarter of a mile of it, we perceived a body of armed men marching toward us. That we might give them as little alarm and have as peaceable an appearance as possible, the two men who had boat-hooks in their hands were ordered into the rear, and Mr. Webber and myself marched in front. The Russian party, consisting of about thirty soldiers, was headed by a decent-looking person, with a cane in his hand. He halted within a few yards of us, and drew up his men in a martial and good order. I delivered to him Ismyloff's letters, and endeavoured to make him understand, as well as I could (though I afterward found in vain), that we were English, and had brought them papers from Oonalashka. After having examined us attentively, he began to conduct us toward the village in great silence and solemnity, frequently halting his men to form them in different manners, and making them perform several parts of their manual exercise, probably with a view to show us that if we had the temerity to offer any violence, we should have to deal with men who were not ignorant of their business.

Though I was all this time in my wet clothes, shivering with cold, and sufficiently inclined to the most unconditional submission, without having my fears violently alarmed, yet it was impossible not to be diverted with this military parade, notwithstanding it was attended with the most unseasonable delay. At length we arrived at the house of the commanding officer of the party, into which we were ushered, and after no small stir in giving orders and disposing

of the military without doors, our host made his appearance, accompanied by another person, whom we understood to be the secretary of the port. One of Ismyloff's letters was now opened, and the other sent off by a special messenger to Bolcheretsk, a town on the west side of the peninsula of Kamtschatka, where the Russian commander of this province usually resides.

It is very remarkable that they had not seen the ship the preceding day, when we came to anchor in the bay, nor indeed this morning till our boats were pretty near the ice. The panic with which the discovery had struck them, we found had been very considerable. The garrison was immediately put under arms. Two small field-pieces were placed at the entrance of the commander's house, and pointed toward our boats, and shot, powder, and lighted matches were all ready at hand. The officer in whose house we were at present entertained was a serjeant, and the commander of the ostrog. Nothing could exceed the kindness and hospitality of his behaviour, after he had recovered from the alarm occasioned by our arrival. We found the house insufferably hot, but exceedingly neat and clean. After I had changed my clothes, which the serjeant's civility enabled me to do by furnishing me with a complete suit of his own, we were invited to sit down to dinner, which I have no doubt was the best he could procure, and considering the shortness of time he had to provide it, was managed with some ingenuity. As there was not time to prepare soup and bouilli, we had in their stead some cold beef sliced, with hot water poured over it. We had next a large bird roasted, of a species with which I was unacquainted, but of a very excellent taste. After having eaten a part of this it was taken off, and we were served with fish dressed two different ways, and soon after the bird again made its appearance, in savoury and sweet pâtés. Our liquor, of which I shall have to speak hereafter, was of the kind called by the Russians quass, and was much the worse part of the entertainment. The serjeant's wife brought in several of the dishes herself, and was not permitted to sit down at table. Having finished our repast, during which it is hardly necessary to remark that our conversation was confined to a few bows, and other signs of mutual respect, we endeavored to open to our host the cause and objects of our visit to this port. As Ismyloff had probably written to them on the same subject in the letters we had before delivered, he appeared very readily to conceive our meaning; but as there was unfortunately no one in the place that could talk any other language except Russian or Kamtschadale, we found the utmost difficulty in comprehending the information he meant to convey to us. After some time spent in these endeavours to understand one another, we conceived the sum of the intelligence we had procured to be, that though no supply either of provisions or naval stores were to be had at this place, yet that these articles were in great plenty at Bolcheretsk; that the commander would most probably be very willing to give us what we wanted, but that till the serjeant had received orders from him, neither he nor his people, nor the natives, could even venture to go on board the ship.

It was now time for us to take our leave, and as my clothes were still too wet to put on, I was obliged to have recourse again to the serjeant's benevolence, for his leave to carry those I had borrowed of him on board. This request was complied with very cheerfully, and a sledge drawn by five dogs, with a driver, was immediately provided for each of our party. The sailors were highly delighted with this mode of conveyance; and what diverted them still more was, that the two boat-hooks had also a sledge appropriated to themselves. These sledges are so light, and their construction so well adapted to the purposes for which they are intended, that they went with great expedition and perfect safety over the ice, which it would have been impossible for us with all our caution to have passed on foot.

On our return we found the boats towing the ship toward the village, and at seven we got close to the ice, and moored with the small bower to the north-east and best bower to the south-west, the entrance of the bay bearing south by east and south three quarters east, and the ostrog north one quarter east, distant one mile and a half. The next morning the masts and cables were got upon the quarter-deck, in order to lighten the ship forward, and the carpenters were set to work to stop the leak, which had given us so much trouble during our last run. It was found to have been occasioned by the falling of some sheathing from the larboard-bow, and the oakum between the planks having been washed out. The war-

weather we had in the middle of the day began to make the ice break away very fast, which drifting with the tide had almost filled up the entrance of the bay. Several of our gentlemen paid their visits to the serjeant, by whom they were received with great civility; and Captain Clerke sent him two bottles of rum, which he understood would be the most acceptable present he could make him, and received in return some fine fowls of the grouse kind, and twenty trouts. Our sportsmen met with but bad success; for though the bay swarmed with flocks of ducks of various kinds, and Greenland pigeons, yet they were so shy that they could not come within shot of them.

In the morning of the 1st of May, seeing the *Discovery* standing into the bay, a boat was immediately sent to her assistance, and in the afternoon she moored close by us. They told us that after the weather cleared up on the 28th, the day on which she had parted company, they found themselves to leeward of the bay, and that when they got abreast of it the following day and saw the entrance choked up with ice, they stood off after firing guns, concluding we could not be here; but finding afterward it was only loose drift-ice, they had ventured on. The next day the weather was so very unsettled, attended with heavy showers of snow, that the carpenters were not able to proceed in their work. The thermometer stood at 28° in the evening, and the frost was exceedingly severe in the night.

The following morning, on our observing two sledges drive into the village, Captain Clerke sent me on shore to inquire whether any message was arrived from the commander of Kamtschatka, which, according to the serjeant's account, might now be expected, in consequence of the intelligence that had been sent of our arrival. Bolcheret-k by the usual route is about one hundred and thirty-five English miles from St. Peter and St. Paul's. Our despatches were sent off in a sledge drawn by dogs, on the 29th about noon. And the answer arrived, as we afterward found, early this morning, so that they were only a little more than three days and a half in performing a journey of two hundred and seventy miles. The return of the commander's answer was, however, concealed from us for the present, and I was told on my arrival at the serjeant's, that we should hear from him the next day. Whilst I was on shore the boat which had brought me, together with another belonging to the *Discovery*, were set fast in the ice, which a southerly wind had driven from the other side of the bay. On seeing them entangled, the *Discovery's* launch had been sent to their assistance, but soon shared the same fate, and in a short time the ice had surrounded them near a quarter of a mile deep. This obliged us to stay on shore till evening, when finding no prospect of getting the boats off, some of us went in sledges to the edge of the ice, and were taken off by boats sent from the ship, and the rest staid on shore all night. It continued to freeze hard during the night, but before morning on the 4th a change of wind drifted away the floating ice, and set the boats at liberty, without their having sustained the smallest damage.

About ten o'clock in the forenoon, we saw several sledges driving down the edge of the ice, and sent a boat to conduct the persons who were in them on board. One of these was a Russian merchant from Bolcheretsk named Fedositsch, and the other a German called Port, who had brought a letter from Major Behm, the commander of Kamtschatka, to Captain Clerke. When they got to the edge of the ice, and saw distinctly the size of the sleds which lay within about two hundred yards from them, they appeared to be exceedingly alarmed, and before they would venture to embark, desired two of our boat's crew might be left on shore as hostages for their safety. We afterward found that Ismyleff, in his letter to the commander, had misrepresented us, for what reasons we could not conceive, as two small trading boats; and that the serjeant, who had only seen the ships at a distance, had not in his despatches rectified the mistake.

When they arrived on board, we still found, from their cautious and timorous behaviour, that they were under some unaccountable apprehensions; and an uncommon degree of dissipation was visible in their countenances, on the German's finding a person amongst us, with whom he could converse. This was Mr. Webber, who spoke that language perfectly well; and at last, though with some difficulty, convinced them that we were Englishmen and friends. M. Port being introduced to Captain Clerke, delivered to him the Commander's letter, which was written in German, and was merely complimentary, inviting him and his

officers to Bolcheretsk, to which place the people, who brought it, were to conduct us. M. Port at the same time acquainted him, that the Major had conceived a very wrong idea of the size of the ships, and of the service we were engaged in; Ismyloff in his letter, having represented us as two small English packet-boats, and cautioned him to be on his guard; insinuating, that he suspected us to be no better than pirates. In consequence of this letter, he said there had been various conjectures formed about us at Bolcheretsk: that the Major thought it most probable we were on a trading scheme, and for that reason had sent down a merchant to us; but that the officer, who was second in command, was of opinion we were French, and come with some hostile intention, and were for taking measures accordingly. It had required, he added, all the Major's authority to keep the inhabitants from leaving the town, and retiring up into the country: to so extraordinary a pitch had their fears risen, from their persuasion that we were French.

Their extreme apprehensions of that nation were principally occasioned, by some circumstances attending an insurrection that had happened at Bolcheretsk a few years before, in which the commander had lost his life. We were informed, that an exiled Polish officer, named Beniowski, taking advantage of the confusion into which the town was thrown, had seized upon a galliot, then lying at the entrance of the Bolchoireka, and had forced on board a number of Russian sailors, sufficient to navigate her: that he had put on shore a part of the crew at the Koure Islands; and, among the rest, Ismyloff, who, as the reader will recollect, had puzzled us exceedingly at Oonalashka, with the history of this transaction though, for want of understanding his language, we could not then make out all the circumstances attending it: that he passed in sight of Japan; made Luconia; and was there directed how to steer to Canton; that arriving there, he had applied to the French, and had got a passage in one of their India ships to France: and that most of the Russians had likewise returned to Europe in French ships; and had afterward found their way to Petersburg. We met with three of Beniowski's crew in the harbour of Saint Peter and Saint Paul; and from them we learned the circumstances of the above story. On our arrival at Canton, we received a farther corroboration of the facts, from the gentlemen of the English factory, who told us, that a person had arrived there in a Russian galliot, who said he came from Kamtschatka; and that he had been furnished by the French factory with a passage to Europe*.

We could not help being much diverted with the fears and apprehensions of these good people, and particularly with the account M. Port gave us of the serjeant's wary proceedings the day before. On seeing me come on shore, in company with some other gentlemen, he had made him and the merchant, who arrived in the sledges we had seen come in the morning, hide themselves in his kitchen, and listen to our conversation with one another, in hopes that, by this means, they might discover whether we were really English or not. As we concluded, from the commission and dress of M. Port, that he might probably be the commander's secretary, he was received as such, and invited, with his companion, the merchant, to dine with Captain Clerke: and though we soon began to suspect, from the behaviour of the latter toward him, that he was only a common servant, yet this being no time to sacrifice our little comforts to our pride, we prevented an explanation, by not suffering the question to be put to him; and, in return for the satisfaction we reaped from his abilities as a linguist, we continued to let him live on a footing of equality with us.

* It hath since appeared, from the account of Kerguelen's voyage, that this extraordinary person, who had entered into the French service, was commander of a new settlement at Madagascar, when Kerguelen touched there in 1774.

CHAPTER II.—SCARCITY OF PROVISIONS AND STORES AT THE HARBOUR OF SAINT PETER AND SAINT PAUL.—A PARTY SET OUT TO VISIT THE COMMANDER AT BOLCHERETSK.—PASSAGE UP THE RIVER AWATSKA.—ACCOUNT OF THEIR RECEPTION BY THE TOWN OF KARATCHIN.—DESCRIPTION OF A KAMTSCHADALE DRESS.—JOURNEY ON SLEDGES.—DESCRIPTION OF THIS MODE OF TRAVELLING.—ARRIVAL AT NATCHEEKEN.—ACCOUNT OF HOT SPRINGS.—EMBARK ON THE BOLCHOIREKA.—RECEPTION AT THE CAPITAL.—GENEROUS AND HOSPITABLE CONDUCT OF THE COMMANDER AND THE GARRISON.—DESCRIPTION OF BOLCHERETSK.—PRESENTS FROM THE COMMANDER.—RUSSIAN AND KAMTSCHADALE DANCING.—AFFECTING DEPARTURE FROM BOLCHERETSK.—RETURN TO SAINT PETER AND SAINT PAUL'S, ACCOMPANIED BY MAJOR BEHM, WHO VISITS THE SHIPS.—GENEROUSITY OF THE SAILORS.—DESPATCHES SENT BY MAJOR BEHM TO PETERSBURG.—HIS DEPARTURE AND CHARACTER.

BEING now enabled to converse with the Russians, by the aid of our interpreter, with tolerable facility, our first inquiries were directed to the means of procuring a supply of fresh provisions, and naval stores; from the want of which latter article, in particular, we had been for some time in great distress. On inquiry, it appeared, that the whole stock of live cattle, which the country about the bay could furnish, amounted only to two heifers; and these the serjeant very readily promised to procure us. Our applications were next made to a merchant, but we found the terms upon which he offered to serve us so exorbitant, that Captain Clerke thought it necessary to send an officer to visit the commander at Bolcheretsk, and to inquire into the price of stores at that place. As soon as this determination was communicated to M. Port, he despatched an express to the commander, to inform him of our intentions, and at the same time to clear us from the suspicions that were entertained with respect to the designation and purposes of our voyage.

Captain Clerke having thought proper to fix on me for this service, I received orders, together with Mr. Webber, who was to accompany me as interpreter, to be ready to set out the next day. It proved, however, too stormy, as did also the 6th, for beginning a journey through so wild and desolate a country; but, on the 7th, the weather appearing more favourable, we set out early in the morning in the ship's boats, with a view to reach the entrance of the Awatska at high water, on account of the shoals with which the mouth of that river abounds: here the country boats were to meet us, and carry us up the stream. Captain Gore now added to our party, and we were attended by Messrs. Port and Fedositsch, with two Cossacks, and were provided, by our conductors, with warm furred clothing; a precaution which we soon found very necessary, as it began to snow briskly just after we set out. At eight o'clock, being stopped by shoal water, about a mile from the mouth of the river, some small canoes belonging to the Kamtschadales, took up us and our baggage, and carried us over a bed of sand, which is thrown up by the rapidity of the river, and which, they told us, was continually shifting. When we had crossed this shoal, the water again deepened; and here we found a commodious boat, built and shaped like a Norway yawl, ready to convey us up the river, together with canoes for our baggage.

The mouth of the Awatska is about a quarter of a mile broad; and as we advanced, it narrowed very gradually. After we had proceeded a few miles, we passed several branches, which we were told emptied themselves into other parts of the bay; and that some of those on the left hand flowed into the Paratonnea river. Its general direction from the bay, for the first ten miles, is to the north, after which it turns to the westward: this bend excepted, preserves, for the most part, a straight course; and the country through which it flows, at the distance of near thirty miles from the sea, is low and flat, and subject to frequent inundations. We were pushed forward by six men, with long poles, three at each end of the boat; two of whom were Cossacks, the others Kamtschadales, and advanced against a strong stream, at the rate, as well as I could judge, of about three miles an hour. Our Kamtschadales bore this severe labour, with great stoutness, for ten hours; during which we stopped only once, and that for a short time, whilst they took some little refreshment. As we had been told, at our first setting out in the morning, that we should easily reach an ostrog, and Karatchin, the same night, we were much disappointed to find ourselves, at sun-set,

fifteen miles from that place. This we attributed to the delay occasioned in passing the shoals we had met with, both at the entrance of the river, and in several other places, as we proceeded up it; for our boat being the first that had passed up the river, the guides were not acquainted with the situation of the shifting sand-banks, and unfortunately the snow not having yet begun to melt, the shallowness of the river was at its extreme. The fatigue our men had already undergone, and the difficulty of navigating the river, which would have been much increased by the darkness of the night, obliged us to give up all thoughts of continuing our journey that evening. Having therefore found a place tolerably sheltered, and cleared it of the snow, we erected a small marquee, which we had brought with us; and, by the assistance of a brisk fire, and some good punch, passed the night not very unpleasantly. The only inconvenience we laboured under was, the being obliged to make the fire at some distance from us. For, although the ground was, to all appearance, dry enough before, yet when the fire was lighted, it soon thawed all the parts round it into an absolute puddle. We adopted, however, the alertness and expedition with which the Kamtschadales erected our marquee, and cooked our provisions; but what was most unexpected, we found they had brought with them their tea-kettles, considering it as the greatest of hardships not to drink tea two or three times a day.

We set out as soon as it was light in the morning, and had not advanced far, before we were met by the *Toion*, or chief of Karatchin, who had been apprised of our coming, and had provided canoes that were lighter, and better contrived for navigating the higher parts of the river. A commodious vessel, consisting of two canoes, lashed close together with cross spars, lined with bear-skins and furnished with fur cloaks, was also provided for us. We now went on very rapidly, the *Toion*'s people being both stout and fresh, and remarkable for their expertness in this business. At ten we got to the *ostrog*, the seat of his command, where we were received at the water-side by the Kamtschadale men and women, and some Russian servants belonging to Fedositsch, who were employed in making canoes. They were all dressed out in their best clothes. Those of the women were pretty and gay, consisting of a full loose robe of white nankeen, gathered close round the neck, and fastened with a collar of coloured silk. Over this they wore a short jacket, without sleeves, made of different coloured nankeens, and petticoats of a slight Chinese silk. Their shifts, which had sleeves down to the wrists, were also of silk; and coloured silk handkerchiefs were bound round their heads, concealing entirely the hair of the married women, whilst those who were unmarried, brought the handkerchief under the hair, and suffered it to flow loose behind.

This *ostrog* was pleasantly situated by the side of the river; and consisted of three log-houses; three *jourts*, or houses made under-ground; and nineteen *balagans*, or summer habitations. We were conducted to the dwelling of the *Toion*, who was a plain decent man, born of a Russian woman, by a Kamtschadale father. His house, like all the rest in this country, was divided into two apartments. A long narrow table, with a bench round it, was all the furniture we saw in the outer; and the household stuff of the inner, which was the kitchen, was not less simple and scanty. But the kind attention of our host, and the hearty welcome we received, more than compensated for the poverty of his lodgings. His wife proved an excellent cook; and served us with fish and game of different sorts, and various kinds of heath-berries, that had been kept since the last year. Whilst we were at dinner in this miserable hut, the guests of a people with whose existence we had before been scarce acquainted, and at the extremity of the habitable globe, a solitary, half-worn pewter spoon, whose shape was familiar to us, attracted our attention; and, on examination, we found it stamped on the back with the word LONDON. I cannot pass over this circumstance in silence, out of gratitude for the many pleasant thoughts, the anxious hopes, and tender remembrances it excited in us. Those who have experienced the effects that long absence and extreme distance from their native country produce on the mind, will readily conceive the pleasure such trifling incidents can give. To the philosopher and the politician they may perhaps suggest reflections of a different nature.

We were now to quit the river, and perform the next part of our journey on sledges, but the thaw had been too powerful in the daytime, to allow us to set out till the cold of the evening had again made the surface of the snow hard and firm. This gave us an oppor-

tunity of walking about the village, which was the only place we had yet seen free from snow, since we landed in this country. It stood upon a well-wooded flat, of about a mile and a half in circumference. The leaves were just budding, and the verdure of the whole scene was strongly contrasted with the sides of the surrounding hills, which were still covered with snow. As the soil appeared to me very capable of producing all the common sorts of garden vegetables, I was greatly surprised not to find the smallest spot anywhere cultivated. If to this we add that none of the inhabitants were possessed of a little of any sort, nothing can be well conceived more wretched than their situation must be during the winter months. They were at this time removing from their *jourts* into their *balugmas*, which afforded us an opportunity of examining both these sorts of habitations; and they will be hereafter more particularly described. The people invited us into their houses with great good humour; a general air of cheerfulness and content was everywhere visible, to which the approaching change of season might probably not a little contribute.

On our return to the Toion's, we found supper prepared for us, which differed in nothing from our former repast; and concluded with our treating the Toion and his wife with some of the spirits we had brought with us, made into punch. Captain Gore, who had great generosity on all occasions, having afterward made them some valuable presents, they retired to the kitchen, leaving us in possession of the outward room, where spreading our bear-skins on the benches, we were glad to get a little repose; having settled with our conductors to resume our journey as soon as the ground should be judged fit for travelling. About nine o'clock the same evening, we were awakened by the melancholy howlings of the dogs, which continued all the time our baggage was lying upon the sledges; but, as soon as they were yoked, and we were all prepared to set out, this changed into a light cheerful yelping, which entirely ceased the instant they marched off. But, before we set out, the reader may expect to be made more particularly acquainted with this curious mode of travelling.

I brought over with me one of these sledges, which is now in the possession of Sir Ashton Lever. The body is about four feet and a half long, and a foot wide, made in the form of a crescent, of light tough wood, strongly bound together with wicker-work; which in those belonging to the better sort of people is elegantly stained of a red and blue colour, and the seat covered with bear-skins, or other furs. It is supported by four legs about two feet high, which rest on two long flat pieces of wood, five or six inches broad, extending a foot at each end beyond the body of the sledge. These are turned up before in the manner of a skate, and shod with the bone of some sea animal. The fore-part of the carriage is ornamented with thongs of leather and tassels of coloured cloth; and from the cross bar, to which the harness is joined, are hung links of iron, or small bells, the jingling of which they conceive to be encouraging to the dogs. They are seldom used to carry more than one person at a time, who sits aside, resting his feet on the lower part of the sledge, and carrying his provisions and other necessities wrapped up in a bundle behind him. The dogs are usually five in number, yoked two and two, with a leader. The reins not being fastened to the head of the dogs, but to the collar, have little power over them, and are therefore generally hung upon the sledge, whilst the driver depends entirely on their obedience to his voice for the direction of them. With this view, the leader is always trained up with a particular degree of care and attention, some of them rising to a most extraordinary value on account of their docility and steadiness; in-somuch, that for one of these, I am well assured, forty roubles (or ten pounds) was no unusual price. The driver is also provided with a crooked stick, which answers the purpose both of whip and reins; as by striking it into the snow, he is enabled to moderate the speed of the dogs, or even to stop them entirely; and when they are lazy, or otherwise inattentive to his voice, he chastises them by throwing it at them. Upon these occasions, their dexterity in picking it up again is very remarkable, and forms the principal difficulty of their art. But it is indeed not surprising, that they should labour to be skilful in a practice upon which their safety so materially depends. For they say, that if the driver should happen to lose his stick, the dogs will instantly perceive it; and unless their leader be of the most sober and resolute kind, they will immediately run a-head full speed, and never stop till they are quite spent. But as that will not

be the case soon, it generally happens that either the carriage is overturned, and dashed to pieces against the trees; or they hurry down some precipice, and all are buried in the snow. The accounts that were given us of the speed of these dogs, and of their extraordinary patience of hunger and fatigue, were scarcely credible, if they had not been supported by the best authority. We were indeed ourselves witnesses of the great expedition with which the messenger who had been despatched to Bolcheretsk with the news of our arrival, returned to the harbour of St. Peter and St. Paul, though the snow was at this time exceedingly soft. But I was informed by the commander of Kamtschatka, that this journey was generally performed in two days and a half; and that he had once received an express from the latter place in twenty-three hours. The dogs are fed during the winter on the offals of dried and stinking fish; but are always deprived of this miserable food a day before they set out on a journey, and never suffered to eat before they reach the end of it. We were also told, that it was not unusual for them to continue thus fasting two entire days, in which time they would perform a journey of one hundred and twenty miles*. These dogs are in shape somewhat like the Pomeranian breed, but considerably larger.

SLEDGE TRAVELLING IN KAMTSCHATKA.

As we did not choose to trust to our own skill, we had each of us a man to drive and guide the sledge, which, from the state the roads were now in, proved a very laborious business. For, as the thaw had advanced very considerably in the valleys through which our road lay, we were under the necessity of keeping along the sides of the hills; and this obliged our guides, who were provided with snow-shoes for that purpose, to support the sledges, on the lower side, with their shoulders, for several miles together. I had a very good-humoured Cossack to attend me, who was, however, so very unskillful in his business, that we were overturned almost every minute, to the great entertainment of the rest of the company. Our party consisted, in all, of ten sledges; that in which Captain Gore was carried, was made of two lashed together, and abundantly provided with furs and bearskins; it had ten dogs, yoked four abreast; as had also some of those that were heavily laden with baggage.

When we had proceeded about four miles, it began to rain; which, added to the darkness of the night, threw us all into confusion. It was at last agreed, that we should remain where we were till daylight; and accordingly we came to anchor in the snow (for I cannot better express the manner in which the sledges were secured), and wrapping ourselves up in our furs, waited patiently for the morning. About three o'clock we were called on to set out, our guides being apprehensive, that if we waited longer, we might be stopped by the thaw, and neither be able to proceed, nor to return. After encountering many difficulties, which were principally occasioned by the bad condition of the road, at two in the afternoon we got safe to an *ostrog*, called Natchekin, situated on the side of a small stream, which falls into the Bolchoireka, a little way below the town. The distance between Karatchin and

* Extraordinary as this may appear, Kraschinikoff, whose account of Kamtschatka, from everything that I saw, and had an opportunity of comparing it with, seems to me to deserve entire credit; and whose authority I shall therefore frequently have recourse to, relates instances of this kind that are much more surprising. "Travelling parties," says he, "are often overtaken with dreadful storms of snow, on the approach of which, they drive with

the utmost precipitation into the nearest wood, and there are obliged to stay, till the tempest, which frequently lasts six or seven days, is over; the dogs remaining all this while quiet and inoffensive; except that sometimes, when pressed by hunger, they will devour their reins, and the other leathern parts of the harness."—History and Description of Kamtschatka, by Kraschinikoff.

Natcheechin is thirty-eight wersts (or twenty-five miles); and had the hard frost continued, we should not, by their account, have been more than four hours in performing it; but the snow was so soft, that the dogs, almost at every step, sunk up to their bellies; and I was indeed much surprised at their being at all able to overcome the difficulties of so fatiguing a journey.

Natcheechin is a very inconsiderable ostrog, having only one log-house, the residence of the Toion; five *balagans* and one *jourt*. We were received here with the same formalities, and in the same hospitable manner, as at Karatchin; and in the afternoon we went to visit a remarkable hot spring, which is near this village. We saw, at some distance, the steam rising from it, as from a boiling caldron; and as we approached, perceived the air had a strong sulphureous smell. The main spring forms a basin of about three feet in diameter; besides which, there are a number of lesser springs, of the same degree of heat, in the adjacent ground; so that the whole spot, to the extent of near an acre, was so hot, that we could not stand two minutes in the same place. The water flowing from these springs is collected in a small bathing pond, and afterward forms a little rivulet; which, at the distance of about a hundred and fifty yards, falls into the river. The bath, they told us, had wrought great cures in several disorders, such as rheumatisms, swelled and contracted joints, and scorbutic ulcers. In the bathing-place the thermometer stood at 100° , or blood heat; but in the spring, after being immersed two minutes, it was 1° above boiling spirits. The thermometer in the air, at this time, was 34° ; in the river 40° ; and in the Toion's house 64° . The ground where these springs break out is on a gentle ascent; behind which there is a green hill of a moderate size. I am sorry I was not sufficiently skilled in botany to examine the plants, which seemed to thrive here with great luxuriance; the wild garlic, indeed, forced itself on our notice, and was at this time springing up very vigorously.

The next morning we embarked on the Bolchoireka in canoes; and, having the stream with us, expected to be at our journey's end the day following. The town of Bolcheretsk is about eighty miles from Natcheechin; and we were informed, that in the summer season, when the river has been full and rapid, from the melting of snow on the mountains, the canoes had often gone down in a single day; but that, in its present state, we should probably be much longer, as the ice had broken up only three days before we arrived, and that ours would be the first boat that had attempted to pass. This intelligence proved but too true. We found ourselves greatly impeded by the shallows; and though the stream in many places ran with great rapidity, yet every half mile we had rippings and shoals, over which we were obliged to haul the boats. The country on each side was very romantic, but unvaried; the river running between mountains of the most craggy and barren aspect, where there was nothing to diversify the scene but now and then the sight of a bear, and the flights of wild-fowl. So uninteresting a passage leaves me nothing farther to say, than that this and the following night we slept on the banks of the river under our marquée, and suffered very much from the severity of the weather, and the snow which still remained on the ground.

At daylight on the 12th, we found we had got clear of the mountains, and were entering a low extensive plain, covered with shrubby trees. About nine in the forenoon we arrived at an ostrog, called Opatchin, which is computed to be fifty miles from Natcheechin, and is nearly of the same size as Karatchin. We found here a serjeant with four Russian soldiers, who had been two days waiting for our arrival, and who immediately despatched a light boat to Bolcheretsk with intelligence of our approach. We were now put into the trammels of formality; a canoe furnished with skins and furs, and equipped in a magnificent manner, was prepared for our reception, in which we were accommodated much at our ease, but to the exclusion of the rest of our fellow-travellers. It was with much regret we found ourselves obliged to separate from our old companion Monsieur Port, whom we had observed to grow every day more shy and distant, as we drew nearer the end of our journey. Indeed, he had himself told us before we set out, that we paid him a respect he had no title to; but as we found him a very modest and discreet man, we had insisted on his living with us during the whole of our journey. The remainder of our passage was performed

with great facility and expedition, the river growing more rapid as we descended, and less obstructed by shoals.

As we approached the capital, we were sorry to observe, from an appearance of much stir and bustle, that we were to be received in form. Decent clothes had been for some time a scarce commodity amongst us; and our travelling dresses were made up of a burlesque mixture of European, Indian, and Kamtschadale fashions. We therefore thought it would be too ridiculous to make a parade in this trim through the metropolis of Kamtschatka; and as we saw a crowd collected on the banks of the river, and were told the commander would be at the water-side to receive us, we stopped short at a soldier's house, about a quarter of a mile from the town, from whence we sent Port with a message to his Excellency, acquainting him, that the moment we had put off our travelling dresses we would pay our respects to him at his own house, and to beg he would not think of waiting to conduct us. Finding, however, that he persisted in his intentions of paying us this compliment, we lost no farther time in attiring ourselves, but made all the haste in our power to join him at the entrance of the town. I observed my companions to be as awkward as I felt myself, in making our first salutations; bowing and scraping being marks of good breeding that we had now, for two years and a half, been totally unaccustomed to. The manner in which we were received by the commander was the most engaging that could be conceived, and increased my mortification at finding that he had almost entirely forgot the French language; so that the satisfaction of conversing with him was wholly confined to Mr. Webber, who spoke the German, his native tongue.

In company with Major Behm was Captain Shmaleff, the second in command, and another officer, with the whole body of the merchants of the place. They conducted us to the commander's house, where we were received by his lady with great civility, and found tea and other refreshments prepared for us. After the first compliments were over, Mr. Webber was desired to acquaint the Major with the object of our journey, with our want of naval stores, flour, and fresh provisions, and other necessaries for the ships' crews; and at the same time to assure him that we were sensible, from what we had already seen of the condition of the country about Awatska Bay, we could not expect much assistance from him in that quarter; that the impossibility of sending heavy stores across the peninsula, during the present season of the year, was but too apparent from the difficulties we had met with in our journey; and that, long before any material change could take place, we should be under the necessity of proceeding on our voyage. We were here interrupted by the commander, who observed that we did not yet know what they were capable of doing; that at least it was not his business to think of the difficulties of supplying our wants, but only to learn what were the articles we stood in need of, and the longest time we could allow him for procuring them. After expressing our sense of his obliging disposition, we gave him a list of the naval stores, the number of cattle, and the quantity of flour we were directed to purchase, and told him that we purposed recommencing our voyage about the 5th of June. Our conversation afterward turned upon different subjects; and it will naturally be supposed, that our inquiries were principally directed to the obtaining some information respecting our own country. Having now been absent three years, we had flattered ourselves with the certainty of receiving intelligence from Major Behm, which could not fail of being interesting; and I cannot express the disappointment we felt, on finding that he had no news to communicate of a much later date than that of our departure from England.

About seven o'clock, the commander, conceiving we might be fatigued with our journey, and desirous of taking some repose, begged he might conduct us to our lodgings. It was in vain that we protested against a compliment which we had certainly no title to expect, but that of being strangers; a circumstance which seemed, in the opinion of this generous Laponian, to counterbalance every other consideration. In our way we passed by two guard-houses, where the men were turned out under arms, in compliment to Captain Gore; and were afterward brought to a very neat and decent house, which the major gave us to understand was to be our residence during our stay. Two sentinels were posted at the door; and in a house adjoining there was a serjeant's guard. Having shown us into our apartments, the major took his leave, with a promise to see us the next day; and we were

left to find out, at our leisure, all the conveniences that he had most amply provided for us. A soldier, called a *putpropersackak*, whose rank is between that of a serjeant and corporal, along with our fellow-traveller Port, were appointed to be our male domestics; besides whom, there was a housekeeper and a cook, who had orders to obey Port's directions in dressing us a supper according to our own mode of cookery. We received many civil messages, in the course of the evening, from the principal people of the town, purporting that they would not add to our fatigues, by paying their respects to us at that time, but would wait on us in the morning. Such well-supported politeness and attention in a country so desolate and uncultivated, formed a contrast exceedingly favourable to its inhabitants; and to finish the piece as it began, at sunset the serjeant came with the report of his guard to Captain Gore.

Early in the morning, we received the compliments of the commander, of Captain Shmaloff, and of the principal inhabitants of the town, who all honoured us with visits soon after. The two first having sent for Port after we were gone to rest, and inquired of him what articles we seemed to be most in want of on board the ships; we found them prepared to insist on our sharing with the garrison under their command, in what little stock of provisions they had remaining. At the same time they lamented, that we had arrived at a season of the year when there was always the greatest scarcity of everything amongst them; the sloops not being yet arrived with their annual supply from Okotsk. We agreed to accept the liberality of these hospitable strangers with the best grace we could, but on condition that we might be made acquainted with the price of the articles we were to be supplied with; and that Captain Clerke should give bills to the amount upon the Victualling-Office in London. This the major positively refused; and whenever it was afterward urged, stopped us short, by telling us he was certain that he could not oblige his mistress more, than in giving every assistance in his power to her good friends and allies the English; and that it would be a particular satisfaction to her to hear that, in so remote a part of the world, her dominions had afforded any relief to ships engaged in such services as ours; that he could not, therefore, act so contrary to the character of his empress, as to accept of any bills, but that, to accommodate the matter, he would take a bare attestation of the particulars, with which we might be furnished; and that this he should transmit to his court, as a certificate of having performed his duty. I shall leave (he continued) to the two courts all farther acknowledgments, but cannot consent to accept anything of the kind alluded to.

When this matter was adjusted, he began to inquire about our private wants, saying he should consider himself as ill-used if he had any dealings with the merchants, or applied to any other person except himself. In return for such singular generosity, we had little to bestow but our admiration and our thanks. Fortunately, however, Captain Clerke had sent by me a set of prints and maps belonging to the last voyage of Captain Cook, which he desired me to present in his name to the commander, who being an enthusiast in everything relating to discoveries, received it with a satisfaction which showed that, though a trifle, nothing could have been more acceptable. Captain Clerke had likewise entrusted me with a discretionary power of showing him a chart of the discoveries made in the present voyage; and as I judged that a person in his situation and of his turn of mind would be exceedingly gratified by a communication of this sort, though out of delicacy he had forborne to ask more than a few general questions on the subject, I made no scruple to repose in him a confidence of which his whole conduct showed him to be deserving. I had the pleasure to find that he felt this compliment as I hoped he would, and was much struck at seeing in one view the whole of that coast, as well on the side of Asia as on that of America, of which his countrymen had been so many years employed in acquiring a partial and imperfect knowledge*.

Excepting this mark of confidence and the set of prints I have already mentioned, we

* On this occasion, Major Belin permitted us to examine all the maps and charts that were in his possession. Those relating to the peninsula of the Tschuktski were made in conformity to the information collected by Plenisher, between the years 1760 and 1770. As the charts of Plenisher were afterward made use of, according to Mr. Coxe, in the compilation of the General Map of Russia,

published by the Academy in 1776, it may be necessary to observe, that we found them exceedingly erroneous, and that the compilers of the General Map seem to have been led into some mistakes on his authority. Those in which the islands on the coast of America were laid down we found to contain nothing new, and to be much less accurate than those we saw at Onalashka.

had brought nothing with us that was in the least worth his acceptance; for it scarce deserves noticing that I prevailed on his son, a young boy, to accept of a silver watch I happened to have about me, and I made his little daughter very happy with two pair of ear-rings, of French paste. Besides these trifles, I left with Captain Shmaleff the thermometer I had used on my journey, and he promised me to keep an exact register of the temperature of the air for one year, and to transmit it to Mr. Muller, with whom he had the pleasure of being acquainted.

We dined this day at the commander's, who, studious on every occasion to gratify our curiosity, had, besides a number of dishes dressed in our own way, prepared a great variety of others, after the Russian and Kamtschadale manner. The afternoon was employed in taking a view of the town and the adjacent country. Bolcheretsk is situated in a low swampy plain, that extends to the sea of Okotsk, being about forty miles long, and of a considerable breadth. It lies on the north side of the Bolchoi-reka (or great river), between the mouth of the Gottsofka and the Bistraia, which here empty themselves into this river; and the peninsula on which it stands has been separated from the continent by a large canal, the work of the present commander, which has not only added much to its strength as a fortress, but has made it much less liable than it was before to inundations. Below the town the river is from six to eight feet deep, and about a quarter of a mile broad. It empties itself into the sea of Okotsk, at the distance of twenty-two miles, where, according to Kraschinicoff, it is capable of admitting vessels of a considerable size.

TOWN OF BOLCHERETSK.

There is no corn of any species cultivated in this part of the country, and Major Belin informed me, that his was the only garden that had yet been planted. The ground was for the most part covered with snow; that which was free from it appeared full of small hillocks of a black turfy nature. I saw about twenty or thirty cows, and the major had six stout horses. These and their dogs are the only tame animals they possess; the necessity they are under in the present state of the country of keeping great numbers of the latter, making it impossible to bring up any cattle that are not in size and strength a match for them. For during the summer season their dogs are entirely let loose, and left to provide for themselves, which makes them so exceedingly ravenous that they will sometimes even attack the bullocks.

The houses in Bolcheretsk are all of one fashion, being built of logs and thatched. That of the commander is much larger than the rest, consisting of three rooms of a considerable size, neatly papered, and which might have been reckoned handsome, if the tale with which the windows were covered had not given them a poor and disagreeable appearance. The town consists of several rows of low buildings, each consisting of five or six dwellings connected together, with a long common passage running the length of them, on one side of which is the kitchen and store-house, and on the other the dwelling apartments. Besides these are barracks for the Russian soldiers and Cossacks, a well-looking church, and a court-room; and at the end of the town a great number of *balagans*, belonging to the Kamtschadales. The inhabitants taken all together amount to between five and six hundred. In the evening the major gave a handsome entertainment, to which the principal people of the town of both sexes were invited.

The next morning we applied privately to the merchant Fedositsch, to purchase some tobacco for the sailors, who had now been upward of a twelvemonth without this favourite commodity. However this, like all our other transactions of the same kind, came imme-

diately to the major's knowledge, and we were soon after surprised to find in our house four bags of tobacco, weighing upward of a hundred pounds each, which he begged might be presented in the name of himself and the garrison under his command, to our sailors. At the same time they had sent us twenty loaves of fine sugar, and as many pounds of tea, being articles they understood we were in great want of, which they begged to be indulged in presenting to the officers. Along with these, Madame Behm had also sent a present for Captain Clerke, consisting of fresh butter, honey, figs, rice, and some other little things of the same kind, attended with many wishes that, in his infirm state of health, they might be of service to him. It was in vain we tried to oppose this profusion of bounty, which I was really anxious to restrain, being convinced that they were giving away not a share but almost the whole stock of the garrison. The constant answer the major returned us on those occasions was, that we had suffered a great deal, and that we must needs be in distress. Indeed, the length of time we had been out since we touched at any known port, appeared to them so very incredible, that it required the testimony of our maps, and other corroborating circumstances, to gain their belief. Amongst the latter was a very curious fact which Major Behm related to us this morning, and which he said but for our arrival he should have been totally at a loss to account for.

It is well known that the Tschutski are the only people of the north of Asia who have maintained their independence, and resisted all the attempts that have been made by the Russians to reduce them. The last expedition against them was undertaken in the year 1750, and terminated, after various success, in the retreat of the Russian forces, and the loss of the commanding officer. Since that time, the Russians had removed their frontier fortress from the Anadyr to the Igigga, a river that empties itself into the northern extremity of the sea of Okotsk, and gives its name to a gulf, situated to the west of that of Penshinsk. From this fort, Major Behm had received despatches the day of our arrival at Bolcheretsk, containing intelligence, that a tribe, or party, of the Tschutski, had arrived at that place with propositions of friendship, and a voluntary offer of tribute; that on inquiring into the cause of this unexpected alteration in their sentiments, they had informed his people, that toward the latter end of the last summer, they had been visited by two very large Russian boats; that they had been treated by the people who were in them with the greatest kindness, and had entered into a league of friendship and amity with them; and that relying on this friendly disposition, they were now come to the Russian fort, in order to settle a treaty, on such terms as might be acceptable to both nations. This extraordinary history had occasioned much speculation, both at Igiginsk and Bolcheretsk; and had we not furnished them with a key to it, must have remained perfectly unintelligible. We felt no small satisfaction in having, though accidentally, shown the Russians, in this instance, the only true way of collecting tribute, and extending their dominions; and in the hopes that the good understanding which this event hath given rise to, may rescue a brave people from the future invasions of such powerful neighbours.

We dined this day with Captain Shumaleff, and in the afternoon, in order to vary our amusements, he treated us with an exhibition of the Russian and Kamtschadale dancing. No description can convey an adequate idea of this rude and uncouth entertainment. The figure of the Russian dance was much like those of our hornpipes, and was danced either single, or by two or four persons at a time. Their steps were short and quick, with the feet scarce raised from the ground; the arms were fixed close to the sides; the body being all the while kept upright and immoveable, excepting when the parties passed each other, at which time the hand was raised with a quick and awkward motion. But if the Russian dance was at the same time both unmeaning and ridiculous, the Kamtschadale joined to the latter quality the most whimsical idea that ever entered into any people's heads. It is intended to represent the awkward and clumsy gestures of the bear, which these people have frequent opportunities of observing in a great variety of situations. It will scarcely be expected that I should give a minute description of all the strange postures which were exhibited on these occasions; and I shall therefore only mention, that the body was always bowed, and the knees bent, whilst the arms were used in imitating the tricks and attitudes of that animal.

As our journey to Bolcheretsk had taken up more time than we expected, and we were told that our return might prove still more difficult and tedious, we were under the necessity

of acquainting the commander, this evening, with our intention of setting out the next day. It was not without the utmost regret we thought of leaving our new acquaintance; and were therefore most agreeably surprised, when the major told us, that if we could stay one day longer, he would accompany us. He had, he said, made up his despatches, and resigned the command of Kamtschatka to his successor Captain Shmaleff; and had prepared everything for his departure to Okotsk, which was to take place in a few days; but that he should feel great pleasure in putting off his journey a little longer, and returning with us to St. Peter and St. Paul's, that he might himself be a witness of everything being done for us; that it was in their power to do.

In return for the few trifles I had given to the children of Major Behm, I was next morning, the 15th, presented by his little boy, with a most magnificent Kamtschadate dress, which shall be described in its proper place. It was of the kind worn by the principal *Tolons* of the country, on occasions of great ceremony; and, as I was afterwards told by Fedositsch, could not have been purchased for one hundred and twenty roubles. At the same time, I had a present from his daughter of a handsome sable muff. We afterwards dined with the commander, who, in order to let us see as much of the manners of the inhabitants, and of the customs of the country, as our time would permit, invited the whole of the better sort of people in the village, to his house this evening. All the women appeared very splendidly dressed after the Kamtschadate fashion. The wives of Captain Shmaleff, and the other officers of the garrison, were prettily dressed, half in the Siberian, and half in the European mode; and Madame Behm, in order to make the stronger contrast, had unpacked part of her baggage, and put on a rich European dress. I was much struck with the richness and variety of the silks which the women wore, and the singularity of their habits. The whole was like some enchanted scene, in the midst of the wildest and most dreary country in the world. Our entertainment again consisted of dancing and singing.

The next morning being fixed for our departure, we retired early to our lodgings, where the first things we saw were three travelling-dresses, made after the fashion of the country, which the major had provided for us, who came himself to our house soon after, to see all our things packed up, and properly taken care of. Indeed what with his liberal presents, and the kindness of Captain Shmaleff, and many other individuals, who all begged to throw in their mite together with the ample stock of provisions he had sent us for our journey, we had amassed no inconsiderable load of baggage.

Early in the morning, everything being ready for our departure, we were invited to call on Madame Behm, in our way to the boats, and take our leave of her. Impressed, as our minds were, with sentiments of the warmest gratitude, by the attentive, benevolent, and generous treatment we had met with at Boleheretsk, they were greatly heightened by the affecting scene which presented itself to us, on leaving our lodgings. All the soldiers and Cossacks belonging to the garrison, were drawn up on one hand, and the male inhabitants of the town, dressed out in their best clothes, on the other; and as soon as we came out of the house, the whole body of the people joined in a melancholy song, which, the major told us, it was usual in that country to sing on taking leave of their friends. In this manner we marched down to the commander's house, preceded by the drums and music of the garrison, where we were received by Madame Behm, attended by the ladies, who were dressed in long silk cloaks, lined with very valuable furs of different colours, which made a most magnificent appearance. After partaking of some refreshment, that was prepared for us, we went down to the water side, accompanied by the ladies, who now joined the song with the rest of the inhabitants; and as soon as we had taken leave of Madame Behm, and assured her of the grateful sense we should ever retain of the hospitality of Boleheretsk, we found ourselves too much affected, not to hasten into the boats with all the expedition we could. When we put off, the whole company gave us three cheers, which we returned from the boat; and, as we were doubling a point, where for the last time we saw our friendly entertainers, they took their farewell in another cheer.

We found the stream, on our return, so exceedingly rapid, that notwithstanding the Cossacks and Kamtschadales used their utmost exertions, we did not reach the first village.

Opatchin, till the evening of the 17th, which was at the rate of about twenty miles a-day. We got to Natchekin on the 19th; and on the 20th we crossed the plain to Karatchin. We found the road much better than when we had passed it before, there having been a smart frost on the night of the 19th. On the 21st, we proceeded down the Awatska River; and, before it was dark, got over the shoals which lie at the entrance of the bay. During the whole course of our journey, we were much pleased with the great good-will with which the *Toions*, and their Kamtschadales, afforded us their assistance, at the different ostrogs through which we passed; and I could not but observe the pleasure that appeared in their countenances, on seeing the major, and their strong expressions of sorrow, on hearing he was so soon going to leave them.

We had despatched a messenger to Captain Clerke, from Bolcheretsk, with an account of our reception, and of the major's intention of returning with us; at the same time apprising him of the day he might probably expect to see us. We were therefore very well pleased to observe, as we approached the harbour, all the boats of the two ships coming toward us, the men clean, and the officers as well dressed as the scarcity of our clothing would permit. The major was much struck at the robust and healthy appearance of the boats' crews, and still more at seeing most of them without any other covering than a shirt and trousers, although at the very moment it actually snowed. As Major Behm had expressed his intentions of visiting the ships before he landed, as soon as we arrived off the town, I desired to receive his commands; when remarking, that from the account we had given of the very bad state of Captain Clerke's health, it might be imprudent to disturb him at so late an hour (it being now past nine o'clock), he thought it, he said, most advisable to remain that night on shore. Accordingly, after attending him to the serjeant's house, I took my leave for the present, and went on board to acquaint Captain Clerke with my proceedings at Bolcheretsk. It was with the utmost concern I found, that in the fortnight we had been absent, this excellent officer was much altered for the worse, instead of reaping that advantage we flattered ourselves he might, from the repose of the harbour, and the milk and vegetable diet with which he was supplied.

As soon as I had despatched this business, I returned to the major, and the next morning conducted him to the ships; where, on his arrival, he was saluted with thirteen guns, and received with every other mark of distinction that it was in our power to pay him. He was attended by the commander of one of the Russian galliots, the master of a sloop that lay in the harbour, two merchants from Bolcheretsk, and the priest of the neighbouring village of Paratonna, for whom he appeared to entertain the highest respect, and whom I shall hereafter have occasion to mention, on account of his great kindness to Captain Clerke.

After visiting the captain, and taking a view of both the ships, he returned to dinner on board the *Resolution*; and, in the afternoon, the various curiosities we had collected in the course of our voyage, were shown him, and a complete assortment of every article presented to him by Captain Clerke. On this occasion I must not pass over an instance of great generosity and gratitude in the sailors of both ships; who, when they were told of the handsome present of tobacco that was made them by the major, desired, entirely of their own accord, that their grog might be stopped, and their allowance of spirits presented, on their part, to the garrison of Bolcheretsk, as they said they had reason to conclude that brandy was scarce in the country, and would be very acceptable to them, since the soldiers on shore had offered four roubles a bottle for it. We, who knew how much the sailors always felt, whenever their allowance of grog was stopped, which was generally done in warm weather, that they might have it in a greater proportion in cold, and that this offer would deprive them of it during the inclement season we had to expect in our next expedition to the north, could not but admire so extraordinary a sacrifice; and that they might not suffer by it, Captain Clerke, and the rest of the officers, substituted in the room of the very small quantity the major could be prevailed on to accept, the same quantity of rum. This, with a dozen or two of Cape wine, for Madame Behm, and such other little presents as were in our power to bestow, were accepted in the most obliging manner. The next morning the tobacco was divided between the crews of the two ships, three pounds being allotted to every man that chewed or smoked tobacco, and one pound to those that did not.

I have before mentioned, that Major Behm had resigned the command of Kamtschatka, and intended to set out in a short time for Petersburg; and he now offered to charge himself with any despatches we might trust to his care. This was an opportunity not to be neglected; and accordingly Captain Clerke acquainted him, that he would take the liberty of sending by him some papers relating to our voyage, to be delivered to our ambassador at the Russian court. Our first intentions were to send only a small journal of our proceedings; but afterward Captain Clerke being persuaded that the whole account of our discoveries might safely be trusted to a person who had given such striking proofs both of his public and private virtues; and considering that we had a very hazardous part of the voyage still to undertake, determined to send, by him, the whole of the journal of our late commander, with that part of his own which completed the period from Captain Cook's death, till our arrival at Kamtschatka; together with a chart of all our discoveries. Mr. Bayly and myself thought it also proper to send a general account of our proceedings to the board of longitude; by which precautions, if any misfortune had afterward befallen us, the Admiralty would have been in possession of a complete history of the principal facts of our voyage. It was also determined, that a smaller packet should be sent by an express from Okotsk, which, the major said, if he was fortunate in his passage to that port, would reach Petersburg by December, and that he himself should be there in February or March. During the three following days, the major was entertained alternately in the two ships, in the best manner we were able. On the 25th, he took his leave, and was saluted with thirteen guns; and the sailors, at their own desire, gave him three cheers. The next morning, Mr. Webber and myself attended him a few miles up the Awatska River, where we met the Russian priest, his wife and children, who were waiting to take the last farewell of their commander.

It was hard to say, whether the good priest and his family, or ourselves, were most affected on taking our leave of Major Behm. Short as our acquaintance had been, his noble and disinterested conduct had inspired us with the highest respect and esteem for him; and we could not part with a person to whom we were under such obligations, and whom we had little prospect of ever seeing again, without feeling the most tender concern. The intrinsic value of the private presents we received from him, exclusive of the stores which might be carried to a public account, must have amounted, according to the current price of articles in that country, to upward of two hundred pounds. But this generosity, extraordinary as it must appear in itself, was exceeded by the delicacy with which all his favours were conferred, and the artful manner in which he endeavoured to prevent our feeling the weight of obligations, which he knew we had no means of requiting. If we go a step further, and consider him as supporting a public character, and maintaining the honour of a great sovereign, we shall find a still higher subject of admiration, in the just and enlarged sentiments by which he was actuated. "The service in which you are employed," he would often say, "is for the general advantage of mankind, and therefore gives you a right, not merely to the offices of humanity, but to the privileges of citizens, in whatever country you may be thrown. I am sure I am acting agreeably to the wishes of my mistress, in affording you all the relief in our power; and I cannot forget either her character, or my own honour, so much, as to barter for the performance of a duty." At other times, he would tell us, that he was particularly desirous of setting a good example to the Kamtschadales, who, he said, were but just emerging from a state of barbarism; that they looked up to the Russians as their patterns in everything; and that he had hopes they might in future look upon it as a duty incumbent upon them to assist strangers to the utmost of their power, and believe that such was the universal practice of civilised nations. To all this must be added, that, after having relieved, to the utmost of his abilities, all our present distresses, he showed himself not much less mindful of our future wants; and, as he supposed it more than probable we should not discover the passage we were in search of, and therefore should return to Kamtschatka in the fall of the year, he made Captain Clerke give him a list of what cordage and flour we should want, and promised they should be sent from Okotsk, and wait our arrival. For the same purpose, he gave Captain Clerke a paper, enjoining all the subjects of the empress, whom we might happen to meet, to give us every assistance in their power.

of Kamtschatka, to charge himself with the liberty of our ambassador at St. Paul, and of our proceedings of our discoveries both of his public and private of the voyage still in the hands of our late commander, until our arrival at St. Paul. CHAPTER III.—CONTINUATION OF TRANSACTIONS IN THE HARBOUR OF ST. PETER AND ST. PAUL.—ABUNDANCE OF FISH.—DEATH OF A SEAMAN BELONGING TO THE RESOLUTION.—THE RUSSIAN HOSPITAL PUT UNDER THE CARE OF THE SHIP'S SURGEONS.—SUPPLY OF FLOUR AND CATTLE.—CELEBRATION OF THE KING'S BIRTH-DAY.—DIFFICULTIES IN SAILING OUT OF THE BAY.—ERUPTION OF A VOLCANO.—STEER TO THE NORTHWARD.—CHEEPOONSKOI NOSS.—ERRORS OF THE RUSSIAN CHARTS.—KAMTSCHATSKOI NOSS.—OLUTORSKOI NOSS.—TCHUKOTSKOI NOSS.—ISLAND OF ST. LAURENCE.—VIEW, FROM THE SAME POINT, OF THE COASTS OF ASIA AND AMERICA, AND THE ISLANDS OF ST. DIOMEDE.—VARIOUS ATTEMPTS TO GET TO THE NORTH, BETWEEN THE TWO CONTINENTS.—OBSTRUCTED BY IMPENETRABLE ICE.—SEA-HORSES AND WHITE BEARS KILLED.—CAPTAIN CLERKE'S DETERMINATION, AND FUTURE DESIGNS.

HAVING concluded the last chapter with an account of our return from Bolcheretsk, accompanied by Major Behm, the Commander of Kamtschatka, and of his departure; I shall proceed to relate the transactions that passed in the harbour of St. Peter and St. Paul during our absence. On the 7th of May, soon after we had left the bay, a large piece of ice drove across the cut-water of the Resolution, and brought home the small bower anchor. This obliged them to weigh the other anchor, and moor again. The carpenters, who were employed in stopping the leak, were obliged to take off a great part of the sheathing from the bows, and found many of the trunnels so very loose and rotten, as to be easily drawn out with the fingers. On the 11th they had heavy gales from the north-east, which obliged both the ships to strike yards and topmasts; but in the afternoon, the weather being more moderate, and the ice having drifted away as far as the mouth of the harbour of St. Peter and St. Paul, they warped close to the shore for the greater convenience of watering and wooding, and again moored as before, the town bearing north half west, half a mile distant, and the mouth of the bay shut in by the southernmost point of Rakowina harbour, south. The next day, a party was sent on shore to cut wood, but made little progress on account of the snow, which still covered the ground. A convenient spot was cleared away abreast of the ships, where there was a fine run of water, and a tent being erected for the cooper, the empty casks were landed, and the sail-makers sent on shore.

On the 15th, the beach being clear of ice, the people were sent to haul the seine, and caught an abundant supply of fine flat fish for both the ships' companies. Indeed from this time, during the whole of our stay in the harbour, we were absolutely overpowered with the quantities of fish which came in from every quarter. The *Tobols* both of this town and of Paratonnea, a village in the neighbourhood, had received orders from Major Behm to employ all the Kamtschadales in our service, so that we frequently could not take into the ships the presents that were sent us. They consisted in general of flat fish, cod, trout, and herring. These last, which were in their full perfection, and of a delicious flavour, were exceedingly abundant in this bay. The Discovery people surrounded at one time so great a quantity in their seine, that they were obliged to throw a vast number out, lest the net should be broken to pieces; and the cargo that landed was afterward so plentiful, that besides a sufficient store for immediate use, they had as many casks as they could spare for salting; and after sending to the Resolution a sufficient quantity for the same purpose, they left several bushels behind on the beach.

The snow now began to disappear every day, and abundance of wild garlic, celery, and nettle-tops were gathered for the use of the crews, which being boiled with wheat and portable soup, made them a wholesome and comfortable breakfast, and with this they were supplied every morning. The birch trees were also tapped, and the sweet juice, which they yielded in great quantities, was constantly mixed with the men's allowance of brandy. The next day, a small bullock, which had been procured for the ships' companies by the sergeant, was killed, and weighed two hundred and seventy-two pounds. It was served out to both crews for their Sunday's dinner, being the first piece of fresh beef they had tasted since our departure from the Cape of Good Hope in December, 1776, a period of near two years and a half.

This evening died John Macintosh, the carpenter's mate, after having laboured under a dysentery ever since our departure from the Sandwich Islands: he was a very hard-working quiet man, and much regretted by his mess-mates. He was the fourth person we lost by sickness during the voyage, but the first who could be said, from his age and the constitutional habits of his body, to have had on our setting out an equal chance with the rest of his comrades: Watman we supposed to be about sixty years of age; and Roberts and Mr. Anderson, from the decay which had evidently commenced before we left England, could not, in all probability, under any circumstances, have lived a greater length of time than they did.

I have already mentioned that Captain Clerke's health continued daily to decline, notwithstanding the salutary change of diet which the country of Kamtschatka afforded him. The priest of Paratounea, as soon as he heard of the infirm state he was in, supplied him every day with bread, milk, fresh butter, and fowls, though his house was sixteen miles from the harbour where we lay.

On our first arrival, we found the Russian hospital, which is near the town of St. Peter and St. Paul, in a condition truly deplorable. All the soldiers were, more or less, affected by the scurvy, and a great many in the last stage of that disorder. The rest of the Russian inhabitants were also in the same condition; and we particularly remarked that our friend the sergeant, by making too free with the spirits we gave him, had brought on himself in the course of a few days, some of the most alarming symptoms of that malady. In this lamentable state, Captain Clerke put them all under the care of our surgeons, and ordered a supply of sour krount, and malt for wort, to be furnished for their use. It was astonishing to observe the alteration in the figures of almost every person we met on our return from Bolcheretsk; and I was informed by our surgeons that they attributed their speedy recovery principally to the effects of the sweet wort.

On the 1st of June we got on board two hundred and fifty poods, or nine thousand pounds' weight of rye flour, with which we were supplied from the stores of St. Peter and St. Paul's, and the *Discovery* had a proportional quantity. The men were immediately put on full allowance of bread, which they had not been indulged in since our leaving the Cape of Good Hope. The same day our watering was completed, having got on board sixty-five tons. On the 4th* we had fresh breezes and hard rain, which disappointed us in our design of dressing the ships, and obliged us to content ourselves with firing twenty-one guns in honour of the day, and celebrating it in other respects in the best manner we were able. Port, who was left with us on account of his skill in languages, behaved himself with so much modesty and discretion, that as soon as his master was gone he was no longer Jean Port, but Monsieur Port, the interpreter, and partook, as well as the sergeant (in his capacity of commander of the place), of the entertainment of the day. Our worthy friend the priest of Paratounea having got intelligence of its being our king's birth-day, gave also a sumptuous feast, at which some of our gentlemen were present, who seemed highly delighted with their entertainment, which consisted of abundance of good eating and drinking, together with dancing.

On the 6th, twenty head of cattle were sent us by the commander's orders from the Verchnei ostrog, which is situated on the river Kamtschatka, at the distance of near a hundred miles from this place, in a direct line. They were of a moderate size; and notwithstanding the Kamtschadales had been seventeen days in driving them down to the harbour, arrived in good condition. The four following days were employed in making ready for sea, and on the 11th, at two in the morning, we began to unmoor; but before we had got one anchor up, it blew so strong a gale from the north-east, that we kept fast, and moored again, conjecturing, from the position of the entrance of the bay, that the current of wind would set up the channel. Accordingly, the pinnace being sent out to examine the passage, returned with an account that the wind blew strong from the south-east, with a great swell, setting into the bay, which would have made any attempt to get to sea very hazardous.

Our friend Port now took his leave of us, and carried with him the box with our journals, which was to go by the major, and the packet that was to be sent express. On the 12th,

ox with our journals, press. On the 12th,

the weather being moderate, we began to unmoor again; but, after breaking the messenger, and reeving a running purchase with a six-inch hawser, which also broke three times, we were obliged at last to heave a strain at low water, and wait for the flowing of the tide to raise the anchor. This project succeeded; but not without damaging the cable in the wake of the hawse. At three, we weighed the best bower, and set sail; and, at eight, having little wind, and the tide making against us, we dropped anchor again in ten fathoms, off the mouth of Rakowina harbour; the ostrog bearing north by east half east, two miles and a half distant; the Needle Rocks, on the east side of the passage, south south-east half east, and the high rock, on the west side of the passage, south.

On the 13th, at four in the morning, we got under weigh with the ebb tide; and, there being a dead calm, the boats were sent ahead to tow the ships. At ten, the wind springing up from the south-east by south, and the tide having turned, we were again obliged to drop anchor in seven fathoms; the Three Needle Rocks bearing south half east; and the ostrog north half east, at the distance of one mile from the nearest land. After dinner, I went with Captain Gore on shore, on the east side of the passage, where we saw, in two different places, the remains of extensive villages; and on the side of the hill, an old ruined parapet, with four or five embrasures. It commanded the passage up the mouth of the bay; and in Beering's time, as he himself mentions, had guns mounted on it. Near this place, were the ruins of some caverns under ground, which we supposed to have been magazines.

At six in the afternoon we weighed with the ebb tide, and turned to windward; but at eight, a thick fog arising, we were obliged to bring-to, as our soundings could not afford us a sufficient direction for steering between several sunk rocks, which lie on each side of the passage we had to make. In the morning of the 14th, the fog clearing away, we weighed as soon as the tide began to ebb; and, having little wind, sent the boats ahead to tow; but, at ten o'clock, both the wind and tide set in so strong from the sea, that we were again obliged to drop anchor in thirteen fathoms, the high rock bearing west one quarter south, distant three quarters of a mile. We remained fast for the rest of the day, the wind blowing fresh into the mouth of the bay; and, toward evening, the weather had a very unusual appearance, being exceedingly dark and cloudy, with an unsettled shifting wind.

Before daylight on the 15th, we were surprised with a rumbling noise, resembling distant hollow thunder; and when the day broke, we found the decks and sides of the ships covered with a fine dust like emery, near an inch thick. The air, at the same time, continued loaded and darkened with this substance; and, toward the volcano mountain, situated to the north of the harbour, it was so thick and black, that we could not distinguish the body of the hill. About twelve o'clock, and, during the afternoon, the explosions became louder, and were followed by showers of cinders, which were, in general, about the size of peas; though many were picked up from the deck larger than a hazel-nut. Along with the cinders fell several small stones, which had undergone no change from the action of fire. In the evening we had dreadful thunder and lightning, which, with the darkness of the atmosphere, and the sulphurous smell of the air, produced altogether a most awful and terrifying effect. We were, at this time, about eight leagues from the foot of the mountain.

On the 16th, at daylight, we again weighed anchor, and stood out of the bay; but the ebb-tide setting across the passage upon the eastern shore, and the wind falling, we were driven very near the Three Needle Rocks, which lie on that side of the entrance, and obliged to hoist out the boats, in order to tow the ships clear of them. At noon we were two leagues from the land, and had soundings with forty-three fathoms of line, over a bottom of small stones, of the same kind with those which fell on our decks, after the eruption of the volcano; but whether they had been left there by the last, or by some former eruptions, we were not able to determine. The aspect of the country was now very different from what it had been on our first arrival. The snow, excepting what remained on the tops of some very high mountains, had disappeared; and the sides of the hills, which in many parts were well wooded, were covered with a beautiful verdure.

As it was Captain Clerke's intention to keep as much in sight of the coast of Kamtschatka as the weather would permit, in order to determine its position, we continued steering to the north north-east, with light and variable winds, till the 18th. The volcano was still seen

throwing up immense volumes of smoke ; and we had no soundings with one hundred and fifty fathoms, at the distance of four leagues from the shore. On the 18th, the wind freshening from the south, the weather became so thick and hazy, as to make it imprudent to attempt any longer to keep in sight of the land. But that we might be ready to resume our survey, whenever the fogs should disperse, we ran on in the direction of the coast, as laid down in the Russian charts, and fired signal-guns for the *Discovery* to steer the same course. At eleven o'clock, just before we lost sight of the land, Cheepoonskoi Noss, so called by the Russians (a description of which, as well as the coast between it and Awatska Bay, will be given hereafter,) bore north north-east, distant seven or eight leagues.

On the 20th, at three in the morning, the weather having cleared up, we stood in toward the land ; and in an hour's time saw it ahead, extending from north-west to north north-east, distant about five leagues. The north part we took to be Kronotskoi Noss ; its position in the Russian charts agreeing nearly with our reckoning as to its latitude, which was $51^{\circ} 42'$; but in longitude we differed from them considerably, they placing it $1^{\circ} 48'$ E. of Awatska ; whereas, our reckoning, corrected by the time-keepers and lunar observations, makes it $3^{\circ} 34'$ E. of that place, or $162^{\circ} 17'$ E. from Greenwich. The land about this cape is very high, and the inland mountains were still covered with snow. The shore breaks off in steep cliffs, and the coast is without any appearance of inlets or bays. We had not been long gratified with this sight of the land, when the wind freshened from the south-west, and brought on a thick fog, which obliged us to stand off to the north-east by east. The weather clearing up again at noon, we steered toward the land, expecting to fall in with Kamtschatskoi Noss, and had sight of it at daybreak of the 21st. The southerly wind was soon after succeeded by a light breeze blowing off the land, which prevented our approaching the coast sufficiently near to describe its aspect, or ascertain, with accuracy, its direction. At noon, our latitude, by observation, was $55^{\circ} 52'$, and longitude (deduced from a comparison of many lunar observations, taken near this time, with the time-keepers,) $163^{\circ} 50'$; the extremities of the land bearing N. W. by W. three quarters W., and N. by W. three quarters W., the nearest part about eight leagues distant. At nine o'clock in the evening, having approached about two leagues nearer the coast, we found it formed a projecting peninsula, extending about twelve leagues in a direction nearly N. and S. It is level and of a moderate height, the southern extremity terminating in a low sloping point ; that to the north forming a steep bluff head ; and between them, about four leagues to the southward of the northern cape, there is a considerable break in the land. On each side of this break the land is quite low ; beyond the opening rises a remarkable saddle-like hill ; and a chain of high mountains covered with snow, ranges along the back of the whole peninsula. As the coast runs in an even direction, we were at a great loss where to place Kamtschatskoi Noss, which, according to Muller, forms a projecting point about the middle of the peninsula, and which certainly does not exist ; but I have since found, that in the general map published by the Academy of Petersburg in 1776, that name is given to the southern cape. This was found, by several accurate observations, to be in latitude $56^{\circ} 3'$, longitude $163^{\circ} 20'$; the difference in longitude from the Russian charts, being the same as at Kronotskoi Noss. The variation of the compass at this time was 10° E. To the southward of this peninsula the great river Kamtschatka falls into the sea. As the season was too far advanced to admit of our making an accurate survey of the coast of Kamtschatka, it was Captain Clerke's plan, in our run to Beering's Straits, to determine principally the positions of the projecting points of the coast. We therefore directed our course across an extensive bay, laid down between Kamtschatskoi Noss and Olutorskoi Noss, intending to make the latter ; which, according to the Russian geographers, terminates the peninsula called Kamtschatka, and becomes the southern boundary of the Koriaki country.

On the 22nd, we passed a dead whale, which emitted a horrid stench, perceivable at upward of a league's distance ; it was covered with a great number of sea-birds, that were feasting on it. On the 24th, the wind, which had varied round the compass, the three preceding days, fixed at S. W. and brought clear weather, with which we continued our course to the N. E. by N., across the bay, without any land in sight. This day we saw a great number of gulls, and were witnesses to the disgusting mode of feeding of the arctic

gull, which has procured it the name of the parasite, and which, if the reader is not already acquainted with it, he will find in the note below.*

On the 25th, at one o'clock in the afternoon, being in latitude $59^{\circ} 12'$, longitude $168^{\circ} 35'$, the wind freshening from the same quarter, a thick fog succeeded; and this unfortunately just at the time we expected to see Olutorskoi Noss; which, if Muller places it right in latitude $53^{\circ} 30'$, and in longitude $167^{\circ} 36'$, could only have then been twelve leagues from us; at which distance land of a moderate height might easily have been seen. But if the same error in longitude prevails here, which we have hitherto invariably found, it would have been much nearer us, even before the fog came on; and as we saw no appearance of land at that time, it must either have been very low, or there must be some mistake of latitude in Muller's account. We tried soundings, but had no ground with one hundred and sixty fathoms of line.

The weather still thickening, and preventing a nearer approach to the land, at five we steered E. by N., which is somewhat more easterly than the Russian charts lay down the trending of the coast from Olutorskoi Noss. The next day we had a fresh gale from the S. W., which lasted till the 27th at noon, when the fogs clearing away, we stood to the northward, in order to make the land. The latitude at noon, by observation, was $59^{\circ} 49'$, longitude $175^{\circ} 43'$. Notwithstanding we saw shags in the forenoon, which are supposed never to go far from land, yet there was no appearance of it this day; but on the 28th, at six in the morning, we got sight of it to the N. W. The coast shows itself in hills of a moderate height; but inland, others are seen to rise considerably. We could observe no wood, and the snow lying upon them in patches, gave the whole a very barren appearance. At nine, we were about ten miles from the shore, the southern extremity bearing W. by S., six leagues distant, beyond which the coast appeared to trend to the westward. This point being in latitude $61^{\circ} 48'$, longitude $174^{\circ} 48'$, lies, according to the Russian charts, near the mouth of the river Opuka. At the same time, the northern extreme bore N. by W.; between which and a hill bearing N. W. by W. a quarter W., and at this distance appearing to us like an island, the coast seemed to bend to the westward, and form a deep bay. About eight miles from land, we perceived ourselves in a strong rippling; and being apprehensive of foul ground, we bore away to the N. E., along the shore; notwithstanding, on heaving the lead, we found regular soundings of twenty-four fathoms, over a gravelly bottom; from whence we concluded, that this appearance was occasioned by a tide, at that time running to the southward. At noon, the extremes of the land bearing W. S. W. three quarters W., and N. N. E. three quarters E., distant from the nearest shore four leagues, we were abreast of the low land, which we now perceived to join the two points, where we had before expected to find a deep bay. The coast bends a little to the westward, and has a small inlet, which may probably be the mouth of some trifling stream. Our latitude, by observation, was $61^{\circ} 56'$, and longitude $175^{\circ} 43'$, and the variation of the compass $17^{\circ} 30'$ E.

We continued during the afternoon to run along the shore, at the distance of four or five leagues, with a moderate westerly breeze, carrying regular soundings from twenty-eight to thirty-six fathoms. The coast presented the same barren aspect as to the southward, the hills rising considerably inland, but to what height the clouds on their tops put it out of our power to determine. At eight in the evening, land was thought to have been seen to the east by north, on which we steered to the southward of east, but it turned out to be only a fog-bank. At midnight, the extreme point bearing north-east a quarter east, we supposed it to be Saint Thadens's Noss; to the southward of which the land trends to the westward, and forms a deep bight, wherein, according to the Russian charts, lies the river Katirka.

On the 29th the weather was unsettled and variable, with the wind from the north-east. At noon of the 30th, our latitude by observation was $61^{\circ} 48'$, and longitude $180^{\circ} 0'$, at which time Saint Thadens's Noss bore north north-west, twenty-three leagues distant, and beyond

* This bird, which is somewhat larger than the common gull, pursues the latter kind whenever it meets them; the gull, after flying for some time, with loud screams and evasive marks of great terror, drops its dung; which its pursuer immediately darts at, and catches before it falls

into the sea. [This is an error. The larger bird forces the smaller to disgorge the food it has just swallowed, which has been mistaken for its dung. See *Encyclopædia Britannica*, article *Larus*.—Ed.]

it we observed the coast stretching almost directly north. The most easterly point of the Noss is in latitude $62^{\circ} 50'$, and longitude $179^{\circ} 0'$, being $3\frac{1}{2}^{\circ}$ more to the east than what the Russians make it. The land about it must be of a considerable height, from its being seen at so great a distance. During the two last days, we saw numbers of whales, large seals, and sea-horses; also gulls, sea-parrots, and albatrosses. We took the advantage of a little calm weather to try for fish, and caught abundance of fine cod. The depth of water from sixty-five to seventy-five fathoms.

On the 1st of July at noon, Mr. Bligh having moored a small keg with the deep-sea lead in seventy-five fathoms, found the ship made a course north by east half a mile an hour. This he attributed to the effect of a long southerly swell, and not to that of any current. The wind freshening from the south-east toward evening, we shaped our course to the north-east by east for the point called in Beering's chart Tschukotskoi Noss, which we had observed on the 4th of September last year, at the same time that we saw to the south-east the island of Saint Laurence. This Cape and Saint Thadens's Noss form the north-east and south-west extremities of the large and deep Gulf of Anadir, into the bottom of which the river of that name empties itself, dividing, as it passes, the country of the Koraias from that of Tschutski. On the 3rd at noon the latitude, by observation, was $63^{\circ} 33'$, and the longitude $186^{\circ} 45'$; half an hour after which we got sight of the Tschukotskoi Noss, bearing north half west, thirteen or fourteen leagues distant, and at five in the afternoon saw the island of St. Laurence, bearing east three quarters north; and another island a little to the eastward of it, which we supposed to be between Saint Laurence and Anderson's Island, about six leagues east-south-east of the former. As we had no certain account of this island, Captain Clerke was desirous of a nearer prospect, and immediately hauled the wind toward it; but unfortunately we were not able to weather the island of Saint Laurence, and were therefore under the necessity of bearing up again, and passing them all to the leeward.

We had a better opportunity of settling the longitude of the island Saint Laurence when we last saw it, than now. But seeing it at that time but once, and to the southward, we could only determine its latitude so far as we could judge of distances, whereas now the noon observations enabled us to ascertain it correctly, which is $63^{\circ} 47'$. Its longitude was found to be $188^{\circ} 15'$, as before. This island, if its boundaries were at this time within our view, is about three leagues in circuit. The north part may be seen at the distance of ten or twelve leagues; but as it falls in low land to the south-east, the extent of which we could not see, some of us conjectured that it might probably be joined to the land to the eastward of it; this, however, the haziness of the weather prevented our ascertaining. These islands, as well as the land about the Tschukotskoi Noss, were covered with snow, and presented us with a most dreary picture. At midnight, Saint Laurence bore south-south-east, five or six miles distant, and our depth of water was eighteen fathoms. We were accompanied by various kinds of sea-fowl, and saw several small crested hawks.

The weather still continuing to thicken, we lost all sight of land till the 5th, when it appeared both to the north-east and north-west. Our latitude, by account, was at this time $65^{\circ} 24'$, longitude $189^{\circ} 14'$. As the islands of Saint Diomedé, which lie between the two continents in Beering's Strait, were determined by us last year to be in latitude $65^{\circ} 48'$, we could not reconcile the land to the north-east with the situation of those islands. We therefore stood toward the land till three in the afternoon, when we were within four miles of it, and finding it to be two islands, were pretty well satisfied of their being the same; but the weather still continuing hazy, to make sure of our situation we stood over to the coast of Asia till seven in the evening, at which time we were within two or three leagues of the east cape of that continent. This cape is a high round head of land, extending four or five miles from north to south, forming a peninsula, and connected with the continent by a narrow neck of low land. Its shore is bold, and off its north part are three high detached spiral rocks. At this time it was covered with snow, and the beach surrounded with ice. We were now convinced that we had been under the influence of a strong current setting to the north, that had caused an error in our latitude at noon of twenty miles. In passing this strait the last year, we had experienced the same effect. Being at length sure of our position, we held on to the north by east. At ten at night the weather becoming clear, we had an

opportunity of seeing at the same moment the remarkable peaked hill near Cape Prince of Wales, on the coast of America, and the east Cape of Asia, with the two connecting islands of Saint Diomedé between them.

At noon on the 6th, the latitude, by account, was 67° N., and the longitude 191° 6' E. Having already passed a considerable number of large masses of ice, and observed that it still adhered in several places to the shore on the continent of Asia, we were not much surprised to fall in, at three in the afternoon, with an extensive body of it, stretching away to the westward. This sight gave great discouragement to our hopes of advancing much farther northward this year, we had done the preceding.

Having little wind in the afternoon, we hoisted out the boats in pursuit of the sea-horses, which were in great numbers on the detached pieces of ice; but they soon returned without success: these animals being exceedingly shy, and before they could come within gun-shot, always making their retreat into the water. At seven in the evening, we hoisted in the boats, and the wind freshening from the southward, we stood on to the N. E., with a view of exploring the continent of America, between the latitudes of 68° and 69°, which, owing to the foggy weather last year, we had not been able to examine. In this attempt we were again in part disappointed. For on the 7th, at six in the morning, we were stopped by a large field of ice stretching from N. W. to S. E., but soon after the horizon becoming clear, we had sight of the coast of America at about ten leagues distance, extending from north-east by east to east, and lying, by observation, between the 68° and 69° 20' of latitude. As the weather was clear, and the ice not high, we were enabled to see over a great extent of it. The whole presented a solid and compact surface not in the smallest degree thawed, and appeared to us likewise to adhere to the land.

The weather soon after changing to hazy, we saw no more of the land; and there not remaining a possibility of approaching nearer to it, we stood to the north north-west, keeping the ice close on board, and got round its western extremity by noon, when we found it trending nearly north. Our latitude at this time was, by account, 68° 22', and longitude 192° 34'. We continued our course to the north north-east, along the edge of the ice, during the remaining part of the day, passing through many loose pieces that had been broken off from the main body, and against which, notwithstanding all our caution, the ships were driven with great violence. At eight o'clock in the evening we passed some driftwood, and at midnight the wind shifted to the north-west; the thermometer fell from 38° to 31°, and we had continued showers of snow and sleet.

On the 8th, at five in the morning, the wind coming still more to the northward, we could no longer keep on the same tack, on account of the ice, but were obliged to stand to the westward. At this time our soundings had decreased to nineteen fathoms, from which, on comparing it with our observations on the depth of water last year, we concluded that we were not at a greater distance from the American shore than six or seven leagues; but our view was confined within a much shorter compass by a violent fall of snow. At noon, the latitude by account was 69° 21', longitude 192° 42'. At two in the afternoon the weather cleared up, and we found ourselves close to an expanse of what appeared from the deck solid ice; but from the mast head it was discovered to be composed of huge compact bodies, close and united toward the outer edge, but in the interior parts several pieces were seen floating in vacant spaces of the water. It extended from north-east by the north to west south-west. We bore away by the edge of it to the southward, that we might get into clearer water; for the strong northerly winds had drifted down such quantities of loose pieces, that we had been for some time surrounded by them, and could not avoid striking against several, notwithstanding we reefed the topsails and stood under an easy sail.

On the 9th we had a fresh gale from the north north-west, with heavy showers of snow and sleet. The thermometer was in the night-time 28°, and at noon 30°. We continued to steer west south-west as before, keeping as near the large body of ice as we could, and had the misfortune to rub off some of the sheathing from the bows against the drift pieces, and to damage the cutwater. Indeed the shocks we could not avoid receiving, were frequently so severe as to be attended with considerable danger. At noon, the latitude by account was 69° 12', and longitude 188° 5'. The variation in the afternoon was found to be 29° 30' E.

Thus far of their ordinary dress and ornaments; but they have some that seem to be used only on extraordinary occasions; either when they exhibit themselves as strangers, in visits of ceremony, or when they go to war. Amongst the first may be considered the skins of animals, such as wolves or bears, tied on in the usual manner, but ornamented at the edges with broad borders of fur, or of the woollen stuff manufactured by them, ingeniously wrought with various figures. These are worn either separately, or over their other common garments. On such occasions, the most common head-dress is a quantity of withe, or half-beaten bark, wrapped about the head; which, at the same time, has various large feathers, particularly those of eagles, stuck in it, or is entirely covered, or, we may say, powdered with small white feathers. The face, at the same time, is variously painted, having its upper and lower parts of different colours, the strokes appearing like fresh gashes; or it is besmeared with a kind of tallow,* mixed with paint, which is afterward formed into a great variety of regular figures, and appears like carved-work. Sometimes, again, the hair is separated into small parcels, which are tied at intervals of about two inches, to the end, with thread; and others tie it together, behind, after our manner, and stick branches of the *Cupressus thyoides* in it. Thus dressed, they have a truly savage and incongruous appearance; but this is much heightened, when they assume what may be called their monstrous decorations. These consist of an endless variety of carved wooden masks or vizors, applied on the face, or to the upper part of the head or forehead. Some of these resemble human faces, furnished with hair, beards, and eye-brows; others, the heads of birds, particularly of eagles and quebrantahuesos; and many, the heads of land and sea animals, such as wolves, deer, and porpoises, and others. But, in general, these representations much exceed the natural size; and they are painted, and often strewed with pieces of the foliaceous *mica*, which makes them glitter, and serves to augment their enormous deformity. They even exceed this sometimes, and fix on the same part of the head large pieces of carved-work, resembling the prow of a canoe, painted in the same manner, and projecting to a considerable distance. So fond are they of these disguises, that I have seen one of them put his head into a tin kettle he had got from us, for want of another sort of mask. Whether they use these extravagant masquerade ornaments on any particular religious occasion, or diversion, or whether they be put on to intimidate their enemies when they go to battle, by their monstrous appearance; or† as decoys when they go to hunt animals, is uncertain. But it may be concluded, that, if travellers or voyagers, in an ignorant and credulous age, when many unnatural or marvellous things were supposed to exist, had seen a number of people decorated in this manner, without being able to approach so near as to be undeceived, they would readily have believed, and in their relations would have attempted to make others believe, that there existed a race of beings, partaking of the nature of man and beast; more especially, when, besides the heads of animals on the human shoulders, they might have seen the whole bodies of their men-monsters covered with quadrupeds' skins‡.

* Usually bears' grease. Turpentine is used to make the feathers, which are arranged with great regularity, adhere to the hair.—Eo.

† Masks and disguises are used generally by the Indians in religious ceremonies, in hunting, and in playing the spy or stealing on the enemy, and are managed with infinite address. See Catlin's letters *passim*. We are not aware, however, of any instance in which they have been adopted with a view of terrifying an enemy. Such an attempt

would appear absurd to an Indian; and their frightful paintings of the warriors are regarded rather as heraldic tokens of their rank and prowess, than as a means of creating fear, although that object is sought, when, as in some of their religious ceremonies, they personate beings of another world, as the Africans with their Mumbo Jumbo.

‡ The reflection in the text may furnish the admirers of Herodotus, in particular, with an excellent apology for some of his wonderful tales of this sort.

ext may furnish the admirer
with an excellent apology for
of this sort.

The only dress amongst the people of Nootka, observed by us, that seems peculiarly adapted to war, is a thick leathern mantle doubled, which, from its size, appears to be the skin of an elk or buffalo, tanned. This they fasten on in the common manner; and it is so contrived, that it may reach up, and cover the breast quite to the throat, falling, at the same time, almost to the heels. It is sometimes ingeniously painted in different compartments; and is not only sufficiently strong to resist arrows, but as they informed us by signs, even spears cannot pierce it; so that it may be considered as their coat of mail, or most complete defensive armour. Upon the same occasion, they sometimes wear a kind of leathern cloak, covered with rows of dried hoofs of deer, disposed horizontally, appended by leathern thongs, covered with quills; which, when they move, make a loud rattling noise, almost equal to that of many small bells. It seems doubtful, however, whether this part of their garb be intended to strike terror in war, or only is to be considered as belonging to their eccentric ornaments on ceremonious occasions; for we saw one of their musical entertainments conducted by a man dressed in this sort of cloak, with his mask on, and shaking his rattle.

Though these people cannot be viewed without a kind of horror, when equipped in such extravagant dresses, yet when divested of them, and beheld in their common habit and actions, they have not the least appearance of ferocity in their countenances*; and seem, on the contrary, as observed already, to be of a quiet, phlegmatic, and inactive disposition; destitute, in some measure, of that degree of animation and vivacity that would render them agreeable as social beings. If they are not reserved, they are far from being loquacious; but their gravity is, perhaps, rather a consequence of the disposition just mentioned, than of any conviction of its propriety, or the effect of any particular mode of education. For, even in the greatest paroxysms of their rage, they seem unable to express it sufficiently, either with warmth of language, or significance of gestures. Their orations, which are made either when engaged in any altercation or dispute, or to explain their sentiments publicly on other occasions, seem little more than short sentences, or rather single words, forcibly repeated, and constantly in one tone and degree of strength, accompanied only with a single gesture, which they use at every sentence, jerking their whole body a little forward, by bending the knees, their arms hanging down by their sides at the same time.

Though there be too much reason, from their bringing to sale human skulls and bones, to infer that they treat their enemies with a degree of brutal cruelty, this circumstance rather marks a general agreement of character with that of almost every tribe of uncivilised man, in every age, and in every part of the globe, than that they are to be reproached with any charge of peculiar inhumanity. We had no reason to judge unfavourably of their disposition in this respect. They seem to be a docile, courteous, good-natured people; but notwithstanding the predominant phlegm of their tempers, quick in resenting what they look upon as an injury; and, like most other passionate people, as soon forgetting it. I never found that these fits of passion went farther than the parties immediately concerned; the spectators not troubling themselves about the quarrel, whether it was with any of us, or amongst their own body; and preserving as much indifference as if they had not known anything about it. I have often

* "The men are in general from about five feet six to five feet eight inches in height; remarkably straight, of a good form, robust and strong, with their limbs in general well turned and proportioned, excepting the legs and feet, which are clumsy and ill-formed, owing no doubt, to their practice of sitting on them, though I have seen instances in which they were very well-shaped. This defect is more particularly apparent in the women, who are for the most part of the time within doors, and constantly sitting while employed in their cooking and other occupations. The only instance of deformity that I saw amongst them was a man of dwarfish stature. He was thirty years old, and but three feet three inches high. He had, however, no other defect than his diminutive size, being well made, and as strong and able to bear fatigue as what they were in general. Their complexion, when freed from the paint and oil with which their skins are generally covered, is a brown, somewhat inclined to a copper cast. The shape of the face is oval, the lips being thin, and the teeth very white and even.

Their eyes are black, but rather small, and the nose pretty well formed, being neither flat nor very prominent. Their hair is black, long, and coarse. As to the women, they are much whiter, many of them not being darker than those in some of the southern parts of Europe. They are in general very well-looking, and some quite handsome. Maquina's favourite wife in particular, who was a Wick-minish princess, would be considered as a beautiful woman in any country. She was uncommonly well-formed, tall, and of a majestic appearance; her skin remarkably fair, for one of these people, with considerable colour; her features handsome; and her eyes black, soft, and languishing. Her hair was very long, thick, and black, as is that of the females in general, which is much softer than that of the men's. In this they take much pride, frequently oiling and plaiting it carefully into two broad plaits, tying the ends with a strip of the cloth of this country, and letting it hang down before on each side of the face."—Jewitt.

seen one of them rave and scold, without any of his countrymen paying the least attention to his agitation; and when none of us could trace the cause, or the object of his displeasure. In such cases they never discover the least symptom of timidity, but seem determined, at all events, to punish the insult. For, even with respect to us, they never appeared to be under the least apprehension of our superiority; but when any difference happened, were just as ready to avenge the wrong, as amongst themselves.

Their other passions, especially their curiosity, appear in some measure to lie dormant. For few expressed any desire to see or examine things wholly unknown to them; and which to those truly possessed of that passion would have appeared astonishing. They were always contented to procure the articles they knew and wanted, regarding everything else with great indifference; nor did our persons, apparel, and manners, so different from their own, or even the extraordinary size and construction of our ships, seem to excite admiration, or even engage attention. One cause of this may be their indolence, which seems considerable. But, on the other hand, they are certainly not wholly unsusceptible of the tender passions; if we may judge from their being so fond of music, which is mostly of the grave or serious, but truly pathetic sort. They keep the exactest concert in their songs, which are often sung by great numbers together, as those already mentioned, with which they used to entertain us in their canoes. These are generally slow and solemn; but the music is not of that confined sort found amongst many rude nations; for the variations are very numerous and expressive, and the cadence or melody powerfully soothing. Besides their full concerts, sonnets of the same grave cast were frequently sung by single performers, who kept time by striking the hand against the thigh. However, the music was sometimes varied, from its predominant solemnity of air; and there were instances of stanzas being sung in a more gay and lively strain, and even with a degree of humour.

The only instruments of music (if such they may be called) which I saw amongst them, were a rattle; and a small whistle, about an inch long, incapable of any variation, from having but one hole. They use the rattle when they sing; but upon what occasions they use the whistle, I know not, unless it be when they dress themselves like particular animals, and endeavour to imitate their howl or cry. I once saw one of them dressed in a wolf's skin, with the head over his own, and imitating that animal, by making a squeaking noise with one of these whistles, which he had in his mouth. The rattles are, for the most part, made in the shape of a bird, with a few pebbles in the belly, and the tail is the handle. They have others, however, that bear rather more resemblance to a child's rattle.

In trafficking with us some of them would betray a knavish disposition, and carry off our goods without making any return. But in general it was otherwise; and we had abundant reason to commend the fairness of their conduct. However their eagerness to possess iron and brass, and, indeed, any kind of metal, was so great, that few of them could resist the temptation to steal it, whenever an opportunity offered. The inhabitants of the South Sea Islands, as appears from a variety of instances in the course of this voyage, rather than be idle, would steal anything that they could lay their hands upon, without ever considering whether it could be of use to them or no. The novelty of the object, with them, was a sufficient motive for endeavouring, by any indirect means, to get possession of it; which marked that, in such cases, they were rather actuated by a childish curiosity, than by a dishonest disposition, regardless of the modes of supplying real wants. The inhabitants of Nootka, who invaded our property, cannot have such apology made for them. They were thieves in the strictest sense of the word; for they pilfered nothing from us, but what they knew could be converted to the purposes of private utility, and had a real value according to their estimation of things. And it was lucky for us, that nothing was thought valuable by them, but the single articles of our metals. Linen and such like things were perfectly secure from their depredations; and we could safely leave them hanging out ashore all night, without watching. The same principle which prompted our Nootka friends to pilfer from us, it was natural to suppose, would produce a similar conduct in their intercourse with each other. And, accordingly, we had abundant reason to believe that stealing is much practised amongst them; and that it chiefly gives rise to their quarrels; of which we saw more than one instance.

