“ And flash for flash returns, and fires for fires ;
“ In his right hand as many swords he wields,
“ And takes the thunder on as many shields.”

The modern appellation Archipelago is derived from the Greek words *Archos* and *Pelagos*; the first signifying chief, and the latter implying a sea, this being the chief sea in these parts.

The islands scattered about the Archipelago all belong to the Turks; but from the oppressions of the Ottoman government, they are surprisingly sunk from their former opulence and importance. We shall take them regularly as they lie, beginning at the westward, and proceeding thus :

1. Tenedos.
2. Lesbos.
3. Carencers.
4. Chios.
5. Pifara.
6. Samos.
7. Icaria, or Nicaria.
8. Pathmos.
9. Claros.
10. Leros.
11. The Mandria Isles.
12. Coos, or Stanchio.
13. Stampalia.
14. Carpanthus.
15. Isles in the Gulph of Smyrna.
16. Rhodes.
17. Cyprus.

These are all situated to the westward.

These are situated to the northward.

1. TENEDOS.

No one of the islands of the Archipelago has been more famed in the historian's page, and the poet's numbers, than Tenedos, though it is one of the smallest in the Ægean sea. It lies in 40 deg. north latitude, and 26 deg. east longitude, exactly opposite to Troy, from the shore of which it is about two leagues distant, and indeed formed the Trojan harbour. It was behind this island that the Grecians concealed their fleet, in order to delude the Trojans by making them suppose that they had raised the siege, and were gone home.

- “ In fight of Troy lies Tenedos, an isle
- “ (While fortune did on Priam's empire smile)
- “ Renown'd for wealth, but since a faithless bay,
- “ Where ships expos'd to winds and weather lay—
- “ There was their fleet conceal'd:—We thought for
- “ Greece
- “ The sails were hoisted, and our fears release :
- “ The Trojans, coop'd within their walls so long,
- “ Unbar their gates, and issue in a throng
- “ Like swarming bees, and with delight survey
- “ The camp deserted where the Grecians lay.”

After the fall of Troy, Pausanias observes, that the inhabitants of this island were reduced to a state of the utmost indigence. At length they were conquered by the Persians, and afterwards alternately subdued by the Lacedemonians, Romans, and Turks. It is near 20 miles in circumference, and formerly had a considerable city, and two havens. It was likewise celebrated for a temple dedicated to Apollo Smynthias. The only antiquities now to be seen on this island, are the ruins of the granaries built by the emperor Justinian; they were 280 feet in length, and 90 in breadth. This island produces the best, and most delicious wine in all the Levant, which is called Muscadine, and is held in the highest repute both by Europeans and Asiatics. Tenedos is surrounded by rocks, and contains several towns, or rather villages, the principal of which has the same name as the island, is inhabited by Greeks, and adorned by many fountains of white marble, being made of stones brought from the ruins of Troy. A strong castle flanked with square towers stands on the north of the town close to the sea; besides which two round towers, and a battery of 20 cannon, defend the haven. To the south of the port there is another castle, which commands the harbour and town, and is consequently of the utmost importance to the place. The tombs of Marpesia queen of the Amazons, and of the hero Achilles are shewn here.

2. LESBOS.

Lesbos, one of the principal islands of the Archipelago, is about 60 miles from Tenedos, and near eight miles from the continent of Asia Minor, lies under the 39th deg. north latitude; and between the 26th and 27th deg. east longitude, being about 70 miles in length, and 186 in circumference; the chief cities were

Aristba, which was entirely destroyed by an earthquake.

Pyrrha, on the western coast towards Greece, which met with the same fate as the former, as did Hiera and Agamis.

Eressus was situated on the southern promontory of the island, and only famous for having been the birth-place of the celebrated Theophrastus, who succeeded Aristotle in his peripatetic academy.

Antissa, according to Strabo, was formerly an island of itself, and was called Antissa from being opposite to Lesbos, which was then known by the name of Ilsa. This city was destroyed by the Romans, on account of its disaffection to their government.

Methymna. This city was the place of Arion's nativity, and was in great repute for the excellent wine which the inhabitants made.

Mitylene, the metropolis of Lesbos. This city was not more famed for the fertility of the circumjacent country, and the uncommon magnificence of its buildings, than for the number of considerable personages to whom it gave birth; among these were Pittacus, one of the seven Grecian sages; Alceus the lyric poet; Sappho, the celebrated poetess; Terpander the musician; Hellanicus the historian; Callias the critic, &c. &c. &c. Indeed Mitylene was deemed so much the seat of the muses, and the center of politeness, that Aristotle resided in it two years, to partake of the elegant conversation of its inhabitants.

The city, after having revolted from the Athenians, was greatly injured by the Peloponnesian war. It was subsequently destroyed by the Romans, and at its siege

the famous Julius Cæsar made his first campaign, and greatly signalized his courage. Being afterwards rebuilt, Pompey restored it to its ancient franchises. The emperor Trajan adorned it with many elegant structures, and from his own name called it Trajanapolis. This island is naturally exceeding fertile, and was celebrated by the ancients for producing in great abundance all the necessaries and delicacies of life. The wine in particular is excellent, and as much celebrated by physicians for its salubrity, as admired by the voluptuous for its admirable flavour.

The character of the Lesbians was the most immoral imaginable, and at length became proverbial; for the Greek saying, *To live like a Lesbian*, implied to live the most abandoned and profligate life that it was possible for the mind to conceive.

Lesbos is at present but thinly peopled, and scarce any thing is to be seen but the fragments of its former magnificence: however, 130 small villages are still reckoned, and several harbours, particularly Castri, built on the ruins of the ancient Mitylene, which is situated on the east side of the island, has an excellent port, and is defended by a strong castle.

Cos-dogg is a town built on the spot where a city antiently stood, called the Mounts of Ida: the inhabitants are principally Greeks, but the neighbouring mountains are infested by a great number of Turkish robbers, who are some of the most bloody and mercilefs villains existing.

The trade of this island consists principally of wine, grain, fruits, cheese, butter, pitch, &c. The duties paid to the Ottoman port amount to 18,000 piastres, and the inhabitants are computed at about 20,000: the houses at present are low and mean built, and the people miserably poor; they are, however, as much debauched as when they lived in greater affluence. Magazines are here kept to furnish with stores the Turkish galleys which are employed by the Porte to cruise against the pirates that infest some of these islands. The governor is a eadi, but the troops on the island are commanded by an aga of the Janissaries.

We shall conclude this article, by observing that as the Lesbians are deemed some of the most amorous people in the universe, so the most emphatical, concise, and expressive description of the tender passion of love that ever was written, is that of the Lesbian poetress Sappho, in her celebrated ode supposed to be addressed by a lover to his mistress:

"Bless'd as the immortal gods is he,
"The youth who fondly fits by thee,
"And hears and sees thee all the while
"Softly speak, and sweetly smile:
"Twas this depriv'd my soul of rest,
"And rais'd such transports in my breast:
"For while I gaz'd, with transport tost,
"My breath was gone, my voice was lost,
"My bosom glow'd; the subtle flame
"Ran quick thro' all my vital frame;
"O'er my dim eyes a darkness hung,
"My ears with hollow murmurs rung;
"In dewy damps my limbs were chill'd,
"My blood with gentle horrors thrill'd;
"My feeble pulse forgot to play,
"I fainted, sunk, and dy'd away."

3. The CAREENERS.

The Careeners, or Spalmadori Islands, are exceedingly small, and being situated to the north of Lesbos, the pirates put in here to careen, the situation being the best imaginable for watching the ships that go to, or come from Constantinople.

4. CHIOS.

Chios, or Scio, which lies in 39 deg. north latitude, and 27 east longitude, is called by the Turks Sakifaduct. It is situated opposite to the coast of Ionia, and has a coast of about 80 miles in circuit, being divided into upper and lower ground, the former terminating towards the north at Cape Apanomeria, and the latter

towards the south at Cape Mastico. This island is mountainous and rocky, yet the plains produce corn, wine, oil, honey, fruit, and gums; though the fertility is much impeded by the great scarcity of water. The country is fertile and populous, and the inhabitants opulent. The men are well made, the women handsome, and both sexes so much inclined to mirth, that they think all the time lost which is not employed in singing, dancing, feasting, revelling, or gallantry.

A great deal of commerce is carried on here; but the harbour is bad, and indeed dangerous; yet the ships going to and coming from Constantinople rendezvous at this place; and a Turkish Squadron is kept here to protect the merchant ships, and annoy the pirates.

Scio, the capital, is a handsome city. The houses are elegant, and have grand terraces, and windows glazed with red and green glass. The Venetians in 1694 took it, and greatly embellished it, but lost it the year following: it is two miles in circumference, and enclosed by several beautiful gardens. The inhabitants are chiefly of the Greek church, or Roman Catholics, and have several churches and monasteries, which remain unmolested by the Turks, who likewise permit them openly to profess their religion.

The castle, which was built by the Genoese, commands the port and town; the garrison consists of 1420 men, and both fortresses and town are not above 12 miles from the continent of Asia, from whence they are supplied with provisions, as the island, though tolerably fertile, does not afford a sufficiency for its numerous inhabitants, and the great number of strangers who are perpetually touching at the port. It is to be observed that Scio was one of the seven cities that contended for the honour of having given birth to Homer, and their coin formerly was stamped with his image.

The natives of this island are by their neighbours in general deemed a very stupid and ignorant set of people; the Turks call them *Praprios*, which signifies *stupid wretches*; and have a proverb concerning them, which may be thus translated:

Before a wife Sciot shall ever be seen,
Be sure you shall meet with a horse that is green.

The whole island contains 30 villages, 300 churches, 2000 Latins, 10,000 Turks, and 100,000 Greeks. In time of peace it is governed by a eadi, with a stipend of 500 aspers per day; but in war time a balla is sent from Constantinople to take upon him the supreme command. The Greek bishop is immensely rich, having, besides the abovementioned 300 churches, many chapels and monasteries under his jurisdiction: the chief of the latter called Neamoni, or New Solitude, is about five miles from Scio, contains 150 monks, and pays to the government 500 crowns annually, which it can well afford, its yearly revenue being 50,000 crowns, or an eighth of the produce of the whole island.

Gum mastich, the staple commodity, is gathered in August and September; at which season the officer who goes to receive the grand signior's quota, is entertained in a very sumptuous and festive manner.

Next to the capital, the following are the most considerable towns of the island.

Callimacha, the chief mastich town, contains six churches, which have 30 subordinate chapels and a nunnery belonging to them.

Pergi, which contains a castle, 30 churches, and 2000 inhabitants.

Mesta, is famous for the nectar wine, which its neighbouring vineyards produce.

Armolia is a mastich town, defended by a strong castle.

Vollisa is famous for its silk manufactory; it contains 300 houses, 1500 inhabitants, and is defended by a castle erected by the celebrated Belisarius, who experienced the most astonishing reverse of fortune, and from the glorious conqueror became the public beggar.

"Then think how few the joys allowed by fate,
"How mixt the cup, how short their longest date,
"How onwards still the stream of pleasure flows,
"That no reflux the rapid current knows;

" Merit itself can't bribe the ruthless hand ;
 " Of rigid time, or stay his ebbing sand ;
 " Wit shall expire, and beauty must decay ;
 " The night of age succeeds the brightest day ;
 " The cheeks where nature's sweetest garden blows,
 " Her whitest lilly, and her warmest rose ;
 " Bright eyes, the meaning ministers of love,
 " And coral lips, whose tender accents move ;
 " These must resign their lustre, those their bloom,
 " Dissolve at length, and find one common tomb."

St. Helena, of the Archipelago, is situated on a rock, and contains two churches, a chapel, and about 200 inhabitants.

Cambia has a castle upon a rock, and is celebrated for its pines, with which the Turks build many gallees, and for a hot medicinal spring.

Cardamita is situated in a very rich territory, which in particular produces annually 170 tons of excellent wine; many coins of Constantine the Great have been dug up in the neighbourhood; and a spring of water issues from a rock, at no great distance, which in its fall forms a beautiful cascade. This town was anciently famed for the temple of Neptune near port Dolphin, the ruins of which are yet to be seen.

" His finny train Saturnian Neptune joins :
 " Then adds the foamy bridle to their jaws,
 " And to the loosen'd reins permits the laws ;
 " High on the waves his azure car he guides ;
 " Its axles thunder, and the sea subsides ;
 " Then the smooth ocean rolls her silent tides ;
 " The tempests fly before their father's face,
 " Trains of inferior gods his triumphs grace,
 " And monster whales before their master play,
 " And chairs of tritons crown'd the wat'ry way."

While this island was under the dominion of the Venetians and the Genoese, the natives were permitted to be governed by their own laws, but since the Turks conquered it, the poor people are both despised and oppressed.

Thus conquest gives the bloody power to kill,
 Or the black privilege of using ill ;
 Who heaves a sigh, if freedom be the cause,
 Is by the victor deem'd to break the laws ;
 On godlike liberty who casts a glance,
 Falls the sad victim of the reeking lance.
 Th' oppress'd in silent sorrow must remain,
 Nor dare of their hard destiny complain.

5. P S A R A.

Psara, a very small island to the westward of Chios, is remarkable for nothing but a breed of asses, who die immediately after being carried from the island, but are exceeding strong, hardy, and long lived, while they remain in their native place.

Near this island are some smaller islands, called Carreners, which like those already mentioned are frequented by pirates.

6. S A M O S.

Samos lies in 37 deg. north lat. and 27 east long. at the distance of 40 miles from Chios, and opposite to the south coast of Ionia; it is about 80 miles in circumference, and the see of an archbishop; but this prelate is exceeding poor, for he is obliged annually to pay so large a stipend to the court of Constantinople, that he scarce leaves himself any thing. It was formerly a commonwealth; and is naturally so very fertile, that when Greece was at the summit of her glory, it was deemed, though less than many, of as much importance as any of the islands of the Archipelago. The trade at present consists of several sorts of wines, which are admirable, a superior kind of onions and garlick, fine earthen ware, raw silk, oil, honey, saffron, fruits, drugs, minerals, emery, oker, and black dye, &c. Notwithstanding the natural richness of this island, the natives are so much oppressed by the Turks, and plundered by the pirates, who infest the coast, that they are in general miserably poor.

The inhabitants are about 12,000, principally Greeks; the capitation tax which they pay amounts to about 6400 crowns, and the customs are farmed at 10,000 more. The governor, who is an aga of the Janissaries, collects about as much again for himself, and makes himself likewise heir to every Greek who dies without male issue, taking money, house, goods, and indeed every thing but the garden, which is left to the quiet possession of the daughters. The Greek monks are 200 in number, and so extremely ignorant, that their whole knowledge of religion consists in being able to say mass by rote.

The chief town Samos, which, as well as the island itself, the Turks called Suffan, is now reduced to a poor mean village; and to add to its wretchedness, the pirates frequently plunder it, but the noble fragments of its ancient splendor which still remain, excite at once admiration and melancholy in the beholder.

Vati, the residence of the French vice-consul, though formerly a splendid city, is now only a mean village, containing about 300 miserable houses and a few wretched inhabitants, that is according to the common acceptance of those words, for though they possess not worldly wealth, yet they appear rich in content, that most valuable of all treasures.

" They cannot want, who wish not to have more,
 " Who ever said an Anchorer was poor?"

Coro contains about 600 houses, but since it was plundered by the Venetians, many of them are gone to ruin, and more are uninhabited. A cadì, and an aga of the Janissaries are obliged by the Porte to reside here, notwithstanding the unwholesomeness of the air, occasioned by the putrid waters that surround the place, which are now stagnant, though they formerly flowed freely to the sea.

The rest of the towns are as much or more miserable; and, upon the whole, the island presents little besides but scenes that are shocking to the imagination.

The hermitage of Caecoprata is highly revered by the Greeks; it is a horrid cavern, with a rocky ascent to it of about 500 yards, narrow, steep, and craggy; but they are exceedingly fond of such dismal and romantic situations.

Perhaps nothing has contributed more to render Samos celebrated in history, than having given birth to that admirable philosopher Pythagoras, who afterwards removed to Crotona, according to Ovid;

" Here dwelt the man divine, whom Samos bore,
 " But now self-banish'd from his native shore ;
 " Because he hated tyrants, nor cou'd bear
 " The chains which none but servile souls will wear ;
 " He, tho' from heav'n remote, to heav'n cou'd move,
 " With strength of mind, and tread th' Abyss above,
 " And penetrate with his interior light
 " Those upper depths, which nature hid from sight ;
 " And what he had observ'd, and learnt from thence,
 " Lev'd in familiar language to dispense."

The city of Samos was formerly very magnificent, as we may judge from its ruins, which are still superb monuments of its ancient grandeur. Among other things it was famous for a noble temple, built to the honour of Juno, who was supposed to preside over clouds, nuptial rights, &c.

" Great queen of gath'ring clouds,
 " Whose moisture fills the floods ;
 " Great queen of nuptial rights,
 " Whose power the soul unites,
 " And fills the genial bed with chaste delights."

7. NICARIA, OR ICARIA.

Nicaria lies in 37 deg. 30 min. north lat. and 26 deg. 30 min. east long. is about 70 miles in circumference, and rocky, mountainous, and barren. It has no harbours for shipping, and consequently must be without commerce. The Samians say, that when the two islands were made, all the good materials were exhausted in making Samos, and that nothing but the rubbish re-

north lat, and 26 deg. iles in circumference, aren. It has no har- ently must be without that when the two aterials were exhausted ng but the rubbish re- mained

maintained for Nicaria. Some negative benefits, however, arise to the natives from these disadvantages, for the Turks do not think it worth their while to oppress them, nor the pirates to plunder them.

The inhabitants, who are about 3000 in number, have wine, which is but indifferent, sheep, goats, and aromatic herbs; they row their boats, and do other work quite naked for fear of wearing out the few cloaths they are able to procure.

A ridge of mountains parts the island in two; here are but two towns and a few scattered houses, and the natives are exceedingly lazy, of savage dispositions, and speak a most barbarous dialect of the Greek. They have a kind of bishop, 24 priests, and a few chapels. The people are strong and well made, but ill favoured and nasty, and have in general a bad character, which they seem fully to merit.

8. PATMOS, OR PATHMOS.

The island of Patmos lies in 37 deg. 20 min. north lat. and 26 deg. 45 min. east long. is 10 miles south-west of Nicaria, and only about 18 in circumference; nevertheless it has several convenient harbours, which give it the advantage over many other of the Levant islands. De la Scala, its principal port, is deemed the very best in the Archipelago. Sapfala and Cricou are likewise excellent harbours, but they are all terribly infested by pirates, which has obliged the inhabitants of Sapfala to evacuate the town, and retire up a neighbouring hill to the monastery of St. John, which is at once a religious house and fortress, has an annual revenue of 6000 crowns, and maintains 100 monks. Though the use of bells are forbidden in all other parts of the Turkish dominions, yet the monks of this monastery are permitted to have two large ones.

St. John the Evangelist was banished by the Romans to this island, and here composed his Apocalyptic or Revelations; the place is consequently in great esteem both by Turks and Christians; St. John's hermitage is situated upon a rock between Port De la Scala and the monastery; the entrance is hewn out of the solid rock, and leads to the chapel, which is almost 44 feet in length, 15 in breadth, and is covered with a gothic roof.

The management of this island is committed to the care of two Greek officers, as no Turks reside upon it. The taxes produce about 10,000 crowns annually. The houses are neater than those of most of the other islands, and the chapels are well built, arched, and about 250 in number. It is remarkable that though the island does not contain above 300 men, yet the women are near 6000 in number; the latter are good tempered and handsome, but spoil their faces by using a prodigious quantity of paint; however, the sweetness of their dispositions makes amends for all faults, and surpasses beauty, either natural or artificial.

"What is the tincture of the finest skin,
"To peace of mind, and harmony within?
"What is the sparkling of the brightest eye,
"To the soft soothing of a calm reply?"

9. CLAROS.

Claros lies very near Patmos, is mountainous, about 40 miles in circumference, has two sea-ports, a town and castle, to which it gives name, yet was never famous for any thing but a magnificent temple dedicated to Apollo.

"Me Claros, Delphos, Tenedos obey;
"These hands the Paterian scepter sway.
"The king of gods begot me; what shall be,
"Or is, or ever was, in fate I see,
"Mine is th' invention of the charming lyre;
"Sweet notes, and heav'nly numbers I inspire;
"Sure is my bow, unerring is my dart,
"But ah! more deadly his who pierceth my heart.
"Medicine is mine; what herbs and simples grow
"In fields and forests, all their powers I know;
"And am the great Physician call'd below."

APOLLO'S ADDRESS TO DAPHNE.

10. LEROS.

The island of Leros, Leria, or Oleron, lies to the south of Patmos and north of Claros, is 18 miles in circumference, and produces abundance of aloes; Greeks and Turks inhabit it, but are not numerous. It contains but one small town, a few scattered hamlets, and a small number of monasteries. Upon a hill are some noble ruins, in particular about 20 superb marble fountains that remain entire, and which are perhaps the remnants of the temple of Diana, on whose account this island was formerly famous, and of whom take the following description,

"The graceful goddess was array'd in green;
"About her feet were little beagles seen,
"That watch'd with upward eyes the motions of
"their queen;
"Her legs were buikin'd, and the left before,
"In act to shoot; a silver bow she bore,
"And at her back a painted quiver wore;
"She trod a waxing moon that soon wou'd wane,
"And drinking borrow'd light be fill'd again;
"With down-cast eyes, as seeming to survey
"The dark dominions, her alternate sway."

11. THE MANDRIA ISLANDS.

The Mandria islands are a cluster of small islands to the eastward of Leros; the center island is by far the largest, but none of them are inhabited, except by the pirates that infest those parts, and who are some of the most cruel and savage wretches existing, murdering the crews of all the ships they are able to overpower.

"Bold were the men, who on the ocean first
"Spread their new sails, when shipwreck was the worst;
"More dangers now from man alone we find,
"Than from the rocks, the billows or the wind."

12. STANCHIO, OR COOS.

Stanchio, which lies in 36 deg. 40 min. north lat. and 27 deg. 30 min. east long. is opposite to the coast of Doris, 80 miles from Samos, 70 in circumference, has a fruitful soil, and towards the east gradually rises into mountains; it is rich in pasture, wines, fruit, turpentine, cypress, medicinal and other plants, &c.

Cos, the capital, is spacious, populous, well built, and strongly fortified; it is situated on the eastern coast, and was formerly famous for a superb temple of Esculapius, as the island itself was for the birth of the celebrated Hippocrates, whose house is still shewn in the town of Harangues; but both these celebrated physicians owed their fame more to their recommending temperance than to any of the medicines they discovered.