CHAPTER III.—MANNER OF BUILDING THE HOUSES IN NOOTKA SOUND.—INSIDE OF THEM DESCRIBED.—FURNITURE AND UTENSILS.—WOODEN IMAGES.—EMPLOYMENTS OF THE MEN —OF THE WOMEN.—FOOD, ANIMAL AND VEGETABLE.—MANNER OF PREPARING IT.—WEAPONS.—MANUFACTURES AND MECHANIC ARTS.—CARVING AND PAINTING.—CANOES.—IMPLEMENTS FOR FISHING AND HUNTING.—IRON TOOLS.—MANNER OF PROCURING THAT METAL.—REMARKS ON THEIR LANGUAGE, AND A SPECIMEN OF IT.—ASTRONOMICAL AND NAUTICAL OBSERVATIONS MADE IN NOOTKA SOUND.

THE two towns or villages mentioned in the course of my Journal seem to be the only inhabited parts of the Sound. The number of inhabitants in both might be pretty exactly computed from the canoes that were about the ships the second day after our arrival. They amounted to about a hundred, which, at a very moderate allowance, must, upon an average, have held five persons each; but as there were scarcely any women, very old men, children, or youths amongst them at that time, I think it will be rather rating the number of the inhabitants of the two towns too low, if we suppose they could be less than four times the number of our visitors, that is, two thousand in the whole.

The village at the entrance of the Sound stands on the side of a rising ground, which has a pretty steep ascent from the beach to the verge of the wood in which space it is situated. The houses are disposed in three ranges or rows, rising gradually behind each other, the largest being that in front and the others less; besides a few straggling or single ones at each end. These ranges are interrupted or disjointed at irregular distances by narrow paths or lanes that pass upward; but those which

run in the direction of the houses between the rows are much broader. Though there be some appearance of regularity in this disposition, there is none in the single houses; for each of the divisions made by the paths may be considered either as one house or as many, there being no regular or complete separation either without or within, to distinguish them by. They are built of very long and broad planks*, resting upon the edges of each other, fastened or tied by withes of pine bark here and there, and have only

HOUSES OF NOOTKA SOUND.

slender posts, or rather poles, at considerable distances on the outside, to which they are also tied; but within are some larger poles, placed aslant. The height of the sides and ends of these habitations is seven or eight feet, but the back part is a little higher, by which means the planks that compose the roof slant forward, and are laid on loose, so as to be moved about, either to be put close to exclude the rain, or in fair weather to be separated, to let in the light, and carry out the smoke. They are however, upon the whole, miserable dwellings, and constructed with little care or ingenuity. For though the side-planks be made to fit pretty closely in some places, in others they are quite open, and there are no regular doors into them, the only way of entrance being either by a hole where the unequal length of the planks has accidentally left an opening, or in some cases, planks are made to pass a little beyond each other, or overlap, about two feet asunder, and the entrance is in this space. There are also holes or windows in the sides of the houses to look out at; but without any regularity of shape or disposition, and these have bits of mat hung before them to prevent the rain getting in.

* The habitations of the natives, more to the north upon this coast, where Behring's people landed in 1741, seem to resemble those of Nootka. Muller describes them thus:

"Ces cabanes étoient de bois revêtu de planches bien unies, et même enchainées en quelques endroits." Muller, Découvertes, p. 255.

On the inside, one may frequently see from one end to the other of these ranges of buildings without interruption. For though in general there be the rudiments, or rather vestiges, of separations on each side, for the accommodation of different families, they are such as do not intercept the sight, and often consist of no more than pieces of plank, running from the side toward the middle of the house, so that if they were complete, the whole might be compared to a long stable with a double range of stalls, and a broad passage in the middle. Close to the sides in each of these parts is a little bench of boards, raised five or six inches higher than

SLEEPING-BENCHES OF NOOTKA SOUND.

the rest of the floor, and covered with mats, on which the family sit and sleep. These benches are commonly seven or eight feet long and four or five broad. In the middle of the floor, between them, is the fire-place, which has neither hearth nor chimney. In one house, which was in the end of a middle range, almost quite separated from the rest by a high close partition and the most regular as to design of any that I saw, there were four of these benches, each of which held a single family at a corner, but without any separation by boards; and the middle part of the house appeared common to them all.

Their furniture consists chiefly of a great number of chests and boxes of all sizes, which are generally piled upon each other close to the sides or ends of the house, and contain their spare garments, skins, masks, and other things which they set a value upon. Some of these are double, or one covers the other as a lid, others have a lid fastened with thongs, and some of the very large ones have a square hole, or scuttle, cut in the upper part, by which the things are put in and taken out. They are often painted black, studded with the teeth of different animals or carved with a kind of frieze-work and figures of birds or animals, as decorations. Their other domestic utensils are mostly square and oblong pails or buckets to hold water and other things*, round wooden cups and bowls, and small shallow wooden troughs about two feet long, out of which they eat their food, and baskets of twigs, bags of matting, &c. Their fishing implements, and other things also, lie or hang up in different parts of the house, but without the least order, so that the whole is a complete scene of confusion; and the only places that do not partake of this confusion are the sleeping-benches, that have nothing on them but the mats, which are also cleaner or of a finer sort than those they commonly have to sit on in their boats.

The nastiness and stench of their houses are, however, at least equal to the confusion; for, as they dry their fish within doors, they also gut them there, which, with their bones and fragments thrown down at meals, and the addition of other sorts of filth, lie everywhere in heaps, and are, I believe, never carried away till it becomes troublesome, from their size, to walk over them. In a word, their houses are as filthy as hog-sties, everything in and about them stinking of fish, train-oil, and smoke. But, amidst all the filth and confusion that are found in the houses, many of them are decorated with images. These are nothing more than the trunks of very large trees four or five feet high, set up singly or by pairs at the upper end of the apartment, with the front carved into a human face, the arms and hands cut out upon

the sides and variously painted; so that the whole is a truly monstrous figure. The general name of those images is *Klumma*, and the names of two particular ones which stood abreast of each other, three or four feet asunder in one of the houses, were *Natchkoa* and *Matsecta*. Mr. Webber's view of the inside of a Nootka house, in which these images are represented, will convey a more perfect idea of them than any description. A mat, by way of curtain, for the most part hung before them, which the natives were not willing at all times to remove; and when they did unveil them, they seemed to speak of them in a very mysterious manner. It should seem that they are at times accustomed to make offerings to them, if we can draw this inference from their desiring us, as we interpreted their signs, to give something to these images when they drew aside the mats that covered them. It was natural, from these circumstances, for us to think that they were representatives of their gods, or symbols of some religious or superstitious object; and yet we had proofs of the little real estimation they were in, for with a small quantity of iron or brass, I could have purchased all the gods (if their images were such) in the place. I did not see one that was not offered to me; and I actually got two or three of the very smallest sort.

NATCHKOA AND MATSEKTA. IDOLS OF NOOTKA SOUND.

The chief employment of the men seems to be that of fishing and killing land or sea animals for the sustenance of their families, for we saw few of them doing anything in the houses; whereas the women were occupied in manufacturing their flaxen or woollen garments, and in preparing the sardines for drying, which they also carry up from the beach in twig baskets, after the men have brought them in their canoes. The women are also sent in the small canoes to gather muscles and other snail-fish, and perhaps on some other occasions, for they manage these with as much dexterity as the men, who, when in the canoes with them, seem to pay little attention to their sex by offering to relieve them from the labour of the paddle; nor, indeed, do they treat them with any particular respect or tenderness in other situations. The young men appeared to be the most indolent or idle set in this community, for they were either sitting about in scattered companies to bask themselves in the sun, or lay wallowing in the sand upon the beach, like a number of hogs, for the same purpose, without any covering. But this disregard of decency was confined to the men. The women were always properly clothed, and behaved with the utmost propriety, justly deserving all commendation for a bashfulness and modesty becoming their sex, but more meritorious in them, as the men seem to have no sense of shame. It is impossible, however, that we should have been able to observe the exact mode of their domestic life and employments from a single visit (as the first was quite transitory) of a few hours. For it may be easily supposed, that on such an occasion most of the labour of all the inhabitants of the village would cease upon our arrival, and an interruption be given even to the usual manner of appearing in their houses, during their more remiss or sociable hours, when left to themselves. We were much better enabled to form some judgment of their disposition, and in some measure even of their method of living, from the frequent visits so many of them paid us at our ships in their canoes, in which it should seem they spend a great deal of time, at least in the summer season; for we observed that they not only eat and sleep frequently in them, but strip off their clothes and lay

themselves along to bask in the sun, in the same manner as we had seen practised at their village. Their canoes of the larger sort are, indeed, sufficiently spacious for that purpose, and perfectly dry; so that, under shelter of a skin they are, except in rainy weather, much more comfortable habitations than their houses.

Though their food, strictly speaking, may be said to consist of everything animal or vegetable that they can procure, the quantity of the latter bears an exceedingly small proportion to that of the former. Their greatest reliance seems to be upon the sea, as affording fish, muscles, and smaller shell-fish and sea animals. Of the first, the principal are herrings and sardines, the two species of bream formerly mentioned, and small cod; but the herrings and sardines are not only eaten fresh in their season, but likewise serve as stores, which after being dried and smoked, are preserved by being sewed up in mats, so as to form large bales three or four feet square. It seems that the herrings also supply them with another grand resource for food, which is a vast quantity of roe very curiously prepared. It is strewed upon, or as it were incrustated about, small branches of the Canadian pine; they also prepare it upon a long narrow sea-grass, which grows plentifully upon the rocks under water. This *caviare*, if it may be so called, is kept in baskets or bags of mat, and used occasionally, being first dipped in water. It may be considered as the winter bread of these people, and has no disagreeable taste. They also eat the roe of some other fish, which, from the size of its grains, must be very large, but it has a rancid taste and smell. It does not appear that they prepare any other fish in this manner, to preserve them for any length of time. For though they split and dry a few of the bream and *chimæra*, which are pretty plentiful, they do not smoke them as the herrings and sardines. The next article on which they seem to depend for a large proportion of their food, is the large muscle; great abundance of which are found in the Sound. These are roasted in their shells, then stuck upon long wooden skewers, and taken off occasionally as wanted, being eat without any other preparation, though they often dip them in oil as a sauce. The other marine productions, such as the smaller shell-fish, though they contribute to increase the general stock, are by no means to be looked upon as a standing or material article of their food, when compared to those just mentioned.

Of the sea animals, the most common that we saw in use amongst them as food is the porpoise; the fat or rind of which, as well as the flesh, they cut in large pieces and, having

ingular manner, putting

pieces of it in a square wooden vessel or bucket with water, and then throwing heated stones into it. This operation they repeat till they think the contents are sufficiently stewed or seethed. They put in the fresh and take out the other stones with a cleft stick, which serves as tongs; the vessel being always placed near the fire for that purpose. This is a pretty common dish amongst them; and, from its appearance seems to be strong nourishing food. The oil which they procure from these and other sea animals is also used by them in great quantities; both supping it alone with a large scoop or spoon made of horn, or mixing it with other food, as sauce.

It may also be presumed that they feed upon other sea-animals, such as seals, sea-otters, and whales; not only from the skins of the two first being frequent amongst them, but from the great number of implements of all sorts intended to destroy these different animals, which clearly points out their dependence upon them; though perhaps they do not catch them in great plenty at all seasons, which seemed to be the case while we lay there, as no great number of fresh skins, or pieces of the flesh, were seen. The same might perhaps be said of the land-animals, which, though doubtless the natives sometimes kill them, appeared to be scarce at this time; as we did not see a single piece of the flesh belonging to any of them; and though their skins be in tolerable plenty, it is probable that many of these are procured by traffic from other tribes. Upon the whole, it seems plain, from a variety of circumstances, that these people procure almost all their animal food from the sea, if we except a few birds, of which the gulls or sea-fowls, which they shoot with their arrows, are the most material.

As the Canadian pine-branches and sea-grass, on which the fish-roe is strewed, may be considered as their only winter vegetables; so, as the spring advances, they make use of several others as they come in season. The most common of these, which we observed, were two sorts of liliaceous roots, one simply tunicated, the other granulated upon its surface, called *mahkutte* and *kookquoppa*, which have a mildish sweetish taste, and are mucilaginous, and eaten raw. The next, which they have in great quantities, is a root called *ahelta*, resembling in taste our liquorice; and another fern root, whose leaves were not yet disclosed. They also eat, raw, another small, sweetish insipid root, about the thickness of *sarsaparilla*; but we were ignorant of the plant to which it belongs, and also of another root, which is very large and palmated, which we saw them dig up near the village, and afterward eat it. It is also probable that, as the season advances, they have many others which we did not see. For though there be no appearance of cultivation amongst them, there are great quantities of alder, gooseberry and currant bushes, whose fruits they may eat in their natural state, as we have seen them eat the leaves of the last, and of the lilies, just as they were plucked from the plant. It must, however, be observed, that one of the conditions which they seemed to require in all food is, that it should be of the bland or less acrid kind; for they would not eat the leek or garlic, though they brought vast quantities to sell, when they understood we were fond of it. Indeed they seemed to have no relish for any of our food; and when offered spirituous liquors, they reject'd them as something unnatural and disgusting to the palate.

Though they sometimes eat small marine animals, in their fresh state, raw, it is their common practice to roast or broil their food; for they are quite ignorant of our method of boiling, unless we allow that of preparing their porpoise broth is such; and indeed their vessels being all of wood, are quite insufficient for this purpose.

Their manner of eating is exactly consonant to the nastiness of their houses and persons: for the troughs and platters, in which they put their food, appear never to have been washed from the time they were first made, and the dirty remains of a former meal are only swept away by the succeeding one. They also tear everything, solid or tough, to pieces, with their hands and teeth; for though they make use of their knives to cut off the larger portions, they have not, as yet, thought of reducing these to smaller pieces and mouthfuls, by the same means, though obviously more convenient and cleanly. But they seem to have no idea of cleanliness; for they eat the roots which they dig from the ground, without so much as shaking off the soil that adheres to them. We are uncertain if they have any set time for meals: for we have seen them eat at all hours, in their canoes. And yet, from seeing several

messes of the porpoise-broth preparing toward noon, when we visited the village, I should suspect that they make a principal meal about that time.

Their weapons are bows and arrows, slings, spears, short truncheons of bone, somewhat like the *patoe patoo* of New Zealand, and a small pickaxe, not unlike the common American *tomahawk*. The spear has generally a long point, made of bone. Some of the arrows are pointed with iron; but most commonly their points were of indented bone. The tomahawk is a stone, six or eight inches long, pointed at one end, and the other end fixed into a handle of wood. This handle resembles the head and neck of the human figure; and the stone is fixed in the mouth, so as to represent an enormously large tongue. To make the resemblance still stronger, human hair is also fixed to it. This weapon they call *taaweesh*, or *tsuskeen*. They have another stone weapon called *seelik*, nine inches or a foot long, with a square point. From the number of stone weapons, and others, we might almost conclude that it is their custom to engage in close fight; and we had too convincing proofs that their wars are both frequent and bloody, from the vast number of human skulls which they brought to sell.

Their manufactures and mechanic arts are far more extensive and ingenious, whether we regard the design or the execution, than could have been expected from the natural disposition of the people, and the little progress that civilisation has made amongst them in other respects. The flaxen and woollen garments, with which they cover themselves, must necessarily engage their first care, and are the most material of those that can be ranked under the head of manufactures. The former of these are made of the bark of a pine-tree, beat into a hempen state. It is not spun, but, after being properly prepared, is spread upon a stick, which is fastened across to two others that stand upright. It is disposed in such a manner that the manufacturer, who sits on her hams at this simple machine, knots it across with small plaited threads, at the distance of half an inch from each other. Though, by this method, it be not so close or firm as cloth that is woven, the bunches between the knots make it sufficiently impervious to the air, by filling the interstices, and it has the additional advantage of being softer and more pliable. The woollen garments, though probably manufactured in the same manner, have the strongest resemblance to woven cloth. But the various figures which are very artificially inserted in them, destroy the supposition of their being wrought in the loom; it being extremely unlikely that these people should be so dexterous as to be able to finish such a complex work, unless immediately by their hands. They are of different degrees of fineness; some resembling our coarsest rugs or blankets, and others almost equal to our finest sorts, or even softer, and certainly warmer. The wool of which they are made seems to be taken from animals, as the fox and brown lynx; the last of which is by far the finest sort, and, in its natural state, differs little from the colour of our coarser wools; but the hair, with which the animal is also covered, being intermixed, its appearance, when wrought, is somewhat different. The ornamental parts or figures in these garments, which are disposed with great taste, are commonly of a different colour, being dyed, chiefly, either of a deep brown, or of a yellow; the last of which, when it is new, equals the best in our carpets, as to brightness.

To their taste or design in working figures upon their garments, corresponds their fondness for carving, in everything they make of wood. Nothing is without a kind of frieze-work, or the figure of some animal upon it; but the most general representation is that of the human face, which is often cut out upon birds, and the other monstrous figures mentioned before; and even upon their stone and their bone weapons. The general design of all these things is perfectly sufficient to convey a knowledge of the object they are intended to represent; but the carving is not executed with the nicety that a dexterous artist would bestow even upon an indifferent design. The same, however, cannot be said of many of the human masks and heads, where they show themselves to be ingenious sculptors. They not only preserve, with exactness, the general character of their own faces, but finish the more minute parts with a degree of accuracy in proportion, and neatness in execution. The strong propensity of this people to works of this sort is remarkable, in a vast variety of particulars. Small whole human figures; representations of birds, fish, and land and sea animals; models of their household utensils and of their canoes, were found amongst them in great abundance.

The imitative arts being nearly allied, no wonder that, to their skill in working figures in their garments, and carv'g them in wood, they should add that of drawing them in colours. We have sometimes seen the whole process of their whale-fishery painted on the caps they wear. This, though rudely executed, serves, at least, to show, that though there be no appearance of the knowledge of letters amongst them, they have some notion of a method of commemorating and representing actions, in a lasting way, independently of what may be recorded in their songs and traditions. They have also other figures painted on some of their things; but it is doubtful if they ought to be considered as symbols, that have certain established significations, or only the mere creation of fancy and caprice.

Their canoes are of a simple structure; but, to appearance, well calculated for every useful purpose. Even the largest, which carry twenty people or more, are formed of one tree. Many of them are forty feet long, seven broad, and about three deep. From the middle, toward each end, they become gradually narrower, the after-part, or stern, ending abruptly or perpendicularly, with a small knob on the top; but the fore-part is lengthened out, stretching forward and upward, ending in a notched point or prow, considerably higher than the sides of the canoe, which run nearly in a straight line. For the most part they are without any ornament; but some have a little carving, and are decorated by setting seals' teeth on the surface, like studs; as is the practice on their masks and weapons. A few have, likewise, a kind of additional head or prow, like a large cut-water, which is painted with the figure of some animal. They have no seats, nor any other supporters, on the inside, than several round sticks, little thicker than a cane, placed across, at mid depth. They are very light, and their breadth and flatness enable them to swim firmly, without an out-rigger, which none of them have; a remarkable distinction between the navigation of all the American nations and that of the southern parts of the East Indies, and the islands in the Pacific Ocean. Their paddles are small and light; the shape, in some measure, resembling that of a large leaf, pointed at the bottom, broadest in the middle, and gradually losing itself in the shaft, the whole being about five feet long. They have acquired great dexterity in managing these paddles, by constant use; for sails are no part of their art of navigation.

Their implements for fishing and hunting, which are both ingeniously contrived and well made, are nets, hooks, and lines, harpoons, gigs, and an instrument like an oar. This last is about twenty feet long, four or five inches broad, and about half an inch thick. Each edge, for about two-thirds of its length (the other third being its handle) is set with sharp bone-teeth, about two inches long. Herrings and sardines, and such other small fish as come in shoals, are attacked with this instrument; which is struck into the shoal, and the fish are caught either upon or between the teeth. Their hooks are made of bone and wood, and rather inartificially; but the harpoon, with which they strike the whales and lesser sea animals, shows a great reach of contrivance. It is composed of a piece of bone, cut into two barbs, in which is fixed the oval blade of a large muscle-shell, in which is the point of the instrument. To this are fastened about two or three fathoms of rope; and to throw this harpoon, they use a shaft about twelve or fifteen feet long, to which the line or rope is made fast; and to one end of which the harpoon is fixed, so as to separate from the shaft, and leave it floating upon the water as a buoy, when the animal darts away with the harpoon.

We can say nothing as to the manner of their catching or killing land animals, unless we may suppose that they shoot the smaller sorts with their arrows, and engage bears, or wolves and foxes, with their spears. They have, indeed, several nets, which are probably applied to that purpose*; as they frequently throw them over their heads, to show their use, when they brought them to us for sale. They also, sometimes, decoy animals by covering themselves with a skin, and running about upon all-fours, which they do very nimbly, as appeared from the specimens of their skill which they exhibited to us, making a kind of noise or neighing at the same time; and, on these occasions, the masks, or carved heads, as well as the real dried heads, of the different animals, are put on.

* One of the methods of catching the sea-otter, when ashore, in Kamtschatka, is with nets.—See Cox's *Ramirez Discoveries*, p. 13, 4to edition.

As to the materials of which they make their various articles, it is to be observed, that everything of the rope kind is formed either from thongs of skins, and sinews of animals, or from the same flaxen substance of which their mantles are manufactured. The sinews often appeared to be of such a length, that it might be presumed they could be of no other animal than the whale. And the same may be said of the bones of which they make their weapons already mentioned; such as their bark-beating instruments, the points of their spears, and the barbs of their harpoons. Their great dexterity in works of wood may, in some measure, be ascribed to the assistance they receive from iron tools; for, as far as we know, they use no other; at least, we saw only one chisel of bone. And though, originally, their tools must have been of different materials, it is not improbable that many of their improvements have been made since they acquired a knowledge of that metal, which is now universally used in their various wooden works. The chisel and the knife are the only forms, as far as we saw, that iron assumes amongst them. The chisel is a long flat piece, fitted into a handle of wood. A stone serves for a mallet, and a piece of fish-skin for a polisher. I have seen some of these chisels that were eight or ten inches long, and three or four inches broad; but, in general, they were smaller. The knives are of various sizes; some very large, and their blades are crooked, somewhat like our pruning-knife; but the edge is on the back or convex part. Most of them, that we saw, were about the breadth and thickness of an iron hoop; and their singular form marks that they are not of European make. Probably, they are imitations of their own original instruments, used for the same purposes. They sharpen these iron tools upon a coarse slate whetstone; and likewise keep the whole instrument constantly bright.

Iron, which they call *seekemalle* (which name they also give to tin, and all white metals, being familiar to these people, it was very natural for us to speculate about the mode of its being conveyed to them. Upon our arrival in the Sound, they immediately discovered a knowledge of traffic, and an inclination for it; and we were convinced afterward, that they had not received this knowledge from a cursory interview with any strangers; but, from their method, it seemed to be an established practice, of which they were fond, and in which they were also skilled. With whom they carry on this traffic, may perhaps admit of some doubt. For though we found amongst them things doubtless of European manufacture, or at least derived from some civilised nation, such as iron and brass, it by no means appears that they receive them immediately from these nations. For we never observed the least sign of their having seen ships like ours before, nor of their having traded with such people. Many circumstances serve to prove this almost beyond a doubt. They were earnest in their inquiries, by signs, on our arrival, if we meant to settle amongst them; and if we came as friends: signifying, at the same time, that they gave the wood and water freely from friendship. This not only proves, that they considered the place as entirely their property, without fearing any superiority; but the inquiry would have been an unnatural one, on a supposition that any ships had been here before, had trafficked, and supplied themselves with wood and water, and had then departed; for, in that case, they might reasonably expect we would do the same. They, indeed, expressed no marks of surprise at seeing our ships. But this, as I observed before, may be imputed to their natural indolence of temper, and want of curiosity. Nor were they even startled at the report of a musket; till one day, upon their endeavouring to make us sensible that their arrows and spears could not penetrate the hide-dresses, one of our gentlemen shot a musket-ball through one of them, folded six times. At this they were so much staggered, that they plainly discovered their ignorance of the effect of fire-arms. This was very often confirmed afterward, when we used them at their village, and other places, to shoot birds, the manner of which plainly confounded them; and our explanations of the use of shot and ball were received with the most significant marks of their having no previous ideas on this matter.

Some accounts of a Spanish voyage to this coast, in 1774, or 1775, had reached England before I sailed; but the foregoing circumstances sufficiently prove, that these ships had not been at Nootka*. Besides this, it was evident that iron was too common here; was in too

* We now know that Captain Cook's conjecture was already referred to, that the Spaniards had intercourse well founded. It appears from the Journal of this Voyage, with the natives of this coast only in three places, in

it is to be observed, that the sinews of animals, or sined. The sinews often be of no other animal they make their weapons of their spears, and may, in some measure, as we know, they use h, originally, their tools of their improvements which is now universally the only forms, as far as a flat piece, fitted into h-skin for a polisher. 1775, had reached England e, that these ships had not common here; was in too

at the Spaniards had intercourse is coast only in three places, in

many hands; and the uses of it were too well known, for them to have had the first knowledge of it so very lately; or, indeed, at any earlier period, by an accidental supply from a ship. Doubtless, from the general use they make of this metal, it may be supposed to come from some constant source, by way of traffic, and that not of a very late date; for they are as dexterous in using their tools as the longest practice can make them. The most probable way, therefore, by which we can suppose that they get their iron, is by trading for it with other Indian tribes, who either have immediate communication with European settlements upon that continent, or receive it, perhaps, through several intermediate nations. The same might be said of the brass and copper found amongst them.

Whether these things be introduced by way of Hudson's Bay and Canada, from the Indians, who deal with our traders, and so successively across from one tribe to the other; or whether they be brought from the north-western parts of Mexico, in the same manner, perhaps cannot be easily determined. But it should seem, that not only the rude materials, but some articles in their manufactured state, find their way hither. The brass ornaments for noses, in particular, are so neatly made, that I am doubtful whether the Indians are capable of fabricating them. The materials certainly are European; as no American tribes have been found, who knew the method of making brass; though copper has been commonly met with, and, from its softness, might be fashioned into any shape, and also polished. If our traders to Hudson's-Bay and Canada do not use such articles in their traffic with the natives, they must have been introduced at Nootka from the quarter of Mexico from whence, no doubt, the two silver table-spoons met with here were originally derived. It is most probable, however, that the Spaniards are not such eager traders, nor have formed such extensive connexions with the tribes north of Mexico, as to supply them with quantities of iron, from which they can spare so much to the people here*.

Of the political and religious institutions established amongst them, it cannot be supposed that we should learn much. This we could observe, that there are such men as chiefs, who are distinguished by the name or title of *Acweek*, and to whom the others are in some measure subordinate. But I should guess, the authority of each of these great men extends no farther than the family to which he belongs, and who own him as their head. These *Acweeks* were not always elderly men; from which I concluded, that this title came to them by inheritance. I saw nothing that could give the least insight into their notions of religion, besides the figures before mentioned, called by them *Klumma*. Most probably these were idols; but as they frequently mentioned the word *acweek*, when they spoke of them, we may perhaps be authorised to suppose that they are the images of some of their ancestors, whom they venerate as divinities. But all this is mere conjecture; for we saw no act of religious homage paid to them; nor could we gain any information, as we had learned little more of the language, than to ask the names of things, without being able to hold any conversation with the natives, that might instruct us as to their institutions or traditions†.

In drawing up the preceding account of the people of this Sound, I have occasionally blended Mr. Anderson's observations with my own; but I owe everything to him that relates to their language; and the following remarks are in his own words:

"Their language is by no means harsh or disagreeable, farther than proceeds from their using the *k* and *h* with more force, or pronouncing them with less softness, than we do; and

latitude 41° 7'; in latitude 47° 21'; and in latitude 57° 18'. So that they were not within two degrees of Nootka; and it is most probable, that the people there never heard of these Spanish ships.

* Though the two silver table-spoons, found at Nootka Sound, most probably came from the Spaniards in the south, there seem to be sufficient grounds for believing, that the regular supply of iron comes from a different quarter. It is remarkable, that the Spaniards, in 1775, found at Puerto de la Trinidad, in latitude 41° 7', arrows pointed with copper or iron, which they understood were procured from the north. Mr. Daines Barrington, in a note at this part of the Spanish Journal, p. 20, says, "I should conceive that the copper and iron, here mentioned, must have originally been bartered at our forts in Hudson's Bay."

† The natives of Nootka Sound are governed by a king, whose office is hereditary, as is the rank of the chiefs. Every son of a chief, when he attained an age fitting him for bearing arms, and had passed through certain ordeals of no trifling nature, testifying his fortitude, assumed the rank of *syee* (so spelt by Jewitt), or chief, in virtue of his birth. The institution of slavery among the people of Nootka, which is not common among the North American Indians, with whom those captives who are spared are generally adopted into the tribe, probably renders it necessary to keep up this hereditary nobility to the full extent. For in tribes where slavery is not known, the dignity of the king or chief alone is hereditary; nor is this always the case; but other honours must be won by desert.—En.

upon the whole, it abounds rather with what we may call labial and dental, than with guttural sounds. The simple sounds which we have not heard them use, and which consequently, may be reckoned rare, or wanting in their language, are those represented by the letters *b, d, f, g, r, and v*. But on the other hand, they have one which is very frequent, and not used by us. It is formed in a particular manner, by clashing the tongue partly against the roof of the mouth, with considerable force; and may be compared to a very coarse or harsh method of lisping. It is difficult to represent this sound by any composition of our letters, unless, somehow, from *lszthl*. This is one of their most usual terminations, though we sometimes found it in the beginning of words. The next most general termination is composed of *tl*; and many words end with *z* and *ss*. A specimen or two of each of these is here put down:

<i>Opulszthl</i>	The sun.	<i>Teeshcheetl</i>	To throw a stone.
<i>Onulszthl</i>	The moon*.	<i>Koomitz</i>	A human skull.
<i>Kahsheetl</i>	Dead.	<i>Quahmiss</i>	Fish roe.

"They seem to take so great a latitude in their mode of speaking, that I have sometimes observed four or five different terminations of the same word. This is a circumstance very puzzling at first to a stranger, and marks a great imperfection in their language.

"As to the composition of it, we can say very little; having been scarcely able to distinguish the several parts of speech. It can only be inferred, from their method of speaking, which is very slow and distinct, that it has few prepositions or conjunctions; and as far as we could discover, is destitute of even a single interjection, to express admiration or surprise. From its having few conjunctions, it may be conceived, that these being thought unnecessary, as being understood, each single word with them will also express a great deal to comprehend several simple ideas; which seems to be the case. But for the same reason, the language will be defective in other respects; not having words to distinguish or express differences which really exist, and hence not sufficiently copious. This was observed to be the case in many instances, particularly with respect to the names of animals. The relation or affinity it may bear to other languages, either on this or on the Asiatic continent, I have not been able sufficiently to trace, for want of proper specimens to compare it with, except those of the Esquimaux and Indians about Hudson's Bay; to neither of which it bears the least resemblance. On the other hand, from the few Mexican words I have been able to procure, there is the most obvious agreement, in the very frequent terminations of the words in *l, tl, or z*, throughout the language†."

The large vocabulary of the Nootka language, collected by Mr. Anderson, shall be reserved for another place‡, as its insertion here would too much interrupt our narration. At present, I only select their numerals, for the satisfaction of such of our readers as love to compare those of different nations, in different parts of the world:

<i>Tsarack.</i>	One.	<i>Nafpo</i>	Six.
<i>Ahhla</i>	Two.	<i>Atlepuo</i>	Seven.
<i>Katsitsa</i>	Three.	<i>Atlaquothl</i>	Eight.
<i>Mo or moo</i>	Four.	<i>Tsavaquuthl</i>	Nine.
<i>Sochah</i>	Five.	<i>Haceco</i>	Ten.

Were I to affix a name to the people of Nootka, as a distinct nation, I would call them *Wakashians*, from the word *wakash*, which was very frequently in their mouths. It seemed to express applause, approbation, and friendship; for when they appeared to be satisfied, or well pleased with anything they saw, or any incident that happened, they would, with one voice, call out, *Wakash! wakash!*§ I shall take my leave of them with remarking, that,

* Jewitt gives *Oop-helth*, as a name common to the sun and the moon. The other words in this list he does not give; but the numerals a little farther on agree with his, save in a slight difference in spelling.—Ed.

† May we not, in confirmation of Mr. Anderson's remark, observe, that *Opulszthl*, the Nootka name of the sun, and *Vitziputzli*, the name of the Mexican divinity, have no very distant affinity in sound?

‡ It will be found at the end of the volume.

§ *Wacash*, or *wocash*, as Jewitt spells it, is an expression of approbation, and in the same indefinite sense as the Italian "*Bravo*" is by us. Jewitt translates it "good," which probably does not convey its exact meaning.—Ed.

differing so essentially as they certainly do in their persons, their customs, and language, from
the inhabitants of the islands of the Pacific Ocean, we cannot suppose their respective proge-
nitors to have been united in the same tribe, or to have had any intimate connexion, when
they emigrated from their original settlements, into the places where we now find their
descendants.

My account of the transactions in Nootka Sound would be imperfect, without adding the
astronomical and nautical observations made by us, while the ships were in that station.

LATITUDE.

The latitude of the observatory by	{	Sun	{	South	49° 36' 1", 15"
		Stars		North	49 36 8, 36
				North	49 36 10, 30
The mean of these means					49 36 6, 47 north.

LONGITUDE.

The longitude by lunar observations.	{	Twenty sets taken on the 21st and 23d of March	233° 26' 18",	7 ^m	
		Ninety-three taken at the observatory	233 18 6,	6	
		Twenty-four taken on the 1st, 2d, and 3d of May	233 7 16,	7	
The mean of these means			233 17 11,	9 east.	
But by reducing each set taken before we arrived in the Sound, and after we left it, by the time-keeper, and adding them up with those made on the spot, the mean of the 137 sets will be			{	233° 17' 30",	5 ^m
Longitude by the time-keeper	{	Greenwich rate	235° 16' 51",	0 ^m	
		Utieta rate	233 59 21,	0	

From the results of the last fifteen days' observations of equal altitudes of the sun, the daily
rate of the time-keeper was losing, on mean time, 7"; and the 16th of April, she was too
slow for mean time, by 16^h 0^m 58", 45. There was found an irregularity in her rate, greater
than at any time before. It was thought proper to reject the first five days, as the rate in
them differed so much from that of the fifteen following; and even in these, each day differed
from another more than usual.

VARIATION OF THE COMPASS.

April 4th.	{	A. M.	{	Observatory	{	15° 57' 40½"	{	15 49' 25" east.
		P. M.		Mean of 4 needles		15 41 2		
5th.	{	A. M.	{	On board the ship	{	19 50 49	{	19 41 57½
17th.	{	P. M.	{	Mean of 4 needles	{	19 38 46	{	

The variation found on board the ship ought to be taken for the true one, not only as it
agreed with what we observed at sea; but because it was found that there was something
amiss on shore that had a considerable effect upon the compasses; in some places more than others.
At one spot, on the west point of the Sound, the needle was attracted 11½ points from its
proper direction.

INCLINATION OF THE DIPPING NEEDLE.

April				
5th. On board with balanced needle	{	Marked	{	End North and dipping
	{	Unmarked	{	
The same needle at the observatory				
	{	Marked	{	End North and dipping
	{	Unmarked	{	
8th. Ditto	{	Marked	{	End North and dipping
	{	Unmarked	{	
9th. Spare needle at the observatory	{	Marked	{	End North and dipping
	{	Unmarked	{	
20th. Ditto	{	Marked	{	End North and dipping
	{	Unmarked	{	
22d. Spare needle on board	{	Marked	{	End North and dipping
	{	Unmarked	{	
Hence the mean dip with both needles on shore, was				72 32 33½
On board				72 25 41½

This is as near as can be expected; and shows that whatever it was that affected the compasses, whether on board or ashore, it had no effect upon the dipping needles.

TIDES.

It is high-water on the days of the new and full moon at 12^h 20^m. The perpendicular rise and fall eight feet nine inches; which is to be understood of the day tides, and those which happen two or three days after the new and full moon. The night tides at this time rise near two feet higher. This was very conspicuous during the spring-tide of the full moon, which happened soon after our arrival; and it was obvious that it would be the same in those of the new moon, though we did not remain here long enough to see the whole of its effect.

Some circumstances that occurred daily, relating to this, deserve particular notice. In the cove where we got wood and water, was a great deal of drift-wood thrown ashore, a part of which we had to remove to come at the water. It often happened that large pieces of trees which we had removed during the day out of the reach of the then high-water, were found the next morning floated again in our way, and all our spouts for conveying down the water thrown out of their places, which were immovable during the day tides. We also found that wood which we had split up for fuel, and had deposited beyond the reach of the day tide, floated during the night. Some of these circumstances happened every night or morning for three or four days, in the height of the spring tides; during which time we were obliged to attend every morning tide, to remove the large logs out of the way of watering. I cannot say whether the flood tide falls into the Sound from the N.W., S.W., or S.E. I think it does not come from the last quarter; but this is only conjecture founded upon the following observations: the S.E. gales which we had in the Sound, were so far from increasing the rise of the tide, that they rather diminished it; which would hardly have happened if the flood and wind had been in the same direction.

CHAPTER IV.—A STORM AFTER SAILING FROM NOOTKA SOUND.—RESOLUTION SPRINGS A LEAK.—PRETENDED STRAIT OF ADMIRAL DE FONTE PASSED UNEXAMINED.—PROGRESS ALONG THE COAST OF AMERICA.—BEERING'S BAY.—KAYE'S ISLAND—ACCOUNT OF IT.—THE SHIPS COME TO ANCHOR.—VISITED BY THE NATIVES.—THEIR BEHAVIOUR.—FONDNESS FOR BEADS AND IRON.—ATTEMPT TO PLUNDER THE DISCOVERY.—RESOLUTION'S LEAK STOPPED.—PROGRESS UP THE SOUND.—MESSRS. GORE AND ROBERTS SENT TO EXAMINE ITS EXTENT.—REASONS AGAINST A PASSAGE TO THE NORTH THROUGH IT.—THE SHIPS PROCEED DOWN IT TO THE OPEN SEA.

HAVING put to sea on the evening of the 26th, as before related, with strong signs of an approaching storm, these signs did not deceive us. We were hardly out of the Sound before the wind, in an instant, shifted from N.E. to S.E. by E., and increased to a strong gale with squalls and rain, and so dark a sky that we could not see the length of the ship. Being apprehensive, from the experience I had since our arrival on this coast, of the wind veering more to the S., which would put us in danger of a lee-shore, we got the tacks on board, and stretched off to the S.W., under all the sail the ships could bear. Fortunately the wind veered no farther southerly than S.E., so that at day-light the next morning we were quite clear of the coast. The Discovery being at some distance astern, I brought to, till she came up, and then bore away, steering N.W., in which direction I supposed the coast to lie. The wind was at S.E., blew very hard, and in squalls, with thick hazy weather. At half past one in the afternoon, it blew a perfect hurricane, so that I judged it highly dangerous to run any longer before it, and, therefore, brought the ships to with their heads to the southward, under the foresails and mizen stay-sails. At this time the Resolution sprung a leak, which, at first, alarmed us not a little. It was found to be under the starboard buttock: where, from the bread-room, we could both hear and see the water rush in, and, as we then

was that affected the
ing needles.

er the starboard buttock:
er rush in, and, as we then

thought, two feet under water. But in this we were happily mistaken; for it was afterward found to be even with the water-line, if not above it, when the ship was upright. It was no sooner discovered, than the fish-room was found to be full of water, and the casks in it afloat; but this was, in a great measure, owing to the water not finding its way to the pumps through the coals that lay in the bottom of the room; for after the water was baled out, which employed us till midnight, and had found its way directly from the leak to the pumps, it appeared that one pump kept it under, which gave us a small satisfaction. In the evening, the wind veered to the S., and its fury in some degree ceased. On this we set the mainsail and two topsails close-reefed, and stretched to the westward; but at eleven o'clock the gale again increased, and obliged us to take in the topsails, till five o'clock the next morning, when the storm began to abate; so that we could bear to set them again.

The weather now began to clear up; and being able to see several leagues round us, I steered more to the northward. At noon, the latitude, by observation, was $50^{\circ} 1'$; longitude $229^{\circ} 26''$. I now steered N.W. by N., with a fresh gale at S.S.E., and fair weather. But at nine in the evening it began again to blow hard and in squalls with rain. With such weather, and the wind between S.S.E. and S.W., I continued the same course till the 30th, at four in the morning, when I steered N. by W., in order to make the land. I regretted very much indeed that I could not do it sooner, for this obvious reason, that we were now passing the place where geographers† have placed the pretended strait of Admiral de Fonte. For my own part, I give no credit to such vague and improbable stories, that carry their own confutation along with them. Nevertheless, I was very desirous of keeping the American coast aboard, in order to clear up this point beyond dispute. But it would have been highly imprudent in me to have engaged with the land in weather so exceedingly tempestuous, or to have lost the advantage of a fair wind by waiting for better weather. The same day at noon we were in the latitude of $53^{\circ} 22'$, and in the longitude of $225^{\circ} 14'$.

The next morning, being the first of May, seeing nothing of the land, I steered northeasterly, with a fresh breeze at S.S.E. and S., with squalls and showers of rain and hail. Our latitude at noon was $54^{\circ} 43'$, and our longitude $224^{\circ} 44'$. At seven in the evening, being in the latitude of $55^{\circ} 20'$, we got sight of the land, extending from N.N.E. to E., or E. by S., about twelve or fourteen leagues distant. An hour after I steered N. by W., and at four the next morning, the coast was seen from N. by W. to S.E., the nearest part about six leagues distant‡. At this time the northern point of an inlet, or what appeared to be one, bore E. by S. It lies in the latitude of 56° , and from it to the northward, the coast seemed to be much broken, forming bays and harbours every two or three leagues, or else appearances much deceived us. At six o'clock, drawing nearer the land, I steered N.W. by N., this being the direction of the coast, having a fresh gale at S.E., with some showers of hail, snow, and sleet. Between eleven and twelve o'clock, we passed a group of small islands lying under the main land, in the latitude of $56^{\circ} 48'$, and off, or rather to the northward of, the S. point of a large bay. An arm of this bay, in the northern part of it, seemed to extend in toward the N., behind a round elevated mountain that lies between it and the sea. This mountain I called Mount Edgecumbe, and the point of land that shoots out from it, Cape Edgecumbe. The latter lies in the latitude of $57^{\circ} 3'$, and in the longitude of $224^{\circ} 7'$, and at noon it bore N. 20° W., six leagues distant.

The land, except in some places close to the sea, is all of a considerable height, and hilly; but Mount Edgecumbe far out-tops all the other hills. It was wholly covered with snow;

* As in the remaining part of this volume, the latitude and longitude are very frequently set down; the former being invariably *north* and the latter *east*, the constant repetition of the two words *north* and *east* has been omitted, to avoid unnecessary precision.

† See De Lisle's Carte Générale des Découvertes de l'Amiral de Fonte, &c. Paris, 1752; and many other maps.

‡ This must be very near that part of the American coast where Tschirikow anchored in 1741. For Muller places its latitude in 56° . Had this Russian navigator been

so fortunate as to proceed a little farther northward along the coast, he would have found, as we now learn from Captain Cook, bays, and harbours, and islands, where his ship might have been sheltered, and his people protected in landing. For the particulars of the misfortunes he met with here, two boats' crews, which he sent ashore, having never returned, probably cut off by the natives, see Muller's Découvertes des Russes, p. 248, 254. The Spaniards, in 1775, found two good harbours on this part of the coast; that called Gualoupe, in latitude $57^{\circ} 11'$; and the other De los Remedios, in latitude $57^{\circ} 18'$.

as were also all the other elevated hills ; but the lower ones, and the flatter spots, bordering upon the sea, were free from it, and covered with wood.

As we advanced to the north, we found the coast from Cape Edgecumbe to trend to north and north-easterly for six or seven leagues, and there form a large bay. In the entrance of that bay are some islands ; for which reason I named it the *Bay of Islands*. It lies in the latitude of $57^{\circ} 20'$; and seemed to branch into several arms, one of which turned to the south, and may probably communicate with the bay on the east side of Cape Edgecumbe, and make the land of that cape an island. At eight o'clock in the evening, the cape bore south-east half south ; the Bay of Islands N. 53° E. ; and another inlet, before which are also some islands, bore N. 52° E., five leagues distant. I continued to steer N.N.W., half W., and N.W. by W., as the coast trended, with a fine gale at N.E., and clear weather. At half an hour past four in the morning, on the 3rd, Mount Edgecumbe bore S. 54° E. ; a large inlet, N. 50° E., distant six leagues ; and the most advanced point of the land, to the N.W., lying under a very high peaked mountain, which obtained the name of Mount Fair Weather, bore N. 32° W. The inlet was named Cross Sound, as being first seen on that day, so marked in our calendar. It appeared to branch in several arms, the largest of which turned to the northward. The south-east point of this sound is a high promontory, which obtained the name of Cross Cape. It lies in the latitude of $57^{\circ} 57'$, and its longitude is $223^{\circ} 21'$. At noon it bore south-east ; and the point, under the peaked mountain, which was called Cape Fair Weather, north by west a quarter west, distant thirteen leagues. Our latitude at this time was $58^{\circ} 17'$, and our longitude $222^{\circ} 14'$; and we were distant from the shore three or four leagues. In this situation we found the variation of the compass to be from $24^{\circ} 11'$ to $26^{\circ} 11'$ E.

Here the north-east wind left us, and was succeeded by light breezes from the north-west, which lasted for several days. I stood to the south-west, and west-south-west, till eight o'clock the next morning, when we tacked and stood toward the shore. At noon the latitude was $58^{\circ} 22'$, and the longitude $220^{\circ} 45'$. Mount Fair Weather, the peaked mountain over the cape of the same name, bore N., 63° E. ; the shore under it twelve leagues distant. This mountain, which lies in the latitude of $58^{\circ} 52'$, and in the longitude of 222° , and five leagues inland, is the highest of a chain, or rather a ridge of mountains, that rise at the north-west entrance of Cross Sound, and extend to the north-west in a parallel direction with the coast. These mountains were wholly covered with snow, from the highest summit down to the sea-coast, some few places excepted, where we could perceive trees rising, as it were, out of the sea ; and which, therefore, we supposed grew on low land, or on islands bordering upon the shore of the continent†. At five in the afternoon, our latitude being then $58^{\circ} 53'$, and our longitude $220^{\circ} 52'$, the summit of an elevated mountain appeared above the horizon, being N. 26° W. ; and, as was afterward found, forty leagues distant. We supposed it to be Beering's Mount St. Elias ; and it stands by that name in our chart. This day we saw several whales, seals, and porpoises ; many gulls, and several flocks of birds, which had a black ring about the head ; the tip of the tail and upper part of the wings with a black band ; and the rest bluish above, and white below. We also saw a brownish duck, with a black or deep blue head and neck, sitting upon the water.

Having but light winds, with some calms, we advanced slowly ; so that, on the 6th at noon, we were only in the latitude of $59^{\circ} 8'$, and in the longitude of $220^{\circ} 19'$. Mount Fair Weather bore S., 63° E., and Mount Elias N., 30° W. ; the nearest land about eight leagues distant. In the direction of north, 47° E. from this station, there was the appearance of a bay, and an island off the south point of it, that was covered with wood. It is here where I suppose Commodore Beering to have anchored. The latitude, which is $59^{\circ} 18'$,

* It should seem that in this very bay, the Spaniards, in 1775, found their port which they call *De los Remedios*. The latitude is exactly the same ; and their journal mentions its " being protected by a long ridge of high islands." — See *Miscellanies*, by the Honourable Daines Barrington, p. 503, 504.

† According to Muller, Beering fell in with the coast

of North America in latitude $58^{\circ} 28'$; and he describes its aspect thus : " L'aspect du pays étoit effrayant par ses hautes montagnes couvertes de neige." The chain, or ridge of mountains, covered with snow, mentioned here by Captain Cook, in the same latitude, exactly agrees with what Beering met with. — See Muller's *Voyages et Découvertes des Russes*, p. 248—254.

corresponds pretty well with the map of his voyage*, and the longitude is 221° E. Behind the bay (which I shall distinguish by the name of Beering's Bay, in honour of its discoverer), or rather to the south of it, the chain of mountains before mentioned is interrupted by a plain of a few leagues' extent; beyond which the sight was unlimited; so that there is either a level country or water behind it. In the afternoon, having a few hours' calm, I took this opportunity to sound, and found twenty fathoms' water over a muddy bottom. The calm was succeeded by a light breeze from the north, with which we stood to the westward; and at noon the next day we were in the latitude of 59° 27', and the longitude of 219° 7'. In this situation, Mount Fair Weather bore S., 79° E.; Mount St. Elias N. half W.; the westernmost land in sight, N., 52° W.; and our distance from the shore four or five leagues; the depth of water being eighty-two fathoms over a muddy bottom. From this station we could see a bay (circular to appearance) under the high land, with low wood-land on each side of it.

We now found the coast to trend very much to the west, inclining hardly anything to the north; and as we had the wind mostly from the westward, and but little of it, our progress was slow. On the 9th, at noon, the latitude was 59° 30', and the longitude 217°. In this situation the nearest land was nine leagues distant; and Mount St. Elias bore N. 30° E., nineteen leagues distant. This mountain lies twelve leagues inland, in the latitude of 60° 27', and in the longitude of 219°. It belongs to a ridge of exceedingly high mountains, that may be reckoned a continuation of the former; as they are only divided from them by the plain above-mentioned. They extend as far to the west as the longitude of 217°; where, although they do not end, they lose much of their height, and become more broken and divided. At noon, on the 10th, our latitude was 59° 51', and our longitude 215° 56', being no more than three leagues from the coast of the continent, which extended from east half north, to north-west half west, as far as the eye could reach. To the westward of this last direction was an island that extended from N., 52° W., to S., 85° W., distant six leagues. A point shoots out from the main toward the north-east end of the island, bearing at this time N., 30° W., five or six leagues distant. This point I named Cape Suckling. The point of the cape is low; but within it is a tolerably high hill, which is disjoined from the mountains by low land; so that, at a distance, the cape looks like an island. On the north side of Cape Suckling is a bay that appeared to be of some extent, and to be covered from most winds. To this bay I had some thoughts of going to stop our leak, as all our endeavours to do it at sea had proved ineffectual. With this view I steered for the Cape; but as we had only variable light breezes, we approached it slowly. However, before night, we were near enough to see some low land spitting out from the Cape to the north-west, so as to cover the east part of the bay from the south wind. We also saw some small islands in the bay, and elevated rocks between the Cape and the north-east end of the island. But still there appeared to be a passage on both sides of these rocks; and I continued steering for them all night, having from forty-three to twenty-seven fathoms water over a muddy bottom.

At four o'clock next morning, the wind, which had been mostly at north-east, shifted to north. This being against us, I gave up the design of going within the island, or into the bay, as neither could be done without loss of time. I therefore bore up for the west end of the island. The wind blew faint; and at ten o'clock it fell calm. Being not far from the island, I went in a boat and landed upon it, with a view of seeing what lay on the other side; but finding it farther to the hills than I expected, and the way being steep and woody, I was obliged to drop the design. At the foot of a tree, on a little eminence not far from the shore, I left a bottle with a paper in it, on which were inscribed the names of the ships, and the date of our discovery. And along with it I inclosed two silver twopenny pieces of his majesty's coin, of the date 1772. These, with many others, were furnished me by the Reverend Dr. Kaye †; and, as a mark of my esteem and regard for that gentleman, I named the island, after him, Kaye's Island. It is eleven or twelve leagues in length, in the

* Probably Captain Cook means Muller's map, prefixed to his History of the Russian Discoveries.

† Then sub-almoner and chaplain to his majesty, afterwards dean of Lincoln.

direction of north-east and south-west ; but its breadth is not above a league, or a league and a half, in any part of it. The south-west point, which lies in the latitude of $59^{\circ} 49'$, and the longitude of $216^{\circ} 58'$, is very remarkable, being a naked rock, elevated considerably above the land within it. There is also an elevated rock lying off it, which, from some points of view, appears like a ruined castle. Toward the sea the island terminates in a kind of bare sloping cliffs, with a beach, only a few paces across to their foot, of large pebble stones, intermixed in some places with a brownish clayey sand, which the sea seems to deposit after rolling in, having been washed down from the higher parts by the rivulets or torrents. The cliffs are composed of a bluish stone or rock, in a soft or mouldering state, except in a few places. There are parts of the shore interrupted by small valleys and gullies. In each of these a rivulet or torrent rushes down with considerable impetuosity ; though it may be supposed that they are only furnished from the snow, and last no longer than till it is all melted. These valleys are filled with pine-trees, which grow down close to the entrance, but only to about half way up the higher or middle part of the island. The woody part also begins everywhere immediately above the cliffs, and is continued to the same height with the former ; so that the island is covered, as it were, with a broad girdle of wood, spread upon its side, included between the top of the cliffy shore, and the higher parts in the centre. The trees, however, are far from being of an uncommon growth ; few appearing to be larger than one might grasp round with his arms, and about forty or fifty feet high ; so that the only purpose they could answer for shipping would be to make top-gallant masts, and other small things. How far we may judge of the size of the trees which grow on the neighbouring continent, it may be difficult to determine. But it was observed that none larger than those we saw growing lay upon the beach amongst the drift-wood. The pine-trees seemed all of one sort ; and there was neither the Canadian pine nor cypress to be seen. But there were a few which appeared to be the alder, that were but small, and had not yet shot forth their leaves. Upon the edges of the cliffs, and on some sloping ground, the surface was covered with a kind of turf, about half a foot thick, which seemed composed of the common moss ; and the top, or upper part, of the island had almost the same appearance as to colour ; but whatever covered it seemed to be thicker. I found amongst the trees some currant and hawberry bushes ; a small yellow-flowered violet ; and the leaves of some other plants not yet in flower, particularly one which Mr. Anderson supposed to be the *Heracleum* of Linnæus, the sweet herb, which Steller, who attended Beering, imagined the Americans here dress for food, in the same manner as the natives of Kamtschatka*.

We saw, flying about the wood, a crow ; two or three of the white-headed eagles mentioned at Nootka ; and another sort full as large, which appeared also of the same colour, or blacker, and had only a white breast. In the passage from the ship to the shore, we saw a great many fowls sitting upon the water, or flying about in flocks or pairs ; the chief of which were a few quebrantahuessos, divers, ducks, or large peterels, gulls, shags, and burres. The divers were of two sorts ; one very large, of a black colour, with a white breast and belly ; the other smaller, and with a longer and more pointed bill, which seemed to be the common guillemot. The ducks were also of two sorts ; one brownish, with a black or deep blue head and neck, and is perhaps the stone-duck described by Steller. The others fly in larger flocks, but are smaller than these, and are of a dirty black colour. The gulls were of the common sort, and those which fly in flocks. The shags were large and black, with a white spot behind the wings as they flew ; but probably only the larger water-cormorant. There was also a single bird seen flying about, to appearance of the gull kind, of a snowy white colour, with black along part of the upper side of its wings. I owe all these remarks to Mr. Anderson. At the place where we landed, a fox came from the verge of the wood, and eyed us with very little emotion, walking leisurely, without any signs of fear. He was of a reddish-yellow colour, like some of the skins we bought at Nootka, but not of a large size. We also saw two or three little seals off-shore ; but no other animals or birds, nor the least signs of inhabitants having ever been upon the island.

I returned on board at half-past two in the afternoon; and, with a light breeze easterly, steered for the south-west of the island, which we got round by eight o'clock, and then stood for the westernmost land now in sight, which at this time bore north-west half north. On the north-west side of the north-east end of Kaye's Island, lies another island stretching south-east and north-west about three leagues, to within the same distance of the north-west boundary of the bay above mentioned, which is distinguished by the name of Comptroller's Bay.

Next morning at four o'clock Kaye's Island was still in sight, bearing east a quarter south. At this time we were about four or five leagues from the main; and the most western part in sight bore north-west half north. We had now a fresh gale at east-south-east; and as we advanced to the north-west we raised land more and more westerly, and at last to the southward of west; so that at noon, when the latitude was $61^{\circ} 11'$ and the longitude $213^{\circ} 28'$, the most advanced land bore from us south-west by west half west. At the same time the east point of a large inlet bore west-north-west, three leagues distant. From Comptroller's Bay to this point, which I name Cape Hinchinbroke, the direction of the coast is nearly east and west. Beyond this it seemed to incline to the southward; a direction so contrary to the modern charts founded upon the late Russian discoveries, that we had reason to expect that by the inlet before us we should find a passage to the north, and that the land to the west and south-west was nothing but a group of islands. Add to this, that the wind was now at south-east, and we were threatened with a fog and a storm; and I wanted to get into some place to stop the leak before we encountered another gale. These reasons induced me to steer for the inlet, which we had no sooner reached than the weather became so foggy that we could not see a mile before us, and it became necessary to secure the ships in some place to wait for a clearer sky. With this view, I hauled close under Cape Hinchinbroke, and anchored before a small cove, a little within the cape, in eight fathoms' water, a clayey bottom, and about a quarter of a mile from the shore.

The boats were then hoisted out, some to sound and others to fish. The seine was drawn in the cove; but without success, for it was torn. At some short intervals the fog cleared away, and gave us a sight of the lands around us. The cape bore south by west half west, one league distant; the west point of the inlet south-west by west, distant five leagues; and the land on that side extended as far as west by north. Between this point and north-west by west we could see no land; and what was in the last direction seemed to be at a great distance. The westernmost point we had in sight on the north shore, bore north-north-west half west, two leagues distant. Between this point and the shore under which we were at anchor is a bay about three leagues deep; on the south-east side of which there are two or three coves, such as that before which we had anchored; and in the middle some rocky islands. To these islands Mr. Gore was sent in a boat, in hopes of shooting some eatable birds. But he had hardly got to them before about twenty natives made their appearance in two large canoes; on which he thought proper to return to the ships, and they followed him. They would not venture alongside, but kept at some distance, holloing aloud, and alternately clapping and extending their arms; and, in a short time, began a kind of song exactly after the manner of those at Nootka. Their heads were also powdered with feathers. One man held out a white garment, which we interpreted as a sign of friendship; and another stood up in the canoe quite naked, for almost a quarter of an hour, with his arms stretched out like a cross, and motionless. The canoes were not constructed of wood, as at King George's or Nootka Sound. The frame only, being slender laths, was of that substance; the outside consisting of the skins of seals, or of such-like animals. Though we returned all their signs of friendship, and, by every expressive gesture, tried to encourage them to come alongside, we could not prevail. Some of our people repeated several of the common words of the Nootka language, such as *seekemaile* and *mahook*; but they did not seem to understand them. After receiving some presents which were thrown to them, they retired toward that part of the shore from whence they came; giving us to understand by signs, that they would visit us again the next morning. Two of them, however, each in a small canoe, waited upon us in the night;

probably with a design to pilfer something, thinking we should be all asleep, for they retired as soon as they found themselves discovered.

During the night the wind was at south-south-east, blowing hard and in squalls, with rain, and very thick weather. At ten o'clock next morning the wind became more moderate, and the weather being somewhat clearer, we got under sail in order to look out for some snug place where we might search for and stop the leak; our present station being too much exposed for this purpose. At first I proposed to have gone up the bay, before which we had anchored; but the clearness of the weather tempted me to steer to the northward, farther up the great inlet, as being all in our way. As soon as we had passed the north-west point of the bay above-mentioned, we found the coast on that side turn short to the eastward. I did not follow it, but continued our course to the north, for a point of land which we saw in that direction.

The natives who visited us the preceding evening, came off again in the morning, in five or six canoes, but not till we were under sail; and although they followed us for some time, they could not get up with us. Before two in the afternoon the bad weather returned again, with so thick a haze that we could see no other land besides the point just mentioned, which we reached at half past four, and found it to be a small island lying about two miles from the adjacent coast, being a point of land, on the east side of which we discovered a fine bay, or rather harbour. To this we plied up under reefed topsails and courses. The wind blew strong at south-east, and in excessively hard squalls, with rain. At intervals we could see land in every direction; but in general the weather was so foggy, that we could see none but the shores of the bay into which we were plying. In passing the island the depth of water was twenty-six fathoms, with a muddy bottom. Soon after the depth increased to sixty and seventy fathoms, a rocky bottom; but in the entrance of the bay the depth was from thirty to six fathoms, the last very near the shore. At length, at eight o'clock, the violence of the squalls obliged us to anchor in thirteen fathoms, before we had got so far into the bay as I intended; but we thought ourselves fortunate that we had already sufficiently secured ourselves at this hour, for the night was exceedingly stormy. The weather, bad as it was, did not hinder three of the natives from paying us a visit. They came off in two canoes, two men in one and one in the other, being the number each could carry; for they were built and constructed in the same manner with those of the Esquimaux, only in the one were two holes for two men to sit in, and in the other but one. Each of these men had a stick about three feet long, with the large feathers or wing of birds tied to it. These they frequently held up to us; with a view, as we guessed, to express their pacific disposition*.

The treatment these men met with, induced many more to visit us between one and two the next morning, in both great and small canoes. Some ventured on board the ship; but not till some of our people had stepped into their boats. Amongst those who came on board, was a good-looking middle-aged man, whom we afterwards found to be the chief. He was clothed in a dress made of the sea-otter's skin; and had on his head such a cap as is worn by the people of King George's Sound, ornamented with sky-blue glass beads, about the size of a large pea. He seemed to set a much higher value upon these than upon our white glass beads. Any sort of beads, however, appeared to be in high estimation with these people; and they readily gave whatever they had in exchange for them; even their fine sea-otter skins. But here I must observe, that they set no more value upon these than upon other skins, which was also the case at King George's Sound, till our people set a higher price upon them; and even after that, the natives of both places would sooner part with a dress made of these, than with one made of the skins of wild cats or of martins. These people were also desirous of iron; but they wanted pieces of eight or ten inches long at least, and of the breadth of three or four fingers. For they absolutely rejected small pieces. Consequently they got but little from us; iron having, by this time, become rather a scarce article. The

* Exactly corresponding to this, was the manner of receiving Beeding's people at the Schumagin Islands on this coast, in 1741. Muller's words are—"On sait ce que c'est que le *calumet*, que les Américains Septentrionaux présentent en signe de paix. Ceux-ci en tenoient de pareils en main. C'étoient des bâtons avec *ailes de faucon* attachés au bout."—Découvertes, p. 268.

points of some of their spears or lances were of that metal; others were of copper, and a few of bone; of which the points of their darts, arrows, &c., were composed. I could not prevail upon the chief to trust himself below the upper deck; nor did he and his companions remain long on board. But while we had their company it was necessary to watch them narrowly, as they soon betrayed a thievish disposition. At length, after being about three or four hours alongside the *Resolution*, they all left her and went to the *Discovery*; none having been there before, except one man, who at this time came from her, and immediately returned thither in company with the rest. When I observed this, I thought this man had met with something there, which he knew would please his countrymen better than what they met with at our ship. But in this I was mistaken, as will soon appear.

As soon as they were gone, I sent a boat to sound the head of the bay. For as the wind was moderate, I had thoughts of laying the ship ashore, if a convenient place could be found where I might begin our operations to stop the leak. It was not long before all the Americans left the *Discovery*, and instead of returning to us, made their way toward our boat employed as above. The officer in her seeing this, returned to the ship, and was followed by all the canoes. The boat's crew had no sooner come on board, leaving in her two of their number by way of a guard, than some of the Americans stepped into her. Some presented their spears before the two men; others cast loose the rope which fastened her to the ship; and the rest attempted to tow her away. But the instant they saw us preparing to oppose them, they let her go, stepped out of her into canoes, and made signs to us to lay down our arms, having the appearance of being as perfectly unconcerned as if they had done nothing amiss. This, though rather a more daring attempt, was hardly equal to what they had meditated on board the *Discovery*. The man who came and carried all his countrymen from the *Resolution* to the other ship, had first been on board of her; where, after looking down all the hatchways, and seeing nobody but the officer of the watch, and one or two more, he, no doubt, thought they might plunder her with ease; especially as she lay at some distance from us. It was unquestionably with this view that they all repaired to her. Several of them, without any ceremony, went on board; drew their knives, and made signs to the officer and people on deck to keep off; and began to look about them for plunder. The first thing they met with was the rudder of one of the boats, which they threw overboard to those of their party who had remained in the canoes. Before they had time to find another object that pleased their fancy, the crew were alarmed, and began to come upon deck armed with cutlasses. On seeing this, the whole company of plunderers snaked off into their canoes, with as much deliberation and indifference as they had given up the boat; and they were observed describing to those who had not been on board, how much longer the knives of the ship's crew were than their own. It was at this time that my boat was on the sounding duty; which they must have seen; for they proceeded directly for her, after their disappointment at the *Discovery*. I have not the least doubt that their visiting us so very early in the morning, was with a view to plunder; on a supposition that they should find everybody asleep. May we not, from these circumstances, reasonably infer, that these people are unacquainted with fire-arms? For certainly, if they had known anything of their effect, they never would have dared to attempt taking a boat from under a ship's guns, in the face of above a hundred men; for most of my people were looking at them, at the very instant they made the attempt. However, after all these tricks, we had the good fortune to leave them as ignorant, in this respect, as we found them. For they neither heard nor saw a musket fired, unless at birds.

Just as we were going to weigh the anchor, to proceed farther up the bay, it began to blow and to rain as hard as before; so that we were obliged to bear away the cable again, and lay fast. Toward the evening, finding that the gale did not moderate, and that it might be some time before an opportunity offered to get higher up, I came to a resolution to heel the ship where we were; and with this view, moored her with a kedge-anchor and hawser. In heaving the anchor out of the boat, one of the seamen, either through ignorance or carelessness, or both, was carried overboard by the buoy-rope, and followed the anchor to the bottom. It is remarkable that, in this very critical situation, he had presence of mind

to disengage himself, and come up to the surface of the water, where he was taken up, with one of his legs fractured in a dangerous manner. Early the next morning we gave the ship a good heel to port, in order to come at and stop the leak. On ripping off the sheathing it was found to be in the seams, which were very open both in and under the wale; and in several places not a bit of oakum in them. While the carpenters were making good these defects, we filled all our empty water-casks at a stream hard by the ship. The wind was now moderate, but the weather was thick and hazy, with rain. The natives, who left us the preceding day, when the bad weather came on, paid us another visit this morning. Those who came first were in small canoes; others afterwards arrived in large boats; in one of which were twenty women and one man, besides children.

In the evening of the 16th, the weather cleared up, and we then found ourselves surrounded on every side by land. Our station was on the east side of the sound, in a place which in a chart is distinguished by the name of Snug Corner Bay; and a very snug place it is. I went, accompanied by some of the officers, to view the head of it; and we found that it was sheltered from all winds; with a depth of water from seven to three fathoms over a muddy bottom. The land near the shore is low; part clear, and part wooded. The clear ground was covered, two or three feet thick, with snow; but very little lay in the woods. The very summits of the neighbouring hills were covered with wood; but those farther inland seemed to be naked rocks buried in snow.

The leak being stopped, and the sheathing made good over it, at four o'clock in the morning of the 17th we weighed, and steered to the north-westward, with a light breeze at east-north-east; thinking if there should be any passage to the north through this inlet, that it must be in that direction. Soon after we were under sail, the natives, in both great and small canoes, paid us another visit, which gave us an additional opportunity of forming a more perfect idea of their persons, dress, and other particulars, which shall be afterward described. Our visitors seemed to have no other business but to gratify their curiosity; for they entered into no sort of traffic with us. After we had got over to the north-west point of the arm in which we had anchored, we found that the flood-tide came into the inlet, through the same channel by which we had entered. Although this circumstance did not make wholly against a passage, it was, however, nothing in its favour. After passing the point above-mentioned, we met with a good deal of foul ground, and many sunken rocks even out in the middle of the channel, which is here five or six leagues wide. At this time the wind failed us, and was succeeded by calms and light airs from every direction; so that we had some trouble to extricate ourselves from the threatening danger. At length, about one o'clock, with the assistance of our boats, we got to an anchor, under the eastern shore, in thirteen fathoms' water, and about four leagues to the north of our last station. In the morning the weather had been very hazy; but it afterward cleared up, so as to give us a distinct view of all the land round us, particularly to the northward, where it seemed to close. This left us but little hopes of finding a passage that way; or indeed in any other direction, without putting out again to sea.

To enable me to form a better judgment, I despatched Mr. Gore, with two armed boats, to examine the northern arm; and the master, with two other boats, to examine another arm that seemed to take an easterly direction. Late in the evening they both returned. The master reported that the arm he had been sent to communicate with that from which he had last come; and that one side of it was only formed by a group of islands. Mr. Gore informed me that he had seen the entrance of an arm, which, he was of opinion, extended a long way to the north-east; and that probably by it a passage might be found. On the other hand, Mr. Roberts, one of the mates, whom I had sent with Mr. Gore to sketch out the parts they had examined, was of opinion that they saw the head of this arm. The disagreement of these two opinions, and the circumstance already mentioned of the flood-tide entering the Sound from the south, rendered the existence of a passage this way very doubtful. And, as the wind in the morning had become favourable for getting out to sea, I resolved to spend no more time in searching for a passage in a place that promised so little success. Besides this, I considered that if the land on the west should prove to be islands,

as taken up, with

agreeably to the late Russian discoveries*, we could not fail of getting far enough to the north, and that in good time; provided we did not lose the season in searching places where a passage was not only doubtful, but improbable. We were now upward of five hundred and twenty leagues to the westward of any part of Baffin's or of Hudson's Bay. And whatever passage there may be, it must be, or at least part of it must lie to the north of latitude 72°. Who could expect to find a passage or strait of such extent?

Having thus taken my resolution, next morning, at three o'clock, we weighed, and with a gentle breeze at north, proceeded to the southward down the inlet; and met with the same broken ground as on the preceding day. However, we soon extricated ourselves from it, and afterward never struck ground with a line of forty fathoms. Another passage into this inlet was now discovered, to the south-west of that by which we came in, which enabled us to shorten our way out to sea. It is separated from the other by an island, extending eighteen leagues in the direction of north-east and south-west; to which I gave the name of Montagu Island. In this south-west channel are several islands. Those that lie in the entrance, next the open sea, are high and rocky. But those within are low ones; and being entirely free from snow, and covered with wood and verdure, on this account they were called Green Islands.

At two in the afternoon the wind veered to the south-west, and south-west by south, which reduced us to the necessity of plying. I first stretched over to within two miles of the eastern shore, and tacked in fifty-three fathoms water. In standing back to Montagu Island, we discovered a ledge of rocks; some above, and others under water, lying three miles within, or to the north of the northern point of Green Islands. Afterward some others were seen in the middle of the channel, farther out than the islands. These rocks made unsafe plying in the night (though not very dark); and, for that reason, we spent it standing off and on, under Montagu Island; for the depth of water was too great to come to an anchor. At daybreak, the next morning, the wind became more favourable, and we steered for the channel between Montagu Island and the Green Islands, which is between two and three leagues broad, and from thirty-four to seventeen fathoms deep. We had but little wind all the day; and at eight o'clock in the evening it was a dead calm; when we anchored in twenty-one fathoms' water, over a muddy bottom, about two miles from the shore of Montagu's Island. The calm continued till ten o'clock the next morning, when it was succeeded by a small breeze from the north, with which we weighed; and, by six o'clock in the evening, we were again in the open sea, and found the coast trending west by south, as far as the eye could reach.

CHAPTER V.—THE INLET CALLED PRINCE WILLIAM'S SOUND.—ITS EXTENT.—PERSONS OF THE INHABITANTS DESCRIBED.—THEIR DRESS.—INCISION OF THEIR UNDER LIP.—VARIOUS OTHER ORNAMENTS.—THEIR BOATS.—WEAPONS, FISHING, AND HUNTING INSTRUMENTS.—UTENSILS.—TOOLS.—USES IRON IS APPLIED TO.—FOOD.—LANGUAGE, AND A SPECIMEN OF IT.—ANIMALS.—BIRDS.—FISH.—IRON AND BEADS, WHENCE RECEIVED.

To the inlet, which we had now left, I gave the name of Prince William's Sound. To judge of this sound from what we saw of it, it occupies, at least, a degree and a half of latitude, and two of longitude, exclusive of the arms or branches, the extent of which is not known. The direction which they seemed to take, as also the situation and magnitude of the several islands in and about it, will be best seen in the sketch, which is delineated with as much accuracy as the short time and other circumstances would allow.

The natives, who came to make us several visits while we were in the Sound, were generally not above the common height; though many of them were under it. They were square, or strong-chested; and the most disproportioned part of their body seemed to be their heads, which were very large, with thick short necks, and large, broad, or spreading

* Captain Cook seems to take his ideas of these from Mr. Stæhlén's map, prefixed to the account of the Northern Archipelago; published by Dr. Maty. London, 1774.

faces; which, upon the whole, were flat. Their eyes, though not small, scarcely bore a proportion to the size of their faces; and their noses had full, round points, hooked, or turned up at the tip. Their teeth were broad, white, equal in size, and evenly set. Their hair was black, thick, straight and strong; and their beards, in general thin, or wanting; but the hairs about the lips of those who have them were stiff or bristly, and frequently of a brown colour. And several of the elderly men had even large and thick, but straight beards.

Though, in general, they agree in the make of their persons and largeness of their heads, there is a considerable variety in their features; but very few can be said to be of the handsome sort, though their countenance commonly indicates a considerable share of vivacity, good-nature, and frankness. And yet some of them had an air of sullenness and reserve. Some of the women have agreeable faces; and many are easily distinguishable from the men by their features, which are more delicate; but this should be understood chiefly of the younger sort, or middle-aged. The complexion of some of the women, and of the children, is white, but without any mixture of red. And some of the men, who were seen naked, had rather a brownish or swarthy cast, which could scarcely be the effect of any stain; for they do not paint their bodies.

Their common dress (for men, women, and children are clothed alike) is a kind of close frock, or rather robe; reaching generally to the ankles, though sometimes only to the knees. At the upper part is a hole just sufficient to admit the head, with sleeves that reach to the wrist. These frocks are made of the skins of different animals; the most common of which are those of the sea-otter, grey fox, racoon, and pine martin; with many of seal skins; and, in general, they are worn with the hairy side outward. Some also have these frocks made of the skins of fowls, with only the down remaining on them, which they glue on other substances. And we saw one or two woollen garments like those of Nootka. At the seams, where the different skins are sewed together, they are commonly ornamented with tassels or fringes of narrow thongs, cut out of the same skins. A few have a kind of cape or collar, and some a hood; but the other is the most common form, and seems to be their whole dress in good weather. When it rains, they put over this another frock, ingeniously made from the intestines of whales, or some other large animal, prepared so skilfully as almost to resemble our gold-beaters' leaf. It is made to draw tight round the neck; its sleeves reach as low as the wrist, round which they are tied with a string; and its skirts, when they are in their canoes, are drawn over the rim of the hole in which they sit, so that no water can enter. At the same time, it keeps the men entirely dry upward. For no water can penetrate through it any more than through a bladder. It must be kept continually moist or wet; otherwise it is apt to crack or break. This, as well as the common frock made of the skins, bears a great resemblance to the dress of the Greenlanders, as described by Crantz*.

* Crantz's History of Greenland, vol. i. p. 136—138. The reader will find in Crantz many striking instances, in which the Greenlanders and Americans of Prince William's Sound resemble each other, besides those mentioned in this chapter by Captain Cook. The dress of the people of Prince William's Sound, as described by Cap-

In general, they do not cover their legs or feet; but a few have a kind of skin stockings, which reach half-way up the thigh; and scarcely any of them are without mittens for the hands, made of the skins of bears' paws. Those who wear anything on their heads resembled in this respect our friends at Nootka; having high truncated conic caps, made of straw, and sometimes of wood, resembling a seal's head well painted.

The men commonly wear their hair cropped round the neck and forehead; but the women allow it to grow long, and most of them tie a small lock of it on the crown, or a few club it behind, after our manner. Both sexes have the ears perforated with several holes about the outer and lower part of the edge, in which they hang little bunches of beads, made of the same tubulose shelly substance used for this purpose by those of Nootka. The septum of the nose is also perforated, through which they frequently thrust the quill-feathers of small birds, or little bending ornaments made of the above shelly substance, strung on a stiff string or cord three or four inches long, which give them a truly grotesque appearance. But the most uncommon and unsightly ornamental fashion adopted by some of both sexes, is their having the under lip slit, or cut quite through in the direction of the mouth, a little below the swelling part. This incision, which is made even in the sucking children, is often above two inches long; and either by its natural retraction when the wound is fresh, or by the repetition of some artificial management, assumes the true shape of lips, and become so large as to admit the tongue through. This happened to be the case, when the first person having this incision was seen by one of the seamen, who called out that the man had two mouths, and, indeed it does not look unlike it. In this artificial mouth they stick a flat narrow ornament, made chiefly out of a solid shell or bone, cut into little narrow pieces like small teeth, almost down to the base or thickest part, which has a small projecting bit at each end that supports it when put into the divided lip, the cut part then appearing outward. Others have the lower lip only perforated into separate holes, and then the ornament consists of as many distinct shelly studs, whose points are pushed through these holes; and their heads appear within the lip, as another row of teeth immediately under their own.

These are their native ornaments. But we found many beads of European manufacture among them, chiefly of a pale blue colour, which they hang in their ears, about their caps, or join to their lip-ornaments, which have a small hole drilled in each point, to which they are fastened, and others to them, till they hang sometimes as low as the point of the chin. But, in this last case, they cannot remove them so easily; for as to their own lip-ornaments, they can take them out with their tongue, or suck within, at pleasure. They also wear bracelets of the shelly beads, or others of a cylindrical shape, made of a substance like amber, with such also as are used in their ears and noses. And so fond are they, in general, of ornament, that they stick anything in their perforated lip, one man appearing with two of our iron nails projecting from it like prongs, and another endeavouring to put a large brass button into it.

The men frequently paint their faces of a bright red and of a black colour, and sometimes of a blue or leaden colour; but not in any regular figure; and the women, in some measure, endeavoured to imitate them, by puncturing or staining the chin with black, that comes to a point in each cheek; a practice very similar to which is in fashion amongst the females of Greenland, as we learn from Crantz*. Their bodies are not painted, which may be owing to the scarcity of proper materials, for all the colours which they brought to sell in bladders were in very small quantities. Upon the whole, I have nowhere seen savages who take more pains than these people do to ornament, or rather to disfigure, their persons.

Their boats or canoes are of two sorts, the one being large and open, and the other small and covered. I mentioned already, that in one of the large boats were twenty women and one man, besides children. I attentively examined and compared the construction of this with Crantz's description of what he calls the great, or women's boat, in Greenland, and found that they were built in the same manner, parts like parts, with no other difference than in the form of the head and stern, particularly of the first, which bears some resemblance to the head of a whale. The framing is of slender pieces of wood, over which the skins of seals, or of other larger sea-animals, are stretched to compose the outside. It appeared also, that the small canoes of these people are made nearly of the same form and of the same

* Vol. i. p. 138.

materials with those used by the Greenlanders* and Esquimaux; at least the difference is not material. Some of these, as I have before observed, carry two men; they are broader in proportion to their length than those of the Esquimaux, and the head or fore-part curves somewhat like the head of a violin.

The weapons and instruments for fishing and hunting are the very same that are made use of by the Esquimaux and Greenlanders, and it is unnecessary to be particular in my account of them, as they are all very accurately described by Crantz†. I did not see a single one with these people that he has not mentioned, nor has he mentioned one that they have not. For defensive armour, they have a kind of jacket or coat of mail made of thin laths bound together with sinews, which makes it quite flexible, though so close as not to admit an arrow or dart. It only covers the trunk of the body, and may not be improperly compared to a woman's stays.

As none of these people lived in the bay where we anchored, or where any of us landed, we saw none of their habitations, and I had not time to look after them. Of their domestic utensils, they brought in their boats some round and oval shallow dishes of wood, and others of a cylindrical shape much deeper. The sides were made of one piece, bent round like chip-boxes, though thick, neatly fastened with thongs, and the bottoms fixed in with small wooden pegs. Others were smaller and of a more elegant shape, somewhat resembling a large oval butter-boat without a handle, but more shallow, made from a piece of wood or horny substance. These last were sometimes neatly carved. They had many little square bags, made of the same gut with their outer frocks, neatly ornamented with very minute red feathers interwoven with it, in which were contained some very fine sinews and bundles of small cord made from them, most ingeniously platted. They also brought many checkered baskets so closely wrought as to hold water, some wooden models of their canoes, a good many little images four or five inches long, either of wood or stuffed, which were covered with a bit of fur, and ornamented with pieces of small quill feathers, in imitation of their shelly beads, with hair fixed on their heads. Whether these might be mere toys for children, or held in veneration as representing their deceased friends, and applied to some superstitious purpose, we could not determine. But they have many instruments made of two or three hoops, or concentric pieces of wood, with a cross-bar fixed in the middle, to hold them by. To these are fixed a great number of dried barnacle-shells, with threads, which serve as a rattle, and make a loud noise when they shake them. This contrivance seems to be a substitute for the rattling-bird at Nootka, and perhaps both of them are employed on the same occasions‡.

With what tools they make their wooden utensils, frames of boats, and other things, is uncertain, as the only one seen amongst them was a kind of strong adze, made almost after the manner of those of Otaheite and the other islands of the South Sea. They have a great many iron knives, some of which are straight, others a little curved, and some very small ones fixed in pretty long handles, with the blades bent upward, like some of our shoemakers' instruments. But they have still knives of another sort, which are sometimes near two feet long, shaped almost like a dagger, with a ridge in the middle. These they wear in sheaths of skins, hung by a thong round the neck under their robe, and they are probably only used as weapons, the other knives being apparently applied to other purposes. Everything they have, however, is as well and ingeniously made as if they were furnished with the most complete tool-chest; and their sewing, platting of sinews, and small work on their little bags, may be put in competition with the most delicate manufactures found in any part of the known world. In short, considering the otherwise uncivilised or rude state in which these people are, their northern situation, amidst a country perpetually covered with snow, and the wretched materials they have to work with, it appears that their invention and dexterity in all manual works is at least equal to that of any other nation.

The food which we saw them eat, was dried fish and the flesh of some animal, either

* See Crantz vol. i. p. 150.

† Vol. i. p. 146. He has also given a representation of them on a plate there inserted.

broiled or roasted. Some of the latter that was bought seemed to be near's flesh, but with a fishy taste. They also eat the larger sort of fern-root, mentioned at Nootka, either baked or dressed in some other way; and some of our people saw them eat freely of a substance which they supposed to be the inner part of the pine bark. Their drink is most probably water, for in their boats they brought snow in the wooden vessels, which they swallowed by mouthfuls. Perhaps it could be carried with less trouble in these open vessels than water itself. Their method of eating seems decent and cleanly, for they always took care to separate any dirt that might adhere to their victuals. And though they sometimes did eat the raw fat of some sea animal, they cut it carefully into mouthfuls with their small knives. The same might be said of their persons, which, to appearance, were always clean and decent, without grease or dirt; and the wooden vessels in which their victuals are probably put, were kept in excellent order, as well as their boats, which were neat and free from lumber.

Their language seems difficult to be understood at first, not from any indistinctness or confusion in their words and sounds, but from the various significations they have. For they appeared to use the very same word frequently on very different occasions, though doubtless this might, if our intercourse had been of longer duration, have been found to be a mistake on our side. The only words I could obtain, and for them I am indebted to Mr. Anderson *, were those that follow, the first of which was also used at Nootka in the same sense, though we could not trace an affinity between the two dialects in any other instance.

Akashon,	What's the name of that?
Namuk,	An ornament for the ear.
Lukluk,	{ A brown shaggy skin, perhaps a bear's.
Aa,	Yes.
Nalooneshuk,	The skin of a sea-otter.
Keeta,	Give me something.
Nema,	{ Give me something in exchange or barter.
Ooonaka,	{ Of, or belonging to me.—Will you barter for this that belongs to me?
Manaka,	
Ahleu,	A spear.
Wena, or Veena,	Stranger—calling to one.
Keelashuk,	Guts of which they make jackets.

Tawuk,	Keep it.
Amitloo,	{ A piece of white bear's skin, or per- haps the hair that covered it.
Whachai,	Shall I keep it? Do you give it me?
Yaut,	I'll go; or, shall I go?
Chilke,	One.
Taiba,	Two.
Tokke,	Three.
(Tinke)	
Chukelo †,	Four?
Koeheene,	Five?
Takulai,	Six?
Keichillo,	Seven?
Klu, or Klieu,	Eight?

As to the animals of this part of the continent, the same must be understood as of those at Nootka, that is, that the knowledge we have of them is entirely taken from the skins which the natives brought to sell. These were chiefly of seals, a few foxes, the whitish cat, or *lynx*, common and pine martins, small ermins, bears, racoons, and sea-otters. Of these, the most common were the martin, racoon, and sea-otter skins, which composed the ordinary dress of the natives; but the skins of the first, which in general were of a much lighter brown than those of Nootka, were far superior to them in fineness; whereas the last, which, as well as the martins, were far more plentiful than at Nootka, seemed greatly inferior in the fineness and thickness of their fur, though they greatly exceeded them in size, and were almost all of the glossy black sort, which is doubtless the colour most esteemed in those skins. Bear and seal skins were also pretty common; and the last were in general white, very beautifully spotted with black, or sometimes simply white, and many of the bears here were of a brown or sooty colour.

Besides these animals, which were all seen at Nootka, there are some others in this place which we did not find there, such as the white bear, of whose skins the natives brought several pieces, and some entire skins of cubs, from which their size could not be determined. We also found the wolverene, or quickhatch, which had very bright colours; a larger sort

* We are also indebted to him for many remarks in this chapter, interwoven with those of Captain Cook, as throwing considerable light on many parts of his Journal.

† With regard to these numerals, Mr. Anderson ob-

serves, that the words corresponding to ours are not certain after passing three; and therefore he marks those, about whose position he is doubtful, with a point of interrogation.

of ermine than the common one, which is the same as at Nootka, varied with a brown colour, and with scarcely any black on its tail. The natives also brought the skin of the head of some very large animal, but it could not be positively determined what it was, though, from the colour and shagginess of the hair, and its unlikeness to any land animal, we judged it might probably be that of the large male ursine seal or sea-bear. But one of the most beautiful skins, and which seems peculiar to this place as we never saw it before, is that of a small animal about ten inches long, of a brown or rusty colour on the back, with a great number of obscure whitish specks, and the sides of a blueish ash-colour, also with a few of these specks. The tail is not above a third of the length of its body, and is covered with a hair of a whitish colour at the edges. It is no doubt the same with those called spotted field-mice by Mr. Stæhlin*, in his short account of the New Northern Archipelago; but whether they be really of the mouse kind or a squirrel, we could not tell, for want of perfect skins, though Mr. Anderson was inclined to think that it is the same animal described under the name of the *Casan* marmot, by Mr. Pennant. The number of skins we found here, points out the great plenty of these several animals just mentioned; but it is remarkable, that we neither saw the skins of the moose nor of the common deer.

Of the birds mentioned at Nootka, we found here only the white-headed eagle; the shag; the alcyon, or great king-fisher, which had very bright colours; and the humming-bird, which came frequently and flew about the ship, while at anchor; though it can scarcely live here in the winter, which must be very severe. The water-fowl were geese; a small sort of duck, almost like that mentioned at Kerguelen's Land; another sort which none of us knew; and some of the black scapies, with red bills, which we found at Van Diemen's Land, and New Zealand. Some of the people who went on shore, killed a grouse, a snipe, and some plover. But though, upon the whole, the water-fowl were pretty numerous, especially the ducks and geese, which frequent the shores, they were so shy, that it was scarcely possible to get within shot; so that we obtained a very small supply of them as refreshment. The duck mentioned above, is as large as the common wild-duck, of a deep black colour, with a short pointed tail, and red feet. The bill is white, tinged with red toward the point, and has a large black spot, almost square, near its base, on each side, where it is also enlarged or distended: and on the forehead is a large triangular white spot; with one still larger on the back part of the neck. The female has much duller colours, and none of the ornaments of the bill, except the two black spots, which are obscure.

There is likewise a species of diver here, which seems peculiar to the place. It is about the size of a partridge; has a short, black, compressed bill; with the head and upper part of the neck of a brown black; the rest of a deep brown, obscurely waved with black, except the under part, which is entirely of a blackish cast, very minutely varied with white; the other (perhaps the female) is blacker above, and whiter below. A small land-bird, of the finch kind, about the size of a yellow-hammer, was also found; but was suspected to be one of those which change their colour with the season, and with their migrations. At this time, it was of a dusky brown colour, with a reddish tail; and the supposed male had a large yellow spot on the crown of the head, with some varied black on the upper part of the neck; but the last was on the breast of the female.

The only fish we got, were some torsk and halibut, which were chiefly brought by the natives to sell; and we caught a few sculpins about the ship; with some purplish star-fish, that had seventeen or eighteen rays. The rocks were observed to be almost destitute of shell-fish; and the only other animal of this tribe seen, was a red crab, covered with spines of a very large size.

The metals we saw were copper and iron; both which, particularly the latter, were in such plenty, as to constitute the points of most of the arrows and lances. The ores, with which they painted themselves, were a red, brittle, unctuous ochre, or iron ore, not much unlike cinnabar in colour; a bright blue pigment, which we did not procure; and black lead. Each of these seems to be very scarce, as they brought very small quantities of the first and last, and seemed to keep them with great care.

* In his Account of Kodjak, p. 32, 34.

Few vegetables of any kind were seen; and the trees which chiefly grew here, were the Canadian and spruce pine, and some of them tolerably large.

The beads and iron found amongst these people, left no room to doubt, that they must have received them from some civilised nation. We were pretty certain, from circumstances already mentioned, that we were the first Europeans with whom they had ever communicated directly; and it remains only to be decided, from what quarter they had got our manufactures, by intermediate conveyance. And there cannot be the least doubt of their having received these articles through the intervention of the more inland tribes, from Hudson's Bay, or the settlements on the Canadian lakes; unless it can be supposed (which however is less likely) that the Russian traders from Kamtschatka have already extended their traffic thus far; or at least that the natives of their most easterly Fox Islands communicate along the coast with those of Prince William's Sound*.