"By exercise our long-liv'd fathers stood,
"Toil thrung their nerves, and purified their blood;
"But we their sons, a pamper'd race of men,
"Are dwindled down to threecore years and ten.
"Better to hunt in fields for health unbought,
"Than see the doctor for a poisonous draught.
"The wife for cure on exercise depend;
"God never made his work for man to mend."

To return to Cos, it was celebrated for some light garments manufactured here, and called *vestimenta coa*; but was still more famous for the statue of Venus, made here by Apelles, who was a native of this little island; and hence originated the notion of Venus's rising out of the sea.

"When bright Venus rises from the flood,
"Around in throngs the wond'ring Neriads crowd,
"The Tritons gaze, and tune the vocal shell,
"And ev'ry grace unfung the waves conceal;
"A lute she holds; and on her head are seen
"A wreath of roses red, and myrtles green;
"Her turtles fan the buxom air above,
"And by his mother stands an infant love."

This admirable piece of workmanship was first lodged in a stately temple, but Augustus carried it to Rome; and to make the superstitious people some amends for its loss, their tribute was entirely remitted. The harbour is good, and well secured from the depredations of pirates.

13. STAMPALIA.

Stampalia lies about 40 miles from the coast of Anatolia, is 60 miles in circumference, has a town of its own name on the south coast, two harbours, and was anciently celebrated for its temple of Apollo. It has a church or two, subject to a bishop, but is very thinly inhabited.

14. CARPANTHUS.

Carpantus or Searpanto, on the south coast of Doris, lies in 35 deg. 45 min. north lat. and 27 deg. 40 min. east long. is between Cerate and Rhodes, and anciently gave name to the Carpathian Sea. It is near 80 miles in circumference, but is mountainous, barren, and but thinly inhabited. It has no town except Searpanto, whose harbour is tolerable, but terribly infested by the pirates.

15. ISLANDS IN THE GULPH OF SMYRNA.

These islands, being five in number, are small and uninhabited, one is called Long Island, or Isola de Eglera, that is church island; it is 10 miles long, rather narrow, and contains the ruins of a magnificent temple. Another of them the Greeks say formerly contained many elegant buildings, of which no vestiges are at present left, but an apartment supported by four pillars; the whole being cut out of the solid rock; from this island a causeway formerly joined to the main land, but it is now entirely ruined. Some have imagined this to be the Clazomenae of the ancients, but whether the conjecture is right we cannot pretend to determine.

16. RHODES.

Rhodes extends from 35 deg. 50 min. to 36 deg. 30 min. north lat. and from 28 deg. 20 min. to 28 deg. 44 min. east long. being 75 miles east from Candia, 8 from the Lycian coast, and about 120 in circumference. This island hath been long famed in history under various names, and its inhabitants very early were deemed a maritime people. When attacked by the Greeks the Rhodians called in the Romans to their assistance; who, according to their usual custom, drove away the Rhodians's enemies, and repaid themselves for their trouble, by seizing their country, and making bold with the property of the natives; after which it underwent many revolutions, being taken by the Venetians in 1124. The Turks conquered it in 1283, but were driven out of it by the knights of St. John of Jerusalem in 1308; however, Soliman the Magnificent attacked it with an army of 200,000 men, and 300 ships, and took it, January 1, A. D. 1523, after the Rhodians had lost 90,000 of their men, and the Turks a much greater number. After this misfortune most of the Rhodians quitted their country, so that the island became very much depopulated; the Turks, however, shewed so great a respect to the knights of Rhodes, that they suffered them to keep their houses, effects, coats of arms, statues, inscriptions, &c. and granted very considerable privileges to such as would come and settle there, which drew back some of the Rhodians, and many of the Greeks; so that Rhodes at present is as populous and flourishing as Turkish tyranny will permit any place in the Ottoman territories to be.

The metropolis of Rhodes is called by the same name, and was always esteemed a place of great strength; at present, though its former splendor is much decayed, it is a handsome city and a good sea-port; the situation at the side of a hill is delightful; it is about three miles in circuit, fortified by a treble wall and castle, though they are but in bad repair; the streets are capacious and well paved, particularly that of St. John, which is

paved with beautiful marble; the houses are elegantly built in the Italian taste, and the markets well supplied with all kinds of provisions. It has two harbours, a large for ships of all nations, and a smaller for the Turkish galleys only, a squadron of which are always kept here to cruise against the Maltese ships. This port is shut up every night with a chain, and near it is a fine piazza adorned with stately trees, at the extremity of which are the arsenal and dock. The church of St. John, a most noble structure, is converted into a mosque, many other churches, the palace formerly belonging to the grand master, the houses of the knights, &c. are still magnificent fabrics.

This city was formerly celebrated for the learning and politeness of its inhabitants, and the numerous academies for various arts and sciences, which were kept open at the public expence; but at present literature meets here with the same treatment that it does in all other parts of the Turkish dominions.

The soil of Rhodes is so fertile and rich, that it produces every delicacy that man can wish to enjoy; and the air is the most pure and serene that he could desire to breathe. Indeed such is the beauty of the country and delightfulness of the climate, as to give occasion to the poets to feign that Apollo rained golden showers upon it, and blessed it with his most prolific and salubrious beams.

“ The glorious ruler of the morning So,
“ But looks on flowers, and straight they grow;
“ And when his beams their light unfold,
“ Ripens the dullest earth, and warms it into gold.”

Hence the inhabitants erected the celebrated Colossus, one of the wonders of the world, to the honour of Apollo or the sun. This prodigious statue was made of brass, 70 cubits, or about 123 feet in height, proportionably big in every part; it stood altride over the haven, so that ships could sail in and out between its legs. In one hand it held a light-house, in the other a scepter; and its head represented a golden sun. The distance between the two feet was 100 yards, and two men could scarce with extended arms embrace its thumb. After having stood 66 years, it was overturned by an earthquake; and though the Rhodians collected from the various Grecian states a prodigious sum to defray the expences of repairing it, yet the money was embezzled, and the image was suffered to lay on the ground for the space of 894 years, when the Saracens took the city, and sold it as old brass to a Jew, who loaded 960 camels with it; the whole weight being 720,000 lb. avoirdupoise. This wonderful work was made by Clares, a native of Rhodes, who was 12 years in completing it. Just on the spot where the feet stood, a castle on one side and a tower on the other were erected, and are standing at present.

The modern Christian inhabitants of this fine island are very poor, and are not suffered to live within the walls of the city, which privilege is, however, granted to the Jews. The principal manufactures are silk, tapestry, and camblets; but the city is a mart for all the commodities and productions of the Levant; yet Rhodes is kept merely in opposition to the Christians, as it does not remit any thing to the grand signior, the Turkish balls being allowed the whole of its revenues, to maintain the gallees, the garrison, and himself.

17. CYPRUS.

This celebrated island lies between 34 and 36 deg. north latitude, and between 33 and 35 deg. east longitude, in the most easterly part of the Levant, and is the largest of all the islands of Asia Minor, being 200 miles in length, 46 in breadth where widest, and about 30 from the continent. The ancients had many names for it, in particular they called it Macaria, on account of its surpassing fertility; and Cyprus, the name it still bears, from the abundance of cyprus trees which it produced. The first mention we have of it in history, is the conquest of it by Cyrus, who found it divided into nine petty kingdoms, each governed by its own sovereign; the Ptolemies of Egypt then subjugated it; the

een 24 and 26 deg. d 36 deg. east longi- the Levant, and is a Minor, being 200 ents wide, and about ts had many names Macaria, on account us, the name it still presr trees which it ave of it in hillary, ho found it divided erned by its own fa- n subjugated it; the Romans,

Romans, and after them, the emperors of Constantino- ple possessed it. In 1191, it was conquered by Richard the first, king of England, and given by him to Guy of Lusignan, whose successful reign over it till 1200, when the Venetians seized it, who remained masters of it till 1570, when it was conquered by the Turks, who still continue in possession of it.

The soil produces all kinds of grain, wines, oil, sugar, cotton, honey, saffron, wood, metals, minerals, plants, drugs, flowers, &c. all excellent in their kinds. It was formerly populous and opulent, but at present is but poor and thinly inhabited, which is chiefly owing to two causes, viz. the tyranny of the Turkish govern- ment, and the swarms of locusts which for some ages past have infested it, to the frequent destruction of the produce of the earth. Their wool and cotton manu- factures are the best in the east, but the silk is very in- different. By one of the Turkish bassas all the sugar canes in the island were destroyed; the people, how- ever, have a great traffic in a delicious bird, which they catch in the months of September and October, and pickle in vast quantities to export to Venice, where they are much prized, and purchased at a high price by the voluptuous.

It was formerly divided into 12 districts, each con- taining a large city, and the whole including 800 vil- lages; at present it is deemed of great importance, be- ing governed by a bassas: subordinate to whom are

Five	[Uchili,] and these	} 40 ziamets,

		Schis,		
		Tausus,		

The inhabitants were formerly deemed some of the most lewd and debauched people in the universe; and, ac- cording to the most authentic accounts, their inclin- ations are as depraved as ever; but the Turkish govern- ment compels them to a more reserved behaviour, and at least obliges them to act with an outward appear- ance of decency. The present inhabitants are chiefly Greeks, who dress after the Italian fashion, but retain their own religion and customs. The people of this island were converted to Christianity by St. Paul and St. Barnabas, the latter of whom was a native of Cy- prus. It gave birth to the poet Alcepius, Xenophon, Zeno, Apollonius, the famous bishop Epiphanius, and several other great men. Cyprus has no considerable rivers, but some famous mountains, particularly Olym- pus, whose height and extent are astonishing:

“ Huge Olympus tow’rs
“ The parliamentary feat of heav’nly pew’rs.”

On this mountain, at the distance of every league, there is a Greek monastery, and a fountain said to be erected by the empress Helena, the mother of Constan- tine the Great.

Hardly any vestiges remain of the ancient city of Sa- lamis, formerly celebrated for its temple of Jupiter, who was here represented by an image armed with thun- der and lightning:

“ The mighty Thund’rer with majestic awe,
“ Then shook his shield, and dash’d his bolts around,
“ And scatter’d temples on the teeming ground.”

The principal places at present are the following: Famagusta, or Afilnee, is an elegant city, and good sea-port; pleasantly situated, and defended by two forts; it is enclosed on two sides by a ditch, and double wall well fortified; and on the other two by the sea. The Turks are sensible of the importance of this place, and, contrary to their usual custom, keep the fortifica- tions in excellent repair. The governor of this city is accountable only to the Ottoman Porte, not being sub- ordinate to the bassas of the islands. The Greeks and other Christians are only permitted to keep shops here in the day time, but are not allowed to live in the city, which is, however, a bishop’s see, subject to the metropoli- tan of Nicosa.

Though the above is the most important place, yet Nicosa is deemed the metropolis of Cyprus. This city, which is delightfully situated in the center of the island,

was formerly the seat of the Cyprian monarchs. It was then nine miles in circuit, but is now dwindled to three. It is, however, still a beautiful town, of a cir- cular form, surrounded by walls, defended by a deep ditch, and well fortified. It formerly contained 40,000 houses, and several noble palaces; but many of the first, and all the latter, are fallen to decay, or have been pulled down. The best churches, particularly St. Sophia, the Turks have converted into mosques. The Greeks, Latins, Armenians, Nestorians, Maronites, &c. have their churches and chapels allowed them. This city is the residence of the Turkish bassas and the Greek archbishop, the suffragans of the latter being the bishops of Famagusta, Paphos, Larneca, and Cerenes.

Larneca is a good sea-port, in which the French and Venetians have a consul; the houses are, however, low and mean, and the inhabitants composed of Turks, Greeks, and some Europeans. The commodities are cotton, cotton yarn, wool, &c.

Cerenes, the ancient Cerania, is almost in ruins, though formerly a strong and populous place. People depart from hence to the Continent as the nearest port. The Palace of Peace, a magnificent edifice formerly be- longing to the knights, is near this city; and at about nine miles distance there is a Greek monastery, the monks of which have cells along the sea coast, where they deposit the fish which they are employed to catch for the use of the brotherhood.

Larneca is now no thing but a mean village, though it remains a bishop’s see; and the situation of the ancient city of Amathus is not at present known.

Paphos, now called Bassa, is situated on the western coast of the island. St. Paul in this city converted its governor Sergius, and struck the necromancer Barjesus with blindness (Acts xiii. 6.) Though much decayed from its former glory, it is still a bishop’s see, and a good sea-port town. In ancient times it was much cele- brated for its magnificent temple dedicated to Venus, from which the goddess of Love was called the Paphian Venus:

“ The goddess flies sublime
“ To visit Paphos, and her native clime,
“ Where garlands ever green, and ever fair,
“ With vows are offer’d, and with solemn pray’r;
“ An hundred altars in her temple smoke,
“ A thousand bleeding hearts her pow’r invoke.”

The condition of the votaries of this captivating goddess are thus finely described by Dryden:

“ In Venus’ temple on the files were seen
“ The broken slumbers of enamour’d men;
“ Looks that ev’n spoke, and pity seem’d to call,
“ And issuing sighs that smok’d along the wall;
“ Complaints and hot desires, the lover’s hell,
“ And scalding tears, that wore a channel where they
“ fell;
“ Expence and after-thought, and idle care,
“ And doubts of motley hue, and dark despair;
“ Suspicions, and fantastical fumes,
“ And jealousy fustus’d with jaundic’d eyes.”

The first king of Cyprus, of whom we have any ac- count, is Cinyras, grandson of Pygmalion. Of the father and grandfather of this prince, the poets have invented the following fable: Pygmalion coming to Cyprus, and finding that all the women here lived in a very licentious and improper manner, he determined never to marry; but, in order to avoid idleness, he ap- plied himself to the art of sculpture. Having made an ivory statue of a female to an amazing degree of per- fection, with respect to beauty and symmetry, he fell desperately in love with his own work, and prayed to the goddess Venus to procure him a wife as beautiful: the goddess complied, by changing the statue into a damsel. Pygmalion married her, and she bore him a son called Paphos, who was the father of Cinyras: the story is thus told by Ovid:

“ Pygmalion, loathing their lascivious life,
“ Abhorr’d all womankind, but most a wife;
“ So single chose to live, and thum’d to wed,
“ Well pleas’d to want a consort of his bed;”

“ Yet

" Yet fearing idleness, the nurse of ill,
 " In sculpture exercis'd his happy skill,
 " And carv'd in ivory such a maid, so fair,
 " As Nature cou'd not with his art compare
 " Were she to work, but in her own defence
 " Must take her pattern here, and copy hence.
 " Pleas'd with his idol, he commends, admires,
 " Adores; and last, the thing ador'd desires:
 " A very virgin in her face was seen,
 " And had she mov'd, a living maid had been:
 " One wou'd have thought she cou'd have stirr'd, but
 strove
 " With modesty, and was asham'd to move;
 " Art hid with art so well perform'd the cheat,
 " It caught the carver with his own deceit:
 " He knows 'tis madness, yet he must adore,
 " And still the more he knows it, loves the more.
 " The feast of Venus came, a solemn day,
 " To which the Cypriots due devotion pay;
 " With gilded horns the milk-white heifers led,
 " Slaughter'd before the sacred altars bled,

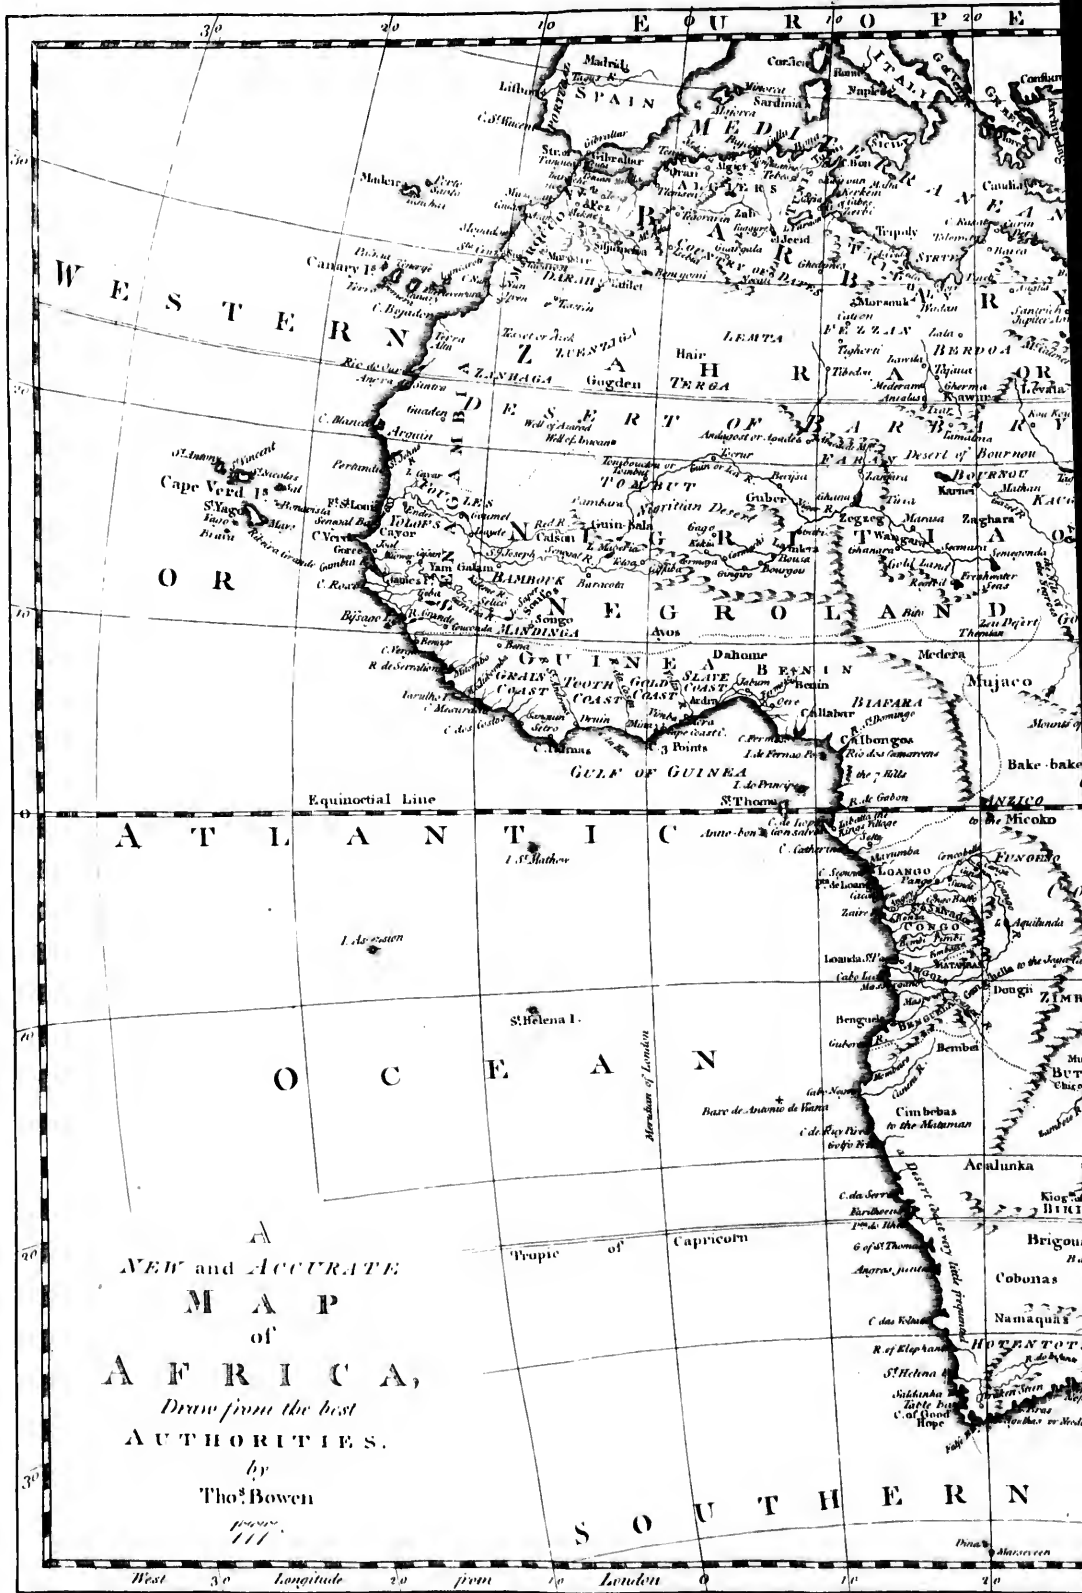

" Pygmalion, off'ring first, approach'd the shrine,
 " And then with pray'rs implor'd the pow'rs divine;
 " Make this fair statue mine, he wou'd have said,
 " But chang'd his words for shame and only pray'd:
 " Give me the likeness of my iv'ry maid,
 " The golden goddess, present at the pray'r,
 " Well knew he meant th' inanimated fair,
 " And gave the sign of granting his desire,
 " For thrice in cheerful flames ascends the fire;
 " Convinc'd, o'erjoy'd, his study'd thanks and praise
 " To her who made the miracle he pays;
 " Then lips to lips he join'd, now freed from fear,
 " He found the favours of the kiss sincere;
 " At this the waken'd image op'd her eyes,
 " And view'd at once the light and lover with surprize;
 " The goddess present at the match she made,
 " So blest'd the bed, such fruitfulness convey'd;
 " That ere ten months had sharpen'd either horn,
 " To crown their bliss a lovely boy was born;
 " Paphos his name, who grown to manhood, wall'd
 " The city Paphos, from the founder call'd.

A NEW AND COMPLETE
 S Y S T E M
 OF
 G E O G R A P H Y.

BOOK II.

A F R I C A.

WE now come to the second grand division of the globe, called *AFRICA*. This quarter of the world is neither so generally fertile as the other three, nor so populous as either Asia or Europe; it nevertheless abounds in riches, and might be rendered of much greater importance than it is at present.

Africa is surrounded on every side with water, except where it joins to Asia by the isthmus of Suez, which separates the Mediterranean from the Red Sea, and is only about 60 miles over. Being thus almost an island, it hath a vast extent of sea coast, and is most advantageously situated for commerce; but navigation is neither esteemed or cultivated by the inhabitants, the best of whom are but despicable sailors, their whole naval skill consisting only in building a few piratical vessels on the northern parts, or Barbary coast, for the purposes of plundering the honest merchant; and the constructing some fishing boats and canoes in all the other maritime parts. This country was once famous for power, riches, learning, and commerce; but the alternate depredations of the Romans, Vandals, and Saracens, have reduced it to the lowest ebb of ignorance and barbarity.

The greatest part of Africa lies between the tropics, the equinoctial line passing through the midst of it, consequently the climate has but little variation, and the whole is so exceedingly sultry, as to prove disagreeable, if not fatal to those born in the colder regions, while the burning sands contribute not a little to render the heat still more incommensurable. The inhabitants are unacquainted with ice, hail, or snow, and being but seldom blessed with rain, depend on the overflowing of the rivers for the fertilization of the soil in many parts, while other extensive regions are nothing but sterile, and

uninhabitable burning sands. The barrenness in several places, the brutality and savageness of the natives, and the ferocity of the innumerable wild beasts in most of its countries, evince that the rays of the sun are here so fervid and powerful as to dry and burn up the juices of the vegetable, and overheat the blood of the animal, creating; so that the first is rendered futile, and the latter furious.

“ What’s all that Afric’s golden rivers roll,
 “ Her od’rous woods, and shining iv’ry stores?
 “ Ill fated race, the softning arts of peace,
 “ And all protecting freedom, which alone
 “ Sustains the name and dignity of man,
 “ These are not theirs—the parent sun himself
 “ Seems o’er this world of slaves to tyrannize,
 “ And with oppressive ray the roset bloom
 “ Of beauty blasting, gives the gloomy hue
 “ And feature gross—or worse to ruthless deeds;
 “ Mad jealousy, blind rage, and fell revenge
 “ Their fervid spirit fires.—The brute creation
 “ This rage partakes, and burns with horrid fire.”

Africa is in length from Cape Bona in the Mediterranean northward, to the Cape of Good Hope southward, 4300 miles, and 3500 miles in breadth, from Cape Gurda-lui, in the straits of Babel-mandel eastward, to Cape Verd westward; being bounded on the north by the Mediterranean sea, which divides it from Europe; on the south by the Pacific ocean; on the east by the India ocean, Red-sea, and little isthmus of Suez, which divide it from Asia; and on the west by the Atlantic ocean, which separates it from America. Many other particulars will be explained at one view, by inspecting the following tables.

Though Africa produces gold, ivory, and many other valuable commodities, yet the chief commerce is the sale of the human species; to carry on which iniquitous trade the natives are perpetually at war with each other, in order to get prisoners to sell for slaves: thus a practice, cruel in itself, is supported by the most barbarous means; but if prisoners of war fall short, one village will commit depredations upon another, and, seizing upon their neighbours, with their wives and children, drive them without remorse to the sea coast, and dispose of them to the Europeans; and, if this last expedient does not answer their purpose, they do not hesitate to sell their own relations and offspring. In fine, Africa produces the

most barbarous people, and the greatest number of wild beasts, and other dangerous animals, of any of the four quarters into which the world is divided; for here are found

“ The tyger darting fierce,
 “ Impetuous on the prey his glance has doom’d;
 “ The lively shining leopard, speckled o’er
 “ With many a spot: — the beauty of the waste;
 “ The keen hyena, fell of the fell;
 “ The elephant, cast in the huge mould;
 “ Th’ amphibious crocodile, and lion bold;
 “ The venom’d snake, that curls along the plain,
 “ And all the reptiles of the hissing train.”

CHAP. I.

B A R B A R Y.

THE considerable countries included under the general name of Barbary, are the most fertile, populous, and trading parts of Africa, Egypt excepted. Barbary is bounded by the Mediterranean on the north, which separates it from Europe; on the east by Egypt; on the south by the deserts of Zaara; and on the west by the Atlantic Ocean; being in length, from east to west, about 2200 miles, and in breadth from north to south, where widest, about 600 miles. This country is divided into the following kingdoms and states, viz.

Barca,	Algers,
Tripoli,	Morocco and Fez.
Tunis,	

SECT. I.
 B A R C A.

THIS inhospitable country, which is a mere desert, extends 400 miles from north to south, and 300 from east to west; comprizing those districts which the antients term’d Marmarica and Cyrenaica. It was better known to the antients than the moderns, and is particularly mentioned by Virgil, on account of the ferocity of the people, in the speech which he puts into the mouth of Anna, queen Dido’s sister, when she is recapitulating the states that surround Carthage:

“ This little spot of land which heav’n bestows,
 “ On ev’ry side is hemm’d with warlike foes;
 “ Getulian cities here are spread around,
 “ And fierce Numidians there your frontiers bound:
 “ Here lies a barren waste of thirsty land,
 “ And there the Syrtes raise the moving sand;
 “ Barcæan troops besiege the narrow shore,
 “ And from the sea Pygmalion threatens more.”

This country is stiled by the few Arabs who inhabit it, Ceyrart Barka, or the Desert of Whirlwinds and Hurricanes. The territory about the towns and villages produce a scanty pittance of corn, millet and maize; all other parts of this wretched region are totally barren, and the whole labours under a great scarcity of water. Small as the quantity of grain is, the poor people are under the necessity of bartering some of it for camels, sheep, dates, &c. Perhaps the most pleasant place in the whole country is that small district upon which the temple of Jupiter Ammon antiently stood; yet this is surrounded by horrid plains of burning sands, which move under the traveller’s feet like waves, or, being raised by the winds, overwhelm him with clouds of dust. If any are obliged to journey through this disagreeable region, they must travel with a compass, or they would be lost in the desert, and wander about till they perished with hunger and thirst. The

antient Cyrenaica is the desert part, and that called Marmarica the inhabitable district: those who live near the sea coast are all given to piracy; and the maritime part itself is called the coast of Derna, from the chief city remaining, all the other towns known to the antients being either totally ruined, or dwindled to the most inconsiderable villages. The authors of the Universal History say thus concerning the principal places of this country, “ What condition they are in, what commerce they drive, or how and by whom governed, we cannot find any satisfactory account of.” And as we have not any information relative to them, more recent than what those gentlemen have adverted to, we can only farther add, that the people are most determined, ferocious, and cruel robbers both by sea and land, and that they are so poor as to be obliged frequently to sell their wives and children to the Sicilians, in order to augment their means of subsisting, and to get rid of all that they may deem an incumbrance.

SECT. II.
 T R I P O L I.

THE kingdom of Tripoli is bounded by Barca on the east, by Tunis and Biledulgerid on the west; by Mount Atlas on the south, and by the Mediterranean on the north; extending along the coast above 700 miles, that is, from 10 deg. 13 min. to 25 deg. 27 min. east longitude, exclusive of the creeks and projections of the shore.

The whole kingdom is divided into six provinces, viz.

Tripoli Proper,	Benolefa,
Meirata,	Gulph of Sidra,
Haicha,	Ogucla,

to which some geographers add Barca; for not knowing by whom that country is at present governed, they without authority give it to the nearest neighbour.

The towns on the sea coast are the most considerable, and the most known: those of the inland parts are so little known, and so trifling, that they have scarce been deemed worthy of attention by either antient or modern travellers: the inhabitants of both, however, are equally addicted to robbing, for the former are professed pirates, and the latter plunder their neighbours, whenever they can find an opportunity.

The city of Tripoli is the capital of the whole country, and was antiently distinguished by the names of Old and New; the former was built by the Romans, subdued by the Vandals, and destroyed by the Mahometans, when the latter arose out of its ruins.

New Tripoli is but small, yet populous; and the natives, though barbarous, are flourishing. Its situation is on a sandy soil, near the margin of the sea; strong

strong walls, defended by formidable ramparts, and flanked by pyramidal towers, surround it. Here are but two gates, the north gate towards the sea, and the south gate towards the country; and the whole city forms the figure of a crescent, the concave part of which encloses the haven. At the extreme points of the harbour, which is very commodious, are some military works; those to the east are in bad condition, but on the westward there is a strong castle well fortified. The houses in general are very mean and low built, and the streets narrow and crooked; yet some remaining monuments of magnificence seem to confirm the prevailing opinion of the inhabitants, that it was once remarkable for the splendor of many of its public buildings: among these are the fragments of a triumphal arch, which is nearly buried in the sand, but exhibits a sufficient part above ground to give some idea of its elegance when perfect, and standing in its proper situation. This city labours under two very great inconveniencies, viz. the scarcity of corn, and want of sweet water; the sandy soil making it difficult to cultivate the first; and the want of rivers, springs, wells, &c. rendering it impossible to procure the latter, without the disagreeable necessity of catching rain in cisterns and reservoirs. The deficiency of fresh water, and great sterility with respect to grain, are both supposed to have been occasioned by the encroachments of the sea, which has frequently been known to overflow the neighbouring territory to a very considerable distance: but these inundations, though they may have essentially injured them in the above respects, have considerably benefited them in another particular, that is, the amazing increase of lotus trees, which thrive best in a saline clay or sandy soil, and produce both food and drink, as the fruit eats excellently well, and makes a most delicious wine. Yet, after all, the inhabitants of Tripoli could not subsist upon the produce of their country, without the additional provisions continually brought in by their piratical vessels.

An admirable author informs us, that the people of Tripoli "trust the guarding of their city in the nighttime to mastiffs, which are shut up during the day in one of the bastions of the ramparts. These mastiffs discharge very faithfully the duties of their functions; they patrol through the streets of the city, and if they happen to meet with any person, they are sure to tear him to pieces. The moment day breaks, they go of themselves to the door of their prison; they bark the instant they hear any person come near their habitation, and their roaring is heard in all that quarter of the city."

The adjacent territory abounds with the country houses of the principal Tripolines, the gardens belonging to which are usually managed by the Christian slaves, who are, however, at night all confined in a single bagnio or goal in the city itself.

Tripoli is frequently visited by the plague, on which account the Franciscans who are settled here have, besides their church and convent, an hospital, in which they administer relief to the Tripolines, as well as those of their own persuasion.

A French nobleman, in speaking of Tripoli, says, "This city is far less considerable than Algiers, and not comparable to Tunis. The government is the same with that of the rest of the cities of Africa; the Moors are in as little credit here as at Algiers; the Nazarene (Christian) renegades enjoy the greatest share of authority of any sect of people in this country, and fill the chief employments; indeed there are a vast number of renegades here, and I have conversed with many of them: they all appeared to be as ignorant of the religion they had embraced, as of that quitted by them; most of the persons in question had been so poorly educated, that they were scarce acquainted with the rudiments of their belief; and indeed they assign the most trifling reasons possible for their quitting their religion; whereas in other countries, slaves are commonly prompted from the ill treatment they meet with from their patrons to turn Mahometans; they here, on the contrary, are brought over by gentleness. Of all the confessions of Barbary, none are I think, though none are so much addicted to their, as the people of Tripoli."

Capez, or Yabs, as the Moors call it, is situated on the ancient river Triton, to which the moderns have given the same name as the town. Being the frontier town between Tripoli and Tunis, it is large and well fortified, and in its neighbourhood are found the ruins of the ancient city called by the Romans Tacapa. Capez, however, is but poor, and thinly inhabited by fishermen and a few husbandmen, the latter of which cultivate a small quantity of barley, a considerable number of palm trees, and a root which resembles a potatoe. The natives are as black as negroes, and so poor, that they look upon a few pecks of barley, and half a dozen of palm trees as a considerable fortune. It is proper to observe, that the river Capes rises in a sandy desert, and disembogues itself into the Mediterranean: hence the waters are so hot, that they cannot be drank till they have been put into some cool place for about the space of two hours.

Mahara, situated at the entrance of a gulph, is now so extremely inconsiderable, as not to be worth mentioning, except on account of a citadel which defends the haven.

El-Hammah is a ruined town about 12 miles from Capez. It was never remarkable but for its Roman walls, its hot sulphurous springs, the aqueducts by which they are conveyed, and of which scarce any vestiges remain. The inhabitants are a few fishermen, who are pirates when occasion offers, and some husbandmen, who are thieves at all opportunities.

Zoara, or as it is commonly called Zares, is supposed to be the ancient Psidua, being situated on the sea coast near 13 miles from the island of Zerbis: it is surrounded by an old wall almost in ruins; the inhabitants, who are but few in number, live by fishing, and burning quick lime and pot-ash, or, when opportunity serves, by piracy.

The above towns, which are situated on the western coast of the gulph of Sidra, are the best in the country; those on the eastern side, and within the gulph, are in a wretched condition indeed, and present a dreadful picture of the devastations of time, which is for ever changing the form of subaltern things:

"Nature knows
"No steadfast station, but or ebbs or flows;
"Ever in motion she destroys her old,
"And casts new figures in another mould;
"Ev'n times are in perpetual flux, and run
"Like rivers from their fountains rolling on;
"For time no more than streams is at a stay;
"The flying hour is ever on her way;
"And as the fountain still supplies her store,
"The wave behind impels the wave before:
"Thus in successive course the minutes run,
"And urge their predecessor minutes on;
"Still moving, ever new, for former things
"Are set aside, like abdicated kings,
"And ev'ry moment alters what is done,
"And innovates some act till then unknown:
"Time is th' effect of motion, born a twin,
"And with the world did equally begin;
"Time like a stream that hastens from the shore,
"Flies to an ocean where 'tis known no more;
"All must be swallow'd in this endless deep,
"And motion rest in everlasting sleep."

These parts of Africa have been subject to a great variety of revolutions from the various inundations of Goths, Vandals, Arabs, Mahometans, &c. who have over-run the country at different times; to which may be added the deprivations of the Europeans, and tyranny of the government. The island of Malta is a perpetual thorn in the sides of the piratical states, particularly to those of Tripoli and Tunis, from the vicinity of its situation; and the Maltese knights merit the thanks of all commercial nations, for having so greatly circumscribed the power, and restrained the piracies of the Barbary rovers.

After the Moors were driven out of Andalusia in Spain, they built the town of Derne on the western side of the gulph of Sidra, which indeed is the only place worth mentioning in the district of that name. It

is situated at the distance of about half a mile from the sea, and is better supplied with sweet water than most of the towns in the Tripoline territories; nevertheless the inhabitants are few in number, and wretchedly poor in circumstances. The most remarkable produce is great quantities of admirable honey, the delicacy of which is occasioned by the bees feeding upon a kind of shrub peculiar to this country, that bears a fragrant yellow flower, and blossoms all the year.

The district of Meqrata was antiently very flourishing, but at present is much reduced, though it contains a few towns on the sea coast, and some scattered villages, and upon an emergency can raise 10,000 men fit to bear arms. The inhabitants retain their former spirit, for they appear at present to be as impatient of the Tripolitan, as they were antiently of the Tunisian yoke: they are often at war with the wild Arabs, and pay a tribute, though reluctantly, to the bey of Tripoli.

The inland districts are less populous, less known, and have fewer towns than any of those above deser bed. Indeed Augucla, or Ouguela, though in many parts a barren desert, contains a few spots that are fertile, particularly in dates and pasturage.

The beys of Tripoli are not mere nominal vassals to the Turkish government, like those of Algiers and Tunis, but are obliged to pay a considerable tribute, which puts them under the necessity of tyrannizing over the poor people, and reducing them to the utmost indigence and misery, in order to obtain a sufficient sum to discharge their quota. The revenues are raised by an impost on the cofairs, which are usually about eight in number, by a tax on commercial imports and exports, and by a subsidy which the Jews are obliged to furnish. The bey likewise taxes the wild Arabs and inland Moors; but these frequently refuse to pay the tribute, when he is obliged to send his flying camp of janissaries among them to reduce them to obedience: but neither the Porte, or the Turkish baila trouble themselves about the government, provided the bey pays with punctuality his stipulated tribute to the sultan, and gratifies the avaricious cravings of the sultan.

The principal article of commerce is in slaves, which are either taken by the cofairs at sea, or stolen by the wild Arabs and Moors from the neighbouring states. Both are, however, usually sent to Turkey, and sold there as the best market, unless they imagine that they belong to a distinguished family, when they are kept in expectation of a considerable ransom.

Besides the above, the only article of trade worth mentioning is the sale of ashes, which are disposed of to the Europeans for the purposes of making soap and glass. It is to be observed of this regency, that with respect to commerce and treaties, the people are much greater observers of their word, and perform their promises with more punctuality, than any of their piratical neighbours.

Revolutions of Tripoli.

THE first accounts of Tripoli we have from the Roman writers, who mention it as a very flourishing state. After the inhabitants had thrown off the Roman yoke, in the decline of that empire, they were successively subdued by the Vandals, Saracens, and the sovereigns of Morocco, Fez, and Tunis. At length, in the reign of Bucamen, king of Tunis, who ruled the Tripolines very despotically, the inhabitants thought proper to revolt, and constituted one of their own people king of Tripoli; but the new monarch turning tyrant was poisoned, and succeeded by Abubacer, who had been one of his officers, but quitted the military for the heremetic life, by turning Marabout.

In the beginning of this king's reign, Tripoli was besieged by an army of 15,000 Spaniards, who soon took the place, and sent Abubacer, with his whole family, prisoners to the emperor Charles V. who was then at Palermo; but this monarch restored him again to his kingdom, upon condition that he should become his vassal and tributary.

Abubacer reigned in Tripoli till the knights of Rhodes were driven from that island, and obliged to

retire to Syracuse, when the beforementioned emperor granted them the island of Malta, together with the city and castle of Tripoli, which lay opposite to it. They accordingly garrisoned the latter, but were soon dispossessed of them by the famous Barbarossa. They were, however, soon after retaken by the emperor, and restored again to the knights of Malta.

In the reign of Sultan Solyman, Tripoli was besieged by the Turks under the command of Serai, bassa; and surrendered, as is imagined, by the cowardice or treachery of the governor, who was a Frenchman, after it had been in the hands of the Christians about 40 years.

Tripoli continued for several years under the government of a sangiac, deputed by the Porte to rule the people, and collect the revenues, the castle being garrisoned by Turks, and the city inhabited by Moors. At length the Turkish despotism and extortions became so intolerable, that a Marabout, named Sid-Hajjah, found an opportunity to cause a general revolt about the close of the 16th century; he was, however, repeatedly defeated by Haf hen bassa, and at length assassinated by some of his own partizans.

The Porte then sent a Greek renegade, named M. homet Beygh, to govern Tripoli; but this officer was no sooner established in his government, than he refused to receive any baila from the grand signior: he indeed acknowledged himself the vassal of the Porte, and voluntarily stipulated to pay a certain annual tribute; but he alleged that it was requisite in common prudence for him to defend himself from the fate of many other governors dependant on the Porte, who were put to death upon the most unjust, and oftentimes frivolous pretences.

The only remarkable transactions remaining to be observed relative to Tripoli, are the bombardment of the capital city by the French in the reign of Lewis XIV. and the treaty of peace and commerce between the Tripolitans and English in the year 1716. The first of these occurrences happened in consequence of the Tripolitans having taken a ship under French colours, and detained several French subjects in a state of slavery. This occasioned Lewis the XIVth to order his officers to make reprisals upon the vessels of Tripoli wherever they met them. These orders were strictly obeyed by the French captains; in particular Monsieur d'Antre, ville attacked six vessels of Tripoli near Cape Sapienza.

Three of the cofairs fled in the beginning of the engagement, and the other three, after having been very much shattered in the fight, took refuge in the island of Chios. The French commodore Monsieur Du Queine, who commanded in the Levant, having intelligence thereof, immediately proceeded to block them up with seven ships of war; but, previous to the commencement of hostilities, he sent a message to the governor aga to the following purport, "That he was in perfect amity with the Chians, and the Porte of Constantinople, but came in search of some Tripolitan pirates, who, contrary to the most solemn treaties, had committed the most outrageous depredations on the subjects of France, and therefore hoped that the aga would not protect such infamous robbers." The aga, however, refused to give up the pirates; which so exasperated the French commodore, that he began immediately to bombard the place, against which he threw upwards of 7000 bombs, made a dreadful havoc both of the houses and Tripolitan ships, and killed a great number of the people; but he could not enter the port on account of a strong flaccado which the Tripolitans had continued to lay in his way. The court of Constantinople thought proper to interfere in order to get matters adjusted, when at length it was agreed between the grand vizir and the Gallic ambassador, that matters should be compromised and settled according to the following articles:

1. "That all the French who were on board any vessel, whether of the Tripolitan cofairs, or any other that had sailed out from that city since the year 1681, should be set at liberty.

2. "That the ship of Capt. Cruvillier, which they had taken under the French banner, and carried to the port of Chio, should be restored, with all its artillery, arms, equipage, &c.

3. "That the vessel taken under Majorcan colours should be detained in the same port, under the authority of the captain Bassa, with all its rigging, cannon, arms, &c. till it be decided whether it ought to pass for a French vessel.

4. "That the ships belonging to Tripoli should not pretend to visit any trading vessel under French colours, nor attempt to seize upon them, or the men, or effects, in case they were provided with passports from the French admiral.

5. "That all strangers on board any French vessel shall pass free, and unmolested in their persons and effects, as likewise all Frenchmen of what rank soever, who shall be found on board any vessels under strange colours, even those of an enemy.

6. "That no French prizes and their prisoners shall be sold in any port belonging to the kingdom of Tripoli.

7. "That France shall have a consul at Tripoli.

8. "That no Corsair belonging to Tripoli shall make any prize on the French coasts at a less distance than ten leagues."

These articles, however, so advantageous to the French, were rejected with the utmost disdain by the regency of Tripoli, who, at the same time prudently prepared for the worst. On the other hand, the French monarch ordered a powerful armament to sail immediately to Tripoli, under the command of the famous Marshal D'Etrees, vice-admiral of France, who being joined by the squadrons under the marquis D'Anseville, and captain Nesmond, appeared before Tripoli, on June 15, 1685, with his whole fleet. On the 22d in the evening, the bombardment began, and was carried on with great success, under the immediate direction of the celebrated marshal Tourville. The marshal D'Etrees then had the port every where founded, in order to find the most convenient place to raise a battery, which might effectually destroy both town and fortifications; this, with the number of houses destroyed, and people killed by the bombs, so terrified the Tripolitans, that they dispatched a venerable old man, of near 100 years of age, to sue for a peace, which they were willing to receive upon any terms; when the following articles were at length agreed upon.

1. That the Tripolitans should pay 200,000 crowns as an equivalent for all the captures made of French merchantmen.

2. That they should restore all the Christian captives they had taken fighting under French colours.

After several delays, which arose chiefly from the difficulty of raising so large a sum of money, it was agreed to sink the demand to 500,000 livres, but even that could not be paid till the day and principal people had stripped their wives of their bracelets, rings, jewels, &c. The whole was at length paid either in money or valuables. The French slaves were set at liberty, and two of the principal people of Tripoli were obliged to go to France to do homage to the French monarch.

In 1716, a treaty of peace and commerce was concluded between the regency of Tripoli, and the British admiral Baker; the articles of which we shall give at full length, since they so nearly concern England as a commercial nation.

ARTICLES of peace and commerce between his most sacred majesty king George, &c. and the most excellent lords, Mahamed Bey, Yusuf Dey, the Dowan, and the rest of the officers, and people of the city and kingdom of Tripoli, renewed, concluded, and ratified on the 19th of July, A. D. 1716, by John Baker, esq. vice-admiral, &c. &c.