As to the copper, these people seem to procure it themselves, or at most it passes through few hands to them; for they used to express its being in a sufficient quantity amongst them, when they offered any to barter, by pointing to their weapons; as if to say, that having so much of this metal of their own, they wanted no more.

It is, however, remarkable, if the inhabitants of this Sound be supplied with European articles, by way of the intermediate traffic to the east coast, that they should, in return, never have given to the more inland Indians any of their sea-otter skins; which would certainly have been seen, some time or other, about Hudson's Bay. But, as far as I know, that is not the case; and the only method of accounting for this, must be by taking into consideration the very great distance; which, though it might not prevent European goods coming so far, as being so uncommon, might prevent the skins, which are a common article, from passing through more than two or three different tribes, who might use them for their own clothing, and send others, which they esteemed less valuable, as being of their own animals, eastward, till they reach the traders from Europe.

AFTER leaving Prince William's Sound, I steered to the south-west, with a gentle breeze at north north-east; which, at four o'clock the next morning, was succeeded by a calm; and soon after, the calm was succeeded by a breeze from south-west. This freshening, and veering to north-west, we still continued to stretch to the south-west, and passed a lofty promontory, situated in the latitude of $59^{\circ} 10'$, and the longitude of $207^{\circ} 45'$. As the discovery of it was connected with the Princess Elizabeth's birth-day, I named it Cape Elizabeth. Beyond it we could see no land; so that, at first, we were in hopes that it was the western extremity of the continent; but not long after, we saw our mistake; for fresh land appeared in sight, bearing west south-west.

The wind, by this time, had increased to a very strong gale, and forced us to a good distance

* There is a circumstance mentioned by Muller, in his account of Beering's voyage to the coast of America in 1741, which seems to decide this question. His people found iron at the Schumagin Islands, as may be fairly presumed from the following quotation. "Un seul homme avoit un couteau pendu à sa ceinture, qui parut fort singulier à nos gens par sa figure. Il étoit long de huit pouces, et fort épais, et largo à l'endroit où devoit être la pointe. On ne peut savoir quel étoit l'usage de cet outil."—*Découvertes des Russes*, p. 274

If there was iron amongst the natives on this part of the American coast, prior to the discovery of it by the Russians, and before there was any traffic with them carried on from Kamtschatka, what reason can there be to make the least doubt of the people of Prince William's Sound, as well as those of Schumagin's Islands, having got this metal from the only probable source, the European settlements on the north-east coast of this continent?

from the coast. In the afternoon of the 22d, the gale abated; and we stood to the northward for Cape Elizabeth; which at noon, the next day, bore west, ten leagues distant. At the same time, a new land was seen, bearing south 77° west, which was supposed to connect Cape Elizabeth with the land we had seen to the westward.

The wind continued at west, and I stood to the southward till noon the next day, when we were within three leagues of the coast which we had discovered on the 22d. It here formed a point that bore west north-west. At the same time, more land was seen extending to the southward, as far as south south-west; the whole being twelve or fifteen leagues distant. On it was seen a ridge of mountains covered with snow, extending, to the north-west, behind the first land, which we judged to be an island, from the very inconsiderable quantity of snow that lay upon it. This point of land is situated in the latitude of $58^{\circ} 15'$, and in the longitude of $207^{\circ} 42'$; and by what I can gather from the account of Beering's voyage, and the chart that accompanies it in the English edition*, I conclude, that it must be what he called Cape St. Hermogenes. But the account of that voyage is so very much abridged, and the chart so extremely inaccurate, that it is hardly possible, either by the one or by the other, or by comparing both together, to find out any one place which that navigator either saw or touched at. Were I to form a judgment of Beering's proceedings on this coast, I should suppose, that he fell in with the continent near Mount Fairweather. But I am by no means certain, that the bay to which I have given his name is the place where he anchored. Nor do I know, that what I called Mount St. Elias, is the same conspicuous mountain to which he gave that name. And as to his Cape St. Elias, I am entirely at a loss to pronounce where it lies.

On the north side of Cape St. Hermogenes, the coast turned toward the north-west, and appeared to be wholly unconnected with the land seen by us the preceding day. In the chart above mentioned, there is here a space, where Beering is supposed to have seen no land. This also favoured the latter account published by Mr. Stæhlin, who makes Cape St. Hermogenes, and all the land that Beering discovered to the south-west of it, to be a cluster of islands; placing St. Hermogenes amongst those which are destitute of wood. What we now saw seemed to confirm this; and every circumstance inspired us with hopes of finding here a passage northward, without being obliged to proceed any farther to the south-west.

We were detained off the cape by variable light airs and calms, till two o'clock the next morning, when a breeze springing up at north-east, we steered north north-west along the coast; and soon found the land of Cape St. Hermogenes to be an island, about six leagues in circuit, separated from the adjacent coast by a channel one league broad. A league and a half to the north of this island lie some rocks above water; on the north-east side of which we had from thirty to twenty fathoms water. At noon, the island of St. Hermogenes bore south-east, eight leagues distant; and the land to the north-west of it extended from south half west to near west. In this last direction it ended in a low point, now five leagues distant, which was called Point Banks. The latitude of the ship, at this time, was $58^{\circ} 41'$, and its longitude $207^{\circ} 44'$. In this situation, the land, which was supposed to connect Cape Elizabeth with this south-west land, was in sight, bearing north-west half north. I steered directly for it; and on a nearer approach, found it to be a group of high islands and rocks entirely unconnected with any other land. They obtained the name of Barren Isles, from their very naked appearance. Their situation is in the latitude of 59° , and in a line with Cape Elizabeth and Point Banks; three leagues distant from the former, and five from the latter.

I intended going through one of the channels that divide these islands, but meeting with a strong current setting against us, I bore up and went to the leeward of them all. Toward the evening, the weather, which had been hazy all day, cleared up, and we got sight of a very lofty promontory, whose elevated summit, forming two exceedingly high mountains, was seen above the clouds. This promontory I named Cape Douglas, in honour of my very good friend, Dr. Douglas, canon of Windsor. It is situated in the latitude of $58^{\circ} 56'$, and in the longitude of $206^{\circ} 10'$, ten leagues to the westward of Barren Isles, and twelve from Point Banks, in the direction of N.W. by W. half W. Between this point and Cape Douglas, the

coast seemed to form a large and deep bay; which, from some smoke that had been seen on Point Banks, obtained the name of Smokey Bay.

At daybreak the next morning, being the 26th, having got to the northward of the Barren Isles, we discovered more land, extending from Cape Douglas to the north. It formed a chain of mountains of vast height, one of which, far more conspicuous than the rest, was named Mount Saint Augustin. The discovery of this land did not discourage us, as it was supposed to be wholly unconnected with the land of Cape Elizabeth. For, in an N.N.E. direction, the sight was unlimited by everything but the horizon. We also thought that there was a passage to the N.W., between Cape Douglas and Mount St. Augustin. In short, it was imagined, that the land on our larboard to the N. of Cape Douglas was composed of a group of islands, disjoined by so many channels, any one of which we might make use of according as the wind should serve.

With these flattering ideas, having a fresh gale at N.N.E., we stood to the N.W. till eight o'clock, when we clearly saw that what we had taken for islands were summits of mountains, everywhere connected by lower land, which the haziness of the horizon had prevented us from seeing at a greater distance. This land was everywhere covered with snow, from the tops of the hills down to the very sea-beach, and had every other appearance of being part of a great continent. I was now fully persuaded that I should find no passage by this inlet; and my persevering in the search of it here was more to satisfy other people than to confirm my own opinion. At this time, Mount St. Augustin bore N. 40° W., three or four leagues distant. This mountain is of a conical figure, and of very considerable height, but it remains undetermined whether it be an island or part of the continent. Finding that nothing could be done to the W., we tacked and stood over to Cape Elizabeth, under which we fetched at half-past five in the afternoon. On the north side of Cape Elizabeth, between it and a lofty promontory, named Cape Bede*, is a bay, in the bottom of which there appeared to be two snug harbours. We stood well into this bay, where we might have anchored in twenty-three fathoms water: but as I had no such view, we tacked, and stood to the westward, with the wind at N., a very strong gale, attended by rain, and thick hazy weather.

The next morning the gale abated, but the same weather continued till three o'clock in the afternoon, when it cleared up. Cape Douglas bore S.W. by W.; Mount St. Augustin W. $\frac{1}{2}$ S., and Cape Bede S. 15° E., five leagues distant. In this situation, the depth of water was forty fathoms, over a rocky bottom. From Cape Bede, the coast trended N.E. by E., with a chain of mountains inland, extending in the same direction. The land on the coast was woody, and there seemed to be no deficiency of harbours. But what was not much in our favour, we discovered low land in the middle of the inlet, extending from N.N.E. to N.E. by E. $\frac{1}{2}$ E. However, as this was supposed to be an island, it did not discourage us. About this time we got a light breeze southerly, and I steered to the westward of this low land, nothing appearing to obstruct us in that direction. Our soundings during the night were from thirty to twenty-five fathoms. On the 28th in the morning, having but very little wind, and observing the ship to drive to the southward, in order to stop her I dropped a kedge-anchor, with an eight-inch hawser bent to it. But, in bringing the ship up, the hawser parted near the inner end, and we lost both it and the anchor. For although we brought the ship up with one of the bowers, and spent most of the day in sweeping for them, it was to no effect. By an observation, we found our station to be in the latitude of $59^{\circ} 51'$; the low land above mentioned extended from N.E. to S. 75° E., the nearest part two leagues distant, and extended from S. 35° W. to N. 7° E., so that the extent of the inlet was now reduced to three points and a half of the compass; that is, from N. $\frac{1}{4}$ E. to N.E. Between these two points no land was to be seen. Here was a strong tide setting to the southward out of the inlet. It was the ebb, and ran between three and four knots in an hour, and it was low water at ten o'clock. A good deal of sea-weed and some drift-wood were carried out with the tide. The water, too, had become thick like that in rivers, but we were encouraged to proceed by finding it as salt at low water as the ocean. The strength of the flood-tide was three knots, and the stream ran up till four in the afternoon.

* In naming this and Mount St. Augustin, Captain Cook was directed by our Calendar.

As it continued calm all day, I did not move till eight o'clock in the evening, when, with a light breeze at E., we weighed and stood to the N., up the inlet. We had not been long under sail, before the wind veered to the N., increasing to a fresh gale, and blowing in squalls, with rain. This did not, however, hinder us from plying up as long as the flood continued, which was till near five o'clock the next morning. We had soundings from thirty-five to twenty-four fathoms. In this last depth we anchored about two leagues from the eastern shore, in the latitude of $60^{\circ} 8'$; some low land that we judged to be an island, lying under the western shore, extended from N. $\frac{1}{2}$ W. to N.W. by N., distant three or four leagues.

The weather had now become fair and tolerably clear, so that we could see any land that might lie within our horizon; and in a N.N.E. direction, no land, nor anything to obstruct our progress, was visible. But on each side was a ridge of mountains, rising one behind another without the least separation. I judged it to be low water by the shore about ten o'clock; but the ebb ran down till near noon. The strength of it was four knots and a half, and it fell upon a perpendicular ten feet three inches, that is, while we lay at anchor; so that there is reason to believe this was not the greatest fall. On the eastern shore we now saw two columns of smoke, a sure sign that there were inhabitants. At one in the afternoon we weighed, and plied up under double-reefed top-sails and courses, having a very strong gale at N.N.E., nearly right down the inlet. We stretched over to the western shore, and fetched within two leagues of the south end of the low land or island before mentioned, under which I intended to have taken shelter till the gale should cease. But falling suddenly into twelve fathoms water, from upward of forty, and seeing the appearance of a shoal ahead spitting out from the low land, I tacked and stretched back to the eastward; and anchored under the shore in nineteen fathoms water, over a bottom of small pebble-stones.

Between one and two in the morning of the 30th, we weighed again with the first of the flood, the gale having by this time quite abated, but still continuing contrary, so that we plied up till near seven o'clock, when the tide being done, we anchored in nineteen fathoms, under the same shore as before. The N.W. part of it forming a bluff point, bore N. 20° E., two leagues distant; a point on the other shore opposite to it, and nearly of the same height, bore N. 36° W., our latitude, by observation, $60^{\circ} 37'$. About noon two canoes with a man in each came off to the ship, from near the place where we had seen the smoke the preceding day. They laboured very hard in paddling across the strong tide, and hesitated a little before they would come quite close; but, upon signs being made to them, they approached. One of them talked a great deal to no purpose, for we did not understand a word he said. He kept pointing to the shore, which we interpreted to be an invitation to go thither. They accepted a few trifles from me, which I conveyed to them from the quarter gallery. These men in every respect resembled the people we had met with in Prince William's Sound, as to their persons and dress. Their canoes were also of the same construction. One of our visitors had his face painted jet black, and seemed to have no beard; but the other, who was more elderly, had no paint, and a considerable beard, with a visage much like the common sort of the Prince William's people. There was also smoke seen upon the flat western shore this day, from whence we may infer, that these lower spots and islands are the only inhabited places.

When the flood made, we weighed, and then the canoes left us. I stood over to the western shore, with a fresh gale at N.N.E., and fetched under the point above mentioned. This, with the other on the opposite shore, contracted the channel to the breadth of four leagues. Through this channel ran a prodigious tide. It looked frightful to us, who could not tell whether the agitation of the water was occasioned by the stream, or by the breaking of the waves against rocks or sands. As we met with no shoal, it was concluded to be the former; but in the end we found ourselves mistaken. I now kept the western shore aboard, it appearing to be the safest. Near the shore we had a depth of thirteen fathoms; and two or three miles off, forty and upward. At eight in the evening, we anchored under a point of land which bore N.E., three leagues distant, in fifteen fathoms water. Here we lay during the ebb, which ran near five knots in the hour.

Until we got thus far, the water had retained the same degree of saltness at low as at

high water, and at both periods was as salt as that in the ocean. But now the marks of a river displayed themselves. The water taken up this ebb, when at the lowest, was found to be very considerably fresher than any we had hitherto tasted, insomuch, that I was convinced that we were in a large river, and not in a strait, communicating with the northern seas. But as we had proceeded thus far, I was desirous of having stronger proofs, and therefore weighed with the next flood in the morning of the 31st, and plied higher up, or rather drove up with the tide, for we had but little wind.

About eight o'clock we were visited by several of the natives, in one large and several small canoes. The latter carried only one person each, and some had a paddle with a blade at each end, after the manner of the Esquimaux. In the large canoes were men, women, and children. Before they reached the ship, they displayed a leathern frock upon a long pole as a sign, as we understood it, of their peaceable intentions. This frock they conveyed into the ship, in return for some trifles which I gave them. I could observe no difference between the persons, dress, ornaments, and boats of these people, and those of Prince William's Sound, except that the small canoes were rather of a less size, and carried only one man. We procured from them some of their fur dresses, made of the skins of sea-eaters, martins, hares, and other animals, a few of their darts, and a small supply of salmon and halibut. In exchange for these they took old clothes, beads, and pieces of iron. We found that they were in possession of large iron knives, and of sky-blue glass beads, such as we had found amongst the natives of Prince William's Sound. These latter they seemed to value much, and consequently those which we now gave them. But their inclination led them, especially, to ask for large pieces of iron, which metal, if I was not much mistaken, they called by the name of *goone*, though, like their neighbours in Prince William's Sound, they seemed to have many significations to one word. They evidently spoke the same language; as the words *keeta*, *naema*, *oonaka*, and a few others of the most common we heard in that Sound, were also frequently used by this new tribe. After spending about two hours between the one ship and the other, they all retired to the western shore.

At nine o'clock we came to an anchor in sixteen fathoms water, about two leagues from the west shore, and found the ebb already begun. At its greatest strength it ran only three knots in the hour, and fell upon a perpendicular, after we had anchored, twenty-one feet. The weather was misty, with drizzling rain, and clear by turns. At the clear intervals, we saw an opening between the mountains on the eastern shore, bearing east from the station of the ships, with low land, which we supposed to be islands lying between us and the main land. Low land was also seen to the northward, that seemed to extend from the foot of the mountains on the one side to those on the other; and at low water we perceived large shoals stretching out from this low land, some of which were at no great distance from us. From these appearances, we were in some doubt whether the inlet did not take an easterly direction, through the above opening, or whether that opening was only a branch of it, and the main channel continued its northern direction through the low land now in sight. The continuation and direction of the chain of mountains on each side of it strongly indicated the probability of the latter supposition. To determine this point, and to examine the shoals, I despatched two boats, under the command of the master; and, as soon as the flood-tide made, followed with the ships; but, as it was a dead calm, and the tide strong, I anchored, after driving about ten miles in an east direction. At the lowest of the preceding ebb, the water at the surface, and for near a foot below it, was found to be perfectly fresh; retaining, however, a considerable degree of saltness at a greater depth. Besides this, we had now many other and but too evident proofs of being in a great river; such as low shores, very thick and muddy water, large trees, and all manner of dirt and rubbish, floating up and down with the tide. In the afternoon the natives, in several canoes, paid us another visit; and trafficked with our people for some time, without ever giving us reason to accuse them of any act of dishonesty.

At two o'clock next morning, being the 1st of June, the master returned, and reported that he found the inlet, or rather river, contracted to the breadth of one league, by low land on each side, through which it took a northerly direction. He proceeded three leagues through this narrow part, which he found navigable for the largest ships, being from twenty to seven

teen fathoms deep. The least water, at a proper distance from the shore and shoals, was ten fathoms; and this was before he entered the narrow part. While the ebb or stream ran down, the water was perfectly fresh; but after the flood made, it became brackish; and, toward high water, very much so, even as high up as he went. He landed upon an island, which lies between this branch and the eastern one; and upon it saw some currant bushes, with the fruit already set, and some other fruit-trees and bushes unknown to him. The soil appeared to be clay, mixed with sand. About three leagues beyond the extent of his search, or to the northward of it, he observed there was another separation in the eastern chain of mountains, through which he supposed the river took a north-east direction; but it seemed rather more probable that this was only another branch, and that the main channel kept its northern direction, between the two ridges or chains of mountains before mentioned. He found that these two ridges, as they extended to the north, inclined more and more to each other, but never appeared to close; nor was any elevated land seen between them, only low land, part woody, and part clear.

All hopes of finding a passage were now given up. But as the ebb was almost spent, and we could not return against the flood, I thought I might as well take the advantage of the latter, to get a nearer view of the eastern branch; and, by that means, finally to determine whether the low land on the east side of the river was an island, as we had supposed, or not. With this purpose in view, we weighed with the first of the flood, and, having a faint breeze at north-east, stood over for the eastern shore, with boats ahead, sounding. Our depth was from twelve to five fathoms; the bottom a hard gravel, though the water was exceedingly muddy. At eight o'clock a fresh breeze sprung up at east, blowing in an opposite direction to our course; so that I despaired of reaching the entrance of the river to which we were plying up, before high-water. But thinking that what the ships could not do might be done with boats, I despatched two, under the command of Lieutenant King, to examine the tides, and to make such observations as might give us some insight into the nature of the river.

At ten o'clock, finding the ebb begun, I anchored in nine fathoms water, over a gravelly bottom. Observing the tide to be too strong for the boats to make head against it, I made a signal for them to return on board, before they had got half way to the entrance of the river they were sent to examine, which bore from us S., 80° E., three leagues distant. The principal information gained by this tide's work, was the determining that all the low land, which we had supposed to be an island or islands, was one continued tract, from the banks of the great river to the foot of the mountains, to which it joined; and that it terminated at the south entrance of this eastern branch, which I shall distinguish by the name of River Turnagain. On the north side of this river, the low land again begins, and stretches out from the foot of the mountains down to the banks of the great river; so that, before the river Turnagain, it forms a large bay, on the south side of which we were now at anchor, and where we had from twelve to five fathoms, from half-flood to high-water. After we had entered the bay, the flood set strong into the river Turnagain; the ebb came out with still greater force; the water falling, while we lay at anchor, twenty feet upon a perpendicular. These circumstances convinced me, that no passage was to be expected by this side river, any more than by the main branch. However, as the water during the ebb, though very considerably fresher, had still a strong degree of saltness, it is but reasonable to suppose that both these branches are navigable by ships, much farther than we examined them; and that by means of this river, and its several branches, a very extensive inland communication lies open. We had traced it as high as the latitude of 61° 30', and the longitude of 201°; which is seventy leagues, or more, from its entrance, without seeing the least appearance of its source.

If the discovery of this great river*, which promises to vie with the most considerable ones already known to be capable of extensive inland navigation, should prove of use either to the present or to any future age, the time we spent in it ought to be the less regretted. But to us, who had a much greater object in view, the delay thus occasioned was an essential

* Captain Cook having here left a blank which he had not filled up with any particular name, I have inserted the word *great*, with the greatest propriety, that it should be called Cook's River.

loss. The season was advancing apace. We knew not how far we might have to proceed to the south; and we were now convinced that the continent of North America extended farther to the west than, from the modern most reputable charts, we had reason to expect. This made the existence of a passage into Baffin's or Hudson's Bays less probable, or, at least, showed it to be of greater extent. It was a satisfaction to me, however, to reflect that, if I had not examined this very considerable inlet, it would have been assumed, by speculative fabricators of geography, as a fact that it communicated with the sea to the north, or with Baffin's or Hudson's Bay to the east; and been marked, perhaps, on future maps of the world, with greater precision, and more certain signs of reality, than the invisible, because imaginary, Straits of de Fuca, and de Fonte.

In the afternoon I sent Mr. King again, with two armed boats, with orders to land on the northern point of the low land, on the south-east side of the river; there to display the flag, and to take possession of the country and river in his Majesty's name; and to bury in the ground a bottle, containing some pieces of English coin, of the year 1772, and a paper, on which were inscribed the names of our ships, and the date of our discovery. In the mean time, the ships were got under sail, in order to proceed down the river. The wind still blew fresh, easterly; but a calm ensued not long after we were under way; and the flood-tide meeting us off the point where Mr. King landed (and which thence got the name of Point Possession), we were obliged to drop anchor in six fathoms water, with the point bearing south, two miles distant. When Mr. King returned, he informed me, that as he approached the shore about twenty of the natives made their appearance, with their arms extended; probably to express thus their peaceable disposition, and to show that they were without weapons. On Mr. King's and the gentlemen with him landing with muskets in their hands, they seemed alarmed, and made signs expressive of their request to lay them down. This was accordingly done; and then they suffered the gentlemen to walk up to them, and appeared to be cheerful and sociable. They had with them a few pieces of fresh salmon, and several dogs. Mr. Law, surgeon of the *Discovery*, who was one of the party, having bought one of the latter, took it down toward the boat and shot it dead in their sight. This seemed to surprise them exceedingly; and, as if they did not think themselves safe in such company, they walked away; but it was soon after discovered that their spears and other weapons were hid in the bushes close behind them. Mr. King also informed me that the ground was swampy, and the soil poor, light, and black. It produced a few trees and shrubs; such as pines, elders, birch, and willows; rose and currant bushes; and a little grass; but they saw not a single plant in flower.

We weighed anchor, as soon as it was high water, and, with a faint breeze southerly, stood over to the west shore, where the return of the flood obliged us to anchor early next morning. Soon after, several large and some small canoes with natives came off, who bartered their skins; after which they sold their garments. All many of them were quite naked. Amongst others, they brought a number of white hare or rabbit skins, and very beautiful reddish ones of foxes; but there were only two or three skins of otters. They also sold us some pieces of salmon and halibut. They preferred iron to everything else offered to them in exchange. The lip-ornaments did not seem so frequent amongst them as at Prince William's Sound; but they had more of those which pass through the nose, and, in general, these were also much longer. They had, however, a greater quantity of a kind of white and red embroidered work on some parts of their garments, and on other things, such as their quivers and knife-cases.

At half-past ten we weighed with the first of the ebb, and having a gentle breeze at south, plied down the river; in doing of which, by the inattention and neglect of the man at the lead, the *Resolution* struck, and stuck fast on the bank, that lies nearly in the middle of the river, and about two miles above the two projecting bluff points before mentioned. This bank was, no doubt, the occasion of that very strong rippling, or agitation of the stream, which we had observed when turning up the river. There was not less than twelve feet depth of water about the ship, at the lowest of the ebb; but other parts of the bank were dry. As soon as the ship came aground, I made a signal for the *Discovery* to anchor. She, as I afterward understood, had been near ashore on the west side of the bank. As the flood-

tide came in, the ship floated off, soon after five o'clock in the afternoon, without receiving the least damage, or giving us any trouble; and, after standing over to the west shore, into deep water, we anchored to wait for the ebb, as the wind was still contrary. We weighed again with the ebb, at ten o'clock at night; and, between four and five next morning, when the tide was finished, once more cast anchor about two miles below the bluff point, on the west shore, in nineteen fathoms water. A good many of the natives came off, when we were in this station, and attended upon us all the morning. Their company was very acceptable; for they brought with them a large quantity of very fine salmon, which they exchanged for such trifles as we had to give them. Most of it was split ready for drying; and several hundred weight of it was procured for the two ships.

In the afternoon the mountains, for the first time since our entering the river, were clear of clouds; and we discovered a volcano in one of those on the west side. It is in the latitude of $63^{\circ} 23'$, and is the first high mountain to the north of Mount St. Augustin. The volcano is on that side of it that is next the river, and not far from the summit. It did not now make any striking appearance, emitting only a white smoke, but no fire. The wind remaining southerly, we continued to tide it down the river; and, on the 5th in the morning, coming to the place where we had lost our kedge-anchor, made an attempt to recover it, but without success. Before we had left this place, six canoes came off from the east shore; some conducted by one, and others by two men. They remained at a little distance from the ships, viewing them with a kind of silent surprise, at least half an hour, without exchanging a single word with us or with one another. At length they took courage and came alongside, began to barter with our people, and did not leave us till they had parted with everything they brought with them, consisting of a few skins and some salmon. And here it may not be improper to remark, that all the people we had met with in this river seemed, by every striking instance of resemblance, to be of the same nation with those who inhabit Prince William's Sound, but differing essentially from those of Nootka, or King George's Sound, both in their persons and language. The language of these is rather more guttural; but, like the others, they speak strongly and distinct, in words which seem sentences.

I have before observed that they are in possession of iron, that is, they have the points of their spears and knives of this metal; and some of the former are also made of copper. Their spears are like our spoontoons; and their knives, which they keep in sheaths, are of a considerable length. These, with a few glass beads, are the only things we saw amongst them that were not of their own manufacture. I have already offered my conjectures from whence they derive their foreign articles; and shall only add here, that, if it were probable that they found their way to them from such of their neighbours with whom the Russians may have established a trade, I will be bold to say, the Russians themselves have never been amongst them; for, if that had been the case, we should hardly have found them clothed in such valuable skins as those of the sea-otter. There is not the least doubt, that a very beneficial fur-trade might be carried on with the inhabitants of this vast coast. But unless a northern passage should be found practicable, it seems rather too remote for Great Britain to receive any emolument from it. It must, however, be observed, that the most valuable, or rather the only valuable skins, I saw on this west side of America, were those of the sea-otter. All their other skins seemed to be of an inferior quality; particularly those of their foxes and martins. It must also be observed, that most of the skins which we purchased were made up into garments. However, some of these were in good condition, but others were old and ragged enough; and all of them very lousy. But as these poor people make no other use of skins but for clothing themselves, it cannot be supposed that they are at the trouble of dressing more of them than are necessary for this purpose. And, perhaps, this is the chief use for which they kill the animals; for the sea and the rivers seem to supply them with their principal articles of food. It would, probably, be much otherwise, were they once habituated to a constant trade with foreigners. This intercourse would increase their wants, by introducing them to an acquaintance with new luxuries; and in order to be enabled to purchase these, they would be more assiduous in procuring skins, which they would soon discover to be the commodity most sought for; and a plentiful supply of which, I make no doubt, would be had in the country.

It will appear, from what has been said occasionally of the tide, that it is considerable in this river, and contributes very much to facilitate the navigation of it. It is high-water in the stream on the days of the new and full moon, between two and three o'clock, and the tide rises, upon a perpendicular, between three and four fathoms. The reason of the tide's being greater here than at other parts of this coast is easily accounted for. The mouth of the river being situated in a corner of the coast, the flood that comes from the ocean is forced into it by both shores, and by that means swells the tide to a great height.

The variation of the compass was $25^{\circ} 40'$ E.

CHAPTER VII.—DISCOVERIES AFTER LEAVING COOK'S RIVER.—ISLAND OF ST. HERMOGENES.—CAPE WHITSUNDAY.—CAPE GREVILLE.—CAPE BARNABAS.—TWO-HEADED POINT.—THRINTY ISLAND.—BEERING'S FOGGY ISLAND.—A BEAUTIFUL BIRD DESCRIBED.—KODIAK AND THE SCHUMAGIN ISLANDS.—A RUSSIAN LETTER BROUGHT ON BOARD BY A NATIVE.—CONJECTURES ABOUT IT.—HOCK POINT.—HALIBUT ISLAND.—A VOLCANO MOUNTAIN.—PROVIDENTIAL ESCAPE.—ARRIVAL OF THE SHIPS AT OONALASCHKA.—INTERCOURSE WITH THE NATIVES THERE.—ANOTHER RUSSIAN LETTER.—SANGANOOPIA HARBOUR DESCRIBED.

As soon as the ebb tide made in our favour we weighed, and, with a light breeze between west south-west and south south-west, plied down the river till the flood obliged us to anchor again. At length, about one o'clock next morning, a fresh breeze sprung up at west, with which we got under sail, and at eight passed the Barren Isles, and stretched away for Cape St. Hermogenes. At noon this cape bore south south-east, eight leagues distant; and the passage between the island of that name and the main land, bore south. For this passage I steered, intending to go through it; but soon after the wind failed us, and we had baffling light airs from the eastward, so that I gave up my design of carrying the ships between the island and the main. At this time we saw several columns of smoke on the coast of the continent, to the northward of the passage; and, most probably, they were meant as signals to attract us thither. Here the land forms a bay, or perhaps a harbour, off the north-west point of which lies a low rocky island. There are also some other islands of the same appearance scattered along the coast, between this place and Point Banks.

At eight in the evening, the island of St. Hermogenes extended from south half east to south south-east, a quarter east; and the rocks that lie on the north side of it bore south-east, three miles distant. In this situation, we had forty fathoms water over a bottom of sand and shells. Soon after, on putting over hooks and lines, we caught several halibut. At midnight, being past the rocks, we bore up to the southward; and, at noon, St. Hermogenes bore north, four leagues distant. At this time, the southernmost point of the main land, within or to the westward of St. Hermogenes, lay north half west, distant five leagues. This promontory, which is situated in the latitude of $58^{\circ} 15'$, and in the longitude of $207^{\circ} 24'$ named, after the day, Cape Whitsunday. A large bay, which lies to the west of it, obtained the name of Whitsuntide Bay. The land on the east side of this bay, of which Cape Whitsunday is the southern point, and Point Banks the northern one, is in all respects like the island of St. Hermogenes; seemingly destitute of wood, and partly free from snow. It was supposed to be covered with a mossy substance, that gave it a brownish cast. There were some reasons to think it was an island. If this be so, the last-mentioned bay is only the straight or passage that separates it from the main land.

Between one and two in the afternoon, the wind, which had been at north-east, shifted at once to the southward. It was unsettled till six, when it fixed at south, which was the very direction of our course; so that we were obliged to ply up the coast. The weather was gloomy, and the air dry, but cold. We stood to the eastward till midnight; then tacked, and stood in for the land; and, between seven and eight in the morning of the 8th, we were within four miles of it, and not more than half a league from some sunken rocks, which bore west south-west. In this situation, we tacked in thirty-five fathoms water, the island of

St. Hermogenes bearing north, 20° E., and the southernmost land in sight, south. In standing in for this coast, we crossed the mouth of Whitsuntide Bay, and saw land all round the bottom of it; so that either the land is connected, or else the points lock in, one behind another. I am more inclined to think that the former is the case; and that the land, east of the bay, is a part of the continent. Some small islands lie on the west of the bay. The sea-coast to the southward of it is rather low, with projecting rocky points, between which are small bays or inlets. There was no wood and but little snow upon the coast; but the mountains, which lie at some distance inland, were wholly covered with the latter. We stood off till noon; then tacked, and stood in for the land. The latitude, at this time, was $57^{\circ} 52\frac{1}{2}'$; Cape St. Hermogenes bore north, 30° W., eight leagues distant, and the southernmost part of the coast in sight, the same that was seen before, bore south-west, ten leagues distant. The land here forms a point, which was named Cape Greville. It lies in the latitude of $57^{\circ} 33'$, and in the longitude of $207^{\circ} 15'$; and is distant fifteen leagues from Cape St. Hermogenes, in the direction of south, 17° W.

The three following days, we had almost constant misty weather, with drizzling rain; so that we seldom had a sight of the coast. The wind was south-east by south, and south south-east, a gentle breeze, and the air raw and cold. With this wind and weather, we continued to ply up the coast, making boards of six or eight leagues each. The depth of water was from thirty to fifty-five fathoms, over a coarse, black sandy bottom. The fog clearing up, with the change of the wind to south-west, in the evening of the 12th, we had a sight of the land bearing west, twelve leagues distant. We stood in for it early next morning. At noon we were not above three miles from it; an elevated point, which obtained the name of Cape Barnabas, lying in the latitude of $57^{\circ} 13'$, bore north-east half east, ten miles distant; and the coast extended from north, 42° E. to west south-west. The north-east extreme was lost in a haze; but the point to the south-west, whose elevated summit terminated in two round hills, on that account was called Two-headed Point. This part of the coast, in which are several small bays, is composed of high hills and deep valleys; and in some places we could see the tops of other hills, beyond those that form the coast; which was but little incumbered with snow, but had a very barren appearance. Not a tree or bush was to be seen upon it: and, in general, it had a brownish hue, probably the effect of a mossy covering. I continued to ply to the south-west by west, as the coast trended; and at six in the evening, being midway between Cape Barnabas and Two-headed Point, and two leagues from the shore, the depth of water was sixty-two fathoms. From this station, a low point of land made its appearance beyond Two-headed Point, bearing south, 60° W.; and without it other land, that had the appearance of an island, bore south, 59° W.

At noon, on the 13th, being in latitude $56^{\circ} 49'$, Cape St. Barnabas bore north, 52° E.; Two-headed Point north, 14° W. seven or eight miles distant; and the coast of the continent extended as far as south, $72\frac{1}{2}^{\circ}$ W.; and the land seen the preceding evening, and supposed to be an island, now appeared like two islands. From whatever quarter Two-headed Point was viewed, it had the appearance of being an island; or else it is a peninsula, on each side of which the shore forms a bay. The wind still continued westerly, a gentle breeze, the weather rather dull and cloudy, and the air sharp and dry.

We were well up with the southernmost land next morning, and found it to be an island, which was named Trinity Island. Its greatest extent is six leagues in the direction of east and west. Each end is elevated naked land, and in the middle it is low; so that, at a distance, from some points of view, it assumes the appearance of two islands. It lies in the latitude of $56^{\circ} 36'$, and in the longitude of 205° ; and between two and three leagues from the continent; which space is interspersed with small islands and rocks; but there seemed to be good passage enough, and also safe anchorage. At first, we were inclined to think that this was Beering's Foggy Island*; but its situation so near the main does not suit his chart.

At eight in the evening, we stood in for the land, till we were within a league of the above-mentioned small islands; the westernmost part of the continent now in sight being

a low point facing Trinity Island, and which we called Cape Trinity, now bore west north-west. In this situation, having tacked in fifty-four fathoms water, over a bottom of black sand, we stood over for the island, intending to work up between it and the main. The land to the westward of Two-headed Point is not so mountainous as it is to the north-east of it, nor does the snow lie upon it. There are, however, a good many hills considerably elevated; but they are disjoined by large tracts of flat land that appeared to be perfectly destitute of wood, and very barren. As we were standing over toward the island, we met two men in a small canoe, paddling from it to the main. Far from approaching us, they seemed rather to avoid it. The wind now began to incline to the south; and we had reason to expect that it would soon be at south-east. Experience having taught us that a south-easterly wind was generally, if not always, accompanied by a thick fog, I was afraid to venture through between the island and the continent, lest the passage should not be accomplished before night, or before the thick weather came on, when we should be obliged to anchor, and by that means lose the advantage of a fair wind. These reasons induced me to stretch out to sea; and we passed two or three rocky islets that lie near the east end of Trinity Island. At four in the afternoon, having weathered the island, we tacked, and steered west, southerly, with a fresh gale at south south-east; which, before midnight, veered to the south-east; and was, as usual, attended with misty, drizzling, rainy weather.

By the course we steered all night, I was in hopes of falling in with the continent in the morning. And, doubtless, we should have seen it, had the weather been in the least clear; but the fog prevented. Seeing no land at noon, and the gale increasing, with a thick fog and rain, I steered west north-west, under such sail as we could easily haul the wind with; being fully sensible of the danger of running before a strong gale in a thick fog, in the vicinity of an unknown coast. It was, however, necessary to run some risk when the wind favoured us; for clear weather, we had found, was generally accompanied with winds from the west. Between two and three in the afternoon, land was seen through the fog, bearing north-west, not more than three or four miles distant. Upon this we immediately hauled up south, close to the wind. Soon after the two courses were split, so that we had others to bring to the yards; and several others of our sails received considerable damage. At nine the gale abated; the weather cleared up; and we got sight of the coast again, extending from west by south to north-west, about four or five leagues distant. On sounding, we found a hundred fathoms water, over a muddy bottom. Soon after, the fog returned, and we saw no more of the land all night.

At four next morning, the fog being now dispersed, we found ourselves in a manner surrounded by land; the continent, or what was supposed to be the continent, extending from west south-west to north-east by north; and some elevated land, bearing south-east half south; by estimation eight or nine leagues distant. The north-east extreme of the main was the same point of land that we had fallen in with during the fog; and we named it Foggy Cape. It lies in latitude 56° 31'. At this time, having but little wind all night, a breeze sprung up at north-west. With this we stood to the southward, to make the land, seen in that direction, plainer. At nine o'clock, we found it to be an island of about nine leagues in compass; lying in the latitude of 56° 10', and in the longitude of 220° 45'; and it is distinguished in our chart by the name of Foggy Island; having reason to believe, from its situation, that it is the same which had that name given to it by Beering. At the same time, three or four islands, lying before a bay, formed by the coast of the main land, bore north by west; a point, with three or four pinnacle rocks upon it, which was called Pinnacle Point, bore north-west by west; and a cluster of small islets, or rocks, lying about nine leagues from the coast south south-east. At noon, when our latitude was 56° 9', and our longitude 201° 45', these rocks bore south, 58° E., ten miles distant; Pinnacle Point, north north-west, distant seven leagues; the nearest part of the main land north-west by west, six leagues distant; and the most advanced land to the south-west, which had the appearance of being an island, bore west, a little southerly. In the afternoon, we had little or no wind, so that our progress was inconsiderable. At eight in the evening, the coast extended from south-west to north north-east; the nearest part about eight leagues distant.

On the 17th, the wind was between west and north-west, a gentle breeze, and sometimes

almost calm. The weather was clear, and the air sharp and dry. At noon, the continent extended from south-west to north by east; the nearest part seven leagues distant. A large group of islands lying about the same distance from the continent, extended from south 26° W., to south 52° W. It was calm great part of the 18th; and the weather was clear and pleasant. We availed ourselves of this, by making observations for the longitude and variation. The latter was found to be $21^{\circ} 27'$ E. There can be no doubt that there is a continuation of the continent between Trinity Island and Foggy Cape, which the thick weather prevented us from seeing. For some distance to the south-west of that cape, this country is more broken or rugged than any part we had yet seen, both with respect to the hills themselves and to the coast, which seemed full of creeks, or small inlets, none of which appeared to be of any great depth. Perhaps, upon a closer examination, some of the projecting points between these inlets will be found to be islands. Every part had a very barren aspect; and was covered with snow, from the summits of the highest hills, down to a very small distance from the sea-coast.

Having occasion to send a boat on board the *Discovery*, one of the people in her shot a very beautiful bird of the hawk kind. It is somewhat less than a duck, and of a black colour, except the fore part of the head, which is white; and from above and behind each eye arises an elegant yellowish-white crest, revolving backward as a ram's horn. The bill and feet are red. It is, perhaps, the *Alca monochora* of Steller, mentioned in the history of Kamtschatka*. I think the first of these birds was seen by us a little to the southward of Cape St. Hermogenes. From that time we generally saw some of them every day, and sometimes in large flocks. Besides these, we daily saw most of the other sea-birds that are commonly found in other northern oceans; such as gulls, shags, puffins, sheerwaters, and sometimes ducks, geese, and swans. And seldom a day passed without seeing seals, whales, and other large fish.

In the afternoon we got a light breeze of wind southerly, which enabled us to steer west for the channel that appeared between the islands and the continent; and at daybreak next morning we were at no great distance from it, and found several other islands within those already seen by us, of various extent, both in height and circuit. But between these last islands and those before seen there seemed to be a clear channel, for which I steered, being afraid to keep the coast of the continent aboard, lest we should mistake some point of it for an island, and by that means be drawn into some inlet, and lose the advantage of a fair wind which at this time blew. I therefore kept along the southernmost chain of islands; and at noon we were in the latitude of $55^{\circ} 18'$, and in the narrowest part of the channel formed by them and those which lie along the continent, where it is about a league and a half or two leagues over. The largest island in this group was now on our left, and is distinguished by the name of Kodiak†, according to the information we afterward received. I left the rest of them without names. I believe them to be the same that Beering calls Schumagin's Islands‡; or those islands which he called by that name to be a part of them. For this group is pretty extensive. We saw islands as far to the southward as an island could be seen. They commence in the longitude of $200^{\circ} 15'$ E., and extend a degree and a half or two degrees to the westward. I cannot be particular, as we could not distinguish all the islands from the coast of the continent. Most of these islands are of a good height, very barren and rugged, abounding with rocks and steep cliffs, and exhibiting other romantic appearances. There are several snug bays and coves about them; streams of fresh water run from their elevated parts; some drift-wood was floating around, but not a tree or bush was to be seen growing on the land. A good deal of snow still lay on many of them; and the parts of the continent which showed themselves between the innermost islands were quite covered with it. At four in the afternoon we had passed all the islands that lay to the southward of us; the southernmost at this time bearing S. 3° E., and the westernmost point of land now in sight, S. 82° W. For this point we steered, and passed between it and two or three elevated rocks that lie about a league to the east of it.

Some time after we had got through this channel, in which we found forty fathoms water, the *Discovery*, now two miles astern, fired three guns and brought to, and made the signal to speak with us. This alarmed me not a little; and as no apparent danger had been remarked in the passage through the channel, it was apprehended that some accident, such as springing a leak, must have happened. A boat was immediately sent to her, and in a short time returned with Captain Clerke. I now learned from him that some natives, in three or four canoes, who had been following the ship for some time, at length got under his stern. One of them then made many signs, taking off his cap and bowing, after the manner of Europeans. A rope being handed down from the ship, to this he fastened a small thin wooden case or box; and having delivered this safe, and spoken something, and made some signs, the canoes dropped astern and left the *Discovery*. No one on board her had any suspicion that the box contained anything till after the departure of the canoes, when it was accidentally opened, and a piece of paper was found folded up carefully, upon which something was written in the Russian language, as was supposed. The date 1778 was prefixed to it; and in the body of the written note there was a reference to the year 1776. Not learned enough to decipher the alphabet of the writer, his numerals marked sufficiently that others had preceded us in visiting this dreary part of the globe, who were united to us by other ties besides those of our common nature; and the hopes of soon meeting with some of the Russian traders, could not but give a sensible satisfaction to those who had, for such a length of time, been conversant with the savages of the Pacific Ocean, and of the continent of North America. Captain Clerke was at first of opinion that some Russians had been shipwrecked here; and that these unfortunate persons, seeing our ships pass, had taken this method to inform us of their situation. Impressed with humane sentiments on such an occasion, he was desirous of our stopping till they might have time to join us. But no such idea occurred to me. It seemed obvious that if this had been the case, it would have been the first step taken by such shipwrecked persons, in order to secure to themselves and to their companions the relief they could not but be solicitous about, to send some of their body off to the ships in the canoes. For this reason, I rather thought that the paper contained a note of information left by some Russian trader who had lately been amongst these islands, to be delivered to the next of their countrymen who should arrive; and that the natives, seeing our ships pass, and supposing us to be Russians, had resolved to bring off the note, thinking it might induce us to stop. Fully convinced of this, I did not stay to inquire any farther into the matter, but made sail and stood away to the westward, along the coast; perhaps I should say along the islands, for we could not pronounce with certainty whether the nearest land within us was continent or islands. If not the latter, the coast here forms some tolerably large and deep bays.

We continued to run all night with a gentle breeze at north-east; and at two o'clock next morning, some breakers were seen within us, at the distance of two miles. Two hours after, others were seen ahead; and, on our larboard bow, and between us and the land, they were innumerable. We did but just clear them by holding a south course. These breakers were occasioned by rocks; some of which were above water. They extend several leagues from the land; and are very dangerous, especially in thick weather, to which this coast seems much subject. At noon we had just got on their outside; and by observation, we were in the latitude of $54^{\circ} 44'$, and in the longitude of 198° . The nearest land being an elevated bluff point, which was called Rock Point, bore north, seven or eight leagues distant; the westernmost part of the main, or what was supposed to be the main, bore N. 80° W.; and a round hill, without which was found to be an island, and was called Halibut-head, bore S. 65° W., thirteen leagues distant. On the 21st at noon, having made but little progress, on account of faint winds and calms, Halibut-head, which lies in the latitude of $54^{\circ} 27'$, and in the longitude of 197° , bore N. 24° W.; and the island on which it is, and called Halibut Island, extended from N. by E., to N. W. by W., two leagues distant. This island is seven or eight leagues in circuit; and except the head, the land of it is low and very barren. There are several small islands near it, all of the same appearance; but there seemed to be a passage between them and the main, two or three leagues broad.

The rocks and breakers before mentioned forced us so far from the continent, that we had

but a distant view of the coast between Rock Point and Halibut Island. Over this and the adjoining islands, we could see the mainland covered with snow; but particularly some hills, whose elevated tops were seen towering above the clouds to a most stupendous height. The most south-westerly of these hills was discovered to have a volcano, which continually threw up vast columns of black smoke. It stands not far from the coast; and in the latitude of $54^{\circ} 48'$, and the longitude of $195^{\circ} 45'$. It is also remarkable from its figure, which is a complete cone; and the volcano is at the very summit. We seldom saw this (or indeed any other of these mountains) wholly clear of clouds. At times both base and summit would be clear; when a narrow cloud, sometimes two or three, one above another, would embrace the middle like a girdle; which, with the column of smoke, rising perpendicularly to a great height out of its top, and spreading before the wind into a tail of vast length, made a very picturesque appearance. It may be worth remarking, that the wind, at the height to which the smoke of this volcano reached, moved sometimes in a direction contrary to what it did at sea, even when it blew a fresh gale.

In the afternoon, having three hours' calm, our people caught upward of a hundred halibuts, some of which weighed a hundred pounds, and none less than twenty pounds. This was a very seasonable refreshment to us. In the height of our fishing, which was in thirty-five fathoms water, and three or four miles from the shore, a small canoe, conducted by one man, came to us from the large island. On approaching the ship, he took off his cap, and bowed, as the other had done who visited the *Discovery* the preceding day. It was evident that the Russians must have a communication and traffic with these people, not only from their acquired politeness, but from the note above mentioned. But we had now a fresh proof of it, for our present visitor wore a pair of green cloth breeches, and a jacket of black cloth, or stuff, under the gut shirt or frock of his own country. He had nothing to barter, except a grey fox skin, and some fishing implements or harpoons, the heads of the shafts of which, for the length of a foot or more, were neatly made of bone, as thick as a walking-cane, and carved. He had with him a bladder full of something, which we supposed to be oil, for he opened it, took a mouthful, and then fastened it again. His canoe was of the same make with those we had seen before, but rather smaller. He used the double-bladed paddle, as did also those who had visited the *Discovery*. In his size and features, he exactly resembled those we saw in Prince William's Sound, and in the Great River; but he was quite free from paint of any kind, and had the perforation of his lip made in an oblique direction, without any ornament in it. He did not seem to understand any of the words commonly used by our visitors in the Sound, when repeated to him. But perhaps our faulty pronunciation, rather than his ignorance of the dialect, may be inferred from this.

The weather was cloudy and hazy, with now and then sunshine, till the afternoon of the 22d, when the wind came round to the S. E., and, as usual, brought thick rainy weather. Before the fog came on, no part of the mainland was in sight, except the volcano, and another mountain close by it. I continued to steer W. till seven in the evening, when being apprehensive of falling in with the land in thick weather, we hauled the wind to the southward, till two o'clock next morning, and then bore away again W. We made but little progress, having the wind variable and but little of it, till at last it fixed in the western board, and at five in the afternoon, having a gleam of sunshine, we saw land bearing N. 59° W., appearing in hillocks like islands. At six in the morning of the 24th, we got a sight of the continent, and at nine it was seen extending from N. E. by E., to S. W. by W. half W., the nearest part about four leagues distant. The land to the S. W. proved to be islands, the same that had been seen the preceding evening; but the other was a continuation of the continent, without any islands to obstruct our view of it. In the evening, being about four leagues from the shore, in forty-two fathoms water, having little or no wind, we had recourse to our hooks and lines, but only two or three small cod were caught.

The next morning, we got a breeze easterly, and, what was uncommon with this wind, clear weather, so that we not only saw the volcano, but other mountains both to the E. and W. of it, and all the coast of the mainland under them, much plainer than at any time before. It extended from N. E. by N., to N. W. half W., where it seemed to terminate. Between this point and the islands without it, there appeared a large opening, for which I steered, till we

raised land beyond it. This land, although we did not perceive that it joined the continent, made a passage through the opening very doubtful. It also made it doubtful whether the land which we saw to the S.W. was insular or continental; and if the latter, it was obvious that the opening would be a deep bay or inlet, from which, if once we entered it with an easterly wind, it would not be so easy to get out. Not caring, therefore, to trust too much to appearances, I steered to the southward. Having thus got without all the land in sight, I then steered W., in which direction the islands lay, for such we found this land to be. By eight o'clock we had passed three of them, all of a good height. More of them were now seen to the westward, the south-westernmost part of them bearing W. N. W. The weather in the afternoon became gloomy, and at length turned to a mist, and the wind blew fresh at E. I therefore, at ten at night, hauled the wind to the southward till daybreak, when we resumed our course to the W. Daylight availed us little, for the weather was so thick that we could not see a hundred yards before us; but as the wind was now moderate, I ventured to run. At half-past four, we were alarmed at hearing the sound of breakers on our larboard bow. On heaving the lead, we found twenty-eight fathoms water, and the next east twenty-five. I immediately brought the ship to, with her head to the northward, and anchored in this last depth, over a bottom of coarse sand, calling the *Discovery*, she being close to us, to anchor also.

A few hours after, the fog having cleared away a little, it appeared that we had escaped very imminent danger. We found ourselves three quarters of a mile from the N.E. side of an island, which extended from S. by W. half W. to N. by E. half E., each extreme about a league distant. Two elevated rocks, the one bearing S. by E., and the other E. by S., were about half a league each from us, and about the same distance from each other. There were several breakers about them, and yet Providence had, in the dark, conducted the ships through between these rocks, which I should not have ventured in a clear day, and to such an anchoring-place, that I could not have chosen a better. Finding ourselves so near land, I sent a boat to examine what it produced. In the afternoon she returned, and the officer who commanded her reported, that it produced some tolerably good grass and several other small plants, one of which was like purslane, and ate very well, either in soups or as a salad. There was no appearance of shrubs or trees, but on the beach were a few pieces of drift-wood. It was judged to be low water between ten and eleven o'clock; and we found, where we lay at anchor, that the flood-tide came from the E. or S.E.

In the night, the wind blew fresh at S., but was more moderate toward the morning, and the fog partly dispersed. Having weighed at seven o'clock, we steered to the northward, between the island under which we had anchored, and another small one near it. The channel is not above a mile broad; and before we were through it, the wind failed, and we were obliged to anchor in thirty-four fathoms water. We had now land in every direction; that to the S. extended to the S.W., in a ridge of mountains, but our sight could not determine whether it composed one or more islands. We afterward found it to be only one island, and known by the name of Oonalashka. Between it and the land to the N., which had the appearance of being a group of islands, there seemed to be a channel in the direction of N.W. by N. On a point which bore W. from the ship, three quarters of a mile distant, were several natives and their habitations. To this place we saw them tow in two whales, which we supposed they had just killed. A few of them now and then came off to the ships, and bartered a few trifling things with our people; but never remained above a quarter of an hour at a time. On the contrary, they rather seemed shy, and yet we could judge that they were no strangers to vessels, in some degree, like ours. They behaved with a degree of politeness uncommon to savage tribes. At one o'clock in the afternoon, having a light breeze at N.E., and the tide of flood in our favour, we weighed and steered for the channel above-mentioned, in hopes, after we were through, of finding the land trend away to the northward, or, at least, a passage out to sea to the W. For we supposed ourselves, as it really happened, to be amongst islands, and not in an inlet of the continent. We had not been long under sail before the wind veered to the N., which obliged us to ply. The soundings were from forty to twenty-seven fathoms, over a bottom of sand and mud. In the evening, the ebb making against us, we anchored about three leagues from our last

station, with the passage bearing N.W. At daybreak the next morning, we weighed with a light breeze at S., which carried us up the passage, when it was succeeded by variable light airs from all directions; but as there ran a rapid tide in our favour, the *Resolution* got through before the ebb made. The *Discovery* was not so fortunate; she was carried back, got into the race, and had some trouble to get clear of it. As soon as we were through, the land on one side was found to trend W. and S.W., and that on the other side to trend N. This gave us great reason to hope that the continent had there taken a new direction, which was much in our favour. Being in want of water, and perceiving that we ran some risk of driving about in a rapid tide, without wind to govern the ship, I stood for a harbour lying on the south side of the passage; but we were very soon driven past it; and to prevent being forced back through the passage, came to an anchor in twenty-eight fathoms water, pretty near the southern shore, out of the reach of the strong tide; and yet, even here, we found it run full five knots and a half in the hour.

While we lay here, several of the natives came off to us, each in a canoe, and bartered a few fishing implements for tobacco. One of them, a young man, overset his canoe, while alongside one of our boats. Our people caught hold of him; but the canoe went adrift, and being picked up by another, was carried ashore. The youth, by this accident, was obliged to come into the ship, and he went down into my cabin upon the first invitation, without expressing the least reluctance or uneasiness. His dress was an upper garment like a shirt, made of the large gut of some sea animal, probably the whale, and an under garment of the same shape, made of the skins of birds dressed with the feathers on, and neatly sewed together, the feathered side being worn next his skin. It was mended or patched with pieces of silk stuff, and his cap was ornamented with two or three sorts of glass beads. His own clothes being wet, I gave him others, in which he dressed himself with as much ease as I could have done. From his behaviour, and that of some others, we were convinced that these people were no strangers to Europeans, and to some of their customs. But there was something in our ships that greatly excited their curiosity; for such as could not come off in canoes, assembled on the neighbouring hills to look at them.

At low water, having weighed and towed the ship into the harbour, we anchored there in nine fathoms water, over a bottom of sand and mud: the *Discovery* got in soon after. A launch was now sent for water, and a boat to draw the seine, but we caught only four trout and a few other small fish. Soon after we anchored, a native of the island brought on board such another note as had been given to Captain Clerke. He presented it to me; but it was written in the Russian language, which, as already observed, none of us could read. As it could be of no use to me, and might be of consequence to others, I returned it to the bearer, and dismissed him with a few presents, for which he expressed his thanks, by making several low bows as he retired. In walking next day along the shore, I met with a group of natives of both sexes, seated on the grass at a repast consisting of raw fish, which they seemed to eat with as much relish as we should a turbot, served up with the richest sauce. By the evening we had completed our water, and made such observations as the time and weather would permit. I have taken notice of the rapidity of the tide without the harbour, but it was inconsiderable within. It was low water at noon, and high water at half-past six in the evening; and the water rose, upon a perpendicular, three feet four inches; but there were marks of its sometimes rising a foot higher.

Thick fogs and a contrary wind detained us till the 2d of July, which afforded an opportunity of acquiring some knowledge of the country and of its inhabitants. The result of our observations will be mentioned in another place. At present I shall only describe the harbour. It is called by the natives Samganoodha, and is situated on the north side of Oonalashika, in the latitude of $53^{\circ} 55'$, in the longitude of $193^{\circ} 30'$; and in the strait or passage that separates this island from those that lie to the north of it, and whose position before the harbour shelters it from the winds that blow from that quarter. It runs in S. by W., about four miles, and is about a mile broad at the entrance, narrowing toward the head, where its breadth is not above a quarter of a mile, and where ships can lie land-locked, in seven, six, and four fathoms water. Great plenty of good water may be easily got, but not a single stick of wood of any size.

CHAPTER VIII.—PROGRESS NORTHWARD AFTER LEAVING OONALASHKA.—THE ISLANDS OONELLA AND ACOOTAN.—OONEEMAK.—SHALLOWNESS OF THE WATER ALONG THE COAST.—BRISTOL BAY.—ROUND ISLAND.—CALM POINT.—CAPE NEWENHAM.—LIEUTENANT WILLIAMSON LANDS, AND HIS REPORT.—BRISTOL BAY, AND ITS EXTENT.—THE SHIPS OBLIGED TO RETURN, ON ACCOUNT OF SHOALS.—NATIVES COME OFF TO THE SHIPS.—DEATH OF MR. ANDERSON; HIS CHARACTER; AND ISLAND NAMED AFTER HIM.—POINT RODNEY.—SLEDGE ISLAND, AND REMARKS ON LANDING THERE.—KING'S ISLAND.—CAPE PRINCE OF WALES, THE WESTERN EXTREME OF AMERICA.—COURSE WESTWARD.—ANCHOR IN A BAY ON THE COAST OF ASIA.

HAVING put to sea with a light breeze, at south south-east, we steered to the north, meeting with nothing to obstruct us in this course; for, as I observed before, the island of Oonala-shka, on the one side, trended south-west, and on the other no land was to be seen in a direction more northerly than north-east; the whole of which land was a continuation of the same group of islands which we had fallen in with on the 25th of June. That which lies before Sanganoodia, and forms the north-east side of the passage through which we came, is called Oonella, and is about seven leagues in circumference. Another island, to the north-east of it, is called Acootan, which is considerably larger than Oonella, and hath in it some very high mountains, which were covered with snow. It appeared, that we might have gone very safely between these two islands and the continent, the south-west point of which opened off the north-east point of Acootan, in the direction of north, 60° east; and which proved to be the same point of land we had seen when we quitted the coast of the continent, on the 25th of June, to go without the islands. It is called by the people of these parts Ooneemak, and lies in the latitude of $54^{\circ} 30'$, and in the longitude of $192^{\circ} 30'$. Over the cape, which, of itself, is high land, is a round elevated mountain, at this time entirely covered with snow.

At six in the evening, this mountain bore east 2° north, and at eight we had no land in sight. Concluding, therefore, that the coast of the continent had now taken a north-easterly direction, I ventured to steer the same course, till one o'clock next morning, when the watch on deck thought they saw land ahead. Upon this we wore, and stood to the south-west for two hours, and then resumed our course to the east north-east. At six o'clock land was seen ahead, bearing south-east, about five leagues distant. As we advanced, we raised more and more land, all connected, and seemingly in the direction of our course. At noon, it extended from south south-west to east; the nearest part five or six leagues distant. Our latitude at this time was $55^{\circ} 21'$, and our longitude $195^{\circ} 18'$. This coast is on the north-west side of the volcano mountain; so that we must have seen it, if the weather had been tolerably clear. At six in the evening, after having run eight leagues upon an east by north course from noon, we sounded, and found forty-eight fathoms over a bottom of black sand. Being at this time four leagues from the land, the eastern part in sight bore east south-east, and appeared as a high round hummock, seemingly detached from the main.

Having continued to steer east north-east all night, at eight in the morning of the 4th the coast was seen from south south-west, and east by south, and at times we could see high land, covered with snow, behind it. Soon after, it fell calm, and being in thirty fathoms water, we put over hooks and lines, and caught a good number of fine cod-fish. At noon, having now a breeze from the east, and the weather being clear, we found ourselves six leagues from the land, which extended from south by west to east by south. The hummock, seen the preceding evening, bore south-west by south, ten leagues distant. Our latitude was now $55^{\circ} 50'$, and our longitude $197^{\circ} 3'$. A great hollow swell from west south-west assured us that there was no main land near in that direction. I stood to the north till six in the afternoon, when the wind having veered to the south-east, enabled us to steer east north-east. The coast lay in this direction, and at noon the next day was about four leagues distant.

On the 6th and 7th, the wind being northerly, we made but little progress. At eight in the evening of the latter, we were in nineteen fathoms water, and about three or four leagues from the coast, which on the 8th extended from south south-west to east by north, and was

all low land, with a ridge of mountains behind it, covered with snow. It is probable that this low coast extends some distance to the south-west, and that such places as we sometimes took for inlets or bays are only valleys between the mountains. On the morning of the 9th, with a breeze at north-west, we steered east by north, to get nearer the coast. At noon, we were in the latitude of $57^{\circ} 49'$, and in the longitude of $201^{\circ} 33'$, and about two leagues from the land, which extended from south by east to east north-east; being all a low coast, with points shooting out in some places, which, from the deck, appeared like islands; but from the mast-head, low land was seen to connect them. In this situation the depth of water was fifteen fathoms, the bottom a fine black sand.

As we had advanced to the north-east, we had found the depth of water gradually decreasing, and the coast trending more and more northerly. But the ridge of mountains behind it continued to lie in the same direction as those more westerly; so that the extent of the low land between the foot of the mountains and the sea-coast insensibly increased. Both high and low grounds were perfectly destitute of wood, but seemed to be covered with green turf, except the mountains, which were covered with snow. Continuing to steer along the coast with a gentle breeze westerly, the water gradually shoaled from fifteen to ten fathoms, though we were at the distance of eight or ten miles from the shore. At eight in the evening, an elevated mountain, which had been in sight for some time, bore south-east by east, twenty-one leagues distant. Some other mountains, belonging to the same chain, and much farther distant, bore east 3° north. The coast extended as far as north-east half north, where it seemed to terminate in a point, beyond which we hoped and expected that it would take a more easterly direction. But soon after, we discovered low land extending from behind this point, as far as north-west by west, where it was lost in the horizon; and behind it was high land, that appeared in detached hills. Thus the fine prospect we had of getting to the north, vanished in a moment. I stood on till nine o'clock, for so long it was light, and then the point above mentioned bore north-east half east, about three miles distant. Behind this point is a river, the entrance of which seemed to be a mile broad; but I can say nothing as to its depth. The water appeared discoloured, as upon shoals; but a calm would have given it the same aspect. It seemed to have a winding direction, through the great flat that lies between the chain of mountains to the south-east and the hills to the north-west. It must abound with salmon, as we saw many leaping in the sea before the entrance; and some were found in the maws of cod which we had caught. The entrance of this river, distinguished by the name of Bristol River, lies in the latitude of $58^{\circ} 27'$, and in the longitude of $201^{\circ} 55'$.

Having spent the night in making short boards, at daybreak on the morning of the 10th we made sail to the west south-west, with a gentle breeze at north-east. At eleven o'clock we thought the coast to the north-west terminated in a point, bearing north-west by west; and as we had now deepened the water from nine to fourteen fathoms, I steered for the point, ordering the Discovery to keep ahead. But before she had run a mile, she made a signal for shoal water. At that instant we had the depth of seven fathoms; and before we could get the ship's head the other way, had less than five; but the Discovery had less than four. We stood back to the north-east, three or four miles; but finding there was a strong tide or current setting to the west south-west, that is, toward the shoal, we anchored in ten fathoms, over a bottom of fine sand. Two hours after we had anchored, the water had fallen two feet and upward, which proved that it was the tide of ebb that came from the river above-mentioned. We also examined some of the water which we had taken up, and found that it was not half so salt as common sea water. This furnished another proof that we were before a large river.

At four in the afternoon, the wind shifting to south-west, we weighed and stood to the southward, with boats ahead sounding, and passed over the south end of the shoal in six fathoms water. We then got into thirteen and fifteen; in which last depth we anchored at half-past eight; some part of the chain of mountains on the south-east shore, in sight, bearing south-east half south; and the westernmost land on the other shore, north-west. We had, in the course of the day, seen high land, bearing north 60° west, by estimation twelve leagues distant. Having weighed next morning, at two o'clock, with a light breeze

at south-west by west, we plied to windward till nine; when judging the flood-tide to be now made against us, we came to an anchor in twenty-four fathoms. We lay here till one, when the fog, which had prevailed this morning, dispersing, and the tide making in our favour, we weighed and plied to the south-west. In the evening the wind was very variable, and we had some thunder. We had heard none before since our arrival upon the coast; and this was at a great distance. The wind having settled again in the south-west quarter in the morning of the 12th, we stood to the north-west, and at ten saw the continent. At noon it extended from north-east by north, to north north-west, a quarter west; and an elevated hill bore north north-west, ten leagues distant. This proved to be an island, which from its figure obtained the name of Round Island. It lies in the latitude of 58° 37', and in the longitude of 200° 6', and seven miles from the continent. In the evening, at nine, having stood to the northward to within three leagues of the shore, we tacked in fourteen fathoms water, the extremities of the coast bearing east south-east half east and west. The wind veering to the north-west enabled us to make a good stretch along-shore, till two o'clock in the morning, when we got all at once into six fathoms water, being at this time two leagues from the shore. After edging off a little, our depth gradually increased, and at noon we had twenty fathoms, when the latitude was 58° 13', and the longitude 199°. Round Island bore north, 5° east; and the west extreme of the coast north, 16° west, seven leagues distant. It is an elevated point, which obtained the name of Calm Point, from our having calm weather when off it. To the north-west of Round Island are two or three hillocks, that appeared like islands; and it is possible they may be such; for we had but a distant view of the coast in this place.

During the 14th and 15th, our progress was slow, having little wind, and sometimes so thick a fog, that we could not see the length of the ship. The soundings were from fourteen to twenty-six fathoms; and we had tolerable success in fishing, catching cod, and now and then a few flat fish. At five in the morning of the 16th, the fog having cleared up, we found ourselves nearer the land than we expected. Calm Point bore north, 72° east, and a point eight leagues from it, in the direction of west, bore north, 3° east, three miles distant. Between these two points, the coast forms a bay, in some parts of which the land was hardly visible from the mast-head. There is also a bay on the north-west side of this last point, between it and an elevated promontory, which, at this time, bore north, 36° west, sixteen miles distant. At nine, I sent Lieutenant Williamson to this promontory, with orders to land, and see what direction the coast took beyond it, and what the country produced, for from the ships it had but a barren appearance. We found here the flood-tide setting strongly to the north-west along the coast. At noon it was high-water, and we anchored in twenty-four fathoms, four leagues distant from the shore. At five in the afternoon, the tide making in our favour, we weighed, and drove with it; for there was no wind.

Soon after, Mr. Williamson returned, and reported that he had landed on the point, and having climbed the highest hill, found that the farthest part of the coast in sight bore nearly north. He took possession of the country in his Majesty's name, and left on the hill a bottle, in which were inscribed, on a piece of paper, the names of the ships, and the date of the discovery. The promontory, to which he gave the name of Cape Newenham, is a rocky point of tolerable height, situated in the latitude of 58° 42', and in the longitude of 197° 36'. Over, or within it, are two elevated hills, rising one behind the other. The innermost, or easternmost, is the highest. The country, as far as Mr. Williamson could see, produces neither tree nor shrub; the hills are naked; but on the lower grounds grew grass and other plants, very few of which were in flower. He saw no other animal but a doe and her fawn, and a dead sea-horse, or cow, upon the beach. Of these animals we had lately seen a great many. As the coast takes a northerly direction from Cape Newenham, that Cape fixes the northern limit of the great bay and gulf, lying before the river Bristol, which, in honour of the admiral Earl of Bristol, was named Bristol Bay. Cape Ooneemak is the south limit of this bay, and is distant eighty-two leagues from Cape Newenham, in the direction of south south-west.

About eight in the evening, a light breeze springing up, which fixed at S. S. E., we steered

N. W., and N. N. W., round Cape Newenham, which at noon next day bore S. by E., distant four leagues. At this time the most advanced land to the northward bore N., 30° E.; our depth of water was seventeen fathoms; and the nearest shore $2\frac{1}{2}$ leagues distant. We had but little wind all the afternoon; so that, at ten at night, we had only made three leagues upon a north course. We steered N. by W. till eight the next morning, when, our depth of water decreasing suddenly to five and seven fathoms, we brought to, till a boat from each ship was sent ahead to sound, and then steered north-east after them; and at noon we had deepened the water to seventeen fathoms. At this time Cape Newenham bore S. 9° E., distant eleven or twelve leagues, the north-east extreme of the land in sight N. 66° E., and the nearest shore about four or five leagues distant. Our latitude, by observation, was 59° 16'.

Between this latitude and Cape Newenham the coast is composed of hills and low land, and appeared to form several bays. A little before one o'clock the boats ahead made the signal for meeting with shoal water. It seems they had only two fathoms, and at the same time the ships were in six fathoms. By hauling a little more to the northward, we continued in much the same depth till between five and six o'clock, when the boats meeting with less and less water, I made the signal to the *Discovery*, she being then ahead, to anchor, which we did soon after. In bringing our ship up, the cable parted at the clinch, which obliged us to come-to with the other anchor. We rode in six fathoms water, a sandy bottom, and about four or five leagues from the main land; Cape Newenham bearing south, seventeen leagues distant. The farthest hills we could see to the north, bore N. E. by E.; but there was low land stretching out from the high land, as far as north by east. Without this was a shoal of sand and stones, that was dry at half ebb.

I had sent the two masters, each in a boat, to sound between this shoal and the coast. On their return, they reported that there was a channel in which they found six and seven fathoms water; but that it was narrow and intricate. At low water we made an attempt to get a hammer round the lost anchor, but did not succeed then. However, being determined not to leave it behind me as long as there was a probability of recovering it, I persevered in my endeavours, and at last succeeded in the evening of the 20th. While we were thus employed, I ordered Captain Clerke to send his master in a boat to look for a passage in the south-west quarter. He did so; but no channel was to be found in that direction; nor did there appear to be any way to get clear of these shoals, but to return by the track which had brought us in. For, although by following the channel we were in, we might probably have got farther down the coast, and though possibly this channel might have led us at last to the north, clear of the shoals, still the attempt would have been attended with vast risk; and if we should not have succeeded, there would have been a considerable loss of time that could ill be spared. These reasons induced me to return by the way in which we came, and so get without the shoals.

A number of lunar observations made by Mr. King and myself, on this and the four preceding days, and all reduced to the ship's present station, gave the longitude				197° 45' 48"
By the time-keeper it was				197 26 48
Our latitude was				59 37 39
Variation by the mean of three compasses { A.M. 23° 34' 3" } mean 22° 56' 51" east.				
				{ P.M. 22 19 40 }

The northernmost part of the coast that we could see from this station I judged to lie in the latitude of 60°. It seemed to form a low point, which obtained the name of Shoal Ness. The tide of flood sets to the north, and the ebb to the south. It rises and falls, upon a perpendicular, five or six feet; and I reckon it to be high water, on the full and change days, at eight o'clock.

Having weighed at three in the morning on the 21st, with a light breeze at N. N. W., we steered back to the southward, having three boats ahead to direct us. But, notwithstanding this precaution, we found more difficulty in returning than we had in advancing; and at last were obliged to anchor, to avoid running upon a shoal, which had only a depth of five feet. While we lay here, twenty-seven men of the country, each in a canoe, came off to the ships, which they approached with great caution; hollowing and opening their arms

ze at N.N.W., we But, notwithstand- in advancing; and had only a depth of in a canoe, came off opening their arms

as they advanced. This we understood was to express their pacific intentions. At length some approached near enough to receive a few trifles that were thrown to them: this encouraged the rest to venture alongside; and a traffic presently commenced between them and our people, who got dresses of skins, bows, arrows, darts, wooden vessels, &c.; our visitors taking in exchange for these whatever was offered them. They seemed to be the same sort of people that we had of late met with all along this coast; wore the same kind of ornaments in their lips and noses; but were far more dirty, and not so well clothed. They appeared to be wholly unacquainted with people like us: they knew not the use of tobacco; nor was any foreign article seen in their possession, unless a knife may be looked upon as such. This, indeed, was only a piece of common iron fitted in a wooden handle, so as to answer the purpose of a knife. They, however, knew the value and use of this instrument so well, that it seemed to be the only article they wished for. Most of them had their hair shaved, or cut short off, leaving only a few locks behind, or on one side. For a covering for the head they wore a hood of skins, and a bonnet which appeared to be of wood. One part of their dress, which we got from them, was a kind of girdle, very neatly made of skin, with trappings depending from it, and passing between the legs, so as to conceal the adjoining parts. By the use of such a girdle, it should seem that they sometimes go naked, even in this high latitude; for they hardly wear it under their other clothing. The canoes were made of skins, like all the others we had lately seen; only with this difference, that these were broader, and the hole in which the man sits was wider than in any I had before met with. Our boats returning from sounding seemed to alarm them; so that they all left us sooner than probably they would otherwise have done.

It was the 22nd, in the evening, before we got clear of these shoals, and then I durst not venture to steer to the westward in the night, but spent it off Cape Newenham, and at day-break next morning steered to the north-west, ordering the Discovery to lead. Before we had run two leagues, our depth of water decreased to six fathoms. Fearing, if we continued this course, that we should find less and less water, I hauled to the southward, the wind being at east, a fresh breeze. This course brought us gradually into eighteen fathoms; and having that depth, I ventured to steer a little westerly, and afterward west, when we at last found twenty-six fathoms water. On the 24th at noon we were, by observation, in the latitude of 58° 7', and in the longitude of 194° 22'. Three leagues to the westward of this station we had twenty-eight fathoms water, and then steered west north-west, the water gradually deepening to thirty-four fathoms. I would have steered more northerly, but the wind having veered in that direction, I could not. The 25th in the evening, having a very thick fog, and but little wind, we dropped anchor in thirty fathoms water. Our latitude was now 58° 29', and our longitude 191½° 37'. At six the next morning the weather clearing up a little, we weighed, and a small breeze at east, steered north; our soundings being from twenty-eight to twenty-five fathoms. After running nine leagues upon this course, the wind returned back to the north, which obliged us to steer more westerly.

The weather continued, for the most part, foggy, till toward noon on the 28th, when we had a few hours' clear sunshine; during which we made several lunar observations. The mean result of them, reduced to noon, when the latitude was 59° 55', gave 190° 6' longitude; and the time-keeper gave 189° 59'. The variation of the compass was 18° 40' east. Continuing our westerly course, the water having now deepened to thirty-six fathoms, at four o'clock next morning we discovered land, bearing north-west by west, six leagues distant. We stood toward it till half-past ten, when we tacked in twenty-four fathoms water; being at this time a league from the land, which bore north north-west. It was the south-east extremity, and formed a perpendicular cliff of considerable height; on which account it was called Point Upright, and lies in the latitude of 60° 17', and in the longitude of 187° 30'. More land was seen to the westward of the point; and, at a clear interval, we saw another elevated portion of land in the direction of west by south; and this seemed to be entirely separated from the other. Here we met with an incredible number of birds, all as the hawk kind before described. We had baffling light winds all the afternoon, so that we made but little progress; and the weather was not clear enough to enable us to determine the extent of the land before us. We supposed it to be one of the many islands laid down by

Mr. Stædlin in his map of the New Northern Archipelago; and we expected every moment to see more of them.

At four in the afternoon of the 30th, Point Upright bore north-west by north, six leagues distant. About this time a light breeze springing up at north north-west, we stood to the north-east till four o'clock next morning, when the wind veering to the eastward, we tacked and steered to the north-west. Soon after the wind came to the south-east, and we steered north-east by north; which course we continued, with soundings from thirty-five to twenty fathoms, till next day at noon. At this time we were in the latitude of $60^{\circ} 58'$, and in the longitude of 191° . The wind now veering to north-east, I first made a stretch of ten leagues to the north-west; and then, seeing no land in that direction, I stood back to the eastward about fifteen leagues, and met with nothing but pieces of drift-wood. The soundings were from twenty-two to nineteen fathoms. Variable light winds, with showers of rain, prevailed all the 2nd; but fixing in the south-east quarter, in the morning of the 3rd, we resumed our course to the northward. At noon we were, by observation, in the latitude of $62^{\circ} 34'$; our longitude was 192° , and our depth of water sixteen fathoms.

Mr. Anderson, my surgeon, who had been lingering under a consumption for more than twelve months, expired between three and four this afternoon. He was a sensible young man, and an agreeable companion, well skilled in his own profession, and had acquired considerable knowledge of other branches of science. The reader of this Journal will have observed how useful an assistant I had found him in the course of the voyage; and had it pleased God to have spared his life, the public, I make no doubt, might have received from him such communications, on various parts of the natural history of the several places we visited, as would have abundantly shown that he was not unworthy of this commendation*. Soon after he had breathed his last, land was seen to the westward, twelve leagues distant. It was supposed to be an island; and, to perpetuate the memory of the deceased, for whom I had a very great regard, I named it Anderson's Island. The next day I removed Mr. Law, the surgeon of the Discovery, into the Resolution, and appointed Mr. Samuel, the surgeon's first mate of the Resolution, to be surgeon of the Discovery.

On the 4th, at three in the afternoon, land was seen extending from north north-east to north-west. We stood on toward it till four o'clock, when, being four or five miles from it, we tacked; and soon after, the wind falling, we anchored in thirteen fathoms water, over a sandy bottom, being about two leagues from the land, and, by our reckoning, in the latitude of $64^{\circ} 27'$, and in the longitude of $194^{\circ} 18'$. At intervals we could see the coast extending from east to north-west, and a pretty high island, bearing west by north, three leagues distant. The land before us, which we supposed to be the continent of America, appeared low next the sea; but inland it swelled into hills, which rise one behind another to a considerable height. It had a greenish hue, but seemed destitute of wood, and free from snow. While we lay at anchor, we found that the flood-tide came from the east and set to the west, till between ten and eleven o'clock. From that time till two the next morning the stream set to the eastward, and the water fell three feet. The flood ran both stronger and longer than the ebb; from which I concluded, that, besides the tide, there was a westerly current.

At ten in the morning of the 5th, with the wind at south-west, we ran down and anchored between the island and the continent, in seven fathoms water. Soon after, I landed upon the island, and, accompanied by Mr. King and some others of the officers, I hoped to have had from it a view of the coast and sea to the westward; but the fog was so thick in that direction, that the prospect was not more extensive than from the ship. The coast of the continent seemed to take a turn to the northward, at a low point named Point Rodney, which bore from the island north-west half west, three or four leagues distant; but the high land, which took a more northerly direction, was seen a great way farther. This island, which was named Sledge Island, and lies in the latitude of $64^{\circ} 30'$, and in the longitude of $193^{\circ} 57'$, is about four leagues in circuit. The surface of the ground is composed chiefly of large loose stones, that are in many places covered with moss and other vegetables, of

which there were above twenty or thirty different sorts, and most of them in flower. But I saw neither shrub nor tree, either upon the island or on the continent. On a small low spot near the beach where we landed, was a deal of wild purslane, peas, long-wort, &c.; some of which we took on board for the st. We saw one fox, a few plovers and some other small birds; and we met with some decayed huts that were partly built below ground. People had lately been on the island; and it is pretty clear that they frequently visit it for some purpose or other. We found, a little way from the shore where we landed, a sledge, which occasioned this name being given to the island. It seemed to be such a one as the Russians in Kamtschatka make use of to convey goods from place to place, over the ice or snow. It was ten feet long, twenty inches broad, and had a kind of rail-work on each side, and was shod with bone. The construction of it was admirable, and all the parts neatly put together; some with wooden pins, but mostly with thongs or lashings of whale-bone, which made me think it was entirely the workmanship of the natives.

At three o'clock the next morning we weighed, and proceeded to the north-westward, with a light southerly breeze. We had an opportunity to observe the sun's meridian altitude for the latitude; and to get altitude, both in the forenoon and afternoon, to obtain the longitude by the time-keeper. As we had but little wind, and variable withal, we advanced but slowly; and, at eight in the evening, finding the ships settle fast toward the land into shoal water, I anchored in seven fathoms, about two leagues from the coast. Sledge Island bore south, 51° east, ten leagues distant; and was seen over the south point of the main land. Soon after we had anchored, the weather, which had been misty, clearing up, we saw high land extending from north, 40° east, to north, 30° west, apparently disjoined from the coast, under which we were at anchor, and seemed to trend away north-east. At the same time an island was seen bearing north 81° west, eight or nine leagues distant. It appeared to have no great extent, and was named King's Island. We rode here till eight o'clock next morning, when we weighed, and stood to the north-west. The weather clearing up toward the evening, we got sight of the north-west land, extending from north by west, to north-west by north, distant about three leagues. We spent the night making short boards, the weather being misty and rainy, with little wind; and between four and five in the morning of the 8th, we had again a sight of the north-west land; and, soon after, on account of a calm, and a current driving us toward the shore, we found it necessary to anchor in twelve fathoms water, about two miles from the coast. Over the western extreme is an elevated peaked hill, situated in latitude 65° 36', and in longitude 192° 18'. A breeze at north-east springing up at eight o'clock, we weighed, and stood to the south-east, in hopes of finding a passage between the coast on which we had anchored on the 6th in the evening, and this north-west land; but we soon got into seven fathoms water, and discovered low land connecting the two coasts, and the high land behind it. Being now satisfied that the whole was a continued coast, I tacked, and stood away for its north-west part, and came to an anchor under it in seventeen fathoms water. The weather, at this time, was very thick with rain; but, at four next morning, it cleared up, so that we could see the land about us. A high steep rock or island bore west by south; another island to the north of it, and much larger, bore west by north; the peaked hill above mentioned, south-east by east; and the point under it, south, 32° east. Under this hill lies some low land, stretching out toward the north-west, the extreme point of which bore north-east by east, about three miles distant. Over, and beyond it, some high land was seen, supposed to be a continuation of the continent. This point of land, which I named Cape Prince of Wales, is the more remarkable, by being the western extremity of all America hitherto known. It is situated in the latitude of 65° 46', and in the longitude of 191° 45'. The observations by which both were determined, though made in sight of it, were liable to some small error, on account of the haziness of the weather. We thought we saw some people upon the coast; and probably we were not mistaken, as some elevations, like stages, and others, like huts, were seen at the same place. We saw the same things on the continent within Sledge Island, and on some other parts of the coast.

It was calm till eight o'clock in the morning, when a faint breeze at north springing up,

we weighed; but we had scarcely got our sails set, when it began to blow and rain very hard, with misty weather. The wind and current, being in contrary directions, raised such a sea, that it frequently broke into the ship. We had a few minutes' sunshine at noon; and from the observations then obtained, we fixed the above-mentioned latitude. Having plied to windward till two in the afternoon, with little effect, I bore up for the island we had seen to the westward, proposing to come to an anchor under it till the gale should cease. But on getting to this land, we found it composed of two small islands each not above three or four leagues in circuit; and consequently they could afford us little shelter. Instead of anchoring, therefore, we continued to stretch to the westward; and at eight o'clock, land was seen in that direction, extending from north north-west, to west by south, the nearest part six leagues distant. I stood on till ten, and then made a board to the eastward, in order to spend the night.

At daybreak in the morning of the 10th, we resumed our course to the west for the land we had seen the preceding evening. At eleven minutes after seven, when the longitude by the time-keeper was $189^{\circ} 24'$, it extended from south, 72° west, to north, 41° east. Between the south-west extreme, and a point which bore west, two leagues distant, the shore forms a large bay, in which we anchored at ten o'clock in the forenoon, about two miles from the north shore, in ten fathoms water, over a gravelly bottom. The south point of the bay bore south, 58° west; the north point north, 43° east; the bottom of the bay north, 60° west, two or three leagues distant; and the two islands we had passed the preceding day, north, 72° east, distant fourteen leagues.

As we were standing into this bay, we perceived on the north shore a village, and some people, whom the sight of the ships seemed to have thrown into confusion or fear. We could plainly see persons running up the country with burdens upon their backs. At these habitations, I proposed to land; and accordingly went with three armed boats, accompanied by some of the officers. About thirty or forty men, each armed with a spoutoon, a bow, and arrows, stood drawn up on a rising ground close by the village. As we drew near, three of them came down toward the shore, and were so polite as to take off their caps, and to make us low bows. We returned the civility: but this did not inspire them with sufficient confidence to wait for our landing; for the moment we put the boats ashore, they retired. I followed them alone without anything in my hand; and by signs and gestures prevailed on them to stop, and receive some trifling presents. In return for these, they gave me two fox-skins, and a couple of sea-horse teeth. I cannot say whether they or I made the first present; for it appeared to me, that they had brought down with them these things for this very purpose; and that they would have given them to me, even though I had made no return. They seemed very fearful and cautious; expressing their desire by signs that no more of our people should be permitted to come up. On my laying my hand on the shoulder of one of them, he started back several paces. In proportion as I advanced, they retreated backward; always in the attitude of being ready to make use of their spears; while those on the rising ground stood ready to support them with their arrows. Insensibly, myself, and two or three of my companions, got in amongst them. A few heads, distributed to those about us, soon created a kind of confidence; so that

of confidence; so that

they were not alarmed when a few more of our people joined us; and, by degrees, a sort of traffic between us commenced. In exchange for knives, beads, tobacco, and other articles, they gave us some of their clothing, and a few arrows. But nothing that we had to offer could induce them to part with a spear, or a bow. These they had in constant readiness, never once quitting them, except at one time, when four or five persons laid theirs down, while they gave us a song and a dance. And even then, they placed them in such a manner, that they could lay hold of them in an instant; and for their security, they desired us to sit down.

The arrows were pointed either with bone or stone, but very few of them had barbs; and some had a round blunt point. What use these may be applied to I cannot say; unless it be to kill small animals without damaging the skin. The bows were such as we had seen on the American coast, and like those used by the Esquimaux. The spears, or spontoons, were of iron or steel, and of European or Asiatic workmanship; in which no little pains had been taken to ornament them with carving, and inlayings of brass and of a white metal. Those who stood ready with bows and arrows in their hands, had a spear slung over their shoulder by a leathern strap. A leathern quiver, slung over their left shoulder, contained arrows; and some of these quivers were extremely beautiful; being made of red leather, on which was very neat embroidery, and other ornaments. Several other things, and in particular their clothing, showed that they were possessed of a degree of ingenuity, far surpassing what one could expect to find amongst so northern a people. All the Americans we had seen since our arrival on that coast, were rather low of stature, with round, chubby faces, and high cheek-bones. The people we now were amongst, far from resembling them, had long visages, and were stout and well made. In short, they appeared to be a quite different nation. We saw neither women nor children of either sex; nor any aged, except one man, who was bald-headed; and he was the only one who carried no arms. The others seemed to be picked men, and rather under than above the middle age. The old man had a black mark across his face, which I did not see in any others. All of them had their ears bored; and some had glass beads hanging to them. These were the only fixed ornaments we saw about them; for they wear none to their lips. This is another thing in which they differ from the Americans we had lately seen.

THE TSCHUTSKI.

Their clothing consisted of a cap, a frock, a pair of breeches, a pair of boots, and a pair of gloves, all made of leather, or the skins of deer, dogs, seals, &c., and extremely well dressed; some with the hair or fur on, but others without it. The caps were made to fit the head

very close; and besides these caps, which most of them wore, we got from them some hoods, made of the skins of dogs, that were large enough to cover both head and shoulders. Their hair seemed to be black; but their heads were either shaved, or the hair cut close off; and none of them wore any beard. Of the few articles which they got from us, knives and tobacco were what they valued most.

We found the village composed both of their summer and their winter habitations. The latter are exactly like a vault, the floor of which is sunk a little below the surface of the earth. One of them which I examined was of an oval form, about twenty feet long, and twelve or more high. The framing was composed of wood, and the ribs of whales, disposed in a judicious manner, and bound together with smaller materials of the same sort. Over this framing is laid a covering of strong coarse grass; and that again is covered with earth; so that, on the outside, the house looks like a little hillock, supported by a wall of stone, three or four feet high, which is built round the two sides, and one end. At the other end the earth is raised sloping, to walk up to the entrance, which is by a hole in the top of the roof over that end. The floor was boarded, and under it a kind of cellar, in which I saw nothing but water. And at the end of each house was a vaulted room, which I took to be a store-room. These store-rooms communicated with the house by a dark passage; and with the open air, by a hole in the roof, which was even with the ground one walked upon; but they cannot be said to be wholly under ground; for one end reached to the edge of the hill, along which they were made, and which was built up with stone. Over it stood a kind of sentry-box, or tower, composed of the large bones of large fish. The summer huts were pretty large and circular, being brought to a point at the top. The framing was of slight poles and bones, covered with the skins of sea-animals. I examined the inside of one. There was a fire-place just within the door, where lay a few wooden vessels, all very dirty. Their bed-places were close to the side, and took up about half the circuit. Some privacy seemed to be observed; for there were several partitions made with skins. The bed and bedding were of deer-skins; and most of them were dry and clean. About the habitations were erected several stages, ten or twelve feet high; such as we had observed on some parts of the American coast. They were wholly composed of bones; and seemed intended for drying their fish and skins, which were thus placed beyond the reach of their dogs, of which they had a great many. These dogs are of the fox kind, rather large, and of different colours, with long soft hair like wool. They are, probably, used in drawing their sledges in winter. For sledges they have, as I saw a good many laid up in one of the winter huts. It is also not improbable that dogs may constitute a part of their food. Several lay dead that had been killed that morning.

The canoes of these people are of the same sort with those of the northern Americans; some, both of the large and of the small ones, being seen lying in a creek under the village. By the large fish-bones, and of their sea-animals, it appeared that the sea supplied them with the greatest part of their subsistence. The country appeared to be exceedingly barren; yielding neither tree nor shrub, that we could see. At some distance westward, we observed a ridge of mountains covered with snow that had lately fallen.

At first we supposed this land to be a part of the island of Alaschka, laid down in Mr. Stæhlin's map, before mentioned. But from the figure of the coast, the situation of the opposite shore of America, and from the longitude, we soon began to think that it was, more probably, the country of the Tschutski, or the eastern extremity of Asia, explored by Beering in 1728. But to have admitted this without farther examination, I must have pronounced Mr. Stæhlin's map, and his account of the New Northern Archipelago, to be either exceeding erroneous, even in latitude, or else to be a mere fiction; a judgment which I had no right to pass upon a publication so respectably vouched, without producing the clearest proofs.

After a stay of between two and three hours with these people, we returned to our ships, and soon after, the wind veering to the south, we weighed anchor, stood out of the bay, and steered to the north-east, between the coast and the two islands. The next day, at noon, the former extended from S. 80° W., to N. 34° W.; the latter bore 43° W.; and the peaked mountain, over Cape Prince of Wales, bore S. 36° E.; with land extending from it as far as S. 75° E. The latitude of the ship was 66° 54'; the longitude 191° 19'; our depth of water

twenty-eight fathoms; and our position nearly in the middle of the channel between the two coasts, each being seven leagues distant. From this station we steered east, in order to get nearer the American coast. In this course the water shoaled gradually, and there being little wind, and all our endeavours to increase our depth failing, I was obliged at last to drop anchor in six fathoms; the only remedy we had left to prevent the ships driving into less. The nearest part of the western land bore W., twelve leagues distant; the peaked hill over Cape Prince of Wales, S. 16° W.; and the northernmost part of the American continent in sight E. S. E., the nearest part about four leagues distant. After we had anchored, I sent a boat to sound, and the water was found to shoal gradually toward the land. While we lay at anchor, which was from six to nine in the evening, we found little or no current; nor could we perceive that the water either rose or fell.

A breeze of wind springing up north, we weighed and stood to the westward, which course soon brought us into deep water; and, during the 12th, we plied to the north, both coasts being in sight; but we kept nearest to that of America. At four in the afternoon of the 13th, a breeze springing up at south, I steered N. E. by N., till four o'clock next morning, when, seeing no land, we directed our course E. by N.; and between nine and ten, land, supposed to be a continuation of the continent, appeared. It extended from east by south to east by north; and, soon after, we saw more land, bearing N. by E. Coming pretty suddenly into thirteen fathoms water, at two in the afternoon we made a trip off till four, when we stood in again for the land; which was seen, soon after, extending from north to south-east; the nearest part three or four leagues distant. The coast here forms a point, named Point Mulgrave, which lies in the latitude of 67° 45'; and in the longitude of 194° 51'. The land appeared very low next the sea; but, a little back, it rises into hills of a moderate height. The whole was free from snow; and to appearance destitute of wood. I now tacked, and bore away N. W. by W.; but soon after, thick weather with rain coming on, and the wind increasing, I hauled more to the west.

Next morning, at two o'clock, the wind veered to S. W. by S., and blew a strong gale, which abated at noon; and the sun shining out, we found ourselves, by observation, in the latitude of 68° 18'. I now steered N. E. till six o'clock the next morning, when I steered two points more easterly. In this run we met with several sea-horses, and flights of birds; some like land-larks, and others seen no bigger than hedge-sparrows. Some shags were also seen; so that we judged ourselves to be not far from the land. But as we had a thick fog, we could not expect to see any; and as the wind blew strong, it was not prudent to continue a course which was most likely to bring us to it. From the noon of this day to six o'clock in the morning of the following, I steered E. by N.; which course brought us into sixteen fathoms water. I now steered N. E. by E., thinking by this course to deepen our water. But, in the space of six leagues, it shoaled to eleven fathoms; which made me think it proper to haul close to the wind, that now blew at west. Toward noon, both sun and moon were seen clearly at intervals, and we got some flying observations for the longitude; which, reduced to noon, when the latitude was 70° 33', gave 197° 41'. The time-keeper, for the same time, gave 198°; and the variation was 35° 1' 22" E. We had afterward reason to believe that the observed longitude was within a very few miles of the truth.

Some time before noon we perceived a brightness in the northern horizon, like that reflected from ice, commonly called the blink. It was little noticed, from a supposition that it was improbable we should meet with ice so soon. And yet the sharpness of the air, and gloominess of the weather, for two or three days past, seemed to indicate some sudden change. About an hour after, the sight of a large field of ice left us no longer in doubt about the cause of the brightness of the horizon. At half past two, we tacked, close to the edge of the ice, in twenty-two fathoms water, being then in the latitude of 70° 41'; not being able to stand on any farther. For the ice was quite impenetrable, and extended from west by south to east by north, as far as the eye could reach. Here were abundance of sea-horses; some in the water, but far more upon the ice. I had the thoughts of hoisting out the boats to kill some; but the wind freshening, I gave up the design, and continued to ply to the southward, rather to the westward; for the wind came from that quarter. We gained nothing; for on the 18th at noon our latitude was 70° 44'; and we were near five leagues farther to the

eastward. We were, at this time, close to the edge of the ice, which was as compact as a wall, and seemed to be ten or twelve feet high at least. But farther north, it appeared much higher. Its surface was extremely rugged, and here and there we saw upon it pools of water.

We now stood to the southward, and, after running six leagues, shoaled the water to seven fathoms; but it soon deepened to nine fathoms. At this time the weather, which had been hazy, clearing up a little, we saw land extending from south to south-east by east, about three or four miles distant. The eastern extreme forms a point, which was much encumbered with ice; for which reason it obtained the name of Icy Cape. Its latitude is $79^{\circ} 29'$, and its longitude $198^{\circ} 20'$. The other extreme of the land was lost in the horizon; so that there can be no doubt of its being a continuation of the American continent. The Discovery being about a mile astern, and to leeward, found less water than we did, and tacking on that account, I was obliged to tack also, to prevent separation. Our situation was now more and more critical. We were in shoal water upon a lee shore; and the main body of the ice to windward, driving down upon us. It was evident that if we remained much longer between it and the land, it would force us ashore, unless it should happen to take the ground before us. It seemed nearly to join the land to leeward; and the only direction that was open was to the south-west. After making a short board to the northward, I made the signal for the Discovery to tack, and tacked myself at the same time. The wind proved rather favourable, so that we lay up south-west, and south-west by west.

At eight in the morning of the 19th, the wind veering back to west, I tacked to the northward; and at noon the latitude was $70^{\circ} 6'$, and the longitude $196^{\circ} 42'$. In this situation we had a good deal of drift-ice about us; and the main ice was about two leagues to the north. At half past one we got in with the edge of it. It was not so compact as that which we had seen to the northward; but it was too close, and in too large pieces, to attempt forcing the ships through it. On the ice lay a prodigious number of sea-horses; and as we were in want of fresh provisions, the boats from each ship were sent to get some. By seven o'clock in the evening, we had received on board the Resolution nine of these animals, which, till now, we had supposed to be sea-cows, so that we were not a little disappointed, especially some of the seamen, who, for the novelty of the thing, had been feasting their eyes for some days past. Nor would they have been disappointed now, nor have known the difference, if we had not happened to have one or two on board, who had been in Greenland, and declared what animals these were, and that no one ever ate of them. But notwithstanding this, we lived upon them as long as they lasted; and there were few on board who did not prefer them to our salt meat.

The fat at first is as sweet as marrow; but in a few days it grows rancid, unless it be salted, in which state it will keep much longer. The lean flesh is coarse, black, and has rather a strong taste, and the heart is nearly as well tasted as that of a bullock. The fat when melted yields a good deal of oil, which burns very well in lamps, and their hides, which are very thick, were very useful about our rigging. The teeth, or tusks, of most of them were at this time very small, even some of the largest and oldest of these animals had them not exceeding six inches in length. From this we concluded that they had lately shed their old teeth. They lie in herds of many hundreds upon the ice, huddling one over the other like swine, and roar or bray very loud; so that in the night, or in foggy weather, they gave us notice of the vicinity of the ice, before we could see it. We never found the whole herd asleep, some being always upon the watch. These, on the approach of the boat, would wake those next to them, and the alarm being thus gradually communicated, the whole herd would be awake presently. But they were seldom in a hurry to get away, till after they had been once fired at. Then they would tumble one over the other into the sea, in the utmost confusion. And if we did not, at the first discharge, kill those we fired at, we generally lost them, though mortally wounded. They did not appear to us to be that dangerous animal some authors have described, not even when attacked. They are rather more so to appearance than in reality. Vast numbers of them would follow, and come close up to the boats; but the flash of a musket in the pan, or even the bare pointing of one

at them, would send them down in an instant. The female will defend the young one to the very last, and at the expense of her own life, whether in the water or upon the ice. Nor will the young one quit the dam, though she be dead, so that, if you kill one, you are sure of the other. The dam, when in the water, holds the young one between her fore-fins.

Mr. Pennant, in his "Synopsis Quadr.," p. 335, has given a very good description of this animal, under the name of Arctic Walrus; but I have nowhere seen a good drawing of one. Why they should be called sea-horses is hard to say, unless the word be a corruption of the Russian name Morse; for they have not the least resemblance of a horse. This is, without doubt, the same animal that is found in the Gulf of St. Laurence, and there called sea-cow. It is certainly more like a cow than a horse, but this likeness consists in nothing but the snout. In short, it is an animal like a seal, but incomparably larger. The dimensions and weight of one, which was none of the largest, were as follow:

I could not find out what these animals feed upon. There was nothing in the maws of those we killed*.

It is worth observing, that, for some days before this date, we had frequently seen flocks of ducks flying to the southward. They were of two sorts, the one much larger than the other. The largest were of a brown colour; and, of the small sort, either the duck or drake was black and white, and the other brown. Some said they saw geese also. Does not this indicate that there must be land to the north, where these birds find shelter in the proper season, to breed, and from whence they were now returning to a warmer climate?

By the time we had got our sea-horses on board we were, in a manner, surrounded with the ice, and had no way left to clear it but by standing to the southward, which was done till three o'clock next morning, with a gentle breeze westerly, and for the most part thick, foggy, weather. The soundings were from twelve to fifteen fathoms. We then tacked and stood to the N. till ten o'clock, when the wind veering to the northward, we directed our course to the W.S.W. and W. At two in the afternoon we fell in with the main ice, along the edge of which we kept, being partly directed by the roaring of the sea-horses; for we had a very thick fog. Thus we continued sailing till near midnight, when we got in amongst the loose ice, and heard the surge of the sea upon the main ice.

The fog being very thick, and the wind easterly, I now hauled to the southward; and at ten o'clock the next morning, the fog clearing away, we saw the continent of America, extending from S. by E. to E. by S.; and at noon from S. W. half S. to E., the nearest part five leagues distant. At this time we were in the latitude of 69° 32', and in the longitude of 195° 48'; and as the main ice was at no great distance from us, it is evident, that it now covered a part of the sea which, but a few days before, had been clear; and that it extended farther to the S. than where we first fell in with it. It must not be understood

* In Griffiths' "Animal Kingdom, by Cuvier," we are told that, "Some say these animals eat the shell-fish at the bottom of the sea. Others assert that they only eat seaweed, with large leaves, and are not carnivorous. The form of the molar teeth would indicate the morse to be om-

nivorous; but its stomach, like that of the seal, simple and membranous, would show that it lived in the same way as these animals." The seal feeds on fish, which, after an imperfect mastication, it swallows entire.—Ed.

that I supposed any part of this ice which we had seen to be fixed; on the contrary, I am well assured that the whole was a moveable mass. Having but little wind, in the afternoon I sent the master in a boat to try if there was any current; but he found none. I continued to steer in for the American land, until eight o'clock, in order to get a nearer view of it, and to look for a harbour, but seeing nothing like one, I stood again to the N., with a light breeze westerly. At this time the coast extended from S.W. to E., the nearest part four or five leagues distant. The southern extreme seemed to form a point, which was named Cape Lisburne. It lies in the latitude of $69^{\circ} 5'$, and in the longitude of $194^{\circ} 42'$, and appeared to be pretty high land, even down to the sea. But there may be low land under it, which we might not see, being not less than ten leagues from it. Everywhere else, as we advanced northward, we had found a low coast, from which the land rises to a middle height. The coast now before us was without snow, except in one or two places, and had a greenish hue. But we could not perceive any wood upon it.

On the 22nd, the wind was southerly, and the weather mostly foggy, with some intervals of sunshine. At eight in the evening it fell calm, which continued till midnight, when we heard the surge of the sea against the ice, and had several loose pieces about us. A light breeze now sprang up at N.E., and as the fog was very thick I steered to the southward, to clear the ice. At eight o'clock next morning the fog dispersed, and I hauled to the westward. For finding that I could not get to the N. near the coast, on account of the ice, I resolved to try what could be done at a distance from it; and as the wind seemed to be settled at N., I thought it a good opportunity. As we advanced to the W., the water deepened gradually to twenty-eight fathoms, which was the most we had. With the northerly wind the air was raw, sharp and cold; and we had fogs, sunshine, showers of snow and sleet, by turns. At ten in the morning of the 26th, we fell in with the ice. At noon it extended from N.W. to E. by N., and appeared to be thick and compact. At this time, we were, by observation, in the latitude of $69^{\circ} 36'$, and in the longitude of 184° , so that it now appeared we had no better prospect of getting to the N. here, than nearer the shore.

I continued to stand to the westward, till five in the afternoon, when we were in a manner embayed by the ice, which appeared high and very close in the N.W. and N.E. quarters, with a great deal of loose ice about the edge of the main field. At this time we had baffling light winds, but it soon fixed at S., and increased to a fresh gale, with showers of rain. We got the tack aboard, and stretched to the eastward; this being the only direction in which the sea was clear of ice. At four in the morning of the 27th, we tacked and stood to the W., and at seven in the evening we were close in with the edge of the ice, which lay E.N.E. and W.S.W., as far each way as the eye could reach. Having but little wind, I went with the boats to examine the state of the ice. I found it consisting of loose pieces of various extent, and so close together, that I could hardly enter the outer edge with a boat; and it was as impossible for the ships to enter it, as if it had been so many rocks. I took particular notice that it was all pure transparent ice, except the upper surface, which was a little porous. It appeared to be entirely composed of frozen snow, and to have been all formed at sea. For setting aside the improbability, or rather impossibility, of such huge masses floating out of rivers, in which there is hardly water for a boat, none of the productions of the land were found incorporated or fixed in it; which must have unavoidably been the case, had it been formed in rivers, either great or small. The pieces of ice that formed the outer edge of the field, were from forty to fifty yards in extent to four or five; and I judged that the larger pieces reached thirty feet or more under the surface of the water. It also appeared to me very improbable that this ice could have been the production of the preceding winter alone; I should suppose it rather to have been the production of a great many winters. Nor was it less improbable, according to my judgment, that the little that remained of the summer could destroy the tenth part of what now subsisted of this mass, for the sun had already exerted upon it the full influence of his rays. Indeed I am of opinion that the sun contributes very little toward reducing these great masses. For although that luminary is a considerable while above the horizon, it seldom shines out for more than a few hours at a time, and is not seen for several days in succession. It is the wind, or rather the waves raised by the wind, that bring

down the bulk of these enormous masses, by grinding one piece against another, and by undermining and washing away those parts that lie exposed to the surge of the sea. This was evident from our observing that the upper surface of many pieces had been partly washed away, while the base or under part remained firm for several fathoms round that which appeared above water, exactly like a shoal round an elevated rock. We measured the depth of water upon one, and found it to be fifteen feet, so that the ships might have sailed over it. If I had not measured this depth, I should not have believed that there was a sufficient weight of ice above the surface, to have sunk the other so much below it. Thus it may happen, that more ice is destroyed in one stormy season than is formed in several winters, and an endless accumulation is prevented. But that there is always a remaining store every one who has been upon the spot will conclude, and none but closet-studying philosophers will dispute.

A thick fog, which came on while I was thus employed with the boats, hastened me aboard rather sooner than I could have wished, with one sea-horse to each ship. We had killed more, but could not wait to bring them with us. The number of these animals on all the ice that we had seen is almost incredible. We spent the night standing off and on, amongst the drift ice; and at nine o'clock the next morning, the fog having partly dispersed, boats from each ship were sent for sea-horses. For, by this time, our people began to relish them, and those we had procured before were all consumed. At noon, our latitude was $69^{\circ} 17'$, our longitude 183° ; the variation, by the morning azimuths, $25^{\circ} 55'$ E.; and the depth of water twenty-five fathoms. At two o'clock, having got on board as much marine beef as was thought necessary, and the wind freshening at S.S.E., we took on board the boats, and stretched to the S.W.; but not being able to weather the ice upon this tack, or to go through it, we made a board to the E., till eight o'clock, then resumed our course to the S.W., and before midnight were obliged to tack again, on account of the ice. Soon after, the wind shifted to the N.W., blowing a stiff gale, and we stretched to the S.W., close hauled.

In the morning of the 29th, we saw the main ice to the northward, and not long after, land bearing south-west by west. Presently after this, more land showed itself, bearing west. It showed itself in two hills like islands, but afterward the whole appeared connected. As we approached the land, the depth of water decreased very fast; so that at noon, when we tacked, we had only eight fathoms; being three miles from the coast, which extended from south, 30° east, to north, 60° west. This last extreme terminated in a bluff point, being one of the hills above mentioned. The weather at this time was very lazy, with drizzling rain; but soon after, it cleared; especially to the southward, westward, and northward. This enabled us to have a pretty good view of the coast; which, in every respect, is like the opposite one of America; that is, low land next the sea, with elevated land farther back. It was perfectly destitute of wood, and even snow; but was, probably, covered with a mossy substance, that gave it a brownish cast. In the low ground lying between the high land and the sea, was a lake, extending to the south-east, farther than we could see. As we stood off, the westernmost of the two hills before mentioned came open off the bluff point, in the direction of north-west. It had the appearance of being an island; but it might be joined to the other by low land, though we did not see it. And if so, there is a two-fold point, with a bay between them. This point, which is steep and rocky, was named Cape North. Its situation is nearly in the latitude of $58^{\circ} 56'$, and in the longitude of $180^{\circ} 51'$. The coast beyond it must take a very westerly direction; for we could see no land to the northward of it, though the horizon was there pretty clear. Being desirous of seeing more of the coast to the westward, we tacked again, at two o'clock in the afternoon, thinking we could weather Cape North. But finding we could not, the wind freshening, a thick fog coming on, with much snow, and being fearful of the ice coming down upon us, I gave up the design I had formed of plying to the westward, and stood off shore again.

The season was now so far advanced, and the time when the frost is expected to set in so near at hand, that I did not think it consistent with prudence, to make any farther attempts to find a passage into the Atlantic this year, in any direction; so little was the prospect of succeeding. My attention was now directed toward finding out some place where we might

supply ourselves with wood and water; and the object uppermost in my thoughts was, how I should spend the winter, so as to make some improvements in geography and navigation, and, at the same time, be in a condition to return to the north, in farther search of a passage, the ensuing summer.

AFTER having stood off till we got into eighteen fathoms water, I bore up to the eastward, along the coast, which, by this time, it was pretty certain, could only be the continent of Asia. As the wind blew fresh, with a very heavy fall of snow, and a thick mist, it was necessary to proceed with great caution. I therefore brought-to for a few hours in the night. At daybreak on the 30th we made sail, and steered such a course as I thought would bring us in with the land; being in a great measure guided by the lead; for the weather was as thick as ever, and it snowed incessantly. At ten we got sight of the coast, bearing south-west, four miles distant; and presently after, having shoaled the water to seven fathoms, we hauled off. At this time, a very low point, or spit, bore south-south-west, four miles distant; to the east of which there appeared to be a narrow channel, leading into some water that we saw over the point. Probably, the lake before mentioned communicates here with the sea. At noon, the mist dispersing for a short interval, we had a tolerably good view of the coast, which extended from south-east to north-west by west. Some parts appeared higher than others; but in general it was very low, with high land farther up the country. The whole was now covered with snow, which had lately fallen, quite down to the sea. I continued to range along the coast, at two leagues distance, till ten at night, when we hauled off; but we resumed our course next morning soon after daybreak, when we got sight of the coast again, extending from west to south-east by south. At eight, the eastern part bore south, and proved to be an island; which at noon bore south-west half south, four or five miles distant. It is about four or five miles in circuit, of a middling height, with a steep rocky coast, situated about three leagues from the main, in the latitude of $67^{\circ} 45'$, and distinguished in the chart by the name of Burney's Island.

The inland country hereabout is full of hills; some of which are of a considerable height. The land was covered with snow, except a few spots upon the sea-coast, which still continued low, but less so than farther westward. For the two preceding days, the main height of the mercury in the thermometer had been very little above the freezing point, and often below it; so that the water in the vessels upon the deck was frequently covered with a sheet of ice. I continued to steer south-south-east, nearly in the direction of the coast, till five in the afternoon, when land was seen bearing south, 50° east, which we presently found to be a continuation of the coast, and hauled up for it. Being abreast of the eastern land, at ten at night, and in doubts of weathering it, we tacked and made a board to the westward, till past one the next morning, when we stood again to the east, and found that it was as much as we could do to keep our distance from the coast, the wind being exceedingly unsettled, varying continually from north to north-east. At half an hour past eight, the eastern extreme above mentioned bore south by east, six or seven miles distant. At the same time, a head-land appeared in sight, bearing east by south, half south; and, soon

thoughts was, how

miles distant. At the
half south; and, soon

after, we could trace the whole coast lying between them, and a small island at some distance from it.

The coast seemed to form several rocky points, connected by a low shore, without the least appearance of a harbour. At some distance from the sea, the low land appeared to swell into a number of hills. The highest of these were covered with snow; and, in other respects, the whole country seemed naked. At seven in the evening, two points of land, at some distance beyond the eastern head, opened off it in the direction of south, 37° east. I was now well assured of what I had believed before, that this was the country of the Tschutski, or the north-east coast of Asia; and that thus far Beering proceeded in 1728; that is, to this head which Muller says is called Serdze Kamen, on account of a rock upon it, shaped like a heart. But I conceive, that Mr. Muller's knowledge of the geography of these parts is very imperfect. There are many elevated rocks upon this cape, and possibly some one or other of them may have the shape of a heart. It is a pretty lofty promontory, with a steep rocky cliff facing the sea; and lies in the latitude of $67^{\circ} 3'$, and in the longitude of $188^{\circ} 11'$. To the eastward of it the coast is high and bold; but to the westward it is low, and trends north-north-west, and north-west by west; which is nearly its direction all the way to Cape North. The soundings are everywhere the same at the same distance from the shore, which is also the case on the opposite shore of America. The greatest depth we found in ranging along it was twenty-three fathoms. And, in the night, or in foggy weather, the soundings are no bad guide in sailing along either of these shores.

At eight o'clock in the morning of the 2nd, the most advanced land to the south-east, bore south, 25° east; and from this point of view had the appearance of being an island. But the thick snow-showers, which succeeded one another pretty fast, and settled upon the land, hid great part of the coast at this time from our sight. Soon after, the sun, whose face we had not seen for near five days, broke out at the intervals between the showers; and, in some measure, freed the coast from the fog, so that we had a sight of it, and found the whole to be connected. The wind still continued at north, the air was cold, and the mercury in the thermometer never rose above 35° , and was sometimes as low as 30° . At noon, the observed latitude was $66^{\circ} 37'$. Cape Serdze Kamen bore north, 52° west, thirteen leagues distant; the southernmost point of land in sight south, 41° east; the nearest part of the coast two leagues distant, and our depth of water twenty-two fathoms. We had now fair weather and sunshine; and as we ranged along the coast, at the distance of four miles, we saw several of the inhabitants, and some of their habitations, which looked like little hillocks of earth. In the evening we passed the Eastern Cape, or the point above mentioned; from which the coast changes its direction, and trends south-west. It is the same point of land which we had passed on the 11th of August. They who believed implicitly in Mr. Stæhlin's map, then thought it the east point of his island Alaschka; but we had by this time satisfied ourselves, that it is no other than the eastern promontory of Asia; and probably the proper Tschukotskoi Noss, though the promontory to which Beering gave that name, is farther to the south-west.

Though Mr. Muller, in his map of the Russian Discoveries, places the Tschukotskoi Noss nearly in 75° of latitude, and extends it somewhat to the eastward of this cape, it appears to me, that he had no good authority for so doing. Indeed his own accounts, or rather Deshneff's*, of the distance between the Noss and the river Anadir cannot be reconciled with this very northerly position. But as I hope to visit these parts again, I shall leave the discussion of this point till then. In the mean time, I must conclude, as Beering did before me, that this is the most eastern point of Asia. It is a peninsula of considerable height, joined to the continent by a very low, and, to appearance, narrow neck of land. It shows a steep rocky cliff next the sea; and off the very point are some rocks like spires. It is situated in the latitude of $66^{\circ} 6'$, and in the longitude of $190^{\circ} 22'$; and is distant from Cape Prince of Wales, on the American coast, thirteen leagues, in the direction of north, 53° west. The land about this promontory is composed of hills and valleys. The former

* "Avec le vent le plus favorable, on peut aller par en trois fois 24 heures; et par terre le chemin ne peu-
mer de cette pointe (des Tschuktschis) jusqu'à l'Anadir guère être plus long." Muller, p. 13.

terminate at the sea in steep rocky points, and the latter in low shores. The hills seemed to be naked rocks; but the valleys had a greenish hue, but destitute of tree or shrub.

After passing the cape, I steered south-west half west, for the northern point of St. Laurence Bay, in which we had anchored on the 10th of last month. We reached it by eight o'clock next morning, and saw some of the inhabitants at the place where I had seen them before, as well as several others on the opposite side of the bay. None of them, however, attempted to come off to us; which seemed a little extraordinary, as the weather was favourable enough; and those whom we had lately visited had no reason that I know of to dislike our company. These people must be the Tschutski; a nation that, at the time Mr. Muller wrote, the Russians had not been able to conquer. And, from the whole of their conduct with us, it appears that they have not, as yet, brought them under subjection; though it is obvious that they must have a trade with the Russians, either directly, or by means of some neighbouring nation; as we cannot otherwise account for their being in possession of the spoons, in particular, of which we took notice.

This Bay of St. Laurence* is, at least, five leagues broad at the entrance, and four leagues deep, narrowing toward the bottom, where it appeared to be tolerably well sheltered from the sea-winds, provided there be sufficient depth of water for ships. I did not wait to examine it, although I was very desirous of finding a harbour in those parts, to which I might resort next spring. But I wanted one where wood might be got, and I knew that none was to be found here. From the south point of this bay, which lies in the latitude of $65^{\circ} 30'$, the coast trends west by south, for about nine leagues, and there forms a deep bay, or river; or else the land there is so low that we could not see it.

At one in the afternoon, in the direction of our course, we saw what was first taken for a rock; but it proved to be a dead whale, which some natives of the Asiatic coast had killed, and were towing ashore. They seemed to conceal themselves behind the fish, to avoid being seen by us. This was unnecessary; for we pursued our course without taking any notice of them. At day-break on the 4th, I hauled to the north-west, in order to get a nearer view of the inlet seen the preceding day; but the wind soon after veering to that direction, I gave up the design; and, steering to the southward along the coast, passed two bays, each about two leagues deep. The northernmost lies before a hill, which is remarkable by being rounder than any other upon the coast. And there is an island lying before the other. It may be doubted, whether there be a sufficient depth for ships in either of these bays, as we always met with shoal water when we edged in for the shore. The country here is exceedingly hilly and naked. In several places on the low ground, next the sea, were the dwellings of the natives; and near all of them were erected stages of bones, such as before described. These may be seen at a great distance, on account of their whiteness.

At noon the latitude was $64^{\circ} 38'$, and the longitude $188^{\circ} 15'$; the southernmost point of the main in sight bore south 48° W., and the nearest shore about three or four leagues distant. By this time the wind had veered again to the north, and blew a gentle breeze. The weather was clear, and the air cold. I did not follow the direction of the coast, as I found that it took a westerly direction toward the Gulf of Anadir, into which I had no inducement to go, but steered to the southward, in order to get a sight of the island of St. Laurence, discovered by Beering, which accordingly showed itself; and at eight o'clock in the evening, it bore south 20° E., by estimation eleven leagues distant. At the same time the southernmost point of the main land bore south 83° W., distant twelve leagues. I take this point to be the point which Beering calls the east point of Suchotski, or Cape Tschukotskoi; a name which he gave it, and with propriety, because it was from this part of the coast that the natives came off to him, who called themselves of the nation of the Tschutski. I make its latitude to be $64^{\circ} 13'$, and its longitude $186^{\circ} 36'$. In justice to the memory of Beering, I must say that he has delineated the coast very well, and fixed the latitude and longitude of the points better than could be expected from the methods he had to go by. This judgment is not formed from Mr. Muller's account of the voyage, or the chart prefixed to

* Captain Cook gives it this name, having anchored in August, 1778; on which account, the neighbouring island it on St. Laurence's day, August 10. It is remarkable, was named by him after the same Saint, that Beering sailed past this very place on the 10th of

his book, but from Dr. Campbell's account of it in his edition of Harris's Collection*, and a map thereto annexed, which is both more circumstantial and accurate than that of Mr. Muller.

The more I was convinced of my being now upon the coast of Asia, the more I was at a loss to reconcile Mr. Stæhlin's map of the New Northern Archipelago with my observations; and I had no way to account for the great difference, but by supposing that I had mistaken some part of what he calls the island of Alaschka for the American continent, and had missed the channel that separates them. Admitting even this, there would still have been a considerable difference. It was with me a matter of some consequence to clear up this point the present season, that I might have but one object in view the next. And, as these northern isles are represented by him as abounding with wood, I was in hopes, if I should find them, of getting a supply of that article, which we now began to be in great want of on board. With these views, I steered over for the American coast; and at five in the afternoon the next day, saw land bearing three quarters east, which we took to be Anderson's Island, or some other land near it, and therefore did not wait to examine it. On the 6th, at four in the morning, we got sight of the American coast near Sledge Island; and at six the same evening this island bore north 6° E., ten leagues distant; and the easternmost land in sight N. 49° E. If any part of what I had supposed to be American coast could possibly be the island of Alaschka, it was that now before us; and in that case, if I must have missed the channel between it and the main, by steering to the west instead of the east after we first fell in with it. I was not, therefore, at a loss where to go, in order to clear up these doubts.

At eight in the evening of the 7th, we had got close in with the land, Sledge Island bearing N. 85° W., eight or nine leagues distant; and the eastern part of the coast N. 70° E., with high land in the direction of east by north, seemingly at a great distance beyond the point. At this time we saw a light ashore, and two canoes filled with people coming off toward us. I brought-up, that they might have time to come up. But it was to no purpose, for, resisting all the signs of friendship we could exhibit, they kept at the distance of a quarter of a mile; so that we left them, and pursued our course along the coast. At one in the morning of the 8th, finding the water shoal pretty fast, we dropped anchor in ten fathoms, where we lay until daylight, and then resumed our course along the coast, which we found to trend east, and east half south. At seven in the evening we were abreast of a point lying in the latitude of $64^{\circ} 21'$, and in the longitude of 197° ; beyond which the coast takes a more northerly direction. At eight, this point, which obtained the name of Cape Darby, bore S. 62° W.; the northernmost land in sight, N. 32° E.; and the nearest shore three miles distant. In this situation we anchored, in thirteen fathoms' water, over a muddy bottom.

Next morning, at daybreak, we weighed and sailed along the coast. Two islands, as we supposed them to be, were at this time seen; the one bearing S. 70° E., and the other E. Soon after, we found ourselves upon a coast covered with wood; an agreeable sight, to which of late we had not been accustomed. As we advanced to the north, we raised land in the direction of north-east half north; which proved to be a continuation of the coast we were upon. We also saw high land over the islands, seemingly at a good distance beyond them. This was thought to be the continent, and the other land the island of Alaschka. But it was already doubtful whether we should find a passage between them, for the water shoaled insensibly as we advanced farther to the north. In this situation two boats were sent to sound before the ships; and I ordered the Discovery to lead, keeping nearly in the mid-channel, between the coast on our larboard and the northernmost island on our starboard. Thus we proceeded till three in the afternoon; when, having passed the island, we had not more than three fathoms and a half of water, and the Resolution at one time brought the mud up from the bottom. More water was not to be found in any part of the channel; for, with the ships and boats, we had tried it from side to side. I therefore thought it high time to return, especially as the wind was in such a quarter that we must ply back. But

* Vol. ii. p. 1016, &c.

what I dreaded most was the wind increasing and raising the sea into waves, so as to put the ships in danger of striking. At this time a headland on the west shore, which is distinguished by the name of Bald Head, bore north by west, one league distant. The coast beyond it extended as far north-east by north, where it seemed to end in a point, behind which the coast of the high land, seen over the islands, stretched itself; and some thought they could trace where it joined. On the west side of Bald Head the shore forms a bay, in the bottom of which is a low beach, where we saw a number of huts or habitations of the natives.

Having continued to ply back all night, by daybreak the next morning we had got into six fathoms' water. At nine o'clock, being about a league from the west shore, I took two boats and landed attended by Mr. King, to seek wood and water. We landed where the coast projects out into a bluff head, composed of perpendicular strata of a rock of a dark blue colour, mixed with quartz and glimmer. There joins to the beach a narrow border of land, now covered with long grass, and where we met with some angelica. Beyond this the ground rises abruptly. At the top of this elevation we found a heath, abounding with a variety of berries; and further on the country was level, and thinly covered with small spruce trees, and birch and willows no bigger than broom stuff. We observed tracks of deer and foxes on the beach, on which also lay a great quantity of drift-wood; and there was no want of fresh water. I returned on board with an intention to bring the ships to an anchor here; but the wind then veering to north-east, which blew rather on this shore, I stretched over to the opposite one, in the expectation of finding wood there also, and anchored at eight o'clock in the evening, under the south end of the northernmost island, so we then supposed it to be; but, next morning we found it to be a peninsula, united to the continent by a low neck of land, on each side of which the coast forms a bay. We plied into the southernmost, and about noon anchored in five fathoms' water, over a bottom of mud; the point of the peninsula, which obtained the name of Cape Denbigh, bearing N. 68° W., three miles distant.

Several people were seen upon the peninsula; and one man came off in a small canoe. I gave him a knife and a few beads, with which he seemed well pleased. Having made signs to him to bring us something to eat, he immediately left us, and paddled toward the shore. But meeting another man coming off, who happened to have two dried salmon, he got them from him; and on returning to the ship, would give them to nobody but me. Some of our people thought that he asked for me under the name of *Capitane*; but in this they were probably mistaken. He knew who had given him the knife and beads, but I do not see how he could know that I was the captain. Others of the natives soon after came off, and exchanged a few dry fish for such trifles as they could get, or we had to give them. They were most desirous of knives; and they had no dislike to tobacco.

After dinner Lieutenant Gore was sent to the peninsula, to see if wood and water were there to be got; or rather water, for the whole beach round the bay seemed to be covered with drift-wood. At the same time a boat was sent from each ship, to sound round the bay; and at three in the afternoon, the wind freshening at north-east, we weighed, in order to work farther in. But it was soon found to be impossible, on account of the shoals, which extended quite round the bay, to the distance of two or three miles from the shore; as the officers who had been sent to sound reported. We therefore kept standing off and on with the ships, waiting for Mr. Gore, who returned about eight o'clock, with the launch laden with wood. He reported that there was but little fresh water, and that wood was difficult to be got at, by reason of the boats grounding at some distance from the beach. This being the case, I stood back to the other shore; and at eight o'clock the next morning, sent all the boats, and a party of men with an officer, to get wood from the place where I had landed two days before. We continued, for a while, to stand on and off with the ships; but at length came to an anchor in one-fourth less than five fathoms, half a league from the coast, the south point of which bore south, 26° W.; and Bald Head north, 60° E., nine leagues distant. Cape Denbigh bore south 72° E., twenty-six miles distant; and the island under the east shore, to the southward of Cape Denbigh, named Besborough Island, south 52° E. fifteen leagues distant.

As this was a very open road, and consequently not a safe station, I resolved not to wait to complete water, as that would require some time, but only to supply the ships with wood, and then to go in search of a more convenient place for the other article. We took off the drift-wood that lay upon the beach; and as the wind blew along-shore, the boats could sail both ways, which enabled us to make great despatch. In the afternoon I went ashore, and walked a little into the country; which, where there was no wood, was covered with heath and other plants, some of which produce berries in abundance. All the berries were ripe; the huckle-berries too much so; and hardly a single plant was in flower. The under-wood, such as birch, willows, and alders, rendered it very troublesome walking among the trees, which were all spruce, and none of them above six or eight inches in diameter. But we found some lying upon the beach more than twice this size. All the drift-wood in these northern parts was fir. I saw not a stick of any other sort.

Next day a family of the natives came near to the place where we were taking off wood. I know not how many there were at first; but I saw only the husband, the wife, and their child; and a fourth person, who bore the human shape, and that was all, for he was the most deformed cripple I had ever seen or heard of. The other man was almost blind; and neither he nor his wife were such good-looking people as we have sometimes seen amongst the natives of this coast. The under lips of both were bored; and they had in their possession some such glass beads as I had met with before amongst their neighbours. But iron was their beloved article; for four knives, which we had made out of an old iron hoop, I got from them near four hundred pounds weight of fish, which they had caught on this or the preceding day. Some were trout, and the rest were, in size and taste, somewhat between a mullet and a herring. I gave the child, who was a girl, a few beads; on which the mother burst into tears, then the father, then the cripple, and at last, to complete the concert, the girl herself. But this music continued not long.* Before night we had got the ships amply supplied with wood, and had carried on board about twelve tons of water to each.

On the 14th, a party of men were sent on shore to cut brooms, which we were in want of, and the branches of spruce-trees for brewing beer. Toward noon everybody was taken on board; for the wind freshening, had raised such a surf on the beach, that the boats could not continue to land without great difficulty. Some doubts being still entertained whether the coast we were now upon belonged to an island, or the American continent, and the shallowness of the water putting it out of our power to determine this with our ships, I sent Lieutenant King, with two boats under his command, to make such searches as might leave no room for a variety of opinions on the subject †. Next day the ships removed over

* Captain King has communicated the following account of his interview with the same family. "On the 12th, while I attended the wooding party, a canoe full of natives approached us; and, beckoning them to land, an elderly man and woman came on shore. I gave this woman a small knife, making her understand that I would give her a much larger one for some fish. She made signs to me to follow her. I had proceeded with them about a mile, when the man, in crossing a stony beach, fell down and cut his foot very much. This made me stop; upon which the woman pointed to the man's eyes, which I observed were covered with a thick white film. He afterward kept close to his wife, who apprised him of the obstacles in his way. The woman had a little child on her back, covered with the hood of her jacket; and which I took for a bundle, till I heard it cry. At about two miles' distance we came to their open skin-boat, which was turned on its side, the convex part toward the wind, and served for their house. I was now made to perform a singular operation on the man's eyes. First, I was directed to hold my breath; afterward, to breathe on the diseased eyes; and next, to spit on them. The woman then took both my hands, and pressing them to his stomach, held them there for some time, while she related some calamitous history of her family, pointing

sometimes to her husband, sometimes to a frightful cripple belonging to the family, and sometimes to her child. I purchased all the fish they had, consisting of a very fine salmon, salmon-trout, and mullet; which were delivered most faithfully to the man I sent for them. The man was about five feet two inches high, and well made; his colour of a bright copper; his hair black and short, and with little bald. He had two holes in his under lip, but no ornaments in them. The woman was short and squat, with a large round face; wore a deer-skin jacket, with a large hood; and had on wide boots. The teeth of both were black, and seemed as if they had been filed down level with the gums. The woman was punctured from the lip to the chin."

† Captain King has been so good as to communicate his instructions on this occasion, and the particulars of the fatigue he underwent in carrying them into execution:

"You are to proceed to the northward as far as the extreme point we saw on Wednesday last, or a little further, if you think it necessary; land there, and endeavour, from the heights, to discover whether the land you are then upon, supposed to be the island of Alasclka, is really an island, or joins to the land on the east, supposed to be the continent of America. If the former, you are to satisfy yourself with the depth of water in

to the bay, which is on the south-east side of Cape Denbigh, where we anchored in the afternoon. Soon after, a few of the natives came off in their small canoes, and bartered some dried salmon for such trifles as our people had to give them.

At daybreak, on the 16th, nine men, each in his canoe, paid us a visit. They approached the ship with some caution; and evidently came with no other view than to gratify their curiosity. They drew up abreast of each other, under our stern, and gave us a song; while one of their number beat upon a kind of drum, and another made a thousand antic motions with his hands and body. There was, however, nothing savage, either in the song or in the gestures that accompanied it. None of us could perceive any difference between these people, either as to their size or features, and those whom we had met with on every other part of the coast, King George's Sound excepted. Their clothing, which consisted principally of deer-skins, was made after the same fashion; and they observed the custom of boring their under lips, and fixing ornaments to them. The dwellings of these people were seated close to the beach. They consist simply of a sloping roof, without any side-walls, composed of logs, and covered with grass and earth. The floor is also laid with logs; the entrance is at one end; the fire-place just within it; and a small hole is made near the door to let out the smoke.

After breakfast, a party of men were sent to the peninsula for brooms and spruce. At the same time half the remainder of the people in each ship had leave to go and pick berries. These returned on board at noon, when the other half went on the same errand. The berries to be got here were wild currant-berries, huckle-berries, partridge-berries, and heath-berries. I also went ashore myself, and walked over part of the peninsula. In several places there was very good grass; and I hardly saw a spot on which some vegetable was not growing. The low land which connects this peninsula with the continent is full of narrow creeks, and abounds with ponds of water, some of which were already frozen over. There were a great many geese and bustards, but so shy that it was not possible to get within musket-shot of them. We also met with some snipes; and on the high ground were partridges of two sorts. Where there was any wood, mosquitoes were in plenty. Some of the officers, who travelled farther than I did, met with a few of the natives of both sexes, who treated them with civility. It appeared to me that this peninsula must have been an island in remote times; for there were marks of the sea having flowed over the isthmus. And, even now, it appeared to be kept out by a bank of sand, stones, and

the channel between them, and which way the flood-tide comes. But if you find the two lands connected, lose no time in sounding; but make the best of your way back to the ship, which you will find at anchor near the point of land we anchored under on Friday last. If you perceive any likelihood of a change of weather for the worse, you are, in that case, to return to the ship, although you have not performed the service you are sent upon. And, at any rate, you are not to remain longer upon it than four or five days; but the sooner it is done the better. If any unforeseen or unavoidable accident should force the ships off the coast, so that they cannot return at a reasonable time, the rendezvous is at the harbour of Sanganootha; that is, the place where we last completed our water.

"To Lieutenant King."

"JAMES COOK."

"Our cutter being hoisted out, and the signal made for the Discovery's, at eight at night, on the 14th, we set out. It was a little unlucky that the boats' crews had been much fatigued during the whole day in bringing things from the shore. They pulled stoutly, without rest or intermission, toward the land, till one o'clock in the morning of the 15th. I wanted much to have got close to it, to have had the advantage of the wind, which had very regularly, in the evening, blown from the land, and in the day-time down the sound, from the N.N.E., and was contrary to our course; but the men were, at this time, too much fatigued to press them farther. We therefore set our

sails, and stood across the bay, which the coast forms to the west of Bald Head, and steered for it. But, as I expected, by three o'clock, the wind headed us; and as it was in vain to endeavour to fetch Bald Head with our sails, we again took to the oars. The Discovery's boat (being a heavy king's-built cutter, while ours was one from Deal) had, in the night-time, detained us very much, and now we soon pulled out of sight of her; nor would I wait, being in great hopes to reach the extreme point that was in sight, time enough to ascend the heights before dark, as the weather was at this time remarkably clear and fine; and we could see to a great distance. By two o'clock we had got within two miles of Bald Head, under the lee of the high land, and in smooth water; but at the moment our object was nearly attained, all the men, but two, were so overcome with fatigue and sleep, that my utmost endeavours to make them put on were ineffectual. They, at length, dropped their oars, quite exhausted, and fell asleep in the bottom of the boat. Indeed, considering that they had set out fatigued, and had now been sixteen hours, out of the eighteen since they left the ship, pulling in a poppling sea, it was no wonder that their strength and spirits should be worn out for want of sleep and refreshments. The two gentlemen who were with me, and myself, were now obliged to lay hold of the oars, and by a little after three, we landed between the Bald Head and a projecting point to the eastward."

wood, thrown up by the waves. By this bank it was evident that the land was here encroaching upon the sea, and it was easy to trace its gradual formation.

About seven in the evening, Mr. King returned from his expedition, and reported that he proceeded with the boats about three or four leagues farther than the ships had been able to go; that he then landed on the west side; that from the heights, he could see the two coasts join, and the inlet to terminate in a small river or creek, before which were banks of sand or mud, and everywhere shoal water. The land too was low and swampy for some distance to the northward; then it swelled into hills, and the complete junction of those on each side of the inlet was easily traced. From the elevated spot on which Mr. King surveyed the Sound, he could distinguish many extensive valleys, with rivers running through them, well wooded, and bounded by hills of a gentle ascent and moderate height. One of these rivers to the north-west appeared to be considerable; and, from its direction, he was inclined to think that it emptied itself into the sea at the head of the bay. Some of his people, who penetrated beyond this into the country, found the trees larger, the farther they advanced.

In honour of Sir Fletcher Norton*, Speaker of the House of Commons, and Mr. King's near relation, I named this inlet Norton's Sound. It extends to the northward as far as latitude of $64^{\circ} 55'$. The bay, in which we were now at anchor, lies on the south-east side of it, and is called by the natives Chacktoole. It is but an indifferent station, being exposed to the south and south-west winds. Nor is there a harbour in all this Sound. But we were so fortunate as to have the wind from the north and north-east all the time, with remarkably fine weather. This gave us an opportunity to make no less than seventy-seven sets of lunar observations, between the 6th and 17th inclusive. The mean result of these made the longitude of the anchoring-place, on the west side of the Sound, to be

	197° 13'

Of the tides it was observed, that the night-flood rose about two or three feet, and that the day-flood was hardly perceivable.

Having now fully satisfied myself that Mr. Stæhlin's map must be erroneous, and having restored the American continent to that space which he had occupied with his imaginary island of Alaschka, it was high time to think of leaving these northern regions, and to retire to some place during the winter, where I might procure refreshments for my people, and a small supply of provisions. Petropaulowska, or the harbour of St. Peter and St. Paul, in Kamtschatka, did not appear likely to furnish either the one or the other, for so large a number of men. I had, besides, other reasons for not repairing thither at this time. The first, and on which all the others depended, was the great dislike I had to lie inactive for six or seven months; which would have been the necessary consequence of wintering in any of these northern parts. No place was so conveniently within our reach, where we could expect to have our wants supplied, as the Sandwich Islands. To them, therefore, I determined to proceed. But before this could be carried into execution, a supply of water was necessary. With this view, I resolved to search the American coast for a harbour, by proceeding along it to the southward, and thus endeavour to connect the survey of this part of it with that lying immediately to the north of Cape Newenham. If I failed in finding a harbour there, my plan was then to proceed to Samganoodha, which was fixed upon as our place of rendezvous, in case of separation.

* Afterwards Lord Grantley.

HAVING weighed, on the 17th, in the morning, with a light breeze at east, we steered to the southward, and attempted to pass within Besborough Island; but though it lies six or seven miles from the continent, were prevented by meeting with shoal water. As we had but little wind all the day, it was dark before we passed the island; and the night was spent under an easy sail. We resumed our course, at daybreak on the 18th, along the coast. At noon we had no more than five fathoms' water. At this time the latitude was $63^{\circ} 37'$. Besborough Island now bore N. 42° E.; the southernmost land in sight, which proved also to be an island, S. 66° W.; the passage between it and the main S. 40° W.; and the nearest land about two miles distant. I continued to steer for this passage, until the boats, which were ahead, made the signal for having no more than three fathoms' water. On this we hauled without the island, and made the signal for the Resolution's boat to keep between the ships and the shore.

This island, which obtained the name of Stuart's Island, lies in the latitude of $63^{\circ} 35'$, and seventeen leagues from Cape Denbigh, in the direction of S., 27° W. It is six or seven leagues in circuit. Some parts of it are of a middling height, but in general it is low, with some rocks lying off the western part. The coast of the continent is, for the most part, low land; but we saw high land up the country. It forms a point opposite the island, which was named Cape Stephens, and lies in latitude $63^{\circ} 33'$, and in longitude $197^{\circ} 41'$. Some drift-wood was seen upon the shores, both of the island and of the continent; but not a tree was perceived growing upon either. One night anchor, upon occasion, between the N. E. side of this island and the continent, in the depth of five fathoms, sheltered from westerly, southerly, and easterly winds. But this station would be wholly exposed to the northerly winds, the land, in that direction, being at too great a distance to afford any security. Before we reached Stuart's Island, we passed two small islands, lying between us and the main, and as we ranged along the coast, several people appeared upon the shore, and, by signs, seemed to invite us to approach them.

As soon as we were without the island, we steered S. by W., for the southernmost point of the continent in sight, till eight o'clock in the evening, when, having shoaled the water from six fathoms to less than four, I tacked, and stood to the northward, into five fathoms, and then spent the night lying off and on. At the time we tacked, the southernmost point of land, the same which is mentioned above, and was named Point Shallow Water, bore S. $\frac{1}{2}$ E., seven leagues distant. We resumed our course to the southward at daybreak next morning; but shoal water obliged us to haul more to the westward. At length we got so far advanced upon the bank that we could not hold a N. N. W. course, meeting sometimes with only four fathoms. The wind blowing fresh at E. N. E., it was high time to look for deep water, and to quit a coast upon which we could no longer navigate with any degree of safety. I therefore hauled the wind to the northward, and gradually deepened the water to eight fathoms. At the time we hauled the wind, we were at least twelve leagues from the continent, and nine to the westward of Stuart's Island. No land was seen to the southward of Point Shallow Water, which I judge to lie in the latitude of 63° . So that between this latitude and Shoal Ness, in latitude 60° , the coast is entirely unexplored. Probably it is

accessible only to boats or very small vessels; or, at least, if there be channels for larger vessels, it would require some time to find them; and I am of opinion that they must be looked for near the coast. From the mast-head, the sea within us appeared to be checkered with shoals; the water was very much discoloured and muddy, and considerably fresher than at any of the places where we had lately anchored. From this I inferred that a considerable river runs into the sea in this unknown part.

As soon as we got into eight fathoms' water, I steered to the westward, and afterward more southerly, for the land discovered on the 5th, which, at noon the next day, bore S. W. by W., ten or eleven leagues distant. At this time we had a fresh gale at N., with showers of hail and snow at intervals, and a pretty high sea, so that we got clear of the shoals but just in time. As I now found that the land before us lay too far to the westward to be Anderson's Island, I named it Clerke's Island. It lies in the latitude of $63^{\circ} 15'$, and in the longitude of $190^{\circ} 30'$. It seemed to be a pretty large island, in which are four or more hills, all connected by low ground; so that at a distance it looks like a group of islands. Near its east part lies a small island, remarkable by having upon it three elevated rocks. Not only the greater island, but this small spot was inhabited. We got up to the northern point of Clerke's Island about six o'clock, and having ranged along its coast till dark, brought to during the night. At daybreak, next morning, we stood in again for the coast, and continued to range along it, in search of a harbour, till noon; when, seeing no likelihood of succeeding, I left it, and steered S. S. W., for the land which we had discovered on the 29th of July, having a fresh gale at N., with showers of sleet and snow. I remarked that as soon as we opened the channel which separates the two continents, cloudy weather, with snow showers, immediately commenced; whereas all the time that we were in Norton Sound, we had, with the same wind, clear weather. Might not this be occasioned by the mountains to the north of that place attracting the vapours, and hindering them to proceed any further?

At daybreak in the morning of the 23d, the land above-mentioned appeared in sight, bearing S. W., six or seven leagues distant. From this point of view, it resembled a group of islands, but it proved to be but one, of thirty miles in extent, in the direction of N. W. and S. E.; the S. E. end being Cape Upright, already taken notice of. The island is but narrow, especially at the low necks of land that connect the hills. I afterward found that it was wholly unknown to the Russians; and therefore considering it as a discovery of our own, I named it Gore's Island. It appeared to be barren, and without inhabitants; at least we saw none; nor did we see so many birds about it as when we first discovered it. But we saw some sea-otters, an animal which we had not met with to the north of this latitude. Four leagues from Cape Upright, in the direction of S., $72^{\circ} W.$, lies a small island, whose elevated summit terminates in several pinnacle rocks. On this account it was named Pinnacle Island. At two in the afternoon, after passing Cape Upright, I steered S. E. by S., for Samganoodlia, with a gentle breeze at N. N. W., being resolved to spend no more time in searching for a harbour amongst islands, which I now began to suspect had no existence; at least not in the latitude and longitude where modern map-makers have thought proper to place them. In the evening of the 24th, the wind veered to S. W. and S., and increased to a fresh gale. We continued to stretch to the eastward till eight o'clock in the morning of the 25th, when, in the latitude of $58^{\circ} 32'$, and in the longitude of $191^{\circ} 10'$, we tacked and stood to the west, and soon after, the gale increasing, we were reduced to two courses, and close-reefed main top-sails. Not long after, the Resolution sprung a leak, under the starboard futtock, which filled the spirit-room with water, before it was discovered; and it was so considerable as to keep one pump constantly employed. We durst not put the ship upon the other tack, for fear of getting upon the shoals that lie to the north-west of Cape Newenham; but continued standing to the west till six in the evening of the 26th, when we wore and stood to the eastward, and then the leak no longer troubled us. This proved that it was above the water-line, which was no small satisfaction. The gale was now over; but the wind remained at S. and S. W. for some days longer.

At length, on the 2nd of October at daybreak, we saw the island of Oonalashka, bearing S. E. But as this was to us a new point of view, and the land was obscured by a thick

haze, we were not sure of our situation till noon, when the observed latitude determined it. As all the harbours were alike to me, provided they were equally safe and convenient, I hauled into a bay that lies ten miles to the westward of Samganoodeha, known by the name of Egoochshac; but we found very deep water, so that we were glad to get out again. The natives, many of whom lived here, visited us at different times, bringing with them dried salmon and other fish, which they exchange with the seamen for tobacco. But a few days before, every ounce of tobacco that was in the ship had been distributed among them; and the quantity was not half sufficient to answer their demands. Notwithstanding this, so improvident a creature is an English sailor, that they were as profuse in making their bargains, as if we had now arrived at a port in Virginia; by which means, in less than eight-and-forty hours, the value of this article of barter was lowered above a thousand per cent.

At one o'clock in the afternoon of the 3rd, we anchored in Samganoodeha Harbour; and the next morning the carpenters of both ships were set to work to rip off the sheathing of and under the wale, on the starboard side abaft. Many of the seams were found quite open, so that it was no wonder that so much water had found its way into the ship. While we lay here, we cleared the fish and spirit rooms, and the after-hold; disposing things in such a manner that, in case we should happen to have any more leaks of the same nature, the water might find its way to the pumps. And besides this work, and completing our water, we cleared the fore-hold to the very bottom, and took in a quantity of ballast.

The vegetables which we had met with when we were here before, were now mostly in a state of decay; so that we were not a little benefited by the great quantities of berries everywhere found ashore. In order to avail ourselves as much as possible of this useful refreshment, one-third of the people, by turns, had leave to go and pick them. Considerable quantities of them were also procured from the natives. If there were any seeds of the scurvy in either ship, these berries, and the use of spruce-beer, which they had to drink every other day, effectually eradicated them. We also got plenty of fish, at first mostly salmon, both fresh and dried, which the natives brought us. Some of the fresh salmon was in high perfection, but there was one sort, which we called hook-nosed, from the figure of its head, that was but indifferent. We drew the seine several times, at the head of the bay, and caught a good many salmon trout, and once a halibut that weighed two hundred and fifty-four pounds. The fishery failing, we had recourse to hooks and lines. A boat was sent out every morning, and seldom returned without eight or ten halibut, which was more than sufficient to serve all our people; the halibut were excellent, and there were few who did prefer them to salmon. Thus we not only procured a supply of fish for present consumption, but had some to carry with us to sea. This enabled us to make considerable saving of our provisions, which was an object of no small importance.

On the 8th, I received, by the hands of an Oonalashka man named Derramoushk, a very singular present, considering the place. It was a rye loaf, or rather a pie made in the form of a loaf, for it enclosed some salmon, highly seasoned with pepper. This man had the like present for Captain Clerke, and a note for each of us, written in a character which none of us could read. It was natural to suppose that this present was from some Russians now in our neighbourhood, and therefore we sent, by the same hand, to these our unknown friends, a few bottles of rum, wine, and porter, which we thought would be as acceptable as anything we had besides; and we soon knew that in this we were not mistaken. I also sent, along with Derramoushk, Corporal Lediard* of the marines, an intelligent

* This Lediard, or Ledyard, as the name is properly spelt, is the same who afterwards distinguished himself by a most adventurous journey across Siberia, with the intention of passing Beering's Straits, and afterwards making his way over the continent of America. His main object in attempting this arduous expedition was the establishment of a fur trade between the western coast of America and China. He had nearly succeeded in traversing Siberia,

when he was seized by order of the Empress, and rapidly conveyed into Poland, where he was turned adrift, with orders never to set foot again in Russia. Jealousy on the part of the Russian Fur Company caused the Empress to treat in this harsh manner a traveller on whom she had at first bestowed favour and assistance. Ledyard sought his way to London, where he met a kind friend in Sir Joseph Banks, at whose recommendation he was engaged by the

e was engaged by the

man, in order to gain some farther information, with orders, that if he met with any Russians he should endeavour to make them understand that we were English, the friends and allies of their nation.

On the 10th Ledyard returned with three Russian seamen, or furriers, who, with some others, resided at Egoochshac, where they had a dwelling-house, some store-houses, and a sloop of about thirty tons burthen. One of these men was either master or mate of this vessel, another of them wrote a very good hand and understood figures, and they were all three well behaved, intelligent men, and very ready to give me all the information I could desire; but for want of an interpreter we had some difficulty to understand each other. They appeared to have a thorough knowledge of the attempts that had been made by their countrymen to navigate the Frozen Ocean, and of the discoveries which had been made from Kamtschatka, by Beering, Tschirikoff, and Spangenberg; but they seemed to know no more of Lieutenant Syndo*, or Synd, than his name. Nor had they the least idea what part of the world Mr. Staehlin's map referred to, when it was laid before them. When I pointed out Kamtschatka, and some other known places upon that map, they asked whether I had seen the islands there laid down, and on my answering in the negative, one of them put his finger upon a part of this map where a number of islands was represented, and said, that he had cruised there for land, but never could find any. I then laid before them my own chart, and found that they were strangers to every part of the American coast, except what lies opposite this island. One of these men said that he had been with Beering in his American voyage, but must then have been very young, for he had not now, at the distance of thirty-seven years, the appearance of being aged. Never was there greater respect paid to the memory of any distinguished person, than by these men to that of Beering. The trade in which they are engaged is very beneficial, and its being undertaken and extended to the eastward of Kamtschatka, was the immediate consequence of the second voyage of that able navigator, whose misfortunes proved to be the source of much private advantage to individuals, and of public utility to the Russian nation. And yet, if his distresses had not accidentally carried him to die in the island which bears his name, and from whence the miserable remnant of his ship's crew brought back sufficient specimens of its valuable furs, probably the Russians never would have undertaken any future voyages which could lead them to make discoveries in this sea, toward the coast of America. Indeed, after his time government seems to have paid less attention to this, and we owe what discoveries have been since made principally to the enterprising spirit of private traders, encouraged, however, by the superintending care of the court of Petersburg. The three Russians having remained with me all night, visited Captain Clerke next morning, and then left us, very well satisfied with the reception they had met with, promising to return in a few days, and to bring with them a chart of the islands lying between Oonalashka and Kamtschatka.

On the 15th, in the evening, while Mr. Webber and I were at a village at a small distance from Samganoodha, a Russian landed there, who, I found, was the principal person amongst his countrymen in this and the neighbouring islands. His name was Erasim Gregorloff Sin Ismyloff. He arrived in a canoe carrying three persons, attended by twenty or thirty other canoes, each conducted by one man. I took notice, that the first thing they did after landing, was to make a small tent for Ismyloff, of materials which they brought with them; and then they made others for themselves of their canoes and paddles, which they covered with grass, so that the people of the village were at no trouble to find them lodging. Ismyloff having invited us into his tent, set before us some dried salmon and

African Association to make researches in Africa, but his career was cut short by death, which overtook him at just as he was about to set out for Sennaar. Ledyard was an American by birth, and was originally destined for the ministry, for which function he studied at Hartford College, on his first establishment by Dr. Wheelock. But his adventurous spirit kept him ever restless, and led him into strange vicissitudes. He kept a journal during his voyage with Cook, to which we shall have occasion to

refer in noticing the melancholy catastrophe which took place at the Sandwich Islands. His memoirs have been written by his countryman, Mr. Jared Sparks, and present the picture of a mind of great originality, and the most untiring energy.—Eu.

* See the little that is known of Synd's voyage, accompanied with a chart, in Mr. Coxe's Russian Discoveries, p. 300.

berries, which, I was satisfied, was the best cheer he had. He appeared to be a sensible intelligent man, and I felt no small mortification in not being able to converse with him, unless by signs, assisted by figures, and other characters, which, however, were a very great help. I desired to see him on board the next day, and accordingly he came, with all his attendants. Indeed, he had moved into our neighbourhood for the express purpose of waiting upon us. I was in hopes to have had by him the chart which his three countrymen had promised; but I was disappointed. However, he assured me I should have it; and he kept his word. I found that he was very well acquainted with the geography of these parts, and with all the discoveries that had been made in them by the Russians. On seeing the modern maps, he at once pointed out their errors. He told me he had accompanied Lieutenant Syndo, or Synd as he called him, in his expedition to the north; and, according to his account, they did not proceed farther than the Tschukotskoi Nos, or rather than the bay of St. Laurence, for he pointed on our chart to the very place where I landed. From thence, he said, they went to an island in latitude 63°, upon which they did not land, nor could he tell me its name. But I should guess it to be the same to which I gave the name of Clerke's Island. To what place Synd went after that, or in what manner he spent the two years, during which, as Ismyloff said, his researches lasted, he either could not or would not inform us. Perhaps he did not comprehend our inquiries about this, and yet, in almost every other thing, we could make him understand us. This created a suspicion that he had not really been in that expedition, notwithstanding his assertion.

Both Ismyloff and the others affirmed, that they knew nothing of the continent of America to the northward; and that neither Lieutenant Synd, nor any other Russian had ever seen it of late. They call it by the same name which Mr. Ståhlin gives to his great island, that is, Alaschka. Stachtan Nitada, as it is called in the modern maps, is a name quite unknown to these people, natives of the islands as well as Russians; but both of them know it by the name of America. From what we could gather from Ismyloff and his countrymen, the Russians have made several attempts to get a footing upon that part of this continent that lies contiguous to Oonalashka and the adjoining islands, but have always been repulsed by the natives, whom they describe as a very treacherous people. They mentioned two or three captains, or chief men, who had been murdered by them; and some of the Russians showed us wounds which they said they had received there.

Some other information, which we got from Ismyloff, is worth recording, whether true or false. He told us, that in the year 1773, an expedition had been made into the Frozen Sea in sledges, over the ice, to three large islands that lie opposite the mouth of the river Kovyma. We were in some doubt whether he did not mean the same expedition of which Muller gives an account*, and yet he wrote down the year, and marked the islands on the chart. But a voyage which he himself had performed engaged our attention more than any other. He said, that on the 12th of May, 1771, he sailed from Bolscheretz, in a Russian vessel, to one of the Kurile islands, named Mareckan, in the latitude of 47°, where there is a harbour and a Russian settlement. From this island he proceeded to Japan, where he seems to have made but a short stay. For when the Japanese came to know that he and his companions were Christians, they made signs for them to be gone, but did not, so far as we could understand him, offer any insult or force. From Japan he got to Canton, and from thence to France, in a French ship. From France, he travelled to Petersburg; and was afterward sent out again to Kamtschatka. What became of the vessel in which he first embarked, we could not learn, nor what was the principal object of the voyage. His not being able to speak one word of French, made this story a little suspicious. He did not even know the name of any one of the most common things that must have been in use every day, while he was on board the ship and in France. And yet

* The latest expedition of this kind, taken notice of by Muller, was in 1724. But in justice to Mr. Ismyloff, it may be proper to mention, which is done on the authority of a MS., communicated by Mr. Pennant, and the substance of which has been published by Mr. Coxe, that, so late as 1768, the governor of Siberia sent three young

officers over the ice in sledges, to the islands opposite the mouth of the Kovyma. There seems no reason for not supposing, that a subsequent expedition of this sort might also be undertaken in 1773. Mr. Coxe, p. 324, places the expedition on sledges in 1764; but Mr. Pennant's MS. may be depended upon.

he seemed clear as to the times of his arriving at the different places, and of his leaving them, which he put down in writing.

The next morning he would fain have made me a present of a sea-otter skin, which he said was worth eighty roubles at Kamtschatka. However, I thought proper to decline it; but I accepted of some dried fish, and several baskets of the lily or saranne root, which is described at large in the History of Kamtschatka*. In the afternoon, Mr. Ismyloff, after dining with Captain Clerke, left us with all his retinue, promising to return in a few days. Accordingly, on the 19th, he made us another visit, and brought with him the charts before mentioned, which he allowed me to copy; and the contents of which furnish matter for the following observations.

There were two of them, both manuscripts, and bearing every mark of authenticity. The first comprehended the Penshinskian Sea; the coast of Tartary, as low as the latitude of 41°; the Kurile Islands; and the peninsula of Kamtschatka. Since this map had been made, Wawseelee Irkechoff, Captain of the fleet, explored, in 1758, the coast of Tartary from Okotsk, and the river Amur, to Japan, or 41° of latitude. Mr. Ismyloff also informed us, that great part of the sea-coast of the peninsula of Kamtschatka had been corrected by himself; and described the instrument he made use of, which must have been a theodolite. He also informed us, that there were only two harbours fit for shipping on all the east coast of Kamtschatka, viz., the bay of Awatska and the river Olutora, in the bottom of the gulf of the same name; that there was not a single harbour upon its west coast; and that Yamsk was the only one on all the west side of the Penshinskian Sea, except Okotsk, till we come to the river Amur. The Kurile islands afford only one harbour; and that is on the north-east side of Mareckan, in the latitude of 47½°; where, as I have before observed, the Russians have a settlement.

The second chart was to me the most interesting, for it comprehended all the discoveries made by the Russians to the eastward of Kamtschatka, toward America, which, if we exclude the voyage of Beerig and Tschirikoff, will amount to little or nothing. The part of the American coast with which the latter fell in is marked in this chart, between the latitude of 58° and 58½°, and 75° of longitude from Okotsk, or 218½° from Greenwich; and the place where the former anchored in 59½° of latitude, and 63½° of longitude from Okotsk, or 207° from Greenwich. To say nothing of the longitude, which may be erroneous from many causes, the latitude of the coast discovered by these two navigators, especially the part of it discovered by Tschirikoff, differs considerably from the account published by Mr. Muller, and his chart. Indeed, whether Muller's chart, or this now produced by Mr. Ismyloff, be most erroneous in this respect, it may be hard to determine, though it is not now a point worth discussing. But the islands that lie dispersed between 52° and 55° of latitude, in the space between Kamtschatka and America, deserve some notice. According to Mr. Ismyloff's account, neither the number nor the situation of these islands is well ascertained. He struck out about one-third of them, assuring me they had no existence; and he altered the situation of others considerably, which, he said, was necessary, from his own observations. And there was no reason to doubt about this. As these islands lie all nearly under the same parallel, different navigators, being misled by their different reckonings, might easily mistake one island, or group of islands, for another; and fancy they had made a new discovery, when they had only found old ones in a different position from that assigned to them by their former visitors.

The islands of St. Macarius, St. Stephen, St. Theodore, St. Abraham, Seduction Island, and some others, which are to be found in Mr. Muller's chart, had no place in this now produced to us; nay, both Mr. Ismyloff, and the others assured me, that they had been several times sought for in vain. And yet it is difficult to believe, how Mr. Muller, from whom subsequent map-makers have adopted them, could place them in his chart without some authority. Relying, however, on the testimony of these people, whom I thought competent witnesses, I have left them out of my chart; and made such corrections amongst the other islands as I was told was necessary. I found there was wanting another correction; for the

* English translation, p. 83, 84.

difference of longitude, between the Bay of Awatska, and the harbour of Samganoodlia, according to astronomical observations made at these two places, is greater, by five degrees and a half, than it is by the chart. This error I have supposed to be infused throughout the whole, though it may not be so in reality. There was also an error in the latitude of some places; but this hardly exceeded a quarter of a degree.

I shall now give some account of the islands; beginning with those that lie nearest to Kamtschatka, and reckoning the longitude from the harbour of Petropaulowska, in the Bay of Awatska. The first is Beering's Island, in 55° of latitude, and 6° of longitude. Ten leagues from the south end of this, in the direction of east by south, or east south-east, lies Maidenoi Ostroff or the Copper Island. The next island is, Atakon, laid down in $52^{\circ} 45'$ of latitude, and in 15° or 16° of longitude. This island is about eighteen leagues in extent, in the direction of east and west; and seems to be the same land which Beering fell in with, and named Mount St. John. But there are no islands about it, except two inconsiderable ones, lying three or four leagues from the east end, in the direction of east north-east. We next come to a group, consisting of six or more islands; two of which, Atghka and Amluk are tolerably large; and in each of them is a good harbour. The middle of this group lies in the latitude of $52^{\circ} 30'$, and 28° of longitude from Awatska; and its extent, east and west, is four degrees. These are the isles that Mr. Ismyloff said were to be removed four degrees to the east, which is here done. And in the situation they have in my chart, was a group, consisting of ten small islands, which, I was told, were wholly to be struck out; and also two islands lying between them and the group to which Oonalashka belongs. In the place of these two, an island called Amoghla (which in the chart was situated in the latitude of $51^{\circ} 45'$, and 4° of longitude to the west) was brought.

Nothing more need be said to show how erroneous the situation of many of these islands may be; and for which I am in nowise accountable. But the position of the largest group, of which Oonalashka is one of the principal islands, and the only one in which there is a harbour, is not liable to any such errors. Most of these islands were seen by us; and consequently their latitude and longitude were pretty exactly determined; particularly the harbour of Samganoodlia in Oonalashka, which must be looked upon as a fixed point. This group of islands may be said to extend as far as Halibut Isles, which are forty leagues from Oonalashka toward the east north-east. Within these isles, a passage was marked in Ismyloff's chart, communicating with Bristol Bay; which converts about fifteen leagues of the coast, that I had supposed to belong to the continent, into an island, distinguished by the name of Oonecmak. This passage might easily escape us, as we were informed that it is very narrow, shallow, and only to be navigated through with boats, or very small vessels.

It appeared by the chart, as well as by the testimony of Ismyloff and the other Russians, that this is as far as their countrymen have made any discoveries, or have extended themselves, since Beering's time. They all said, that no Russians had settled themselves so far to the east as the place where the natives gave the note to Captain Clerke; which Mr. Ismyloff, to whom I delivered it, on perusing it, said, had been written at Oomanak. It was, however, from him that we got the name of Kodiak*, the largest of Schumagin's Islands; for it had no name upon the chart produced by him. The names of all the other islands were taken from it, and we wrote them down as pronounced by him. He said, they were all such as the natives themselves called their islands by; but if so, some of the names seem to have been strangely altered. It is worth observing, that no names were put to the islands which Ismyloff told us were to be struck out of the chart; and I considered this as some confirmation that they have not existence. I have already observed, that the American continent is here called, by the Russians, as well as by the islanders, Alaschka; which name, though it properly belong only to the country adjoining to Oonecmak, is used by them when speaking of the American continent in general, which they know perfectly well to be a great land.

This is all the information I got from these people, relating to the geography of this part of the world; and I have reason to believe that this was all the information they were able

to give. For they assured me, over and over again, that they knew of no other islands, besides those which were laid down upon this chart; and that no Russian had ever seen any part of the continent of America to the northward, except that which lies opposite the country of the Tschutskis. If Mr. Stæhlin was not grossly imposed upon, what could induce him to publish a map, so singularly erroneous; and in which many of these islands are jumbled together in regular confusion, without the least regard to truth? And yet, he is pleased to call it "a very accurate map"*. Indeed, it is a map to which the most illiterate of his illiterate sea-faring countrymen would have been ashamed to have set his name.

Mr. Ismyloff remained with us till the 21st, in the evening, when he took his final leave. To his care I entrusted a letter to the Lords Commissioners of the Admiralty; in which was inclosed a chart of all the northern coasts I had visited. He said there would be an opportunity of sending it to Kamtschatka, or Okotsk, the ensuing spring; and that it would be at Petersburg the following winter. He gave me a letter to Major Behm, Governor of Kamtschatka, who resides at Bolscheretsk; and another to the commanding officer at Petropaulowska. Mr. Ismyloff seemed to have abilities that might entitle him to a higher station in life, than that in which we found him. He was tolerably well versed in astronomy, and in the most useful branches of the mathematics. I made him a present of a Hadley's octant; and though, probably, it was the first he had ever seen, he made himself acquainted, in a very short time, with most of the uses to which that instrument can be applied.

In the morning of the 22nd, we made an attempt to get to sea, with the wind at south-east, which miscarried. The following afternoon, we were visited by one Jacob Ivanovitch Soposnicoff, a Russian, who commanded a boat, or small vessel, at Oomanak. This man had a great share of modesty; and would drink no strong liquor, of which the rest of his countrymen, whom we had met with here, were immoderately fond. He seemed to know more accurately what supplies could be got at the harbour of Petropaulowska, and the price of the different articles, than Mr. Ismyloff. But, by all accounts, everything we should want at that place was very scarce, and bore a high price. Flour, for instance, was from three to five roubles the pood †; and deer, from three to five roubles each. This man told us that he was to be at Petropaulowska in May next; and, as I understood, was to have the charge of my letter. He seemed to be exceedingly desirous of having some token from me to carry to Major Behm; and, to gratify him, I sent a small spying-glass.

After we became acquainted with these Russians, some of our gentlemen, at different times, visited their settlement on the island; where they always met with a hearty welcome. This settlement consisted of a dwelling-house, and two store-houses. And, besides the Russians, there was a number of the Kamtschadales, and of the natives, as servants, or slaves, to the former. Some others of the natives, who seemed independent of the Russians, lived at the same place. Such of them as belonged to the Russians were all males; and they are taken, or perhaps purchased, from their parents when young. There were, at this time, about twenty of these, who could be looked upon in no other light than as children. They all live in the same house; the Russians at the upper end, the Kamtschadales in the middle; and the natives at the lower end; where is fixed a large boiler for preparing their food, which consists chiefly of what the sea produces, with the addition of wild roots and berries. There is little difference between the first and last table, besides what is produced by cookery, in which the Russians have the art to make indifferent things palatable. I have eat whale's flesh of their dressing, which I thought very good; and they made a kind of pan-pudding of salmon roe, beaten up fine, and fried, that is no bad succedaneum for bread. They may, now and then, taste real bread, or have a dish in which flour is an ingredient; but this can only be an occasional luxury. If we except the juice of berries, which they sip at their meals, they have no other liquor besides pure water: and it seems to be very happy for them that they have nothing stronger.

As the island supplies them with food, so it does, in a great measure, with clothing. This consists chiefly of skins, and is, perhaps, the best they could have. The upper garment is made like our waggoner's frock, and reaches as low as the knee. Besides this, they wear a

* Stæhlin's New Northern Archipelago, p. 15.

† 36lb.

waistcoat or two, a pair of breeches; a fur cap; and a pair of boots, the soles and upper leathers of which are of Russian leather; but the legs are made of some kind of strong gut. Their two chiefs, Ismyloff and Ivanovitch, wore each a calico frock; and they, as well as some others, had shirts, which were of silk. These, perhaps, were the only part of their dress not made amongst themselves. There are Russians settled upon all the principal islands between Oonalashka and Kamtschaika, for the sole purpose of collecting furs. Their great object is the sea beaver or otter. I never heard them inquire after any other animal; though those, whose skins are of inferior value, are also made part of their cargoes. I ever thought to ask how long they have had a settlement upon Oonalashka, and the neighbouring isles; but, to judge from the great subjection the natives are under, this cannot be of a very late date*. All these furriers are relieved, from time to time, by others. Those we met with arrived here from Okotsk, in 1776, and are to return in 1781; so that their stay at the island will be four years at least.

It is now time to give some account of the native inhabitants. To all appearance, they are the most peaceable, inoffensive people, I ever met with. And, as to honesty, they might serve as a pattern to the most civilized nation upon earth. But from what I saw of their neighbours, with whom the Russians have no connexion, I doubt whether this was their original disposition; and rather think that it has been the consequence of their present state of subjection. Indeed, if some of our gentlemen did not misunderstand the Russians, they had been obliged to make some severe examples†, before they could bring the islanders into any order. If there were severities inflicted at first, the best apology for them is, that they have produced the happiest consequences; and, at present, the greatest harmony subsists between the two nations. The natives have their own chiefs in each island, and seem to enjoy liberty and property unmolested. But whether or no they are tributaries to the Russians, we could never find out. There was some reason to think that they are. These people are rather low of stature, but plump and well shaped; with rather short necks; swarthy chubby faces; black eyes; small beards; and long, straight, black hair; which the men wear loose behind, and cut before, but the women tie up in a bunch. Their dress has been occasionally mentioned. Both sexes wear the same in fashion; the only difference is in the materials. The women's frock is made of seal-skin; and that of the men, of the skins of birds; both reaching below the knee. This is the whole dress of the women. But, over the frock, the men wear another made of gut, which resists water; and has a hood to it, which draws over the head. Some of them wear boots; and all of them have a kind of oval-snouted cap, made of wood, with a rim to admit the head. These caps are dyed with green and other colours; and round the upper part of the rim, are stuck the long bristles of some sea-animal, on which are strung glass beads; and on the front is a small image or two made of bone.

CAP OF THE NATIVES.

They make use of no paint; but the women puncture their faces slightly; and both men and women bore the under lip, to which they fix pieces of bone. But it is as uncommon at Oonalashka to see a man with this ornament, as to see a woman without it. Some fix beads to the upper lip, under the nostrils, and all of them hang ornaments in their ears. Their food consists of fish, sea-animals, birds, roots, and berries; and even of sea-weed. They dry large quantities of fish in summer, which they lay up in small huts for winter use; and, probably, they preserve roots and berries for the same time of scarcity. They eat almost every thing raw. Boiling and broiling were the only methods of cookery that I saw them make use of; and the first was probably learnt from the Russians. Some have got little

brass kettles; and those who have not, make one of a flat stone, with sides of clay, not unlike a standing pye.

I was once present when the chief of Oonalashka made his dinner of the raw head of a large halibut just caught. Before any was given to the chief, two of his servants ate the gills, without any other dressing, besides squeezing out the slime. This done, one of them cut off the head of the fish, took it to the sea and washed it; then came with it, and sat down by the chief; first pulling up some grass, upon a part of which the head was laid, and the rest was strewn before the chief. He then cut large pieces off the cheeks, and laid these within the reach of the great man, who swallowed them with as much satisfaction as we should do raw oysters. When he had done, the remains of the head were cut in pieces, and given to the attendants, who tore off the meat with their teeth, and gnawed the bones like so many dogs.

As these people use no paint, they are not so dirty in their persons as the savages who besmear themselves; but they are full as lousy and filthy in their houses. Their method of building is as follows: They dig in the ground an oblong square pit, the length of which seldom exceeds fifty feet, and the breadth twenty; but in general the dimensions are smaller. Over this excavation, they form the roof of wood which the sea throws ashore. This roof is covered first with grass, and then with earth; so that the outward appearance is like a dunghill. In the middle of the roof, toward each end, is left a square opening, by which the light is admitted; one of these openings being for this purpose only, and the other being

INTERIOR OF A HUT OF OONALASHKA.

also used to go in and out by, with the help of a ladder, or rather a post, with steps cut in it*. In some houses there is another entrance below; but this is not common. Round the sides and ends of the huts, the families (for several are lodged together) have their separate apartments, where they sleep, and sit at work; not upon benches, but in a kind of pucave trench, which is dug all round the inside of the house, and covered with mats; so

* Mr. Coxe's description of the habitations of the natives of Oonalashka, and the other Fox Islands, in *Natural History of the Pacific Ocean*, vol. i. p. 41. See also *Histoire des différents Peuples soumis à la Domination des Russes*, par M. Levenque, tom. i. p. 41.

that this part is kept tolerably decent. But the middle of the house, which is common to all the families, is far otherwise. For, although it be covered with dry grass, it is a receptacle for dirt of every kind, and the place for the urine trough; the stench of which is not mended by raw hides, or leather, being almost continually steeped in it. Behind and over the trench are placed the few effects they are possessed of; such as their clothing, mats, and skins.

Their household furniture consists of bowls, spoons, buckets, piggins, or cans, matted baskets, and perhaps a Russian kettle or pot. All these utensils are very neatly made, and well formed; and yet we saw no other tools among them but the knife and the hatchet; that is, a small flat piece of iron, made like an adze, by fitting it into a crooked wooden handle. These were the only instruments we met with there, made of iron. For although the Russians live amongst them, we found much less of this metal in their possession than we had met with in the possession of other tribes on the American continent, who had never seen, nor perhaps had any intercourse with the Russians. Probably a few beads, a little tobacco and snuff, purchase all they have to spare. There are few, if any of them, that do not both smoke and chew tobacco, and take snuff; a luxury that bids fair to keep them always poor. They do not seem to wish for more iron, or to want any other instruments, except sewing-needles, their own being made of bone. With these they not only sew their canoes, and make their clothes, but also very curious embroidery. Instead of thread, they use the fibres of sinews, which they split to the thickness which each sort of work requires. All sewing is performed by the women. They are tailors, shoemakers, and boat-builders, or boat-coverers; for the men, most probably, construct the frame of wood over which the skins are sewed. They make mats and baskets of grass, that are both beautiful and strong. Indeed there is a neatness and perfection in most of their work that shows they neither want ingenuity nor perseverance.

I saw not a fire-place in any one of their houses. They are lighted as well as heated by lamps, which are simple, and yet answer the purpose very well. They are made of a flat stone, hollowed on one side like a plate, and about the same size, or rather larger. In the hollow part they put the oil, mixed with a little dry grass, which serves the purpose of a wick. Both men and women frequently warm their bodies over one of these lamps, by placing it between their legs, under their garments, and sitting thus over it for a few minutes. They produce fire by collision and by attrition; the former by striking two stones one against another; on one of which a good deal of brimstone is first rubbed. The latter method is with two pieces of wood; one of which is a stick of about eighteen inches in length, and the other a flat piece. The pointed end of the stick they press upon the other, whirling it nimbly round as a drill; thus producing fire in a few minutes. This method is common in many parts of the world. It is practised by the Kamtschadales, by these people, by the Greenlanders, by the Brazilians, by the Otahiteans, by the New Hollanders; and probably by many other nations. Yet some learned and ingenious men have founded an argument on this custom to prove, that this and that nation are of the same extraction. But accidental agreement, in a few particular instances, will not authorise such a conclusion; nor will a disagreement, either in manners or customs, between two different nations, of course prove that they are of different extraction. I could support this opinion by many instances besides the one just mentioned.

No such thing as an offensive or even defensive weapon was seen amongst the natives of Oonalashka. We cannot suppose that the Russians found them in such a defenceless state; it is more probable that for their own security they have disarmed them. Political reasons too may have induced the Russians not to allow these islanders to have any large canoes; for it is difficult to believe they had none such originally, as we found them amongst all their neighbours. However we saw none here but one or two belonging to the Russians. The canoes made use of by the natives are the smallest we had anywhere seen upon the American coast; though built after the same manner, with some little difference in the construction. The stern of these terminates a little abruptly; the head is forked; the upper point of the fork projecting without the under one, which is even with the surface of the water. Why they should thus construct them is difficult to conceive; for the fork is apt to catch

CHINESE MERCHANTS.

hold of everything that comes in the way ; to prevent which they fix a piece of small stick from point to point. In other respects their canoes are built after the manner of those used by the Greenlanders and Esquimaux ; the framing being of slender laths, and the covering of seal-skins. They are about twelve feet long ; a foot and a half broad in the middle ; and twelve or fourteen inches deep. Upon occasion they can carry two persons ; one of whom is stretched at full length in the canoe ; and the other sits in the seat, or round hole, which is nearly in the middle. Round this hole is a rim or hoop of wood, about which is sewed gut skin, that can be drawn together, or opened like a purse, with leathern thongs fitted to the outer edge. The man seats himself in this place, draws the skin tight round his body over his gut frock, and brings the ends of the thongs, or purse-string, over the shoulder to keep it in its place. The sleeves of his frock are tied round his wrists ; and it being close round his neck, and the hood drawn over his head, where it is confined by his cap, water can scarcely penetrate either to his body or into the canoe. If any should, however, insinuate itself, the boatman carries a piece of sponge, with which he dries it up. He uses the double-bladed paddle, which is held with both hands in the middle, striking the water with a quick regular motion, first on one side and then on the other. By this means the canoe is impelled at a great rate, and in a direction as straight as a line can be drawn. In sailing from Egooschshak to Sanganoodha, two or three canoes kept way with the ship, though she was going at the rate of seven miles an hour.

FISHING CANOE OF QONALASHUKA.

Their fishing and hunting implements lie ready upon the canoes, under straps fixed for the purpose. They are all made in great perfection of wood and bone ; and differ very little from those used by the Greenlanders, as they are described by Crantz. The only difference is in the point of the missile dart ; which, in some we saw here, is not above an inch long ; whereas Crantz says that those of the Greenlanders are a foot and a half in length. Indeed these darts, as well as some other of their instruments, are so curious that they deserve a particular description ; but as many of them were brought away on board the ships, this can be done at any time, if thought necessary. These people are very expert in striking fish, both in the sea and in rivers. They also make use of hooks and lines, nets and weirs. The hooks are composed of bone, and the lines of sinews.

The fishes, which are common to other northern seas, are found here ; such as whales, grampusses, porpoises, sword-fish, halibut, cod, salmon, trout, soles, flat-fish ; several other sorts of small fish ; and there may be many more that we had no opportunity of seeing. Halibut and salmon seem to be in the greatest plenty ; and on them the inhabitants of these isles subsist chiefly ; at least they were the only sort of fish, except a few cod, which we observed to be laid up for their winter store. To the north of 60°, the sea is, in a manner, destitute of small fish of every kind ; but then whales are more numerous. Seals, and that whole tribe of sea-animals, are not so numerous as in many other seas. Nor can this be thought strange, since there is hardly any part of the coast, on either continent, nor any of

the islands lying between them, that is not inhabited, and whose inhabitants hunt these animals for their food and clothing. Sea-horses are, indeed, in prodigious numbers about the ice; and the sea-otter is, I believe, nowhere found but in this sea. We sometimes saw an animal with a head like a seal's, that blow after the manner of whales. It was larger than a seal, and its colour was white, with some dark spots. Probably this was the sea-cow, or *manati*.

I think I may venture to assert, that sea and water-fowls are neither in such numbers, nor in such variety, as with us in the northern parts of the Atlantic Ocean. There are some, however, here that I do not remember to have seen anywhere else; particularly the *Alca monochroa* of Steller, before-mentioned; and a black and white duck, which I conceive to be different from the stone-duck described by Krasheninnikoff*. All the other birds seen by us are mentioned by this author, except some that we met with near the ice; and most, if not all of these, are described by Martin in his voyage to Greenland. It is a little extraordinary that penguins, which are common in many parts of the world, should not be found in this sea. Albatrosses too are so very scarce, that I cannot help thinking that this is not their proper climate. The few land-birds that we met with are the same with those in Europe; but there may be many others which we had no opportunity of knowing. A very beautiful bird was shot in the woods at Norton Sound, which, I am told, is sometimes found in England, and known by the name of chatterer. Our people met with other small birds there, but in no great variety and abundance; such as the wood-pecker, the bull-finch, the yellow-finch, and a small bird called a tit-mouse.

As our excursions and observations were confined wholly to the sea-coast, it is not to be expected that we could know much of the animals or vegetables of the country. Except mosquitoes, there are few other insects, or reptiles, that I saw, but lizards. There are no deer upon Oonalashka, nor upon any other of the islands. Nor have they any domestic animals, not even dogs. Foxes and weasels were the only quadrupeds we saw; but they told us that they had hares also, and the *marmotas* mentioned by Krasheninnikoff†. Hence it is evident that the sea and rivers supply the greatest share of food to the inhabitants. They are also obliged to the sea for all the wood made use of for building, and other necessary purposes; for not a stick grows upon any of the islands, nor upon the adjacent coast of the continent. The learned tell us, that the seeds of plants are, by various means, conveyed from one part of the world to another; even to islands in the midst of great oceans, and far remote from any other land. How comes it to pass that there are no trees growing on this part of the continent of America, nor any other of the islands lying near it? They are certainly as well situated for receiving seeds, by all the various ways I have heard of, as any of those coasts that abound in wood. May not nature have denied to some soil the power of raising trees without the assistance of art? As to the drift-wood upon the shores of the islands, I have no doubt that it comes from America. For although there may be none on the neighbouring coast, enough may grow farther up the country, which torrents in the spring may break loose, and bring down to the sea. And not a little may be conveyed from the woody coasts, though they lie at a greater distance.

There are a great variety of plants at Oonalashka; and most of them were in flower the latter end of June. Several of them are such as we find in Europe, and in other parts of America, particularly in Newfoundland; and others of them, which are also met with in Kamtschatka, are eat by the natives both there and here. Of these Krasheninnikoff has given us descriptions. The principal one is the *saranne*, or lily-root; which is about the size of a root of garlic, round, made up of a number of small cloves, and grains like groats. When boiled, it is somewhat like saloop; the taste is not disagreeable, and we found means to make some good dishes with it. It does not seem to be in great plenty, for we got none but what Ismyloff gave us.

We must reckon amongst the food of the natives some other wild roots; the stalk of a plant resembling *angelica*, and berries of several different sorts; such as bramble-berries, cran-berries, huckle-berries, heath-berries, a small red berry which, in Newfoundland, is

* History of Kamtschatka. Eng. Trans., p. 160.

called partridge-berry; and another brown berry, unknown to us. This has somewhat of the taste of a sloe, but is unlike it in every other respect. It is very astringent, if eaten in any quantity. Brandy might be distilled from it. Captain Clerke attempted to preserve some; but they fermented, and became as strong as if they had been steeped in spirits. There were a few other plants which we found serviceable, but are not made use of by either Russians or natives; such as wild purslain, pea-tops, a kind of scurvy-grass, cresses, and some others. All these we found very palatable, dressed either in soups or in salads. On the low ground, and in the valleys, is plenty of grass, which grows very thick, and to a great length. I am of opinion that cattle might subsist at Oonalashka all the year round, without being housed. And the soil, in many places, seemed capable of producing grain, roots, and vegetables. But at present, the Russian traders and the natives seem satisfied with what nature brings forth.

Native sulphur was seen amongst the inhabitants of the island; but I had no opportunity of learning where they got it. We found also ochre; a stone that gives a purple colour, and another that gives a very good green. It may be doubted whether this last is known. In its natural state, it is of a greyish-green colour, coarse and heavy. It easily dissolves in oil; but when put into water, it entirely loses its properties. It seemed to be scarce in Oonalashka; but we were told that it was in greater plenty on the island of Oonemak. As to the stones about the shore and hills, I saw nothing in them that was uncommon.