1. In the first place it is agreed and concluded, that from this time forward for ever, there shall be a true and unviolable peace between the most serene king of Great Britain, and the most illustrious lords and governors of the city and kingdom of Tripoli in Barbary; and between all the dominions and subjects of either side; and if the ships and subjects of either party shall happen to meet upon the sea, or elsewhere, they shall not molest each other, but shall shew all possible respect and friendship.

2. That all merchant ships belonging to the dominions of Great Britain, and trading to the city, or any part of the kingdom of Tripoli, shall pay no more

than three per cent. custom for all kinds of goods they shall sell; and as for those they shall not sell, they shall be permitted freely to embark them again on board their ships without paying any duty whatsoever, and shall depart without any hindrance or molestation.

3. That all ships, and other vessels, as well belonging to the said king of Great Britain, or to any of his majesty's subjects, as those belonging to the city and kingdom of Tripoli, shall freely pass the seas, and traffic where they please, without any search, hindrance, or molestation from each other. And that all persons or passengers, of what country soever, and all manner of monies, goods, merchandizes, and moveables, to whatsoever people or nation belonging, being on board any of the said ships or vessels, shall be wholly free, and shall not be stopped, taken, or plundered, or receive any harm or damage whatsoever from either party.

4. That the Tripoline ships of war, or any other vessels thereunto belonging, meeting with any merchant ships, or other vessels of the king of Great Britain's subjects, (not being in any seas belonging to his majesty's dominions) may send on board one single boat with two fitters, besides the ordinary crew of rowers, and no more than the two fitters, to enter into the said merchant ships, or any other vessels, without the express leave of the commander of every such ship or vessel; and then upon their producing to them a pass, under the hand and seal of the high admiral of England, or of the commissioners for executing the said office; the said boat shall depart, and the merchant ship, or ships, vessel or vessels, shall freely proceed on its or their voyage; and though the commander or commanders of such merchant ship or ships, or vessels, &c. produce no pass from the high admiral of England, or &c. yet if the major part of the ship's or vessel's company be subjects of the said king of Great Britain; the said boat shall presently depart, and the merchant ship or ships, &c. shall freely proceed on their voyage.

And any of the said ships of war, or other vessels of his said majesty, meeting with any ship or ships, &c. belonging to Tripoli, if the commander or commanders of any such ship or ships, &c. shall produce a pass signed by the governors of Tripoli, and a certificate from the English consul residing there; or if they have no such pass or certificate, yet if the major part of the said ship's or vessel's company be Turks, Moors, or slaves belonging to Tripoli, then the said Tripoli ship, vessel, &c. shall freely proceed on their voyage.

5. That no commander, or other person, of any ship belonging to Tripoli, shall take out of any ship or vessel of his said majesty's subjects any person or persons whatsoever, to carry them any where to be examined, or upon any other pretence, nor shall use any torture or violence unto any person of what nation or quality soever, being on board any ship or vessel of his said majesty, upon any pretence whatsoever.

6. That no ship-wreck belonging to the said king of Great Britain, or to any of his subjects upon any part of the coast belonging to Tripoli, shall be made or become a prize, and that neither the goods thereof shall be seized, nor the men made slaves; but that all the subjects of Tripoli shall do their best endeavours to save the said men and their effects.

7. That no ship, nor any other vessel of Tripoli shall have permission to be delivered up, or to go to any other place at enmity with the king of Great Britain, to be made use of as corsairs against his majesty's subjects.

8. That if any ship or vessel belonging to Tunis, Algiers, Tetuan, Salee, or any other place being at war with the king of Great Britain, bring any ships or vessels of his said majesty's subjects to Tripoli, or any other port or place of that kingdom, the governors there shall not permit them to be sold within the territories of Tripoli.

9. That if any of the said king of Great Britain's subjects shall happen to die in Tripoli, or any of its territories, his goods or monies shall not be seized by the governors, or any ministers of Tripoli, but shall remain with the English consul.

And any of his of his said majesty, c. belonging to the commanders of any such pass signed by the date from the English have no such pass or of the said ship's or, or slaves belonging ship, vessel, &c. shall

er person, of any ship out of any ship or any person or persons there to be examined, shall use any torture or at nation or quality or vessel of his said ever.

ing to the said king of subjects upon any part shall be made or be goods thereof shall; but that all the best endeavours to

vessel of Tripoli shall up, or to go to any of Great Britain, to his majesty's sub-

belonging to Tunis, their place being at in, being any ships subjects to Tripoli, or dom, the governor and within the territo-

of Great Britain's Tripoli, or any of its all not be seized by Tripoli, but shall re-

nor any other sub-

ject of Great Britain shall be bound to pay the debts of any other British subject, unless they become surety for the same by a public act.

11. That the subjects of his said British majesty in Tripoli, or its territories, in matters of controversy, shall be liable to no other jurisdiction but that of the dey or dowan, except the difference be between themselves, in which case they shall be liable to no other determination than that of the consul.

12. That in case any subject of his Britannic majesty being in any part of the kingdom of Tripoli, shall happen to kill, wound, or strike a Turk or Moor; if he be taken, he shall be punished in the same manner, and with no greater severity than a Turk ought to be for the like offence; but if he escape, neither the English consul, nor any other British subject shall be in any sort questioned, or troubled on that account.

13. That the English consul now, or at any time hereafter, residing at Tripoli, shall be there at all times with entire freedom and safety of his person and estate, and shall be permitted to chuse his own interpreter and broker, and freely to go on board any ship in the roads, as often as he pleases, and to have the liberty of the country, and shall be allowed a place to pray in; and that no person shall do him any injury in word or deed.

14. That not only during the continuance of this peace and friendship, but likewise if any breach or war happen to be hereafter between his said British majesty, and the city and kingdom of Tripoli, the said consul and all other his majesty's subjects inhabiting in the kingdom of Tripoli, shall always, and at all times, both in peace and war, have full and absolute liberty to depart, and to go into their own or any other country, in any ship or vessel of what nation soever they shall think fit, and to carry with them all their effects, goods, families, and servants, though born in the country, without any molestation or hindrance.

15. That no subject of his Britannic majesty, being a passenger from or to any port, shall be molested or meddled with, though he be in a ship or vessel at war with Tripoli.

16. That if any of his said Britannic majesty's ships of war come to Tripoli, or to any other port or place of that kingdom, with any prize, they shall have liberty to sell it, or otherwise dispose of it at their own pleasure, without any let or molestation; and that his said majesty's ships of war shall not be obliged to pay any customs whatsoever; and that if they shall want provisions, victuals, or any other things, they may freely buy them at the market price.

17. That when any of his Britannic majesty's ships of war shall appear before Tripoli, upon notice thereof given to the English consul, or by the commander of the said ships, to the chief governor of Tripoli, public proclamation shall be immediately made to secure the Christian captives; and if after that any Christians whatsoever make their escape on board any of the said ships of war, they shall not be required back again, nor shall the said consul or commander, or any other British subject be obliged to pay any thing for the said escaped Christians.

18. That all the merchant ships coming to the city or kingdom of Tripoli, though not belonging to Great Britain, shall have free liberty to put themselves under the protection of the British consul, in selling and disposing of their goods and merchandize, if they shall think proper, without any molestation.

19. That all the British ships of war carrying his majesty's flag, upon their appearing before the city of Tripoli, after due notice given of it by the British consul, shall, in honour of his Britannic majesty, be saluted with 27 cannon fired from the castle of the city, and that the said ship shall return the same number to it.

20. That no merchant ship belonging to Great Britain, or any other nation under the protection of the British consul, being in the port of Tripoli, shall be detained from proceeding to sea on her voyage longer than three days, under pretence of arming the ships of war of this government, or any other whatsoever.

21. That no British subject shall be permitted to turn Musselman in the city and kingdom of Tripoli, being

induced to it by any surprize whatsoever, unless he voluntarily appear before the dey, or governor, with the English consul's interpreter, thrice in 24 hours, and every time declaring his resolution to become Mahometan.

22. That his Britannic majesty's consul residing in Tripoli, shall, at all times when he pleases, have liberty to put up his said majesty's flag on the top of his house, and there to continue it displayed as long as he pleases; and likewise that the said consul shall have the like liberty of putting up and displaying the said flag in his boat, when he passes on the water; and no man whatsoever to oppose, disturb, or injure him therein either by word or deed.

23. That whereas the island of Minorca, and city of Gibraltar have been yielded to his Britannic majesty, by the king of Spain, as well as several other powers of Europe engaged in the late war; it is agreed and concluded, that from this time forward for ever, the said island of Minorca and city of Gibraltar shall be esteemed in every respect by the government of Tripoli to be part of his Britannic majesty's dominions, and the inhabitants thereof shall be deemed his natural subjects, as if they had been born in Great Britain; and they, with their ships carrying British colours, shall be permitted freely to trade and traffic in any part of the kingdom of Tripoli; and shall pass without any molestation, either on the seas or otherwise, in the same manner, and with the same freedom and privileges, as have been stipulated in this and all former treaties, in behalf of the British nation and subjects.

24. And whereas, in the treaty concluded in the reign of king Charles II. A. D. 1676, by Sir John Narborough, an article was inserted, by which the ships of Tripoli were excluded from cruising before or in sight of the port of Tangier, then belonging to his majesty; it is now ratified and concluded, that none of the ships or vessels belonging to Tripoli shall cruise or look for prizes before or in sight of the island of Minorca and Gibraltar, to disturb or molest the commerce thereof in any manner whatsoever.

25. That all and every article in the treaty shall be inviolably kept and observed between his said majesty, &c. and the most illustrious lords, &c. of the city and kingdom of Tripoli; and all other matters not particularly expressed in this treaty, and provided for in any former, shall still remain in full force, and shall be esteemed the same as if inserted.

Dated in the presence of Almighty God, in the city of Tripoli, on the 19th day of June, in the year 1716 of the Christian era; and of the Mahometan heigera 1128.

S E C T. III.

T U N I S.

THE kingdom of Tunis, anciently the republic of Carthage, was formerly of a much larger extent than it is at present; as it then contained not only Tunis, properly so called, but Tripoli, Bugia, Essab, or Zaab, and Constantia. But now Tripoli forms a state of itself, on which Essab is dependant; and Constantia and Bugia are both dependant on Algiers; so that modern Tunis is in length from north to south 220 miles, in breadth from east to west 170, extending from 33 deg. 30 min. to 37 deg. 12 min. north lat. and from 8 deg. to 11 deg. 20 min. east long. and divided into eight districts, viz.

1. Tunis Proper.
2. Bysa, or Carthage and Goletta.
3. El-Medea.
4. Sufa.
5. Kayr-wan or Cairvan.
6. Hamamet.
7. Bizerta.
8. Porto Farino.

But these are included in two grand circuits, called the summer and winter circuits, which the dey makes annually.

The inland towns have in general been destroyed by the Arabians, who will not suffer them to be rebuilt, that their rambles may not be impeded, or their depredations

dations prevented. The principal cities and towns are therefore on the sea-coast, but they are not above 14 in number, small of extent, and most of them but thinly inhabited; the other places either near the coast or in the interior part of the country, are so inconsiderable as not to merit mentioning.

To describe the country, it will be most convenient to follow the deſy in his ſummer and winter circuits, with his flying camp, by which means the modern ſtate of the different places may be traced with greater eaſe.

In ſummer, the deſy takes the northern circuit, which is by far the moſt agreeable, as he then paſſes through the pleaſant, fertile, and populous places; and in the winter, he purſues his journey through the other parts of his dominions. The principal rivers are, 1. The Zaine, which ſeparates the Tunician from the Algerine dominions. 2. The Mejerda or Mejerada. 3. The Miliana, which forms the bay of Tunis. 4. The Gabbs, or Triton, of the ancients, which is particularly mentioned by Virgil, in the ſpeech made by Neptune, when he rebuked the winds.

“ Hence to your lord my royal mandate bear;
 “ The realms of ocean, and the fields of air
 “ Are mine, not his, by fatal lot to me
 “ The liquid empire fell, and trident of the ſea;
 “ His pow'r to hollow caverns is confin'd,
 “ There let him reign the jailor of the wind;
 “ With hoarſe commands his breathing ſubjects
 “ call,
 “ And boaſt and bluffer in his empty hall.
 “ He ſpoke, and while he ſpoke, he ſmooth'd the ſea,
 “ Diſpell'd the darkneſs, and reſtor'd the day;
 “ Cynoſthos, Triton, and the ſea green train
 “ Of beautiful nymphs, the daughters of the main,
 “ Clear from the rocks the veſſels with their
 “ hands.”

Some authors deſcribe a river in this country, called *Guadil-Barbar*, but the accurate Dr. Shaw poſitively denies the exiſtence of any ſuch ſtream.

Belonging to this ſtate are a few iſlands, viz. A ſmall one in the river Zaine, rented by the Genoefe; Cape Negroe Iſland, rented by the French African company; the Jalta, and the iſlands of Cani, remarkable only for the dangerous ſhoals near them. The principal capes are, Cape Serra, 15 miles from Cape Negroe; the Three Brothers, which are three rocky capes near the continent; Cape Bianca, or the White Cape, famed for being the place where Scipio firſt landed in Africa; Cape Zibed, celebrated for the great quantities of raiſins made upon it; and Cape Bon, or the Promontory of Hercules.

The principal gulphs are thoſe of Bizerta and Tunis. The moſt remarkable mountains are, 1. The Zowaan, which is very high, and gives name to a town ſituated at its foot, the inhabitants of which are particularly ſkilled in dying ſcarlet caps, and bleaching linen. 2. The Guelfet. 3. The Noſura. And 4. The Bene-terfen. The chief cities, according to the order of the ſummer circuit, are,

Tunis, the metropolis of the kingdom, is in 36 deg. 43 min. north lat. and 10 deg. 25 min. eaſt long. at about the diſtance of 300 miles from Algiers. The ſituation of this capital is exceeding unhealthy, from the maſſes and lakes that ſurround it, and the deficiency of freſh water; the former inconveniency the inhabitants remedy as much as poſſible, by burning prodigious quantities of aromatic woods and herbs, and the latter by procuring ſweet water from the ſprings of Bardo, at about a mile diſtance, and catching rain water in large reſervoirs.

The Tunifians have plenty of palms, figs, dates, citrons, lemons, olives, &c. but feel a great ſcarcity of corn, and are not even ſecure of what little they are able to raiſe; for it is no uncommon thing in harveſt time, for the Arabs to come ſuddenly upon the huſbandmen, and plunder the whole territory of all the ripe grain. The rich are, however, ſupplied by commercial means

with wheat, with which they make fine cakes, and an excellent kind of vermicelli. The poor are obliged to content themſelves with barley, and even that they cannot at all times procure; but when they are ſo happy as to obtain a little, they regale themſelves, by making it into a dumpling, which they eat raw, only dipping it into a little oil and vinegar, or plain water if thoſe are not to be got; they have, however, plenty of honey and fruits, but ſeldom eat meat, except upon feſtivals, or ſome very ſingular occaſion.

The city is about three miles in circumference, excluſive of the ſuburbs, which are not very large; the main ſtreets are capacious, but the lanes very narrow. The houſes, which are built of ſtone, are but one ſtory high, and have flat roofs. There are but few handſome buildings, the great moſque, and bey's palace excepted. The latter is a magnificent ſquare ſtructure, with four ſuperb gates, one at each front, and towers at each end. The galleries are rich and elegant, the courts capacious, and the apartments very ſpacious and handſome, but the gardens, though large, are laid out in a bad taſte. In the treaſury chamber, beſides other valuable articles, the book containing the Tunifian code of laws is kept. The grand moſque is remarkable for its bignefs, and magnificent tower, but in other reſpects it merits not attention, as the architecture is entirely in the Turkiſh taſte. The city has five gates, viz. Vaſonk, Carthage, El-boar, Alſeya, and Ellinair gate; and without the walls are the Turkiſh ſepulchres, which have an agreeable look from the intermixture of marble tombs and flower plants.

In the ſuburb is a very capacious piazza, that formerly contained about 2000 ſhops, but their number at preſent is much diminiſhed. The ſtaple commodities are woollen and linen, in which articles the manufacturers excel all others in Barbary. The colleges and academies are numerous and large; the Janitaries barracks ſpacious, the cuſtom-houſe tolerably handſome, and the exchange for the merchants very convenient. The dock is tolerable, and the arſenal pretty well ſtor'd with materials for the building of gallies.

The city is defended by a ſtrong caſtle, erected on an eminence, by the fort of Golctta, and by a fort built on an iſland in the neighbouring lake. With reſpect to the inhabitants of Tunis, they are a mixture of Turks, Moors, Arabians, Jews, and Chriſtians of various nations; but their general character does them ſingular honour, as they are reputed to be more polite and juſt, rather kinder to their ſlaves, and much leſs haughty, inſolent and mercenary than moſt of the other inhabitants of Barbary; in ſhorte, the generality of them prefer the fruits of honeſt induſtry to unlawful plunder, and ſeek wealth from commerce, rather than from piracy.

Both ſexes are clean in their perſons, and neat in their dreſſes, uſe perfumes very much, and bathe frequently; the women, when they go abroad are veiled, but at home they are permitted to be ſeen by, and converſe with ſtrangers.

Nabel is a flouriſhing town, ſituated in a low ground, at about a mile and half from the ſea ſhore, and nine miles from Tunis. It is famous for its potteries.

Marſa or El-Merſa, which implies a haven, is ſituated where the port of ancient Carthage ſtood. It contains a magnificent moſque, a capacious college, about 800 houſes, and ſeveral palaces, built by the moſt conſiderable Tunifians for pleaſure, as the territory is exceeding agreeable and fertile. This pleaſant diſtrict was once the ſeat of the celebrated city of Carthage, the center of commerce, miſtreſs of the ſea, and rival of imperial Rome, when that city was in its moſt flouriſhing ſtate. It was ſuppoſed to have been founded by queen Dido, 141 years before the building of Rome. In Virgil's *Æneid*, Venus thus relates to *Æneas* the occaſion of Carthage being founded:

“ In Libyan lands you are,
 “ A people rude in peace, and tough in war;
 “ The riſing city, which from far you ſee,
 “ Is Carthage, and a Tyrian colony;

 † The
 hands ex

" Phœnician Dido rules the growing state,
 " Who fled from Tyre to shun her brother's hate;
 " Great were her wrongs, her story full of fate,
 " Which I will sum in short.—Sichæus, known
 " For wealth, and brother to the Punic throne,
 " Possess'd fair Dido's bed; and either heart,
 " At once was wounded with an equal dart:
 " Her father gave her, yet a spotless maid.
 " Pygmalion then the Tyrian scepter sway'd;
 " One who contemn'd divine and human laws;
 " Then strife ensu'd, and curst gold the cause.
 " The monarch, blinded with desire of wealth,
 " With steel invades his brother's life by stealth;
 " Before the sacred altar made him bleed,
 " And long from her conceal'd the cruel deed;
 " Some tale, some new pretence, he daily coin'd
 " To soothe his sister, and delude her mind;
 " At length, in dead of night, the ghost appears
 " Of her unhappy lord—the spectre stares!
 " And with erected eyes his bloody bosom bares;
 " The cruel altars, and his fate he tells,
 " And the dire secret of his house reveals;
 " Then warns the widow and her household gods,
 " To seek a refuge in remote abodes;
 " Lest, to support her in so long a way,
 " He shows her where his hidden treasures lay.
 " Admonish'd thus, and seiz'd with mortal fright,
 " The queen provides companions of her flight;
 " They meet, and all combine to leave the state,
 " Who hate the tyrant, or who fear his hate;
 " They seize a fleet, which ready rigg'd they find,
 " Nor is Pygmalion's treasure left behind;
 " The vessels, leav'd laden, put to sea
 " With prosperous winds—a woman leads the way.
 " I know not if by stress of weather driv'n,
 " Or was their fatal course dispos'd by heaven;
 " At last they landed, where from far your eyes
 " May view the turrets of new Carthage rise:
 " There bought a space of ground, which, Byrsa
 " call'd
 " From the bull's hide, they first inclos'd and
 " wall'd."

Carthage stood on a gulph in a peninsula of between
 40 and 50 miles in circuit. In the center of the city
 was the citadel, called Byrsa, on the summit of which
 was a temple dedicated to *JEsculapius*. On the land
 side, the city was defended by a very high triple wall,
 flanked with towers 480 feet distant from each other.
 The towers, walls, &c. contained stables, store-houses,
 and barracks, for 20,000 foot, 4000 horse, and 300
 elephants, with the requisite food, fodder, &c. which,
 though lodged within the walls, did not in the least in-
 commode the trading part of the inhabitants.

Carthage had two harbours, which communicated
 with each other, and had only one common entrance
 of 70 feet in breadth. The one was for merchant
 ships, and the other for ships of war. The latter harbour,
 and the island of Cothou in the midst of it, had many
 magnificent warehouses full of stores appertaining to
 them.

We shall here insert Virgil's lively description of the
 progress made in the buildings and establishment of this
 city, even in queen Dido's life-time.

" The prince * with wonder sees the stately towers,
 " Which late were huts, and shepherds homely bowers,
 " The gates and streets; and hears from ev'ry part
 " The noise and busy concourse of the mart;
 " The toiling Tyrians on each other call,
 " To ply their labour; some extend the wall,
 " Some build the citadel, the brawny throng,
 " Or dig, or push unweildly stones along;
 " Some for their dwellings choose a spot of ground,
 " Which first design'd, with ditches they surround;
 " Some laws ordain, and some attend the choice
 " Of holy senates, and elect by voice;

* *Aneas*.

† The idol was made in the attitude of receiving with
 hands extended, but rather held downwards, so that the

" Here some design a mole, while others there
 " Lay deep foundations for a theatre;
 " From marble quarries mighty columns hew,
 " For ornaments of scenes, and future view."

A modern author says, " The number of inhabitants
 of this city (Carthage) at the beginning of the third
 Punic war was 700,000; a prodigious number, con-
 sidering the many terrible blows received from the Ro-
 mans during the first and second Punic wars, as well as
 from their own mercenaries betwixt these wars, and in
 their destructive broils with Maffinissa; the forces they
 could bring into the field, as well as their power by sea,
 was very formidable; those under Hamilcar against
 Gelon consisting of 300,000 men, and the fleet of more
 than 2000 ships of war, and above 3000 transports."

At this time the Roman historians inform us, that
 the city was 23 miles in circuit, and that the temple
 of Apollo was lined with plates of gold, and the image
 of that fabulous deity was of massy gold; but these
 treasures, as well as many other valuable articles, be-
 came the plunder of the Romans, when Scipio sacked
 the city. The temple of Juno, built by queen Dido
 herself, was likewise extremely magnificent.

" Sidonian Dido here with solemn state,
 " Did Juno's temple build and consecrate,
 " Enrich'd with gifts, and with a golden shrine,
 " But more the goddess made the place divine;
 " On brazen steps the marble threshold rose;
 " And brazen plates the cedar beams infuse;
 " The rafters are with brazen coverings crown'd,
 " And lofty doors on brazen hinges found."

It may not be improper to observe, that the Cartha-
 ginians were addicted to the grossest idolatry, and their
 sacrifices were replete with the most horrid cruelties;
 Diodorus Siculus informs us, that their principal deity
 was Chronus, the Saturn of the Romans, to whom they
 sacrificed the children of the best families, as a certain
 law enjoined them to offer up none but such as were
 nobly born. At length, however, they substituted the
 children of slave, prisoners, &c. to gratify their sup-
 posed bloody idol, till Agathocles made war upon them,
 and reduced them to the utmost extremity; when fancy-
 ing that their misfortunes were owing to the improper
 offerings made to Chronus, they barbarously sacrificed
 200 well defended children; but their absurd cruelty
 availed them nothing, for their army was soon after
 totally defeated. This so surprized them, that they
 imagined the sacrifice was not sufficiently bloody, when
 influenced by the same ridiculous idea, 300 of the prin-
 cipal citizens voluntarily offered up their lives as obla-
 tions to the sanguinary idol; their cruel sacrifices were,
 however, useless, for their misfortunes encreas'd instead
 of diminishing.

This idol of the Carthaginians is frequently mentioned
 in the sacred writings under the name of *Molech*, and these
 very execrable sacrifices are strictly forbidden, particu-
 larly in the following passages, Leviticus xviii. 21.
*And thou shalt not let any of thy seed pass through the
 fire to Molech, neither shalt thou profane the name of thy
 God, I am the LORD.* Leviticus xx. 2. *Again thou
 shalt say to the children of Israel, or of the strangers that
 sojourn in Israel, that whoever any of his seed unto Molech,
 he shall surely be put to death, the people of the land shall
 stone him with stones.* II Kings xxiii. 10. *And he defiled
 Topheth, which is in the valley of the children of Hinno-
 m, that no man might make his son or his daughter to pass
 through the fire of Molech.* Psalm cvi. 37. *And shed inno-
 cent blood, even the blood of their sons and their daughters,
 whom they offered unto the idols of Canaan, and the land
 was defiled with blood.* And from the abominable prac-
 tice of sacrificing children to Chronus or Saturn, the
 fable of Saturn's devouring his children originated, But
 the custom was so shocking to humanity, that the Ro-
 man poets and fabulists thought proper to drop the
 literal meaning for an allegorical one; and therefore

victims being placed upon the hands immediately fell into
 a fiery furnace, which was prepared just beneath to receive
 them.

 Phœnician,

changing the mythological *Saturn* into *Time*, the idea appeared without any horror annexed to it; and they repeated ther: by a pleasing and instructive fable; for *Saturn* was said to *consume all things, devour his own children, and vomit them up again*. This alludes to *Time*, which consumes all things that it produces, till they are revived, and as it were again renewed; thus days, months, and years are the children of *Time*, which he constantly devours, and re-produces. Sometimes *Saturn* is painted betwixt two boys and two girls, implying, that as parents are surrounded by their children, *Time* is encompassed by the four seasons of the year; in his left hand is a scythe, with which he mows down all things; he holds an hour glass in his hand, to express the vicissitudes of life:

“ The strange vicissitudes of human fate,
 “ Still al’ring, never in a steady state;
 “ Good after ill, and after pain delight,
 “ Alternate, like the scenes of day and night;
 “ Since ev’ry man who lives is born to die,
 “ And none can boast sincere felicity;
 “ With equal minds, what happens let us bear,
 “ Nor joy, nor grief, too much beyond our care;
 “ Like pilgrims, to th’ appointed place we tend;
 “ The world’s an inn, and death the journey’s end;
 “ Ev’n kings but play, and when their part is done,
 “ Some other, worse, or better, mount the throne.”

And in his right hand he holds a serpent, twisted into a circular form, with the tail in its mouth to denote eternity, which revolves into itself, and is

“ A gulf, whose large extent no bounds engage,
 “ A still beginning, never ending age;
 “ Eternity, that boundless race,
 “ Which time himself can never run,
 “ (Swift as he flies with an unwearied pace;)
 “ Which, when ten thousand thousand years are
 done
 “ Is still the same, and still to be begun.”

The inhuman custom of sacrificing children to idols did not however cease with the destruction of Carthage, but continued among the Africans till the time of *Tiberius*, who was so shocked at the horrid practice, that he not only prohibited it under severe penalties, but destroyed the idols, and hanged the priests.

The extensive, opulent, and populous city of Carthage was finally destroyed by *Scipio Emilianus*, in the third year of the 158 Olympiad, in the year of the world, 4159, and 147 years before Christ; and at present no vestiges of it remain, except some fragments of the noble reservoirs which received into the city fresh water for the use of the inhabitants, and the ruins of the expensive aqueducts, by which the water was conveyed; the latter reach above 30 miles into the country, are near 12 yards over, finely arched, and in most places faced with stone, or coated with a strong cement.

At a little distance from the ruins of Carthage, and about nine miles north of Tunis, stands *Kommart*, a walled town, inhabited by fishermen and gardeners, who supply Tunis with fish, fruit, and sugar canes.

Ariana, a little village, at about three miles distance from Tunis, is inhabited by poor gardeners, who bring their fruit and herbs to that metropolis for sale.

Arradez is situated on the road between Tunis and the gulf of *Guletta*, and is famous for its fine springs and excellent baths.

El-Medeæ, called *Africa* by some, and supposed to be the *Adrumetum* of the ancients by others, was formerly a place of great strength, but is much decayed, and at present scarcely merits mentioning.

Sonfa, or *Susa*, the capital of the province of the same name, is one of the most considerable cities in the kingdom. It has a flourishing trade for oil, linen, wax, honey, and pickled fish. The town is situated on a high rock, behind which runs an extensive plain country, fertile in barley, figs, olives, fruit, and pasture. Though it hath greatly fallen from its pristine grandeur, it is still wealthy and populous, and the inhabitants are polite and courteous to strangers. A Turkish

hassa resides here; the superior people are merchants, warehousemen, and mechanics; the lower class are husbandmen, herdsmen, and potters. It is divided into Upper and Lower city, has a good port, and pays 12,000 ducats to the governor of the province.

Monasther was famed in the Carthaginian and Roman times, and is now a flourishing city, surrounded by stout walls, and situated on the extremity of a cape; the houses are handsome, but the inhabitants are extremely poor.

Of *Heraclea*, a city on the sea coast, built by the Romans, but since destroyed by the Arabians, scarce any vestiges are remaining.

Kaywan or *Carvany*, is the capital of a province of the same name; and what is singular, it may be deemed one of the most populous and flourishing towns of the kingdom, though situated in a barren desert, destitute of fresh water, and without the least article which can sustain life, except what is brought in carts from several miles distance. It is 24 miles from *Sonfa*, and has, about half a mile from the town, a reservoir and a pond for the reception of rain water; the inhabitants are supplied from the first, and the cattle by the last; the waters of both, but more particularly of the latter, are unwholesome, and occasion many disorders, not only in the beasts but in the human species. A late author says, from good authority, “ This city was rebuilt by *Hukba*, generalissimo of *Ottoman*, or *Hamen’s* forces, which last was the successor of *Mahomet III.* Caliph of *Damascus*, in the year 652, and had led him from Arabia into these parts to make what conquests he could in them; *Hukba* having landed his forces in some of the neighbouring ports, made choice of this barren and desolate spot for the place of their rendezvous, and of the ruined city for his retreat, which he accordingly caused to be surrounded with lofty and strong brick walls, flanked with stately towers; and among other noble edifices, built a most magnificent mosque, supported by an incredible number of stately columns of the finest granite, two of which were of so exquisite and lively a red, bespangled all over with little white spots like the porphyry, that their price was reckoned incalculable, and the whole structure the most magnificent in all Africa. It had likewise a very considerable revenue and endowments, and the title and privilege of a head metropolis, as being the first Mahometan mosque built in this part of the world, upon which account it is likewise become the burying place of the Tunisian monarchs; and not only they, but all the grandees and wealthy men of the kingdom, are ambitious of having their remains deposited in it, from a superstitious notion, that the prayers of the head pontiff and successor of *Mahomet* will procure them a plenary pardon of their sins, and send them by the nearest way into paradise. The very city itself is held to sacred among them, that those great personages usually pull off their shoes before they enter it, and cause some stately chapels and oratories to be erected over the graves of their dead relations, and settle a yearly sum upon them, not only to keep them in repair, but likewise to retain a number of idle priests and monks to resort thither at proper times. It is most probably upon the account of this superstitious concourse, and vast donations, that this city is still so thriving, notwithstanding the dearth and scarcity of provisions.”

Tobulba, once a considerable city, is now but a very poor village; and *Gables* or *Capes*, anciently the noble city of *Epicurus*, is in much the same condition. About 12 miles south of the latter, is the island of *Jerba*, the southern boundary of the summer circuit.

Hamamel is a small but opulent city, situated upon a promontory near the sea, and so well secured on the land side by rugged and inaccessible rocks, that a very small expence would render it totally impregnable. It is 51 miles from Tunis by land, and 60 leagues by sea.

Bizerta is situated upon a canal between a lake of the same name and the sea, eight miles from Cape *Blanca*, and ten miles from Tunis; it is well fortified, particularly on the side nearest the sea, and contains two towers to defend the haven, a considerable magazine, and

and two large prisons for slaves; it has plenty of fresh water, and is well supplied with fish. Eight considerable villages belong to the governor of this place, whose inhabitants, as well as those of Bizerta itself are miserably poor, though the territory is pretty fertile; their only dress is a coarse cloth wrapped round their bodies, and another about their heads in lieu of a turban. They are, however, admirable horsemen, but they do not shoe their horses, or use either bridles or saddles. The Bizertines are deemed by all travellers the most superstitious people in the kingdom of Tunis, and by some in all Barbary. They will not undertake the most trivial affair without hanging a great number of amulets or charms about them; and if they travel, they load their horses with the same kind of supposed securities, which are only pieces of parchment or paper inscribed with strange characters, and sewed in leather or silk.

Porto Farino is much fallen from its ancient splendor, and is now only remarkable for its fine cotton, where the Tunisian navy is kept. The town stands between the Cape of Bizerta and the Cape of Carthage, on the promontory of Apollo; it is called by the natives *Gard-el-Malab*, or the *Cave of Salt*, from the salt-works in the vicinity. Lewis, king of France, commonly called St. Lewis, died here in his expedition to the Holy Land.

Bayjah or Baia, is the chief mart in the kingdom for corn, which the neighbouring territory produces in such plenty, that the Tunisians proverbially say, *if they had but such another market town, corn would be as cheap as sand all over the kingdom.* This town, which is about 30 miles from the northern coast, and 108 W. S. W. from Tunis, is surrounded by a wall, and defended by a citadel.

Turbo, or Urbs, is 180 miles south of Tunis, it has a castle with some cannon, and a garrison, and is inhabited by Andalusian Moors. Many vestiges of its former splendor are here found; and Maham bey, from the ruins of a magnificent theatre, caused a very lofty bridge, or rather dam, to be erected, in order to raise water from the river Mejerda sufficiently high to water a beautiful plantation of oranges, lemons, citrons, pomegranates, nectarines, peaches, apricots, dates, figs, and other fruit trees, which were set in distinct spots, that they might grow without intermixture with each other. Between the castle and the town, a chrysaline stream of fresh water ran through an alabaster conduit, and turned several mills in its course, but this valuable work is now almost ruined.

It is necessary to observe, that along some of the coast of this kingdom, the sand banks, which hydrographers denominate *fyries*, are very dangerous, as ships which approach too near are drawn in by the vortex, and often lost. The hot springs in many parts of the country likewise deserve mention. The waters of those of Mekkouan and Mereuga are exceeding hot, particularly those of the first; but their excessive heat renders them unfit for bathing. The baths of Seedy-Ebli and Elelmal-Hammah are just of a proper temperature, but those of Jereed, Caila, and Zuzer are only lukewarm.

This kingdom contains many salt lakes and marshes, and a mountain of salt, named Jibbel Hadileffa, which is as hard as a rock, of a dark red colour and bitter; but when it is washed from the precipices by the rains, it loses its bitterness, and becomes soft and white; besides the above, there are some small rocks of a bluish cast, the fat of which is much admired, and sells at a high price.

Some artificial curiosities are found in this kingdom, besides those already mentioned, particularly a threefold mosaic pavement, which is a noble piece of workmanship, exhibiting a great number of objects in the animal and vegetable creation, beautifully diversified, finely variegated with the most admirable colours, and wrought with a symmetry that is truly astonishing; this place is called *Seedy-David*, or the *Sanctuary of David*; for the natives imagine that it is the sepulchral monument of a celebrated Moorish saint of that name. Dr. Shaw, however, insists, that from the nature of the workmanship, it evidently appears to be the fragment of a Roman

Another magnificent piece of Roman antiquity is the amphitheatre of Jemine, or rather its fragments, which are 64 arches, and four orders of columns; but they have suffered considerably from the Arabs, and from one of the beys, who ordered four of the arches to be blown up.

The remains of the triumphal arches of Spaida evince their ancient magnificence; and the Mausoleum near Haunnamel is an admirable building, in the form of a cylinder, vaulted beneath, and 60 feet in diameter.

POLITICAL AND CIVIL HISTORY OF TUNIS.

THE government of Tunis is despotic and hereditary, but not to the eldest son only, for the bey is at liberty to name for his successor which son he pleases, or even to exclude all his sons, and nominate a brother, nephew, or any other relation. The sovereign is in fact independent of both the Ottoman Porte and his own dewan, though a nominal respect to the persons of both is still affected to be kept up. A Turkish *basla* resides here, and a dewan is frequently assembled, but the former is a mere cypher, and the latter without the least authority; so that the one can only act as a spy, and the other approve what they dare not condemn.

The beys of Tunis, however, through motives of fear, keep up a good correspondence with their neighbours of Algiers and Tripoli, and from policy, aim to cultivate a friendship with the subjects of England and France, though they are at perpetual variance with the Spaniards, Sarinians, Venetians, Maltese, the subjects of the ecclesiastical state, &c.

The revenues consist of the customs arising from imports and exports, and the tributes paid by the Arabians and Moors. The forces are composed of renegades, and the militia of the country; the first form the bey's guard, and garrison the metropolis, and the latter garrison all the other sea-ports and fortresses. This is the peace establishment; but in war time they are able to encrease their army with strong bodies of Arabians and Moors, though there is not much dependence to be placed upon the fidelity of these auxiliaries. Their maritime power is much less than what might be imagined, considering their admirable situation for commerce of every kind. Their capital ships are but four in number, the largest carrying only 40 guns; besides which they have about 30 galliots of various burthens, that are manned with from 20 to 120 men each, who are renegades, Turks, and Couloglies, or sons of married soldiers; the command is, however, always given to renegades, at least very few instances have been known to the contrary. The four large ships cruise twice a year, and are furnished with biscuit, butter, oil, and vinegar, by the bey. The galliots are fitted out by private persons, who pay a certain stipulated quota of whatever they acquire to the bey. The mercantile vessels are very numerous, and the merchants pursue traffic with great avidity. The whole of the Tunisian marine may be distinguished

Into	Ships Patachas Polachas Ketches Barks Pinks Tartans Canoes	Which have	Four masts, viz. main, fore, mizzen, and bowsprit.
			Three masts, viz. main, fore, and bowsprit.
			A square sail to the main mast, a smack sail to the foremast, and a mizen mast.
			A main, mizen, and bowsprit, and several smack sails forward.
			A round head, } A sharp ditto, } And main, fore, and mizen masts with smack sails.
			But one mast. Ditto, differing in nothing from Tartans, except being smaller.

When a ship brings in a prize, the hull of the vessel, and half the cargo, after all expences are deducted, belong to the bey, and the remainder is divided between the captain and the ship's company, in the following manner:

The

The	Rais or captain Under rais or mate Pilot Gunner Clerk Quarter master Cockswain	} Hath	} Shares	6
				4
				4
				4
				3
				2

And each private man hath half a share. The bey has, moreover, one half of the prisoners taken, and the privilege of purchasing the rest, if he chuses it, at 100 piasters per head, every tenth person excepted, who becomes the property of the dewan; but the members of that body do not dare to claim their right.

Christian merchantment, on their arrival, always salute the castle of Goletta with three guns; but men of war wait to be saluted according to their rate, when they return the compliment with the same number of guns. During the whole time that a Christian man of war is in the road, the consul, and the merchants of the nation to which it belongs, keep colours flying on the tops of their houses. If a slave escapes, and gets on board a man of war, the bey cannot reclaim him; on which account it is usual, as soon as a ship of force appears in the road, to keep all the Christian slaves very close confined, and abridge them of the liberty otherwise allowed them till her departure; previous to which the bey sends to the commander a present of oxen, sheep, poultry, and other refreshments. The French passports for these seas are limited to three years, but the English extend to fourteen, and are not loaded with so many restrictions as the former. The Tunisians export corn, oil, wax, wool, hides, Morocco leather, beans, lentils, &c. and import Spanish wool, Languedoc cloth, pepper, sugar, vermilion, cloves, wine, brandy, hard ware, iron, steel, paper, gold and silver tissue, damasks, silken and woollen stuffs, &c. They likewise trade for a variety of articles to Egypt, Arabia, the Levant, and the neighbouring piratical states.

In Tunis the English, French, Dutch, Genoese, and Germans have their consuls, who are treated with great respect.

All public writings are in the Arabic language, which is here much corrupted from its purity and elegance; but commerce is carried on in that jargon of tongues known by the name of Lingua Franca.

Renegades of all nations, Jews are very numerous in this kingdom, and it is affirmed that there are upwards of 10,000 in Tunis only: but as they are very much addicted to cheat all with whom they deal, keep false weights and measures, make fraudulent bankruptcies, and adulterate most articles in which they trade, the laws are particularly levelled against them, and they are, when detected, more severely punished than any other foreigners.

As the religion, customs, manners, laws, &c. of the Tunisians are exactly the same with those of the Algerines, we shall defer our account of them to the article of Algiers, in order to avoid the necessity of repetitions, and only mention a few circumstances peculiar to these people. If a renegade should turn Christian again, they wrap him up in a cloth dipped in pitch, and burn him; or else pile stones, mud, mortar, &c. all round him, and having walled in all but his head, they rub that over with honey, which attracts wasps and other insects, who torment the poor wretch with their stings till he expires, which sometimes does not happen for several days. If a slave is caught in attempting to escape, or murders his patron, his limbs are all broken, and then he is fastened to a horse's tail, and dragged through the streets till he dies.

When dissolution sets his body free
From painful life, and loss of liberty.

REVOLUTIONS.

THIS country was alternately subjugated and overrun by the Romans, Goths, Vandals, Saracens, and Arabs; at length Abdul-Hedi, a Moorish officer of Seville, came with a considerable force, landed at Tunis, obliged the Arabs to evacuate the towns and villages,

and ruled the kingdom in quality of viceroy to the emperor of Morocco, with great reputation till his death, when he bequeathed the government to his son Abu-Zechatiah, a martial yet prudent prince, who extended the Tunisian territories, and raised contributions in all the countries to the confines of Negroland. On his demise he left the kingdom and an immense treasure to his son Abraham, or Abu-Ferez. This prince finding himself sufficiently powerful, revolted from the emperor of Morocco, assumed the title of King of Africa, strengthened and embellished Tunis, and gave it the name of the Metropolis of Africa. At his death he divided the kingdom between his three sons, giving Tunis to one, Bugia to another, and Numidia to the third.

Hutman, or Autman, who reigned over Tunis, soon dispossessed his brother Hamar of Numidia, and left both to his son Abu-Bar, who was afterwards deprived of them by Suhajah, a descendant of the caliphs of the Saracens. Muley-Mahmet, one of his successors, had many children, but they were all, except the youngest, so exceedingly wicked, that he appointed him to succeed him. This young prince, who was the celebrated Muley-Hassan, was scarce settled upon the throne, before his eldest brother attempted to make his escape from the prison in which he was confined; but, failing in his attempt, he was put to death, with several of his other brothers, and many persons who were suspected of adhering to their cause; for suspicion, in these cases, is as fatal as conviction:

“ He that but fears the thing he would not know,
“ Has, by instinct, knowledge from other eyes,
“ That what he fear'd was chanc'd.”

But one of his brothers, named Afrashid, fled to the king of Numidia, who raised an army in his favour, marched against Hassan, and totally defeated him: but being without artillery, it was impossible to take Tunis. Afrashid, therefore, burnt the suburbs, took leave of his Arabs, and repaired to Algiers, to engage in his cause the famous Barbarossa, who governed that kingdom for the grand signior.

Barbarossa took this prince to Constantople, where he was apparently well received, and promised redress; he was, however, detained there as a kind of hostage, while Barbarossa sailed for Tunis with a strong armament: having taken Biserta, Porto Farino, &c. he appeared before the tower of Goletta. This terrified Hassan, who was hated by his subjects, that he fled in the utmost consternation, leaving all his treasures behind him.

Hassan was no sooner gone, than the principal people imagining that prince Afrashid was in the Turkish fleet, released his wife and son from confinement, paid them the most profound respect, and sent two horses finely caparisoned to Goletta, one for Afrashid, and the other for Barbarossa, that they might make their public entry into the city. Perceiving their humour and mistake, the artful Barbarossa took care not to undecieve them, but gave them to understand that Afrashid was with him, and should immediately land to receive their allegiance.

Sixty royal galleys were then filled with Turkish troops to the number of 9000, who landed, and immediately took possession of the city and castle. The people were rather surprized not to see prince Afrashid with Barbarossa; but how greatly was their consternation increased, when, instead of even mentioning him, the politic Turk talked of nothing but their submission to the will of the grand signior. This apparent treachery so irritated the inhabitants that they flew to arms; some went after Hassan, to bring him back to their deliverance; while others attacked the castle: but the latter were repulsed with great loss, and the Tunisians were at length compelled to acknowledge the grand signior for their sovereign, and Barbarossa as his viceroy.