The people of Oonalashka bury their dead on the summits of hills, and raise a little hillock over the grave. In a walk into the country, one of the natives who attended me pointed out several of these receptacles of the dead. There was one of them by the side of the road leading from the harbour to the village, over which was raised a heap of stones. It was observed, that every one who passed it, added one to it. I saw in the country several stone hillocks that seemed to have been raised by art. Many of them were apparently of great antiquity. What their notions are of the Deity, and of a future state, I know not. I am equally unacquainted with their diversions; nothing having been seen that could give us an insight into either.

They are remarkably cheerful and friendly amongst each other, and always behaved with great civility to us. The Russians told us, that they never had any connexions with their women, because they were not Christians. Our people were not so scrupulous; and some of them had reason to repent that the females of Oonalashka encouraged their addresses without any reserve, for their health suffered by a distemper that is not unknown here. The natives of this island are also subject to the cancer, or a complaint like it, which those whom it attacks are very careful to conceal. They do not seem to be long-lived. I nowhere saw a person, man or woman, whom I could suppose to be sixty years of age, and but very few who appeared to be above fifty. Probably their hard way of living may be the means of shortening their days.

I have frequently had occasion to mention, from the time of our arrival in Prince William's Sound, how remarkably the natives on this north-west side of America resemble the Greenlanders and Esquimaux, in various particulars of person, dress, weapons, canoes, and the like. However, I was much less struck with this than with the affinity which we found subsisting between the dialects of the Greenlanders and Esquimaux, and those of Norton's Sound and Oonalashka. This will appear from a table of corresponding words, which I put together, and will be inserted in the course of this work*. It must be observed, however, with regard to the words which we collected on this side of America, that too much stress is not to be laid upon their being accurately represented; for after Mr. Anderson's death, we had few who took much pains about such matters, and I have frequently found, that the same words written down by two or more persons, from the mouth of the same native, on being compared together, differed not a little. But still enough is certain to warrant this judgment, that there is great reason to believe that all these nations are of the same extraction; and if so, there can be little doubt of there being a northern communication of some sort by sea, between this west side of America and the east side, through Baffin's Bay;

* It will be found amongst other vocabularies, at the end of the volume.

which communication, however, may be effectually shut up against ships, by ice and other impediments. Such, at least, was my opinion at this time.

I shall now quit these northern regions with a few particulars relative to the tides and currents upon the coast, and an account of the astronomical observations made by us in Samganooodha Harbour. The tide is nowhere considerable but in the great river*. The flood comes from the south or south-east, everywhere following the direction of the coast to the north-westward. Between Norton Sound and Cape Prince of Wales, we found a current setting to the north-west, particularly off the cape, and within Sledge Island. But this current extended only a little way from the coast; nor was it either consistent or uniform. To the north of Cape Prince of Wales, we found neither tide nor current, either on the American or on the Asiatic coast, though several times looked for. This gave rise to an opinion, entertained by some on board our ships, that the two coasts were connected either by land or by ice; which opinion received some strength by our never having any hollow waves from the north, and by our seeing ice almost the whole way across.

The following are the results of the several observations made ashore during our stay in the harbour of Samganooodha.

The latitude, by the mean of several observed meridian altitudes of the sun	53° 5' 0"	
The longitude {	By the mean of twenty sets of lunar observations, with the sun east of the moon	193 47 45
	By the mean of fourteen sets, with the sun and stars west of the moon	193 11 45
	The mean of these	193 29 45
The longitude assumed	193 30 0	
By the mean of equal altitudes of the sun, taken on the 12th, 14th, 17th, and 21st, the timekeeper was found to be losing on mean time 8", 8 each day; and on the last of these days, was too slow for mean time 13 ^h 46 ^m 43 ^s , 98. Hence the timekeeper must have been too slow on the 4th, the day after our arrival, by 13 ^h 41 ^m 36 ^s , 62; and the longitude, by Greenwich rate, will be 13 ^h 23 ^m 53 ^s , 8

CHAPTER XII.—DEPARTURE FROM OONALASHKA, AND FUTURE VIEWS.—THE ISLAND AMOGHTA.—SITUATION OF A REMARKABLE ROCK.—THE STRAIT BETWEEN OONALASHKA AND OONELLA REPASSED.—PROGRESS TO THE SOUTH.—MELANCHOLY ACCIDENT ON BOARD THE DISCOVERY.—MOWEE, ONE OF THE SANDWICH ISLANDS, DISCOVERED.—INTERCOURSE WITH THE NATIVES.—VISIT FROM TERREBOHOO.—ANOTHER ISLAND CALLED OWHYHEE, DISCOVERED.—THE SHIPS PLY TO WINDWARD TO GET ROUND IT.—AN ECLIPSE OF THE MOON OBSERVED.—THE CREW REFUSE TO DRINK SUGAR-CANE BEER.—CORDAGE DEFICIENT IN STRENGTH.—COMMENDATION OF THE NATIVES OF OWHYHEE.—THE RESOLUTION GETS TO WINDWARD OF THE ISLAND.—HER PROGRESS DOWN THE SOUTH-EAST COAST.—VIEWS OF THE COUNTRY, AND VISITS FROM THE NATIVES.—THE DISCOVERY JOINS.—SLOW PROGRESS WESTWARD.—KARAKAKOOA BAY EXAMINED BY M^r. BIRCH.—VAST CONCOURSE OF THE NATIVES.—THE SHIPS ANCHOR IN THE BAY.

In the morning of Monday the 26th, we put to sea from Sanganoohla Harbour, and as the wind was southerly, stood away to the westward. My intention was now to proceed to Sandwich Islands, there to spend a few of the winter months, in case we should meet with the necessary refreshments, and then to direct our course to Kamtschatka, so as to endeavour to be there by the middle of May, the ensuing summer. In consequence of this resolution, I gave Captain Clerke orders how to proceed in case of separation; appointing Sandwich Islands for the first place of rendezvous, and the harbour of Petropaulowska, in Kamtschatka, for the second.

Soon after we were out of the harbour, the wind veered to the S.E. and E.S.E., which, by the evening, carried us as far as the western part of Oonalashka, where we got the wind at S. With this we stretched to the westward, till seven o'clock the next morning, when we were, and stood to the E. The wind, by this time, had increased in such a manner as to reduce us to our three courses. It blew in very heavy squalls attended with rain, hail, and snow. At nine o'clock in the morning of the 28th, the island of Oonalashka bore S.E., four leagues distant. We then wore and stood to the westward. The strength of the gale was now over, and toward evening, the little wind that blew insensibly veered round to the E., where it continued but a short time before it got to N.E., and increased to a very hard gale with rain. I steered first to the southward, and as the wind inclined to the N. and N.W., I steered more westerly.

On the 29th, at half-past six in the morning, we saw land extending from E. by S. to S. by W., supposed to be the island Amoghta. At eight, finding that we could not weather the island, as the wind had now veered to the westward, I gave over plying, and bore away for Oonalashka, with a view of going to the northward and eastward of that island, not daring to attempt a passage to the S.E. of it, in so hard a gale of wind. At the time we bore away, the land extended from E. by S. $\frac{1}{2}$ S. to S.S.W., four leagues distant. The longitude by the time keeper was $191^{\circ} 17'$, and the latitude $53^{\circ} 38'$. This will give a very different situation to this island from that assigned to it upon the Russian map. But it must be remembered, that this is one of the islands which Mr. Ismyloff said was wrongly placed. Indeed it is a doubt if this be Amoghta*; for after Ismyloff had made the correction, no land appeared upon the map in this latitude; but as I have observed before, we must not look for accuracy in this chart. At eleven o'clock, as we were steering to the N.E., we discovered an elevated rock, like a tower, bearing N.N.E. $\frac{1}{2}$ E., four leagues distant. It lies in the latitude of $53^{\circ} 57'$, and in the longitude of $191^{\circ} 2'$, and hath no place in the Russian map†. We must have passed very near it in the night. We could judge of

* On the chart of Kreutzen's and Levassieff's voyage, in 1768 and 1769, which we find in Mr. Coxe's book, p. 251, an island called Amuckta is laid down, not very far from the place assigned to Amoghta by Captain Cook.

† Though this rock had no place in the Russian map produced by Ismyloff, it has a place in the chart of Kreutzen's and Levassieff's voyage, above referred to.

The chart also agrees with Captain Cook's, as to the general position of this group of islands. The singularly indented shores of the island of Oonalashka are represented in both charts much alike; these circumstances are worth attending to, as the more modern Russian maps of this archipelago are so wonderfully erroneous.

its steepness from this circumstance, that the sea, which now ran very high, broke no where but against it. At three in the afternoon, after getting a sight of Oonalashka, we shortened sail, and hauled the wind, not having time to get through the passage before night. At day break the next morning, we bore away under courses, and close-reefed top-sails, having a very hard gale at W. N. W., with heavy squalls, attended with snow. At noon, we were in the middle of the strait, between Oonalashka and Oonella, the harbour of Sanganooodha bearing S. S. E., one league distant. At three in the afternoon, being through the strait and clear of the isles, Cape Providence bearing W. S. W., two or three leagues distant, we steered to the southward, under double-reefed top-sails and courses, with the wind at W. N. W., a strong gale, and fair weather.

On Monday the 2d of November, the wind veered to the southward, and before night blew a violent storm, which obliged us to bring to. The Discovery fired several guns, which we answered, but without knowing on what occasion they were fired. At eight o'clock, we lost sight of her, and did not see her again till eight the next morning. At ten, she joined us; and, as the height of the gale was now over, and the wind had veered back to W. N. W., we made sail, and resumed our course to the southward. The 6th, in the evening, being in the latitude of $42^{\circ} 12'$, and in the longitude of $201^{\circ} 26'$, the variation was $17^{\circ} 15' E$. The next morning, our latitude being $41^{\circ} 20'$, and our longitude 202° , a shag, or cormorant, flew several times round the ship. As these birds are seldom, if ever, known to fly far out of sight of land, I judged that some was not far distant. However, we could see none. In the afternoon, there being but little wind, Captain Clerke came on board, and informed me of a melancholy accident that happened on board his ship, the second night after we left Sanganooodha. The main tack gave way, killed one man, and wounded the boatswain and two or three more. In addition to this misfortune, I now learned, that on the evening of the 3d, his sails and rigging received considerable damage; and that the guns which he fired were the signal to bring to. On the 8th, the wind was at north; a gentle breeze, with clear weather. On the 9th, in the latitude of $39^{\circ} 1^{\circ}$, we had eight hours calm. This was succeeded by the wind from the south, attended with fair weather. Availing ourselves of this, as many of our people as could handle a needle were set to work to repair the sails; and the carpenters were employed to put the boats in order.

On the 12th at noon, being then in the latitude of $38^{\circ} 14'$, and in the longitude of $206^{\circ} 17'$, the wind returned back to the northward; and on the 15th, in the latitude of $33^{\circ} 30'$, it veered to the east. At this time, we saw a tropic bird, and a dolphin; the first that we had observed during the passage. On the 17th, the wind veered to the southward, where it continued till the afternoon of the 9th, when a squall of wind and rain brought it at once round by the west to the north. This was in the latitude of $32^{\circ} 26'$, and in the longitude of $207^{\circ} 30'$. The wind presently increased to a very strong gale, attended with rain, so as to bring us under double-reefed top-sails. In lowering down the main-top-sail to reef it, the wind tore it quite out of the foot-rope; and it was split in several other parts. This sail had only been brought to the yard the day before, after having had a repair. The next morning, we got another top-sail to the yard. This gale proved to be the forerunner of the trade-wind, which, in latitude 25° , veered to east, and east south-east.

I continued to steer to the southward, till daylight in the morning of the 25th, at which time we were in the latitude of $20^{\circ} 55'$. I now spread the ships, and steered to the west. In the evening, we joined; and at midnight brought to. At daybreak, next morning, land was seen extending from south south-east to west. We made sail, and stood for it. At eight, it extended from south-east half south, to west; the nearest part two leagues distant. It was supposed that we saw the extent of the land to the east, but not to the west. We were now satisfied, that the group of the Sandwich Islands had been only imperfectly discovered; as those of them which we had visited in our progress northward, all lie to the leeward of our present station. In the country was an elevated saddle hill, whose summit appeared above the clouds. From this hill the land fell in a gentle slope, and terminated in a steep, rocky coast, against which the sea broke in a dreadful surf. Finding that we could not weather the island, I bore up, and ranged along the coast to the westward. It was not long before we saw people on several parts of the shore, and some houses and plantations.

The country seemed to be both well wooded and watered; and running streams were seen falling into the sea in various places.

As it was of the last importance to procure a supply of provisions at these islands; and experience having taught me that I could have no chance to succeed in this, if a free trade with the natives were to be allowed; that is, if it were left to every man's discretion to trade for what he pleased, and in the manner he pleased; for this substantial reason, I now published an order, prohibiting all persons from trading, except such as should be appointed by me and Captain Clerke; and even these were enjoined to trade only for provisions and refreshments. Women were also forbidden to be admitted into the ships, except under certain restrictions. But the evil I meant to prevent, by this regulation, I soon found, had already got amongst them.

At noon, the coast extended from S. 81° E. to N. 56° W.; a low flat, like an isthmus, bore S. 42° W.; the nearest shore three or four miles distant; the latitude was 20° 59', and the longitude 203° 50'. Seeing some canoes coming off to us, I brought to. As soon as they got alongside, many of the people who conducted them came into the ship, without the least hesitation. We found them to be of the same nation with the inhabitants of the islands more to leeward, which we had already visited; and, if we did not mistake them, they knew of our having been there. Indeed, it rather appeared too evident; for these people had got amongst them the venereal distemper; and, as yet, I knew of no other way of its reaching them, but by an intercourse with their neighbours since our leaving them.

We got from our visitors a quantity of cuttle-fish, for nails and pieces of iron. They brought very little fruit and roots; but told us that they had plenty of them on their island, as also hogs and fowls. In the evening, the horizon being clear to the westward, we judged the westernmost land in sight to be an island, separated from that off which we now were. Having no doubt that the people would return to the ships next day, with the produce of their country, I kept plying off all night, and in the morning stood close in-shore. At first, only a few of the natives visited us; but toward noon, we had the company of a good many, who brought with them bread-fruit, potatoes, tarro, or eddy roots, a few plantains, and small pigs; all of which they exchanged for nails and iron tools. Indeed, we had nothing else to give them. We continued trading with them till four o'clock in the afternoon, when, having disposed of all their cargoes, and not seeming inclined to fetch more, we made sail, and stood off-shore.

While we were lying to, though the wind blew fresh, I observed that the ships drifted to the east. Consequently, there must have been a current setting in that direction. This encouraged me to ply to windward, with a view to get round the east end of the island, and so have the whole lee-side before us. In the afternoon of the 30th, being off the north-east end of the island, several canoes came off to the ships. Most of these belonged to a chief named Terrecoboo, who came in one of them. He made me a present of two or three small pigs; and we got, by barter, from the other people, a little salt. After a stay of about two hours, they all left us, except six or eight of their company, who chose to remain on board. A double-sailing canoe came, soon after, to attend upon them; which we towed astern all night. In the evening, we discovered another island to windward, which the natives call Owhyhee. The name of that off which we had been for some days, we were also told, is Mowee.

On the 1st of December, at eight in the morning, Owhyhee extended from south 22° E. to S. 12° W.; and Mowee from N. 41° to N. 83° W. Finding that we could fetch Owhyhee, I stood for it; and our visitors from Mowee not choosing to accompany us, embarked in their canoe, and went ashore. At seven in the evening, we were close up with the north side of Owhyhee; where we spent the night, standing off and on. In the morning of the 2d, we were surprised to see the summits of the mountains on Owhyhee covered with snow. They did not appear to be of any extraordinary height; and yet, in some places, the snow seemed to be of a considerable depth, and to have lain there some time. As we drew near the shore, some of the natives came off to us. They were a little shy at first; but we soon enticed some of them on board; and at last prevailed upon them to return to the island, and bring off what we wanted. Soon after these reached the shore,

we had company enough; and few coming empty-handed, we got a tolerable supply of small pigs, fruit, and roots. We continued trading with them till six in the evening; when we made sail, and stood off, with a view of plying to windward round the island.

In the evening of the 4th, we observed an eclipse of the moon. Mr. King made use of a night-telescope, a circular aperture being placed at the object end, about one-third of the size of the common aperture. I observed with the telescope of one of Ramsden's sextants; which, I think, answers this purpose as well as any other. The following times are the means, as observed by us both:—

6 ^h 3' 25" beginning of the eclipse	} Longitude {	201° 40' 45"
8 ^h 27' 25" end of the eclipse		201° 25' 15"
Mean		204° 35' 0"

The penumbra was visible, at least ten minutes before the beginning, and after the end of the eclipse. I measured the uneclipsed part of the moon, with one of Ramsden's sextants, several times before, at, and after the middle of the eclipse; but did not get the time of the middle so near as might have been effected by this method. Indeed these observations were made only as an experiment, without aiming at much nicety. I also measured mostly one way; whereas I ought to have brought alternately the reflected and direct images to contrary sides, with respect to each other; reading the numbers off the quadrant, in one case, to the left of the beginning of the divisions; and in the other case, to the right hand of the same. It is evident, that half the sum of these two numbers must be the true measurement, independent of the error of the quadrant; and this is the method that I would recommend. But I am well assured, that it might have been observed much nearer; and that this method may be useful when neither the beginning nor end of an eclipse can be observed, which may often happen.

Immediately after the eclipse was over, we observed the distance of each limb of the moon from Pollux and Arietis; the one being to the east, and the other to the west. An opportunity to observe, under all these circumstances, seldom happens; but when it does, it ought not to be omitted; as, in this case, the local errors to which these observations are liable destroy each other; which, in all other cases, would require the observations of a whole moon. The following are the results of these observations:

Myself with	Arietis 204° 22' 7"	} mean 201° 21' 5"
	Pollux 204° 20' 4"	
Mr. King with	Arietis 204° 27' 45"	} mean 204° 18' 29"
	Pollux 204° 9' 12"	

Mean of the two means	204° 19' 47"
The time-keeper, at 4 ^h 30', to which time all the lunar observations are reduced	204° 4' 45"

The current which I have mentioned, as setting to the eastward, had now ceased; for we gained but little by plying. On the 6th, in the evening, being about five leagues farther up the coast, and near the shore, we had some traffic with the natives. But, as it had furnished only a trifling supply, I stood in again the next morning, when we had a considerable number of visitors; and we lay to, trading with them till two in the afternoon. By that time, we had procured pork, fruit, and roots, sufficient for four or five days. We then made sail, and continued to ply to windward.

Having procured a quantity of sugar-cane, and having, upon a trial, made but a few days before, found that a strong decoction of it produced a very palatable beer, I ordered some more to be brewed for our general use. But when the cask was now broached, not one of my crew would even so much as taste it. As I had no motive in preparing this beverage, but to save our spirit for a colder climate, I gave myself no trouble, either by exerting authority, or by having recourse to persuasion, to prevail upon them to drink it; knowing that there was no danger of the scurvy, so long as we could get a plentiful supply of other vegetables. But that I might not be disappointed

in my views, I gave orders that no grog should be served in either ship. I myself, and the officers, continued to make use of this sugar-cane beer, whenever we could get materials for brewing it. A few hops, of which we had some on board, improved it much. It has the taste of new malt beer; and I believe no one will doubt of its being very wholesome. And yet my inconsiderate crew alleged that it was injurious to their health. They had no better reason to support a resolution, which they took on our first arrival in King George's Sound, not to drink the spruce-beer made there. But, whether from a consideration that it was not the first time of their being required to use that liquor, or from some other reason, they did not attempt to carry their purpose into actual execution; and I had never heard of it till now, when they renewed their ignorant opposition to my best endeavours to serve them. Every innovation whatever, on board a ship, though ever so much to the advantage of seamen, is sure to meet with their highest disapprobation. Both portable soup and sour kroun were, at first, condemned as stuff unfit for human beings. Few commanders have introduced into their ships more novelties, as useful varieties of food and drink, than I have done. Indeed few commanders have had the same opportunities of trying such experiments, or been driven to the same necessity of trying them. It has, however, been in a great measure owing to various little deviations from established practice, that I have been able to preserve my people, generally speaking, from that dreadful distemper, the scurvy, which has perhaps destroyed more of our sailors, in their peaceful voyages, than have fallen by the enemy in military expeditions.

I kept at some distance from the coast till the 13th, when I stood in again, six leagues farther to windward than we had as yet reached; and, after having some trade with the natives who visited us, returned to sea. I should have got near the shore again on the 15th, for a supply of fruit or roots, but the wind happening to be at south-east by south, and south south-east, I thought this a good time to stretch to the eastward, in order to get round, or at least to get a sight of the south-east end of the island. The wind continued at south-east by south most part of the 16th. It was variable between south and east on the 17th; and on the 18th it was continually veering from one quarter to another, blowing sometimes in hard squalls, and at other times calm, with thunder, lightning, and rain. In the afternoon, we had the wind westerly for a few hours; but in the evening it shifted to east by south, and we stood to the southward, close hauled, under an easy sail, as the *Discovery* was at some distance astern. At this time the south-east point of the island bore south-west by south, about five leagues distant; and I made no doubt that I should be able to weather it. But at one o'clock next morning it fell calm, and we were left to the mercy of a north-easterly swell, which impelled us fast toward the land; so that, long before daybreak we saw lights upon the shore, which was not more than a league distant. The night was dark, with thunder, lightning, and rain.

At three o'clock the calm was succeeded by a breeze from the south by east, blowing in squalls, with rain. We stood to the north-east, thinking it the best tack to clear the coast; but if it had been daylight we should have chosen the other. At daybreak, the coast was seen extending from north by west to south-west by west, a dreadful surf breaking upon the shore, which was not more than half a league distant. It was evident that we had been in the most imminent danger. Nor were we yet in safety, the wind veering more easterly; so that, for some time, we did but just keep our distance from the coast. What made our situation more alarming, was the leach-ropes of the main-top-sail giving way; which was the occasion of the sail's being rent in two; and the two top-gallant sails gave way in the same manner, though not half worn out. By taking a favourable opportunity, we soon got others to the yards; and then we left the land astern. The *Discovery*, by being at some distance to the north, was never near the land; nor did we see her till eight o'clock.

On this occasion, I cannot help observing, that I have always found that the bolt-ropes to our sails have not been of sufficient strength or substance. This, at different times, has been the source of infinite trouble and vexation; and of much expense of canvas, ruined by their giving way. I wish, also, that I did not think there is room for remarking, that the cordage and canvas, and indeed all the other stores made use of in the navy, are not

of equal goodness with those in general used in the merchant-service. It seems to be a very prevalent opinion amongst naval officers of all ranks, that the king's stores are better than any others, and that no ships are so well fitted out as those of the navy. Undoubtedly they are in the right as to the quantity, but, I fear, not as to the quality, of the stores. This, indeed, is seldom tried; for things are generally condemned, or converted to some other use, by such time as they are half worn out. It is only on such voyages as ours that we have an opportunity of making the trial; as our situation makes it necessary to wear everything to the very utmost*.

As soon as daylight appeared, the natives ashore displayed a large white flag, which we conceived to be a signal of peace and friendship. Some of them ventured out after us; but the wind freshening, and it not being safe to wait, they were soon left astern. In the afternoon, after making another attempt to weather the eastern extreme, which failed, I gave it up, and ran down to the *Discovery*. Indeed, it was of no consequence to get round the island; for we had seen its extent to the south-east, which was the thing I aimed at; and according to the information which we had got from the natives, there is no other island to the windward of this. However, as we were so near the south end of it, and as the least shift of wind in our favour would serve to carry us round, I did not wholly give up the idea of weathering it, and therefore continued to ply.

On the 20th, at noon, this south-east point bore south, three leagues distant; the snowy hills west north-west; and we were about four miles from the nearest shore. In the afternoon, some of the natives came in their canoes, bringing with them a few pigs and plantains. The latter were very acceptable, having had no vegetables for some days; but the supply we now received was so inconsiderable, being barely sufficient for one day, that I stood in again the next morning, till within three or four miles of the land, where we were met by a number of canoes laden with provisions. We brought to, and continued trading with the people in them till four in the afternoon; when, having got a pretty good supply, we made sail, and stretched off to the northward. I had never met with a behaviour so free from reserve and suspicion, in my intercourse with any tribes of savages, as we experienced in the people of this island. It was very common for them to send up into the ship the several articles they brought off for barter; afterward, they would come in themselves, and make their bargains on the quarter-deck. The people of Otaheite, even after our repeated visits, do not care to put so much confidence in us. I infer from this, that those of Owhyhee must be more faithful in their dealings with one another than the inhabitants of Otaheite are. For a little faith were observed amongst themselves, they would not be so ready to trust strangers. It is also to be observed, to their honour, that they had never once attempted to cheat us in exchanges, nor to commit a theft. They understand trading as well as most people, and seemed to comprehend clearly the reason of our plying upon the coast. For, though they brought off provisions in great plenty, particularly pigs, yet they kept up their price; and, rather than dispose of them for less than they thought they were worth, would take them ashore again.

On the 22d, at eight in the morning, we tacked to the southward, with a fresh breeze at east by north. At noon, the latitude was $20^{\circ} 28' 30''$; and the snowy peak bore south-west half south. We had a good view of it the preceding day, and the quantity of snow seemed to have increased, and to extend lower down the hill. I stood to the south-east till midnight, then tacked to the north till four in the morning, when we returned to the south-east tack; and, as the wind was at north-east by east, we had hopes of weathering the island. We should have succeeded, if the wind had not died away, and left us to the mercy of a great swell, which carried us fast toward the land, which was not two leagues distant. At length, we got our head off, and some light puffs of wind, which came with showers of

* Captain Cook may, in part, be right in his comparison of some cordage used in the king's service, with what is used in that of the merchants; especially in time of war, when part of the cordage wanted in the navy is, from necessity, made by contract. But it is well known, that there is no better cordage than what is made in the king's yards. This explanation of the preceding paragraph

has been subjoined on the authority of a naval officer of distinguished rank, and great professional ability, who has, at the same time, recommended it as a necessary precaution, that ships fitted out on voyages of discovery should be furnished with no cordage but what is made in the king's yards; and, indeed, that every article of their stores of every kind, should be the best that can be made.

rain, put us out of danger. While we lay, as it were, becalmed, several of the islanders came off with hogs, fowls, fruit, and roots. Out of one canoe we got a goose; which was about the size of a Muscovy duck. Its plumage was dark grey, and the bill and legs black.

At four in the afternoon, after purchasing everything that the natives had brought off, which was full as much as we had occasion for, we made sail, and stretched to the north, with the wind at E.N.E. At midnight we tacked, and stood to the S.E. Upon a supposition that the *Discovery* would see us tack, the signal was omitted; but she did not see us, as we afterward found, and continued standing to the north; for, at daylight next morning, she was not in sight. At this time, the weather being hazy, we could not see far; so that it was possible the *Discovery* might be following us; and being past the north-east part of the island, I was tempted to stand on, till, by the wind veering to N.E., we could not weather the land upon the other tack. Consequently we could not stand to the north to join or look for the *Discovery*. At noon we were, by observation, in the latitude of $19^{\circ} 55'$, and in the longitude of $205^{\circ} 3'$; the S.E. point of the island bore S. by E. a quarter E. six leagues distant; the other extreme bore N., 60° W.; and we were two leagues from the nearest shore. At six in the evening, the southernmost extreme of the island bore S.W., the nearest shore seven or eight miles distant; so that we had now succeeded in getting to the windward of the island, which we had aimed at with so much perseverance. The *Discovery*, however, was not yet to be seen. But the wind, as we had it, being very favourable for her to follow us, I concluded that it would not be long before she joined us. I therefore kept cruising off this south-east point of the island, which lies in the latitude of $19^{\circ} 34'$, and in the longitude of $205^{\circ} 6'$, till I was satisfied that Captain Clerke could not join me here. I now conjectured that he had not been able to weather the north-east part of the island, and had gone to leeward in order to meet me that way.

As I generally kept from five to ten leagues from the land, no canoes, except one, came off to us till the 28th, when we were visited by a dozen or fourteen. The people who conducted them brought, as usual, the produce of the island. I was very sorry that they had taken the trouble to come so far. For we could not trade with them, our old stock not being as yet consumed; and we had found, by late experience, that the hogs could not be kept alive, nor the roots preserved from putrefaction, many days. However, I intended not to leave this part of the island before I got a supply; as it would not be easy to return to it again, in case it should be found necessary. We began to be in want on the 30th; and I would have stood in near the shore, but was prevented by a calm; but a breeze springing up, at midnight, from S. and S.W., we were enabled to stand in for the land at daybreak. At ten o'clock in the morning, we were met by the islanders with fruit and roots; but in all the canoes were only three small pigs. Our not having bought those which had been lately brought off, may be supposed to be the reason of this very scanty supply. We brought to for the purposes of trade; but soon after our marketing was interrupted by a very hard rain; and, besides, we were rather too far from the shore. Nor durst I go nearer; for I could not depend upon the wind's remaining where it was for a moment; the swell also being high, and setting obliquely upon the shore, against which it broke in a frightful surf. In the evening the weather mended; the night was clear, and it was spent in making short boards.

Before daybreak, the atmosphere was again loaded with heavy clouds; and the new year was ushered in with very hard rain, which continued, at intervals, till past ten o'clock. The wind was southerly; a light breeze, with some calms. When the rain ceased, the sky cleared, and the breeze freshened. Being at this time about five miles from the land, several canoes arrived with fruit and roots; and, at last, some hogs were brought off. We lay to, trading with them till three o'clock in the afternoon; when, having a tolerable supply, we made sail, with a view of proceeding to the N.W. or lee-side of the island, to look for the *Discovery*. It was necessary, however, the wind being at S., to stretch first to the eastward, till midnight, when the wind came more favourable, and we went upon the other tack. For several days past, both wind and weather had been exceedingly unsettled; and there fell a great deal of rain. The three following days were spent in running down the

south-east side of the island. For during the nights we stood off and on; and part of each day was employed in lying-to, in order to furnish an opportunity to the natives of trading with us. They sometimes came on board, while we were five leagues from the shore. But whether from a fear of losing their goods in the sea, or from the uncertainty of a market, they never brought much with them. The principal article procured was salt, which was extremely good.

On the 5th, in the morning, we passed the south point of the island, which lies in the latitude of $18^{\circ} 54'$; and beyond it we found the coast to trend N. 60° W. On this point stands a pretty large village, the inhabitants of which thronged off to the ship with hogs and women. It was not possible to keep the latter from coming on board; and no women I ever met with were less reserved. Indeed it appeared to me that they visited us with no other view than to make a surrender of their persons. As I had now got a quantity of salt, I purchased no hogs but such as were fit for salting; refusing all that were under size. However, we could seldom get any above fifty or sixty pounds weight. It was happy for us that we still had some vegetables on board; for we now received few such productions. Indeed this part of the country, from its appearance, did not seem capable of affording them. Marks of its having been laid waste by the explosion of a volcano, everywhere presented themselves; and though we had as yet seen nothing like one upon the island, the devastation that it had made, in this neighbourhood, was visible to the naked eye. This part of the coast is sheltered from the reigning winds; but we could find no bottom to anchor upon; a line of an hundred and sixty fathoms not reaching it, within the distance of half a mile from the shore. The islanders having all left us toward the evening, we ran a few miles down the coast; and then spent the night standing off and on.

The next morning the natives visited us again, bringing with them the same articles of commerce as before. Being now near the shore, I sent Mr. Bligh, the master, in a boat, to sound the coast, with orders to land, and to look for fresh water. Upon his return, he reported that, at two cables' length from the shore, he had found no soundings with a line of one hundred and sixty fathoms; that, when he landed, he found no stream or spring, but only rain-water, deposited in holes upon the rocks; and even that was brackish, from the spray of the sea; and that the surface of the country was entirely composed of slags and ashes, with a few plants here and there interspersed. Between ten and eleven we saw with pleasure the Discovery coming round the south point of the island; and, at one in the afternoon, she joined us. Captain Clerke then coming on board, informed me that he had cruised four or five days where we were separated, and then plied round the east side of the island; but that, meeting with unfavourable winds, he had been carried to some distance from the coast. He had one of the islanders on board all this time, who had remained there from choice, and had refused to quit the ship, though opportunities had offered.

Having spent the night standing off and on, we stood in again the next morning; and when we were about a league from the shore, many of the natives visited us. At noon the observed latitude was $19^{\circ} 1'$, and the longitude, by the timekeeper, was $203^{\circ} 26'$; the island extending from S. 74° E., to N. 13° W.; the nearest part two leagues distant. At daybreak, on the 8th, we found that the currents, during the night, which we spent in plying, had carried us back considerably to windward, so that we were now off the south-west point of the island. There we brought to, in order to give the natives an opportunity of trading with us. At noon our observed latitude was $19^{\circ} 1'$, and our longitude, by the timekeeper, was $203^{\circ} 13'$; the south-west point of the island bearing N. 30° E., two miles distant. We spent the night as usual, standing off and on. It happened that four men and ten women who had come on board the preceding day, still remained with us. As I did not like the company of the latter, I stood in-shore toward noon, principally with a view to get them out of the ship; and some canoes coming off, I took that opportunity of sending away our guests.

We had light airs from N.W. and S.W., and calms, till eleven in the morning of the 10th, when the wind freshened at W.N.W., which, with a strong current setting to the S.E., so much retarded us, that in the evening, between seven and eight o'clock, the south point of the island bore N., $10\frac{1}{4}^{\circ}$ W., four leagues distant. The south snowy hill now bore

and part of each natives of trading to the shore. But plenty of a market, salt, which was

the morning of the rent setting to the o'clock, the south lowy hill now bore

N. 1½° E. At four in the morning of the 11th, the wind having fixed at W., I stood in for the land, in order to get some refreshments. As we drew near the shore, the natives began to come off. We lay-to, or stood on and off, trading with them all the day; but got a very scanty supply at last. Many canoes visited us, whose people had not a single thing to barter; which convinced us that this part of the island must be very poor, and that we had already got all that they could spare. We spent the 12th plying off and on, with a fresh gale at west. A mile from the shore, and to the north-east of the south point of the island, having tried soundings, we found ground at fifty-five fathoms' depth; the bottom a fine sand. At five in the evening we stood to the S.W., with the wind at W.N.W.; and soon after midnight we had a calm.

At eight o'clock next morning, having got a small breeze at S.S.E., we steered to the N.N.W., in for the land. Soon after a few canoes came alongside with some hogs, but without any vegetables, which articles we most wanted. We had now made some progress; for, at noon, the south point of the island bore S. 86½° E.; the S.W. point N. 13° W.; the nearest shore two leagues distant; latitude, by observation, 18° 56', and our longitude, by the timekeeper, 203° 40'. We had got the length of the south-west point of the island in the evening; but the wind now veering to the westward and northward, during the night we lost all that we had gained. Next morning, being still off the south-west point of the island, some canoes came off; but they brought nothing that we were in want of. We had now neither fruit nor roots, and were under a necessity of making use of some of our sea-provisions. At length some canoes from the northward brought us a small supply of hogs and roots. We had variable light airs, next to a calm, the following day, till five in the afternoon, when a small breeze at E.N.E. springing up, we were at last enabled to steer along-shore to the northward. The weather being fine, we had plenty of company this day, and abundance of everything. Many of our visitors remained with us on board all night, and we towed their canoes astern.

At daybreak on the 16th, seeing the appearance of a bay, I sent Mr. Bligh, with a boat from each ship to examine it, being at this time three leagues off. Canoes now began to arrive from all parts; so that before ten o'clock there were not fewer than a thousand about the two ships, most of them crowded with people, and well laden with hogs and other productions of the island. We had the most satisfying proof of their friendly intentions; for we did not see a single person who had with him a weapon of any sort. Trade and curiosity alone had brought them off. Among such numbers as we had, at times, on board, it is no wonder that some should betray a thievish disposition. One of our visitors took out of the ship a boat's rudder. He was discovered, but too late to recover it. I thought this a good opportunity to show these people the use of fire-arms; and two or three muskets, and as many four-pounders, were fired over the canoe which carried off the rudder. As it was not intended that any of the shot should take effect, the surrounding multitude of natives seemed rather more surprised than frightened. In the evening Mr. Bligh returned, and reported that he had found a bay in which was good anchorage, and fresh water, in a situation tolerably easy to be come at. Into this bay I resolved to carry the ships, there to refit, and supply ourselves with every refreshment that the place could afford. As night approached, the greater part of our visitors retired to the shore; but numbers of them requested our permission to sleep on board. Curiosity was not the only motive, at least with some; for the next morning several things were missing, which determined me not to entertain so many another night.

At eleven o'clock in the forenoon we anchored in the bay (which is called by the natives Karakakooa), in thirteen fathoms' water, over a sandy bottom, and about a quarter of a mile from the north-east shore. In this situation, the south point of the bay bore south by west, and the north point west half north. We moored with the stream-anchor and cable to the northward, mubent the sails, and struck the yards and topmasts. The ships continued to be much crowded with natives, and were surrounded by a multitude of canoes. I had nowhere, in the course of my voyages, seen so numerous a body of people assembled at one place. For besides those who had come off to us in canoes, all the shore of the bay was covered with spectators, and many hundreds were swimming round the ships like shoals of fish. We

As we had now sailed near forty leagues to the westward, along the edge of the ice, without seeing any opening, or a clear sea to the northward beyond it, and had therefore no prospect of advancing farther north for the present, Captain Clerke resolved to bear away to the south by east, (the only quarter that was clear) and to wait till the season was more advanced, before he made any farther efforts to penetrate through the ice. The intermediate time he proposed to spend in examining the bay of St. Laurence, and the coast to the southward of it; as a harbour so near, in case of future damage from the ice, would be very desirable. We also wished to pay another visit to our Tschutski friends; and particularly since the accounts we had heard of them from the commander of Kamtschatka.

We therefore stood on to the southward till the noon of the 10th, at which time we passed great quantities of drift-ice, and the wind fell to a perfect calm. The latitude by observation was $68^{\circ} 1'$, longitude $188^{\circ} 30'$. We passed several whales in the forenoon, and in the afternoon hoisted out the boats, and sent them in pursuit of the sea-horses, which were in great numbers on the pieces of ice that surrounded us. Our people were more successful than they had been before, returning with three large ones and a young one; besides killing and wounding several others. The gentlemen who went on this party were witnesses of several remarkable instances of parental affection in those animals. On the approach of our boats toward the ice, they all took their cubs under their fins, and endeavoured to escape with them into the sea. Several, whose young were killed or wounded and left floating on the surface, rose again and carried them down, sometimes just as our people were going to take them up into the boat; and might be traced bearing them to a great distance through the water, which was coloured with their blood: we afterward observed them bringing them at times above the surface, as if for air, and again diving under it with a dreadful bellowing. The female, in particular, whose young had been destroyed and taken into the boat, became so enraged that she attacked the cutter, and struck her two tusks through the bottom of it.

At eight in the evening a breeze sprung up to the eastward, with which we still continued our course to the southward, and at twelve fell in with numerous large bodies of ice. We endeavoured to push through them with an easy sail, for fear of damaging the ship; and having got a little farther to the southward, nothing was to be seen but one compact field of ice, stretching to the south-west, south-east, and north-east, as far as the eye could reach. This unexpected and formidable obstacle put an end to Captain Clerke's plan of visiting the Tschutski, for no space remained open but back again to the northward. Accordingly, at three in the morning of the 11th, we tacked and stood to that quarter. At noon the latitude by observation was $67^{\circ} 49'$, and longitude $188^{\circ} 47'$. On the 12th, we had light winds with thick hazy weather; and, on trying the current, we found it set to the north-west, at the rate of half a knot an hour. We continued to steer northward, with a moderate southerly breeze and fair weather, till the 13th, at ten in the forenoon, when we again found ourselves close in with a solid field of ice, to which we could see no limits from the mast-head. This at once dashed all our hopes of penetrating farther, which had been considerably raised by having now advanced near ten leagues through a space which, on the 9th, we had found occupied by impenetrable ice. Our latitude, at this time, was $69^{\circ} 37'$, our position nearly in the mid-channel between the two continents, and the field of ice extending from east north-east to west south-west.

As there did not remain the smallest prospect of getting farther north in the part of the sea where we now were, Captain Clerke resolved to make one more and final attempt on the American coast, for Baffin's Bay, since we had been able to advance the farthest on this side last year. Accordingly, we kept working the remaining part of the day to the windward, with a fresh easterly breeze. We saw several fulmars and arctic gulls, and passed two trees, both appearing to have lain in the water a long time. The larger was about ten feet in length, and three in circumference, without either bark or branches, but with the roots remaining attached. On the 14th, we stood on to the eastward, with thick and foggy weather, our course being nearly parallel to that we steered on the 8th and 9th, but six leagues more to the northward. On the 15th, the wind freshened from the westward, and having in a great measure dispersed the fog, we immediately stood to the northward,

that we might take a nearer view of the ice, and in an hour were close in with it, extending from north north-west to north-east. We found it to be compact and solid; the outer parts were ragged and of different heights, the interior surface was even, and, we judged, from eight to ten feet above the level of the sea. The weather becoming moderate for the remaining part of the day, we directed our course according to the trending of the ice, which in many parts formed deep bays.

In the morning of the 16th, the wind freshened, and was attended with thick and frequent showers of snow. At eight in the forenoon, it blew a strong gale from the west south-west, and brought us under double-reefed topsails; when, the weather clearing a little, we found ourselves embayed, the ice having taken a sudden turn to the south-east, and in one compact body surrounding us on all sides, except on the south quarter. We therefore hauled our wind to the southward, being at this time in latitude $70^{\circ} 8' N.$, and in twenty-six fathoms' water; and, as we supposed, about twenty-five leagues from the coast of America. The gale increasing, at four in the afternoon we close reefed the fore and main top-sails, furled the mizen top-sail, and got the top-gallant-yards down upon deck. At eight, finding the depth of water had decreased to twenty-two fathoms, which we considered as a proof of our near approach to the American coast, we tacked and stood to the north. We had blowing weather, accompanied with snow, through the night, but next morning it became clear and moderate; and, at eight in the forenoon, we got the top-gallant-yards across, and made sail with the wind still at west south-west. At noon, we were in latitude, by observation, $69^{\circ} 55'$, longitude $194^{\circ} 30'$. Toward evening the wind slackened, and at midnight it was a calm.

On the 18th, at five in the morning, a light breeze sprung up from the east north-east, with which we continued our course to the north, in order to regain the ice as soon as possible. We passed some small logs of driftwood, and saw abundance of sea-parrots, and the small ice-birds, and likewise a number of whales. At noon, the latitude, by observation, was $70^{\circ} 26'$, and longitude $194^{\circ} 54'$, the depth of water twenty-three fathoms; the ice stretched from north to east north-east, and was distant about three miles. At one in the afternoon, finding that we were close in with a firm united field of it, extending from west north-west to east, we tacked, and the wind coming round to the westward, stood on to the eastward along its edge, till eleven o'clock at night. At that time a very thick fog coming on, and the water shoaling to nineteen fathoms, we hauled our wind to the south. The variation observed this day was $31^{\circ} 20' E.$ It is remarkable, that though we saw no sea-horses on the body of the ice, yet they were in herds, and in greater numbers on the detached fragments, than we had ever observed before. About nine in the evening, a white bear was seen swimming close by the *Discovery*, it afterward made to the ice, on which were also two others. On the 19th, at one in the morning, the weather clearing up, we again steered to the north-east till two, when we were a second time so completely embayed, that there was no opening left but to the south; to which quarter we accordingly directed our course, returning through a remarkably smooth water, and with very favourable weather, by the same way we had come in. We were never able to penetrate farther north than at this time, when our latitude was $70^{\circ} 33'$; and this was five leagues short of the point to which we advanced last season. We held on to the south south-west, with light winds from the north-west, by the edge of the main ice, which lay on our left hand, and stretched between us and the continent of America. Our latitude by observation, at noon, was $70^{\circ} 11'$, our longitude $196^{\circ} 15'$, and the depth of water sixteen fathoms. From this circumstance, we judged that the Icy Cape was now only at seven or eight leagues' distance; but, though the weather was in general clear, it was at the same time hazy in the horizon; so that we could not expect to see it.

In the afternoon, we saw two white bears in the water, to which we immediately gave chase in the jolly-boat, and had the good fortune to kill them both. The larger, which probably was the dam of the younger, being shot first, the other would not quit it, though it might easily have escaped on the ice, whilst the men were reloading, but remained swimming about, till, after being fired upon several times, it was shot dead.

The dimensions of the larger were as follows :—

	Pt.	In.
From the snout to the end of the tail	7	2
From the snout to the shoulder-bone	2	3
Height of the shoulder	4	3
Circumference near the fore-legs	4	10
Breadth of the fore-paw	0	10
lbs.		
Weight of the four quarters	436	
Weight of the four quarters of the smaller	256	

On comparing the dimensions of this with Lord Mulgrave's white bear, they were found almost exactly the same, except in the circumference, where ours fell exceedingly short. These animals afforded us a few excellent meals of fresh meat. The flesh had indeed a strong fishy taste, but was, in every respect, infinitely superior to that of the sea-horse; which, nevertheless, our people were again persuaded, without much difficulty, to prefer to their salted provisions.

At six in the morning of the 20th, a thick fog coming on, we lost sight of the ice for two hours; but the weather clearing, we saw the main body again to the south south-east, when we hauled our wind which was easterly, toward it, in the expectation of making the American coast to the south-east, and which we effected at half-past ten. At noon, the latitude, by account, was $69^{\circ} 33'$, and longitude $194^{\circ} 53'$, and the depth of water nineteen fathoms. The land extended from south by east, to south south-west half west, distant eight or ten leagues, being the same we had seen last year: but it was now much more covered with snow than at that time; and to all appearance the ice adhered to the shore. We continued, in the afternoon sailing through a sea of loose ice, and standing toward the land, as near as the wind, which was east south-east, would admit. At eight, the wind lessening, there came on a thick fog; and, on perceiving a rippling in the water, we tried the current, which we found to set to the east north-east, at the rate of a mile an hour, and therefore determined to steer, during the night, before the wind in order to stem it, and to oppose the large fragments of loose ice, that were setting us on towards the land. The depth of the water at midnight was twenty fathoms. At eight in the morning of the 21st, the wind freshening, and the fog clearing away, we saw the American coast to the south-east, at the distance of eight or ten leagues, and hauled in for it; but were stopped again by the ice, and obliged to bear away to the westward, along the edge of it. At noon, the latitude, by account, was $69^{\circ} 34'$ and longitude 193° , and the depth of water twenty-four fathoms.

Thus a connected, solid, field of ice, rendering every effort we could make to a nearer approach to the land fruitless, and joining, as we judged, to it, we took a last farewell of a North-east passage to Old England. I shall beg leave to give in Captain Clerke's own words, the reasons of this his final determination, as well as of his future plans; and this the rather, as it is the last transaction his health permitted him to write down.

"It is now impossible to proceed the least farther to the northward upon this coast (America); and it is equally as improbable that this amazing mass of ice should be dissolved by the few remaining summer-weeks which will terminate this season; but it will continue. it is to be believed, as it now is, an insurmountable barrier to every attempt we can possibly make. I, therefore, think it the best step that can be taken, for the good of the service, to trace the sea over to the Asiatic coast, and to try if I can find any opening, that will admit me farther north; if not, to see what more is to be done upon that coast; where I hope, yet cannot much flatter myself, to meet with better success; for the sea is now so choked with ice, that a passage, I fear, is totally out of the question.

CHAPTER IV.—FRUITLESS ATTEMPTS TO PENETRATE THROUGH THE ICE TO THE NORTH-WEST.—DANGEROUS SITUATION OF THE DISCOVERY.—SEAHORSES KILLED.—FRESH INSTRUCTIONS FROM THE ICE.—REPORT OF DAMAGES RECEIVED BY THE DISCOVERY.—CAPTAIN CLERKE'S DETERMINATION TO PROCEED TO THE SOUTHWARD.—JOY OF THE SHIP'S CREWS ON THAT OCCASION.—PASS SERDZE KAMEN.—RETURN THROUGH BEERING'S STRAITS.—INQUIRY INTO THE EXTENT OF THE NORTH-EAST COAST OF ASIA.—REASONS FOR REJECTING MULLER'S MAP OF THE PROMONTORY OF THE TSCHUTSKI.—REASONS FOR BELIEVING THE COAST DOES NOT REACH A HIGHER LATITUDE THAN $70\frac{1}{2}^{\circ}$ NORTH.—GENERAL OBSERVATIONS ON THE IMPRACTICABILITY OF A NORTH-EAST, OR NORTH-WEST PASSAGE FROM THE ATLANTIC INTO THE PACIFIC OCEAN.—COMPARATIVE VIEW OF THE PROGRESS MADE IN THE YEARS 1778 AND 1779.—REMARKS ON THE SEA AND SEACOASTS, NORTH OF BEERING'S STRAITS.—HISTORY OF THE VOYAGE RESUMED.—PASS THE ISLAND OF ST. LAURENCE.—THE ISLAND OF MEDNOI.—DEATH OF CAPTAIN CLERKE.—SHORT ACCOUNT OF HIS SERVICES.

CAPTAIN CLERKE having determined, for the reasons assigned at the conclusion of the last chapter, to give up all further attempts on the coast of America, and to make his last efforts in search of a passage on the coast of the opposite continent, we continued during the afternoon of the 21st of July, to steer to the west north-west, through much loose ice. At ten at night, discovering the main body of it through the fog, right ahead, and almost close to us, and being unwilling to take a southerly course, so long as we could possibly avoid it, we hauled our wind, which was easterly, and stood to the northward; but in an hour after, the weather clearing up, and finding ourselves surrounded by a compact field of ice on every side, except to the south-south-west, we tacked and stood on in that direction, in order to get clear of it. At noon of the 22d, our latitude, by observation, was $69^{\circ} 30'$, and longitude $187^{\circ} 30'$. In the afternoon, we again came up with the ice, which extended to the north-west and south-west, and obliged us to continue our course to the southward, in order to weather it.

It may be remarked, that since the 8th of this month, we had twice traversed this sea, in lines nearly parallel with the run we had just now made; that in the first of those traverses, we were not able to penetrate so far north, by eight or ten leagues, as in the second; and that in the last we had again found an united body of ice, generally about five leagues to the southward of its position in the preceding run. As this proves that the large compact fields of ice which we saw were moveable, or diminishing; at the same time, it does not leave any well-founded expectation of advancing much farther in the most favourable seasons.

At seven in the evening, the weather being hazy, and no ice in sight, we bore away to the westward; but, at half-past eight the fog dispersing, we found ourselves in the midst of loose ice, and close in with the main body; we therefore stood upon a wind which was still easterly, and kept beating to windward during the night, in hopes of weathering the loose pieces, which the freshness of the wind kept driving down upon us in such quantities, that we were in manifest danger of being blocked up by them. In the morning of the 23d, the clear water, in which we continued to stand to and fro, did not exceed a mile and a half, and was every instant lessening. At length, after using our utmost endeavours to clear the loose ice, we were driven to the necessity of forcing a passage to the southward, which at half-past seven, we accomplished, but not without subjecting the ship to some very severe shocks. The Discovery was less successful. For, at eleven, when they had nigh got clear out, she became so entangled by several large pieces, that her way was stopped, and immediately dropping bodily to leeward, she fell, broadside foremost, on the edge of a considerable body of ice; and having, at the same time, an open sea to windward, the surf caused her to strike violently upon it. This mass at length either so far broke, or moved, as to set them at liberty to make another trial to escape; but, unfortunately, before the ship gathered way enough to be under command, she again fell to leeward on another fragment; and the swell making it unsafe to lie to windward, and finding no chance of getting clear, they pushed into a small opening, furled their sails, and made fast with ice-hooks.

In this dangerous situation we saw them at noon, about three miles from us, bearing north-west, a fresh gale from the south-east driving more ice to the north-west, and increasing the body that lay between us. Our latitude, by account, was $69^{\circ} 8'$, the longitude 187° , and the depth of water twenty-eight fathoms. To add to the gloomy apprehensions which began to force themselves on us, at half-past four in the afternoon, the weather becoming thick and hazy, we lost sight of the *Discovery*; but, that we might be in a situation to afford her every assistance in our power, we kept standing on close by the edge of the ice. At six, the wind happily coming round to the north, gave us some hopes, that the ice might drift away and release her; and in that case, as it was uncertain in what condition she might come out, we kept firing a gun every half hour, in order to prevent a separation. Our apprehensions for her safety did not cease till nine, when we heard her guns in answer to ours; and soon after, being hailed by her, were informed, that upon the change of the wind the ice began to separate; and that, setting all their sails, they forced a passage through it. We learned further, that whilst they were encompassed by it, they found the ship drift, with the main body, to the north-east, at the rate of half a mile an hour. We were sorry to find that the *Discovery* had rubbed off a great deal of the sheathing from the bows, and was become very leaky, from the strokes she had received when she fell upon the edge of the ice.

On the 24th, we had fresh breezes from south-west, with hazy weather, and kept running to the south-east till eleven in the forenoon, when a large body of loose ice, extending from north north-east, round by the east, to south south-east, and to which (though the weather was tolerably clear) we could see no end, again obstructed our course. We therefore kept working to windward, and at noon, our latitude, by observation, was $68^{\circ} 53'$, longitude 188° ; the variation of the compass $22^{\circ} 30'$ E. At four in the afternoon it became calm, and we hoisted out the boats in pursuit of the sea-horses, which were in prodigious herds on every side of us. We killed ten of them, which were as many as we could make use of for eating, or for converting into lamp oil. We kept on with the wind from the south-west, along the edge of the ice, which extended in a direction almost due east and west, till four in the morning of the 25th, when observing a clear sea beyond it, to the south-east, we made sail that way, with a view of forcing through it. By six we had cleared it, and continued the remainder of the day running to the south-east, without any ice in sight. At noon, our latitude, by observation, was $68^{\circ} 38'$, longitude $189^{\circ} 9'$, and the depth of water thirty fathoms. At midnight, we tacked, and stood to the westward, with a fresh gale from the south; and at ten in the forenoon of the 26th, the ice again showed itself, extending from north-west to south. It appeared loose, and drifting, by the force of the wind, to the northward. At noon, our latitude, by observation, was 68° N., longitude $188^{\circ} 10'$ E.; and we had soundings with twenty-eight fathoms. For the remaining part of the day, and till noon of the 27th, we kept standing backward and forward, in order to clear ourselves of different bodies of ice. At noon, we were in latitude, by observation, $67^{\circ} 47'$, longitude 188° . At two in the afternoon, we saw the continent to the south by east; and at four, having run, since noon, with a south south-east wind to the south-west, we were surrounded by loose masses of ice, with the firm body of it in sight, stretching in a north by west, and a south by east direction, as far as the eye could reach; beyond which we saw the coast of Asia, bearing south and south by east.

As it was now necessary to come to some determination with respect to the course we were next to steer, Captain Clerke sent a boat, with the carpenters, on board the *Discovery*, to inquire into the particulars of the damage she had sustained. They returned, in the evening, with the report of Captain Gore, and of the carpenters of both ships, that the damages they had received were of a kind that would require three weeks to repair; and that it would be necessary, for that purpose, to go into some port. Thus, finding a farther advance to the northward, as well as a nearer approach to either continent, obstructed by a sea blocked up with ice, we judged it both injurious to the service, by endangering the safety of the ships, as well as fruitless, with respect to the design of our voyage, to make any farther attempts toward a passage. This, therefore, added to the representations of Captain Gore, determined Captain Clerke not to lose more time in what he

concluded to be an unattainable object, but to sail for Awatska Bay, to repair our damages there; and, before the winter should set in, and render all other efforts toward discovery impracticable, to explore the coast of Japan. I will not endeavour to conceal the joy that brightened the countenance of every individual, as soon as Captain Clerke's resolutions were made known. We were all heartily sick of a navigation full of danger, and in which the utmost perseverance had not been repaid with the smallest probability of success. We therefore turned our faces toward home, after an absence of three years, with a delight and satisfaction, which, notwithstanding the tedious voyage we had still to make, and the immense distance we had to run, were as freely entertained, and perhaps as fully enjoyed, as if we had been already in sight of the Land's-end.

On the 28th, we kept working to windward with a fresh breeze from the south-east, having the coast of Asia still in sight. At four in the morning, the cape, which, on the authority of Muller, we have called Serdze Kamen, bore south south-west, distant six or seven leagues. We saw, in different places, upon the tops of the hills, which rise inland on both sides of the cape, protuberances of a considerable height, which had the appearance of huge rocks, or pillars of stone. On the 29th, the wind still continuing contrary, we made but slow progress to the southward. At midnight, we had thick foggy weather, accompanied with a breeze from the north north-west, with which we directed our course to the south south-east, through the straits, and had no land in sight till seven in the evening of the 30th; when the fog clearing away, we saw Cape Prince of Wales bearing south by east, distant about six leagues; and the island St. Diomedé south-west by west. We now altered our course to the west, and at eight made the east cape, which, at midnight, bore west by north, distant four leagues. In the night we steered to the south south-west, with a fresh west north-westerly breeze; and, at four in the morning of the 31st, the East Cape bore north north-east, and the north-east part of the bay of St. Laurence (where we anchored the last year) west by south, its distance being four leagues. As we could not have worked up to windward without a greater waste of time than the object appeared to deserve, we ran across the bay, regretting much, as we passed along, the loss of this opportunity of paying a second visit to the Tschutski. At noon our latitude, by observation, was $65^{\circ} 6'$, and longitude 189° . The south point of the bay of St. Laurence bore north by west one quarter west, and was distant seven or eight leagues. In the afternoon the variation was found to be $22^{\circ} 50'$ east.

Having now passed Beering's Straits, and taken our final leave of the north-east coast of Asia, it may not be improper, on this occasion, to state the grounds on which we have ventured to adopt two general conclusions respecting its extent, in opposition to the opinions of Mr. Muller. The first, that the promontory named East Cape is actually the easternmost point of that quarter of the globe; or, in other words, that no part of the continent extends in longitude beyond $190^{\circ} 22'$ E.: the second, that the latitude of the north-easternmost extremity falls to the southward of 70° N. With respect to the former, if such land exist, it must necessarily be to the north of latitude 69° , where the discoveries made in the present voyage terminate; and, therefore, the probable direction of the coast, beyond this point, is the question I shall endeavour, in the first place, to investigate.

As the Russian is the only nation that has hitherto navigated these seas, all our information respecting the situation of the coast to the northward of Cape North, must necessarily be derived from the charts and journals of the persons who have been employed at various times, in ascertaining the limits of that empire; and these are, for the most part, so imperfect, so confused and contradictory, that it is not easy to form any distinct idea of their pretended, much less to collect the amount of their real discoveries. It is on this account that the extent and form of the peninsula, inhabited by the Tschutski, still remains a point, on which the Russian geographers are much divided. Mr. Muller, in his map, published in the year 1754, supposes this country to extend toward the north-east, to the 75° of latitude, and in longitude 190° east of Greenwich, and to terminate in a round cape, which he calls Tschukotskoi Noss. To the southward of this cape he conceives the coast to form a bay to the westward, bounded, in latitude $67^{\circ} 18'$, by Serdze Kamen, the northernmost point seen by Beering in his expedition in the year 1728. The map published by the Academy of

St. Petersburg, in the year 1776, gives the whole peninsula entirely a new form, placing its north-easternmost extremity in the latitude 73° , longitude $178^{\circ} 30'$. The easternmost point in latitude $65^{\circ} 30'$, longitude $189^{\circ} 30'$. All the other maps we saw, both printed and in manuscript, vary between these two, apparently more according to the fancy of the compiler, than on any grounds of more accurate information. The only point in which there is a general coincidence, without any considerable variation, is in the position of the East Cape, in latitude 66° . The form of the coast, both to the south and north of this cape, in the map of the Academy, is exceedingly erroneous, and may be totally disregarded. In that of Mr. Muller, the coast to the northward bears a considerable resemblance to our survey, as far as the latter extends, except that it does not trend sufficiently to the westward; receding only about 5° of longitude, between the latitude 66° and 69° ; whereas, in reality, it recedes near ten. Between the latitude 69° and 74° , he makes the coast bend round to the north and north-east, and to form a considerable promontory. On what authority, now remains to be examined.

Mr. Coxe, whose accurate researches into this subject give his opinion great weight, is persuaded that the extremity of the Noss in question was never passed but by Deshneff and his party, who sailed from the river Kovyma in the year 1648, and are supposed to have got round it into the Anadyr. As the account of this expedition, the substance of which the reader will find in Mr. Coxe's account of Russian discoveries, contains no geographical delineation of the coast along which they sailed, its position must be conjectured from incidental circumstances; and from these it appears very manifest, that the Tschukotski Noss of Deshneff is no other than the promontory called by Captain Cook the East Cape. Speaking of the Noss, he says, "One might sail from the isthmus to the river Anadyr, with a fair wind, in three days and three nights." This exactly coincides with the situation of the East Cape, which is about one hundred and twenty leagues from the mouth of the Anadyr; and as there is no other isthmus to the northward between that and the latitude of 69° , it is obvious that, by this description, he must intend either the cape in question, or some other to the southward of it. In another place he says, "Over against the isthmus there are two islands in the sea, upon which were seen people of the Tschutski nation, through whose lips were run pieces of the teeth of the sea-horse." This again perfectly agrees with the two islands situated to the south-east of the East Cape. We saw, indeed, no inhabitants on them; but it is not at all improbable, that a party of the Americans from the opposite continent, whom this description accurately suits, might, at that time, have been accidentally there: and whom it was natural enough for him to mistake for a tribe of the Tschutski*.

These two circumstances are of so striking and unequivocal a nature, that they appear to me conclusive on the point of the Tschukotski Noss, notwithstanding there are others of a more doubtful kind, which we have from the same authority, and which now remain to be considered. "To go," says Deshneff in another account, "from the Kovyma to the Anadyr, a great promontory must be doubled, which stretches very far into the sea; and afterward, this promontory stretches between north and north-east." It was probably from the expressions contained in these passages, that Mr. Muller was induced to give the country of the Tschutski the form we find in his map; but had he been acquainted with the situation of the East Cape, as ascertained by Captain Cook, and the remarkable coincidence between it and their promontory or isthmus (for it must be observed that Deshneff appears

* From the circumstance, related in book iv., chap. ii, that gave name to Sledge Island, it appears that the inhabitants of the adjacent continents visit occasionally the small islands lying between them, probably for the convenience of fishing, or in pursuit of furs. It appears also from Popoff's deposition, which I shall have occasion to speak of more particularly hereafter, that the general resemblance between the people who are seen in these islands and the Tschutski, was sufficient to lead Deshneff into the error of imagining them to be the same. "Opposite to the Noss," he says, "is an island of moderate size,

without trees, whose inhabitants resemble in their exterior, the Tschutski, although they are quite another nation; not numerous, indeed, yet speaking their own particular language." Again, "One may go in a baidare from the Noss to the island in half a day; beyond is a great continent, which can be discovered from the island in serene weather. When the weather is good, one may go from the island to the continent in a day. The inhabitants of the continent similar to the Tschutski, excepting that they speak another language."

to be all along speaking of the same thing), in the circumstances already mentioned. I am confident he would not have thought those expressions, merely by themselves, of sufficient weight to warrant him in extending the north-eastern extremity of Asia either so far to the north or to the eastward. For after all these expressions are not irreconcilable with the opinion we have adopted, if we suppose Deshneff to have taken these bearings from the small bight which lies to the westward of the Cape.

The deposition of the Cossac Popoff, taken at the Anadirskoi *ostrog* in the year 1711, seems to have been the next authority on which Mr. Muller has proceeded; and beside these two I am not acquainted with any other. This Cossac, together with several others, was sent by land to demand tribute from the independent Tschutski tribes, who lived about the Noss. The first circumstance in the account of this journey that can lead to the situation of Tschukotskoi Noss is its distance from Anadirsk; and this is stated to be ten weeks' journey with loaded rein-deer; on which account, it is added, their day's journey was but very small. It is impossible to conclude much from so vague an account; but as the distance between the East Cape and the *ostrog* is upward of two hundred leagues in a straight line, and therefore may be supposed to allow twelve or fifteen miles a day, its situation cannot be reckoned incompatible with Popoff's calculation. The next circumstance mentioned in this deposition is, that their route lay by the foot of a rock called Matkol, situated at the bottom of a great gulf. This gulf Muller supposes to be the bay he had laid down between latitude 66° and 72°; and accordingly places the rock Matkol in the centre of it; but it appears equally probable, even if we had not so many reasons to doubt the existence of that bay, that it might be some part of the gulf of Anadir, which they would undoubtedly touch upon in their road from the *ostrog* to the East Cape. But what seems to put this matter beyond all dispute, and to prove that the cape visited by Popoff cannot be to the northward of 69° latitude, is that part of his deposition which I have already quoted, relative to the island lying off the Noss, from whence the opposite continent might be seen. For as the two continents in latitude 69° have diverged so far as to be more than three hundred miles distant, it is highly improbable that the Asiatic coast should again trend in such a manner to the eastward, as to come nearly within sight of the coast of America.

If these arguments should be deemed conclusive against the existence of the peninsula of the Tschutski, as laid down by Muller, it will follow that the East Cape of the Tschukotskoi Noss of the * more early Russian navigators, and consequently that the undescribed coast from the latitude of 69° to the mouth of the river Kovyma must uniformly trend more or less to the westward. As an additional proof of this, it may be remarked that the Tschukotskoi Noss is always represented as dividing the sea of Kovyma from that of Anadir, which could not be the case if any considerable cape had projected to the north-east in the higher latitudes. Thus, in the depositions taken at Anadirsk, it is related "that opposite the Noss, on both sides, as well in the sea of Kovyma as in that of Anadir, an island is said to be seen at a great distance, which the Tschutski call a large country; and say that people dwell there who have large teeth put in their mouths that project through their cheeks." Then follows a description of these people and their country, exactly corresponding with our accounts of the opposite continent.

The last question that arises is, to what degree of northern latitude this coast extends, before it trends more directly to the westward. If the situation of the mouth of the Kovyma, both with respect to its latitude and longitude, were accurately determined, it would perhaps not be very difficult to form a probable conjecture upon this point. Captain Cook was always strongly of opinion that the northern coast of Asia, from the Indigirka eastward, has hitherto been generally laid down more than two degrees to the northward of its true position; and he has therefore, on the authority of a map that was in his possession, and on the information he received at Oonalashka, placed the mouth of the river Kovyma, in his chart of the north-west coast of America and the north-east coast of Asia, in the latitude of 68°.

* I mention the more early Russian navigators, because Beering, whom we have also followed, and after him all the late Russian geographers, have given this name to the

south-east cape of the peninsula of the Tschutski, which was formerly called the Anadirskoi Noss.

Should he be right in this conjecture, it is probable, for the reasons that have been already stated, that the Asiatic coast does not anywhere exceed 70° before it trends to the westward; and consequently that we were within 1° of its north-eastern extremity. For if the continent be supposed to stretch anywhere to the northward of Shelatskoi Noss, it is scarcely possible that so extraordinary a circumstance should not have been mentioned by the Russian navigators; and we have already shown that they make mention of no remarkable promontory between the Koyvma and the Anadir, except the East Cape. Another circumstance related by Deshneff, may perhaps be thought a further confirmation of this opinion, namely, that he met with no impediment from ice in navigating round the north-east extremity of Asia; though he adds, that this sea is not always so free from it; as indeed is manifest from the failure of his first expedition, and since that, from the unsuccessful attempts of Shalauoff, and the obstacles we met with, in two different years, in our present voyage.

The continent left undetermined in our chart, between Cape North and the mouth of the Koyvma, is in longitudinal extent one hundred and twenty-five leagues. One third or about forty leagues of this distance, from the Koyvma eastward, was explored in the year 1723 by a *Sinbojarskoi* of Jakutz, whose name was Fedot Amosoff, by whom Mr. Muller was informed that its direction was to the eastward. It is said to have been since accurately surveyed by Shalauoff, whose chart makes it trend to the north-east by east as far as the Shelatskoi Noss, which he places about forty-three leagues to the eastward of the Koyvma. The space between this Noss and Cape North, about eighty-two leagues, is therefore the only part of the Russian empire that now remains unascertained. But if the river Koyvma be erroneously situated with respect to its longitude as well as in its latitude, a supposition for which probable grounds are not wanting, the extent of the unexplored coast will become proportionably diminished. The reasons which incline me to believe that the mouth of this river is placed in the Russian charts much too far to the westward, are as follows: First, because the accounts that are given of the navigation of the Frozen Sea, from that river round the north-east point of Asia to the gulf of Anadir, do not accord with the supposed distance between these places. Secondly, because the distance overland from the Koyvma to the Anadir is represented by the early Russian travellers as a journey easily performed, and of no very extraordinary length. Thirdly, because the coast from the Shelatskoi Noss of Shalauoff* seems to trend directly south-east to the East Cape. If this be so, it will follow, that as we were probably not more than 1° to the southward of Shelatskoi Noss, only sixty miles of the Asiatic coast remained unascertained.

Had Captain Cook lived to this period of our voyage, and experienced, in a second attempt, the impracticability of a north-east or north-west passage from the Pacific to the Atlantic Ocean, he would doubtless have laid before the public, in one connected view, an account of the obstacles which defeated this, the primary object of our expedition, together with his observations on a subject of such magnitude, and which had engaged the attention and divided the opinions of philosophers and navigators for upward of two hundred years. I am very sensible how unequal I am to the task of supplying this deficiency; but that the expectations of the reader may not be wholly disappointed, I must beg his candid acceptance of the following observations, as well as of those I have already ventured to offer him, relative to the extent of the north-east coast of Asia.

The evidence that has been so fully and judiciously stated in the introduction,† amounts to the highest degree of probability that a north-west passage from the Atlantic into the Pacific Ocean cannot exist to the southward of 65° of latitude. If then there exists a passage, it must be either through Baffin's Bay, or round by the north of Greenland, in the western hemisphere; or else through the Frozen Ocean, to the northward of Siberia, in the eastern; and on whichever side it lies, the navigator must necessarily pass through Beering's Straits. The impracticability of penetrating into the Atlantic on either side, through this strait, is therefore all that remains to be submitted to the consideration of the public.

As far as our experience went, it appears, that the sea to the north of Beering's Strait is clearer of ice in August than in July, and perhaps in a part of September it may be still

more free. But after the equinox, the days shorten so fast, that no farther thaw can be expected; and we cannot rationally allow so great an effect to the warm weather in the first half of September, as to imagine it capable of dispersing the ice from the most northern parts of the American coast. But admitting this to be possible, it must at least be granted, that it would be madness to attempt to run from the icy Cape to the known parts of Baffin's Bay (a distance of four hundred and twenty leagues) in so short a time as that passage can be supposed to continue open.

Upon the Asiatic side, there appears still less probability of success, both from what came to our own knowledge with respect to the state of the sea to the southward of Cape North, and also from what we learn from the experience of the * lieutenants under Beering's direction, and the journal of Shalauoff, in regard to that on the north of Siberia. The voyage of Deshneff, if its truth be admitted, proves undoubtedly the possibility of passing round the north-east point of Asia; but when the reader reflects, that near a century and a half has elapsed since the time of that navigator, during which, in an age of great curiosity and enterprise, no man has yet been able to follow him, he will not entertain very sanguine expectations of the public advantages that can be derived from it. But let us even suppose, that in some singularly favourable season a ship has found a clear passage round the coast of Siberia, and is safely arrived at the mouth of the Lena, still there remains the Cape of Taimura, stretching to the 78° of latitude, which the good fortune of no single voyager has hitherto doubled.

It is, however, contended, that there are strong reasons for believing that the sea is more free from ice the nearer we approach to the pole; and that all the ice we saw in the lower latitudes was formed in the great rivers of Siberia and America, the breaking up of which had filled the intermediate sea. But even if that supposition be true, it is equally so that there can be no access to those open seas, unless this great mass of ice is so far dissolved in the summer, as to admit of a ship's getting through it. If this be the fact, we have taken a wrong time of the year for attempting to find this passage, which should have been explored in April and May, before the rivers were broken up. But how many reasons may be given against such a supposition? Our experience at Saint Peter and Saint Paul enabled us to judge what might be expected farther north; and upon that ground we had reason to doubt, whether the continents might not in winter be even joined by the ice; and this agreed with the stories we heard in Kamtschatka, that on the Siberian coast they go out from the shore in winter, upon the ice, to greater distances than the breadth of the sea is, in some parts, from one continent to the other. In the depositions referred to above, the following remarkable circumstance is related. Speaking of the land seen from the Tschukotskoi Noss, it is said, "that in summer time they sail in one day to the land in baidares, a sort of vessel constructed of whalebone, and covered with seal-skins; and in winter time, going swift with rein-deer, the journey may likewise be made in a day." A sufficient proof that the two countries were usually joined together by the ice.

The account given by Mr. Muller of one of the expeditions undertaken to discover a supposed island in the Frozen Sea is still more remarkable. "In the year 1714, a new expedition was prepared from Jakutzk for the same place, under the command of Alexei Markoff, who was to sail from the mouth of the Jana; and if the *Schüiki* were not fit for sea-voyages, he was to construct, at a proper place, vessels fit for prosecuting the discoveries without danger. On his arrival at Ust-janskoe Simovie, the port at which he was to embark, he sent an account, dated February 2, 1715, to the chancery of Jakutzk, mentioning that it was impossible to navigate the sea, as it was continually frozen both in summer and winter; and that consequently the intended expedition was no otherwise to be carried on but with sledges drawn by dogs. In this manner he accordingly set out with nine persons on the 10th of March the same year, and returned on the 3d of April to Ust-janskoe Simovie. The account of his journey is as follows: that he went seven days as fast as his dogs could draw him, (which in good ways and weather is eighty or a hundred wersts in a day,) directly toward the north upon the ice, without discovering any island; that it had not been

* See Gmelin, pages 369, 374.

possible for him to proceed any farther, the ice rising there in the sea like mountains; that he had climbed to the top of some of them, whence he was able to see to a great distance round about him, but could discern no appearance of land; and that at last wanting food for his dogs, many of them died, which obliged them to return."

Besides these arguments, which proceed upon an admission of the hypothesis that the ice in those seas comes from the rivers, there are others which give great room to suspect the truth of the hypothesis itself. Captain Cook, whose opinion respecting the formation of ice had formerly coincided with that of the theorists we are now controverting, found abundant reason in the present voyage for changing his sentiments. We found the coast of each continent to be low, the soundings gradually decreasing toward them, and a striking resemblance between the two; which, together with the description Mr. Hearne gives of the Coppermine river, afford reason to conjecture that whatever rivers may empty themselves into the Frozen Sea from the American continent, are of the same nature with those on the Asiatic side; which are represented to be so shallow at the entrance as to admit only small vessels; whereas the ice we have seen, rises above the level of the sea to a height equal to the depth of those rivers; so that its entire height must be at least ten times greater. The curious reader will also in this place be led naturally to reflect on another circumstance, which appears very incompatible with the opinion of those who imagine land to be necessary for the formation of ice; I mean the different state of the sea about Spitzbergen, and to the north of Beering's Straits. It is incumbent on them to explain how it comes to pass that in the former quarter, and in the vicinity of much known land, the navigator annually penetrates to near 80° north latitude; whereas, on the other side, his utmost efforts have not been able to carry him beyond 71°; where, moreover, the continents diverge nearly east and west, and where there is no land yet known to exist near the pole. For the farther satisfaction of the reader on this point, I shall beg leave to refer him to Observations made during a Voyage round the World, by Dr. Forster, where he will find the question of the formation of ice fully and satisfactorily discussed, and the probability of open polar seas disproved by a variety of powerful arguments.

I shall conclude these remarks with a short comparative view of the progress we made to the northward, at the two different seasons we were engaged in that pursuit, together with a few general observations relative to the sea, and the coast of the two continents which lie to the north of Beering's Straits. It may be observed, that in the year 1778 we did not meet with the ice till we advanced to the latitude of 70°, on August 17th; and that then we found it in compact bodies, extending as far as the eye could reach, and of which a part or the whole was moveable, since, by its drifting down upon us we narrowly escaped being hemmed in between it and the land. After experiencing both how fruitless and dangerous it would be to attempt to penetrate farther north between the ice and the land, we stood over toward the Asiatic side, between the latitude of 69° and 70°, frequently encountering in this tract large and extensive fields of ice; and though, by reason of the fogs and thickness of the weather, we were not able absolutely and entirely to trace a connected line of it across, yet we were sure to meet with it before we reached the latitude of 70°, whenever we attempted to stand to the northward. On the 26th of August, in latitude 69½°, and longitude 184°, we were obstructed by it in such quantities, as made it impossible for us to pass either to the north or west, and obliged us to run along the edge of it to the south south-west, till we saw land, which we afterwards found to be the coast of Asia. With the season thus far advanced, the weather setting in with snow and sleet, and other signs of approaching winter, we abandoned our enterprise for that time.

In this second attempt we could do little more than confirm the observations we had made in the first; for we were never able to approach the continent of Asia higher than the latitude of 67°, nor that of America in any parts, excepting a few leagues between the latitude of 68° and 68° 20', that were not seen the last year. We were now obstructed by ice 3° lower, and our endeavours to push farther to the northward were principally confined to the mid-space between the two coasts. We penetrated near 3° farther on the American side than on the Asiatic, meeting with the ice both years sooner, and in greater quantities on the latter coast. As we advanced north, we still found the ice more compact

and solid; yet as in our different traverses from side to side, we passed over spaces which had before been covered with it, we conjectured that most of what we saw was moveable. Its height, on a medium, we took to be from eight to ten feet, and that of the highest to have been sixteen or eighteen. We again tried the currents twice, and found them unequal, but never to exceed one mile an hour. By comparing the reckoning with the observations, we also found the current to set different ways, yet more from the south-west than any other quarter; but whatever their direction might be, their effect was so trifling that no conclusions respecting the existence of any passage to the northward could be drawn from them. We found the month of July to be infinitely colder than that of August. The thermometer in July was once at 28°, and very commonly at 30°; whereas the last year, in August, it was very rare to have it so low as the freezing point. In both seasons we had some high winds, all of which came from the south-west. We were subject to fogs whenever the wind was moderate, from whatever quarter, but they attended southerly winds more constantly than contrary ones.

The straits between the two continents, at their nearest approach, in latitude 66°, were ascertained to be thirteen leagues, beyond which they diverge to N.E. by E. and W.N.W.; and in latitude 69° they become 14° of longitude, or about one hundred leagues asunder. A great similarity is observable in the appearance of the two countries to the northward of the straits. Both are destitute of wood. The shores are low, with mountains rising to a great height farther up the country. The depth of water in the mid-way between them was twenty-nine and thirty fathoms, decreasing gradually as we approached either continent, with the difference of being somewhat shoaler on the American than on the Asiatic coast, at the same distance from land. The bottom in the middle was a soft slimy mud; and on drawing nearer to either shore, a brown sand, intermixed with small fragments of bones, and a few shells. We observed but little tide or current; what there was came from the westward.

But it is now time to resume the narrative of our voyage, which was broken off on the 31st of July, on which day at noon we had advanced eighteen leagues to the southward of the East Cape. We had light airs from the south-west till noon of the 1st of August, at which time our latitude, by observation, was 64° 23', longitude 189° 15'; the coast of Asia extended from north-west by west to west half south, distant about twelve leagues; and the land to the eastward of St. Laurence bore south half west. On the 2d, the weather becoming clear, we saw the same land at noon, bearing from west south-west half west to south-east, making in a number of high hummocks, which had the appearance of separate islands; the latitude, by observation, was 64° 3', longitude 189° 28', and depth of water seventeen fathoms. We did not approach this land sufficiently near to determine whether it was one island, or composed of a cluster together. Its westernmost part we passed July 3d, in the evening, and then supposed to be the island of Saint Laurence; the easternmost we ran close by in September last year, and this we named Clerke's Island, and found it to consist of a number of high cliffs, joined together by very low land. Though we mistook, the last year, those cliffs for separate islands, till we approached very near the shore, I should still conjecture that the island Saint Laurence was distinct from Clerke's Island, since there appeared a considerable space between them, where we could not perceive the smallest rising of ground. In the afternoon we also saw what bore the appearance of a small island, to the north-east of the land which was seen at noon, and which from the haziness of the weather we had only sight of once. We estimated its distance to be nineteen leagues from the island of Saint Laurence, in a north-east by east half east direction. On the 3d we had light variable winds, and directed our course round the north-west point of the island of Saint Laurence. On the 4th, at noon, our latitude by account was 64° 8', longitude 188°; the island Saint Laurence bearing south one quarter east, distant seven leagues. In the afternoon, a fresh breeze springing up from the east, we steered to the south south-west, and soon lost sight of Saint Laurence. On the 7th, at noon, the latitude by observation was 59° 38', longitude 183°. In the afternoon it fell calm, and we got a great number of cod in seventy-eight fathoms of water. The variation was found to be 19° E. From this time to the 17th we were making the best of our way to the south, without any occurrence worth remarking,

except that the wind, coming from the western quarter, forced us farther to the eastward than we wished, as it was our intention to make Beering's Island. On the 17th, at half past four in the morning, we saw land to the north-west, which we could not approach, the wind blowing from that quarter. At noon, the latitude by observation was $53^{\circ} 49'$, longitude $168^{\circ} 5'$, and variation 10° E. The land in sight bore north by west, twelve or fourteen leagues distant. This land we take to be the island Mednoi, laid down in the Russian charts to the south-east of Beering's Island. It is high land, and appeared clear of snow. We place it in the latitude $54^{\circ} 28'$, longitude $167^{\circ} 52'$. We got no soundings with one hundred and fifty fathoms of line.

Captain Clerke was now no longer able to get out of his bed; he therefore desired that the officers would receive their orders from me, and directed that we should proceed with all speed to Awatska Bay. The wind continuing westerly, we stood on to the south till early on the morning of the 19th, when, after a few hours' rain, it blew from the eastward, and freshened to a strong gale. We accordingly made the most of it whilst it lasted, by standing to the westward under all the sail we could carry. On the 20th, the wind shifting to the south-west, our course was to the west north-west. At noon the latitude, by observation, was $53^{\circ} 7'$, longitude $162^{\circ} 49'$. On the 21st, at half-past five in the morning, we saw a very high-peaked mountain on the coast of Kamtschatka, called Cheepoonskoi Mountain, from its lying behind the Noss, bearing north-west by north, twenty-five or thirty leagues distant. At noon, the coast extended from north by east to west with a very great haziness upon it, and distant about twelve leagues. We had light airs the remaining part of this and the following day, and got no soundings with one hundred and forty fathoms of line.

On the 22d of August, 1779, at nine o'clock in the morning, departed this life Captain Charles Clerke, in the thirty-eighth year of his age. He died of a consumption, which had evidently commenced before he left England, and of which he had lingered during the whole voyage. His very gradual decay had long made him a melancholy object to his friends; yet the equanimity with which he bore it, the constant flow of good spirits which continued to the last hour, and a cheerful resignation to his fate, afforded them some consolation. It was impossible not to feel a more than common degree of compassion for a person whose life had been a continued scene of those difficulties and hardships to which a seaman's occupation is subject, and under which he at last sunk. He was brought up to the navy from his earliest youth, and had been in several actions during the war which began in 1756, particularly in that between the *Bellona* and *Courageux*, where being stationed in the mizen-top, he was carried overboard with the mast, but was taken up without having received any hurt. He was midshipman in the *Dolphin*, commanded by Commodore Byron, on her first voyage round the world, and afterward served on the American station. In 1768, he made his second voyage round the world, in the *Endeavour*, as master's mate, and by the promotion which took place during the expedition, he returned a lieutenant. His third voyage round the world was in the *Resolution*, of which he was appointed the second lieutenant: and soon after his return, in 1775, he was promoted to the rank of master and commander. When the present expedition was ordered to be fitted out, he was appointed to the *Discovery*, to accompany Captain Cook; and by the death of the latter succeeded, as has been already mentioned, to the chief command.

It would be doing his memory extreme injustice not to say, that during the short time the expedition was under his direction, he was most zealous and anxious for its success. His health, about the time the principal command devolved upon him, began to decline very rapidly, and was every way unequal to encounter the rigours of a high northern climate. But the vigour and activity of his mind had in no shape suffered by the decay of his body: and though he knew, that by delaying his return to a warmer climate, he was giving up the only chance that remained for his recovery, yet, careful and jealous to the last degree that a regard to his own situation should never bias his judgment to the prejudice of the service, he persevered in the search of a passage till it was the opinion of every officer in both ships that it was impracticable, and that any farther attempts would not only be fruitless, but dangerous.

CHAPTER V.—RETURN TO THE HARBOUR OF ST. PETER AND ST. PAUL.—PROMOTION OF OFFICERS.—FUNERAL OF CAPTAIN CLERKE.—DAMAGES OF THE DISCOVERY REPAIRED.—VARIOUS OTHER OCCUPATIONS OF THE SHIPS' CREWS.—LETTERS FROM THE COMMANDER.—SUPPLY OF FLOUR AND NAVAL STORES FROM A RUSSIAN GALLIOT.—ACCOUNT OF AN EXILE.—BEAR-HUNTING AND FISHING PARTIES.—DISGRACE OF THE SERJEANT.—CELEBRATION OF THE KING'S CORONATION DAY, AND VISIT FROM THE COMMANDER.—THE SERJEANT REINSTATED.—A RUSSIAN SOLDIER PROMOTED AT OUR REQUEST.—REMARKS ON THE DISCIPLINE OF THE RUSSIAN ARMY.—CHURCH AT PARATOUNCA.—METHOD OF BEAR-HUNTING.—FARTHER ACCOUNT OF THE BEARS AND KAMTSCHADALES.—INSCRIPTION TO THE MEMORY OF CAPTAIN CLERKE.—SUPPLY OF CATTLE.—ENTERTAINMENTS ON THE EMPRESS'S NAME-DAY.—PRESENT FROM THE COMMANDER.—ATTEMPT OF A MARINE TO DESERT.—WORK OUT OF THE BAY.—NAUTICAL AND GEOGRAPHICAL DESCRIPTION OF AWATSKA BAY.—ASTRONOMICAL TABLES, AND OBSERVATIONS.

I SENT Mr. Williamson to acquaint Captain Gore with the death of Captain Clerke, and received a letter from him, ordering me to use all my endeavours to keep in company with the *Discovery*; and, in case of a separation, to make the best of my way to the harbour of St. Peter and St. Paul. At noon, we were in latitude $53^{\circ} 8' N.$, longitude $160^{\circ} 40' E.$, with Cheepoonskoi Noss bearing west. We had light airs in the afternoon, which lasted through the forenoon of the 23d. At noon, a fresh breeze springing up from the eastward, we stood in for the entrance of Awatska Bay; and at six in the evening, saw it bearing west north-west half west, distant five leagues. At eight, the light-house, in which we now found a good light, bore north-west by west, three miles distant. The wind about this time died away; but the tide being in our favour, we sent the boats ahead and towed beyond the narrow parts of the entrance; and at one o'clock in the morning of the 24th, the ebb-tide setting against us, we dropped anchor. At nine, we weighed, and turned up the bay with light airs, and the boats still ahead till one; when, by the help of a fresh breeze, we anchored, before three in the afternoon, in the harbour of Saint Peter and St. Paul, with our ensign half-staff up, on account of our carrying the body of our late Captain; and were soon after followed by the *Discovery*.

We had no sooner anchored, than our old friend, the serjeant, who was still the commander of the place, came on board with a present of berries, intended for our poor deceased Captain. He was exceedingly affected when we told him of his death, and showed him the coffin that contained his body. And as it was Captain Clerke's particular request to be buried on shore, and, if possible, in the church of Paratounca, we took the present opportunity of explaining this matter to the serjeant, and consulting with him about the proper steps to be taken on the occasion. In the course of our conversation, which, for want of an interpreter, was carried on but imperfectly, we learned that Professor de L'Isle, and several Russian gentlemen, who died here, had been buried in the ground near the barracks, at the ostrog of St. Peter and St. Paul; and that this place would be preferable to Paratounca, as the church was to be removed thither the next year. It was therefore determined, that we should wait for the arrival of the priest of Paratounca, whom the serjeant advised us to send for, as the only person that could satisfy our inquiries on this subject. The serjeant having, at the same time, signified his intentions of sending off an express to the commander at Bolcheretsk, to acquaint him with our arrival, Captain Gore availed himself of that occasion of writing him a letter, in which he requested that sixteen head of black cattle might be sent with all possible expedition; and because the commander did not understand any language except his own, the nature of our request was made known to the serjeant, who readily undertook to send, along with our letter, an explanation of its content.

We could not help remarking, that, although the country was much improved in its appearance since we were last here, the Russians looked, if possible, worse now than they did then. It is to be owned, they observed, that this was also the case with us; and as neither party seemed to like to be told of their bad looks, we found mutual consolation

in throwing the blame upon the country, whose green and lively complexion, we agreed, cast a deadness and sallowness upon our own. The eruption of the volcano, which was so violent when we sailed out of the bay, we found had done no damage here, notwithstanding stones had fallen at the ostrog, of the size of a goose's egg. This was all the news we had to inquire after, and all they had to tell; excepting that of the arrival of Soposnikoff from Oonalashka, who took charge of the packet Captain Cook had sent to the Admiralty, and which, it gave us much satisfaction to find, had been forwarded.

In the morning of the 25th, Captain Gore made out the new commissions, in consequence of Captain Clerke's death; appointing himself to the command of the *Resolution*, and me to the command of the *Discovery*; and Mr. Lanyan, master's mate of the *Resolution*, who had served in that capacity on board the *Adventure* in the former voyage, was promoted to the vacant lieutenantancy. These promotions produced the following farther arrangements: Lieutenants Burney and Rickman were removed from the *Discovery*, to be first and second lieutenants of the *Resolution*; and Lieutenant Williamson was appointed first lieutenant of the *Discovery*. Captain Gore also permitted me to take into the *Discovery* four midshipmen, who had made themselves useful to me in astronomical calculations, and whose assistance was now particularly necessary, as we had no Ephemeris for the present year. And, that astronomical observations might continue to be made in both ships, Mr. Bayley took my place in the *Resolution*. The same day we were visited by the Pope Romanoff Vereshagen, the worthy priest of Paratounca. He expressed his sorrow at the death of Captain Clerke in a manner that did honour to his feelings, and confirmed the account given by the serjeant, respecting the intended removal of the church to the harbour; adding that the timber was actually preparing, but leaving the choice of either place entirely to Captain Gore.

The *Discovery*, as has been mentioned, had suffered great damage from the ice, particularly on the 23d day of July; and having, ever since, been exceedingly leaky, it was imagined that some of her timbers had started. Captain Gore therefore sent the carpenters of the *Resolution* to assist our own in repairing her; and accordingly, the forehold being cleared, to lighten her forward, they were set to work to rip the damaged sheathing from the larboard bow. This operation discovered that three feet of the third strake, under the wale, were staved, and the timbers within started. A tent was next erected for the accommodation of such of our people as were employed on shore; and a party were sent a mile into the country, to the northward of the harbour, to fell timber. The observatories were erected at the west end of the village, near a tent, in which Captain Gore and myself took up our abode.

The farther we proceeded in removing the sheathing, the more we discovered of the decayed state of the ship's hull. The next morning, eight feet of a plank in the wale were found to be so exceedingly rotten, as to make it necessary to shift it. This left us for some time at a stand, as nothing was to be found, in either ship, wherewith to replace it, unless we chose to cut up a top-mast; an expedient not to be had recourse to, till all others failed. The carpenters were therefore sent on shore in the afternoon in search of a tree big enough for the purpose. Luckily they found a birch, which I believe was the only one of sufficient size in the whole neighbourhood of the bay, and which had been sawed down by us when we were last here; so that it had the advantage of having lain some time to season. This was shaped on the spot, and brought on board the next morning. As the season was now so far advanced, I was fearful lest any delay or hindrance should arise, on our parts, to Captain Gore's farther views of discovery, and therefore gave orders that no more sheathing should be ripped off than was absolutely necessary for repairing the damages sustained by the ice. This I did, being apprehensive of their meeting with more decayed planks, which, I judged, had much better remain in that state, than be filled up with green birch, upon a supposition that such was to be had. All hands were, at present, busily employed in separate duties, that everything might be in readiness for sea, against the time our carpenters should have finished their work. We set apart four men to haul the seine for salmon, which were caught in great abundance, and found to be of an excellent quality. After supplying the immediate wants of both ships, we salted down near a hog'shead a-day. The invalids, who were four in number, were employed in gathering greens, and in cooking for the parties on

shore. Our powder was also landed, in order to be dried ; and the sea-horse blubber, with which both ships, in our passage to the north (as has been before related), had stored themselves, was now boiled down for oil, which was become a necessary article, our candles having long since been expended. The cooper was fully engaged in his department : and in this manner were both ships' companies employed in their several occupations, till Saturday afternoon, which was given up to all our men, except the carpenters, for the purpose of washing their linen and getting their clothes in some little order, the they might make a decent appearance on Sunday.

In the afternoon of that day, we paid the last offices to Captain Clerke. The officers and men of both ships walked in procession to the grave, whilst the ships fired minute-guns ; and the service being ended, the marines fired three volleys. He was interred under a tree, which stands on rising ground, in the valley to the north side of the harbour, where the hospital and storehouses are situated : Captain Gore having judged this situation most agreeable to the last wishes of the deceased, for the reasons abovementioned ; and the priest of Paratounea having pointed out a spot for his grave, which, he said, would be, as near as he could guess, in the centre of the new church. This reverend pastor walked in the procession, along with the gentleman who read the service ; and all the Russians in the garrison were assembled, and attended with great respect and solemnity.

On the 30th, the different parties returned to their respective employments, as mentioned in the course of the preceding week ; and on the 2d of September, the carpenters having shifted the rotten and damaged planks, and repaired and calked the sheathing of the larboard bow, proceeded to rip off the sheathing that had been injured by the ice, from the starboard side. Here, again, they discovered four feet of a plank, in the third strake under the wale, so shaken, as to make it necessary to be replaced. This was accordingly done, and the sheathing repaired on the 3d. In the afternoon of the same day, we got on board some ballast, unlung the rudder, and sent it on shore, the lead of the pintles being found entirely worn away, and a great part of the sheathing rubbed off. As the carpenters of the Resolution were not yet wanted, we got this set to rights the next day ; but finding the rudder out of all proportion heavy, even heavier than that of the Resolution, we let it remain on shore, in order to dry and lighten.

The same day, an ensign arrived from Bolcheretsk with a letter from the commander to Captain Gore, which we put into the serjeant's hands ; and, by his assistance, were made to understand, that orders had been given about the cattle, and that they might be expected here in a few days ; and moreover, that Captain Shmaleff, the present commander, would himself pay us a visit immediately on the arrival of a sloop which was daily expected from Okotzk. The young officer who brought the letter was the son of the Captain-lieutenant Synd, who commanded an expedition on discovery, between Asia and America, eleven years ago, and resided at this time at Okotzk*. He informed us, that he was sent to receive our directions, and to take care to get us supplied with whatever our service might require ; and that he should remain with us, till the commander was himself able to leave Bolcheretsk ; after which he was to return, that the garrison there might not be left without an officer.

On the 5th, the parties that were on shore returned on board, and were employed in scrubbing the ship's bottom, and getting in eight tons of shingle ballast. We also got up two of our guns, that had been stowed in the fore-hold, and mounted them on the deck, being now about to visit nations, our receptions amongst whom might a good deal depend

* See all that is known of his voyage, and a chart of his discoveries, in Mr. Cox's Account of Russian Discoveries between Asia and America. We were not able to learn from the Russians in Kamtschatka a more perfect account of Synd than we now find is given by Mr. Cox ; and yet they seemed disposed to communicate all that they really knew. Major Behn could only inform us, in general, that the expedition had miscarried as to its object, and that the commander had fallen under much blame. It appeared evidently, that he had been on the coast of America to the southward of Cape Prince of Wales, between the latitude of 64° and 65° : and it is most pro-

bable, that his having got too far to the northward to meet with sea-otters, which the Russians, in all their attempts at discoveries, seem to have principally in view, and his returning without having made any that promised commercial advantages, was the cause of his disgrace, and of the great contempt with which the Russians always spoke of this officer's voyage. The cluster of islands, placed in Synd's chart between the latitude of 61° and 65°, is undoubtedly the same with the island called, by Beering, St. Laurence's, and those we named Clerke's, Anderson's, and King's Islands ; but their proportionate size, and relative situation, are exceedingly erroneous.

on the respectability of our appearance. The *Resolution* hauled on shore on the 8th, to repair some damages, which she had also received among the ice, in her cutwater; and our carpenters, in their turn, were sent to her assistance.

About this time we began to brew a strong decoction of a species of dwarf-pine that grows here in great abundance, thinking that it might hereafter be useful in making beer, and that we should probably be able to procure sugar or molasses to ferment with it at Canton. At all events, I was sure it would be serviceable as a medicine for the scurvy; and was more particularly desirous of supplying myself with as much of it as I could procure, because most of the preventives we had brought out were either used or spoiled by keeping. By the time we had prepared a hogshead of it, the ship's copper was discovered to be very thin, and cracked in many places. This obliged me to desist, and to give orders, that it should be used as sparingly, for the future, as possible. It might, perhaps, be a useful precaution for those who may hereafter be engaged in long voyages of this kind, either to provide themselves with a spare copper, or to see that the copper usually furnished be of the strongest kind. The various extra services in which it will be found necessary to employ them, and especially the important one of making anti-scorbutic decoctions, seem absolutely to require some such provision; and I should rather recommend the former, on account of the additional quantity of fuel that would be consumed in heating thick coppers.

In the morning of the 10th, the boats from both ships were sent to tow into the harbour a Russian galliot from Okotzk. She had been thirty-five days on her passage, and had been seen from the lighthouse a fortnight ago, beating up toward the mouth of the bay. At that time, the crew had sent their only boat on shore for water, of which they now began to be in great want; and the wind freshening, the boat was lost on its return; and the galliot, being driven out to sea again, had suffered exceedingly. There were fifty soldiers in her, with their wives and children; and several other passengers, besides the crew, which consisted of twenty-five; so that they had upward of an hundred souls on board; a great number for a vessel of eighty tons, and that was also heavy laden with stores and provisions. Both this galliot, and the sloop we saw here in May, are built like the Dutch doggers. Soon after she had come to anchor, we received a visit from a *Put-parouchick*, or sub-lieutenant, who was passenger in the galliot, and sent to take the command of this place. Part of the soldiers, we understood, were also designed to reinforce the garrison; and two pieces of small cannon were landed, as an additional defence to the town. It should seem, from these circumstances, that our visit here had drawn the attention of the Russian commanders in Siberia to the defenceless situation of the place; and I was told by the honest sergeant, with many significant shrugs, that, as we had found our way into it, other nations might do the same, some of whom might not be altogether so welcome.

Next morning the *Resolution* hauled off from the shore, having repaired the damages she had sustained by the ice; and in the course of the day we got from the galliot a small quantity of pitch, tar, cordage, and twine; canvas was the only thing we asked for with which their scanty store did not put it into their power to supply us. We also received from her an hundred and forty skins of flour, amounting to 13,782 pounds English, after deducting five pounds for the weight of each bag. We had a constant course of dry weather till this day, when there came on a heavy rain, accompanied with strong squalls of wind, which obliged us to strike our yards and top-masts.

The 12th, being Sunday, was kept as a day of rest; but the weather unfortunately continuing foul, our men could not derive the advantage from it we wished, by gathering the berries that grew in great quantities and varieties on the coast, and taking other pastime on shore. The same day, Ensign Synd left us to return to Bolcheretsk with the remainder of the soldiers that came in the galliot. He had been our constant guest during his stay. Indeed, we could not but consider him, on his father's account, as in some measure belonging to us, and entitled, as one of the family of discoverers, to a share in our afflictions.

We had hitherto admitted the sergeant to our tables, in consideration of his being commander of the place; and, moreover, because he was a quick sensible man, and comprehended better than any other the few Russian words we had learned. Ensign Synd had very

politely suffered him to enjoy the same privileges during his stay; but, on the arrival of the new commander from Okotsk, the sergeant, for some cause or other which we could not learn, fell into disgrace, and was no longer suffered to sit down in the company of his own officers. It was in vain to think of making any attempt to obtain an indulgence which, though it would have been highly agreeable to us, was doubtless incompatible with their discipline.

On Wednesday we had finished the stowage of the holds, got on board all our wood and water, and were ready to put to sea at a day's notice. It is, however, necessary to observe, that though everything was in this degree of readiness on board, the cattle were not yet arrived from Verchnei; and as fresh provisions were the most important article of our wants, and in a great measure necessary for the health of the men, we could not think of taking our departure without them. We therefore thought this a favourable opportunity (especially as there was an appearance of fine weather) of taking some amusement on shore, and acquiring a little knowledge of the country. Accordingly, Captain Gore proposed a party of bear-hunting, which we all very readily came into.

We did not set out on this expedition till Friday the 17th, in order to give a day's rest to the Hospodin Ivaskin, a new acquaintance, that was to be of our party, and who came down here on Wednesday. This gentleman, who, we understood, usually resides at Verchnei, had been desired by Major Behm to attend us on our return to the harbour, in order to be our interpreter; and the accounts we had heard of him before his arrival, had excited in us a great curiosity to see him. He is of a considerable family in Russia. His father was a general in the empress's service; and he himself, after having received his education partly in France and partly in Germany, had been page to the Empress Elizabeth, and an ensign in her guards. At the age of sixteen he was knouted, had his nose slit, and was banished, first to Siberia and afterward to Kamtschatka, where he had now lived thirty-one years. He was a very tall thin man, with a face all over furrowed with deep wrinkles, and here, in his whole figure, the strongest marks of old age, though he had scarcely reached his fifty-fourth year.

To our very great disappointment, he had so totally forgotten both his German and French, as not to be able to speak a sentence, nor readily to understand what was said to him in either of these languages. We found ourselves thus unfortunately deprived of what we flattered ourselves would have turned out a favourable opportunity of getting farther information relative to this country. We had also promised ourselves much pleasure from the history of this extraordinary man, which he probably would have been induced to relate to strangers, who might perhaps be of some little service to him, but who could have no inducement to take advantage, from anything he might say, to do him an injury. No one here knew the cause of his banishment; but they took it for granted that it must have been for something very atrocious, particularly as two or three commanders of Kamtschatka have endeavoured to get him recalled since the present empress's reign, but far from succeeding in this, they have not been even able to get the place of his banishment changed. He told us, that for twenty years he had not tasted bread, nor had been allowed subsistence of any kind whatsoever; but that, during this period, he had lived among the Kamtschadales on what his own activity and toil in the chase had furnished. That afterward he had a small pension granted; and that since Major Behm came to the command, his situation had been infinitely mended. The notice that worthy man had taken of him, and his having often invited him to become his guest, had been the occasion of others following his example; besides which, he had been the means of getting his pension increased to one hundred roubles a year, which is the common pay of an ensign in all parts of the empress's dominions, except in this province, where the pay of all the officers is double. Major Behm told us that he had obtained permission to take him to Okotsk, which was to be the place of his residence in future; but that he should leave him behind for the present, on an idea that he might, on our return to the bay, be useful to us as an interpreter.

Having given orders to the first lieutenants of both ships to let the rigging have such a repair as the supply of stores we had lately received would permit, we set out on our hunting-party, under the direction of the corporal of the Kamtschadales, intending, before

we began to look for our game, to proceed straight to the head of Behm's Harbour. It is an inlet on the west side of the bay (which we had named after that officer, from its being a favourite place of his, and having been surveyed by himself), and is called by the natives Tarcinska.

In our way toward this harbour, we met the *Toion* of Saint Peter and Saint Paul in a canoe, with his wife and two children, and another Kamtschadale. He had killed two seals upon a round island that lies in the entrance of the harbour, with which, and a great quantity of berries that he had gathered, he was returning home. As the wind had veered to the south-west, we now changed our route, by his advice; and instead of going up the harbour, directed our course to the northward, toward a pool of water that lies near the mouth of the river Paratounca, and which was a known haunt of the bears. We had scarce landed, when unfortunately the wind changed to the eastward, and a second time destroyed all hopes of coming up with our game; for the Kamtschadales assured us, that it was in vain to expect to meet with bears whilst we were to the windward, owing to their being possessed of an uncommon acuteness in scenting their pursuers, which enabled them, under such circumstances, to avoid the danger whilst it is yet at a very great distance. We returned, therefore, to the boat, and passed the night on the beach, having brought a tent with us for that purpose; and the next day, by the advice of our guides, crossed the bay, and went to the head of Rakoweena Harbour. Having here secured the boats, we proceeded with all our luggage on foot, and, after a walk of five or six miles, came to the sea-side, a league to the northward of the Lighthouse Head. From hence, as far as we could see toward Cheepoonskoi Noss, there is a continued narrow border of low level ground adjoining to the sea, which is covered with heath, and produces great abundance of berries, particularly those called partridge and crow berries. We were told we should not fail to meet with a number of bears feeding upon these berries; but that the weather, being showery, was unfavourable for us.

Accordingly, we directed our course along this plain; and though we saw several bears at a distance, we could never, with all our management, contrive to get within shot of them. Our diversion was therefore changed to spearing of salmon, which we saw pushing, in great numbers, through the surf into a small river. I could not help observing, how much inferior our Kamtschadales were at this method of fishing, to the people at Oonalashka; nor were their instruments, although pointed with iron, near so good for the purpose, nor to be compared in neatness to those of the Americans, though pointed only with bone. On inquiring into the reason of this inferiority, I was informed by the corporal, who had lived many years amongst the Americans, that formerly the Kamtschadales made use of the same kind of darts and spears with the Americans, headed and barbed with bone, and were not less dexterous in the management of them than the latter. We could not understand one another sufficiently for me to learn the cause of this change; probably it was one of the not unusual effects of a forced and imperfect state of improvement. It fell out very opportunely, that the water afforded us a little prey; for besides our ill success in the chase by land, we had also been disappointed in our expectations of shooting wild fowl, on a supply of which we had in some measure depended for our subsistence; and on its failure, began to think that we had been full long absent from head-quarters. Our Kamtschadales now discovered, that the want of success, in not meeting with game, was owing to the party being too large, and to the unavoidable noise that was the consequence of it. We, therefore, agreed to separate; Ivaskin, the corporal, and myself, forming one party; Captain Gore and the rest of the company, the other.

Accordingly after passing the night under our tent, we set out on the morning of the 19th, by different routes, meaning to take a circuit round the country, and meet at Saint Peter and Saint Paul. The party to which I belonged took the course of the river, at the mouth of which we had fished for the salmon; and, after being thoroughly soaked by the heavy rains that fell all the morning, we came about three in the afternoon to some old *balagans*, where a Kamtschadale village had been formerly situated, without meeting with a single bear during the whole of a long and tedious walk. It was our first intention to have remained here all night, in order to have resumed our chase early the next morning; but the weather clearing, and at the same time a fresh breeze springing up from a quarter

unfavourable to our designs, the Hospodin, whom former sufferings had made very unfit to bear much fatigue, and who seemed at present more particularly distressed from having emptied his snuff-box, began to be very importunate with us to return home. It was some time before the old corporal consented, alleging, that we were at a great distance from the harbour; and that, on account of the badness of the way, the night would probably overtake us before we reached the end of our journey. At length, however, he yielded to Ivaskin's entreaties, and conducted us along the side of a number of small lakes, with which the flat part of this country seems much to abound. These lakes are from half a mile to two miles in length, and about half a mile broad, the water is fresh and clear, and they are full of a red-coloured fish, resembling, both in shape and size, a small salmon; of which a more particular description will be given hereafter. The banks of these lakes were covered with the fragments of fish that the bears had half eaten, and which caused an intolerable stench. We often came upon the spots which the bears had just left, but were never able even to come within sight of them. It was night before we reached the ships, and we had then been twelve hours upon our legs. Poor Ivaskin found himself exceedingly tired, and overcome with fatigue; probably he was more sensible of it, for want of a supply of snuff; for every step he took, his hand dived mechanically into his pocket, and drew out his huge empty box. We had scarcely got into the tent, when the weather set in exceedingly rough and wet. We congratulated ourselves that we had not stayed out another day, the Hospodin's box was replenished, and we forgot the fatigues and ill success of our expedition over a good supper.

I was exceedingly sorry, on being told the next day, that our friend the sergeant had undergone corporal punishment, during our absence, by command of the old Put-parouchick. None of our people had been able to learn what was the cause of his displeasure; but it was imagined to have arisen from some little jealousy subsisting between them on account of the civility which we had shown to the former. However, having every reason to believe that the offence, whatever it might be, did not call for so disgraceful a chastisement, we could not help being both sorry and much provoked at it, as the terms on which we had lived with him, and the interest we were known to take in his affairs, made the affront in some measure personal to ourselves. For it has not yet been mentioned, that we had consulted with the late worthy commander, Major Behn, who was also his friend, by what means we might be most likely to succeed in doing him some service, for the good order he had kept in the ostrog during our stay, and for his readiness, on all occasions, to oblige us. The major advised a letter of recommendation to the governor-general, which Captain Clerke had accordingly given him, and which, backed with his own representations, he had no doubt would get the sergeant advanced a step higher in his profession. We did not choose to make any remonstrance on this subject, till the arrival of Captain Shmaleff. Indeed our inability, from the want of language, to enter into any discussion of the business, made it advisable to come to this determination. However, when the Put-parouchick paid us his next visit, we could not help testifying our chagrin, by receiving him very coolly.

The 22d, being the anniversary of his Majesty's coronation, twenty-one guns were fired, and the handsomest feast our situation would allow of was prepared in honour of the day. As we were sitting down to dinner, the arrival of Captain Shmaleff was announced. This was a most agreeable surprise; in the first place, because he arrived so opportunely to partake of the good fare and festivity of the occasion; and, in the next, because, in our last accounts of him, we were given to understand, that the effects of a severe illness had made him unequal to the journey. We were glad to find that this had been merely an excuse; that, in fact, he was ashamed of coming empty-handed, knowing we must be in great want of tea, sugar, &c. &c.; and that, therefore, he had deferred his setting out, in daily expectation of the sloop from Okotsk; but having no tidings of her, and dreading lest we should sail without his having paid us a visit, he was determined to set out, though with nothing better to present to us than apologies for the poverty of Bolcheretsk. At the same time he acquainted us, that our not having received the sixteen head of black cattle, we had desired might be sent down, was owing to the very heavy rains at Verchnei, which had prevented their setting out. We made the best answer we were able, to so much politeness and

generosity; and the next day, on coming on board the *Resolution*, he was saluted with eleven guns. Specimens of all our curiosities were presented to him; and Captain Gore added to them a gold watch and a fowling-piece.

The next day, he was entertained on board the *Discovery*; and on the 25th, he took leave of us to return to *Bolcheretsk*. He could not be prevailed on to lengthen his visit, having some expectations, as he told us, that the sub-governor-general, who was at this time making a tour through all the provinces of the governor-general of *Jakutsk*, might arrive in the sloop that was daily expected from *Okotsk*. Before his departure, and without any interference of ours, he reinstated the sergeant in the command of this place, having determined to take the *Put-paronchick* along with him; at the same time, we understood that he was highly displeased with him, on account of the punishment that had been inflicted on the sergeant, and for which there did not appear to be the slightest grounds. Captain *Shmaleff's* great readiness to give us every possible proof of his desire to oblige us, encouraged us to ask a small favour for another of our *Kamtschadale* friends. It was to requite an old soldier, whose house had been, at all times, open to the inferior officers, and who had done both them, and all the crew, a thousand good offices. The captain most obligingly complied with our request, and dubbed him (which was all he wished for) a corporal upon the spot, and ordered him to thank the English officers for his great promotion. It may not here be improper to observe, that, in the Russian army, the inferior class of officers enjoy a degree of pre-eminence above the private men, with which we, in our service, are in a great measure unacquainted. It was no small astonishment to us, to see a sergeant keep up all the state, and exact all the respect, from all beneath him, belonging to a field-officer. It may be farther remarked, that there are many more gradations of rank amongst them, than are to be met with in other countries. Between a sergeant and a private man, there are not less than four intermediate steps; and I have no doubt, but that the advantages arising from this system are found to be very considerable. The salutary effects of little subordinate ranks in our sea-service cannot be questioned. It gives rise to great emulation, and the superior officers are enabled to bestow, on almost every possible degree of merit, a reward proportioned to it. Having been incidentally led into this subject, I shall beg leave to add but one observation more, namely, that the discipline of the Russian army, though at this distance from the seat of government, is of the strictest and severest kind; from which even the commissioned officers are not exempt. The punishment of the latter for small offences is imprisonment, and a bread-and-water diet. An ensign, a good friend of ours at this place, told us, that for having been concerned in a drunken riot, he was confined in the black-hole for three months, and fed upon bread-and-water, which, he said, so shattered his nerves, that he had never since had spirits for a common convivial meeting.

I accompanied Captain *Shmaleff* to the entrance of *Awatska* river, and, having bid him farewell, took this opportunity of paying a visit to the priest of *Paratounca*. On Sunday the 26th, I attended him to church. The congregation consisted of his own family, three *Kamtschadale* men, and three boys, who assisted in singing part of the service, the whole of which was performed in a very solemn and edifying manner. The church is of wood, and by far the best building either in this town, or in that of *Saint Peter* and *Saint Paul*. It is ornamented with many paintings, particularly with two pictures of *Saint Peter* and *Saint Paul*, presented by *Beering*; and which, in the real richness of their drapery, would carry off the prize from the first of our European performances; for all the principal parts of it are made of thick plates of solid silver, fastened to the canvas, and fashioned into the various foldings of the robes with which the figures were clothed.

The next day, I set on foot another hunting-party, and put myself under the direction of the clerk of the parish, who was a celebrated bear-hunter. We arrived, by sunset, at the side of one of the larger lakes. The next step was to conceal ourselves as much as possible; and this we were able to do very effectually, among some long grass and brush-wood, that grew close to the water's edge. We had not lain long in arambush, before we had the pleasure to hear the growlings of bears in different parts round about us; and our expectations were soon gratified by the sight of one of them in the water, which seemed to be swimming directly to the place where we lay hid. The moon, at this time, gave a

considerable light; and when the animal had advanced about fifteen yards, three of us fired at it, pretty nearly at the same time. The beast immediately turned short on one side, and set up a noise, which could not properly be called roaring, nor growling, nor yelling, but was a mixture of all three, and horrible beyond description. We plainly saw that it was severely wounded, and that with difficulty it gained the bank, and retreated to some thick bushes at a little distance. It still continued to make the same loud and terrible noise; and though the Kamtschadales were persuaded it was mortally wounded, and could get no farther, yet they thought it most advisable not to rouse it again for the present. It was at this time past nine o'clock, and the night becoming overcast, and threatening a change of weather, we thought it most prudent to return home, and defer the gratification of our curiosity till morning, when we returned to the spot, and found the bear dead in the place to which it had been watched. It proved to be a female, and beyond the common size.

As the account of our first hunting-party will be apt to give the reader a wrong idea of the method in which this sport is usually conducted, it may not be amiss to add a few more words on the subject; and which I am the better able to do since this last expedition. When the natives come to the ground frequented by the bears, which they contrive to reach about sunset, the first step is to look for their tracks, to examine which are the freshest, and the best situated with a view to concealment, and taking aim at the beast, either as he is passing by or advancing in front, or going from them. These tracks are found, in the greatest numbers, leading from the woods down to the lakes, and among the long sedgy grass and brakes by the edge of the water. The place of ambuscade being determined upon, the hunters next fix in the ground the crutches, upon which their firelocks are made to rest, pointing them in the direction they mean to make their shot. This done, they kneel or lie down, as the circumstances of the cover require, and, with their bear-spears by their side, wait for their game. These precautions, which are chiefly taken in order to make sure of their mark, are, on several accounts, highly expedient. For, in the first place, ammunition is so dear at Kamtschatka, that the price of a bear will not purchase more of it than is sufficient to load a musket four or five times; and what is more material, if the bear be not rendered incapable of pursuit by the first shot, the consequences are often fatal. He immediately makes toward the place from whence the noise and smoke issue, and attacks his adversaries with great fury. It is impossible for them to reload, as the animal is seldom at more than twelve or fifteen yards' distance when he is fired at: so that, if he does not fall, they immediately put themselves in a posture to receive him upon their spears; and their safety greatly depends on their giving him a mortal stab, as he first comes upon them. If he parries the thrust (which, by the extraordinary strength and agility of their paws, they are often enabled to do), and thereby breaks in upon his adversaries, the conflict becomes very unequal, and it is well if the life of one of the party alone suffice to pay the forfeit.

There are two seasons of the year when this diversion, or occupation as it may be rather called, is more particularly dangerous: in the spring, when the bears first come forth, after having subsisted, as is universally asserted here, on sucking their paws through the winter; and especially if the frost happen to be severe, and the ice not to be broken up in the lake at that time, by which means they are deprived of their ordinary and expected food. Under these circumstances they soon become exceedingly famished, and fierce and savage in proportion. They will pursue the natives by the scent; and, as they now prowls about out of their usual tracks, frequently come upon them unawares; and when this happens, as the Kamtschadales have not the smallest notion of shooting flying, nor even at an animal running, or in any way except with their piece on a rest, the bear-hunters often fall a sacrifice to their hunger. The other season in which it is dangerous to come in their way, is at the time of their copulation, which is generally about this time of the year.

An extraordinary instance of natural affection in these animals hath been already mentioned. The chase affords a variety of a similar nature, and not less affecting; many of which were related to me. The Kamtschadales derive great advantage, in hunting, from this circumstance. They never venture to fire upon a young bear, when the mother is near: for, if the cub drop, she becomes enraged to a degree little short of madness; and if she get

sight of the enemy, will only quit her revenge with her life. On the contrary, if the dam be shot, the cubs will not leave her side, even after she has been dead a long time; but continue about her, showing, by a variety of affecting actions and gestures, marks of the deepest affliction, and thus become an easy prey to the hunters. Nor is the sagacity of the bears, if the Kamtschadales are to be credited, less extraordinary, or less worthy to be remarked, than their natural affection. Of this they have a thousand stories to relate. I shall content myself with mentioning one instance, which the natives speak of as a well-known fact; and that is, the stratagem they have recourse to, in order to catch the bairins, which are considerably too swift of foot for them. These animals keep together in large herds; they frequent mostly the low grounds, and love to browse at the feet of rocks and precipices. The bear hunts them by scent till he come in sight, when he advances warily, keeping above them, and concealing himself amongst the rocks, as he makes his approaches, till he gets immediately over them, and nigh enough for his purpose. He then begins to push down, with his paws, pieces of the rock amongst the herd below. This manœuvre is not followed by any attempt to pursue, until he find he has maimed one of the flock, upon which a course immediately ensues, that proves successful, or otherwise, according to the hurt the bairin has received.

I cannot conclude this digression without observing, that the Kamtschadales very thankfully acknowledge their obligations to the bears for what little advancement they have hitherto made, either in the sciences or polite arts. They confess that they owe to them all their skill both in physie and surgery; that by remarking with what herbs these animals rub the wounds they have received, and what they have recourse to when sick and languid, they have become acquainted with most of the simples in use among them, either in the way of internal medicine, or external application. But what will appear somewhat more singular is, they acknowledge the bears likewise for their dancing-masters. Indeed, the evidence of one's senses puts this out of dispute; for the bear dance of the Kamtschadales is an exact counterpart of every attitude and gesture peculiar to this animal, through its various functions; and this is the foundation and ground-work of all their other dances, and what they value themselves most upon. I returned to the ships on the 28th, very well pleased with my excursion, as it had afforded me an opportunity of seeing a little more of the country, and of observing the manners and behaviour of the Kamtschadales, when freed from that constraint which they evidently lie under in the company of the Russians.

No occurrence worth mentioning took place till the 30th, when Captain Gore went to Paratounea, to put up in the church there an esentecheon, prepared by Mr. Webber, with an inscription upon it, setting forth Captain Clerke's age and rank, and the object of the expedition in which he was engaged at the time of his decease. We also affixed to the tree under which he was buried a board, with an inscription upon it to the same effect. Before his departure, Captain Gore left orders with me to get the ships out of the harbour into the bay, to be in readiness to sail. We were prevented from doing this by a violent gale of wind, which lasted the whole day of the 1st of October. However, on the 2d, both ships warped out of the harbour, clear of the narrow passage, and came to anchor in seven fathoms, a quarter of a mile from the ostrog. The day before we went out of the harbour, the cattle arrived from Verchnei; and that the men might receive the full benefit of this capital and much-longed-for supply, by consuming it fresh, Captain Gore came to a determination of staying five or six days longer. Nor was this time idly employed. The boats, pumps, sails, and rigging of both ships, thereby received an additional repair. And Captain Gore sparing me some molasses, and the use of the Resolution's copper, I was enabled to brew a fortnight's beer for the crew, and to make a farther provision of ten puncheons of strong spruce essence. The present supply was the more acceptable, as our last cask of spirits, except a small quantity left in reserve for cases of necessity, was now serving out.

The 3rd was the name-day of the empress, and we could want no inducement to show it every possible respect. Accordingly, Captain Gore invited the priest of Paratounea, Ivaskin, and the sergeant, to dinner; and an entertainment was also provided for the inferior officers of the garrison, for the two *Toims* of Paratounea, and St. Peter and St. Paul, and for the other better sort of Kamtschadale inhabitants. were invited to partake with the ships' companies, who had a pound of good fat beef served out to each man; and what remained of our spirits was made into grog, and divided amongst them. A salute of twenty-one guns was fired at the usual hour; and the whole was conducted (considering the part of her dominions it was in) in a manner not unworthy so renowned and magnificent an empress. On the 5th, we received from Bolcheretsk a fresh supply of tea, sugar, and tobacco. This present had met Captain Shmaleff on his return, and was accompanied by a letter from him, in which he informed us, that the sloop from Okotsk had arrived during his absence, and that Madame Shmaleff, who was entirely in our interests, had lost no time in despatching a courier, with the few presents, of which our acceptance was requested.

The appearance of foul weather, on the 6th and 7th, prevented our unmooring; but on the morning of the 8th, we sailed out toward the mouth of the bay, and hoisted in all the boats; when the wind, veering to the southward, stopped our farther progress, and obliged us to drop anchor in ten fathoms; the ostrog bearing due north, half a league distant. The weather being foggy, and the wind from the same quarter during the forenoon of the 9th, we continued in our station. At four in the afternoon, we again unmoored; but whilst we were, with great difficulty, weighing our last anchor, I was told that the drummer of the marines had left the boat, which had just returned from the village, and that he was last seen with a Kamtschadale woman, to whom his messmates knew he had been much attached, and who had often been observed persuading him to stay behind. Though this man had been long useless to us, from a swelling in his knee, which rendered him lame, yet this made me the more unwilling he should be left behind, to become a miserable burthen, both to the Russians and himself. I therefore got the sergeant to send parties of soldiers in different directions, in search of him, whilst some of our sailors went to a well-known haunt of his in the neighbourhood, where they found him with his woman. On the return of this party, with our deserter, we weighed, and followed the Resolution out of the bay.

Having at length taken our leave of Saint Peter and Saint Paul, I shall conclude this chapter with a particular description of Awatska bay, and the coast adjoining; not only because (its three inlets included) it constitutes perhaps the most extensive and safest harbour that has yet been discovered, but because it is the only port in this part of the world, capable of admitting ships of any considerable burthen. The term bay, indeed, is perhaps not applicable, properly speaking, to a place so well sheltered as Awatska; but then it must be observed, that from the loose, undistinguishing manner, in which navigators have denominated certain situations of sea and land, with respect to each other, bays, roads, sounds, harbours, &c. we have no defined and determinate ideas affixed to these words, sufficient to warrant us in changing a popular name, for one that may appear more proper.

The entrance into this bay, is in $52^{\circ} 51'$ N. latitude, and $158^{\circ} 48'$ E. longitude, and lies in the bight of another exterior bay, formed by Cheepoonskoi Noss, to the north, and Cape Gavareca to the south. The former of these headlands bears from the latter north-east by north, three quarters east, and is distant thirty-two leagues. The coast, from Cape Gavareca to the entrance of Awatska Bay, takes a direction nearly north, and is eleven leagues in extent. It consists of a chain of high, ragged cliffs, with detached rocks frequently lying off them. This coast, at a distance, presents, in many parts, an appearance of bays or inlets, but on a nearer approach, the headlands were found connected by low ground.

Cheepoonskoi Noss bears, from the entrance of the bay, east north-east a quarter east, and is seventeen leagues distant. On this side, the shore is low and flat, with hills rising behind, to a considerable height. In the latitude of Cape Gavareca, there is an error of twenty-one miles in the Russian charts; its true latitude being $52^{\circ} 21'$.

This striking difference of the land on each side Awatska Bay, with their different bearings, are the best guides to steer for it, in coming from the southward: and, in approaching it from the northward, Cheepoonskoi Noss will make itself very conspicuous; for it is a high projecting headland, with a considerable extent of level ground, lower than the Noss, uniting it to the continent. It presents the same appearance, whether viewed from the north or south, and will warn the mariner not to be deceived, in imagining Awatska Bay to lie in the bight which the coast forms to the northward of this Noss, and which might be the

case, from the striking resemblance there is between a conical hill within this bight or bay, and one to the south of Awatska Bay.

I have been thus particular, in giving a minute description of this coast, from our own experience of the want of it. For had we been furnished with a tolerable account of the form of the coast, on each side of Awatska Bay, we should on our first arrival upon it, have got safely within the bay two days before we did, and thereby have avoided part of the stormy weather, which came on when we were plying off the mouth of the harbour. Besides, from the prevalence of fogs in these seas, it must frequently happen, that an observation for ascertaining the latitude cannot be got; to which we may add, that the deceptive appearances land makes, when covered with snow, and when viewed through an hazy atmosphere, both which circumstances prevail here, during the greatest part of the year, render the knowledge of a variety of discriminating objects the more necessary. Should, however, the weather be clear enough to admit a view of the mountains on the coast in its neighbourhood, these will serve to point out the situation of Awatska Bay, with a great deal of precision. For to the south of it are two high mountains; that which is nearest the bay, is shaped like a sugar-loaf; the other, which is farther inland, does not appear so high, and is flat at the top. To the north of the bay, are three very conspicuous mountains; the westernmost is, to appearance, the highest; the next is the volcano mountain, which may be known from the smoke that issues from its top, and likewise from some high table-hills connected with it, and stretching to the northward: these two are somewhat peaked. The third, and the most northerly, might perhaps be more properly called a cluster of mountains, as it presents to the sight several flat tops. When the navigator has got within the enpees, and into the onward bay, a perpendicular headland, with a light-house erected upon it, will point out the entrance of the bay of Awatska to the northward. To the eastward of this headland lie many sunken rocks, stretching into the sea, to the distance of two or three miles; and which will show themselves, if there be but a moderate sea or swell. Four miles to the south of the entrance lies a small round island, very distinguishable from being principally composed of high pointed rocks, with one of them strikingly remarkable, as being much larger, more peaked and perpendicular than the rest.

It is no way necessary to be equally particular in the description of the bay itself, as of its approaches and environs; since no words can give the mariner so perfect an idea of it, as the plan*. From this it will appear, that the entrance is at first near three miles wide, and in the narrowest part one mile and a half, and four miles long, in a north north-west direction. Within the mouth is a noble basin of twenty-five miles' circuit, with the capacious harbours of Tarcinska to the west, of Rakoweena to the east, and the small one of Saint Peter and Saint Paul, where we lay, to the north. Tarcinska harbour is about three miles in breadth, and twelve in length; it stretches to the east-south-east, and is separated from the sea, at the bottom, by a narrow neck of land. The road into this harbour is perfectly free from rocks or shoals. We had never less than seven fathoms' water, as far as our survey extended; for we were not able to get to the bottom of the harbour on account of the ice. The harbour of Rakoweena would deserve the preference over the other two, if its entrance were not impeded by a shoal lying in the middle of the channel, which, in general, will make it necessary to warp in, unless there be a leading wind. It is from one mile to half a mile in width, and three miles long, running at first in a south-east, and afterward in an easterly direction. Its depth is from thirteen to three fathoms.

Saint Peter and Saint Paul's is one of the most convenient little harbours I ever saw. It will hold conveniently half a dozen ships, moored head and stern, and is fit for giving them any kind of repairs. The south side is formed by a low sandy neck, exceedingly narrow, on which the ostrog is built, and whose point may almost be touched by ships going in, having three fathoms' water close in with it. In the mid-channel, which is no more than two hundred and seventy-eight feet across, there are six fathoms and a half; the deepest water

* This refers to a plan given in the original edition, transferred to the common charts, or superseded by more modern surveys.—Ed.
but omitted here, as is the case with all maps and plans merely explanatory of sailing directions, such being either

within is seven fathoms; and in every part over a muddy bottom. We found some inconvenience from the toughness of the ground, which constantly broke the messenger, and gave us a great deal of trouble in getting up the anchors. There is a watering-place at the head of the harbour.

The plan will likewise point out the shoal that is to be avoided, lying off the eastern harbour as well as the spit within the entrance, stretching from the south-west shore, and over which there is only three fathoms' water. In order to steer clear of the latter, a small island, or perhaps it may rather be called a large detached rock, lying on the west shore of the entrance, is to be shut in with the land to the south of it; and, to steer clear of the former, the Three Needle Rocks, which lie on the east shore of the entrance near the light-house head, are to be kept open with the headlands (or bluff heads) that rise to the northward of the first small bay, or bending, observable on the east side of the entrance. When arrived to the north of the north headland of the eastern harbour, the shoal is past. In sailing into the harbour of Saint Peter and Saint Paul, and approaching the village, it is necessary to keep in close to the eastern shore, in order to avoid a spit, which runs from the headland to the south-west of the town.

Before I proceed to give a table of the result of our astronomical observations at this place, it may be proper to acquaint the reader, that the timekeeper we had on board the *Resolution*, which was an exact copy of that invented by Mr. Harrison, and executed by Mr. Kendal, stopped on the 27th of April, a few days before we first came into Awatska Bay. It had been always kept with the most scrupulous care during the voyage, having never been trusted for a moment into any other hands than those of Captain Cook and mine. No accident could, therefore, have happened to it, to which we could attribute its stopping; nor could it have arisen from the effects of intense cold, as the thermometer was very little below the freezing point. As soon as the discovery was made, I consulted with Captain Clerke what course it was best to pursue; whether to let it remain as it was, entirely useless to us, for the purpose of satisfying the curious at home, where it was sure of being examined by proper judges, or suffer it to be inspected by a seaman on board, who had served a regular apprenticeship to a watchmaker in London; and appeared sufficiently knowing in the business, from his success in cleaning and repairing several watches since we had been out. The advantages we had derived from its accuracy made us extremely unwilling to be deprived of its use during the remaining part of the voyage; and that object appeared to us of much greater importance than the small degree of probability, which we understood was all that could be expected, of obtaining any material knowledge respecting its mechanism, by deferring the inspection of it. At the same time, it should be remembered, that the watch had already had a sufficient trial, both in the former voyage, and during the three years we had now had it on board, to ascertain its utility. On these considerations, we took the opportunity of the first clear day, after our arrival in Awatska Bay, of opening the watch, which was done in the Captain's cabin, and in our presence. The watchmaker found no part of the work broken; but not being able to set it agoing, he proceeded to take off the cock and balance, and cleaned both the pivot-holes, which he found very foul, and the rest of the work rather dirty; he also took off the dial-plate; and, between two teeth of the wheel that carries the second hand, found a piece of dirt, which he imagined to be the principal cause of its stopping. Having afterward put the work together, and oiled it as sparingly as possible, the watch appeared to go free and well.

Having received orders the next day to go to Bolcheretsk, the time-keeper was left in the care of Mr. Bayly, to compare it with his watch and clock, in order to get its rate. On my return, I was told it had gone for some days with tolerable regularity, losing only from fifteen to seventeen seconds a-day, when it stopped a second time. It was again opened, and the cause of its stopping appeared to be owing to the man having put some part of the work badly together when he first opened it. Being again adjusted, it was found to gain above a minute a-day; and, in the attempt to alter the regulator and balance-spring, he broke the latter. He afterward made a new spring; but the watch now went so irregularly, that we made no farther use of it. The poor fellow was not less chagrined than we were, at our bad success; which, however, I am convinced was more owing to the miserable tools he was

obliged to work with, and the stiffness his hands had contracted from his ordinary occupation, than to his want of skill.

For the satisfaction of those who may wish to have a general view of its rate of going, I have added the following table. The first and second columns contain the dates when, and the names of the places where, its rate was observed. The third column contains the daily error of its rate, so found from mean time. The fourth column has the longitude of each place, according to the Greenwich rate; that is, calculated on a supposition that the timekeeper had not varied its rate from the time it left Greenwich. But as we had frequent opportunities of ascertaining the variation of its daily error, or finding its new rate, the fifth column has the longitude, according to its last rate, calculated from the true longitude of the place last departed from. The sixth is the true longitude of the place, deduced from astronomical observations made by ourselves, and compared with those made by others, whenever such could be obtained. The seventh column shows the difference between the fourth column and the sixth in space; and the eighth the same difference in time. The ninth shows the number of months and days in which the error, thus determined, had been accumulating. The difference between the fifth and sixth columns is found in the tenth, and shows the error of the timekeeper, according to its rate last found in space; and the eleventh, the same error in time. The twelfth contains the time elapsed in sailing from the place where the rate was last taken, to the place whose longitude is last determined. The thirteenth and fourteenth contain the state of the air at the time of each observation.

As persons unaccustomed to calculations of this sort, may find some difficulty in comprehending the nature of the table, the two following instances will more clearly explain it. Thus, on the 24th October, 1776 (first column), at the Cape of Good Hope (second column), we found the daily error in the rate of its going to be 2',26 (third column). The longitude of that place, calculated on a supposition that the rate of the timekeeper had continued the same from the time of our leaving Greenwich, that is, had a regular daily error of 1',21, is found to be 18° 26' 30" E. (fourth column). And as its rate at Greenwich is, in this instance, its latest rate, the longitude thus found is the same (fifth column). The true longitude of the place is 18° 23' 15" (sixth column). From whence it appears that, in our run from Greenwich to the Cape, the watch would have led us into an error only of 3' 15" (seventh column), or three miles one quarter; or had varied 13' of time (eighth column), in four months twenty-three days (ninth column), the period between our leaving Greenwich and our arrival at the Cape. As the Greenwich is the latest error, the tenth, eleventh, and twelfth columns will be the same with the seventh and ninth.

But, on the 22nd of February, 1777 (first column), at Queen Charlotte's Sound, New Zealand (second column), the daily error of its rate was found to be 2',91 (third column). The longitude of this place, according to the Greenwich rate, is 175° 25' (fourth column). But having found at the Cape that it had altered its rate, from a daily error of 1',21 to 2',26, the longitude corrected by this new rate is found to be 174° 54' 23" (fifth column). The true longitude of the place being 174° 23' 31" (sixth column); it appears, that in our run from Greenwich to New Zealand the error would have been only 1° 1' 29" (seventh column), or sixty-one miles and a half, even if we had not had an opportunity of correcting its daily error; or, in other words, that the watch had varied 4' 6" (eighth column), in eight months eleven days (ninth column). But the longitude, as given by its new rate, leaves an error of only 30' 54" (tenth column), near thirty-one miles, or, in time, 2' 3",6 (eleventh column), which has been accumulating during our run from the Cape to New Zealand, or, in three months, 28" (twelfth column). The thirteenth and fourteenth columns require no explanation.

TABLE
OF THE RATE AND ERROR OF MR. KENDAL'S WATCH, ON BOARD THE RESOLUTION.

From this view of the timekeeper it appears, that for near two years it altered its rate very inconsiderably, and, therefore, that its error, according to the Greenwich rate, if we had had no opportunities of correcting it, would have amounted only to $2\frac{1}{4}^{\circ}$. That afterward, at King George's Sound, or Nootka, it was found to have varied exceedingly; of course, the longitude, by its Greenwich rate, was becoming considerably erroneous. About this time, it should be remarked, the thermometer was varying from 65° to 41° . The greatest alteration we ever observed in the watch was, during the three weeks we were cruising to the north; in which interval, it gave the longitude of the East Cape with a difference of twenty-eight miles. I have marked the longitude of Saint Peter and Saint Paul, as given by the timekeeper, notwithstanding it stopped a few days before we arrived there; this I was enabled to do, from comparing the longitude it gave the day before it stopped with that given by Mr. Bayley's watch, and allowing for the error of the latter.

The use of so accurate a measure of time is sufficiently evident, from its furnishing in itself the means of approximating to the longitude at sea, as may be seen in the above table. But besides this we were enabled, by the same means, to give a degree of accuracy to the lunar observations, which they cannot otherwise pretend to; and, at the same time, by reducing a number of those observations to one time, obtain results approaching still nearer the truth. In surveying coasts, and ascertaining the true position of capes and headlands, it reaches the utmost degree of practical exactness. On the other hand, it is to be observed, that lunar observations, in their turn, are absolutely necessary, in order to reap the greatest possible advantages from the timekeeper; since, by ascertaining the true longitude of places, they discover the error of its rate. The original observations that were made in the course of this voyage have been published by order of the board of longitude; and to those I must refer the reader for his further information on this subject.

N.B.—The observatories were placed on the west side of the village of Saint Peter and Saint Paul.

It was high-water, on the full and change of the moon, at thirty-six minutes past four, and the greatest rise was five feet eight inches. The tides were very regular every twelve hours. On the coast, near the bay, the flood came from the south, and the time of high-water was near two hours sooner than in the harbour of Saint Peter and Saint Paul.

CHAPTER VI. — GENERAL ACCOUNT OF KAMTSCHATKA. — GEOGRAPHICAL DESCRIPTION. — RIVERS. — SOIL. — CLIMATE. — VOLCANOES. — HOT SPRINGS. — PRODUCTIONS. — VEGETABLES. — ANIMALS. — BIRDS. — FISH.

KAMTSCHATKA is the name of a peninsula situated on the eastern coast of Asia, running nearly north and south, from 52° to 61° north latitude; the longitude of its southern extremity being $156^{\circ} 45'$ E. The isthmus, which joins it to the continent on the north, lies between the Gulf of Olutorsk and the Gulf of Penshinsk. Its southern extremity is Cape Lopatka, a word signifying the blade-bone of a man, and is so called from its supposed resemblance to it. The shape of the whole peninsula is not unlike that of a shoe, widening from the toe (which we may suppose to be Cape Lopatka) toward the middle, and narrowing again toward the heel, the neck of land above-mentioned connecting it with the continent.

Its greatest breadth is from the mouth of the river Tigil to that of Kamtschatka, and is computed to be two hundred and thirty-six miles, from whence it narrows very gradually toward each extremity. It is bounded on the north by the country of the Koriacks; to the south and east by the north Pacific Ocean; and to the west by the sea of Okotsk. A chain of high mountains stretches the whole length of the country, from north to south, dividing it nearly into two equal parts, from whence a great number of rivers take their rise, and empty themselves, on each side, into the Pacific Ocean and the sea of Okotsk.

There are three rivers of much greater magnitude than the rest; the Bolchoireka, or Great River, so called from *bolchoia*, which signifies great, and *reka*, a river; the river Kamtschatka and the Awatska. The first empties itself into the sea of Okotsk, and is navigable for the Russian galliots upwards of five leagues from its mouth, or within nine miles of Bolcheretsk, a town situated at the conflux of the Goltsoffka and the Bistraia, which here lose themselves in the Bolchoireka. The Bistraia itself is no inconsiderable river. It derives its source from the same mountain with the river Kamtschatka, and, by taking a direct contrary course, affords the Kamtschadales the means of transporting their goods by water in small canoes, almost across the whole peninsula. The river Kamtschatka, after maintaining a course of near three hundred miles from south to north, winds round to the eastward, in which direction it empties itself into the ocean, a little to the southward of Kamtschatkoi Noss. Near the mouth of the Kamtschatka, to the north-west, lies the great lake called Nerpitsch, from *nerpi*, a Kamtschadale word, signifying a seal, with which this lake abounds. About twenty miles up the river, reckoning from the mouth of the lake, is a fort called Nishnei Kamtschatka ostrog, where the Russians have built a hospital and barracks, and which, we were informed, is become the principal mart in this country.

The river Awatska arises from the mountains situated between the Bolchoireka and the Bistraia, and running from north-west to south-east, a course of one hundred miles, falls into the bay of Awatska. The Tigil is likewise a river of considerable size, rising amidst some very high mountains, which lie under the same parallel with Kamtschatkoi Noss, and running in an even course from south-east to north-west, falls into the sea of Okotsk. All the other rivers of this peninsula, which are almost infinite in number, are too small to deserve a particular enumeration.

If I may judge of the soil from what I saw of its vegetable productions, I should not hesitate in pronouncing it barren in the extreme. Neither in the neighbourhood of the bay, nor in the country I traversed on my journey to Bolcheretsk, nor in any of our hunting expeditions, did I ever meet with the smallest spot of ground that resembled what in England is called a good green turf, or that seemed as if it could be turned to any advantage, either in the way of pasturage, or other mode of cultivation. The face of the country in general was thinly covered with stunted trees, having a bottom of moss, mixed with low weak heath. The whole bore a more striking resemblance to Newfoundland than to any other part of the world I had ever seen. It must, however, be observed, that I saw at Paratounca three or four stacks of sweet and very fine-looking hay; and Major Behm informed me, that many parts of the peninsula, particularly the banks of the river Kamtschatka and the Bistraia, produce grass of great height and strength, which they cut twice in the summer; and that the hay is of a succulent quality, and particularly well adapted to the fattening of cattle. Indeed it should appear, from the size and fatness of the thirty-six head that were sent down to us from the Verchnei ostrog, and which we were told were bred and fattened in the neighbourhood, that they must have had the advantage of both good pastures and meadows. For it is worth our notice, that the first supply we received, consisting of twenty, came to us just at the close of the winter, and before the snow was off the ground, and therefore probably had tasted nothing but hay for the seven preceding months. And this agrees with what is related by Krascheninoff, that there is no part of the country equal in fertility to that which borders on the river Kamtschatka; and that to the north and south it is much inferior, both in point of soil and climate. He relates, that repeated experiments have been made in the culture of oats, barley, and rye, in different quarters near this river, which have generally succeeded; that, in particular, some persons belonging to the convent of Jakutsk, who had settled in that part of the country, had sown

barley there, which had yielded an extraordinary increase; and he has no doubt but that wheat, in many parts, particularly near the source of the Bistraia and Kamtschatka, would grow as well as in the generality of countries situated in the same latitude. Perhaps the superior fertility of the country here spoken of may, in a great measure, be accounted for, from its lying in that part of the peninsula which is by much the widest, and consequently farthest removed from the sea, on each side. The moist chilling fogs, and drizzling weather, which prevail almost perpetually along the coast, must necessarily render the parts adjacent very unfit for all the purposes of agriculture.

It is natural to suppose, that the severity of the climate must be in due proportion to the general sterility of the soil, of which it is probably the cause. The first time we saw this country was in the beginning of May, 1779, when the whole face of it was covered with snow, from six to eight feet deep. On the 6th we had snow, with the wind from the north-east. On the 8th of May, at noon, the thermometer stood at 32° ; and the same day, some of our men were sent on shore to try to cut wood; but the snow was still so deep on the ground, as to render all their attempts fruitless. Nor was it found practicable to proceed in this necessary business, with all the efforts of a very stout party, till the 12th, at which time the thaw began to advance gradually. The sides of the hills were now in some places free from snow; and by the beginning of June, it was generally melted from the low lands. On the 15th of June, the day we sailed out of the harbour, the thermometer had never risen higher than 58° , nor the barometer than $30^{\circ} 04'$. The winds blew almost invariably from the eastward during our stay, and the south-east was more prevalent than any other. On our return, the 24th of August, the foliage of the trees, and all other sorts of vegetation, seemed to be in the utmost state of perfection. For the remainder of this month, and through September, the weather was very changeable, but in no respect severe. The winds, at the beginning of the month, were, for the most part, easterly, after which they got round to the west. The greatest height of the thermometer was 65° , the lowest 40° . The barometer's greatest height 30° , its lowest $29^{\circ} 3'$. So that upon the whole, during this month, an equal and moderate degree of temperature prevailed. But at the beginning of October, the tops of the hills were again covered with new-fallen snow, the wind continuing westerly.

In computing the seasons, the spring ought certainly not to be taken into the account. From the middle of June to the middle of September may be properly said to constitute the summer. October may be considered as an autumnal month; from thence till the middle of June it is perfect winter. It was toward the end of May that we made our journey between Bolcheretsk and Awatska, over the snow in sledges. It is said that the climate in the country adjoining to the river Kamtschatka, is not less serene and temperate than in many parts of Siberia that are under the same latitude. This variation is probably owing to the same causes to which the superior fertility of the soil in those parts has been before attributed. But it is not in the sterility of the ground alone that the Kamtschadales feel the unfavourable temperature of their climate. The uncertainty of the summer season sometimes prevents their laying up a sufficient stock of dried fish for their winter's provision, and the moisture of the air causes worms to breed in them, which not unfrequently destroy the greatest part.

I do not remember that we had either thunder or lightning during our stay, excepting on the night of the eruption of the volcano; and, from the account of the inhabitants, they are very seldom troubled with storms of this kind, and never but in a slight degree. The general severity of the winter, as well as the dreadful hurricanes of wind and snow that season brings along with it, cannot be questioned, from the subterraneous habitations the natives are under a necessity of retiring to, for warmth and security. Major Behm told us, that the cold and inclemency of the winter of 1779 was such, that, for several weeks, all intercourse between the inhabitants was entirely stopped, every one being afraid to stir, even from one house to another, for fear of being frost-bitten. This extraordinary rigour of climate, in so low a latitude, may be accounted for, from its being situated to the east of an immense uncultivated tract of country, and from the prevalence of the westerly winds, blowing over so extensive and cold a continent. The extraordinary violence and impetuosity of the winds, is attributed to the subterraneous fires, the sulphureous exhalations,

and the general volcanic disposition of the country. This peninsula abounds in volcanoes, of which only three have, for some time past, been subject to eruptions. We have already mentioned that which is situated in the neighbourhood of Awatska. Besides this, there are others not less remarkable, according to the account given of them by Krascheninoff.

The volcano of Tolbatchick is situated on a neck of ground between the river of Kamtschatka and Tolbatchick. The mountain, from the summit of which the eruptions proceed, is of a considerable height, and terminates in pointed rocks. In the beginning of the year 1739, there issued from it a whirlwind of flames, which reduced to ashes the forests of the neighbouring mountains. This was succeeded by a cloud of smoke, which spread over and darkened the whole country, till it was dissipated by a shower of cinders, that covered the ground to the distance of thirty miles. M. Krascheninoff, who was at this time on a journey from Bolchoireka to the Kamtschatka ostrog, at no great distance from the mountain, relates, that the eruption was preceded by an alarming sound in the woods, which he thought the forerunner of some dreadful storm or hurricane, till three shocks of an earthquake, at about a minute's interval each, convinced him of its real cause; but that he was hindered from approaching nearer the mountain by the cinders that fell, and prevented him from proceeding on his journey. The third volcano is on the top of the mountain of Kamtschatka, which is mentioned as by far the highest in the peninsula. A thick smoke never ceases to ascend from its summit, and it has frequent eruptions of the most violent and dreadful kind, some of which were much talked of, and seemed to be fresh in the memories of the Kamtschadales. The country is likewise said to contain numerous springs of hot water. The only one that I had an opportunity of seeing was at Natchekin ostrog, and hath been already described. Krascheninoff makes mention of several others, and also of two very extraordinary pits or wells, at the bottom of which the water is seen to boil as in a caldron, with prodigious force and impetuosity; at the same time a dreadful noise issues out of them, and so thick a vapour, that a man cannot be seen through it.

Of the trees which fell under our notice, the principal are the birch, the poplar, the alder (with the bark of which they stain their leather), many species of the willow, but all small, and two sorts of dwarfish pines or cedars*. One of these grows upon the coast, creeping along the ground, and seldom exceeds 5 or 6 feet in height. It was of this sort we made our essence for beer, and found it excellent for the purpose. The other grows on the mountains, to a greater height, and bears a small nut or apple. We were told by the old *Tolon* at St. Peter and St. Paul, that Beering, during the time he lay in that harbour, first taught them the use of the decoction of these pines, and that it had proved a most excellent remedy for the scurvy; but, whether from the great scarcity of sugar, or from what other cause we could not learn, we were sorry to find that it was no longer in use amongst them. The birch was by far the most common tree we saw, and of this we remarked three sorts. Two of them fit for timber, and differing only in the texture and colour of the bark; the third of a dwarfish kind. This tree is applied to a great variety of uses by the inhabitants. The liquor which, on tapping, it yields in great abundance, they drink without mixture or any preparation, as we had frequent opportunities of observing upon our journey to Bolcheretsk, and found it ourselves pleasant and refreshing, but somewhat purgative. The bark they convert into vessels for almost all their domestic and kitchen purposes; and it is of the wood of this tree the sledges and canoes are also made†. The birch, and every kind of tree in the neighbourhood of the bay, were small and stunted; and they are obliged to go many miles up into the country for wood of a proper size to work into canoes, for the principal timbers of their *balagans*, and the like uses.

Besides the trees above mentioned, Krascheninoff relates, that the larch grows on the banks of the river Kamtschatka, and of those that fall into it, but nowhere else, and that there are firs in the neighbourhood of the river Berezowa; that there is likewise the service-

* Krascheninoff says that the tree here spoken of is a dwarf cedar, for that there is not a pine in the peninsula.

† Krascheninoff says that the natives likewise convert

the bark into a pleasant wholesome food, by stripping it off whilst it is young and green, and cutting it into long narrow stripes, like vermicelli, drying it, and stewing it afterward along with their caviar.

tree (*Padus foliis annuis*); and two species of the whitethorn, one bearing a red the other a black berry. Of the shrub kind, as junipers, the mountain-ash, wild rose-trees, and raspberry-bushes, the country produces great abundance, together with a variety of berries; blue-berries, of two sorts, round and oval; partridge-berries, cranberries, crow-berries, and black-berries. These the natives gather at proper seasons, and preserve, by boiling them into a thick jam, without sugar. They make no inconsiderable part of their winter provisions, and are used as sauce to their dried and salt fish, of which kind of food they are unquestionably excellent correctives. They likewise eat them by themselves, in puddings and various other ways, and make decoctions of them for their ordinary liquor.

We met with several wholesome vegetables, in a wild state, and in great quantities, such as wild celery, angelica, chervil, garlic, and onions. Upon some few patches of ground in the valleys, we found excellent turnips, and turnip-radishes. The garden cultivation went no farther; yet from hence I am led to conclude, that many of the hardy sorts of vegetables (such at least as push their roots downward), like carrots, parsnips, and beet, and perhaps potatoes, would thrive tolerably well. Major Behm told me, that some other sorts of kitchen vegetables had been tried, but did not answer; that neither any of the cabbage or lettuce kind would ever head; and that peas and beans shot up very vigorous stalks, flowered and podded, but the pods never filled. He likewise told me, that in the experiments made by himself at Bolcheretsk, with different sorts of farinaceous grain, there generally came up a very high and strong blade, which eared, but that the ears never yielded flour. This short account of the vegetable productions reaches to such parts of the country only as fell within our notice. In the neighbourhood of the Kamtschatka river, where (as has been observed) both the soil and climate is by much the best in the whole peninsula, garden culture is attended to, and probably with great success, as appears from our having received at the same time, with a second drove of cattle from Verchnei, a present of cucumbers, of very large fine turnips, celery, and some other garden-stuff, of which I do not recollect the kinds.

There are two plants, which, from the great use made of them, merit a particular mention and description. The first is called by the natives the *sarana*; and by botanists, *Lilium Kamtskatiense flore atro rubente* *. The stem is about the thickness of that of the tulip, and grows to the height of five inches, is of a purple colour toward the bottom, and green higher up, and hath growing from it two tier of leaves of an oval figure, the lower consisting of three leaves, the uppermost of four, in the form of a cross: from the top of the stalk grows a single flower, of an exceedingly dark red colour, in shape resembling the flower of the narcissus, only much smaller: from the centre of the flower rises a style of a triangular form, and obtuse at the end, which is surrounded by six white stamina, whose extremities are yellow. The root is of the bulbous kind, and resembles in shape that of garlic, being much of the same size, but rounder, and having, like that, four or five cloves hanging together. The plant grows wild, and in considerable abundance: the women are employed in collecting the roots at the beginning of August, which are afterwards dried in the sun, and then laid up for use. On our second arrival, this harvest was just over, and had fallen much short of

n, and then laid
a much short of

its usual produce. It is a common observation among the Kamtschadales, that the bounty of Providence never fails them; for that such seasons as are most hurtful to the sarana, are always the most favourable for fishing; and that, on the contrary, a bad fishing month is always made up by the exuberance of the sarana harvest. It is used in cookery in various ways. When roasted in embers, it supplies the place of bread, better than anything the country affords. After being baked in an oven, and pounded, it becomes an excellent substitute for flour and meal of every sort, and in this form is mixed in all their soups, and most of their other dishes. It is esteemed extremely nourishing, has a pleasant bitter taste, and may be eaten every day without cloying. We used to boil these roots, and eat them as potatoes, either alone or with our meat, and found them very wholesome and pleasant. It has been already mentioned, that this useful plant grows also at Oonalashka, where the roots of it are used, and constitute a considerable part of their food, in like manner as in Kamtschatka.

The other plant alluded to is called the sweet-grass; the botanical description is, *Heracleum Sibericum foliis pinnatis, foliolis quinis, intermediis sessilibus corollulis uniformibus*. Hort. Upsal. 65. The time I took particular notice of it was in May, when it was about a foot and a half high, had much the appearance of sedge, and was covered with a white down, or dust, which looked exceedingly like the hoar-frost hanging upon it, and might be rubbed off: it tasted as sweet as sugar, but was hot and pungent. The stalk is hollow, and consists of three or four joints, from each of which arise large leaves, and, when at its full growth, is six feet high. This plant was formerly a principal ingredient in the cookery of most of the Kamtschadale dishes; but since the Russians got possession of the country, it has been almost entirely appropriated to the purpose of distillation. The manner in which it is gathered, prepared, and afterward distilled, is as follows: having cut such stalks as have leaves growing on them, of a proper age (the principal stem, by the time the plant has attained its full growth, having become too dry for their purpose), and scraped off with shells the downy substance on their surface, they are laid in small heaps, till they begin to sweat and smell. On growing dry again, they put them into sacks made of matting; where, after remaining a few days, they are gradually covered with a sweet saccharine powder, which exudes from the hollow of the stalk. From thirty-six pounds of the plant, in this state, they obtain no more than a quarter of a pound of powder. The women, whose province it is to collect and prepare the materials, are obliged to defend their hands with gloves whilst they are scraping the stalks, the rind they remove being of so acrid a quality, as to blister and even ulcerate whatever it touches.

The spirit is drawn from the plant in this state by the following process. After steeping bundles of it in hot water, they promote its fermentation in a small vessel, by the help of berries of the *gimolost**, or of the *golubitsa*†, being careful to close up well the mouth of the vessel, and to keep it in a warm place whilst the fermentation is going on, which is generally so violent as to occasion a considerable noise, and to agitate the vessel in which it is contained. After drawing off this first liquor, they pour on more hot water, and make a second in the same manner. They then pour both liquor and herbs into a copper still, and

SWEET GRASS, OR HERACLEUM SIBERICUM.

* *Lonicera pedunculata biflora*, floribus in fundibuliformis, baccis solitariis, oblongis, angulosis. Gmel. Flor. Sib.

† *Myrtillus grandis ceruleus*.

draw off the spirit after the usual method. The liquor, thus obtained, is of the strength of brandy; and is called by the natives *raka*. Two pood (seventy-two pounds) of the plant yield generally one *vedro* (twenty-five pints) of *raka*. Steller says, that the spirit distilled from this plant, unscrapped, is exceedingly prejudicial to the health, and produces the most sudden and terrible nervous effects.

Besides these, Krascheninickoff mentions a variety of other plants, from whence the inhabitants prepare several decoctions; and which, being mixed with their fish, make palatable and wholesome ragouts. Such as the *kipri**, with which is brewed a pleasant common beverage; and, by boiling this plant and the sweet herb together, in the proportion of one to five of the latter, and fermenting the liquor in the ordinary way, is obtained a strong and excellent vinegar. The leaves of it are used instead of tea; and the pith is dried and mixed in many of their dishes; the *morkovai*†, which is very like angelica; the *kotkorica*‡, the root of which they eat indifferently, green or dried; the *ikoun*§; the *utchicklei* ||, which is much eaten with fish; with many others. It is said, that the Kamtschadales (before their acquaintance with fire-arms), poisoned their spears and arrows with the juice of the root of the *zgate* ¶; and that wounds inflicted by them are equally destructive to land and marine animals. The Tschutski are reported to use the same drug for this purpose at present.

I shall conclude this part of the natural history of Kamtschatka with an account, from the same author, of three plants, which furnish the materials of all their manufactures. The first is the *Triticum radice perenni spiculis binis lanuginosis* **, which grows in abundance along the coast. Of the straw of this grass they make a strong sort of matting, which they use not only for their floors, but for sacks, bed-clothes, curtains, and a variety of other domestic purposes. Of the same materials, they also make very neat little bags and baskets, of different forms, and for various uses. The plant called *bolotnaia*, which grows in the marshes, and resembles *cyperoides*, is gathered in the autumn, and carded like wool, with a comb made of the bones of the sea-swallow; with this, in lieu of linen and woollen clothes, they swathe their new-born infants, and use it for a covering next the skin whilst they are young. It is also made into a kind of wadding, and used for the purpose of giving additional warmth to various parts of their clothing.

There remains still a vulgar and well-known plant, which, as it contributes more effectually to their subsistence than all the rest put together, must not be passed over in silence. This is the nettle; which, as the country produces neither hemp nor flax, supplies the materials of which are made their fishing-nets; and without which they could not possibly subsist. For this purpose they cut it down in August, and, after hanging it up in bundles in the shade, under their *balagans*, the remainder of the summer, treat it like hemp. They then spin it into thread with their fingers, and twist it round a spindle; after which they twine several threads together, according to the different purposes for which it may be designed.

Though there is little doubt but that many parts of this peninsula would admit of such cultivation as might contribute considerably to the comfort of the inhabitants, yet its real riches must always consist in the number of wild animals it produces; and no labour can ever be turned to so good account as what is employed upon their furrieries. The animals, therefore, which supply these, come next to be considered: and these are, the common fox; the stoat or *ermine*; the *zikelline* or sable; the *isatis* or arctic fox; the varying hare; the mountain rat or earless marmot; the weasel; the glutton or *wolcerine*; the *argali* or wild sheep; rein-deer, bears, wolves, dogs.

The fox†† is the most general object of the chase; and they are found in great numbers, and of variety of colours. The most common is the same in species with the European, with this variation, that the colours are more bright and shining; some are of a dark chesnut, others are striped with dark-coloured bars; others have the belly black, and the rest of the body of a light chesnut. Some again are of a very dark brown, some black,

others of a stone colour; and there are a few quite white; but these last are very scarce. Their fur is exceedingly thick and fine, and of a quality much superior to those either of Siberia or America. A variety of artifices are made use of by the hunters to catch this animal, which, in all climates, seems to preserve the same character of craftiness and cunning. Traps of different sorts, some calculated to fall upon them, others to catch them by the feet, others by the head, are amongst the most common; to which may be added, several ingenious contrivances for taking them in nets. Poisoned baits are likewise in use; and the *nux romica* is the drug principally employed for this purpose. Before their knowledge of the Russians, by which they became acquainted with fire arms, they also carried bows and arrows to the chase. But since that period, almost every Kamtschadale is provided with a rifle-barrel gun; and, though far from being dexterous in the use of it, its superiority over the former instruments he is ready to acknowledge.

The sables* of Kamtschatka are said to be considerably larger than those of Siberia, and their fur much thicker and brighter, though not of so good a black as those in the neighbourhood of the Olekma and the Vitimet, a circumstance which depreciates their value much more than their superiority in other respects enhances it. The sables of the Tigil and Ouka are counted the best in Kamtschatka; and a pair of these sometimes sell for thirty roubles (five pounds sterling). The worst are those of the southern extremity. The apparatus of the sable hunters consist of a rifle-barrel gun of an exceedingly small bore, a net, and a few bricks: with the first they shoot them when they see them on the trees; the net is to surround the hollow trees in which, when pursued, they take refuge; and the bricks are heated and put into the cavities, in order to smoke them out.

I must refer the reader for an account of the *isatis*,‡ or arctic fox, to Mr. Pennant's Arctic Zoology, as I never saw either the animal or the skin, which I understand they set no value upon. The varying hare§ is also neglected on the same account. They are in great abundance; and, as is always the case with this species, turn quite white during the winter. Our shooting parties saw several of this colour the beginning of May, but found them so shy, that they were not able to get within gun-shot. The mountain-rat or earless marmot ||, is a beautiful little animal, considerably smaller than a squirrel, and, like it, feeds upon roots, berries, the cedar apple, &c. which it eats sitting up on its hindlegs, and holding them up to

its mouth with the paws. Its skin is much valued by the Kamtschadales, is both warm and light, and of a bright shining colour, forming like the plumage of some birds, various colours when viewed in different lights. The stoat, or *ermine*,¶ is here held in no estimation, and, consequently never engages the attention of the hunters, because, as I have heard, its fur is of an ordinary kind. I saw many of these little animals running about; and we bought several of their skins, which were of a bad white, and of a dirty yellow toward the belly. The common weasel** is also neglected, and for the same reason. On

WOLVERINE.

* *Mustela zibellina*.

† Rivers emptying themselves into the Lena, near its source.

the contrary, the skin of the glutton, or wolverine*, is here in the highest repute; insomuch that a Kamtschadale looks upon himself as most richly attired, when a small quantity of this fur is seen upon him. The women adorn their hair with its pats, which are white and considered as an extraordinary piece of finery; and they have a superstitious opinion that the angels are clad with the skins of these animals. It is said, that this creature is easily tamed, and taught a number of pleasant tricks.†

Having already had occasion to speak, as fully as my own knowledge enables me, of the bears, and the method of killing them, I shall only here observe, that all those I saw were of a dun brown colour; that they are generally seen in companies of four or five together; that the time they are most abroad is during the season that the fish (which is their principal food) are pushing up from the sea into the rivers, and that they are seldom visible in the winter months‡. Their skins are exceedingly useful. They make both excellent warm mattresses, and coverings for their beds; comfortable bonnets and gloves, and good collars for the dogs' harness. Their flesh, and particularly the fat, is considered as great delicacies. The wolves are only seen in the winter, at which season they prowl about, as I was told, in large companies in search of prey.

There are rein-deer, both wild and tame, in several parts of the peninsula, but none in the neighbourhood of Awatska. It is somewhat singular, that this nation should never have used the rein-deer for the purposes of carriage, in the same manner as their neighbours, both to the north and the eastward. Their dogs, indeed, seem fully sufficient for all the demands of the natives in their present state; and the breed of Russian horses will, probably, increase with the future necessities of the country. But when it is recollected that the use of dogs, in a great measure, precludes them from the advantage of bringing up any other domestic animals, it will appear the more extraordinary that they should not have adopted the services of an animal so much more gentle as well as powerful.

The *argali*, or wild mountain sheep§, an animal, I believe, unknown in Europe (except in Corsica and Sardinia), is here in great plenty. Its skin is like the deer's, but in gait and general appearance it partakes more of the goat. It has two large twisted horns, sometimes weighing, when at full growth, from twenty-five to thirty pounds, which in running it rests upon its back. These creatures are exceedingly nimble and swift, haunt only the most craggy and mountainous parts, and make their way among the steepest rocks with an agility that is astonishing. The natives work their horns into spoons, and small cups, and platters; and have frequently one of a smaller size hanging to a belt, which serves them to drink out of in their hunting expeditions. This animal is gregarious. I frequently tasted the flesh of them, and thought it had a very sweet and delicate flavour, but never had an opportunity of seeing one alive. I must, therefore, refer the reader for a particular description of this beautiful animal (for such it is said to be), to the Memoirs of the Academy of Petersburg, tom. iv. tab. xiii.

I have already observed, that the dogs of this country are, in shape and mien, exceedingly like the Pomeranian, with this difference, that they are a great deal larger, and the hair somewhat coarser. They are of a variety of colours; but the most general is a light dun, or dirty cream colour. Toward the end of May they are all turned loose, and left to provide for themselves through the summer, being sure to return to their respective homes when the snow begins to fall. Their food in the winter consists entirely of the head, entrails, and back-bones of salmon, which are put aside and dried for that purpose; and with this diet they are fed but sparingly. The number of dogs must needs be very great, since five are yoked to a sledge, and a sledge carries but one person; so that, on our journey to Boleheretsk we required no fewer than a hundred and thirty-nine, at the two stages of Karatchin and Natchikin. It is also to be remarked, that they never make use of bitches

* *Ursus lousens*.

† Krascheninikoff relates, that this small animal frequently destroys deer, and the wild mountain sheep, in the following way: they scatter at the bottom of trees bark and moss, which those animals are fond of: and whilst they are picking it up, drop suddenly upon them, and fastening behind the head, suck out their eyes.

‡ The Koriacks make use of a very simple method of catching bears. They suspend, between the forks of a tree, a running noose, within which they fasten a bait, which the animal endeavouring to pull away, is caught, sometimes by the neck and sometimes by the paw.

for the draft, nor dogs but those that are cut. The whelps are trained to this business, by being tied to stakes with light leathern thongs, which are made to stretch, and having their victuals placed at a proper distance out of their reach, so that, by constantly pulling and labouring in order to come at their food, they acquire both the strength of limbs and the habit of drawing that are necessary for their future destination.

The coasts and bays of this country are frequented by almost every kind of northern sea-fowl; and amongst the rest are the sea-eagles, but not, as at Oonalashka, in great numbers. The rivers inland (if I may judge from what I saw in our journey to Boleheretsk), are stored with numerous flocks of wild-ducks of various species; one kind of which, in particular, has a most beautiful plumage, and is called by the natives *a-an-gitché*, a word intended to express its cry, which is not less singular than agreeable, consisting of three distinct notes, rising at equal intervals above each other*. There is another species called the mountain-duck†, which, Steller says, is peculiar to Kamtschatka. The drake is covered with plumage of extraordinary beauty. Besides these, we observed a variety of other water-fowl, which, from their size, seemed to be of the wild-goose kind.

In the woods through which we passed, were seen several eagles of a prodigious size, but of what species they were I cannot pretend to determine. These are said to be of three different sorts; the black eagle, with a white head, tail, and legs‡, of which the eaglets are as white as snow; the white eagle, so called, though in fact it is of a light grey; and the lead, or stone-coloured eagle§, which is the most common, and probably those I saw were of this sort. Of the hawk, falcon, and bustard kind, there are great numbers. This country likewise affords woodcocks, snipes, and two sorts of grouse, or moor-game. Swans are also said to be in great plenty, and, in their entertainments, generally to make a part of the repast, though I do not remember to have seen one on any occasion. The vast abundance of wild-fowl with which the country is stored, was manifest from the numerous presents we received from the *Tobion* of Saint Peter and Saint Paul, and which sometimes consisted of twenty brace.

We met with no amphibious sea-animals on the coast, except seals, with which the bay of Awatska swarmed; as they were, at this time, in pursuit of the salmon that were collecting in shoals, and ready to ascend the rivers. Some of them are said to pursue the fish into the fresh water, and to be found in most of the lakes which communicate with the sea. The sea-otters|| are exactly the same with those we met with at Nootka Sound, which have been already fully described, and where they are in great plenty. They are also said to have been formerly in equal abundance here; but, since the Russians have opened a trade for their skins to China, where they are sold at a price much beyond that of any other kind of fur, they have been hunted almost entirely out of the country. Amongst the Kurile Islands they are still caught, though in no great numbers; but are of a superior quality to those of Kamtschatka, or the American coast. We are informed that on Mednoi and Beering's Island, scarce a sea-otter is now to be found; though it appears from Muller¶, that in his time they were exceedingly plentiful.

The Russian voyagers make mention of a great variety of amphibious sea-animals, which are said to frequent these coasts: the reason why we saw no other kinds might be, that this was the season of their migration. Not having it in my power to treat these articles more fully, I conclude them with the less regret, since the ingenious Mr. Pennant has a work,

* Mr. Steller has made the following scale of its cry:—

For a further account of this bird, I must refer the reader to Krascheniucoff, Vol. II. part 4.

§ *Vultur albiulla.*

almost ready for publication, entitled "Arctic Zoology," in which the learned will receive full information concerning the animals of this peninsula. This gentleman has very obligingly communicated to me his Catalogue of Arctic Animals, with references to his work, and permission to insert it. It will be found at the end of this chapter; and I feel myself extremely happy in laying it before the reader, and thereby presenting him with what could have been furnished from no other quarter, one entire view of Kamtschadale zoology.

Fish may be considered as the staple article of food with which Providence hath supplied the inhabitants of this peninsula, who in general must never expect to draw any considerable part of their sustenance either from grain or cattle. It is true, the soil, as has been remarked, affords some good and nourishing roots, and every part of the country abounds in berries; but though these alone would be insufficient for the support of the people, yet, at the same time they are necessary correctives of the putrescent quality of their dried fish. In short, fish may, with much greater justice, be here called the staff of life, than bread is in other countries; since it appears that neither the inhabitants, nor the only domestic animal they have, the dog, could exist without it.

Whales are very frequently seen, both in the sea of Okotsk and on the side of the eastern ocean, and when caught are turned to a variety of uses. Of the skin they make the soles of their shoes, and straps and thongs for various other purposes. The flesh they eat, and the fat is carefully stored, both for kitchen use and for their lamps. The whiskers are found to be the best material for sewing together the seams of their canoes; and they likewise make nets of them for the larger kinds of fish; and with the under jaw-bones, their sledges are shod. They likewise work the bones into knives; and formerly the chains with which their dogs are tied were made of that material, though at present iron ones are generally used. The intestines they clean, then blow, and dry like bladders, and it is in these their oil and grease is stored; and of the nerves and veins, which are both strong and slip readily, they make excellent snares; so that there is no part of the whale which here does not find its use.

From the middle of May till our departure on the 24th of June, we caught great quantities of excellent flat-fish, trout, and herrings. Upward of three hundred of the former, beside a number of sea-trout, were dragged out at one haul of the seine, the 15th of May. These flat-fish are firm, and of a good flavour, studded upon the back with round prickly knobs, like turbot, and streaked with dark brown lines, running from the head toward the tail. About the end of May the first herring season begins. They approach in great shoals, but do not remain long on the coast. They had entirely left the bay before we sailed out of it the first time, but were beginning to revisit it again in October. It has been already mentioned that the herrings were remarkably fine and large, and that we filled a great part of our empty casks with them. The beginning of June, large quantities of excellent cod were taken, a part of which were likewise salted. We caught too, at different times, numbers of small fish, much resembling a smelt, and once drew out a wolf-fish.

Notwithstanding this abundance of flat-fish, cod, and herring, it is on the salmon fishery alone that the Kamtschadales depend for their winter provisions. Of these, it is said by naturalists, there are to be found on this coast all the different species that are known to exist, and which the natives formerly characterised by the different months in which they ascend the rivers. They say, too, that though the shoals of different sorts are seen to mount the rivers at the same time, yet they never mix with each other; that they always return to the same river in which they were bred, but not till the third summer; that neither the male nor female live to regain the sea; that certain species frequent certain rivers, and are never found in others, though they empty themselves nearly at the same place. The first shoals of salmon begin to enter the mouth of the Awatska about the middle of May; and this kind, which is called by the Kamtschadales *ichavitsi*, is the largest and most valued. Their length is generally about three feet and a half; they are very deep in proportion, and their average weight is from thirty to forty pounds. The tail is not forked, but straight. The back is of a dark blue, spotted with black; in other respects they are much like our common salmon. They ascend the river with extraordinary velocity, insomuch that the water is sensibly agitated by their motion; and the Kamtschadales, who are always on the watch for

them about the time they are expected, judge of their approach by this circumstance, and immediately let drop their nets before them. We were presented with one of the first that was caught, and given to understand that it was the greatest compliment that could be paid to us. Krascheninoff relates, that formerly the Kamtschadales made a point of eating the first fish they took, with great rejoicings, and a variety of superstitious ceremonies; and that after the Russians became their masters, it was for a long time a constant subject of quarrel between them to whom the first should belong. The season for fishing for this species lasts from the middle of May till the end of June.

The other sort is of a smaller kind, weighing only from eight to sixteen pounds. They are known by the general name of the red fish, and begin to collect in the bays, and at the mouths of the rivers, the beginning of June; from which time till the end of September they are caught in great quantities, both upon the eastern and western coast, where any fresh water falls into the sea, and likewise all along the course of the rivers to their very source. The manner in which they draw their nets within the bay of Awatska, is as follows: they tie one end of the net to a large stone at the water's edge, they then push off in a canoe about twenty yards in a right line, dropping their net as they advance, after which they turn and run out the remainder of the net in a line parallel to the shore; in this position they wait, concealing themselves very carefully in the boat, and keeping a sharp look-out for the fish, which always direct their course close in with the shore, and whose approach is announced by a rippling in the water, till they find that the shoal has advanced beyond the boat, when they shoot the canoe to shore in a direct line, and never fail of enclosing their prey. Seldom more than two men are employed to a net, who haul with facility, in this manner, seines larger than ours to which we appoint a dozen. We at first met with very poor success in our own method of hauling; but after the Kamtschadales had very kindly put us in the way, we were not less successful than themselves. In the rivers, they shoot one net across, and haul another down the stream to it. The lakes that have a communication with the sea, which was the case of all those that I saw, abound with fish that have very much the resemblance of small salmon, and are from four to six pounds' weight. I could not understand that the inhabitants thought it worth their while to fish for them. As these lakes are not deep, they become an easy prey to the bears and dogs during the summer; and if I might judge from the quantity of bones to be seen upon the banks, they devour vast numbers of them.

The inhabitants for the most part dry their salmon, and salt very little of it. Each fish is cut into three pieces, the belly-piece being first taken off, and afterward a slice along each side the back-bone. The former of these are dried and smoked, and esteemed the finest part of the fish, and sold, when we were at Saint Peter's and Saint Paul's, at the rate of one hundred for a rouble. The latter are dried in the air, and either eaten whole as bread, or reduced to powder, of which they make pastes and cakes, that are not unpleasant to the taste. The head, tail, and bones, are hung up and dried for winter provision for the dogs.

CHAPTER VII.—GENERAL ACCOUNT OF KAMTSCHATKA CONTINUED.—OF THE INHABITANTS.—ORIGIN OF THE KAMTSCHADALES.—DISCOVERED BY THE RUSSIANS.—ABSTRACT OF THEIR HISTORY.—NUMBERS.—PRESENT STATE.—OF THE RUSSIAN COMMERCE IN KAMTSCHATKA.—OF THE KAMTSCHADALE HABITATIONS AND DRESS.—OF THE KURILE ISLANDS.—THE KOREKI.—THE TSCHUTSKI.

The present inhabitants of Kamtschatka are of three sorts. The natives, or Kamtschadales; the Russians and Cossacks; and a mixture of these two by marriage. Mr. Steller, who resided some time in this country, and seems to have taken great pains to gain information on this subject, is persuaded, that the true Kamtschadales are a people of great antiquity, and have for many ages inhabited this peninsula; and that they are originally descended from the Mungalians, and not either from the Tongusian Tartars, as some, or the Japanese, as others, have imagined.

MAN AND WOMAN OF KAMTSCHATKA.

The principal arguments, by which he supports these opinions, are, that there exists not among them the trace of a tradition of their having migrated from any other country; and they believe themselves to have been created and placed in this very spot by their god Koutkou; that they are the most favoured of his creatures; the most fortunate and happy of beings; and that their country is superior to all others, affording means of gratification far beyond what are anywhere else to be met with; that they have a perfect knowledge of all the plants of the country, their virtues and uses, which could not be acquired in a short time; that their instruments and household utensils differ greatly from those of any other nation, and are made with an extraordinary degree of neatness and dexterity, which implies that they are both of their own invention, and have been long in arriving at so great perfection; that antecedently to the arrival of the Russians and Cossacks among them, they had not the smallest knowledge of any people except the Koreki; that it is but of late that they have had any intercourse with the Kuriles, and still later (and happened by means of a vessel being shipwrecked on their coast) that they knew anything of the Japanese; and, lastly, that the country was very populous, at the time the Russians first got footing in it.

The reasons he alleges for supposing them to be originally descended from the Mungalians are; that many words in their language have terminations similar to those of Mungalian Chinese, such as, *ong, ing, oing, tching, tcha, tchoing, ksi, ksung, &c.*; and moreover, that the same principle of inflexion or derivation obtains in both languages; that they are in

general under-sized, as are the Mungalians; that their complexion, like theirs, is swarthy, that they have black hair, little beard, the face broad, the nose short and flat, the eyes small and sunk, the eye-brows thin, the belly pendent, the legs small; all which are peculiarities that are to be found among the Mungalians. From the whole of which he draws this conclusion, that they fled for safety to this peninsula, from the rapid advances of the eastern conquerors; as the Laplanders, the Samoides, &c. were compelled to retreat to the extremities of the north, by the Europeans.

The Russians having extended their conquests, and established posts and colonies along that immense extent of coast of the frozen sea, from the Jenesei to the Anadir, appointed commissaries for the purpose of exploring and subjecting the countries still farther eastward. They soon became acquainted with the wandering Koriaes, inhabiting the north and north-east coast of the sea of Okotsk, and without difficulty made them tributary. These being the immediate neighbours of the Kamtschadales, and likewise in the habit of bartering with them, a knowledge of Kamtschatka followed of course. The honour of the first discovery is given to Feodot Alexeieff, a merchant, who is said to have sailed from the river Kovyma round the peninsula of the Tschutski, in company with seven other vessels, about the year 1648. The tradition goes, that being separated from the rest by a storm, near the Tschutskoi Noss, he was driven upon the coast of Kamtschatka, where he wintered; and the summer following coasted round the promontory of Lopatka, into the sea of Okotsk, and entered the mouth of the Tigil; but that he and his companions were cut off by the Koriaes, in endeavouring to pass from thence by land to the Anadirsk. This in part is corroborated by the accounts of Simeon Deshneff, who commanded one of the seven vessels, and was thrown on shore at the mouth of the Anadir. Be this as it may, since these discoveries, if such they were, he did not live to make any report of what they had done.* Volodimir Atlassoff, a Cossack, stands for the first acknowledged discoverer of Kamtschatka †.

This person was sent, in the year 1697, from the fort Jakutsk to the Anadirsk, in the quality of commissary, with instructions to call in the assistance of the Koriaes, with a view to the discovery of countries beyond theirs, and to the subjecting them to a tribute. In 1699, he penetrated, with about sixty Russian soldiers, and the same number of Cossacks, into the heart of the peninsula, gained the Tigil, and from thence, levying a tribute in furs, in his progress crossed over to the river Kamtschatka, on which he built the higher Kamtschatka ostrog, called Verchnei, where he left a garrison of sixteen Cossacks, and returned to Jakutsk in 1700, with an immense quantity of rare and valuable tributary furs. These he had the good sense and policy to accompany to Moscow, and, in recompense for his services, was appointed commander of the fort of Jakutsk, with farther orders to repair again to Kamtschatka, having first drawn from the garrison at Tobolsk a reinforcement of a hundred Cossacks, with ammunition, and whatever else could give efficacy to the completion and settlement of his late discoveries. Advancing with this force toward the Anadirsk, he fell in with a bark on the river ‡ Tunguska, laden with Chinese merchandize, which he pillaged; and, in consequence of a remonstrance from the sufferers to the Russian court, he was seized upon at Jakutsk, and thrown into prison.

In the mean time, Fotop Serioukoff, who had been left by Atlassoff, kept peaceable possession of the garrison of Verchnei; and though he had not a sufficient force to compel the payment of a tribute from the natives, yet, by his management and conciliating disposition, he continued to carry on an advantageous traffic with them as a merchant. On his

* There is still existing in the imperial library of St. Petersburg, Deshneff's own manuscript account of this voyage. Six vessels were lost, with their crews, the seventh, commanded by Deshneff himself, was wrecked in the bay of Okotsk; he and his companions spent the whole winter in the Siberian wilderness, subsisting chiefly on the bark of trees. Several sunk under the hardships they were exposed to. The survivors at length reached the Anadyr, built some boats there, and sailing up that river, made their way to the settlements on the Kolyma. Deshneff made several other attempts to explore the northern seas, but never returned from an expedition on which he

set out from the Kolyma, in 1652, in a large boat built expressly for his use. He and his companions undoubtedly perished on that occasion, but his account of his first expedition in 1648 is still preserved, although it has never been published.—Ed.

† It is proper to remark, that Atlassoff sent an advanced party, under the command of a subaltern, called Lucas Moloskoff, who certainly penetrated into Kamtschatka, and returned with an account of his success before Atlassoff set out, and is therefore not unjustly mentioned as the discoverer of Kamtschatka.