Hassan had recourse to a very unaccountable expedient to regain his dominions, which was making application to the Christian emperor Charles V. to whom he promised to become tributary. This rendered him still more odious to his own subjects, and obnoxious to all Mahometans in general. The emperor entered heartily into the enterprise, and prepared a powerful armament accordingly; while Barbarossa did all that an able commander

The poor prince Afrashid with their confirmation mentioning him, the to his submission to his apparent treachery flew to arms; some back to their deliverable: but the latter of the Tunisians were the grand signior as his viceroy. unaccountable expectation was making ap- Charles V. to whom his rendered him still and obnoxious to all eror entered heartily powerful armament all that an able commander

murder could do upon such an occasion; he put Tunis into the best state of defence possible; invited all the Moorish and Arabian princes to join him, who readily gave him assistance, as they imagined that it was a general cause, in which all Mahometans were concerned, and persuaded most of the Levantine cruisers to aid him with all their strength: the court of Constantinople was, however, so involved in its Asiatic wars, that it could afford him but little assistance.

The emperor's fleet, consisting of 1400 ships of various sizes, at length appeared on the Tunisian coast, when the numerous forces were immediately landed, and the castle of Goleta invested in form, which, after a very stout resistance, and great loss on both sides, was taken by storm. The emperor then proceeded towards Tunis, while Barbarossa marched on his approach, and drew his army in order of battle in the plain of Cozur-Menevi, which is about three miles from the metropolis. The two armies presently came to engagement, when the Arabs soon giving way, Barbarossa was totally defeated.

Barbarossa, who had retreated to Tunis, now thought of making but escaping with his treasure, though he did all he could to conceal his intentions from even his own people: but his design was perceived, both from his hurry to remove his riches from the castle, and the order he gave to blow up all the Christian slaves. This diabolical command, however, none of his officers had the cruelty to put into execution. Among the Christian slaves was one named Paul Simoni, a brave Maltese, who had behaved so gallantly against the Turks, that Barbarossa would never suffer him to be ransomed on any account. This gentleman having an intimation of Barbarossa's design, found means privately to procure some hammers and files, when he immediately released himself and the rest of the Christian slaves from their chains, to the amount of 7000; and joyfully breaking into the castle arms, they furnished themselves with weapons, with which they sallied out, and killed or routed all the Turks who guarded the avenues to the castle. They then secured the place, and waved a white banner from the battlements, inviting the Christians to come to their relief.

The tumult this occasioned brought Barbarossa to the place, who demanded entrance into the castle, but was answered only by a volley of musquetry; when perceiving the nature of the case, he cried out, "I am undone! these Christian dogs have got possession of the castle, and all my treasure," and fled with the utmost precipitation, so that he got safe to the city of Barca before the emperor Charles knew of the revolution in his favour. Simoni, however, sent him word of Barbarossa's flight; and as soon as he entered the city, presented himself before him at the head of the newly-emancipated Christians; when the monarch tenderly embraced the Maltese knight, saying at the same time, "My dear friend, blessed for ever be that noble resolution which enabled you to break off your fetters, to facilitate my conquest, and increase the glory of the Maltese order." This gentleman was afterwards sent to Malta loaded with favours, and was most cordially received by those of his order. Thus the Christians became possessors of Tunis; but we are sorry to add, that the cruelties which they indiscriminately exercised upon the poor Tunisians of all ranks and ages, and of either sex, tended greatly to tarnish the laurels they had gained by their courage during the whole enterprise.

The emperor now re-settled Hassan upon his throne, under the following conditions:

1. That the fort of Goleta should remain in the emperor's hands as a pledge, though Hassan should be obliged to repair the fortifications at his own expence.
2. That a garrison of the emperor's troops should remain in it, but Hassan should maintain and pay them.
3. That prince Mahomet, Hassan's son, should remain in the emperor's power, as an hostage for the fidelity of the father.
4. That all Christian captives, of whatsoever nation, should be released without any ransom.
5. That the Christians should have a free commerce throughout the whole kingdom.
6. That they should be allowed to settle in it, to

build churches and monasteries, and enjoy the free exercise of their religion.

7. That no corsair, Turk or Moor, should be allowed to come to any sea-port, be furnished with any provisions, or be assisted or favoured in any case by the Tunisians.

8. That the whole coral fishery should belong to the emperor and his heirs for ever.

9. That the kings of Tunis should hold themselves vassals and dependants on the crown of Spain, and send thither yearly in token of it six horses, and 12 felleas; in consideration of which they should be invited to the protection of that crown.

All these things were exceeding disagreeable to the Mahometan powers, and rendered Hassan not only hated by them, but very contemptible in their eyes. As soon as the emperor returned to Europe, this general dislike began to evince itself, by the revolt of several of his cities, which either put themselves under the protection of the Turks, or erected themselves into little commonwealths; Barbarossa at the same time having raised a considerable army and fleet in Algiers, began a new attack upon Tunis. Hassan, being harassed on every side, sent to Europe for succour, which were liberally promised him, but the performance was so slow, that he determined to go and solicit them personally. While he was in Europe upon this errand, his son Hamida revolted against him, and raised a dangerous commotion at home, making the following specious motives the pretext for his unnatural rebellion:

1. That his father was gone to the emperor in order to turn Christian.

2. That Hassan's design was to cut him off from the succession, because he was a friend to Mahometanism, and to place the crown upon his brother Mahmud's head, who had a great propensity to Christianity.

The governor of Tunis, however, severely reprimanded him for his unnatural proceedings; which republic to much chagrined the prince, that he retired to a country house at a small distance from Tunis, where he mourned in private his precipitate conduct; but the people, who were more prepossessed in his favour than he imagined, really fancied that Hassan was dead, according to some flying reports, and that the governor would conspire with the Spanish garrison in the Goleta to crown prince Mahmud, and thereby free a Christian king upon them: these notions operated so powerfully upon the minds of the vulgar, that they tumultuously went to the place of prince Hamida's retirement, and made him an immediate offer of the crown. This exactly suiting his ambitious temper, he accepted of the proposal, and, putting himself at the head of the malecontents, he proceeded to the castle, where he caused the old governor to be murdered, and committed several other enormities.

Hassan having been apprized of this revolution, returned home with about 2000 Italian forces, but his son defeated him, took him prisoner, and deprived him of his sight, Hassan's brother Abdulmelech, however, drove Hamida from Tunis, and assumed the reins of government himself; but dying in a very short time, the Spanish governor of Goleta had one of his sons crowned king, instead of Hassan's son Mahmud, who ought in justice to have been advanced to the throne. The unfortunate Hassan himself found means to make another voyage to Europe; when applying to the emperor Charles V, he was kindly received, much pitied, and promised redress; but the promise was the only comfort he ever had, for the emperor never thought proper to perform it.

Hamida, in the mean time, had been so successful in forming alliances with the Arabian and Moorish princes and chiefs, that he recovered Tunis, and reigned without molestation till the year 1570, when Hali, basha of Algiers, again dispossessed him of it.

Hassan, during this interval, remained in the emperor's court, till that monarch had prepared a powerful armament to drive Barbarossa, and other formidable pirates, from the places they possessed on the Barbary coast. The command of the Christian fleet was given to the famous Doria, a great Genoese admiral, who

was ordered to begin his operations by dislodging the celebrated pirate, Dragut, from the places of which he had possessed himself on the Tunisian coast; for Dragut not only commanded the piratical, but the Turkish fleet, Barbarossa having resigned in his favour, that himself might have more leisure to pursue all manner of debaucheries, as his inclination for every species of libertinism seemed to increase, instead of diminishing with his years, till he fell a martyr to excess at upwards of four-score years of age. At length the grand imperial Christian fleet arrived on the coast of Africa with the unfortunate Hassan, old and blind, and his sons Mahomet and Muley-Bubekar on board: but the wretched monarch soon after died of a fever in the camp of the Christians, and was buried with his ancestors at Kaswan. He was of a majestic appearance, black complexion, brave, wise, and politic; but vindictive, cruel, and to the last degree revengeful.

Doria soon made himself master of most places on the sea coast, particularly Aloehia, in which he got an immense plunder; but the emperor afterwards ordered that place to be totally demolished, and the Christians to evacuate their possessions on the Barbary coast, the Goletta excepted, having occasion for his troops in Europe, when Hali the Turk possessed himself of Tunis; but Sinan bafsa made a total conquest of the kingdom in the reign of the grand signior Selim II, and destroyed all the Christians but 14, whom he sent in chains to Constantinople. Having brought the whole beneath the Ottoman yoke, he appointed for its government a bafsa, or viceroy, a dewan, several governors, or beys, over the different provinces, 4000 janissaries, and a number of garisons in the different cities, towns, and fortresses. This revolution terminated the splendor of the kings of Tunis, after 370 years continuance, from its first establishment in 1204 by Abu-Ferez.

Now Tunis began to be governed by deys chosen by the dewan; but the state was in such confusion, the jealousies so great, and the intrigues so various, that new deys were frequently elected, the whole being murdered or dethroned; so that in the space of 120 years, no less than 23 reigned, all of whom, five excepted, were either dethroned or murdered. The people in general were so dissatisfied at the very first with the bafsa that Sinan had placed over them, that they petitioned the Porte to abolish that office, and permit them to elect a dey to govern them, as was done at Algiers. This request was granted, and they immediately elected a popular person, of whom they were wonderfully fond at first, but they murdered him within the twelvemonth. One Ibrahim was their next choice, and they would have killed him in the same manner, if he had not luckily given them the slip, and fled to Mecca. These frequent and bloody revolutions gave an opportunity to the deys or officers of the second rank to usurp an authority over the deys, and to render the dewan, or senate itself, subservient to their pleasure. The Sublime Porte, alarmed at the despotic power of the Tunisian deys, determined to revive the office of bafsa, that they might have a person upon the spot to be a check upon the former: but so jealous was this polite court, that it never permitted its own bafsa to reside above two years at Tunis, lest that officer should become as powerful, as arbitrary, and as troublesome as the dey himself.

During the reigns of the several deys, Tunis must be considered rather as a kingdom involved in anarchy and confusion, than as a well-regulated government; and we are less acquainted with their history at that period, than at any other. But, subsequent to the year 1681, we are better acquainted with the Tunisian affairs; for at this time the bey Morat II. dying, left three sons, viz. Mahomet, Hali, and Ramadan, who for some time maintained a bloody contest for the succession: but Ramadan at length, greatly to his honour, declined his pretensions, and gave up all his right to his brothers, persuading them at the same time, in pity to the people, to compromise matters, and put a stop to their sanguinary proceedings: but his brothers, more ambitious and less humane than himself, continued the dispute for a considerable time by frequent appeals to the

sword, till Mahomet, growing tired of this contest, gave it up, and retired to Kaswan, where he resigned himself to a life of devotion; but the war was soon after again kindled by the perfidy of Hali; for Mahomet, when he went into retirement, entrusted his son Achmet to the care of his brother, that he might be brought up in the court in a manner suitable to his rank; but the treacherous Hali, instead of protecting, betrayed and murdered his nephew. This so exasperated Mahomet, that it drew him from his solitude; and being informed that the persons who had advised Hali to murder the young prince were fled, he pursued, overtook, and sacrificed them to his resentment. Hali himself had been driven from Tunis by the citizens, some of whose privileges he had attempted to infringe, but was now to full march to lay siege to that place, in order to reduce it to obedience. This seemed a favourable opportunity for Mahomet to obtain the crown; but an ambitious and artful person, named Cheleby, had an address to prejudice the people equally against both brothers, so that Mahomet appeared as obnoxious to them as Hali. This, however, occasioned a reconciliation to take place between the two brothers, who united their forces, and invested Tunis; when Cheleby making a fall, totally routed their troops; but he had not the prudence to make a proper advantage of his success, by pursuing the brothers, who soon rallied, recruited their force, and strengthened their army by the addition of 40,000 Algerines, whom they hired of Ibrahim dey of Algiers. With these troops they soon made themselves masters of Tunis, and took Cheleby prisoner, whom they put to death. The Algerines committed many horrid cruelties and depredations in the city, till they were paid and sent home, and Mahomet was universally acknowledged as bey: but this prince ruling in a very arbitrary manner, the people called in the Algerines to expel him from the government, which they did, and made Ben-Choukce, his brother-in-law, bey in his stead; but the change availed them nothing, for the latter was as arbitrary and rapacious as the former; so changing their minds again with their usual facility, they dethroned Ben-Choukce, and restored Mahomet.

Mahomet dying soon after, his brother Ramadan was made bey; who, having lived always a recluse life, knew nothing of public business, or of mankind, and was consequently very unfit to govern a kingdom: but what was worse, instead of taking any trouble to acquaint himself with his duty, he devoted himself entirely to pleasure, and made an Italian sinner his prime minister, leaving the whole administration of affairs to him. This occasioned several commotions, and at length so much exasperated the people, that they strangled Ramadan, and tore his prime minister piece-meal. Morat, the nephew of the former bey, succeeded his uncle, and proved a monster of cruelty; but being murdered by Ibrahim, the captain of his guard, the assassin was advanced to the throne, and, after an unfortunate reign of no great length, was killed in a sea-engagement, (the consequence of an insurrection among his subjects,) and was succeeded by Hassan-Ben-Hali, a polite and formidable prince, who freed Tunis from a dependence on the Porte, rendered himself so powerful as to stand in no awe of his neighbours the Algerines or Tripolitans, refrained his subjects from acts of piracy, and concluded many commercial treaties with the Christian powers, particularly the Dutch and English: the stipulated articles between the Tunisians and the latter being nearly the same as those between the Tripolitans and the English, and concluded with them by the same general man, that is, admiral Baker; since which nothing hath happened that requires any particular mention.

This kingdom, which is 480 miles in length from east to west, and 100 miles in breadth, where widest, is situated between 30 and 37 deg. north latitude, and between one deg. west, and nine degrees east longitude; being bounded by the Mediterranean on the north, Mount Atlas on the south, the kingdom of Tunis on the east, and the river Mulvin, which separates it from the empire of Morocco, on the west. The climate of Algiers is remarkably serene and fine, so that the country seems to enjoy a perpetual verdure, and the people are enacquainted with the extremes of heat and cold. This is to be understood only of the parts toward the sea, the inland parts being principally wild and barren, and very little inhabited except by a great variety of wild creatures, particularly lions, tygers, leopards, buffaloes, wild boars, flags, porcupines, monkeys, ostriches, &c. some of which it may not be improper to describe here.

The African lion has a very large head, which is principally owing to the extraordinary thickness of the skin that covers it, and the largeness of the jaw bones. The tail runs tapering to the end, yet it appears to be all of a thickness, which deception is owing to the inequality of the hair that covers it; for at the beginning the hair is very short, but increases in length, as the size of the tail decreases in bulk, and is very long and bushy at the extremity. He has 14 teeth in each jaw, a strong neck, rough tongue beset with prickles, and bright shining eyes; the structure of the paws, teeth, eyes, and tongue is the same as those of a cat; and, according to the observations of the members of the Royal Academy at Paris, the internals of both these animals resemble each other: one of the lions dissected by those gentlemen, though a young one, was seven feet and a half in length, from the nose to the beginning of the tail, and four feet and an half from the top of the back to the ground.

The difference betwixt the lion and lioness is this, the latter hath no long hair about the neck, but the muzzle is more taper, the head flatter, and the claws less than those of the lion.

The characteristics of a lion are the strength of his limbs, the majesty of his appearance, the dignity of his prey, the fire of his eyes, and the nobleness of his disposition; he fights the weak enemy, but attacks a strong one with the most impetuous fury. He expresses his anger by erecting his mane, and beating his sides with his tail; but his hunger and ferocious temper often give way to his generosity:

- "For when the generous lion has in fight
- "His equal match, he rouses for the fight:
- "But when his foe lies prostrate on the plain,
- "He sheaths his paws, uncurls his angry mane,
- "And, pleas'd with bloodless honours of the day,
- "Walks over, and disdain'd th'inglorious prey."

The tyger has a short neck, and skin full of blackish streaks, or yellow spots encompassed with black hair; shining eyes, sharp teeth, crooked claws, feet like those of a cat, and long tails without any tuft at the end, like a lion. The flesh is white, tender, and well-tasted. The tyger will not feed upon any animal but what he kills himself; and when he meets with several animals, he kills all if he can, and sucks a little of the blood of each.

A panther, or leopard, is like a tyger in all respects except the size and skin, being a smaller animal, and spotted instead of streaked: the body is long, the eyes bright, the mouth large, the teeth strong and white, the ears round, and the spots of several colours.

The wild bear is always of a grizzle or iron grey colour; the front is larger than that of a tame hog, the ears are shorter, rounder, and black, the tail and feet being of a similar colour.

The Porcupine is about the size of a badger, and not unlike that animal in shape, being about two feet and a half from the end of the nose to the tail; the feet are short, the neck is about five inches in length, and the head the same. On the back and sides he is covered all over with quills; on the back part of the head, and on the neck, there is a broad tuft, consisting of many flexible quills; some of the quills are a foot, and many of the whiskers six inches long.

The ostrich is a very large bird, being usually seven feet in height from the top of the head to the ground; but the neck itself is so long, that it comprizes three of those feet. From the top of the head to the rump, when the neck is stretched out in a right line, it is about six feet, and the tail is 12 inches in length. The wings are exceeding strong, but at the same time they are too short to enable the bird to fly, though they serve as sails, and assist it to run with great expedition. The plumage is black, white, or grey; the large feathers at the extremities of the wings and tail are white; the others are black and white intermixed. The sides and thighs have no feathers, nor are there any under the wings. All the feathers of ostriches are as soft as down. Dr. Brooke, in his Natural History, says, "An ostrich is the most greedy bird that is known, for it will devour leather, grass, bread, hair, metals, or any thing else that is given him; however, he does not digest iron and stones, as some have pretended, but voids them whole; these substances enter into the gizzard: a remarkable instance of this occurred in an ostrich belonging to a Morocco ambassador here, and intended a present to the king's menagerie. I, among many others, went to see it, when it plucked off the brass shell of a button from a gentleman's coat, and swallowed it; a few days afterwards it sickened and died, when, upon opening it, the button was found in the gizzard, which it had gangrened."

The beforementioned 18 provinces into which Algiers is divided, are comprehended under three general heads or governments, viz. the eastern, or Levantine; the western, and the southern government. The towns in the first are Bona, Constantin, Gigeri, Bugia, Steffa, Tebes, Zamoura, Biscara, Necanz, and Corco. The second contains Oran, Tremecen, Mostagan, Tenez, and Scerelly. But the third, or southern government, hath not a single house in it, the inhabitants being almost wild, and living in tents, which they remove at pleasure. To speak of these in order:

1. Bona, once the capital of the province of its name, and supposed to be the ancient Hippo, a sea-port built by the Romans, and the seat of the celebrated St. Auslin. Nothing now is visible of its ancient splendor, as it is but a poor mean place, thinly inhabited, and much exposed to the incursions of the Arabs. The only fragments of its ancient grandeur are the ruins of a noble cathedral or monastery; for antiquaries are uncertain which. Near there is a famous spring, called St. Auslin's well, and much resorted to by French and Italian sailors. The fortress hath a garrison of 300 Turks, commanded by an aga, who is governor of the town.

2. Constantin, the Cista-Numidia of the Romans, received its present name from Constantina, the daughter of Constantine the Great, who rebuilt it with great magnificence; the situation is on a peninsula, difficult of access, except towards the south-west. It is 48 miles from the sea, one mile in circumference, well fortified, and contains many antique fragments, particularly a noble bridge, near which is a large subterraneous aqueduct that terminates in a cascade, into which state criminals are thrown, and receive their deaths by being dashed to pieces against the rocky bottom. The bey of the eastern government resides here, and has under his command 300 Turkish horse, and 1500 Moorish soldiers. The inhabitants are opulent, haughty, and spirited. The neighbouring mountainous territory contains a robust, hardy, and brave people, tenacious of their

their liberty, civilized, and humane. They furnish the neighbouring towns with great quantities of fruit and other provisions, and are able to raise 40,000 fighting men; on which account the bay of Constantina stands in great awe of them. They, however, are destitute of firearms, and have only lances and arrows to annoy the enemy with. On the sea-coast, at a small distance from Constantina, stand the ruins of a Roman colony, anciently called Colo. It is situated on a high rock, and has a garrison under the command of an aga; adjoining to it is a French factory, where the Moors bring hide, wax, and wool for sale; and, at no great distance, are the remains of the ancient city of Stora, the bay of which is still good. Constantina was the residence of the kings of the province of the same name, till 1520, when it was conquered by Barbarossa, and annexed to the Algerine territories.

5. Gigeri contains about 1500 houses, which are inhabited by very poor people. It is defended by a fort, and a small garrison, and is situated on the sea-coast between Bona and Bujyah, at about the distance of 15 miles from each. The whole territory contains no other towns, the natives living in a roving wild manner, robbing all they can come at, plundering any ship that is so unfortunate as to be wrecked on the coast, and treating the crew with the most savage ferocity. The bey himself cannot take or reduce them to any kind of order, as they fly to places inaccessible to all but themselves, and put the Algerine army at defiance.

6. Duga was formerly a splendid place, but now lies in ruins, and contains nothing remarkable but the sepulchre of Sedy Buis, the tutelary saint of the place. There are three castles, two at the port, and one upon a rock. The inhabitants deal in iron works, particularly plate, muskets, &c. &c.

7. Souda, or Souda, about 60 miles to the south of Bujyah, and 15 from the sea, is situated in a fertile valley, contains about 200 families, who are miserably poor, and exhibit only the melancholy ruins of its former magnificent buildings.

8. Tabet was formerly a flourishing city, but at present is quite deserted, and a desert inhabited.

9. Zenneta, by the tyranny of the Algerine government, is reduced to a deplorable situation as the two former, though the territory is one of the most fertile spots in all Barbaria. It has a market every Monday frequented by the Arabs, and is defended by a fort with a good garrison.

10. Biskera has a fort and a garrison to keep the inhabitants of the neighbouring district in awe. The people are very ignorant, and lead a wandering kind of life; but their chief employ is catching and taming wild beasts, particularly lions and tigers, which they carry to Algiers for sale.

11. Necanz, situated about 60 miles to the south of Souda, is one of the pleasantest towns in Barbaria. It is watered by an agreeable river, whose banks are adorned with a variety of beautiful trees. The town contains a magnificent mosque, and a large well-endowed college for the education of Mahometan youth. The merchants in general are polite, the women handsome, the houses neat, the gardens well laid out, and the neighbourhood very fertile.

12. Ghiso was formerly the metropolis of a kingdom of the same name, but the Portuguese entering into frequent alliance with the Spanish court, the Algerine government, in the beginning of the 17th century, thought proper to lay waste the whole country, and destroy every town in it. The territory, though mountainous, is very fertile, and the people could never be brought to submit; but the Algerines keep them in a state of servitude by preventing them from carrying on any kind of commerce as they formerly did.