‡ This river empties itself into the Jenesei.

return to the Anadirsk, with the general good-will of the natives of Kamtschatka, himself and party were attacked by the Koriaes, and unfortunately all cut off. This happened about 1703; and several other successive commissaries were sent into Kamtschatka, with various success, during the disgrace and trial of Atlassoff. In 1706, Atlassoff was reinstated in his command, and appointed to conduct a second expedition into Kamtschatka, with instructions to gain upon the natives by all peaceable means, but on no pretence to have recourse to force and compulsion; but, instead of attending to his orders, he not only, by repeated acts of cruelty and injustice, made the natives exceedingly hostile and averse to their new governors, but likewise so far alienated the affections of his own people, that it ended in a mutiny of the Cossacks, and their demand of another commander. The Cossacks having carried their point in displacing Atlassoff, seized upon his effects; and after once tasting the sweets of plunder, and of living without discipline or control, in vain did his successors attempt to reduce them to military discipline and subjection. Three successive commanders were assassinated in their turn; and the Cossacks, being thus in open rebellion to the Russian government, and with arms in their hands, were let loose upon the natives. The history of this country from that period, till the grand revolt of the Kamtschadales in 1731, presents one unvaried detail of massacres, revolts, and savage and sanguinary rencounters between small parties, from one end of the peninsula to the other.

What led to this revolt, was the discovery of a passage from Okotsk to the Bolchoireka, which was first made by Cosmo Sokoloff, in the year 1715. Hitherto the Russians had no entrance into the country, but on the side of Anadirsk; so that the natives had frequent opportunities of both plundering the tribute, as it was carried by so long a journey out of the peninsula, and harassing the troops in their march into it. But, by the discovery of this communication, there existed a safe and speedy means, as well of exporting the tribute, as of importing troops and military stores into the very heart of the country; which the natives easily saw gave the Russians so great an advantage, as must soon confirm their dominion, and therefore determined them to make one grand and immediate struggle for their liberty. The moment resolved upon for carrying their designs into execution was when Beering should have set sail, who was at this time on the coast with a small squadron, and had despatched all the troops that could well be spared from the country, to join Fouloutski, in an expedition against the Tschutski. The opportunity was well chosen; and it is altogether surprising that this conspiracy, which was so general, that every native in the peninsula is said to have had his share in it, was at the same time conducted with such secrecy, that the Russians had not the smallest suspicion that anything hostile to their interests was in agitation. Their other measures were equally well taken. They had a strong body in readiness to cut off all communication with the fort Anadirsk; and the eastern coast was likewise lined with detached parties, with a view of seizing on any Russians that might by accident arrive from Okotsk. Things were in this state, when the commissary Cheekaerdin marched from Verchnei with his tribute, escorted by the troops of the fort, for the mouth of the Kamtschatka river, where a vessel was lying to convey them to the Anadir. Besides waiting for the departure of Beering, the revolt was to be suspended till this vessel should be out at sea, notice of which was to be given to the different chiefs. Accordingly, the moment she was out of sight, they began to massacre every Russian and Cossack that came in their way, and to set fire to their houses. A large body ascended the river Kamtschatka, made themselves masters of the fort and ostrog the commissary had just quitted, put to death all that were in it, and, except the church and fort, reduced the whole to ashes. Here it was that they first learned that the Russian vessel, in which the commissary had embarked, was still on the coast, which determined them to defend themselves in the fort. The wind fortunately soon brought the vessel back to the harbour; for had she proceeded in her voyage, nothing probably could have prevented the utter extirpation of the Russians. The Cossacks finding, on their landing, that their houses had been burnt to the ground, and their wives and children either massacred or carried off prisoners, were enraged to madness. They marched directly to the fort, which they attacked with great fury, and the natives as resolutely defended, till at length, the powder-magazine taking fire, the fort was blown up, together with most of those that were in it. Various

rencontres succeeded to this event, in which much blood was spilled on both sides. At length, two of the principal leaders being slain, and the third (after despatching his wife and children, to prevent their falling into the enemy's hands) having put an end to himself, peace was established. From that period everything went on very peaceably, till the year 1740, when a few Russians lost their lives in a tumult which was attended with no farther consequences; and, except the insurrection at Bolcheretsk in 1770, (which hath been already noticed), there has been no disturbance since.

Though the quelling the rebellion of 1731 was attended with the loss of a great number of inhabitants, yet I was informed, that the country had recovered itself, and was become more populous than ever, when, in the year 1767, the small-pox, brought by a soldier from Okotsk, broke out among them for the first time, marking its progress with ravages not less dreadful than the plague, and seeming to threaten their entire extirpation. They compute, that near twenty thousand died of this disorder in Kamtschatka, the Koreki country, and the Kurile Islands. The inhabitants of whole villages were swept away. Of this we had sufficient proofs before our eyes. There are no less than eight ostrogs scattered about the bay of Awatska, all which, we were informed, had been fully inhabited, but are now entirely desolate, except Saint Peter and Saint Paul, and even that contains no more than seven Kamtschadales, who are tributary. At Paratouna ostrog there are but thirty-six native inhabitants, men, women, and children, which, before it was visited by the small-pox, we were told, contained three hundred and sixty. In our road to Bolcheretsk, we passed four extensive ostrogs, with not an inhabitant in them. In the present diminished state of the natives, with fresh supplies of Russians and Cossacks perpetually pouring in, and who intermix with them by marriage, it is probable that in less than half a century there will be very few of them left. By Major Behn's account, there are not now more than three thousand who pay tribute, the Kurile islanders included. I understood that there are at this time, of the military, in the five forts of Nichnei, Verchnei, Tigil, Bolcheretsk, and Saint Peter and Saint Paul, about four hundred Russians and Cossacks, and near the same number at Ingiga, which, though to the north of the peninsula, is, I learned, at present under the commander of Kamtschatka. To these may be added the Russian traders and emigrants, whose numbers are not very considerable.

The Russian government established over this country is mild and equitable, considered as a military one, in a very high degree. The natives are permitted to choose their own magistrates from among themselves, in the way and with the same powers they had ever been used. One of these, under the title of *Toion*, presides over each ostrog; is the referee in all differences; imposes fines, and inflicts punishments for all crimes and misdemeanors; referring to the governor of Kamtschatka such only as he does not choose, from their intricacy or heinousness, to decide upon himself. The *Toion* has likewise the appointment of a civil officer, called a corporal, who assists him in the execution of his office, and in his absence acts as his deputy. By an edict of the present empress, no crime whatsoever can be punished with death. But we were informed, that in cases of murder (of which there are very few), the punishment of the knout is administered with such severity, that the offender for the most part dies under it.

The only tribute exacted (which can be considered as little more than an acknowledgment of the Russian dominion over them) consists, in some districts, of a fox's skin; in others of a sable's; and in the Kurile Isles of a sea-eater's; but as this is much the most valuable, one skin serves to pay the tribute of several persons. The *Toions* collect the tribute in their respective districts. Besides the mildness of their government, the Russians have a claim to every praise for the pains they have bestowed, and which have been attended with great success, in converting them to Christianity, there remaining, at present, very few idolaters among them. If we may judge of the other Missionaries, from the hospitable and benevolent pastor of Paratouna (who is a native on the mother's side), more suitable persons could not be set over this business. It is needless to add, that the religion taught is that of the Greek church. Schools are likewise established in many of the ostrogs, where the children of both the natives and Cossacks are gratuitously instructed in the Russian language.

The commerce of this country, as far as concerns the exports, is entirely confined to furs, and carried on principally by a company of merchants, instituted by the present empress. This company originally consisted of twelve, and three have been lately added to it. They are indulged with certain privileges, and distinguished by wearing a golden medal, as a mark of the empress's encouragement and protection of the fur trade. Besides these, there are many inferior traders (particularly of the Cossacks) scattered through the country. The principal merchants, for the time they are here, reside at Bolcheretsk, or the Nishnei ostrog, in which two places the trade almost wholly centres. Formerly this commerce was altogether carried on in the way of barter, but of late years every article is bought and sold for ready money only; and we were surprised at the quantity of specie in circulation in so poor a country. The furs sell at a high price, and the situation and habits of life of the natives call for few articles in return. Our sailors brought a great number of furs with them from the coast of America, and were not less astonished than delighted with the quantity of silver the merchants paid down for them; but on finding neither gin-shops to resort to, nor tobacco, or any thing else that they cared for, to be had for money, the roubles soon became troublesome companions, and I often observed them kicking them about the deck. The merchant I have already had occasion to mention, gave our men at first thirty roubles for a sea-otter's skin, and for others in proportion; but finding that they had considerable quantities to dispose of, and that he had men to deal with who did not know how to keep up the market, he afterward bought them for much less.

The articles of importation are principally European, but not confined to Russian manufactures; many are English and Dutch, several likewise come from Siberia, Bucharia, the Calmucs, and China. They consist of coarse woollen and linen cloths, yarn stockings, bonnets, and gloves, thin Persian silks, cottons, and pieces of nankeen, silk, and cotton handkerchiefs; brass coppers and pans, iron stoves, files, guns, powder and shot; hardware, such as hatchets, bills, knives, scissors, needles, looking-glasses, flour, sugar, tanned hides, boots, &c. We had an opportunity of seeing a great many of these articles in the hands of a merchant, who came in the empress's galliot from Okotsk; and I shall only observe, generally, that they sold for treble the price they might have been purchased for in England. And though the merchants have so large a profit upon these imported goods, they have still a larger upon the furs at Kiachta, upon the frontiers of China, which is the great market for them. The best sea-otter skins sell generally in Kamschatka for about thirty roubles a-piece. The Chinese merchant at Kiachta purchases them at more than double that price, and sells them again at Pekin at a great advance, where a farther profitable trade is made with some of them to Japan. If, therefore, a skin is worth thirty roubles in Kamschatka, to be transported first to Okotsk, thence to be conveyed by land to Kiachta, a distance of one thousand three hundred and sixty-four miles, thence on to Pekin, seven hundred and sixty miles more, and after this to be transported to Japan, what a prodigiously advantageous trade might be carried on between this place and Japan, which is but about a fortnight's, at most three weeks', sail from it.

All furs exported from hence across the sea of Okotsk, pay a duty of ten per cent., and sables a duty of twelve. And all sorts of merchandise, of whatever denomination, imported from Okotsk, pay half a rouble for every pood*. The duties arising from the exports and imports, of which I could not learn the amount, are paid at Okotsk; but the tribute is collected at Bolcheretsk, and, I was informed by Major Behm, amounted in value to ten thousand roubles annually. There are six vessels (of forty to fifty tons burthen) employed by the empress between Okotsk and Bolcheretsk, five of which are appropriated to the transporting of stores and provisions from Okotsk to Bolcheretsk, except that once in two or three years, some of them go round to Awatska, and the Kamschatka river; the sixth is only used as a packet-boat, and always kept in readiness, and properly equipped for conveying dispatches. Besides these, there are about fourteen vessels employed by the merchants in the fur trade, amongst the islands to the eastward. One of these we found frozen up in the harbour of Saint Peter and Saint Paul, which was to sail on a trading voyage to Oonalashka, as soon as the season would permit.

* Thirty-six pounds English.

It is here to be observed, that the most considerable and valuable part of the fur-trade is carried on with the islands that lie between Kamtschatka and America. These were first discovered by Beering, in 1741, and being found to abound with sea-otters, the Russian merchants became exceedingly eager in searching for the other islands seen by that navigator to the south-east of Kamtschatka, called, in Muller's map, the Islands of Seduction, St. Abraham, &c. In these expeditions they fell in with three groups of islands. The first about fifteen degrees to the east of Kamtschatka, in 53° N. latitude; the second about twelve degrees to the eastward of the former; and the third, Oonalashka, and the islands in its neighbourhood. These trading adventurers advanced also as far east as Shumagin's Islands (so called by Beering), the largest of which is named Kodlak. But here, as well as on the continent at Alashka, they met with so warm a reception in their attempts to compel the payment of a tribute, that they never afterward ventured so far. However, they conquered and made tributary the three groups before mentioned.

In the Russian charts, the whole sea between Kamtschatka and America is covered with islands; for the adventurers in these expeditions frequently falling in with land, which they imagined did not agree with the situation of other laid down by preceding voyagers, immediately concluded it must be a new discovery, and reported it as such on their return; and since the vessels employed in these expeditions were usually out three or four years, and oftentimes longer, these mistakes were not in the way of being soon rectified. It is, however, now pretty certain, that the islands already enumerated are all that have yet been discovered by the Russians in that sea to the southward of 60° of latitude. It is from these islands that the sea-otter skins, the most valuable article of the fur trade, are for the most part drawn; and as they are brought completely under the Russian dominion, the merchants have settlements upon them, where their factors reside for the purpose of bartering with the natives. It was with a view to the farther increase and extension of this trade, that the admiralty of Okotsk fitted out an expedition for the purpose of making discoveries to the north and north-east of the islands above mentioned, and gave the command of it, as I have already observed, to Lieutenant Synd. This gentleman, having directed his course too far to the northward, failed in the object of his voyage; for, as we never saw the sea-otter to the northward of Bristol Bay, it seems probable that they shun those latitudes where the larger kinds of amphibious sea animals abound. This was the last expedition undertaken by the Russians for prosecuting discoveries to the eastward; but they will undoubtedly make a proper use of the advantages we have opened to them, by the discovery of Cook's river*.

Notwithstanding the general intercourse that, for the last forty years, hath taken place between the natives, the Russians, and the Cossacks, the former are not more distinguished from the latter by their features and general figure, than by their habits and cast of mind. Of the persons of the natives, a description hath already been given; and I shall only add, that their stature is much below the common size. This Major Behm attributes, in a great measure, to their marrying so early; both sexes generally entering into the conjugal state at the age of thirteen or fourteen. Their industry is abundantly conspicuous, without being contrasted with the laziness of their Russian and Cossack inmates, who are fond of intermarrying with them, and, as it should seem, from no other reason but that they may be supported in sloth and inactivity. To this want of bodily exertion may be attributed those dreadful scorbutic complaints which none of them escape; whilst the natives, by constant exercise and toil in the open air, are entirely free from them.

Referring the reader for an account of the manners, customs, and superstitions of the Kamtschadales at the time the Russians became first acquainted with this country, to Krascheninicoff, I shall proceed to a description of their habitations and dress. The houses (if they may be allowed that name) are of three distinct sorts, *fourts*, *balagans*, and *log-houses*, called here *isbas*. The first are their winter, the second their summer habitations; the third are altogether of Russian introduction, and inhabited only by the better and wealthier sort.

* The chief expedition undertaken by the Russians for the further exploration of the north-eastern coast of Asia, is that of Wrangel, of which some account will be found in the Appendix.—Eo.

The *jourts*, or winter habitations, are constructed in the following manner:—An oblong square of dimensions proportioned to the number of persons for whom it is intended (for it is proper to observe, that several families live together in the same *jourt*), is dug in the earth to the depth of about six feet. Within this space strong posts, or wooden pillars, are fastened in the ground, at proper distances from each other, on which are extended the beams for the support of the roof, which is formed by joists resting on the ground with one end, and on the beams with the other. The interstices between the joists are filled up with a strong wicker-work, and the whole covered with turf; so that a *jourt* has externally the appearance of a round squat hillock. A hole is left in the centre, which serves for chimney, window, and entrance, and the inhabitants pass in and out by means of a strong pole (instead of a ladder) notched just deep enough to afford a little holding to the toe. There is likewise another entrance in the side, even with the ground, for the convenience of the women; but if a man makes use of it, he subjects himself to the same disgrace and derision as a

sailor would who descends through lubbers' hole. The *jourt* consists of one apartment of the form of an oblong square. Along the sides are extended broad platforms made of boards, and raised about six inches from the ground, which they use as seats, and on which they go to rest, after strewing them with mats and skins. On one side is the fire-place, and the side opposite is entirely set apart for the stowage of provisions and kitchen utensils. At their feasts and ceremonious entertainments, the hotter the *jourts* are made for the reception of the guests the greater the compliment. We found them at all times so hot, as to make any length of stay in them to us intolerable. They betake themselves to the *jourts* the middle of October; and, for the most part, continue in them till the middle of May.

The *balagans* are raised upon nine posts, fixed into the earth in three rows, at equal distances from one another, and about thirteen feet high from the surface. At the height of between nine and ten feet, rafters are passed from post to post, and firmly secured by strong ropes. On these rafters are laid the joists, and the whole being covered with turf, constitutes the platform or floor of the *balagan*. On this is raised a roof of a conical figure, by means of tall poles, fastened down to the rafters at one end, and meeting together in a point at the top, and thatched over with strong coarse grass. The *balagans* have two doors placed opposite each other, and they ascend to them by the same sort of ladders they use in the *jourts*. The lower part is left entirely open; and within it they dry their fish, roots, vegetables, and other articles of winter consumption. The proportion of *jourts* to *balagans* is as one to six; so that six families generally live together in one *jourt*.

The loghouses (*ishas*) are raised with long timbers piled horizontally, the ends being let into one another, and the seams caulked with moss. The roof is sloping like that of our common cottage houses, and thatched with coarse grass or rushes. The inside consists of three apartments. At one end is what may be called the entry, which runs the whole width and height of the house, and is the receptacle of their sledges, harness, and other more bulky gears and household stuff. This communicates with the middle and best

ount will be found

apartment, furnished with broad benches for the purpose, as hath been above mentioned, of both eating and sleeping upon. Out of this is a door into the kitchen, one half of which is taken up by the oven or fire-place, so contrived, by being let into the wall that separates the kitchen and the middle apartment, as to warm both at the same time. Over the middle apartment and kitchen are two lofts, to which they ascend by a ladder placed in the entry. There are two small windows in each apartment made of tale, and, in the houses of the poorer sort, of fish-skin. The beams and boards of the ceiling are dubbed smooth with a hatchet (for they are unacquainted with the plane); and, from the effects of the smoke, are as black and shining as jet.

A town of Kamtschatka is called an *ostrog*, and consists of several of the three sorts of houses above described; but of which *balagans* are much the most numerous; and I must observe, that I never met with a house of any kind detached from an *ostrog*. Saint Peter and Saint Paul consists of seven log-houses, or *isbas*, nineteen *balagans*, and three *jourts*. Paratounka is of about the same size. Karatchin and Natchekin contain fewer log-houses, but full as many *jourts* and *balagans* as the former; from whence I conclude, that such is the usual size of the *ostrogs*.

Having already had occasion to mention the dress of the Kamtschadale women, I shall here confine myself to a description of that of the men. The outermost garment is of the shape of a carter's frock. Those worn in summer are of nankeen; in winter they are made of skins, most commonly of the deer or dog, tanned on one side, the hair being left on the other, which is worn innermost. Under this is a close jacket of nankeen, or other cotton stuffs; and beneath that a shirt of thin Persian silk, of a blue, red, or yellow colour. The remaining part of their dress consists of a pair of tight trowsers, or long breeches, of leather, reaching down to the calf of the leg; of a pair of dog or deer-skin boots, with the hair innermost; and of a fur cap, with two flaps, which are generally tied up close to the head, but in bad weather are let to fall round the shoulders.

The fur dress presented to me by a son of Major Behm (as already mentioned), is one of those worn by the *Tsions*, on ceremonious occasions. The form exactly resembles that of the common exterior garment just described. It is made of small triangular pieces of fur, chequered brown and white, and joined so neatly as to appear to be one skin. A border of six inches breadth, wrought with threads of different coloured leather, and producing a rich effect, surrounds the bottom, to which is suspended a broad edging of the sea-otter skin. The sleeves are turned up with the same materials; and there is likewise an edging of it round the neck, and down the opening at the breast. The lining is of a smooth white skin. A cap, a pair of gloves, and boots, wrought with the utmost degree of neatness, and made of the same materials, constitute the remainder of this suit. The Russians in Kamtschatka wear the European dress; and the uniform of the troops quartered here is of a dark green, faced with red.

As the people situated to the north and south of this country are yet imperfectly known, I shall conclude the account of Kamtschatka with such information concerning the Kurile Islands, and the Koreki and Tschutski, as I have been able to acquire. The chain of islands, running in a south-west direction from the southern promontory of Kamtschatka to Japan, extending from latitude 51° to 45° , are called the Kuriles. They obtained this name from the inhabitants of the neighbourhood of Lopatka, who being themselves called Kuriles, gave their own name to these islands, on first becoming acquainted with them. They are, according to Spanberg, twenty-two in number, without reckoning the very small ones. The northernmost, called Shoonska, is not more than three leagues from the promontory Lopatka, and its inhabitants are a mixture of natives and Kamtschadales. The next to the south, called Paramousir, is much larger than Shoonska, and inhabited by the true natives; their ancestors, according to a tradition among them, having come from an island a little farther to the south, called Onecutan. Those two islands were first visited by the Russians in 1713, and at the same time brought under their dominion. The others in order, are at present made tributary down to Ooshesheer inclusive, as I am informed by the worthy pastor of Paratounka, who is their missionary, and visits them once in three years, and speaks of the islanders in terms of the highest commendation, representing them

as a friendly, hospitable, generous, humane race of people, and excelling their Kamtschadale neighbours, not less in the formation of their bodies, than in docility and quickness of understanding. Though Ooshesheer is the southernmost island that the Russians have yet brought under their dominion, yet I understand that they trade to Oorooop, which is the eighteenth; and, according to their accounts, the only one where there is a good harbour for ships of burthen. Beyond this, to the south, lies Nadeegsda, which was represented to us by the Russians as inhabited by a race of men remarkably hairy, and who, like those of Oorooop, live in a state of entire independence*.

In the same direction, but inclining somewhat more to the westward, lie a group of islands, which the Japanese call Jeso; a name which they also give to the whole chain of islands between Kamtschatka and Japan. The southernmost, called Matmai, hath been long subject to the Japanese, and is fortified and garrisoned on the side toward the continent. The two islands to the north-east of Matmai, Kunachir, and Zellany, and likewise the three still farther to the north-east, called the Three Sisters, are perfectly independent. A trade of barter is carried on between Matmai and the islands last mentioned, and between those again and the Kuriles, to the northward; in which, for furs, dried fish, and oil, the latter get silk, cotton, iron, and Japanese articles of furniture†.

The inhabitants of as many of the islands as are brought under the Russian dominion, are at present converted to Christianity. And probably the time is not very distant, when a friendly and profitable intercourse will be brought about between Kamtschatka and the whole of this chain of islands; and which will draw after it a communication with Japan itself. This may eventually be greatly facilitated by a circumstance related to me by Major Behm, that several Russians, who had been taught the Japanese language by two men belonging to a vessel of that nation, which had been ‡ shipwrecked on the coast of Kamt-

* Spanberg places the island here spoken of, in 43° 50' north latitude, and mentions his having watered upon it; and that this watering party brought off eight of the natives, of whom he relates the following circumstances:—That their bodies were covered all over with hair; that they wore a loose striped silk gown, reaching as low as their ankles; and that some of them had silver rings pendant from the ears; that, on spying a live cock on deck, they fell on their knees before it; and likewise before the presents that were brought out to them, closing and stretching forth their hands, and bowing their heads at the same time down to the ground; that, except the peculiarity of their hairiness, they resembled the other Kurile islanders in their features and figure, and spoke the same language. The journal of the ship *Castricum* also mentions this circumstance of the inhabitants of the country discovered by them, and called Jeso, being hairy all over the body.

[The inhabitants of the island of Jeso, Jesso, or more properly Yezo, which gives the sound of the Japanese letters with which the name is written, more correctly, have been rendered tributary by the Japanese, who possess there several ports on the southern and western coasts; the principal of which is Matsumai, at the southern extremity of the island, being a town of some size, and the residence of the Governor. The inhabitants, who are generally called Ainos, from a word in their language signifying man, but are called Yezos by the Japanese, appear formerly to have occupied the northern parts of Japan, from whence they have been expelled by their more civilized neighbours, and are now apparently fading away from Yezo, sharing the general fate of perfect savages when in contact with civilization. The account which the Japanese give of them, representing them as but one degree removed from wild beasts, covered with a fur nearly as thick as dogs, bears, or foxes, and even Spanberg, (or Spangenberg's) relation, is greatly exaggerated. Krusenstern, who saw more of them than any other traveller, describes them as of a middling height, nearly black, with bushy beards, black rough large hair, but more regular features than the Kamt-

chadales. Their character he represents as mild and inoffensive, and their chief occupation is hunting and fishing. —Eo.]

† This accounts for what Kraschenincoff says, that he got from Paramousir a japanned table and vase, a scimitar, and a silver rlog, which he sent to the cabinet of her imperial majesty at Petersburg. And if what M. Steller mentions on the authority of a Kurile, who was interpreter to Spanberg in his voyage to Japan, is to be credited, that nearly the same language is spoken at Kunashir and Paramousir, it cannot be questioned that some intercourse has always subsisted between the inhabitants of this extensive chain of islands.

‡ The vessel here spoken of was from Satsuma, a port in Japan, bound for another Japanese port, called Azaka, and laden with rice, cotton, and silks. She sailed with a favourable wind; but, before she reached her destination, was driven out to sea by a violent storm, which carried away her masts and rudder. On the storm's abating, not one of the crew, which consisted of seventeen (having probably never made other than coasting voyages), knew where they were, or what course to steer. After remaining in this situation six months, they were driven on shore near the promontory Lopatka; and having cast out an anchor, began to carry on shore such articles as were necessary to their existence. They next erected a tent, and had remained in it twenty-three days, without seeing a human being, when chance conducted a Cossack officer, called Andrew Chinnicoff, with a few Kamtschadales, to their habitation. The poor unfortunate Japanese, overwhelmed with joy at the sight of fellow-creatures, made the most significant tenders they were able of friendship and affection; and presented their visitors with silks, sabres, and a part of whatever else they had brought from the ship. The treacherous Chinnicoff made reciprocal returns of kindness and good-will; and, after remaining with them long enough to make such observations as suited his designs, withdrew from them in the night. The Japanese, finding that their visitors did not return, knew

schatka, had been sent amongst those islands. The advantages that would accrue to the Russians by an immediate trade to Japan, have been already adverted to, and are too many, and too obvious, to need insisting upon.

The Koreki country includes two distinct nations, called the Wandering and Fixed Koriaes. The former inhabit the northern part of the isthmus of Kamtschatka, and the whole coast of the Eastern Ocean, from thence to the Anadir. The country of the Wandering Koriaes stretches along the north-east of the sea of Okotsk to the river Penskina, and westward toward the river Kovyma. The fixed Koriaes have a strong resemblance to the Kamtschadales, and, like them, depend altogether on fishing for subsistence. Their dress and habitations are of the same kind.* They are tributary to the Russians, and under the district of the Ingiga. The Wandering Koriaes occupy themselves entirely in breeding and pasturing deer, of which they are said to possess immense numbers; and that it is no unusual thing for an individual chief to have a herd of four or five thousand. They despise fish, and live entirely on deer. They have no *balagans*; and their only habitations are like the Kamtschadale *fourts*, with this difference, that they are covered with raw deer-skins in winter, and tanned ones in summer. Their sledges are drawn by deer, and never by dogs; which, like the latter, are likewise always spayed, in order to be trained to this business. The draft-deer pasture in company with the others; and when they are wanted, the herdsmen make use of a certain cry, which they instantly obey, by coming out of the herd. The priest of Paratouna informed me, that the two nations, of the Koriaes and the Tschutski, speak different dialects of the same language; and that it bears not the smallest resemblance to the Kamtschadale.

The country of the Tschutski is bounded on the south by the Anadir, and extends along the coast to the Tschutskoi Noss. Like the Wandering Koriaes, their attention is principally confined to their deer, of which their country affords great numbers, both tame and wild. They are a stout, well-made, bold, warlike race of people; redoubtable neighbours to both nations of the Koriaes, who often feel the effects of their depredatory incursions. The Russians have, for many years, been using their endeavours to bring them under their dominion; and, after losing a great many men in their different expeditions for this purpose, have not been able to effect it*. I shall here conclude this article; since all we can say of this people, on our own knowledge, hath been laid already before the reader.

not what course to take. In despair they manned their boat, and were rowing along the coast in search of a habitation, when they came up with their vessel which had been driven ashore, and found Chinnicoff and his companions pillaging her, and pulling her in pieces for the sake of the iron. This sight determined them to continue their course, which Chinnicoff perceiving, ordered his men to pursue and massacre them. The unfortunate Japanese, seeing a canoe in pursuit, and which they could not escape, apprehended what was to follow. Some of them leaped into the sea; others, in vain, had recourse to prayer and entreaties. They were all massacred but two, by the very sabres they had presented to their supposed friends a few days before. One of the two was a boy about eleven years old, named Gowga, who had accompanied his father, the ship's pilot, to learn navigation; the other was a middle-aged man, the supercargo, and called Sosa.

Chinnicoff soon met with the punishment due to his

crimes. The two strangers were conducted to Petersburg, where they were sent to the academy, with proper instructors and attendants; and several young men were, at the same time, put about them for the purpose of learning the Japanese language. They were thrown on the coast of Kamtschatka in 1730. The younger survived the absence from his country five, the other six years. Their portraits are to be seen in the cabinet of the empress at Petersburg.—Vid. Krascheninoff, vol. ii., part 4.—*Fr. Ed.*

* The Tschutski, or Tsheskois, are remarkable as being the only Siberian nation that has not hitherto submitted to the dominion of Russia. The difference of their language, and their superiority, not only in personal, but mental capacity to their neighbours, deserves greater attention than can be given in a note. All the particulars that can be gathered from more recent travellers, will be found in the Appendix.—*Ed.*

CHAPTER VIII.—PLAN OF OUR FUTURE PROCEEDING COURSE TO THE SOUTHWARD, ALONG THE COAST OF KAMTSCHATKA.—CAPE LOPATKA.—PASS THE ISLANDS SHOOMSKA AND PARAMOUSIR.—DRIVEN TO THE EASTWARD OF THE KURILES.—SINGULAR SITUATION WITH RESPECT TO THE PRETENDED DISCOVERIES OF FORMER NAVIGATORS.—FRUITLESS ATTEMPTS TO REACH THE ISLANDS NORTH OF JAPAN.—GEOGRAPHICAL CONCLUSIONS.—VIEW OF THE COAST OF JAPAN.—RUN ALONG THE EAST SIDE.—PASS TWO JAPANESE VESSELS.—DRIVEN OFF THE COAST BY CONTRARY WINDS.—EXTRAORDINARY EFFECT OF CURRENTS.—STEER FOR THE BASHEES.—PASS LARGE QUANTITIES OF PUMICE-STONE.—DISCOVER SULPHUR ISLAND.—PASS THE PRATAS.—ISLES OF LEMA, AND LADRON ISLAND.—CHINESE PILOT TAKEN ON BOARD THE RESOLUTION.—JOURNALS OF THE OFFICERS AND MEN SECURED.

Our instructions from the Board of Admiralty having left a discretionary power with the commanding officer of the expedition, in case of failure in the search of a passage from the Pacific into the Atlantic Ocean, to return to England, by whatever route he should think best for the farther improvement of geography, Captain Gore demanded of the principal officers their sentiments, in writing, respecting the manner in which these orders might most effectually be obeyed. The result of our opinions, which he had the satisfaction to find unanimous, and entirely coinciding with his own, was, that the condition of the ships, of the sails and cordage, made it unsafe to attempt, at so advanced a season of the year, to navigate the sea between Japan and Asia, which would otherwise have afforded the largest field for discovery; that it was therefore advisable to keep to the eastward of that island, and in our way thither to run along the Kuriles, and examine more particularly the islands that lie nearest the northern coast of Japan, which are represented as of a considerable size, and independent of the Russian and Japanese governments. Should we be so fortunate as to find in these any safe and commodious harbours, we conceived they might be of importance, either as places of shelter for any future navigators, who may be employed in exploring the seas, or as the means of opening a commercial intercourse among the neighbouring dominions of the two empires. Our next object was to survey the coast of the Japanese Islands, and afterward to make the coast of China, as far to the northward as we were able, and run along it to Macao.

This plan being adopted, I received orders from Captain Gore, in case of separation, to proceed immediately to Macao; and at six o'clock in the evening of the 9th of October, having cleared the entrance of Awatska Bay, we steered to the south-east, with the wind north-west and by west. At midnight, we had a dead calm, which continued till noon of the 10th; the light-house, at this time, bearing north half west, distant five leagues, and Cape Gavareea south by west half west. Being luckily in soundings of sixty and seventy fathoms' water, we employed our time very profitably in catching cod, which were exceedingly fine and plentiful; and at three in the afternoon a breeze sprung up from the west, with which we stood along the coast to the southward. A headland bearing south by west, now opened with Cape Gavareea, lying about seven leagues beyond it. Between them are two narrow but deep inlets, which may probably unite behind what appears to be a high island. The coast of these inlets is steep and cliffy. The hills break abruptly, and form chasms and deep valleys, which are well wooded. Between Cape Gavareea (which lies in latitude $52^{\circ} 21'$, longitude $158^{\circ} 38'$) and Awatska Bay, there are appearances of several inlets, which at first sight may flatter the mariner with hopes of finding shelter and safe anchorage: but the Russian pilots assured us, that there are none capable of admitting vessels of the smallest size, as the low land fills up the spaces that appear vacant between the high projecting headlands. Toward evening, it again became calm; but at midnight we had a light breeze from the north, which increased gradually to a strong gale; and at noon the next day, we found ourselves in latitude $52^{\circ} 4'$, longitude $158^{\circ} 31'$, when Cape Gavareea bore north by west one quarter west; the south extreme south-west half west. We were at this time distant from the nearest shore about three leagues, and saw the whole country inland covered with snow. A point of land to the southward, which we place in latitude $51^{\circ} 54'$, formed the north side

of a deep bay, called Achachinskoi, in the distant bottom of which we supposed a large river to empty itself, from the land behind being so unusually low. South of Achachinskoi Bay, the land is not so rugged and barren as that part of the country which we had before passed.

During the night, we had variable winds and rain; but at four in the morning of the 12th, it began to blow so strong from the north-east, as to oblige us to double-reef the top-sails, and make it prudent to stand more off the shore. At six, the weather becoming more moderate and fair, we again made sail, and stood in for the land. At noon, our latitude was $51^{\circ} 0'$, longitude $157^{\circ} 25'$. The northernmost land in sight, being the point we have mentioned as first opening with Cape Gavareea, bore north north-east. A head-land with a flat top, which is in latitude $51^{\circ} 27'$, and makes the south point of an inlet, called Girowara, bore north one quarter east, and the southernmost land in sight west three quarters north, distant six leagues. At this time we could just perceive low land stretching from the southern extreme; but the wind veering round to the north-west, we could not get a nearer view of it. At six in the afternoon, we saw from the mast-head, Cape Lopatka, the southernmost extremity of Kamtschatka. It is a very low flat cape, sloping gradually from the high level land that we saw at noon, and bore west half north, about five leagues distant; and the high land north-west by west half west. As this point of land forms so marked an object in the geography of the eastern coast of Asia, we were glad to be able, by an accurate observation, and several good angles, to determine its precise situation, which is in latitude $51^{\circ} 0'$, longitude $156^{\circ} 45'$. To the north-west of it we saw a remarkable high mountain, the top of which loses itself in the clouds; and, at the same time, the first of the Kurile Islands, called Shoomska, appeared in sight, bearing west half south. The passage between this island and Cape Lopatka, the Russians describe as being three miles broad, and very dangerous, on account of the rapidity of the tides, and the sunk rocks that are off the Cape. From Cape Gavareea to Lopatka, the coast trends south-east, south of Achachinskoi, the land is not so high and broken as between that bay and the mouth of Awatska, being only of a moderate elevation toward the sea, with hills gradually rising farther back in the country. The coast is steep and bold, and full of white chalky patches. At noon, the weather falling again to a calm, afforded us an opportunity of catching some fine cod. We were at this time, in forty fathoms' water, and about five or six leagues from Cape Lopatka. Both in the fore and afternoon, we had observations, with different compasses, for the variation, and found it to be $5^{\circ} 20'$ E.

We stood on all night, under an easy sail, to the south south-west, having the wind westerly. At midnight we sounded, and had sixty fathoms; and at day-break of the 13th, we saw the second of the Kurile Islands (called by the Russians Paramousir), extending from north-west by west, to west half south. This land is very high, and almost entirely covered with snow. At noon, the extremes bore from north north-west half west, to west north-west half west; and a high-peaked mountain, from which some thought they saw smoke issuing, north-west by west half west, about twelve or fourteen leagues distant. At this time our latitude, by observation, was $49^{\circ} 49'$, and our longitude $157^{\circ} 0'$. In the course of the day we saw many gulls and albatrosses, and several whales. Paramousir is the largest of the Kuriles under the dominion of Russia, and well deserves a more accurate survey, than we were at this time allowed to take. For, in the afternoon, the gale increasing from the west, we were never able to approach it nearer than we had done at noon; and were, therefore, obliged to be contented with endeavouring to ascertain its situation at that distance. We place the south end of the island in latitude $49^{\circ} 58'$; the north end in latitude $50^{\circ} 46'$, and in longitude $10'$ W. of Lopatka; and as this position is found not to differ materially from that given by the Russians, it is probably very near the truth. Whilst we were abreast of this island, we had a very heavy swell from the north-east, though the wind had, for some time, been from the westward; a circumstance which we have already remarked more than once during the course of our voyage. In the night we tried for soundings, but found no ground with fifty fathoms of line.

On the 14th and 15th, the wind blowing steadily and fresh from the westward, we were obliged to stand to the southward; and consequently hindered from seeing any more of

the Kurile Islands. At noon of the 16th, the latitude, by observation, was $45^{\circ} 27'$; the longitude, $155^{\circ} 30'$, deduced from a number of lunar observations taken during the three days past, $155^{\circ} 30'$. The variation $4^{\circ} 30'$ E. In this situation, we were almost surrounded by the supposed discoveries of former navigators, and uncertain to which we should turn ourselves. To the southward and the south-west were placed, in the French charts, a group of five islands, called the Three Sisters, Zellany and Kunashir. We were about ten leagues, according to the same maps, to the westward of the land of De Gama, which we had passed to the eastward in April last, at a distance rather less than this, without seeing any appearance of it; from which circumstance we may now conclude, that, if such land exist at all, it must be an island of a very inconsiderable size.* On the other hand, if we give credit to the original position of this land, fixed by Texiera†, it lay to the west by south; and as the Company's Land‡, Staten Island§, and the famous land of Jeso||, were also supposed to lie nearly in the same direction, together with the group first mentioned, according to the Russian charts, we thought this coast deserved the preference, and accordingly hauled round to the westward, the wind having shifted in the afternoon to the northward. During this day, we saw large flocks of gulls, several albatrosses, fulmars, and a number of fish, which our sailors called grampuses; but, as far as we could judge, from the appearance of those that passed close by the ships, we imagined them to be the *kasatka*, or sword-fish, described by Krascheninoff, to whom I refer the reader, for a curious account of the manner in which they attack the whales. In the evening, a visit from a small land bird, about the size of a goldfinch, and resembling that bird in shape and plumage, made us keep a good look out for land. However, at midnight, on trying for soundings, we found no ground with forty-five fathoms of line.

On the 17th, at noon, we were in latitude $45^{\circ} 7'$, by observation, longitude $154^{\circ} 0'$. The

* From Muller's account of the course steered by Captain Spangberg, in his route from Kamtschatka to Japan, it appears that he must also undoubtedly have seen De Gama's Land, if it really has the extent given it in M. D'Anville's maps. Walton, who commanded a vessel in the same expedition, seems also to have looked in vain for this land on his return from Japan: and three years afterward, on account of some doubts that had arisen respecting Spangberg's course, Deering went directly in search of it as low as the latitude of 46° .—See *Voyages et Découvertes*, &c. p. 210, et seq.

† See book vi. chap. i. p. 149.

‡ This land was seen by the Dutchmen who sailed in the *Castricum* and *Breskes*, and imagined by them to be part of the continent of America. There now remains scarce any doubt of its being the islands of Ooroo and Nadeegda. See the *Journals* of the *Castricum* and *Breskes*, published by Wetzer.

§ This land was also discovered by the *Castricum*; and, from its situation, as described in the journal of that vessel, it appears to be the islands of the Three Sisters.

|| The country of Jeso, which has so long been a stumbling-block to our modern geographers, was first brought to the knowledge of Europeans by the Dutch vessels, mentioned in the preceding notes. The name appears, from the earliest accounts, to have been well known, both to the Japanese and the Kamtschadales; and used by them, indiscriminately, for all the islands lying between Kamtschatka and Japan. It has since been applied to a large imaginary island, or continent, supposed to have been discovered by the *Castricum* and *Breskes*: and it may not, therefore, be improper to consider the grounds of this mistake, as far as can be collected from the journals of this expedition. The object of the voyage in which those ships were engaged, was to explore the eastern shore of Tartary; but, being separated by a storm off the south-east point of Japan, they sailed in different tracks along the east side of that island; and, having passed its

northern extremity, proceeded singly on their intended expedition.

The *Castricum*, commanded by De Vries, steering northward, fell in with land on the third day, in latitude 42° . He sailed along the south-east coast about sixty leagues in "a constant fog; and having anchored in various places," held a friendly intercourse with the inhabitants. Thus far the journal. Now, as the islands of Matimai, Kunashir, and Zellany appear, from Captain Spangberg's discoveries, to lie exactly in this situation, there can be no doubt of their being the same land; and the circumstance of the fog sufficiently accounts for the error of De Vries, in imagining them to be one continent, without having recourse to the supposition of an earthquake, by which Mr. Muller, from his desire to reconcile the opinion generally received with the latter Russian discoveries, conceives the several parts to have been separated. The journal then proceeds to give an account of the discovery of Staten Island and Company's Land, of which I have already given my opinion, and shall have occasion to speak hereafter. Having passed through the Straits of De Vries, says the journal, they entered a vast, wild, and tempestuous sea, in which they steered, through mists and darkness, to the 48° latitude north; after which they were driven by contrary winds to the southward, and again fell in with land to the westward, in latitude 45° , which they unaccountably still imagined to be part of the continent of Jeso; whereas, whoever examines Jansen's map of their discoveries (which appears to be exceedingly accurate, as far as his information went), will, I believe, have no doubt, that they were, at this time, on the coast of Tartary. Having traced this land four degrees to the northward, they returned to the southward through the straits they had passed before.

It is not necessary to trouble the reader with the journal of the *Breskes*, as it contains no new matter, and has been already republished, and very satisfactorily animadverted upon by Mr. Muller.—*Voyages from Asia to America*, &c. English Translation, p. 78.

wind now again coming to the westward, obliged us to steer a more southerly course; and, at midnight, it blew from that quarter a fresh gale, accompanied with heavy rain. In the morning we saw another land bird, and many flocks of gulls and peterels bending their course to the south-west. The heavy north-east swell, with which we had constantly laboured since our departure from Lopatka, now ceased, and changed suddenly to the south-east. In the forenoon of the 18th, we passed great quantities of rock-weed, from which, and the flights of birds above mentioned, we conjectured that we were at no great distance from the southernmost of the Kuriles; and, at the same time, the wind coming round to the south, enabled us to stand in for it. At two, we set studding-sails, and steered west; but the wind increasing to a gale, soon obliged us to double reef the top-sails; and, at midnight, we judged it necessary to try for soundings. Accordingly we hove to; but finding no bottom at seventy-five fathoms, we were encouraged to persevere, and again bore away west, with the wind at south-east. This course we kept till two in the morning, when the weather becoming thick, we hauled our wind and steered to the south-west till five, when a violent storm reduced us to our courses.

Notwithstanding the unfavourable state of the weather left us little prospect of making the land, we still kept this object anxiously in view; and at day-light, ventured to steer west by south, and continued to stand on in this direction till ten in the forenoon, when the wind suddenly shifting to the south-west, brought with it clear weather. Of this we had scarcely taken advantage, by setting the top-sails, and letting out the reefs, when it began to blow so strong from this quarter, that we were forced to close reef again; and at noon, the wind shifting two points to the west, rendered it vain to keep any longer on this tack. We, therefore, put about, and steered to the southward. At this time, our latitude, by observation, was $44^{\circ} 12'$, and longitude $150^{\circ} 40'$; so that, after all our efforts, we had the mortification to find ourselves, according to the Russian charts, upon a meridian with Nadeegda, which they make the southernmost of the Kurile Islands, and about twenty leagues to the southward. But, though the violent and contrary winds we had met with during the last six days, prevented our getting in with these islands, yet the course we had been obliged to hold, is not without its geographical advantages. For the group of Islands, consisting of the Three Sisters, Kunashir, and Zellany, which, in D'Anville's maps, are placed in the track we had just crossed; being, by this means, demonstratively removed from that situation, an additional proof is obtained of their lying to the westward, where Spanberg actually places them, between the longitude 142° and 147° . But as this space is occupied in the French charts by part of the supposed land of Jeso and Staten Island, Mr. Muller's opinion becomes extremely probable, that they are all the same lands; and as no reasons appear for doubting Spanberg's accuracy, we have ventured, in our general map,* to reinstate the Three Sisters, Zellany, and Kunashir, in their proper situation, and have entirely omitted the rest. When the reader recollects the manner in which the Russians have multiplied the islands of the Northern Archipelago, from the want of accuracy in determining their real situation, and the desire men naturally feel of propagating new discoveries, he will not be surprised, that the same causes should produce the same effects. It is thus that the Jesoian lands, which appear, both from the accounts of the Japanese and the earliest Russian traditions, to be no other than the southern Kurile Islands, have been supposed distinct from the latter. The Land of De Gama is next on record, and was originally placed nearly in the same situation with those just mentioned; but was removed, as has been already suggested, to make room for Staten Island, and the Company's Land; and as Jeso, and the southernmost of the Kuriles, had also possession of this space, that nothing might be lost, they were provided for, the former a little to the westward, and the latter to the eastward.

As the islands of Zellany and Kunashir, according to the Russian charts, were still to the southward, we were not without hopes of being able to make them, and therefore kept our head as much to the westward as the wind would permit. On the 20th, at noon, we were in latitude $43^{\circ} 47'$, and longitude $150^{\circ} 30'$; and steering west by south, with a moderate

MONUMENT TO CAPT. COOK, KEALAKEKUA BAY, SANDWICH ISLANDS.
Erected near the spot where Capt. Cook was murdered by the Natives, Feb. 14, 1779.

breeze from south-east, and probably not more than twenty-four leagues to the eastward of Zellany, when our good fortune again deserted us. For, at three o'clock in the afternoon, the wind veering round to the north-west, began to blow so strong, that we were brought under our foresail and mizen staysail. We had very heavy squalls, and hard rain during the next twenty-four hours; after which, the horizon clearing a little, and the weather growing moderate, we were enabled to set the topsails; but the wind still continuing to blow from the north-west, baffled all our endeavours to make the land, and obliged us at last to give up all further thoughts of discovery to the north of Japan. We submitted to this disappointment with the greater reluctance, as the accounts that are given of the inhabitants of these islands mentioned at the end of the last chapter, had excited in us the greater curiosity to visit them.

In the afternoon the leach-rope of the Resolution's fore-topsail gave way, and split the sail. As this accident had often happened to us in Captain Cook's life-time, he had ordered the foot and leach ropes of the topsails to be taken out, and larger fixed in their stead; and as these also proved unequal to the strain that was on them, it is evident that the proper proportion of strength between those ropes and the sail, is exceedingly miscalculated in our service. This day a land-bird perched on the rigging, and was taken; it was larger than a sparrow, but in other respects very like one. The gale now abated gradually, so that in the morning of the 22d, we let out the reefs of the top sails, and made more sail. At noon, we were in latitude $40^{\circ} 58'$, and longitude $148^{\circ} 17'$; the variation 3° E. In the afternoon, another little wanderer from the land pitched on the ship, and was so worn out with fatigue, that it suffered itself to be taken immediately, and died a few hours afterward. It was not bigger than a wren, had a tuft of yellow feathers on its head, and the rest of its plumage like that of the linnet. The sparrow, being stronger, lived a long time. These birds plainly indicating, that we could not be at any great distance from the land, and the wind after varying a little, fixing in the evening at north, our hopes of making the land again revived, and we hauled up to the west north-west, in which direction, the southernmost islands seen by Spanberg, and said to be inhabited by hairy men, lay at the distance of about fifty leagues. But the wind not keeping pace with our wishes, blew in such light airs, that we made little way, till eight the next morning, when we had a fresh breeze from the south south-west, with which we continued to steer west north-west till the evening. At noon, we were in latitude $40^{\circ} 35'$, longitude $146^{\circ} 45'$; the latter deduced from several lunar observations taken during the night. The variation of the needle we found to be 17° E. In the evening, we had strong squally gales attended with rain, and having passed, in the course of the day, several patches of green grass, and seen a shag, many small land birds, and flocks of gulls, it was not thought prudent, with all these signs of the vicinity of land, to stand on during the whole night. We therefore tacked at midnight, and steered a few hours to the south-east, and at four in the morning of the 24th, again directed our course to the west north-west, and carried a press of sail till seven in the evening, when the wind shifted from south south-west, to north, and blew a fresh gale. At this time we were in the latitude of $40^{\circ} 57'$, and the longitude of $145^{\circ} 20'$.

This second disappointment, in our endeavours to get to the north-west, together with the boisterous weather we had met with, and the little likelihood, at this time of the year, of its becoming more favourable to our views, were Captain Gore's motives for now finally giving up all farther search for the islands to the north of Japan, and for shaping a course west south-west, for the north part of that island. In the night, the wind shifted to the north-east, and blew a fresh gale, with hard rain and hazy weather, which, by noon of the 25th, brought us to the latitude of $40^{\circ} 18'$, and in the longitude $144^{\circ} 0'$. To-day we saw flights of wild ducks; a pigeon lighted on our rigging, and many birds like linnets flew about us with a degree of vigour that seemed to prove they had not been long upon the wing. We also passed patches of long grass, and a piece either of sugar-cane or bamboo. These signs, that land was at no great distance, induced us to try for soundings, but we found no ground with ninety fathoms of line. Toward evening, the wind by degrees shifted round to the south, with which we still kept on to the west south-west; and at daybreak of the 26th, we had the pleasure of descriing high land to the westward, which proved to be Japan. At

LANDS.

eight it extended from north-west to south by west, distant three or four leagues. A low, flat cape bore north-west three-quarters west, and seemed to make the south part of the entrance of a bay. Toward the south extreme, a conical-shaped hill bore south by west three-quarters west. To the northward of this hill there appeared to be a very deep inlet, the north side of the entrance into which is formed by a low point of land; and, as well as we could judge by our glasses, has a small island near it to the southward.

We stood on till nine, when we were within two leagues of the land, bearing west three-quarters south, and had soundings of fifty-eight fathoms, with a bottom of very fine sand. We now tacked and stood off; but the wind dying away, at noon we had got no farther than three leagues from the coast, which extended from north-west by north three-quarters west, to south half east, and was, for the most part, bold and cliffy. The low cape to the northward bore north-west by west, six leagues distant; and the north point of the inlet south, three-quarters west. The latitude, by observation, was $40^{\circ} 5'$, and longitude $142^{\circ} 28'$. The northernmost land in sight we judged to be the northern extremity of Japan.* It is lower than any other part; and, from the range of the high lands that were seen over it from the mast-head, the coast appeared evidently to incline round to the westward. The north point of the inlet we supposed to be Cape Nambu, and the town to be situated in a break of the high land, toward which the inlet seemed to direct itself†. The country is of a moderate height, consists of a double range of mountains; it abounds with wood, and has a pleasing variety of hills and dales. We saw the smoke of several towns or villages, and many houses near the shore, in pleasant and cultivated situations.

During the calm, being willing to make the best use of our time, we put our fishing lines overboard in ten fathoms water, but without any success. As this was the only amusement our circumstances admitted, the disappointment was always very sensibly felt, and made us look back with regret to the cod-banks of the dreary regions we had left, which had supplied us with so many wholesome meals, and, by the diversion they afforded, had given a variety to the wearisome succession of gales and calms, and the tedious repetition of the same nautical observations. At two in the afternoon, the breeze freshened from the southward, and by four had brought us under close-reefed topsails, and obliged us to stand off to the south-east. In consequence of this course, and the haziness of the weather, the land soon disappeared. We kept on all night, and till eight the next morning, when the wind coming round to the north, and growing moderate, we made sail, and steered west south-west, toward the land; but did not make it till three in the afternoon, when it extended from north-west half west to west. The northernmost extreme being a continuation of the high land, which was the southernmost we had seen the day before; the land to the west we conceived to be the Hofe Tafel Berg (the High Table Hill) of Jansen. Between the two extremes, the coast was low and scarcely perceptible, except from the mast-head. We stood on toward the coast till eight, when we were about five leagues distant; and having shortened sail for the night, steered to the southward, sounding every four hours; but never found ground with one hundred and sixty fathoms of line.

On the 28th, at six in the morning, we again saw land twelve leagues to the southward of that seen the preceding day, extending from west south-west to west by north. We steered south-west obliquely with the shore; and at ten, saw more land open to the south-west. To the westward of this land, which is low and flat, are two islands, as we judged, though some doubts were entertained whether they might not be connected with the adjacent low ground. The hazy weather, joined to our distance, prevented us also from determining whether there are any inlets or harbours between the projecting points, which seem here to promise good shelter. At noon, the north extreme bore north-west by north, and a high-peaked hill, over a steep headland, west by north, distant five leagues. Our latitude at this

* The only authentic survey of the eastern coast of Japan with which I am acquainted, is that published by Jansen in his atlas, and compiled with great accuracy from the charts and journals of the Castreom and Breskes. I have therefore adopted, wherever the identity of the situations could be nearly ascertained, the names given in that

map to the corresponding points and headlands seen by us along the coast.

Jansen places the northern extremity of Japan in latitude $40^{\circ} 15'$. The point seen by us was in latitude $40^{\circ} 27'$.

time, by observation, was 38° 16', longitude 142° 9'. The mean of the variation, from observations taken both in the fore and afternoon, was 1° 20' E. At half past three in the afternoon, we lost sight of the land; and, from its breacking off so suddenly, conjectured that what we had seen this day is an island, or perhaps a cluster of islands, lying off the main land of Japan; but as the islands, called by Jansen the Schildpads, and by Mr. D'Anville Matsima, though laid down nearly in the same situation, are not equal in extent to the land seen by us, we must leave this point undecided. Having kept a south-west course during the remaining part of the day, we found ourselves, at midnight, in seventy fathoms' water, over a bottom of fine dark brown sand. We therefore hauled up to the eastward till morning, when we saw the land again, about eleven leagues to the southward of that which we had seen the day before; and at eight we were within six or seven miles of the shore, having carried in regular soundings from sixty-five to twenty fathoms, over coarse sand and gravel. Unluckily there was a haze over the land, which hindered our distinguishing small objects on it. The coast is straight and unbroken, and runs nearly in a north and south direction. Toward the sea the ground is low, but rises gradually into hills of a moderate height, whose tops are tolerably even, and covered with wood.

At nine o'clock, the wind shifting to the southward, and the sky lowering, we tacked and stood off to the east, and soon after we saw a vessel close in with the land, standing along the shore to the northward, and another in the offing, coming down on us before the wind. Objects of any kind belonging to a country so famous, and yet so little known, it will be easily conceived, must have excited a general curiosity; and, accordingly, every soul on board was upon deck in an instant to gaze at them. As the vessel to windward approached us, she hauled farther off shore; upon which, fearing that we should alarm them by the appearance of a pursuit, we brought the ships to, and she passed ahead of us. at the distance of about half a mile. It would have been easy for us to have spoken with them; but perceiving, by their manœuvres, that they were much frightened, Captain Gore was not willing to augment their terrors; and, thinking that we should have many better opportunities of communication with this people, suffered them to go off without interruption. Our distance did not permit us to remark any particulars regarding the men on board, who seemed to be about six in number, especially as the haziness of the weather precluded the use of our glasses. According to the best conjectures we were able to form, the vessel was about forty tons burthen. She had but one mast, on which was hoisted a square sail, extended by a yard aloft, the braces of which worked forward. Half way down the sail came three pieces of black cloth at equal distances from each other. The vessel was higher at each end than in the midship; and we imagined, from her appearance and form, that it was impossible for her to sail any otherwise than large.

At noon the wind freshened, and brought with it a good deal of rain; by three it had increased so much, that we were reduced to our courses; at the same time, the sea ran as high as any one on board ever remembered to have seen it. If the Japanese vessels are, as Kämpfer describes them, open in the stern, it would not have been possible for those we saw to have survived the fury of this storm; but as the appearance of the weather all the preceding part of the day, foretold its coming, and one of the sloops had, notwithstanding, stood far out to sea, we may safely conclude that they are perfectly capable of bearing a gale of wind. Spanberg indeed describes two kinds of Japanese vessels; one answering to the above description of Kämpfer; the other, which he calls busses, and in which he says they make their voyages to the neighbouring islands, exactly corresponds with those we saw*.

At eight in the evening, the gale shifted to the west without abating the least in violence, and by raising a sudden swell in a contrary direction to that which prevailed before, occasioned the ships to strain and labour exceedingly. During the storm several of the sails were split on board the Resolution. Indeed they had been so long bent, and were worn so thin, that this accident had of late happened to us almost daily in both ships; especially, when, being stiff and heavy with the rain, they became less able to bear the shocks of the

* Vide Muller, Fr. ed. page 215.

violent and variable winds we at this time experienced. The gale at length growing moderate, and settling to the west, we kept upon a wind to the southward; and at nine in the morning of the 30th we saw the land at the distance of about fifteen leagues, bearing from west by north to north-west one quarter west. It appeared in detached parts; but whether they were small islands or parts of Japan, our distance did not enable us to determine. At noon it extended from north-west to west, the nearest land being about thirteen leagues distant, beyond which the coast seemed to run in a westerly direction. The latitude, by observation, was $36^{\circ} 41'$, longitude $142^{\circ} 6'$. The point to the northward, which was supposed to be near the southernmost land seen the day before, we conjectured to be Cape de Kennis, and the break to the southward of this point, to be the mouth of the river on which the town of Gissima is said to be situated. The next cape is probably that called in the Dutch charts Boontje's Point, and the southernmost, of which we were abreast at noon, we suppose to be near Low Point*, and that we were at too great a distance to see the low land, in which it probably terminates, to the eastward.

In the afternoon, the wind veering round to the north-east, we stood to the southward, at the distance of about eighteen leagues from the shore, trying for soundings, as we went along, but finding none with one hundred and fifteen fathoms of line. At two the next morning it shifted to west, attended with rain and lightning, and blowing in heavy squalls. During the course of the day, we had several small birds of a brown plumage, resembling linnets, flying about us, which had been forced off the land by the strong westerly gales; but toward the evening, the wind coming to the north-west, we shaped our course, along with them, to west south-west, in order to regain the coast. In the morning of the 1st of November, the wind again shifted to south-east, and bringing with it fair weather, we got forty-two sets of distances of the moon from the sun and stars, with four different quadrants, each set consisting of six observations. These agreeing pretty nearly with each other, fix our situation at noon the same day, with great accuracy, in longitude $141^{\circ} 32'$, the latitude, by observation, was $35^{\circ} 17'$. We found an error of latitude in our reckonings of the preceding day, of eight miles, and in this day's of seventeen, from whence, and from our being much more to the eastward than we expected, we concluded that there had been a strong current from the south-west.

At two in the afternoon, we again made the land to the westward, at the distance of about twelve leagues; the southernmost land in sight, which we supposed to be White Point†, bore west south-west half west; a hummock to the northward, which had the appearance of being an island, bore north north-west half west, within which we saw from the mast-head low land, which we took to be Sand-down Point‡. We stood in toward the land, till half-past five, when we hauled our wind to the southward. At this time we saw a number of Japanese vessels, close in with the land, several seemingly engaged in fishing, and others standing alongshore. We now discovered to the westward a remarkably high mountain, with a round top, rising far inland. There is no high ground near it, the coast being of a moderate elevation, and, as far as we could judge, from the haziness of the horizon, much broken by small inlets. But to the southward of the hummock island before mentioned, there appeared, at a great distance, within the country, a ridge of hills, stretching in a direction toward the mountain, and probably joining with it. As this is the most remarkable hill on the coast, we could have wished to have settled its situation exactly; but having only had this single view, were obliged to be contented with such accuracy as our circumstances would allow. Its latitude, therefore, we conceive to be $35^{\circ} 20'$; its longitude, estimated by its distance from the ships, at this time fifteen leagues, $140^{\circ} 26'$.

As the Dutch charts make the coast of Japan extend about ten leagues to the south-west of White Point, at eight we tacked, and stood off to the eastward, in order to weather the point. At midnight, we again tacked to the south-west, expecting to fall in with the coast to the southward, but were surprised, in the morning at eight, to see the hummock, at the distance only of three leagues, bearing west north-west. We began at first to doubt the

evidence of our senses, and afterward to suspect some deception from a similarity of land; but, at noon, we found ourselves, by observation, to be actually in latitude 35° 43', at a time when our reckonings gave us 34° 48'. So that, during the eight hours in which we supposed we had made a course of nine leagues to the south-west, we had in reality been carried eight leagues from the position we left, in a direction diametrically opposite; which made, on the whole, in that short space of time, a difference, in our reckoning, of seventeen leagues. From this error, we calculated that the current had set to the north-east by north, at the rate of at least five miles an hour. Our longitude at this time was 141° 16'.

The weather having now the same threatening appearance as on the 29th of October, which was followed by so sudden and severe a gale, and the wind continuing at south south-east, it was thought prudent to leave the shore, and stand off to the eastward, to prevent our being entangled with the land. Nor were we wrong in our prognostications; for it soon afterward began, and continued till next day, to blow a heavy gale, accompanied with hazy and rainy weather. In the morning of the 3d, we found ourselves, by our reckoning, upward of fifty leagues from the land which circumstance, together with the very extraordinary effect of currents we had before experienced, the late season of the year, the unsettled state of the weather, and the little likelihood of any change for the better, made Captain Gore resolve to leave Japan altogether, and prosecute our voyage to China; hoping, that as the track he meant to pursue had never yet been explored, he should be able to make amends, by some new discovery, for the disappointments we had met with on this coast. If the reader should be of opinion that we quitted this object too hastily, in addition to the facts already stated it ought to be remarked, Kämpfer describes the coast of Japan as the most dangerous in the whole world*; that it would have been equally dangerous, in case of distress, to run into any of their harbours, where we know, from the best authorities, that the aversion of the inhabitants to any intercourse with strangers has led them to commit the most atrocious barbarities; that our ships were in a leaky condition; that our sails were worn out, and unable to withstand a gale of wind; and that the rigging was so rotten as to require constant and perpetual repairs.

As the strong currents which set along the eastern coast of Japan, may be of dangerous consequence to the navigator who is not aware of their extraordinary rapidity, I shall take leave of this island, with a summary account of their force and direction, as observed by us from the 1st to the 8th of November. On the 1st, at which time we were about eighteen leagues to the eastward of White Point, the current set north-east by north, at the rate of three miles an hour; on the 2nd, as we approached the shore, we found it continuing in the same direction, but increased in its rapidity to five miles an hour; as we left the shore it again became more moderate and inclined to the eastward; on the 3rd, at the distance of sixty leagues, it set to the east north-east, three miles an hour: on the 4th and 5th it turned to the southward, and at 120 leagues from the land, its direction was south-east, and its rate not more than a mile and a half an hour; on the 6th and 7th it again shifted round to the north-east, its force gradually diminishing till the 8th, when we could no longer perceive any at all.

During the 4th and 5th, we continued our course to the south-east, having very unsettled weather, attended with much lightning and rain. On both days we passed great quantities of pumice-stone, several pieces of which we took up, and found to weigh from one ounce to three pounds. We conjectured that these stones had been thrown into the sea, by eruptions of various dates, as many of them were covered with barnacles, and others quite bare. At the same time, we saw two wild ducks, and several small land-birds, and had many porpoises playing round us. On the 6th, at day-light, we altered our course to the south-seath-west; but at eight in the evening we were taken back, and obliged to steer to the south-east. On the 7th, at noon, we saw a small land-bird, our latitude, by observation at this time, being 33° 52', and longitude 148° 42'. On the 9th, we were in latitude 31° 46', longitude 146° 20', when we again saw a small land-bird, a tropic-bird, porpoises, flying-fishes, and had a great swell from the east-south-east. We continued our course to the south-west having the winds from the northward, without any remarkable occurrence,

* See Kämpfer's Hist. of Japan, vol. i. p. 92, 93, 94, and 102.

till the 12th, when we had a most violent gale of wind from the same quarter, which reduced us to the fore-sail, and mizen-stay-sail; and, as the weather was so hazy that we were not able to see a cable's length before us, and many shoals and small islands are laid down in our charts in this part of the ocean, we brought-to with our heads to the south-west. At noon, the latitude by account, was $27^{\circ} 36'$, longitude $144^{\circ} 25'$. In the morning of the 13th, the wind shifting round to the north-west, brought with it fair weather; but though we were at this time nearly in the situation given to the island of St. Juan, we saw no appearance of land. We now bore away to the south-west, and set the top-sails, the gale still continuing with great violence. At noon the latitude, by observation, was $26^{\circ} 0'$, longitude $143^{\circ} 40'$, and variation $3^{\circ} 50'$ E. In the afternoon, we saw flying-fish and dolphins, also tropic birds and albatrosses. We still continued to pass much pumice-stone; indeed, the prodigious quantities of this substance which float in the sea, between Japan and the Bashee Islands, seem to indicate, that some great volcanic convulsion must have happened in this part of the Pacific Ocean; and, consequently, give some degree of probability to the opinion of Mr. Muller, which I have already had occasion to mention, respecting the separation of the continent of Jesso, and the disappearance of Company's Land and Staten Island.

At six in the afternoon we altered our course to the west-south-west, Captain Gore judging it useless to steer any longer to the south-south-west, as we were near the meridian of the Ladrones, or Marianne Islands, and at no great distance from the track of the Manilla ships. In the morning of the 14th, the weather became fine, and the wind, which was moderate, gradually shifted to the north-east, and proved to be the trade-wind. At ten, Mr. Trevenen, one of the young gentlemen who came along with me into the Discovery, saw land, appearing like a peaked mountain, and bearing south-west. At noon, the latitude, by observation, was $24^{\circ} 37'$, longitude $142^{\circ} 2'$. The land, which we now discovered to be an island, bore south-west half-west, distant eight or ten leagues, and at two in the afternoon, we saw another to the west-north-west. This second island, when seen at a distance, has the appearance of two; the south point consisting of a high conical hill, joined by a narrow neck to the northern land, which is of a moderate height. As this was evidently of greater extent than the island to the south, we altered our course toward it. At four, it bore north-west by west; but not having daylight sufficient to examine the coast, we stood upon our tacks during the night.

On the 15th at six in the morning, we bore away for the south point of the larger island, at which time we discovered another high island, bearing north three-quarters west, the south island being on the same rhomb line, and the south point of the island ahead, west by north. At nine we were abreast, and within a mile of the middle island, but Captain Gore, finding that a boat could not land without some danger from the great surf that broke on the shore, kept on his course to the westward. At noon, our latitude, by observation, was $24^{\circ} 50'$, longitude $140^{\circ} 56'$ E. This island is about five miles long, in a north-north-east and south-south-west direction. The south point is a high barren hill, flattish at the top, and when seen from the west southwest, presents an evident volcanic crater. The earth, rock, or sand, for it was not easy to distinguish of which its surface is composed, exhibited various colours, and a considerable part we conjectured to be sulphur, both from its appearance to the eye, and the strong sulphureous smell which we perceived as we approached the point. Some of the officers on board the Resolution, which passed nearer the land, thought they saw steams rising from the top of the hill. From these circumstances, Captain Gore gave it the name of *Sulphur Island*. A low, narrow, neck of land connects this hill with the south end of the island, which spreads out into a circumference of three or four leagues, and is of a moderate height. The part near the isthmus has some bushes on it, and has a green appearance; but those to the north-east are very barren, and full of large detached rocks, many of which were exceedingly white. Very dangerous breakers extend two miles and a half to the east, and two miles to the west, off the middle part of the island, on which the sea broke with great violence. The north and south islands appeared to us as single mountains, of a considerable height; the former peaked, and of a conical shape; the latter more square, and flat at the top. Sulphur Island we place in latitude $24^{\circ} 48'$, longitude $141^{\circ} 12'$.

The north island in latitude $25^{\circ} 14'$, longitude $141^{\circ} 10'$. The south island in latitude $24^{\circ} 22'$, and longitude $141^{\circ} 20'$. The variation observed was $3^{\circ} 30'$ E.

Captain Gore now directed his course to the west-south-west, for the Bashee Islands, hoping to procure at them such a supply of refreshments as would help to shorten his stay in Macao. These islands were visited by Dampier, who gives a very favourable account, both of the civility of the inhabitants, and of the plenty of hogs and vegetables, with which the country abounds; they were afterward seen by Byron and Wallis, who passed them without landing. In order to extend our view in the day-time, the ships spread between two and three leagues from each other, and during the night we went under an easy sail; so that it was scarcely possible to pass any land that lay in the neighbourhood of our course. In this manner we proceeded, without any occurrence worth remarking, with a fresh breeze from the north-east, till the 22d, when it increased to a strong gale, with violent squalls of wind and rain, which brought us under close-reefed top-sails.

At noon of the 23d, the latitude, by account, was $21^{\circ} 5'$, and longitude $123^{\circ} 20'$; at six in the evening, being now only twenty-one leagues from the Bashee islands, according to the situation in Mr. Dalrymple's map, and the weather squally, attended with a thick haze, we hauled our wind to the north north-west, and hauled the fore top-sail. During the whole of the 24th it rained incessantly, and the wind still blew a storm; a heavy sea rolled down on us from the north, and in the afternoon we had violent flashes of lightning from the same quarter. We continued upon a wind to the north north-west till nine o'clock, when we tacked and stood to the south south-east till four in the morning of the 25th, and then wore. During the night there was an eclipse of the moon, but the rain prevented our making any observation; unfortunately, at the time of the greatest darkness, a seaman, in stowing the main top-mast stay-sail, fell overboard, but laying hold of a rope which providentially was hanging out of the fore-chains into the water, and the ship being quickly brought in the wind, he was got on board without any other hurt than a slight bruise on his shoulder. At eight, the weather clearing, we bore away, but the wind blew still so strong, that we carried no other sail than the fore-sail, and the main top-sail close reefed. About this time we saw a land bird resembling a thrush, and a sugar-cane; at noon the latitude, by observation, was $21^{\circ} 35'$, and longitude $121^{\circ} 35'$.

As our situation in longitude was now to the west of the Bashee, according to Mr. Dalrymple's maps, I perceived that Captain Gore was governed, in the course he was steering, by the opinions of Commodore Byron and Captain Wallis, with whom he sailed when they passed these islands; the former placing it near four degrees to the westward, or in longitude $118^{\circ} 14'$. In consequence of this opinion, at two we stood to the southward, with a view of getting into the same parallel of latitude with the islands before we ran down our longitude. At six we were nearly in that situation, and consequently ought to have been in sight of land, according to Mr. Wallis's account, who places the Bashees near three degrees more to the eastward than Mr. Byron. The gale at this time had not in the least abated; and Captain Gore, still conceiving that the islands must undoubtedly lie to the westward, brought the ships to, with their heads to the north-west, under the fore-sail and balanced mizen. At six in the morning of the 26th, the wind having considerably abated, we bore away west, set the top-sails, and let out the reefs. At noon the latitude, by observation, was $21^{\circ} 12'$, and longitude $120^{\circ} 25'$. We saw, this day, a flock of ducks and many tropic-birds, also dolphins and porpoises, and still continued to pass several pumice-stones. We spent the night upon our tacks; and at six in the morning of the 27th again bore away west in search of the Bashees.

I now began to be a little apprehensive, lest, in searching for those islands, we should get so much to the southward as to be obliged to pass to leeward of the Pratas. In this case it might have been exceedingly difficult for such bad-sailing ships as ours to fetch Macao, particularly should the wind continue to blow as it now did, from the north north-east and north. As I had some doubts whether Mr. Dalrymple's charts were on board the Resolution, I made sail and hailed her; and having acquainted Captain Gore with the position of these shoals, and my apprehensions of being driven to the southward, he informed me that he should continue on his course for the day, as he was still in hopes of finding Admiral Byron's longitude

right; and, therefore, ordered me to spread a few miles to the south. At noon the weather became hazy; the latitude, by reckoning, was $21^{\circ} 2'$, and longitude $118^{\circ} 30'$; and at six, having got to the westward of the Bashees, by Mr. Byron's account, Cap^tain Goro hauled his wind to the north-west under an easy sail, the wind blowing very strong, and there being every appearance of a dirty boisterous night. At four in the morning of the 28th, we saw the Resolution, then half a mile ahead of us, wear, and immediately perceived breakers close under our lee. At daylight we saw the island of Prata; and at half past six we wore again, and stood toward the shoal, and finding we could not weather it, bore away and ran to leeward. As we passed the south side, within a mile of the reef, we observed two remarkable patches on the edges of the breakers that looked like wrecks. At noon, the latitude found by double altitudes was $20^{\circ} 39'$, longitude $116^{\circ} 45'$. The island bore north three quarters east, distant three or four leagues. On the south-west side of the reef, and near the south end of the island, we thought we saw from the mast-head openings in the reef, which promised safe anchorage.

The Prata shoal is of a considerable extent, being six leagues from north to south, and stretching three or four leagues to the eastward of the island; its limit to the westward we were not in a situation to determine. The north-east extremity we place in latitude $20^{\circ} 58'$, and longitude 117° ; and the south-west in latitude $20^{\circ} 45'$, and longitude $116^{\circ} 44'$. For the remaining part of the day we carried a press of sail, and kept the wind, which was north-east by north, in order to secure our passage to Macao. It was fortunate that, toward evening, the wind favoured us by changing two points more to the east; for, had the wind and weather continued the same as during the preceding week, I doubt whether we could have fetched that port, in which case we must have borne away for Batavia; a place we all dreaded exceedingly, from the sad havoc the unhealthiness of the climate had made in the crews of the former ships that had been out on discovery, and had touched there.

In the forenoon of the 29th, we passed several Chinese fishing-boats, who eyed us with great indifference. They fish with a large dredge-net, shaped like a hollow cone, having a flat iron rim fixed to the lower part of its mouth. The net is made fast with cords to the head and stern of the boat, which being left to drive with the wind, draws the net after it, with the iron part dragging along the bottom. We were sorry to find the sea covered with the wrecks of boats that had been lost, as we conjectured, in the late boisterous weather. At noon we were in latitude, by observation, $22^{\circ} 1'$, having run one hundred and ten miles upon a north-west course since the preceding noon. Being now nearly in the latitude of the Lema Islands, we bore away west by north, and, after running twenty-two miles, saw one of them nine or ten leagues to the westward. At six, the extremes of the islands in sight bore north north-west half west, and west north-west half west; distant from the nearest four or five leagues; the depth of water twenty-two fathoms, over a soft muddy bottom. We now shortened sail, and kept upon our tacks for the night. By Mr. Bailey's time-keeper, the Grand Lema bore from the Prata Island north 60° W. one hundred and fifty-three miles; and by our run, north 57° W. one hundred and forty-six miles.

In the morning of the 30th, we ran along the Lema Isles, which, like all the other islands on this coast, are without wood, and, as far as we could observe, without cultivation. At seven o'clock, we had precisely the same view of these islands, as is represented in a plate of Lord Anson's voyage. At nine o'clock, a Chinese boat, which had been before with the Resolution, came alongside, and wanted to put on board us a pilot, which however we declined, as it was our business to follow our consort. We soon after passed the rock marked R, in Lord Anson's plate; but, instead of hauling up to the northward of the Grand Ladrone Island, as was done in the Centurion, we proceeded to leeward. It is hardly necessary to caution the mariner not to take this course, as the danger is sufficiently obvious; for, should the wind blow strong, and the current set with it, it will be extremely difficult to fetch Macao. Indeed we might, with great safety, by the direction of Mr. Dalrymple's map, have gone either entirely to the north of the Lema Isles, or between them, and made the wind fair for Macao. Our fears of missing this port, and being forced to Batavia, added to the strong and eager desires of hearing news from Europe, made us rejoice to see the

Resolution soon after fired a gun, and hoisted her colours as a signal for a pilot. On repeating the signal, we saw an excellent race between four Chinese boats; and Captain Gore having engaged with the man who arrived first, to carry the ship to the Typa for thirty dollars, sent me word, that, as we could easily follow, that expense might be saved to us. Soon after, a second pilot getting on board the Resolution, insisted on conducting the ship, and, without further ceremony, laid hold of the wheel, and began to order the sails to be trimmed. This occasioned a violent dispute, which at last was compromised, by their agreeing to go shares in the money. At noon, the latitude, by observation, was $21^{\circ} 57'$ N., and longitude $114^{\circ} 2'$ E.; the Grand Ladrone Island extending from north-west half north, to north half west, distant four miles. The land of which the bearings are here given, we conceived to be one island; but afterward found the western part to be the island marked Z in Mr. Dalrymple's chart of part of the coast of China, &c. which, at that time, we unfortunately had not on board.

In obedience to the instructions given to Captain Cook by the Board of Admiralty, it now became necessary to demand of the officers and men their journals, and what other papers they might have in their possession, relating to the history of our voyage. The execution of these orders seemed to require some delicacy, as well as firmness. I could not be ignorant, that the greatest part of our officers, and several of the seamen, had amused themselves with writing accounts of our proceedings for their own private satisfaction, or that of their friends, which they might be unwilling, in their present form, to have submitted to the inspection of strangers. On the other hand, I could not, consistently with the instructions we had received, leave in their custody papers which, either from carelessness or design, might fall into the hands of printers, and give rise to spurious and imperfect accounts of the voyage, to the discredit of our labours, and perhaps to the prejudice of officers, who, though innocent, might be suspected of having been the authors of such publications. As soon, therefore, as I had assembled the ship's company on deck, I acquainted them with the orders we had received, and the reasons which I thought ought to induce them to yield a ready obedience. At the same time, I told them, that any papers which they were desirous not to have sent to the Admiralty, should be sealed up in their presence, and kept in my own custody, till the intentions of the Board, with regard to the publication of the history of the voyage, were fulfilled; after which they should faithfully be restored back to them. It is with the greatest satisfaction I can relate, that my proposals met with the approbation and the cheerful compliance both of the officers and men; and I am persuaded, that every scrap of paper, containing any transactions relating to the voyage, were given up. Indeed it is doing bare justice to the seamen of this ship to declare, that they were the most obedient and the best-disposed men I ever knew, though almost all of them were very young, and had never before served in a ship of war.

CHAPTER IX.—WORKING UP TO MACAO.—A CHINESE COMPASS.—SENT ON SHORE TO VISIT THE PORTUGUESE GOVERNOR.—EFFECTS OF "STELLIGENCE WE RECEIVED FROM EUROPE.—ANCHOR IN THE TYPA.—PASSAGE UP TO CANTON.—BOCCA TYGRIS.—WAMPU.—DESCRIPTION OF A SAMPANE.—RECEPTION AT THE ENGLISH FACTORY.—INSTANCE OF THE SUSPICIOUS CHARACTER OF THE CHINESE.—OF THEIR MODE OF TRADING.—OF THE CITY OF CANTON.—ITS SIZE.—POPULATION.—NUMBER OF SAMPANES.—MILITARY FORCE.—OF THE STREETS AND HOUSES.—VISIT TO A CHINESE.—RETURN TO MACAO.—GREAT DEMAND FOR THE SEA-OTTER SKINS.—PLAN OF A VOYAGE FOR OPENING A FUR TRADE ON THE WESTERN COAST OF AMERICA, AND PROSECUTING FURTHER DISCOVERIES IN THE NEIGHBOURHOOD OF JAPAN.—DEPARTURE FROM MACAO.—PRICE OF PROVISIONS IN CHINA.

WE kept working to windward till six in the evening, when we came to anchor, by the direction of the Chinese pilot on board the Resolution, who imagined the tide was setting against us. In this, however, he was much deceived; as we found, upon making the experiment, that it set to the northward till ten o'clock. The next morning he fell into a similar mistake; for, at five, on the appearance of slack water, he gave orders to get under

weigh; but the ignorance he had discovered having put us on our guard, we chose to be convinced, by our own observations, before we weighed; and, on trying the tide, we found a strong under-tow, which obliged us to keep fast till eleven o'clock. From these circumstances, it appears that the tide had run down twelve hours. During the afternoon, we kept standing on our tacks, between the island of Potoe and the Grand Ladrone, having passed to the eastward of the former. At nine o'clock the tide beginning to ebb, we again came to anchor in six fathoms' water; the town of Macao bearing north-west, three leagues distant, and the island of Potoe south half-west, two leagues distant. This island lies two leagues to the north north-west of the island marked Z in Mr. Dalrymple's chart, which we at first took to be part of the Grand Ladrone. It is small and rocky; and off the west end there is said to be foul ground, though we passed near it without perceiving any.

In the forenoon of the 2d, one of the Chinese contractors, who are called *Compradors*, went on board the *Resolution*, and sold to Captain Gore two hundred pounds' weight of beef, together with a considerable quantity of greens, oranges, and eggs. A proportionable share of these articles was sent to the *Discovery*; and an agreement made with the man to furnish us with a daily supply, for which, however, he insisted on being paid beforehand. Our pilot pretending he could carry the ships no farther, Captain Gore was obliged to discharge him, and we were left to our own guidance.

At two in the afternoon, the tide flowing, we weighed, and worked to windward; and at seven anchored in three and a half fathoms of water, Macao bearing west, three miles distant. This situation was, indeed, very ineligible, being exposed to the north-east, and having shoal water, not more than two fathoms and a half deep, to leeward; but as no nautical description is given in Lord Anson's voyage of the harbour in which the *Centurion* anchored, and Mr. Dalrymple's general map, which was the only one on board, was on too small a scale to serve for our direction, the ships were obliged to remain there all night.

In the evening, Captain Gore sent me on shore to visit the Portuguese governor, and to request his assistance in procuring refreshments for our crews, which he thought might be done on more reasonable terms than the *Comprador* would undertake to furnish them. At the same time I took a list of the naval stores, of which both vessels were greatly in want, with an intention of proceeding immediately to Canton, and applying to the servants of the East India Company who were at that time resident there. On my arrival at the citadel, the fort-major informed me that the governor was sick, and not able to see company; but that we might be sure of receiving every assistance in their power. This, however, I understood would be very inconsiderable, as they were entirely dependent on the Chinese, even for their daily subsistence. Indeed, the answer returned to the first request I made, gave me a sufficient proof of the fallen state of the Portuguese power; for, on my acquainting the Major with my desire of proceeding immediately to Canton, he told me, that they could not venture to furnish me with a boat, till leave was obtained from the *Hoppo*, or officer of the customs; and that the application for this purpose must be made to the Chinese government at Canton.

The mortification I felt at meeting with this unexpected delay, could only be equalled by the extreme impatience with which we had so long waited for an opportunity of receiving intelligence from Europe. It often happens, that, in the eager pursuit of an object, we overlook the easiest and most obvious means of attaining it. This was actually my case at present; for I was returning under great dejection to the ship, when the Portuguese officer who attended me asked me, if I did not mean to visit the English gentlemen at Macao. I need not add with what transport I received the information this question conveyed to me; nor the anxious hopes and fears, the conflict between curiosity and apprehension, which passed in my mind, as we walked toward the house of one of our countrymen. In this state of agitation, it was not surprising that our reception, though no way deficient in civility or kindness, should appear cold and formal. In our inquiries, as far as they related to objects of private concern, we met, as was indeed to be expected, with little or no satisfaction; but the events of a public nature which had happened since our departure, and now, for the first time, burst all at once upon us, overwhelmed every other feeling, and left us for some time

• The d
whose indep

almost without the power of reflection. For several days we continued questioning each other about the truth of what we had heard, as if desirous of seeking, in doubt and suspense, for that relief and consolation which the reality of our calamities appeared totally to exclude. These sensations were succeeded by the most poignant regret at finding ourselves cut off at such a distance from the scene, where, we imagined, the fate of fleets and armies was every moment deciding.

The intelligence we had just received of the state of affairs in Europe*, made us the more exceedingly anxious to hasten our departure as much as possible; and I therefore renewed my attempt to procure a passage to Canton, but without effect. The difficulty arising from the established policy of the country, I was now told, would probably be much increased by an incident that had happened a few weeks before our arrival. Captain Panton, in the *Sea-horse*, a ship of war of twenty-five guns, had been sent from Madras, to urge the payment of a debt owing by the Chinese merchants of Canton to private British subjects in the East Indies and Europe, which, including the principal and compound interest, amounted, I understood, to near a million sterling. For this purpose, he had orders to insist on an audience with the viceroy of Canton, which, after some delay, and not without recourse being had to threats, was at length obtained. The answer he received on the subject of his mission was fair and satisfactory; but, immediately after his departure, an edict was stuck up on the houses of the Europeans, and in the public places of the city, forbidding all foreigners, on any pretence, to lend money to the subjects of the emperor.

This measure had occasioned very serious alarms at Canton. The Chinese merchants, who had incurred the debt, contrary to the commercial laws of their own country, and denied, in part, the justice of the demand, were afraid that intelligence of this would be carried to Peking, and that the emperor, who has the character of a just and rigid prince, might punish them with the loss of their fortunes, if not of their lives. On the other hand, the Select Committee, to whom the cause of the claimants was strongly recommended by the Presidency of Madras, were extremely apprehensive lest they should embroil themselves with the Chinese government at Canton, and by that means bring, perhaps, irreparable mischief on the Company's affairs in China. For I was further informed, that the Mandarins were always ready to take occasion, even on the slightest grounds, to put a stop to their trading; and that it was often with great difficulty, and never without certain expense, that they could get such restraints taken off. These impositions were daily increasing; and, indeed, I found it a prevailing opinion, in all the European factories, that they should soon be reduced either to quit the commerce of that country, or to bear the same indignities to which the Dutch are subjected in Japan.

The arrival of the *Resolution* and *Discovery* at such a time, could not fail of occasioning fresh alarms; and, therefore, finding there was no probability of my proceeding to Canton, I despatched a letter to the English supercargoes, to acquaint them with the cause of our putting into the Tygris, to request their assistance in procuring me a passport, and in forwarding the stores we wanted, of which I sent them a list, as expeditiously as possible. The next morning I was accompanied on board by our countryman, who pointing out to us the situation of the *Typa*, we weighed at half-past six, and stood toward it; but the wind failing, we came to, at eight, in three and a half fathoms' water; Macao bearing west north-west, three miles distant; the *Grand Ladrone*, south-east by south. The *Resolution* here saluted the Portuguese fort with eleven guns, which were returned by the same number. Early on the 4th, we again weighed, and stood in to the *Typa*, and moored with the stream anchor and cable to the westward. The Comprador whom we at first engaged with, having disappeared with a small sum of money, which had been given him to purchase provisions, we contracted with another, who continued to supply both ships, during our whole stay. This was done secretly, and in the night-time, under pretence that it was contrary to the regulations of the port; but we suspected all this caution to have been used with a view either of enhancing the price of the articles he furnished, or of securing to himself the profits of his employment, without being obliged to share them with the Mandarins.

* The declaration of war with France in 1777, on account of the assistance she rendered to the Americans, whose independence she had acknowledged.—Eo.

On the 9th, Captain Gore received an answer from the committee of the English supercargoes at Canton, in which they assured him that their best endeavours should be used to procure the supplies we stood in need of, as expeditiously as possible; and that a passport should be sent for one of his officers, hoping, at the same time, that we were sufficiently acquainted with the character of the Chinese government, to attribute any delays that might unavoidably happen to their true cause. The day following, an English merchant, from one of our settlements in the East Indies, applied to Captain Gore for the assistance of a few hands to navigate a vessel he had purchased at Macao, up to Canton. Captain Gore, judging this a good opportunity for me to proceed to that place, gave orders that I should take along with me my second lieutenant, the lieutenant of marines, and ten seamen. Though this was not precisely the mode in which I could have wished to visit Canton, yet as it was very uncertain when the passport might arrive, and my presence might contribute materially to the expediting of our supplies, I did not hesitate to put myself on board, having left orders with Mr. Williamson to get the *Discovery* ready for sea as soon as possible, and to make such additions and alterations in her upper works, as might contribute to make her more defensible. That the series of our astronomical observations might suffer no interruption by my absence, I entrusted the care of continuing them to Mr. Trevenen, in whose abilities and diligence I could repose an entire confidence.

We left the harbour of Macao on the 11th of December, and sailing round the south-eastern extremity of the island, we steered to the northward, leaving, as we passed along, Lantau Lintin, and several smaller islands, to the right. All these islands, as well as that of Macao, which lie to the left, are entirely without wood; the land is high and barren, and uninhabited, except occasionally by fishermen. As we approached the Bocca Tygris, which is thirteen leagues from Macao, the Chinese coast appears to the eastward in steep white cliffs; the two forts commanding the mouth of the river are exactly in the same state as when Lord Anson was here; that on the left is a fine old castle, surrounded by a grove of trees, and has an agreeable romantic appearance. We were here visited by an officer of the customs; on which occasion the owner of the vessel, being apprehensive that, if we were discovered on board, it would occasion some alarm, and might be attended with disagreeable consequences, begged us to retire into the cabin below. The breadth of the river above these forts is variable, the banks being low and flat, and subject to be overflowed by the tide to a great extent. The ground on each side is level, and laid out in rice-fields; but, as we advanced, it rose gradually into hills of considerable declivity, the sides of which are cut into terraces, and planted with sweet potatoes, sugar-canes, yams, plantains, and the cotton-tree. We saw many lofty *pagodas*, scattered over the country, and several towns at a distance, some of which appeared to be of a considerable size.

We did not arrive at Wampû, which is only nine leagues from the Bocca Tygris, till the 18th, our progress having been retarded by contrary winds and the lightness of the vessel. Wampû is a small Chinese town, off which the ships of the different nations who trade here lie, in order to take in their lading. The river, higher up, is said by M. Sonnerat not to be deep enough to admit heavy-laden vessels, even if the policy of the Chinese had suffered the Europeans to navigate them up to Canton; but this circumstance I cannot take upon me to decide on, as no stranger, I believe, has been permitted to inform himself with certainty of the truth. The small islands that lie opposite to the town are allotted to the several factories who have built warehouses for the reception of the merchandise that is brought down from Canton.

From Wampû I immediately proceeded in a *sampane*, or Chinese boat, to Canton, which is about two leagues and a half higher up the river. These boats are the neatest and most convenient for passengers I ever saw. They are of various sizes, almost flat at the bottom, very broad upon the beam, and narrow at the head and stern, which are raised and ornamented; the middle, where we sat, was arched over with a roof of bamboo, which may be raised or lowered at pleasure; in the sides were small windows with shutters, and the apartment was furnished with handsome mats, chairs, and tables. In the stern was placed a small waxen idol, in a case of gilt leather, before which stood a pot containing lighted tapers made of dry chips or matches, and gum. The hire of this boat was a Spanish dollar.