We come now to the western or second Algerine government, in which district the principal places are,

1. Oran. This city was the residence of a bey, and though it has fallen from its primitive splendour, is still the most important place in the kingdom, the city of Algiers excepted. It is situated upon a declivity near the sea-coast, a mountain overlooks it, upon the top of which stand two castles; and, at the distance of a fur-

long, a third. These defend it towards the sea. The southern side is covered by two other castles, and a fortress is erected near the source of a rivulet, which supplies the city with water, for the defence of the subterranean magazines of corn. In 1505 the Spaniards took this important place, which was recovered by the Algerines in 1738; but the former again retook it in 1732, and are still in possession of it, though some modern geographers, for want of better information, have returned it to the Algerines without giving them even the trouble to besiege it. About six miles from Oran, stand the ruins of the ancient city of Batha, where a little chapel is built to the memory of a Marabout, who saved up money enough to maintain 500 disciples, whose sole business was, at certain hours, to repeat a long Mahometan litany by the help of their beads.

2. Tremezen, situated 30 miles from the sea, and 90 south-west of Oran, is surrounded by a strong wall well fortified; has five gates with draw-bridges before them, and a strong castle containing very handsome barracks for the janizaries who are in garrison. Tremezen, while the metropolis of the kingdom of the same name, was a noble city, but is now fallen greatly to decay; for out of 150 mosques, and 160 baths, there are remaining only eight of the former, and four of the latter. The inhabitants are extremely indigent, and the place exhibits little but the fragments of its antique magnificence; among which the remains of a reservoir, or basin for water, are the most conspicuous.

3. Mologan, 60 miles to the east of Oran, is built in the form of a theatre opening to the sea, and surrounded on every other side with rocks which hang over the town. The ruins of an old Moorish castle stand in a space between the rocks, and there is a strong stone wall towards the sea with a modern-built castle garrisoned by a number of Turks. The citadel is erected upon the summit of one of the rocks, and commands both city and territory: the haven is commodious, and the town is well supplied with fresh water. The neighbouring mountains are inhabited by a people called Mologans, who live in tents, pay a great number of tributes, and pay 12,000 crowns annually to the dey of Algiers.

4. Tenez, about 20 miles east of Mologan, is a league from the sea, where it has a convenient port. Here is a castle that was once a royal palace, and in which the governor resides. The fortification is strong, the garrison numerous, and the neighbouring territory fertile.

5. Sheshel, or Serrelly, the last town in the western government, is a very poor desolate place, situated about 24 miles to the westward of Algiers. It is defended by a Turkish garrison, and has a little port, which will only admit of small vessels.

The southern district, or third government, is inhabited by a wild set of people, who roam from place to place, and live in tents while they reside in any particular spot. The territory itself is hilly, a part of Mount Atlas running through it; the only riches of the people are their numerous flocks and herds. They pay a tribute to government, but the bey is obliged to come at the head of an army to collect it annually, and may then evade the payment by retiring to inaccessible places till the troops are withdrawn.

Having gone through the three districts or governments, their towns and inhabitants, we shall now view the whole with a particular description of the city of Algiers, the metropolis of, and only city of real consideration in the whole kingdom.

Algiers stands in 36 deg. 30 min. north latitude, and 34 deg. 15 min. east longitude, and is situated upon the Mediterranean Sea, which washes it upon the north, and north-east sides. It is built upon a declivity, on which account, and the whiteness of the terraces, the prospect of it from the sea is admirable. It is about three miles in circumference, and the walls are in general 25, and towards the sea 40 feet in height, 12 feet in thickness, and flanked with 69 towers. The ditch is 20 feet wide, and seven deep; but at present it is almost choked up with mud. Many of the gates of Algiers have been walled up, but those still open are six in number, viz.

AFRICA.]

B A R B A R Y.

1. The Alcaflava, which forms the western angle of the highest part of the city, is of an octagonal figure, and has embrasures on every side.
2. The Babjilkeed, or New Gate, towards the south.
3. Bab-Azoune towards ditto.
4. The Fisher's Gate, which forms the eastern angle of the city.
5. The Mole, or Down Gate, towards the north.
6. The Babel wed, or River-Gate, facing the river Elaved towards the north.

On the western side of the river is a ridge of hills, on which two fortresses are erected. The above are the strength on the land side, but the fortifications towards the sea are much stronger, and more considerable.

The Mole was the work of Cherodin the son of Barbarossa, as well as many of the other fortifications; for that monarch employed all the Christian slaves in the improvement of the old, and construction of new fortifications in and about Algiers; and by personally inspecting their proceedings, had the satisfaction to see all be wished for completed in the space of three years. The Mole is 100 paces in length from its gate to the castle that defends it, and about seven in width: on one side is a rock, and on the other a stone key; the castle, which is erected upon a rock, serves at once for a fortress and a light-house. To the south there is another fortress, with three batteries, to defend the entrance of the harbour. The slaves are continually employed in bringing stones from a quarry in the neighbourhood, which they lay on the sand to defend the Mole from the impetuosity of the waves; and this laborious work is obliged to be repeated continually, because the sea constantly washes them away, and makes a perpetual supply necessary. The embrasures of the castle and batteries are in good repair; the cannon are of brass, and their carriages, with all other necessary utensils, are kept in excellent order.

Algiers is supposed to contain 100,000 Mahometans, 15,000 Jews, 2000 Christian slaves, and some renegades. There is one street which is broad and handsome, and passes quite through the town from east to west, in which the houses and shops are elegant and capacious, and the markets are here kept; but all the other streets are narrow, incommodious, and dirty; so that passengers are forced to squeeze themselves continually against the houses, to give way to camels, horses, asses, mules, &c. and persons of all denominations are obliged to make room, if they meet with a Turkish soldier, till he is past, otherwise they are sure of being insulted and ill-treated for their want of respect to these fellows, who walk about with prodigious dignity, and respect to be revered as much as if they were sovereign princes; for their pride is almost inconceivable, and their insolence intolerable. Some travellers have accounted for the narrowness of the streets, by asserting that they were so continued as a shelter from the heat; and others attribute their being built in that manner to the frequency of earthquakes, on which account the streets are not only contracted, but the houses low, and propped by pieces of timber passing across the streets from one to the other.

The houses, which are about 15,000 in number, are built either of stone or brick, upon a square plan, with a paved court in the center. Round the court is a double range of galleries one above the other, and both supported by columns. All the houses are flat-roofed; the terraces in general serve either to walk upon, or dry linen, but many embellish them with pretty gardens, and a neat summer-house in one corner. The people are obliged, by the laws of the place, to whitewash their houses inside and out, at least once a year; but all who can afford it do it much oftener. Their furniture is exceeding mean, consisting only of a few wooden and earthen utensils, a mat, and two quilts laid upon a few boards to serve as bed and bedstead. As there are no squares or large vacancies throughout Algiers, the inhabitants may pass from one end of the town to the other over the roofs of the houses, and most of them visit each other this way. Though the houses in general are mean, many of the principal people have very fine edifices, the pillars and pavements of which are of a

very beautiful marble, and the ceilings and folding doors finely carved, painted, and gilt. Of these, the palace of the dey stands in the center of, and is the most magnificent in the city. It is very extensive, and surrounded by two superb galleries, one above the other, supported by marble pillars. It has two grand halls, in one of which the down meets every Sunday, Monday, and Tuesday.

The barracks for the Turkish troops are noble structures, adorned with fountains, and contain many spacious and convenient apartments. Married men are precluded from lodging here, but take up their habitation either in private houses, or in one of the four fenelucas of the town; the latter being large commodious buildings, consisting of several ranges of apartments, warehouses, &c. which are let indiscriminately to all who chuse to take them, and serve instead of taverns or inns. Christian strangers, if of any consideration, are usually accommodated at the consul's house of the nation to which they belong; but the poorer Levantine, or other traders, lodge as above, and may eat and drink according to the circumstances or inclinations, as there are many cooks shops, taverns, and other public houses, kept either by the Christian slaves of the deylike, or the Jews, who will accommodate any person, or deal in any commodity. The mosques are 107 in number, superbly built, and easily situated near the sea side; the baths are numerous, and in general large, sumptuous, paved with marble, and well furnished with the conveniencies requisite in such places. The Mahometans are obliged by their religion to use them five times daily, but their pleasure often prompts them to go still more frequently. A number of baths are appropriated to the use of women only, who do not resort to them for the benefit of bathing alone, but for the sake of intriguing; for though the most dreadful punishments attend detection, yet the Algerine women venture every thing to pursue their inclinations. Upon this occasion we cannot forbear transcribing the following passage from the writings of a nobleman of distinguished abilities: "The women are indulged much more liberty throughout all Barbary, than in the Levant, and the Algerine women are less confined than the rest of the Africans. They are allowed to go out when they please, upon the pretence of going to the bath, being commonly accompanied by some Christian slave, who are as to many waiting women. Those women whose husbands are very rich, are preceded by a man who serves as a conductor. This man is always a slave, on whose fidelity the husband relies very much; but he is frequently imposed on by the man in whom he confides. As eunuchs are bought at a very dear price in this country, and can be employed in nothing but in superintending the women, they not being robust enough to undertake laborious toils, the Algerines have no concern with them; they prefer Christian slaves, who are of great service, being employed by them in works of every kind. It must indeed be confessed, that the liberty which slaves are allowed, of being in the company of women, and even of speaking to them, is frequently of dangerous consequence to the repose and honour of husbands."

"The female sex are still more devoted to gallantry in this country than in Constantinople; the climate inspires fondness, and the scorching air raises in the heart such a flame as nothing can extinguish; an African woman will brave every sort of danger, and run every hazard to satiate her passion, and cannot be intimidated even by the fear of death. There is a law enacted here, which is strictly put in execution, pursuant to which, any woman who is convicted of being engaged in a criminal correspondence with a Christian, is sentenced to be tossed into the sea, with her head tied in a sack in case her lover does not turn Mahometan. Examples of this severe punishment are frequently seen, notwithstanding which, the married women and maidens are fired with a most violent passion for the Christians, and there perhaps are as many intrigues in Algiers as in any Christian city. The little affection they bear to their husbands, and the constraint that is put upon them excite them to break the marriage vow; farther, the indulgence, in which they pass

pass their days, they being confined to their houses, where their sole employment is to invent methods, in order to over-reach their tyrants, and the long voyages these commonly undertake, greatly favour their intrigues. They sometimes are eight or nine months at sea, and whilst they are plundering and destroying the Christians, such as are slaves in Algiers revenge part of the ills which those of their faith suffer."

"When these confaits are upon their expeditions, they generally keep their wives in the city, but the moment they return they take them to their country houses, where they unbend after the many hardships they have undergone at sea. The liberty allowed their women of walking in the gardens gives them an opportunity of continuing their intrigues. If they can speak to their lovers only by stealth, they find an opportunity of explaining their meaning, by ranging the flower pots in a certain order."

"Artifice and love have invented such a language in this country as is unknown in all others. A slave who is in love with and beloved by his mistress, is able to explain the several impulses of his heart, by the manner in which he disposes a parterre; a nosegay made in a certain manner, contains as many tender and passionate ideas as could be thrown into a letter of eight pages in length; the *flower-gentle* being placed by the *visite*, signifies that the lover hopes, after the husband is gone away, to compensate for all the evils which his presence contains. The *orange flower* denotes hope, the *marigold* implies despair, the *amaranth* shews constancy, the *tulip* reproaches with being unfaithful, and the *rose* supposes an encomium of beauty."

"From the particular attributes ascribed to their flowers a perfect language is formed. If a lover, for instance, was desirous of acquainting his mistress, that the torments he suffers have brought him to the brink of despair, and if he never expected to be made happy again by the absence of his rival; in this case, he forms a nosegay of a *marigold*, an *orange flower*, a *flower-gentle*, and a *visite*. The slaves easily find an opportunity to communicate those billet-doux to their mistresses, there being some secret place in the garden where they always place them. Answers are returned in the same manner; for by gathering some flowers, they form their letter of them undiscovers by any spectator; the signification of the principal letters being sometimes known only to two persons, who never fail to make deviations from the language commonly used, to prevent their being discovered."

"Love only could have been industrious enough to invent so ingenious a method to elude the care and foresight of jealous husbands; what will not two lovers effect when necessity forces them to have recourse to stratagem? I was lately told a story which will equally touch and surprize all readers, who are unacquainted with the violent lengths to which love will carry the African women."

"The only daughter of one of the richest Moors in this country, entertained a passion for a Portuguese slave. The girl, pursuant to the custom established in Africa, made the first advances, neither the large fortune she justly expected, nor the groveling condition of her lover, could divert the resolution she had taken to marry him; and notwithstanding the obstacles which the forelaw with regard to the execution of her project, nothing could make her lose the hopes of giving success to it. The Portuguese, struck with the thoughts of his good fortune, offered the fond mad the moment she discovered her passion to run away with her to Lisbon, which might have been done easily enough, and the Christian might have escaped by the assistance furnished

him by Zulima, for such was the name of our beautiful female African. She was sensible that the expedient proposed by her lover was the most rational one, and almost the only one that could bring her to her wished-for happiness; but being a jealous Mahometan, and firmly persuaded of the truth of her religion, she could not consent to retire to a country where she would have been forced to quit her faith. I love you, Sebastiano, said she to her lover, much more than I do myself; grief will kill me, if I am not made your wife, and yet I can never prevail upon myself to purchase my happiness at the price of my faith. It is not impossible but we may be happy in this country without running the hazard of being discovered in case we should fly: change your religion, remove by turning Mahometan the chief obstacle that keeps us asunder, and leave the rest to me. The Portuguese was much less attached to his religion than the female Mahometan, not to mention that the fear of totally losing his mistress, the desire of recovering his liberty, and the hope of acquiring a great fortune, had the strongest influence on his resolutions. He promised to comply with any thing she might require of him, and upon a solemn promise made by him to quit his religion whenever it should be necessary, the charming Moor indulged him with whatever love was capable of bestowing."

"These favours served only to strengthen the passion which Sebastiano felt for her; the fear he was under of one day losing his dear Zulima increased his tenderness, and his mistress was in the like frame of mind. Her whole attention was to give success to the design she had in view, but she found new obstacles every moment; when on a certain day, at a time she least expected it, her father declared that he intended to marry her to one of the principal men of the country. These words were as a thunderbolt to the maiden; in the first transports of her grief she resolved to fall at her father's feet, and open her whole soul to him; nevertheless she did not yet dare to comply with her first impulses, for fear of exposing her husband to the anger of an exasperated father, which might probably carry him to the greatest lengths."

"In this dilemma Zulima resolved to make use of an expedient, which was equally extraordinary and infallible; in order to succeed in her design, she bade her lover meet her at a certain place, whither she went upon the pretence of going to the bath, and was attended only by one woman; Sebastiano being come to the place appointed, had like to have died with sorrow, upon hearing his mistress was going to enter into the marriage state; however, Zulima bade him take heart, telling him that she hoped fortune would soon become more propitious to him; she then ordered the woman who had accompanied her, and was her constant, to go and inform the cadi, that her mistress was in such a place in the arms of a Christian: the attendant obeying, the judge came with his subaltern officers, and surprized the two lovers in the midst of their warm transports, when they were instantly conveyed to the prison where criminals are tried; Zulima's father being told the accident which had happened to his daughter, was seized with despair, upon which she flew to the prison in order to see her, but he was told that he could not be admitted to speak with her till such time as her trial was over; that inquiry was now making whether the Christian slave would turn Mahometan, and that if he would comply on that condition, the two lovers should be married together pursuant to the laws, but that in case of his refusal he should be impaled, and his daughter drowned in the sea."

"Mustapha, for this was the name of Zulima's father, knew but too well what punishment would be

* Many of the learned have supposed that love, and not commerce, first introduced the knowledge of letters to mankind, as the human heart feels less anxiety for the produce of the earth than the passions of the soul, and is not so solicitous concerning fecrity in articles of trade as in the impulses of inclination.

"Heav'n's first taught letters for some wretch's ill,
Some Hamid's lover, or some captive maid;

"They live, they breathe, they speak what love inspires,
"Warm from the soul, and faithful to its fires;
"The virgin's sigh, without her tears impart,
"Excuse the blush, and pour out all the heart;
"Speed the lost intercoure from soul to soul,
"And wait a sigh from Indus to the Pole."

POET.
inflicted

inflicted upon his daughter, in case the Portuguese re-
fused to turn Mussulman, and indeed the only motive
which prompted Mustapha to desire a fight of them,
was to offer his wealth, and engage the Christian to
change his religion. He had no occasion to make use of
rhetoric to exhort them to prefer life to a cruel death,
for the moment he made the overtures, Sebastiano an-
swered, that he would gladly embrace the religion pro-
posed by Zulima, and marry her, and the father thought
himself happy in having the opportunity of preserving
the life of his only daughter upon these conditions."

Besides the baths used for bathing, which are about
do in number, six others are converted into prisons for
the Christian slaves, in each of which there is a chapel
for the free exercise of their religion. Every slave is
allowed a mattress and a rug for a bed; they are let out
at a certain hour in the morning, and must be punctual
at night, to the time limited for their return to be
locked up.

Without the walls of the town are several tolerable
edifices, which add to the beauty of the environs, par-
ticularly the marine officer's public hall, a Marabout's
superb dwelling, and a variety of Turkish sepulchres
and monuments; among the latter, six magnificent tombs
of a circular figure are the most conspicuous: they
were erected to the memory of six deys, who were suc-
cessively elected, and then murdered in the dewan with-
in a few days. It is to be observed, that the tombs
of deys and bassas are distinguished by a stone, on which
a turban is carved in relief; those of the agas, and
other military officers, by a pike fixed in the ground
close to the coffin; those of the sea captains, by a staff
with a gilded ball at the top; and those of the common
people, by stones laid on the grave in the form of a
coffin.

Formerly the city of Algiers had none but rain wa-
ter, and the inhabitants were often greatly distressed
upon that account; till a Moor, who had been driven
from Spain, contrived, by means of two aqueducts, to
introduce as much into the city as was requisite to sup-
ply 100 fountains with water.

The territory about Algiers is very fertile, and the
gardens, groves, and country feats numerous: in their
gardens they use but little art, but trust to nature in
most productions of the earth, which occasions a wild
exuberance to reign throughout the whole, and many
of the fruits and vegetables not to arrive at the per-
fection they might be brought to by means of grafting,
pruning, transplanting, &c. The gardens are not
walled, but surrounded by inclosures of Barbary fig-
trees, which, from their compactness and prickles, are
more secure than any other kind of fence. Among other
rich spots in Algiers Proper, the great plain of Metu-
jah is admired for its astonishing fertility; it is 50
miles in length, and 20 in breadth, includes many de-
lightful villas, fragrant groves, and pleasant gardens, and
produces such a profusion of the most delicious fruits of
all kinds, rice, roots, and grain of every species, that
the inhabitants enjoy always two, and frequently three
crops in the year.

The only natural curiosities in the vicinity of this
city, are the hot baths of Meerega, the principal of
which is 12 feet square, and four deep; the waters are
exceeding hot, and when they have filled the above
basin, discharge themselves into a smaller, where the
Jews bathe, as they are not permitted to use the same
bath as the Mahometans. These hot baths proceed
from the great quantity of sulphur, nitre, and other
inflammable bodies in the bowels of the earth; from
whence likewise originate the frequent earthquakes that
disturb the kingdom in general, and the city of Algiers
in particular.

S E C T. V.

Of the Inhabitants of Algiers, their Customs, Manners,
civil and ecclesiastical History, &c.

THE inhabitants of Algiers are a mixture of Bere-
bers, the oldest possessors of the country, Moors,
Moriscos driven from Spain, Arabians, Levantines,
Turks, Jews, Christian slaves or most nations, and the

children descended from combinations of all the above
various kinds of people; but the most numerous are
the Moors and Arabians: the Moors are divided into
two orders, viz. those who live in towns and follow
piracy, or various professions by land or sea; and those
who wander about without being possessed of houses,
land, or riches. The first are the citizens of the king-
dom, the latter the bulk of the inhabitants.

The wandering sort are distinguished into various
tribes, each forming an itinerant village, and every
family living in a portable hut; they live by the produce
of the lands, which they farm of those of the first order;
they pay their rent to their landlords in corn, herbs,
fruit, honey, wax, &c. and a tribute to the dey accord-
ing to the number of the family in each moving village,
or rather camp. Their tents are mean, their utensils
trifling, their circumstances poor, and their manner of
living filthy. The family, and all domestic animals
lye promiscuously in the hut together, dogs excepted,
these being placed on the outside as sentinels. They
live chiefly on rice, bread, fruit, and plain water; and
their principal employ is husbandry, or breeding bees,
and silk worms. The dress of the men is only a long
piece of coarse cloth wrapped round their shoulders,
and falling down to their ankles, and a cap of the
same. The women wear a piece of woollen stuff that
covers them from their shoulders to their knees; they
braid their hair, and adorn it with glass beads and
fishes teeth; their arms and legs they ornament with
bracelets of ivory, horn, and even wood; and blacken
their cheeks, foreheads, arms, legs, &c. The children
are suffered to go naked till seven or eight years, when
they cover them with a few rags, rather for ornament
than decency. The dress of the chief or chief
of every tribe, is a shirt and cloak all of one piece, hang-
ing from the shoulders half way down the leg, and he
wears a cap of fine cloth.

From their wandering and abstemious life, they are both
of a swarthy complexion and robust habit of body. The
men are active, the women fruitful, and the children
healthy. When a youth would marry, he drives a num-
ber of cattle to the hut where the intended bride resides.
The girl and her parents on viewing the flock im-
mediately consent; and all the young women of the adowr
or village are then invited to the feast; the bride is after-
wards placed on a horse of the bridegroom's, and led
home amidst the shouts of all present. When she ar-
rives at the door of the bridegroom's hut, a mixture of
milk and honey is given her to drink, while a nuptial
song is sung. She then alights and is presented with
a stick, which she thrusts into the ground, and repeats
some lines to the following purport:

As this stick is fastened in the ground,
So to my husband, I'm in duty bound;
As violence alone can this remove,
So nought but death shall force me from his love.

She then drives his flock to water and back again, to
show her willingness to perform any duty he may as-
sign her. These previous ceremonies being settled,
all the company enter the hut, and the evening con-
cludes with the greatest festivity that these poor people
are capable of enjoying. Subsequent to the marriage the
wife is obliged to wear a veil, and never stir from the
hut during a month, and ever after is excluded from
all concern in and knowledge of public affairs.

These Moors are of a warlike disposition, excellent
horsemen, and sometimes give the government great
trouble. They are armed with a zagay or short lance,
and a scymeter, or broad cutlass; they are great thieves,
so that it is dangerous travelling without a marabout or
priest in company, to whom they shew such respect
that they will not touch any person thus attended.

The Arabians of Algiers are divided into tribes,
wander up and down, and profess the same religion,
customs, and manners as those of Arabia.