English supercar- could be used to that a passport were sufficiently elays that might ehant, from one stance of a few in Gore, judging should take along Though this was et as it was very ate materially to g left orders with d to make such e more defensible. y my absence, s and diligence I

I reached Canton a little after it was dark, and landed at the English Factory, where, though my arrival was very unexpected, I was received with every mark of attention and civility. The select committee, at this time, consisted of Mr. Fitzlugh the president, Mr. Bevan, and Mr. Rapier. They immediately gave me an account of such stores as the India ships were able to afford us; and though I have not the smallest doubt that the commanders were desirous of assisting us with everything they could spare, consistently with a regard to their own safety, and the interest of their employers, yet it was a great disappointment to me to find in their list scarcely any articles of cordage or canvas, of both which we stood principally in need. It was, however, some consolation to understand that the stores were in readiness for shipping, and that the provisions we required might be had at a day's notice. Wishing therefore to make my stay here as short as possible, I requested the gentlemen to procure junks or boats for me the next day, with an intention of leaving Canton the following one; but I was soon informed, that a business of that kind was not to be transacted so rapidly in this country; that leave must be first procured from the viceroy; that the *Hoppo*, or principal officer of the customs, must be applied to for *chops*, or permits: and that these favours were not granted without mature deliberation: in short, that patience was an indispensable virtue in China; and that they hoped to have the pleasure of making the factory agreeable to me, for a few days longer than I seemed willing to favour them with my company.

Though I was not much disposed to relish this compliment, yet I could not help being diverted with an incident that occurred very opportunely to convince me of the truth of their representations, and of the suspicious character of the Chinese. The reader will recollect that it was now about fifteen days since Captain Gore had written to the factory, to desire their assistance in procuring leave for one of his officers to pass to Canton. In consequence of this application, they had engaged one of the principal Chinese merchants of the place, to interest himself in our favour, and to solicit the business with the viceroy. This person came to visit the president whilst we were talking on the subject, and with great satisfaction and complacency in his countenance acquainted him, that he had at last succeeded in his applications, and that a passport for one of the officers of the Ladrone ship (or pirate) would be ready in a few days. The president immediately told him not to give himself any farther trouble, as the officer, pointing to me, was already arrived. It is impossible to describe the terror which seized the old man on hearing this intelligence. His head sunk upon his breast, and the sofa on which he was sitting shook from the violence of his agitation. Whether the Ladrone ship was the object of his apprehensions, or his own government, I could not discover; but after continuing in this deplorable state a few minutes, Mr. Bevan bade him not despair, and recounted to him the manner in which I had passed from Macao, the reasons of my journey to Canton, and my wishes to leave it as soon as possible. This last circumstance seemed particularly agreeable to him, and gave me hopes that I should find him equally disposed to hasten my departure; and yet, as soon as he had recovered the courage to speak, he began to recount the unavoidable delays that would occur in my business, the difficulty of gaining admittance to the viceroy, the jealousies and suspicions of the Mandarins respecting our real designs, which had risen, he said, to an extraordinary height, from the strange account we had given of ourselves.

After waiting several days with great impatience for the event of our application, without understanding that the matter was at all advanced toward a conclusion, I applied to the commander of an English country ship, who was to sail on the 25th, and who offered to take the men and stores on board, and to lie to if the weather should permit, off Macao, till we could send boats to take them out of his ship. At the same time he apprised me of the danger there might be of his being driven with them out to sea. Whilst I was doubting what measures to pursue, the commander of another country ship brought me a letter from Captain Gore, in which he acquainted me that he had engaged him to bring us down from Canton, and to deliver the stores we had procured, at his own risk, in the *Typa*. All our difficulties being thus removed, I had leisure to attend to the purchase of our provisions and stores, which was completed on the 26th; and the day following the whole stock was sent on board.

As Canton was likely to be the most advantageous market for furs, I was desired by

Captain Gore to carry with me about twenty sea-otter skins, chiefly the property of our deceased commanders, and to dispose of them at the best price I could procure; a commission which gave me an opportunity of becoming a little acquainted with the genius of the Chinese for trade. Having acquainted some of the English supercargoes with these circumstances, I desired them to recommend me to some Chinese merchant of credit and reputation, who would at once offer me a fair and reasonable price. I was accordingly directed to a member of the *Hong*, a society of the principal merchants of the place, who being fully informed of the nature of the business, appeared sensible of the delicacy of my situation; assured me I might depend on his integrity; and that, in a case of this sort, he should consider himself merely as an agent, without looking for any profit to himself. Having laid my goods before him, he examined them with great care over and over again, and at last he told me that he could not venture to offer more than three hundred dollars for them. As I knew from the price our skins had sold for in Kamtschatka that he had not offered me one half their value, I found myself under the necessity of driving a bargain. In my turn I therefore demanded one thousand; my Chinese then advanced to five hundred; then offered me a private present of tea and porcelain, amounting to one hundred more; then the same sum in money; and, lastly, rose to seven hundred dollars, on which I fell to nine hundred. Here, each side declaring he would not recede, we parted; but the Chinese soon returned with a list of India goods, which he now proposed I should take in exchange, and which, I was afterward told, would have amounted in value, if honestly delivered, to double the sum he had before offered. Finding I did not choose to deal in this mode, he proposed as his ultimatum, that we should divide the difference, which, being tired of the contest, I consented to, and received the eight hundred dollars.

The ill health which at this time I laboured under left me little reason to lament the very narrow limits within which the policy of the Chinese obliges every European at Canton to confine his curiosity. I should otherwise have felt exceedingly tantalized with living under the walls of so great a city, full of objects of novelty, without being able to enter it. The accounts given of this place by Pères le Comte and Du Halde are in every one's hand. The authors have lately been accused of great exaggeration by M. Sonnerat; for which reason the following observations, collected from the information with which I have been obligingly furnished by several English gentlemen, who were a long time resident at Canton, may not be unacceptable to the public.

Canton, including the old and new town, and the suburbs, is about ten miles in circuit. With respect to its population, if one may judge of the whole from what is seen in the suburbs, I should conceive it to fall considerably short of a European town of the same magnitude. Le Comte estimated the number of inhabitants at one million five hundred thousand; Du Halde, at one million; and M. Sonnerat says he has ascertained them to be no more than seventy-five thousand*: but as this gentleman has not favoured us with the grounds on which his calculation was founded, and, besides, appears as desirous of depreciating everything that relates to the Chinese as the Jesuits may be of magnifying, his opinion certainly admits of some doubt. The following circumstances may perhaps lead the reader to form a judgment with tolerable accuracy on this subject.

A Chinese house undoubtedly occupies more space than is usually taken up by houses in Europe; but the proportion suggested by M. Sonnerat, of four or five to one, certainly goes much beyond the truth. To this should be added, that a great many houses in the suburbs of Canton are occupied for commercial purposes only, by merchants and rich tradesmen, whose families live entirely within the city. On the other hand, a Chinese family appears to consist, on an average, of more persons than a European. A Mandarin, according to his rank and substance, has from five to twenty wives; a merchant, from three to five.

* "J'ai vérifié moi-même, avec plusieurs Chinois, la population de Canton, de la ville de Tartare, et de celle de Battaux," &c. *Voyage aux Indes*, &c., par M. Sonnerat, tom. ii. p. 14. [It is even at the present day difficult to ascertain the amount of the population of Canton. In the Chinese Repository, vol. ii. p. 367, it is

estimated at 1,236,000; while, on the other hand, Mr. Davis, who is a high authority, does not think it possible for even 1,670,000 to find room in the city, and does not consider the actual population to be more than one half the number stated in the Repository.—Ed.]

* These years ago to

One of this class at Canton had, indeed, twenty-five wives, and thirty-six children; but this was mentioned to me as a very extraordinary instance. An opulent tradesman has usually two; and the lower class of people very rarely more than one. Their servants are at least double in number to those employed by persons of the same condition in Europe. If, then, we suppose a Chinese family one-third larger, and a European house two-thirds less, than each other, a Chinese city will contain only half the number of inhabitants contained in a European town of the same size. According to these data, the city and suburbs of Canton may probably contain about one hundred and fifty thousand.

With respect to the number of inhabited *sampanes*, I found different opinions were entertained; but none placing them lower than forty thousand*. They are moored in rows close to each other, with a narrow passage, at intervals, for the boats to pass up and down the river. As the Tygris at Canton is somewhat wider than the Thames at London, and the whole river is covered in this manner for the extent of at least a mile, this account of their number does not appear to me in the least exaggerated; and, if it be allowed, the number of inhabitants in the *sampanes* alone (for each of them contains one family) must amount to nearly three times the number supposed by M. Sonnerat to be in the whole city. The military force of the province, of which Canton is the capital, amounts to fifty thousand men. It is said that twenty thousand are stationed in and about the city; and, as a proof of this, I was assured, that, on the occasion of some disturbance that had happened at Canton, thirty thousand men were drawn together within the space of a few hours.

The streets are long, and most of them narrow and irregular; but well paved with large stones; and, for the most part, kept exceedingly clean. The houses are built of brick, one story high, having generally two or three courts backward, in which are the warehouses for merchandize, and, in the houses within the city, the apartments for the women. A very few of the meanest sort are built of wood. The houses belonging to the European factors are built on a handsome quay, with a regular façade of two stories toward the river, and disposed, within, partly after the European and partly after the Chinese manner. Adjoining to these are a number of houses, belonging to the Chinese, and hired out to the commanders of ships, and merchants, who make an occasional stay. As no European is allowed to bring his wife to Canton, the English supercargoes live together, at a common table, which is kept by the Company, and have each a separate apartment, consisting of three or four rooms. The time of their residence seldom exceeds eight months annually; and as they are pretty constantly employed during that time in the service of the Company, they may submit, with the less regret, to the restraints they are kept under. They very rarely pay any visits within the walls of Canton, except on public occasions. Indeed, nothing gave me so unfavourable an idea of the character of the Chinese, as to find, that amongst so many persons of liberal minds and amiable manners, some of whom have resided in that country for near fifteen years together, they have never formed any friendship or social connexion. As soon as the last ship quits Wampû, they are all obliged to retire to Macao; but as a proof of the excellent police of the country, they leave all the money they possess in specie behind them, which, I was told, sometimes amounted to one hundred thousand pounds sterling, and for which they had no other security than the seals of the merchants of the Hong, the viceroys, and Mandarins.

During my stay at Canton, I was carried by one of the English gentlemen to visit a person of the first consequence in the place. We were received in a long room or gallery, at the upper end of which stood a table, with a large chair behind it, and a row of chairs extending from it on each side down the room. Being previously instructed that the point of civility consisted in remaining as long unseated as possible, I readily acquitted myself of this piece of etiquette; after which we were entertained with tea, and some preserved and fresh fruits. Our host was very fat, with a heavy dull countenance, and of great gravity in his deportment. He spoke a little broken English and Portuguese; and, after we had taken our refreshment, he carried us about his house and garden; and having shown us all the improvements he was making, we took our leave.

* These are all registered, and according to an account given in the Chinese Repository, they amounted a few years ago to no less than 84,000.—Ed.

Having procured an account of the price of provisions at Canton, as settled for the year 1780, which the reader will find at the end of this chapter, I have only to observe, that the different articles are supposed to be the best of the kind; and that the natives purchase the same for nearly one-third less than the price, which in the list is fixed only for strangers.

I had hitherto intended, as well to avoid the trouble and delay of applying for passports, as to save the unnecessary expense of hiring a *savipane*, which I understood amounted at least to twelve pounds sterling, to go along with the stores to Macao, in the country merchant's ship I have before mentioned. But having received an invitation from two English gentlemen, who had obtained passports for four, I accepted, along with Mr. Phillips, their offer of places in a Chinese boat, and left Mr. Lannyon to take care of the men and stores, which were to sail the next day. In the evening of the 26th, I took my leave of the supercargoes, having thanked them for their many obliging favours; amongst which I must not forget to mention a handsome present of tea, for the use of the ships' companies, and a large collection of English periodical publications. The latter we found a valuable acquisition, as they both served to amuse our impatience, during our tedious voyage home, and enabled us to return not total strangers to what had been transacting in our native country. At one o'clock the next morning we left Canton, and arrived at Macao about the same hour the day following, having passed down a channel which lies to the westward of that by which we had come up.

During our absence, a brisk trade had been carrying on with the Chinese for the sea-otter skins, which had every day been rising in their value. One of our seamen sold his stock alone for eight hundred dollars; and a few prime skins, which were clean, and had been well preserved, were sold for one hundred and twenty each. The whole amount of the value, in specie and goods, that was got for the furs, in both ships, I am confident did not fall short of two thousand pounds sterling; and it was generally supposed that at least two-thirds of the quantity we had originally got from the Americans were spoiled and worn out, or had been given away, and otherwise disposed of, in Kamtschatka. When, in addition to these facts, it is remembered, that the furs were at first collected without our having any idea of their real value; that the greatest part had been worn by the Indians, from whom we purchased them; that they were afterward preserved with little care, and frequently used for bed-clothes, and other purposes, during our cruise to the north; and that, probably, we had never got the full value for them in China; the advantages that might be derived from a voyage to that part of the American coast, undertaken with commercial views, appear to me of a degree of importance sufficient to call for the attention of the public.

The rage with which our seamen were possessed to return to Cook's River, and, by another cargo of skins, to make their fortunes at one time, was not far short of mutiny; and I must own, I could not help indulging myself in a project, which the disappointment we had suffered, in being obliged to leave the Japanese Archipelago, and the northern coast of China, unexplored, first suggested; and, by what I conceived, that object might still be happily accomplished, through means of the East India Company, not only without expense, but even with the prospect of very considerable advantages. Though the situation of affairs at home, or perhaps greater difficulties in the execution of my scheme than I had foreseen, have hitherto prevented its being carried into effect, yet, as I find the plan in my journal, and still retain my partiality for it, I hope it will not be entirely foreign to the nature of this work if I beg leave to insert it here.

I proposed, then, that the Company's China ships should carry an additional complement of men each, making in all one hundred. Two vessels, one of two hundred and the other of one hundred and fifty tons, might, I was told, with proper notice, be readily purchased at Canton; and, as victualling is not dearer there than in Europe, I calculate that they might be completely fitted out for sea, with a year's pay and provision, for six thousand pounds, including the purchase. The expense of the necessary articles for barter is scarcely worth mentioning. I would, by all means, recommend that each ship should have five tons of unwrought iron, a forge, and an expert smith, with a journeyman and apprentice, who might be ready to forge such tools as it should appear the Indians were most desirous of

For, though six of the finest skins purchased by us were got for a dozen large green glass beads, yet it is well known that the fancy of these people for articles of ornament is exceedingly capricious; and that iron is the only sure commodity for their market. To this might be added a few gross of large pointed case-knives, some bales of coarse woollen cloth, (linen they would not accept of from us,) and a barrel or two of copper and glass trinkets.

I have here proposed two ships, not only for the greater security of the expedition, but because I think single ships ought never to be sent out on discoveries. For where risks are to be run, and doubtful and hazardous experiments tried, it cannot be expected that single ships should venture so far, as where there is some security provided against an untoward accident. The vessels being now ready for sea, will sail with the first south-westerly monsoon, which generally sets in about the beginning of April. With this wind they will steer to the northward, along the coast of China, beginning a more accurate survey from the mouth of the river Kayana, or the Nankin River, in latitude 29° , which I believe is the utmost limit of this coast hitherto visited by European ships. As the extent of that deep gulf, called Whang Hay, or the Yellow Sea, is at present unknown, it must be left to the discretion of the commander to proceed up it as far as he may judge prudent; but he must be cautious not to entangle himself too far in it, lest he should want time for the prosecution of the remaining part of his enterprise. The same discretion must be used, when he arrives in the straits of Tessoï, with respect to the islands of Jesso, which, if the wind and weather be favourable, he will not lose the opportunity of exploring.

Having proceeded to the latitude of $51^{\circ} 40'$, where he will make the southernmost point of the island of Sagaleen, beyond which the sea of Okotsk is sufficiently known, he will steer to the southward, probably in the beginning of June, and endeavour to fall in with the southernmost of the Kurile Islands. Ourroop, or Nadeschda, according to the accounts of the Russians, will furnish the ships with a good harbour, where they may wood and water, and take in such other refreshments as the place may afford. Toward the end of June, they will shape their course for the Shummagins, and from thence to Cook's River, purchasing, as they proceed, as many skins as they are able, without losing too much time, since they ought to steer again to the southward, and trace the coast with great accuracy from the latitude of 56° to 50° , the space from which we were driven out of sight of land by contrary winds. It should here be remarked, that I consider the purchase of skins, in this expedition, merely as a secondary object for defraying the expense; and it cannot be doubted, from our experience in the present voyage, that two hundred and fifty skins, worth one hundred dollars each, may be procured without any loss of time; especially as it is probable they will be met with along the coast to the southward of Cook's River. Having spent three months on the coast of America, they will set out on their return to China early in the month of October, avoiding in their route, as much as possible, the tracks of former navigators. I have now only to add, that if the fur trade should become a fixed object of Indian commerce, frequent opportunities will occur of completing whatever may be left unfinished, in the voyage of which I have here ventured to delineate the outlines.

The barter which had been carrying on with the Chinese for our sea-otter skins had produced a very whimsical change in the dress of all our crew. On our arrival in the Typa nothing could exceed the ragged appearance both of the younger officers and seamen; for, as our voyage had already exceeded, by near a twelvemonth, the time it was at first imagined we should remain at sea, almost the whole of our original stock of European clothes had been long worn out, or patched up with skins, and the various manufactures we had met with in the course of our discoveries. These were now again mixed and coked out with the gaudiest silks and cottons of China. On the 30th, Mr. Lannyon arrived with the stores and provisions, which were immediately stowed in due proportion on board the two ships. The next day, agreeably to a bargain made by Captain Gore, I sent our sheet-anchor to the country ship, and received in return the guns which she before rode by.

Whilst we lay in the Typa, I was shown a garden belonging to an English gentleman at Macao, the rock under which, as the tradition there goes, the poet Camoens used to sit and compose his *Lusiad*. It is a lofty arch, of one solid stone, and forms the entrance of a grotto dug out of the rising ground behind it. The rock is overshadowed by large spreading

trees, and commands an extensive and magnificent view of the sea, and the interspersed islands.

On the 11th of January, two seamen, belonging to the Resolution, found means to run off with a six-oared cutter, and notwithstanding diligent search was made, both that and the following day, we were never able to learn any tidings of her. It was supposed that these people had been seduced by the prevailing notion of making a fortune, by returning to the fur islands. As we heard nothing, during our stay in the Typa, of the measurement of the ships, it may be concluded, that the point so strongly contested by the Chinese, in Lord Anson's time, has, in consequence of his firmness and resolution, never since been insisted on.*

The following nautical observations were made while we lay here:—

Harbour of Macao	{ Lat. 22° 12' 0" N.
	{ Long. 113 47 0 E.
Anchoring-place in the Typa	{ Lat. 22 9 20 N.
	{ Long. 113 48 34 E.
Mean dip of the north pole of the magnetic needle	21 1 0
Variation of the compass	0 19 9 W.

On the full and change days it was high water in the Typa at 5^h 15^m, and in Macao harbour at 5^h 50^m. The greatest rise was six feet one inch. The flood appeared to come from the south-eastward; but we could not determine this point with certainty, on account of the great number of islands which lie off the mouth of the river of Canton.

CHAPTER X.—LEAVE THE TYPA.—ORDERS OF THE COURT OF FRANCE RESPECTING CAPTAIN COOK.—RESOLUTIONS IN CONSEQUENCE THEREOF.—STRIKE SOUNDINGS ON THE MACCLESFIELD BANKS.—PASS PULO SAPATA.—STEER FOR PULO CONDOR.—ANCHOR AT PULO CONDOR.—TRANSACTIONS DURING OUR STAY.—JOURNEY TO THE PRINCIPAL TOWN.—RECEIVE A VISIT FROM A MANDARIN.—EXAMINE HIS LETTERS.—REFRESHMENTS TO BE PROCURED.—DESCRIPTION AND PRESENT STATE OF THE ISLAND.—ITS PRODUCE.—AN ASSERTION OF M. SONNERAT REFUTED.—ASTRONOMICAL AND NAUTICAL OBSERVATIONS.

On the 12th of January, 1780, at noon we unmoored, and sealed the guns, which on board my ship now amounted to ten; so that, by means of four additional ports, we could, if occasion required, fight seven on a side. In like manner, the Resolution had increased the number of her guns from twelve to sixteen; and in both ships, a stout barricade was carried round their upper works, and every other precaution taken to give our small force as respectable an appearance as possible.

We thought it our duty to provide ourselves with these means of defence, though we had some reason to believe that the generosity of our enemies had, in a great measure, rendered them superfluous. We were informed at Canton, that the public prints, which had arrived last from England, made mention of instructions having been found on board all the French ships of war, captured in Europe, directing their commanders, in case of falling in with the ships that sailed under the command of Captain Cook, to suffer them to proceed on their voyage without molestation. The same orders were also said to have been given by the American Congress to the vessels employed in their service. As this intelligence was farther confirmed by private letters of several of the supercargoes, Captain Gore thought himself bound, in return for the liberal exceptions made in our favour, to refrain from availing himself of any opportunities of capture which these might afford, and to preserve throughout his voyage, the strictest neutrality.

At two in the afternoon, having got under sail, the Resolution saluted the fort of Macao with eleven guns, which was returned with the same number. At five, the wind dropping, the ship missed stays, and drove into shallow water; but, by carrying out an anchor, she was hauled off without receiving the smallest damage. The weather continuing calm, we were obliged to warp out into the entrance of the Typa, which we gained by eight o'clock, and lay there till nine the next morning; when, by the help of a fresh breeze from the east, we stood to the southward between Potoe and Wun-boo. At noon we were saluted by a

Swedish ship as she passed us on her way to Europe. At four, the Ladrone bore east, distant two leagues. We now steered south half-east, with a fresh breeze from the east north-east, without any occurrence worth remarking, till noon of the 15th; when, being in latitude $18^{\circ} 57'$, and longitude $114^{\circ} 13'$, the wind veering to the north, we directed our course half a point more to the eastward, in order to strike soundings over the Macclesfield Bank. This we effected at eight in the evening of the 16th, and found the depth of water to be fifty fathoms over a bottom of white sand and shells. This part of the Macclesfield shoals we placed in latitude $15^{\circ} 51'$, and longitude $114^{\circ} 20'$; which agrees very exactly with the position given in Mr. Dalrymple's map, whose general accuracy, if it stood in need of any support, was confirmed, in this instance, by a great number of lunar observations, which we had an opportunity of making every day since we left the Tupa. The variation was found to be, in the forenoon, $0^{\circ} 39' W$.

On the 17th, we had heavy gales from the east by north, with a rough tumbling sea, and the weather overcast and boisterous. On the 18th, the wind still continuing to blow strong, and the sea to run high, we altered our course to south-west by south; and, at noon, being in latitude $12^{\circ} 34'$, longitude 132° , we began to steer a point more to the westward for Pulo Sapata, which we saw on the 19th, at four in the afternoon, bearing north-west by west, about four leagues distant. This small, high, barren island is called *Sapata*, from its resemblance of a shoe. Our observations, compared with Mr. Bayly's time keeper, place it in latitude $10^{\circ} 4' N$. longitude $109^{\circ} 10' E$. The gale had, at this time, increased with such violence, and the sea ran so high, as to oblige us to close-reef the top-sails. During the last three days, the ships had outrun their reckoning at the rate of twenty miles a-day; and as we could not attribute the whole of this to the effects of a following sea, we imputed it in part to a current, which, according to my own calculations, had set forty-two miles to the south south-west, between the noon of the 19th and the noon of the 20th, and is taken into the account in determining the situation of the island.

After passing Sapata, we steered to the westward; and at midnight sounded, and had ground with fifty fathoms of line, over a fine sandy bottom. In the morning of the 20th, the wind becoming more moderate, we let out the reefs, and steered west by south for Pulo Condore. At noon the latitude was $8^{\circ} 46' N$., longitude $106^{\circ} 45' E$.; and, at half-past twelve, we got sight of the island, bearing west. At four, the extremes of Pulo Condore, and the islands that lie off it, bore south-east and south-west by west; our distance from the nearest islands being two miles. We kept to the north of the islands, and stood for the harbour on the south-west end of Condore, which having its entrance from the north-west, is the best sheltered during the north-east monsoon. At six we anchored, with the best bower, in six fathoms, reeved away two-thirds of the cable, and kept the ship steady with a stream anchor and cable to the south-east. When moored, the extremes of the entrance of the harbour bore north by west, and west north-west, one quarter west; the opening at the upper end, south-east by east, three quarters east; our distance from the nearest shore, a quarter of a mile.

As soon as we were come to anchor, Captain Gore fired a gun, with a view of apprising the natives of our arrival, and drawing them toward the shore, but without effect. Early in the morning of the 21st, parties were sent to cut wood, which was Captain Gore's principal motive for coming hither. In the afternoon, a sudden gust of wind broke the stream-cable, by which the Discovery was riding, and obliged us to moor with the bower anchors. None of the natives having yet made their appearance, notwithstanding a second gun had been fired, Captain Gore thought it advisable to land and go in search of them, that no time might be lost in opening a trade for such provisions as the place could afford. With this view he appointed me to accompany him in the morning of the 22d; and, as the wind at this time blew strong from the east, we did not think it prudent to coast in our boats to the town, which is situated in the east side of the island, but rowed round the north point of the harbour. We had proceeded about two miles along the shore, when observing a reef that led into a wood, we landed. Here I quitted Captain Gore, taking with me a midshipman and four armed sailors, and pursued the path which seemed to point directly across the island. We proceeded through a thick wood up a steep hill to the distance of a mile,

when, after descending through a wood of the same extent, on the other side, we came out into a flat, open, sandy country, interspersed with cultivated spots of rice and tobacco, and groves of cabbage palm-trees, and cocoa-nut trees. We here spied two huts situated on the edge of the wood, to which we directed our course; and before we came up to them, were desiered by two men, who immediately ran away from us, notwithstanding all the peaceable and supplicating gestures we could devise.

On reaching the huts, I ordered the party to stay without, lest the sight of so many armed men should terrify the inhabitants, whilst I entered and reconnoitred alone. I found in one of the huts an elderly man who was in a great fright, and preparing to make off with the most valuable of his effects that he could carry. However, I was fortunate enough, in a very little time, so entirely to dispel his fears, that he came out and called to the two men who were running away to return. The old man and I now soon came to a perfect understanding. A few signs, particularly that most significant one of holding out a handful of dollars, and then pointing to a herd of buffaloes, and the fowls that were running about the huts in great numbers, left him without any doubts as to the real objects of our visit. He pointed toward a place where the town stood, and made us comprehend that, by going thither, all our wants would be supplied. By this time the young men who had fled were returned, and the old man ordered one of them to conduct us to the town as soon as an obstacle should be removed, of which we were not aware. On our first coming out of the wood, a herd of buffaloes, to the number of twenty at least, came rushing toward us, tossing up their heads, snuffing the air, and roaring in a hideous manner. They had followed us to the huts, and stood drawn up in a body at a little distance, and the old man made us understand that it would be exceedingly dangerous for us to move till they were driven into the woods; but so enraged were the animals grown at the sight of us, that this was not effected without a good deal of time and difficulty. The men not being able to accomplish it, we were surprised to see them call to their assistance a few little boys, who soon drove them out of sight. Afterward we had occasion to observe, that in driving these animals and securing them, which is done by putting a rope through a hole which is made in their nostrils, little boys were always employed, who could stroke and handle them with impunity at times when the men durst not approach them. Having got rid of the buffaloes, we were conducted to the town, which was at a mile's distance, the road to it lying through a deep white sand. It is situated near the sea-side, at the bottom of a retired bay, which must afford a safe roadstead during the prevalence of the south-west monsoons.

This town consists of between twenty and thirty houses, built close together; besides six or seven others that are scattered about the beach. The roof, the two ends, and the side fronting the country, are neatly constructed of reeds; the opposite side, facing the sea, is entirely open; but, by means of a sort of bamboo screens, they can exclude or let in as much of the sun and air as they please. We observed likewise other large screens or partitions for the purpose of dividing, as occasion required, the single room of which the house, properly speaking, consists, into separate apartments. We were conducted to the largest house in the town belonging to their chief, or, as they called him, their captain. This house had a room at each end, separated by a partition of reeds from the middle space, which was open on both sides, and provided with partition-screens like the others. It had, besides, a penthouse projecting four or five feet beyond the roof, and running the whole length on each side. At each end of the middle room were hung some Chinese paintings, representing men and women in ludicrous attitudes. In this apartment we were civilly desired to seat ourselves on mats, and betel was presented to us.

By means of my money, and pointing at different objects in sight, I had no difficulty in making a man, who seemed to be the principal person of the company, comprehend the main business of our errand; and I as readily understood from him that the chief or captain was absent, but would soon return, and that, without his consent, no purchases of any kind could be made, we availed ourselves of the opportunity which this circumstance afforded us to walk about the town; and did not forget to search, though in vain, for the remains of a fort, which had been built by our countrymen near the spot we were now upon in

1702*. On returning to the captain's house, we were sorry to find that he was not yet arrived, and the more so, as the time was almost elapsed which Captain Gore had fixed for our return to the boat. The natives were desirous we should lengthen our stay; they even proposed our passing the night there, and offered to accommodate us in the best manner in their power. I had observed when we were in the house before, and now remarked it the more, that the man I have mentioned above, frequently retired into one of the end rooms, and staid there some little time before he answered the questions that were put to him; which led me to suspect that the Captain was all the time there, though, for reasons best known to himself, he did not choose to appear; and I was confirmed in this opinion by being stopped as I was attempting to go into the room. At length, it clearly appeared that my suspicions were well founded; for, on our preparing to depart, the person who had so often passed in and out came from the room with a paper in his hand, and gave it to me to read; and I was not a little surprised to find it a sort of certificate in French as follows:

Pierre Joseph George, Eeêque d'Adran, Vicaire Apost. de Cochiu Chine, &c. &c.

Le petit Mandarin, porteur de cet écrit, est véritablement envoyé de la cour à Palo Condore, pour y attendre et recevoir tout vaisseau européen qui auroit sa destination d'approcher ici. Le capitaine, en conséquence, pourroit se fier on pour conduire le vaisseau au port, ou pour faire passer les nouvelles qu'il pourroit croire nécessaire.

PIERRE JOSEPH GEORGE, Evêque d'Adran.

A Sai-Gon, 10 d'Août, 1779.

We returned the paper, with many protestations of our being the Mandarin's good friends; begging he might be informed that we hoped he would do us the favour to visit the ships, that we might convince him of it. We now took our leave, well satisfied, on the whole, with what had passed, but full of conjectures about this extraordinary French paper. Three of the natives offered their services to accompany us back, which we readily accepted, and returned by the way we came. Captain Gore felt peculiar satisfaction at seeing us; for, as we had exceeded our time near an hour, he began to be alarmed for our safety, and was preparing to march after us. He and his party had, during our absence, been profitably employed in loading the boat with the cabbage-palm, which abounds in this bay. Our guides were made exceedingly happy, on our presenting them with a dollar each for their trouble, and intrusting to their care a bottle of rum for the Mandarin. One of them chose to accompany us on board.

At two in the afternoon we joined the ships, and several of our shooting-parties returned about the same time from the woods, having had little success, though they saw a great variety of birds and animals, some of which will be hereafter noticed. At five a *proa* with six men rowed up to the ship, from the upper end of the harbour, and a decent-looking personage introduced himself to Captain Gore with an ease and good breeding which convinced us his time had been spent in other company than what this island afforded. He brought with him the French paper above transcribed, and said he was the Mandarin mentioned in it. He spoke a few Portuguese words, but as none of us were acquainted with this language, we were obliged to have recourse to a black man on board, who could speak the Malay, which is the general language of these islanders, and was understood by the Mandarin. After a little previous conversation, he declared to us that he was a Christian, and had been baptised by the name of Luco; that he had been sent hither in August last, from Sai-gon, the capital of Cochiu China, and had since waited in expectation of some French ships, which he was to pilot to a safe port, not more than a day's sail hence, upon

* The English settled here in the year 1702, when the factory of Chusan, on the coast of China, was broken up, and brought with them some Maccassar soldiers, who were hired to assist in building a fort; but the president not fulfilling his engagement with them, they watched an opportunity, and one night murdered all the English in the fort. Those without the fort hearing a noise, took the

alarm and ran to their boats, very narrowly escaping with their lives, but not without much fatigue, hunger, and thirst, to the Johore dominions, where they were treated with great humanity. Some of these afterward went to form a settlement at Benjar-Massan, on the island of Borneo.—East India Directory, p. 86.

the coast of Cochin China. We acquainted him, that we were not French, but English, and asked him whether he did not know that these two nations were now at war with one another? He made answer in the affirmative; but, at the same time, signified to us, that it was indifferent to him to what nation the ships he was instructed to wait for belonged, provided their object was to trade with the people of Cochin China. He here produced another paper which he desired us to read. This was a letter sealed and directed, "To the captains of any European vessels that may touch at Condore." Although we apprehended that this letter was designed for French ships in particular, yet as the direction included all European captains, and as Luco was desirous of our perusing it, we broke the seal, and found it to be written by the bishop who wrote the certificate. Its contents were as follows: "That having reason to expect, by some late intelligence from Europe, that a vessel would soon come to Cochin China, he had, in consequence of this news, got the court to send a Mandarin (the bearer) to Pulo Condore, to wait its arrival; that if the vessel should put in there, the commander might either send by the bearer an account to him of his arrival, or trust himself to the Mandarin, who would pilot him into a well-sheltered port in Cochin-China, not more than a day's sail from Condore; that should he choose to remain in Condore till the return of the messenger, proper interpreters would be sent back, and any other assistance which a letter should point out be furnished; that it was unnecessary to be more particular, of which the Captain himself must be sensible." This letter had the same date as the certificate, and was returned to Luco again, without any copy being taken.

From this letter, and the whole of Luco's conversation, there remained little doubt that it was a French ship he was to expect. At the same time, we found he would be glad not to lose his errand, and had no objection to become our pilot. We could not discover, from the Mandarin, the exact object and business which the vessel he was waiting for intended to prosecute in Cochin China. It is true that our interpreter, the black, was extremely dull and stupid; and I should, therefore, be sorry, with such imperfect means of information, to run the risk of misleading the reader by any conjectures of my own respecting the object of Luco's visit to this island. I shall only add, that he told us the French ships might perhaps have put into Timon, and from thence sail to Cochin China; and as he had received no intelligence of them, he thought this most likely to have been the case. Captain Gore's inquiries were next directed to find out what supplies could be obtained from the island. Luco said, that he had two buffaloes of his own, which were at our service; and that there were plenty on the island, which might be purchased for four or five dollars a head; but finding that Captain Gore thought that sum exceedingly moderate, and would willingly give for them a much greater, the price was afterwards raised upon us to seven and eight dollars.

Early in the morning of the 23d, the launches of both ships were sent to the town to fetch the buffaloes which we had given orders to be purchased; but they were obliged to wait till it was high-water, as they could at no other time get through the opening at the head of the harbour. On their arrival at the village, they found the surf breaking on the beach with such force, that it was with the utmost difficulty each launch brought a buffalo on board in the evening, and the officers who were sent on this service gave it as their opinion, that between the violence of the surf and the fierceness of the buffaloes, it would be extremely imprudent to attempt bringing any more off in this way. We had purchased eight, and were now at a loss in what manner to proceed to get them on board. We could kill no more than was just necessary for the consumption of one day, as in this climate meat will not keep till the next. After consulting with Luco, it was concluded, that the remainder should be driven through the wood and over the hill down to the bay, where Captain Gore and I had landed the day before, which being sheltered from the wind, was more free from surf. This plan was accordingly put in execution, but the untractableness and prodigious strength of the buffaloes rendered it a tedious and difficult operation. The method of conducting them was, by passing ropes through their nostrils, and round their horns; but having been once enraged at the sight of our men, they became so furious, that they sometimes broke the trees, to which we were often under the necessity of tying them; sometimes they tore asunder the cartilage of the nostril, through which the ropes ran, and got loose

On these occasions, all the exertions of our men to recover them would have been ineffectual, without the assistance of some young boys, whom these animals would permit to approach them, and by whose little managements their rage was soon appeased. And when at length they were got down to the beach, it was by their aid, in twisting ropes round their legs in the manner they were directed, that we were enabled to throw them down, and by that means to get them into the boats. A circumstance respecting these animals, which I thought no less singular than this gentleness toward, and, as it should seem, affection for little children, was, that they had not been twenty-four hours on board, before they became the tamest of all creatures. I kept two of them, a male and female, for a considerable time, which became great favourites with the sailors; and thinking that a breed of animals of such strength and size, some of them weighing, when dressed, seven hundred pounds weight, would be a valuable acquisition, I was inclined to have brought them with me to England; but my intention was frustrated by an incurable hurt that one of them received at sea.

It was not till the 28th, that the buffaloes were all got on board; however, there was no reason to regret the time taken up by this service, since, in the interim, two wells of excellent water had been discovered, of which, as also of wood, part of the ship's companies had been employed in laying in a good supply; so that a shorter stop would be necessary for replenishing our stock of these articles in the Strait of Sunda. A party had likewise been occupied in drawing the seine at the head of the harbour, where they took a great many good fish; and another party in cutting down the cabbage-palm, which was boiled, and served out with the meat. Besides this, having been able to procure only a scanty supply of cordage at Macao, the repairing of our rigging was become an object of constant attention, and demanded all our spare time.

Pulo Condore is high and mountainous, and surrounded by several smaller islands, some of which are less than one, and others two miles distant. It takes its name from two Malay words, *Pulo*, signifying an island, and *Condore*, a calabash, of which it produces great quantities. It is of the form of a crescent, extending near eight miles from the southernmost point, in a north-east direction; but its breadth nowhere exceeds two miles. From the westernmost extremity, the land trends to the south-east for about four miles; and opposite to this part of the coast there is an island, called by Monsieur D'Après* Little Condore, which runs two miles in the same direction. This position of the two islands affords a safe and commodious harbour, the entrance into which is from the north-west. The distance between the two opposite coasts is three-quarters of a mile, exclusive of a border of coral rock, which runs down along each side, extending about one hundred yards from the shore. The anchorage is very good, from eleven to five fathoms' water; but the bottom is so soft and clayey, that we found great difficulty in weighing our anchors. Toward the bottom of the harbour there is shallow water for about half a mile, beyond which the two islands approach so near each other, as to leave only a passage at high-water for boats. The most convenient place for watering is at a beach on the eastern side, where there is a small stream which furnished us with fourteen or fifteen tons of water a-day.

This island, both with respect to animal and vegetable productions, is considerably improved since the time when Dampier visited it. Neither that writer, nor the compiler of the East India Directory, makes mention of any other quadrupeds than hogs, which are said to be very scarce, lizards, and the guanoes; and the latter, on the authority of Monsieur Dedier, a French engineer, who surveyed the island about the year 1720, says, that none of the fruits and esculent plants, so common in the other parts of India, are to be found here, except water-melons, a few potatoes, small gourds, *chibbols* (a small species of onion), and little black beans. At present, besides the buffaloes, of which we understood there were several large herds, we purchased from the natives some remarkably fine fat hogs, of the Chinese breed. They brought us three or four of a wild sort; and our sportsmen reported, that they frequently met with their tracks in the woods, which also abound with monkeys and squirrels, but so shy, that it was difficult to shoot them. One species of the squirrel was of a beautiful shining black colour, and another species striped brown and white. This

s considerably the compiler of which are said y of Monsieur s, that none of be found here, of onion), and od there were at hogs, of the smen reported, with monkeys of the squirrel d white. This

is called the flying-squirrel, from being provided with a thin membrane, resembling a bat's wing, extending on each side the belly, from the neck to the thighs, which, on stretching out their legs, spreads, and enables them to fly from tree to tree, at a considerable distance. Lizards were in great abundance; but I do not know that any of us saw the guano, and another animal, described by Dampier* as resembling the guano, only much larger. Amongst its vegetable improvements, I have already mentioned the fields of rice we passed through; and plantains, various kinds of pumpions, cocoa-nuts, oranges, shaddockes, and pomegranates, were also met with; though, except the plantains and shaddockes, in no great abundance. It is probable, from what has been already said relative to the bishop of Adran, that the French have introduced these improvements into the island, for the purpose of making it a more convenient refreshing-station for any of their ships that may be bound for Cambodia, or Cochin China. Should they have made, or intend to make, any settlement in those countries, it is certainly well situated for that purpose, or for annoying the trade of their enemies, in case of war.

Our sportsmen were very unsuccessful in their pursuit of the feathered game, with which the woods are well stocked. One of our gentlemen had the good fortune to shoot a wild hen: and all the shooting parties agreed that they heard the crowing of the cocks on every side, which they described to be like that of our common cock, but shriller; that they saw several of them on the wing, but that they were exceedingly shy. The hen that was shot was of a speckled colour, and of the same shape, though not quite so large, as a full-grown pullet of this country. Monsieur Sonnerat has entered into a long dissertation, to prove that he was the first person who determined the country to which this most beautiful and useful bird belongs, and denies that Dampier met with it here.

The land in the neighbourhood of the harbour is a continued high hill, richly adorned with a variety of fine tall trees, from the summit to the water's edge. Among others, we observed what Dampier calls the tar-tree†; but observed none that were tapped in the manner he describes. The inhabitants, who are fugitives from Cambodia and Cochin China, are not numerous. They are of a short stature, and very swarthy, and of a weak and unhealthy aspect; but, as far as we could judge, of a gentle disposition.

We remained here till the 28th of January; and, at taking leave of the *Mandarin*, Captain Gore, at his own request, gave him a letter of recommendation to the commanders of any other ships that might put in here; to which he added a handsome present. He likewise gave him a letter for the bishop of Adran, together with a telescope, which he begged might be presented to him as a compliment for the services he had received through his means at Condore.

The harbour at Pulo Condore is in latitude	8° 40' 00" N.

CHAPTER XI.—DEPARTURE FROM PULO CONDORE.—PASS THE STRAITS OF BANCA.—VIEW OF THE ISLAND OF SUMATRA.—STRAITS OF SUNDA.—OCCURRENCES THERE.—DESCRIPTION OF THE ISLAND OF CRACATOA.—PRINCE'S ISLAND.—EFFECTS OF THE CLIMATE OF JAVA.—RUN TO THE CAPE OF GOOD HOPE.—TRANSACTIONS THERE.—DESCRIPTION OF FALSE BAY.—PASSAGE TO THE ORKNEYS.—GENERAL REFLECTIONS.

On the 28th day of January, 1780, we unmoored; and, as soon as we were clear of the harbour, steered south south-west for Pulo Timoan. On the 30th, at noon, the latitude, by observation, being $5^{\circ} 0' N.$, and longitude $104^{\circ} 45' E.$, we altered our course to south three quarters west, having a moderate breeze from the north-east, accompanied by fair weather. At two in the morning of the 31st, we had soundings of forty-five fathoms, over a bottom of fine white sand; at which time our latitude was $4^{\circ} 4' N.$, longitude $104^{\circ} 29' E.$, and the variation of the compass $0^{\circ} 31' E.$ At one in the afternoon, we saw Pulo Timoan; and, at three, it bore south south-west, three quarters west, distant ten miles. This island is high and woody, and has several small ones lying off to the westward. At five, Pulo Puisang was seen bearing south by east three quarters east; and, at nine, the weather being thick and hazy, and having outrun our reckoning from the effect of some current, we were close upon Pulo Aor, in latitude $2^{\circ} 46' N.$, longitude $104^{\circ} 37' E.$, before we were well aware of it, which obliged us to haul the wind to the east south-east. We kept this course till midnight, and then bore away south south-east for the Straits of Banca.

On the 1st of February, at noon, our latitude, by observation, was $1^{\circ} 20' N.$, and the longitude, deduced from a great number of lunar observations taken in the course of the preceding twelve hours, $105^{\circ} E.$ At the same time, the longitude, by Mr. Bayly's time-keeper, corrected, was $105^{\circ} 15' E.$ We now steered south by east; and, at sunset, having fine clear weather, saw Pulo Panjang; the body of the island bearing west north-west, and the small islands, lying on the south-east of it, west half south, seven leagues distant. Our latitude, at this time, was $0^{\circ} 53' N.$ On the 2d, at eight in the morning, we tried for soundings, continued to do the same every hour, till we had passed the straits of Sunda, and found the bottom with twenty-three fathoms of line. At noon, being in latitude, by observation, $0^{\circ} 22' S.$, longitude $105^{\circ} 14' E.$, and our soundings twenty fathoms, we came in sight of the little islands called Dominis, which lie off the eastern part of Langen; and which bore from north $62^{\circ} W.$, to north $80^{\circ} W.$, five leagues distant. At this time we passed a great deal of wood drifting on the sea; and, at one o'clock, we saw Pulo Taya, bearing south-west by west, distant seven leagues. It is a small high island, with two round peaks, and two detached rocks lying off it to the northward. When abreast of this island, we had soundings of fifteen fathoms. During this and the preceding day, we saw great quantities of a reddish-coloured snail or spawn, floating on the water in a southerly direction. At daylight, on the 3d, we came in sight of the Three Islands; and soon after, of Monopin Hill, on the island of Banca. At noon, this hill, which forms the north-east point of the entrance of the Straits, bore south-east half south, distant six leagues; our latitude, by observation, being $1^{\circ} 48' S.$, and longitude $105^{\circ} 3' E.$, the soundings seventeen fathoms, and no perceivable variation in the compass.

Having got to the westward of the shoal called Frederick Endrie, at half-past two we entered the Straits, and bore away to the southward; and, in the afternoon, Monopin Hill bearing due east, we determined its latitude to be $2^{\circ} 3' S.$, the same as in Mons. D'Après' map, and its longitude $105^{\circ} 18' E.$ At nine, a boat came off from the Banca shore, and having rowed round the ships, went away again. We hailed her in the Malay tongue to come on board, but received no answer. At midnight, finding a strong tide against us, we anchored in twelve fathoms, Monopin Hill bearing north $29^{\circ} W.$ On the 4th, in the morning, after experiencing some difficulty in weighing our anchors, owing to the stiff tenacious quality of the ground, we proceeded with the tide down the Straits; the little wind we had from the northward dying away as the day advanced. At noon, there being a perfect calm, and the tide making against us, we dropt our anchor in thirteen fathoms water, about three miles from what is called the Third Point, on the Sumatra shore; Monopin Hill bearing

N. 54° W. The latitude, by observation, was 2° 22' S., longitude 105° 38' E. At three in the afternoon, we weighed and stood on through the Straits with a light breeze; and at eight, were abreast of the second point, and passed it within two miles, in seventeen fathoms water, a sufficient proof that this point may be bordered upon with safety. At midnight, we again came to anchor, on account of the tide, in thirteen fathoms, Mount Permissang, on the island of Banca, bearing N. 7° E., and the First Point S. 54° E., distant about three leagues. In the morning of the 5th, we weighed, and kept on to the south-east; and, at ten, passed a small shoal, lying in a line with Lasepara and the First Point, at the distance of five miles from the latter. At noon, the island of Lasepara, bearing S. 57½° E., four miles distant, we determined its latitude to be 3° 10½' S., and longitude 106° 15' E. The difference of longitude between the island Lasepara, which lies in the south entrance of the Straits of Banca, and Monopin Hill, which forms one side of the entrance from the north, we found to be 55', which is only two miles less than what is given in D'Après' chart.

In passing these Straits, the coast of Sumatra may be approached somewhat closer than that of Banca. At the distance of two or three miles from the shore, there are ten, eleven, twelve, or thirteen fathoms, free from rocks or shoals; however, the lead is the surest guide. The country is covered with wood down to the water's edge, and the shores are so low, that the sea overflows the land, and washes the trunks of the trees. To this flat and marshy situation of the shore, we may attribute those thick fogs and vapours, which we perceived every morning, not without dread and horror, hanging over the island, till they were dispersed by the rays of the sun. The shores of Banca are much bolder, and the country inland rises to a moderate height, and appears to be well wooded throughout. We often saw fires on this island during the night time; but none on the opposite shore. The tide runs through the Straits at the rate of between two and three knots an hour.

In the morning of the 6th, we passed to the westward of Lasepara, at the distance of four or five miles; generally carrying soundings of five and six fathoms' water, and never less than four. We afterward steered south by east; and having brought Lasepara to bear due north, and deepened our water to seven fathoms, we altered our course to south by west, keeping the lead going, and hauling out a little, whenever we shoaled our water. The soundings on the Sumatra side we still found to be regular, and gradually shoaling, as we approached the shore. At five in the afternoon we saw the Three Sisters, bearing south by west half west; and, at seven, we came to an anchor in ten fathoms, about eight miles to the north of the islands. The weather was close and sultry, with light winds, generally from the north-west; but sometimes varying round as far as the north-east; and, during the night, we observed much lightning over Sumatra. We weighed the next morning at five, and at eight were close in with the Sisters. These are two very small islands, well covered with wood, lying in latitude 5° 0½' S., longitude 106° 12' E., nearly north and south from each other, and surrounded by a reef of coral rocks; the whole circumference of which is about four or five miles. At noon we got sight of the island of Java to the southward; the north-west extremity of which (Cape St. Nicholas) bore south; North Island, on the Sumatra shore, S. 27° W., and the Sisters north, 27° E., distant four leagues. Our latitude was 5° 21' S., longitude 105° 57' E.

At four in the afternoon, we saw two sail in the Straits of Sunda; one lying at anchor near the Midchannel Island; the other nearer the Java shore. Not knowing to what nation they might belong, we cleared our ship for action; and at six came to an anchor in twenty-five fathoms, four miles east by south from North Island. Here we lay all night, and had very heavy thunder and lightning to the north-west; from which quarter the wind blew in light breezes, accompanied with hard rain. At eight o'clock the next morning, we weighed, and proceeded through the Straits, the tide setting to the southward, as it had done all night; but about ten the breeze failing, we came to again in thirty-five fathoms; a high island, or rather rock, called the Grand Toque, bearing south by east. We were, at this time, not more than two miles from the ships, which now hoisting Dutch colours, Captain Gore sent a boat on board for intelligence. The rain still continued with thunder and lightning. Early in the afternoon, the boat returned with an account that the large ship was a Dutch East-Indiaman, bound for Europe; and the other a packet from Batavia,

with orders for the several ships lying in the Straits. It is the custom for the Dutch ships, as soon as their lading is nearly completed, to leave Batavia, on account of its extreme unwholesomeness, and proceed to some of the more healthy islands in the Straits, where they wait for the remainder of their cargo, and their despatches. Notwithstanding this precaution, the Indiaman had lost, since her departure from Batavia, four men, and had as many more whose recovery was despaired of. She had lain here a fortnight, and was now about to proceed to water at Cracatoa, having just received final orders by the packet.

At seven in the morning of the 9th, we weighed, and stood on through the straits to the south-west, keeping pretty close in with the islands on the Sumatra shore, in order to avoid a rock near Midchannel Island, which lay on our left. At half after ten, I received orders from Captain Gore to make sail toward a Dutch ship which now hove in sight to the southward, and which we supposed to be from Europe; and, according to the nature of the intelligence we could procure from her, either to join him at Cracatoa, where he intended to stop for the purpose of supplying the ships with arrack, or to proceed to the south-east end of Prince's Island, and there take in our water, and wait for him. I accordingly bore down toward the Dutch ship, which soon after came to an anchor to the eastward; when the wind slackening, and the current still setting very strong through the strait to the south-west, we found it impossible to fetch her, and having, therefore, got as near her as the tide would permit, we also dropped anchor. I immediately despatched Mr. Williamson, in the cutter, with orders to get on board her if possible; but as she lay near a mile off, and the tide ran with great rapidity, we soon perceived that the boat was dropping fast astern. We therefore made the signal to return, and immediately began to veer away the cable, and sent out a buoy astern, in order to assist him in getting on board again. Our poverty, in the article of cordage, was here very conspicuous; for we had not a single coil of rope, in the store-room, to fix to the buoy, but were obliged to set about unreeving the studding-sail gear, the topsail-halliards, and tackle-falls, for that purpose; and the boat was at this time driving to the southward so fast, that it was not before we had veered away two cables, and almost all our running-rigging, that she could fetch the buoy.

I was now under the necessity of waiting till the strength of the tide should abate, which did not happen till the next morning, when Mr. Williamson got on board the ship, and learnt, that she had been seven months from Europe, and three from the Cape of Good Hope; that before she sailed, France and Spain had declared war against Great Britain; and that she left Sir Edward Hughes, with a squadron of men-of-war, and a fleet of East India ships, at the Cape. Mr. Williamson having, at the same time, been informed, that the water at Cracatoa was very good, and always preferred by the Dutch ships, to that of Prince's Island, I resolved to rejoin the Resolution at the former place; and a fair breeze springing up, we weighed and stood over toward the island, where we soon after saw her at anchor; but the wind falling, and the tide setting strong against us, I was obliged to drop anchor at the distance of about five miles from the Resolution, and immediately sent a boat on board, to acquaint Captain Gore with the intelligence we had received. As soon as the Resolution saw us preparing to come to, she fired her guns, and hoisted an English jack at the ensign staff, the signal at sea to lead a-head. This we afterward understood was intended to prevent our anchoring, on account of the foul ground, which the maps she had on board placed here. However, as we found none, having a muddy bottom, and good holding ground, in sixty fathoms water, we kept fast till the return of the boat, which brought orders to proceed the next morning to Prince's Island. We were at this time two miles distant from the shore; the peak of Cracatoa bore north-west by north; Bantam Point east north-east half east; Prince's Island south-west by west.

The island of Cracatoa is the southernmost of a group situated in the entrance of the Straits of Sunda. It has a high-peaked hill on the south end*, which lies in latitude $6^{\circ} 9' S.$, and longitude $105^{\circ} 15' E.$; the whole circuit of the island is not more than three

* The island of Tannulu, or Sambouricou, which lies about four leagues to the north of Cracatoa, may be easily mistaken for the latter, having a hill of nearly the same size and form, situated also near its southern extremity.

of Cracatoa, may be near its southern ex-

leagues. Off the north-east end lies a small island, which forms the road where the Resolution anchored; and within a reef that runs off the south end of the latter, there is good shelter against all northerly winds, with eighteen fathoms water near the reef, and twenty-seven in the mid-channel. To the north-west, there is a narrow pass for boats between the two islands. The shore, which forms the western side of the road, is in a north-west direction, and has a bank of coral stretching into the sea, about one-third of a cable's length, which makes the landing difficult for boats, except at high water; but the anchoring ground is very good, and free from rocks. The place where the Resolution watered is a small spring, situated abreast of the south end of the small island, at a short distance from the water-side. A little to the southward, there is a very hot spring, which is used by the natives as a bath. Whilst we were lying off the south end of this island, we sent a boat with the master on shore, to look for water; but after having landed with some difficulty, he returned unsuccessful.

Cracatoa is esteemed very healthy, in comparison of the neighbouring countries. It consists of high land, rising gradually on all sides from the sea; and the whole is covered with trees, except a few spots which the natives have cleared for rice-fields. The number of people on the island is very inconsiderable. Their chief, as are those of all the other islands in the Straits, is subject to the king of Bantam. The coral reefs afford plenty of small turtles; but other refreshments are very scarce, and sold at an enormous price.

Latitude of the road where the Resolution anchored	8° 6' south.

Ditto, by observation	105 36 east.
Dip of the south end of the magnetic needle	26 3
Variation of the compass	1 0 west.

On the full and change days, it is high-water at 7^h in the morning. The water rises three feet two inches perpendicular.

At eight o'clock in the evening, it began to blow fresh from the westward, with violent thunder, lightning, and rain; and at three the next morning, we weighed and stood over for Prince's Island, but the westerly wind dying away, was succeeded by a breeze from the south-east, and, at the same time, a strong tide setting to the south-west, prevented our fetching the island, and obliged us, at two in the afternoon, to drop anchor in sixty-five fathoms, over a muddy bottom, at three leagues' distance from it; the high hill bearing south-west by south, and the peak on Cracatoa north by east. We had light airs and calms till six next morning, when we weighed and made sail, having, in our endeavours to leave the anchor out of the ground, twice broken the old messenger, and afterward a new one, cut out of our best hawser. This, however, was entirely owing to the wretched state of our cordage, as the strain was not very considerable, and we had beside assisted the cable in coming in, by clapping the cat-tackle on it. The wind continuing fair, at noon we came to an anchor off the south-east end of Prince's Island, in twenty-six fathoms, over a sandy bottom; the east end of the island bearing north north-east, the southernmost point in sight south-west by south, the high peak north-west half west, distant from the nearest shore half a mile.

As soon as we had come to anchor, Lieutenant Larnyon, who had been here before with Captain Cook, in the year 1770, was sent along with the master, to look for the watering-place. The brook from which, according to the best of his recollection, the Endeavour had been supplied, was found quite salt. Further inland, they saw a dry bed, where the water seemed to have lodged in rainy seasons; and, about a cable's length below, another rim, supplied from an extensive pool, the bottom of which, as well as the surface, was covered with dead leaves. This, though a little brackish, being much preferable to the other, we began watering here early the next morning, and finished the same day. The natives, who came to us soon after we anchored, brought a plentiful supply of large fowls, and some turtles; but the last were for the most part very small. In the course of the night we had heavy rain; and on the 14th, at day-light, we saw the Resolution to the northward, standing toward the island, and at two in the afternoon, she dropt anchor close to us. In

the course of the day we heeled the ship, and scrubbed and hogged her bottom, which was very foul; and got ready for sea.

The next day, Captain Gore not having completed his stock of water at Cracatoa, sent his men on shore, who now found the brook that was first mentioned, rendered perfectly sweet by the rain, and flowing in great abundance. This being too valuable a treasure to be neglected, I gave orders that all the casks we had filled before should be started, and replenished with the fresh water, which was accordingly done before noon the next day; and in the evening, we cleared the decks, and both ships were ready for sea. In the forenoon of the 18th, we had heavy rains, and variable winds, which prevented our getting under weigh till two in the afternoon, when a light wind sprung up from the northward; but this soon after leaving us, we were obliged to drop our anchor again at eight o'clock that night, in fifty fathoms water, and wait till the same hour the next morning. At that time, being favoured by a breeze from the north-west, we broke ground, to our inexpressible satisfaction, for the last time in the Straits of Sunda, and, the next day, had entirely lost sight of Prince's Island.

This island having been already described by Captain Cook, in the history of a former voyage, I shall only add, that we were exceedingly struck with the great general resemblance of the natives, both in figure, colour, manners, and even language, to the nations we had been so much conversant with in the South Seas. The effects of the Javanese climate, and I did not escape without my full share of it, made me incapable of pursuing the comparison so minutely as I could have wished. The country abounds with wood to such a degree, that notwithstanding the quantity cut down every year by the ships which put into the road, there is no appearance of its diminution. We were well supplied with small turtle and fowls of a moderate size; the last were sold at the rate of ten for a Spanish dollar. The natives also brought us many hog-deer, and a prodigious number of monkeys, to our great annoyance, as most of our sailors provided themselves with one, if not two of these troublesome animals.

As we should have met with some difficulty in finding the watering-place, if Mr. Lamyon had not been with us, it may be worth while, for the use of future navigators, to describe its situation more particularly. The peaked hill on the island bears from it north-west by north; a remarkable tree growing upon a coral reef, and quite detached from the neighbouring shrubs, stands just to the northward; and, close by it, there is a small plot of reedy grass, the only piece of the kind that can be seen hereabout. These marks will show the place where the pool empties itself into the sea; but the water here is generally salt as well as that which is in the pool. The casks must, therefore, be filled about fifty yards higher up; where, in dry seasons, the fresh water that comes down from the hills is lost among the leaves, and must be searched for by clearing them away.

The latitude of the anchoring place at Prince's Island was	6°	36	15	S.
Longitude	103°	17	30	E.

Mean of the thermometer	83	0½	0	

From the time of our entering the Straits of Banca, we began to experience the powerful effects of this pestilential climate. Two of our people fell dangerously ill of malignant putrid fevers; which, however, we prevented from spreading, by putting the patients apart from the rest, in the most airy births. Many were attacked with teasing coughs; others complained of violent pains in the head; and even the healthiest among us felt a sensation of suffocating heat, attended by an insufferable languor, and a total loss of appetite. But though our situation was, for a time, thus uneasy and alarming, we had, at last, the singular satisfaction of escaping from these fatal seas without the loss of a single life, a circumstance which was probably owing in part to the vigorous health of the crews when we first arrived here, as well as to the strict attention, now become habitual in our men, to the salutary regulations introduced amongst us by Captain Cook.

ence to the

Cape of Good Hope, the crew of the *Resolution* was in a much more sickly state than that of the *Discovery*; for, though many of us continued for some time complaining of the effects of the noxious climate we had left, yet happily we all recovered from them. Of the two who had been ill of fevers, one, after being seized with violent convulsions on the 12th of February, which made us despair of his life, was relieved by the application of blisters, and was soon after out of danger. The other recovered, but more slowly. On board the *Resolution*, besides the obstinate coughs and fevers under which they very generally laboured, a great many were afflicted with fluxes, the number of whom, contrary to our expectations, continued increasing till their arrival at the Cape. Captain Gore attributed this difference in part, and probably with some reason, to the *Discovery* having her fire-place between decks; the heat and smoke of which he conceived might help to mitigate the bad effects of the damp night air. But I am rather inclined to believe that we escaped the flux by the precautions that were taken to prevent our catching it from others. For if some kinds of fluxes be, as I apprehend there is no doubt they are, contagious, it is not improbable that the *Resolution* caught this disorder from the Dutch ships at Cracatoa. In order to avoid this danger, when Mr. Williamson was sent to the Indianman in the entrance of the Straits of Sunda, he had the strictest orders not to suffer any of our people, on any account whatever, to go on board; and whenever we had afterwards occasion to have any communication with the *Resolution*, the same caution was constantly observed.

We were no sooner clear of Prince's Island, than we had a gentle breeze from the west north-west; but this did not last long; for the following day the wind became again variable, and continued so till the noon of the 25th, when it blew squally, and blew fresh from the north. On the 22d at noon, being in latitude $10^{\circ} 28' S.$, and longitude $104^{\circ} 14'$, we saw great quantities of boobies and other fowls that seldom go far from land; from which, we conjectured that we were near some small unknown island. In the evening of the 25th, the wind changed suddenly to the southward, accompanied with heavy rains, and began to blow with great violence. During the night, almost every sail we had bent gave way, and most of them were split to rags; our rigging also suffered materially, and we were, the next day, obliged to bend our last suit of sails, and to knot and splice the rigging, our cordage being all expended. This sudden storm we attributed to the change from the monsoon to the regular trade-wind; our latitude was about $13^{\circ} 10' S.$ and we had made by our reckoning about $4\frac{1}{2}^{\circ}$ of longitude west from Java head.

From the 26th of this month to the 28th of March, we had a regular trade-wind from the south-east to east by south, with fine weather; and, being in an old beaten track, met no occurrence that deserved the smallest notice. In the morning of the 28th of March, being in latitude $31^{\circ} 42' S.$, and longitude $35^{\circ} 26' E.$, the trade-wind left us in a violent thunder-storm. From this time to the 3rd of April, when our latitude was $35^{\circ} 1'$ and longitude $26^{\circ} 3' E.$ the winds were moderate, and generally from the south quarter. A fresh breeze then sprung up from the eastward, which continued till the afternoon of the 4th; after which, we had a calm that lasted the two following days.

It had hitherto been Captain Gore's intention to proceed directly to St. Helena, without stopping at the Cape; but the rudder of the *Resolution* having been for some time complaining, and, on being examined, reported to be in a dangerous state, he resolved to steer immediately for the Cape, as the most eligible place, both for the recovery of his sick, and for procuring a new main-piece to the rudder. From the 21st of March, when we were in latitude $27^{\circ} 22' S.$, longitude $52^{\circ} 25' E.$, to the 5th of April, when we had got into latitude $39^{\circ} 12' S.$, longitude $22^{\circ} 7' E.$, we were strongly affected by the currents, which set to the south south-west, and south-west by west, sometimes at the rate of eighty knots a day. On the 6th, having got under the lee of the African coast, we lost them entirely. In the morning of the 6th, a sail was seen to the south-west, standing toward us; and, as the wind soon after rose from the same quarter, we cleared our ships for action. We now discovered, from the mast-head, five sail more on our lee-bow, standing to the eastward; but the weather coming on hazy, we lost sight of them all in an hour's time. Our latitude at noon was $35^{\circ} 49' S.$, longitude $21^{\circ} 32' E.$ At seven o'clock, the next morning (the seventh), we made

the land to the northward at a considerable distance. On the 8th, the weather was squally, and blew fresh from the north-west; the following day it settled to the west, and we passed pretty close to the sail seen on the 6th, but did not hail her. She was clumsy in figure, and, to appearance, unskillfully managed; yet she out-sailed us exceedingly. The colours which she hoisted were different from any we had seen; some supposed them to be Portuguese, others Imperial.

At day-light the next morning, the land again appeared to the north north-west, and, in the forenoon, a snow was seen bearing down to us, which proved to be an English East India packet, that had left Table Bay three days before, and was cruising with orders for the China fleet, and other India ships. She told us, that about three weeks before, Mons. Troncoller's squadron, consisting of six ships, had sailed from the Cape, and was gone to cruise off St. Helena, for our East India fleet. This intelligence made us conjecture, that the five sail we had seen standing to the eastward must have been the French squadron, who, in that case, had given over their cruise, and were probably proceeding to the Mauritius. Having informed the packet of our conjectures, and also of the time we understood the China ships were to sail from Canton, we left them, and proceeded toward the Cape.

In the evening of the 10th, the Gummer's Quoin bore north by east, and False Cape east north-east; but the wind being at south-west, and variable, prevented our getting into False Bay till the evening of the 12th, when we dropt anchor abreast of Simon's Bay. We found a strong current setting to the westward, round the Cape, which, for some time, we could but just stem, with a breeze that would have carried us four knots an hour. The next morning we stood into Simon's Bay; and at eight came to anchor, and moored a cable each way; the best bower to the east south-east, and small bower west north-west; the south-east point of the bay bearing south by east, Table Mountain north-east half north; distant from the nearest shore one-third of a mile. We found lying here the Nassau and Southampton East-Indiamen, waiting for convoy for Europe. The Resolution saluted the fort with eleven guns, and the same number was returned. Mr. Brandt, the governor of this place, came to visit us as soon as we had anchored. This gentleman had conceived a great affection for Captain Cook, who had been his constant guest the many times he had visited the Cape; and though he had received the news of his melancholy fate some time before, he was exceedingly affected at the sight of our ships returning without their old commander. He appeared much surprised to see our crew in so stout and healthy a condition, as the Dutch ship that had left Macao on our arrival there, and had touched at the Cape some time before, reported, that we were in a most wretched state, having only fourteen hands left on board the Resolution, and seven on board the Discovery. It is not easy to conceive the motive these people could have had for propagating so wanton and malicious a falsehood.

On the 15th I accompanied Captain Gore to Cape Town; and the next morning we waited on Baron Plettenberg, the governor, by whom we were received with every possible attention and civility. He had also conceived a great personal affection for Captain Cook, as well as the highest admiration of his character, and heard the recital of his misfortune with many expressions of unaffected sorrow. In one of the principal apartments of the governor's house he showed us two pictures, of Van Tromp and De Ruyter, with a vacant space left between them, which he said he meant to fill up with the portrait of Captain Cook; and for that purpose he requested our assistance, when we should arrive in England, in purchasing one for him at any price. We were afterwards informed by the governor, that all the powers at this time at war with England had given orders to their cruisers to let us pass unmolested. This, as far as related to the French, we had sufficient reason to think true; as Mr. Brandt had already delivered to Captain Gore a letter from Mr. Stephens, inclosing a copy of Mons. de Sartine's orders, taken on board the *Licorne*. With respect to the Americans, the matter still rested on report; but Baron Plettenberg assured us, that he had been expressly told by the commander of a Spanish ship, which had touched at the Cape, that he, and all the officers of his nation, had received orders to the same effect. These assurances confirmed Captain Gore in the resolution he had taken of maintaining, on

was squally, and we passed in figure, and, colours which the Portuguese,

his part, a neutral conduct: and accordingly, when, on the arrival of the Sybil, to convoy the India ships home, it was proposed to him to accompany them on their passage, he thought proper to decline an offer, the acceptance of which might, in case we had fallen in with any of the enemies' ships, have brought him into a very difficult and embarrassing situation.

During our stay at the Cape, we met with every proof of the most friendly disposition toward us, both in the governor and principal persons of the place, as well Africans as Europeans. At our first arrival, Colonel Gordon, the commander of the Dutch forces, with whom, on our former visit here, I had the happiness of being on a footing of intimacy and friendship was absent on a journey into the interior parts of Africa, but returned before our departure. He had, on this occasion, penetrated farther up the country than any other traveller had done before him, and made great additions to the valuable collection of natural curiosities with which he has enriched the museum of the Prince of Orange. Indeed, a long residence at the Cape, and the powerful assistance he has derived from his rank and situation there, joined to an active and indefatigable spirit, and an eager thirst after knowledge, have enabled him to acquire a more intimate and perfect knowledge of this part of Africa than could have fallen to the lot of any other person; and it is with great pleasure I can congratulate the public on the information I have received of his intentions to give the world, from his own hand, a history of his travels.

False Bay, situated to the eastward of the Cape of Good Hope, is frequented by shipping during the prevalence of the north-west winds, which begin to blow in May, and make it dangerous to lie in Table Bay. It is terminated on the west by the Cape of Good Hope, and on the eastward by False Cape. The entrance of the bay is six leagues wide, the two capes bearing from each other due east and west. About eleven miles from the Cape of Good Hope, on the west side, is situated Simon's Bay, the only convenient station for ships to lie in; for although the road without it affords good anchorage, it is too open, and but ill circumstanced for procuring necessaries, the town being small, and supplied with provisions from Cape Town, which is about twenty-four miles distant. To the north north-east of Simon's Bay there are several others, from which it may be easily distinguished by a remarkable sandy way to the northward of the town, which makes a striking object. In steering for the harbour, along the west shore, there is a small flat rock, called Noah's Ark; and, about a mile to the north-east of it, several others, called the Roman Rocks. These lie one mile and a half from the anchoring place; and either between them, or to the northward of the Roman Rocks, there is a safe passage into the bay. When the north-west gales are set in, the following bearings will direct the mariner to a safe and commodious birth: Noah's Ark, S. 51° E., and the centre of the hospital S. 53° W. in seven fathoms. But if the south-east winds have not done blowing, it is better to stay further out in eight or nine fathoms. The bottom is sandy, and the anchors settle considerably before they get hold. All the north part of the bay is low sandy land, but the east side is very high. About six miles east of Noah's Ark lies Seal Island, the south part of which is said to be dangerous, and not to be approached with safety nearer than in twenty-two fathoms. Off the Cape of Good Hope are many sunk rocks, some of which appear at low water; and others have breakers constantly on them.

The latitude of the anchoring-place in Simon's Bay, by observation	34° 20' S.
The longitude	18 29 E.
Dip of the south end of the magnetic needle	46 47
Variation of the compass	22 16 W.

On the full and change days, it was high-water at 5^h 55^m apparent time; the tide rose and fell five feet five inches; at the neap tides it rose four feet one inch.

From the observations taken by Mr. Bayly and myself, on the 11th of this month, when the Cape of Good Hope bore due west, we found its latitude to be 34° 23' S., which is 4' to the northward of its position as determined by the Abbé de la Caille.

Having completed our victualling, and furnished ourselves with the necessary supply of

naval stores, we sailed out of the bay on the 9th of May, and on the 14th we got into the south-east trade-wind, and steered to the westward of the islands of St. Helena and Ascension. On the 31st, being in latitude $12^{\circ} 48' S.$, longitude $15^{\circ} 40' W.$, the magnetic needle was found to have no dip. On the 12th of June we passed the equator for the fourth time during this voyage, in longitude $26^{\circ} 16' W.$ We now began to perceive the effects of a current setting north by east, half a knot an hour. It continued in this direction till the middle of July, when it began to set a little to the southward of the west.

On the 12th of August, we made the western coast of Ireland, and, after a fruitless attempt to get into Port Galway, from whence it was Captain Gore's intention to have sent the journals and maps of our voyage to London, we were obliged, by strong southerly winds, to steer to the northward. Our next object was to put into Lough Swilly, but the wind continuing in the same quarter, we stood on to the northward of Lewis Island; and on the 22nd of August, at eleven in the morning, both ships came to an anchor at Stromness. From hence I was despatched by Captain Gore to acquaint the Board of Admiralty with our arrival; and on the 4th day of October the ships arrived safe at the Nore, after an absence of four years, two months, and twenty-two days.

On quitting the Discovery at Stromness, I had the satisfaction of leaving the whole crew in perfect health; and at the same time, the number of convalescents on board the Resolution did not exceed two or three, of whom only one was incapable of service. In the course of our voyage, the Resolution lost but five men by sickness, three of whom were in a precarious state of health at our departure from England; the Discovery did not lose a man. An unremitting attention to the regulations established by Captain Cook, with which the world is already acquainted, may be justly considered as the principal cause, under the blessing of Divine Providence, of this singular success. But the baneful effects of salt provisions might perhaps, in the end, have been felt, notwithstanding these salutary precautions, if we had not assisted them, by availing ourselves of every substitute our situation at various times afforded. These frequently consisting of articles which our people had not been used to consider as food for men, and being sometimes exceedingly nauseous, it required the joint aid of persuasion, authority, and example, to conquer their prejudices and disgusts. The preventives we principally relied on were sour kront and portable soup. As to the antiscorbutic remedies, with which we were amply supplied, we had no opportunity of trying their effects, as there did not appear the slightest symptoms of the scurvy, in either ship, during the whole voyage. Our malt and hops had also been kept as a resource, in case of actual sickness, and on examination at the Cape of Good Hope, were found entirely spoiled. About the same time, were opened some casks of biscuit, flour, malt, peas, oatmeal, and groats, which, by way of experiment, had been put up in small casks, lined with tinfoil, and found all, except the peas, in a much better state than could have been expected, in the usual manner of package.

I cannot neglect this opportunity of recommending to the consideration of government, the necessity of allowing a sufficient quantity of Peruvian bark to such of his Majesty's ships as may be exposed to the influence of unwholesome climates. It happened very fortunately in the Discovery, that only one of the men that had fevers in the Straits of Sunda, stood in need of this medicine, as he alone consumed the whole quantity usually carried out by surgeons, in such vessels as ours. Had more been affected in the same manner, they would probably all have perished, from the want of the only remedy capable of affording them effectual relief.

Another circumstance attending this voyage, which, if we consider its duration, and the nature of the service in which we were engaged, will appear scarcely less singular than the extraordinary healthiness of the crews, was, that the two ships never lost sight of each other for a day together, except twice; which was owing, the first time, to an accident that happened to the Discovery off the coast of Owhyhee; and the second, to the fogs we met with at the entrance of Awatska Bay. A stronger proof cannot be given of the skill and vigilance of our subaltern officers, to whom this share of merit almost entirely belongs.

VOCABULARY

OF THE LANGUAGE OF NOOTKA, OR KING GEORGE'S, SOUND, APRIL 1778.

Nootka.	English.
Opulszthl	The sun.
Onulszthl	The moon.
Nas, or eensaheehl nas	The sky.
Noohchai	A mountain, or hill.
Mookace	Rocks, or the shore.
Tanass, or tanas . .	A man.
Oonook	A song.
Eeneek, or eelek . .	Fire.
Nuheche, or nookchee.	The land; a country.
Konassama	The ground.
Mahiai	A house.
Neit, or Neet	A canille, or lamplight.
Neetopok	The smoke of a lamp.
Tassyai	A door.
Ai, and aio	Yes.
Wook, or wik	No.
Wik ait	None, not any.
Macook	To batter.
Kaceemai, or kyomai .	Give me some more for it.
Kootche, or kotehe . .	To paddle.
Aook, or ehianis . . .	To eat, to chew.
Topalszthl, or toopilszthl	The sea.
Oowhabbe	A paddle.
Thapats, or shapitz, or	A canoe.
Chapas	
Tavalluck	White hagle heads.
Seekemaile	Iron, or metal of any sort.
Abkou, or ahko	This.
Kaa, or kaa ehelle . .	Give it me, let me look at it, or examine it.
Wook hak	Will he not do it?
Ma, or man	Take it.
Chukenk	A hatchet, or hacking tool.
Eteche, or sheesh . . .	Displeasure.
Haoume, or haoouma .	Food.
Takho,	Bad. This iron is bad: Takho, seekemaile.
Chelle	I, me.
Kaeen	Broken.
Alle, or alla	(Speaking to one.) Friend; hark ye.
Klao appe, or klao . . .	Keep it; I'll not have it.
Asko	Long, or large.
Iakoueshmaish	Clothing in general.
Tahquoe, or toohiquoe .	A metal button or ear-ring.
Wae	(Calling to one, perhaps) you!
Weeketateesh	Sparkling sand, which they spin- kle on their faces.
Chank	Water.
Pachetl, or pachatl . .	To give; give me.
Haweezth, or hawalth .	Friendship, friend.
Kleesetl	To palat, or mark with a pencil.
Abetszle	To go away or depart.
Shesookto	To remain, or abide.
Seeaik	A stone weapon, with a square point.

Nootka.	English.
Suhyak	A spear, pointed with bone.
Tnak	The wood of the depending pine.
Luksheet, or luksheetl	To drink.
Soochiis	A tree, a wood.
Haiceapt,	A broad leaf, shrub, or under- wood.
Tolumbeet	Variegated pine; silver pine.
Atlieu	The depending pine, or cypress.
Kueeklipt	The Canadian pine.
Cho	Go.
Sateu	A pine top.
Kleeteenek,	The little cloak that they wear.
Kleethak	A bear's skin.
Klochimne	Muscles.
Ohkullik	A wooden box they hold things in.
Il'slaakasl, or slaikalszth	Coarse mats of bark.
Eesee	An instrument of bone to beat bark.
Chapitz knole	The model of a canoe.
Klapatuketeel	A bag made of mat.
Tahmis	To spit; spitte.
Wauksheet	To cough.
Poop	Common moss.
Okumlia	The wind.
Chutzquabeelsl	A bag made of seal skin.
Konneemnis	A kind of sea weed.
Quonook, or tookeetl . .	To sit down.
Klukeelszthl, or quoeel- szthl	To rise up.
Tsookeats	To walk.
Kummutchehuti	To run.
Klutsklace	To strike or beat.
Teesheetl	To throw a stone.
Teelszthtee	To rub or sharpen metal.
Tsook	To cleave or strike hard.
Mahkatte	A small liliaceous root which they eat.
Eumaltame	Fur of a sea otter.
Cheennaine	Their largest fishing hooks.
Moostatto	A bow.
Kalsheetl	Dead.
Kleeshieetl	To shoot with a bow.
Taehtatte	An arrow.
Katslak	A flaxen garment worn as their common dress.
Heshelcene	A plain Venus shell.
Koohuime	A bag rattle.
Akeek	A plain bone point for striking seals with.
Kaheita	A barbed bone point for ditto.
Cheetakulheiwha	Bracelets of white hagle beads.
Mittcmul-zsth	Thongs of skin worn about the wrist and neck.
Iaiopox	Pieces of copper worn in the ear.
Neeskshetl	To sneeze.

<i>Nootka.</i>	<i>English.</i>	<i>Nootka.</i>	<i>English.</i>
Buchkas . . .	A comb.	Kolsheetl, or Kolsheat	To sup. with a spoon.
Seelil . . .	Small feathers which they strew on their heads.	Achatla, or Achaklak . . .	What is your name?
Wamulte . . .	Twisted thongs and sinews worn about their ankles.	Achatlaha . . .	What is his name?
Xutseeontala . . .	Veins under the skin.	Akaashcha, or akasche . . .	What is the name of that?
Tookquuk . . .	The skin.	Haimussik . . .	A wooden sabre.
Muszhelo . . .	Pain.	Maetaalulathl . . .	A bone weapon like the Pei-oo.
Waeeteh . . .	To sleep.	Kookelizo . . .	A fish fin; the hand.
Siksalimaha . . .	To breathe, or pant.	Natcha . . .	A fish tail.
Tulshoetl . . .	To weep.	Klihkleeek . . .	The hoof of an animal.
Matakoot . . .	A fly.	Klaklasn: . . .	A bracelet.
Matook . . .	To fly.	Ko . . .	An article, to give strength of expression to another word
Koocce, or quoces . . .	Snow, or hail.	Nabei, or naheis . . .	Friendly.
Aopk . . .	To whistle.	Teelathoop . . .	A large cuttle fish.
Ahecaiksheetl . . .	To yawn.	Pachas . . .	He gave it me.
Elathltheek . . .	An instrument of two sticks standing from each other with bars.	Quacraitsaak . . .	A yellow, or red fox.
Cheecceakis . . .	A scar of a wound.	Atehakoe . . .	A limpet.
Tehoo . . .	Throw it down, or to me.	Aheita . . .	A sweet fern root they eat.
Cheetkoolekal, or Cheetkoalk . . .	A wooden instrument with many bone teeth, to catch small fish with.	Kishkillup . . .	The strawberry plant.
Kaenne, or Koenai . . .	A crow, a bird.	Akhmupt . . .	A narrow grass that grows on the rocks.
Keesapa . . .	A fish; a white bream.	Klaiwahmiss . . .	A cloud.
Khamoo . . .	A bream striped with blue and gold colours.	Mollsthapait . . .	A feather.
Tuaweech, or Tsuskeech . . .	A stone weapon, or tomahawk, with a wooden handle.	Taetecha . . .	Full, satisfied with eating.
Kamaisthlik . . .	A kind of snare, to catch fish or other animals with.	Kaaitz . . .	A necklace of small volute shells.
Klahna . . .	Wing feathers of a red bird.	Tahoquoosim . . .	A carved human head of wood, decorated with hair.
Seetsaennuk . . .	Anger; scolding.	Moowatche . . .	A carved wooden vizor, like the head of a Quebrechtalnesses.
Heeeni, or Heecee . . .	A brown streaked snake.	Mamat . . .	A black linnet, with a white bill.
Klapissine . . .	A racoon.	Klaokotl . . .	Give me something.
Owatine . . .	A white-headed eagle.	Pallszthpait . . .	Glimmer (sheet).
Klumissa . . .	Train oil; a bladder filled with it.	Eineetl . . .	The name they apply to a goat; probably of a deer.
Oukkoona . . .	Large carved wooden faces.	Seeta . . .	The tail of an animal.
Kotyook, or hotyok . . .	A knife.	Seelshoetl . . .	To kill.
See-cema . . .	A fishing net.	Oonolsth . . .	A sand piper.
Weena . . .	A stranger.	Saemnitz . . .	Chequered straw baskets.
Qualuniss . . .	Fish roe strewed upon pine branches and sea-weed.	Chookwak . . .	To go up, or away.
Kaati . . .	Give me.	Kloosashit . . .	Smoked herrings.
Hooksquahoolsthl . . .	A whale harpoon and rope.	Keetsua . . .	Puncturation.
Komook . . .	Chimera monstrosa.	Mikeellzyth . . .	To fasten, or tie a thing.
Quotluk, or quotlukac . . .	A sea-otter's skin.	Cheetceakamilzath . . .	White beads.
Maasenulathl . . .	An oblong wooden weapon, two feet long.	Kakkumipt . . .	A sea weed, or grass on which they strew fish roe.
Hookoomag . . .	A wooden mask of the human face.	Eissuk . . .	A sort of leek; allium triquetrum.
Tooquacumilsthl . . .	A seal skin.	Kutakushilzath . . .	To tear a thing.
Chna . . .	Let me see it.	Mitzaleo . . .	A knot.
Sooma . . .	A kind of haddock, of a reddish brown colour.	Mamakeeo . . .	To tie a knot.
Aeca . . .	Assardine.	Klukaizath . . .	To loosen, or untie.
Koeetask . . .	A wolf-skin dress.	Klakaikom . . .	The leaf of a plant.
Keepaleetoksal . . .	A woollen garment.	Sasinne, or asin . . .	A humming bird.
Iseu . . .	Pine bark.	Koohquoppa . . .	A granulated lily root they eat.
Waishee . . .	Wild cat-skin (lynx brunneus).	Seeweebt . . .	Alder tree.
Chastimmetz . . .	A coonion, and also pine martin.	Kaweeb . . .	Raspberry bush.
Ookoomillazthl . . .	A little, round wooden cup.	Kleeheep . . .	The flower of a plant.
Koomnitz . . .	A human skull.	Klumma . . .	Large wooden images placed at one end of their houses.
Keelwahmoot . . .	A skin bladder used in fishing.	Aiahtoop, or siahtoopah	A porpoise.
Taeapoox . . .	A conic cap made of mat, worn on the head.	Toshko . . .	A small brown spotted cod.
Summeto . . .	A squirrel; they also called a rat by this name.	Azlimupt, or ulszthmipt . . .	Flaxen stuff, of which they make their garments.
Maalszthl . . .	A deer's horn.	Wakaah . . .	An expression of approbation, or friendship.
Jaapops . . .	A man, or male.	Kullekeea . . .	Troughs out of which they eat.
		Kaots . . .	A twig basket.
		Silook . . .	The roof of a house; boards.
		Eilazthmukt . . .	Nettles.
		Koeeklassa . . .	A woollen stage, or frame, on which the fish roe is dried.

<i>Nootka.</i>	<i>English.</i>	<i>Nootka.</i>	<i>English.</i>
Matlieu . . .	{ A withe of bark for fastening planks.	Nootka . . .	The name of the bay or sound.
Nahose . . .	{ A circular hole that serves as a window.	Satsueheck . . .	The name of a woman.
Neetsoaninime . . .	{ Large planks, of which their houses are built.	NAMES OF DIFFERENT PARTS OF THE BODY.	
Chapma . . .	Straw.	Ooomitz . . .	The head.
Haquanuk . . .	A chest, or large box.	Apsoop . . .	The hair of the head.
Chahkots . . .	{ A square wooden bucket, to hold water.	Uhpuekel, or upuppen . . .	The forehead.
Chahquauna . . .	A square wooden drinking cup.	Checheetah . . .	The teeth.
Kienmut . . .	A wooden wedge.	Choop . . .	The tongue.
Kolkolsainum . . .	A large chest.	Kusse, or kasse . . .	The eye.
Klieutsunulu . . .	{ A board to kneel on when they paddle.	Naets . . .	The nose.
Taeelszhook . . .	A frame of square poles.	Papal . . .	The ear.
Aninulszth . . .	A fish.	Annusa . . .	The cheek.
Natchkoa and Maseeta . . .	{ The particular names of two of the monstrous images called Klumma.	Eethlux . . .	The chin.
Ilona . . .	To go that way.	Apuxim . . .	The beard.
Archiehl . . .	What does he say?	Taeekoomiz . . .	The neck.
Aeck . . .	The oval part of a whale dart.	Seckutz . . .	The throat.
Aptsheeti . . .	To steal.	Elulszth . . .	The face.
Quoeup . . .	To break.	Eethluxooth . . .	The lips.
Uhsaspal . . .	To pull.	Klooskooah, klah, tama . . .	The nostrils.
Taeekha . . .	A general song.	Aetehac . . .	The eye-brow.
Apte, or appe . . .	You.	Apso . . .	The arm.
Kai . . .	Thanks.	Apsoouilk . . .	The arm-pit.
Kotl . . .	Me; I.	Eneema . . .	The nipple.
Punihpunih . . .	A black beating stone.	Kooquainux, or Koo- quainuxoo . . .	{ The fingers.
Yatsequeuppe . . .	{ The names of three men.	Chushehuh . . .	Nail of the finger.
Kakallakecheelook . . .		Kleashklione . . .	The thighs and legs.
Nolokum . . .		Klahumme . . .	The foot.
		Aiahkomeetz . . .	The thumb.
		Kopeak . . .	The fore finger.
		Teeal . . .	The middle finger.
		Ontso, or akkukluc . . .	The ring finger.
		Kasleka . . .	The little finger.

TABLE

TO SHOW THE AFFINITY BETWEEN THE LANGUAGES SPOKEN AT OONALASHKA AND NORTON SOUND, AND THOSE OF THE GREENLANDERS AND ESQUIMAUX.

<i>English.</i>	<i>Oonalashka.</i>	<i>Norton Sound.</i>	<i>Greenland (from Crantz.)</i>	<i>Esquimaux.</i>

Three	Canooqu	Pingashook	Pingajual	Pingsut
Four	Sechu	Shetamik	Sissamat	Sissamat
Five	Chang	Dallamik	Tellimat	Tellimat
Six	Atoo	<i>In counting more than five, they repeat the same words over again.</i>		Arbanget
Seven	Ooloo		—	Arbanget, Attausek
Eight	Kamching		—	Arbanget mardlik
Nine	Seebing		—	Kollin illoet
Ten	Hase		—	Kollit.

A COMPARATIVE TABLE OF NUMERALS,

EXHIBITING THE AFFINITY AND EXTENT OF LANGUAGE, WHICH IS FOUND TO PREVAIL IN ALL THE ISLANDS OF THE EASTERN SEA, AND DERIVED FROM THAT SPOKEN ON THE CONTINENT OF ASIA, IN THE COUNTRY OF THE MALAYES.

N.B. The Malaye being considered as the root, three specimens of its Numerals stand separate at the top of the Table. The derivative branches are ranged and numbered, according to the longitudinal situation of the several places, proceeding from Madagascar, the most western boundary, eastward to Easter Island. In the instances marked with a star, liberty has been taken to separate the Article from the Numeral.

Malay.	Malay at Sumatra.	Malay.	Malay.	Malay at Sumatra.	Malay.
One, Satu	Satoo	Sa.	Seven, Tufou	Toojoo	Toojoo.
Two, Dua	Duo	Dua.	Eight, De-lappan	Slappan	Delapan.
Three, Tiga	Teego	Teega.	Nine, Sambalan	Sambilan	Sambelan.
Four, Enpa	Ampat	Ampat.	Ten, Sapola	Sapooloo	Sapooloo.
Five, Lyma	Leemoo	Leem.	HERBERT, p. 368. MARSDEN, p. 163. FORSTER'S <i>Observations</i> , p. 284		
Six, Nam	Anam	Nam and Anam.			
I.	II.	III.	IV.	V.	
Madagascar.	Madagascar.	Madagascar.	Madagascar.	Acheen in Sumatra.	
One, Issee, or Essa	Eser	Isso	Isso	Sah	
Two, Rooe	Rooa	Toue	Rica	Dua	
Three, Tulloo, or Tailloo	Talu	Tello	Tellon	Tloo	
Four, Efax, or Efar	Effutchi	Effad	Effats	Pnat	
Five, Lime, or Leman	Deceme	Fruto	Limi	Leemung	
Six, One, or Aine	Eanning	Woubla	Ene	Nam	
Seven, Hicito, or Pctoo	Feeto	Sidda	Titon	Too-joo	
Eight, Balloo	Varlo	Poulo	Walou	D'Lappan	
Nine, Seeva	Sevo	Malo	Sivi	Sakoorang	
Ten, Foroo, and Fooloo	Folo	Ncl	Tourou	Saploo	
PARKINSON, p. 205.	DRURY, p. 457.	HERBERT, p. 22.	SIR JOSEPH BANKS, Cook's Voyages, vol. i. p. 321.	MARSDEN, p. 168.