The Algerines are the most cruel and dangerous pi-
rates of all Africa, base, perfidious and rapacious to
the last degree; no oaths or ties, human or divine, will avail
to bind them when their interest interposes; in short,
whatever respect they may pretend to pay to their prophet
Mahomet,

Mahomet, gold is the only true idol which they worship. Gold, that

- “ Invidious bane that makes destruction smooth,
 “ The foe to virtue, liberty, and truth,
 “ Whose arts the fates of monarchies decide,
 “ Who gild’st deceit, the darling child of pride;
 “ How oft, allur’d by thy persuasive charms,
 “ Have earth’s contending powers appear’d in arms?
 “ What nations brib’d have own’d thy powerful reign?
 “ For thee, what millions plough’d the stormy main;
 “ Travell’d from pole to pole with ceaseless toil,
 “ And felt their blood alternate freeze and boil?”

The people who reside on the coast are equally savage to such as unfortunately fall into their hands by shipwreck; so that it appears that the Algerines in general are as much strangers to humanity, as they are to an elegant taste or polite behaviour; Algiers retains the title of a kingdom, though in fact it is but a republic, as their public ordinances evince, which run thus, “ We the great and small members of the mighty and invincible militia of Algiers,” &c. This alteration was caused by the tyranny of the Turkish baskis, who were at length deposed by the militia, and janissaries, and a dey of their own chusing put up, when the Ottoman Porte found themselves under a necessity of ratifying this regulation, not to run the risk of losing Algiers entirely. The janissaries now became extremely powerful, as they formed themselves into a dewan, and from their own body always elected a dey; but this dignity is a very precarious station, for by the manner of election, a dey is seldom chosen without great tumult and bloodshed; from the nature of his office he is always in danger, and from the disposition of those about him, seldom dies a natural death.

The next officer in dignity and power is the aga of the Janissaries, who only enjoys his post two months, and then retires upon a pension; the other officers of importance are, a secretary of state, 24 chiah bassas, or colonels subordinate to the aga; 800 bolluk bassas, or senior captains, and 400 oldak bassas, or lieutenants. In all these offices the right of seniority is strictly observed in Algiers; for a single infringement in this essential point would immediately cause a revolt among the soldiery, and perhaps cost the dey his life.

Besides the above, there are purveyors to the army, a body guard to the dey, &c. and the officers of the Turkish forces, who are distinct from the rest.

The general language of Algiers is a compound of Arabic, Moreisco, and the remains of the ancient Phœnician; but all public business is transacted, and records are kept in the Turkish tongue, though most of the Algerines of all denominations understand the Lingua Franca. The people in general are fond of the piratical trade, yet admit free Christians, Jews, Arabians, Moors, &c. to trade in silk, wool, cotton, leather, carpets, &c. in the country. To import gold and silver stuffs, damasks, cloths, spices, tin, iron, brass, lead, quicksilver, linen, cordage, sail cloths, bullets, rice, alum, tartar, cochineal, sugar, soap, cotton, raw and spun, aloes, copperas, brazil, logwood, arsenic, vermilion, gum-lack, opium, sulphur, anise and cummin seeds, sarsaparilla, frankincense, galls, honey, paper, conchs, cards, dried fruits, &c. And to export ostriches feathers, wax, hides, wool, copper, rugs, silk sashes, embroidered handkerchiefs, dates, and Christian slaves, who, for large ransoms, are allowed to be sent home. But commerce is greatly injured by the oppressions of the government, the suspicious of the merchants, who are always afraid of being deprived of their properties, and the perfidy of the common traders.

The religion is Mahometan, and the principal officers who preside over ecclesiastical matters are,

- The mufti, or high priest,
 Cadi, or ecclesiastical judge, and
 Grand marabout, or superior of the Monkish orders.

The Algerines in general are exceeding superstitious,

and the marabouts upon all occasions take an advantage of their weaknets, and enrich themselves by the folly of the people.

The Algerine Turks dress with as much elegance as the inhabitants of Turkey. The free Christians are permitted to dress in the fashion of their respective countries, but the slaves are obliged to wear a coarse grey luit and a scannai’s cap. The bashis, or those who pretend to be descended from Mahomet, are distinguished by a green turban; but the common Algerines wear shirts, linen drawers, an open wool’en jacket with a hood behind, and a black cloak, which reaches to their knees, when they go abroad.

The revenues of the dey cannot be ascertained, for as they are founded on rapine and plunder, and depend chiefly on casual robberies, they must fluctuate continually, and be at all times uncertain. Justice is venally administered, favour publicly sold, and corruption in general, that it is not looked upon as a vice.

Rebels are strangled with a bow-string, or hanged on an iron hook; lesser offences are punished by fire, degradation or the bastinado; women detected in adultery are fastened by their necks to a pole, and held under water till they are suffocated. But the most dreadful punishments are inflicted on the Christians and Jews for various offences, such as speaking against Mahomet, for which the offender must either turn Mahometan or be impaled alive; changing to the Christian faith again, after having turned Mahometan, for which the punishment is roasting alive, or being thrown from the city walls, when the unhappy sufferer is caught upon sharp pointed hooks, and hangs several days in the most exquisite tortures before he expires; fomenting a revolt or killing a Turk, is punished by impaling or burning; and those who attempt to escape from slavery are put to death in the following singular and cruel manner: The criminal is hung naked on a high gallows by two hooks, the one fastened quite through the palm of one hand, and the other through the sole of the opposite foot, where he is left till death relieves him from his cruel sufferings; a Moor convicted of burglary hath his right hand cut off, and fastened about his neck, and then is led through the city on an ass with his face towards the tail; and persons of distinction, for crimes against the state, are placed between two boards and sawed asunder.

Besides the grand dewan, there are inferior ones in some of the districts, in all which the process is very concise, the charge is heard, the witnesses sworn, the defence attended to, and sentence immediately given. Christian slaves in Algiers are very numerous, every eight of whom is the property of the dey; those who come of good families, and can procure a considerable ransom, and such as have trades, or can make themselves otherwise useful, are treated tolerable well; but such as are of poor parentage, and have not learned to perform any thing which can procure favour, are terribly ill used.

O slavery! thou friend of hell’s recess,
 Profuse of woes, and pregnant with distress;
 Eternal horrors in thy presence reign,
 And meagre famine leads thy doleful train:
 To each cruel load, subjection adds more weight,
 And pain is doubled in the vassal’s fate;
 O’er nature’s brightly face thou spread’st a gloom,
 And to the grave dost every pleasure doom.

None but the principal people are allowed to ride on horseback, at least in the metropolis; others either ride on asses or walk on foot. Women throw a veil over them when they go abroad, so that they are unknown to all but the slaves who attended them. Some are carried in litters made of olive twigs, and covered with painted cloth, but so low that they are obliged to sit cross-legged in them; this mode of travelling is used by both sexes in long journeys, particularly pilgrimages, as the traveller can see and not be seen, and travel without being annoyed by wind, dust, rain, heat, &c.

g, chatting, visiting the tombs of their relations, and
in their gardens. The men spend most of their
time with the women in their gardens, in conversa-
tion, drinking coffee, smoking, &c. The Algerines may
have as many wives as they please by their law, but
they usually content themselves with two or three at
the most. They seldom see them before marriage, but
have their description from a female go-between. When
the marriage is agreed upon, the bridegroom sends a
present of fruits and sweetmeats to the bride, and gra-
tifies her relations with a feast and a musical entertain-
ment. On the nuptial day she is conveyed, richly
dressed, in a sedan, to the house of the intended bride-
groom, when the marriage is concluded with another
entertainment.

In sickness the Algerines are attended by persons of
their own sex to nurse them, the physicians are very
ignorant, and if they find their patients on the point
of death they turn them towards the east. The corpse,
after being washed and clad in a shirt, drawers,
silk robe and a turban, is laid in a squarish kind
of coffin, and carried on mens shoulders by means
of poles to the grave, attended by the relations,
friends, &c. Mourning is expressed by the women
going veiled for some days, and the men wearing their
beards for a month; during three days after the inter-
ment of the body the nearest relations visit the tomb,
distribute alms to the poor, and suffer no fire to be
lighted in their houses; the better sort of people have
epitaphs, or suitable texts from the koran upon their
tomb stones, in which, as with us, the dead are com-
plimented with virtues which they never possessed, that
the living may be flattered in the supposed merits of
their deceased relations.

The forces of Algiers consist of the Turkish Jani-
saries, who are the most powerful, Moors and Couloglies.
About 20 ships form the navy, of which one only,
called the Deylik or Royal ship, belongs to the govern-
ment. They are supplied with military stores by the
Europeans, who purchase their friendship with the im-
plements of mischief, and court them not to make de-
predations on their trading ships, by supplying them
with the means; the English consul in particular fur-
nishes them with powder, balls, bombs, fire arms,
anchors, cordage, &c. And takes in return corn, oil,
and other provisions for the garrison of Gibraltar.

The Algerine sailors are extremely filthy, and even
beast of their nastiness, and pretend to despise the
nicety found in most of the vessels belonging to the
Christians. The sailors are composed of Couloglies,
Moors, Renegadoes, Christian slaves, &c. But all the
officers must be Turks.

REVOLUTIONS.

THE Romans were expelled from the Algerine ter-
ritories by the Vandals, and other northern barbarians,
who held them from the year 427 to 558, when they
were conquered by Belisarius, the emperor Justinian's
celebrated general. From this period they continued
subject to the Greek emperors till the year 663, when
the whole country was over-run by the Arabs, who
remained masters of it till 1051, when Abel-Tezein, of
the Zinhagian tribe, expelled them, and took the reins
of government upon himself, which continued in his
family till the 12th century, when the Zinhagians
were driven out by the Marabouts. This priestly race
was soon divested of power by the Benimerini, who
were likewise deprived of what they had conquered in
the 13th century, by the Sharifs of Halesen, who divided
Algiers, and other parts of Barbary into several petty
kingdoms; but falling out among themselves, Ferdinand
the 5th, king of Arragon, took advantage of their
civil dissensions; and in the year 1505, by the advice
of his prime minister, Cardinal Ximenes, sent a power-
ful armament to Algiers, under the command of the
count of Navarre. This nobleman soon made himself
master of Oran, Bugia, and some other places. In this
emergency the Algerines applied to Selmi Eutemi, an
Arabian prince, for assistance; but though he aided them
as much as in his power, he could not prevent the

count from making the city of Algiers tributary to the
court of Spain. This subjection continued till the
death of king Ferdinand, which happened in 1516,
when the famous pirate, Barbarossa, undertook their
deliverance; but instead of vanquishing their enemies,
he conquered the kingdom of Algiers, put prince
Eutemi to death, caused himself to be proclaimed sov-
ereign, subdued the kingdom of Tenez and Tremecen,
and established his power in such a manner as to be
dreaded not only by the neighbouring states, but by the
Europeans; till in 1517, the emperor Charles V. pre-
pared to oppose him, and to set the young king of Tre-
mecen on the throne, of which he had been deprived by
Barbarossa. The Spaniards and Arabs were so success-
ful, that Barbarossa's army was totally defeated, himself
slain, his head carried in triumph upon a lance, and
the kingdom of Tremecen re-conquered.

The news of Barbarossa's defeat and death occasioned
great consternation at Algiers; but the people determined
to chuse his brother, Hayradin Barbarossa, king and
high admiral in his room. But Hayradin fearing that
he should not be able to support himself against the
numerous enemies that surrounded him, and his own do-
mestic foes, applied to the grand seignor, and proposed
to cede the Algerine kingdom to him, on condition that
himself should continue to rule it as viceroy, and be
assisted with some Turkish forces. These proposals
were gladly acceded to by Selim I. and a body of
forces immediately dispatched to the assistance of Hay-
radin; by these means he became formidable to the
Moors and Arabians by land, and the Christians by
sea.

Hayradin then laid siege to the Spanish fort, which
was a continual thorn in his side, and took it by storm,
after a brave resistance; being now secure from enemies,
he turned his thoughts to improve the harbour of Algiers,
which he did effectually, by building a strong mole for
the safety and convenience of the shipping. Upon this
great work 30,000 Christian slaves were incessantly em-
ployed till the whole was completed; he afterwards re-
paired the fort, and put a strong garrison in it, and thus
rendered Algiers more secure than it had ever before
been.

The grand seignor now raised Hayradin to the dignity
of *captain-bassa of the Ottoman empire*, and appointed Haf-
san, a Sardinian renegado, as *bassa of Algiers* in his
stead. The latter pursued his piracies with great success,
and even made depredations on the coasts of the eccle-
siastical state. This induced the pope to exhort the
emperor Chales V. to put a stop to the ravages of the
Algerines, which that monarch immediately undertook,
and soon set sail at the head of a formidable armament,
consisting of 120 ships, 20 gallees, a large train of artil-
lery, 30,000 soldiers, and a great number of volunteers
of several nations, among whom were many knights of
Malta.

The emperor having landed his forces, built a fort
on an eminence, which, to this day, goes by the name
of the *Emperor's Fort*; he then closely invested the city,
and turned the course of the streams that supplied it
with water, which greatly distressed the inhabitants.

The Algerines looked upon their condition as so
desperate that the members of the dowan were upon the
point of surrendering it, when a poor eunuch, named
Yusef, who was looked upon as a lunatic, appeared be-
fore, and thus addressed them, "My lords, I am the
poor Yusef, the slave of slaves, and most object of
Mussulmen, persecuted by the great, represented as a
madman by our Marabouts, on which account not
only my advices have been rejected, but myself treated
ignominiously; the cadi, who is the judge of the law,
hath often made me undergo very severe public punish-
ments, and why, because the Almighty, whose ways are
to us unsearchable, hath sometimes given me an insight
into futurity, and what I have hitherto foretold hath
been thought unworthy of their regard. I have re-
mained silent towards them that despised me, but have
informed those poor people, who pined and relieved me
of things of the greatest moment to them; but at this
juncture, Hassan, being ruler of our city, the public
danger forces me to speak: here is a powerful fleet of
Infidels,

Infidels, whose vessels are crowded with armed men, and who have come as suddenly upon us as if they had risen out of the sea. We are destitute of every means of defence, and our only hope placed on an equitable capitulation, if equity can be expected from Christians. But God, who laughs at the machinations of men, hath quite other thoughts: he will release his people out of the hands of idolators* in spite of all their faints, be they ever so many. Lord Hassan, and you his ministers, and great men of the kingdom, and learned men in the law, I call upon you to take courage, rely for this once upon the despised and abject Yusef; and be assured that before the end of this moon God will display his glory to the utter confusion of the Christians. Their ships and army will perish in your fight, and our city be victorious and free. Their arms and equipage will fall to our share; and as they have already employed a vast number of hands in erecting forts for our future defence against themselves, so they shall continue still slaves to us, and few of those blind and hardened people shall be permitted to return to their own country."

This singular speech diverted them from their intended design of delivering up the city; and what is still more extraordinary, every circumstance of the prediction was verified within the month, the greatest part of the emperor's fleet being destroyed by a violent tempest, and his army greatly distressed by the incessant rains, which occasioned torrents of water to pour down from the mountains and overwhelm his camp. These disasters obliged him to raise the siege, which he did with precipitation, leaving behind him tents, baggage, artillery, &c. and betaking himself to his ships; which the Algerines no sooner perceived than they fell upon his troops while they were embarking, cut many to pieces, and took a great number of prisoners. In fine, the emperor's whole loss amounted to 120 ships and gallees, 300 officers, and above 12,000 soldiers and sailors killed or drowned, and near as many taken prisoners; with respect to the latter, the Algerines in derision put many of them up to public sale, at an onion per head. Yusef was liberally rewarded, and looked upon as a saint, and the Algerines have ever since been much addicted to astrology, and great admirers of the art of divination.

Hassan dying soon after, was succeeded by Hiji, an officer of the militia, who was, however, obliged to resign in favour of Hassan, the son of Hayradin, the brother of Barbarossa; the latter being nominated by the Ottoman Porte. In the beginning of the reign of this prince, the Algerines were, however, obliged by the Spaniards to evacuate Tremecen. But a few years afterwards they subdued and plundered it; Hassan was afterwards, by the intrigues of the bassa Rustan, and Salha Rais, deposed, and a creature of theirs advanced to the throne in his stead. This prince rendered tributary several Numidian provinces, and returned with 15 camel loads of gold dust, and other valuable spoils; he afterwards died of the plague, and was succeeded by a Corsican renegade, called Hassan Corso, who was soon murdered by a Turk, named Tekelli.

Tekelli tyrannized for a short time, but being killed by *Yussef Calabres*, the murderer succeeded him, and reigned only six days, being seized by the plague, which carried him off immediately.

A Turk, named Chajah, now held the office in trust, till the pleasure of the porte was known; when Hassan, who had been deposed by means of Rustan and Salha Rais, was restored by the grand seignior's order, and Chajah quietly resigned the government to him. This prince invaded Tremecen, but was totally defeated; the ensuing year, however, made him some amends, for the Spaniards making an attempt upon Mostagan he gave them a dreadful overthrow. In the fight, he brave count *D'Acordela* and his son, Don Martin de Cordona, with many other officers, and a great number of private men were slain, and 12,000 Spaniards, including several noblemen and gentlemen were made

* The Mahometans term the Roman Catholics idolators, on account of the homage they pay to the images

captives; but Hassan becoming obnoxious to the Janissaries, was again deposed, and sent to Constantinople in irons, when *Bosnoe Hassan*, aga of the Janissaries, and *Couza Mahomet*, the general of the land forces, took upon them jointly the office of deputies to superintend the affairs of government. Soon after, a new viceroi named *Achmet*, arrived from Constantinople, who began his reign by sending the two deputies to that city where they were beheaded. Achmet died in four months, and his lieutenant *Yajat* governed the kingdom four more, till the will of the Ottoman court could be known; when Hassan was a third time appointed to the sovereignty; such was the friendship which Solymon the second entertained for him, and the esteem which he always professed for the two famed *Barbarossas*, his father and uncle.

He was no sooner installed on the throne of Algiers, than he raised a greater armament than had ever been done by any of his predecessors; his army consisted of 15,000 Turks, renegadoes, &c. 1000 spahis, and 10,000 horse; and his fleet of 32 gallees and galliots, and three French vessels laden with provisions; with this force he intended to make himself master of *Marfalsquibber*, and drive the Spaniards from thence: this he had near effected, when a powerful fleet appeared upon the coast, under the command of the celebrated Genoese admiral *Doria*, which obliged him to raise the siege with precipitation. The court of Constantinople now growing jealous of him, he was obliged finally to resign his dignity; when retiring to that city with all his wealth, he died about three years after, in the 50th year of his age, and 8th of his last bassahship.

His successor, *Mahomet*, was a public spirited prince, and became very popular on many occasions, in particular he incorporated the Janissaries and Levantines, which proved the first step towards rendering Algiers independent of the Ottoman Porte. In this prince's reign, a bold Spanish adventurer, named *Galeon*, made a romantic attempt on Algiers, but being taken prisoner, he was put to a cruel death. The grand seignior, however, thought proper to depose *Mahomet*, and appoint a renegade, called *Oehali*, or *Hali Balla*, in his room. This prince subjected Tunis, took three rich Maltese gallees, and in the famous battle of *Lepanto* was the only Mahometan chief who gained the least reputation; he was nevertheless soon after deposed by the Porte, and Arab-Achmed appointed to the government in his stead. Within three years the latter was recalled, and *Rumardan Sardo* placed in his room, who contributed to the expulsion of the Spaniards from most parts of Barbary, and assisted *Muley Moloch* in the conquest of *Fez*; but being recalled from Algiers, he was sent as bassa of Tunis, and Hassan *Veredic* appointed to the kingdom of Algiers in his stead.

Hassan reigned better than three years, and being recalled, on account of his uncommon extortions, an Hungarian renegade, named *Jaffer*, succeeded him, arriving at Algiers about the end of August 1580, when that city suffered a dreadful famine, occasioned by his predecessor's having monopolized the principal necessaries of life. *Jaffer*, by the most prudent methods, relieved the distresses of the people, and acted with great equity upon all other occasions; yet the rapacious Hassan found means to make so many friends at the court of Constantinople, that the just *Jaffer* was recalled, and himself again appointed to the government of Algiers. The first thing he did after his restoration was to fit out a considerable fleet, with which he made depredations on the coasts of *Sardinia*, and plundered other parts of *Christendom*; but once more displeasing the Ottoman Porte, he was again recalled, and soon after poisoned.

Mommi Arnaud succeeded the above tyrant, and grew so bold, that he effected what no corsair had ever been confident enough to attempt before, that is, to pass the straits of *Gibraltar*; after entering the Atlantic ocean he proceeded to the *Canary Islands*, which he plundered, and returned to Algiers in safety, notwithstanding a Spanish fleet of 18 ships was ordered to

of faints, relics, &c. which kind of superstition the Mahometans themselves utterly detest.

watch his return; but he took the opportunity of re-passing the streights in a stormy night, while the Spaniards sought shelter in different ports. He was soon after ordered from Algiers to the Tunisian government, and was succeeded by Achmet.

Achmet made some descents upon the Christian territories, reigned three years, and then was ordered to the government of Tripoli, to make room for Hidir bafsa, who, in the year 1592, was recalled, and succeeded by Shaaban bafsa: the latter ruled Algiers about three years; when, being ordered to Constantinople, his kinsman Mustapha was placed on the throne. This prince was supplanted four years afterwards in favour of Hidir bafsa, who was re-appointed to the government of Algiers by the Porte. Hidir had no sooner regained his power, than he extorted 15,000 ducats from Mustapha, before he set sail for Constantinople, and ruled the Algerines with his usual tyranny, oppressing the poor, and plundering the rich with the utmost rapacity. All these things Mustapha, on his arrival at Constantinople, represented with such energy, and painted Hidir's character in such glaring colours, that the Ottoman ministry thought proper again to recall that tyrant, and to re-appoint Mustapha once more. The latter soon returned to Algiers, stripped Hidir of the principal part of his ill-got wealth, sent him to Constantinople, and afterwards ruled the people with so much justice and moderation, and acted upon all occasions with such generosity and humanity, that he became beloved by all ranks of people, and the nation was never more prosperous nor happier than under his government.

This period brings the Algerine history down to the latter end of the 16th century, and here conclude the annals of the celebrated Diego de Haedo, the most circumstantial and authentic historian who hath written upon the affairs of Africa in general, and Algiers in particular. Since this era we are not so minutely acquainted with the history of those parts; but the following extract from an able writer will, in some measure, help to fill up the chasm:

“ Since the miscarriage of Charles V. (the emperor) the kingdom of Algiers continued a province of the grand seignior's, governed by a viceroy of his nomination: The abuses of these viceroys were great, by assuming a despotic power, seizing upon all the public revenues, and embezzling the funds destined for the payment of the Turkish soldiers, whose number was always deficient, and these but ill paid. In the 17th century this body of soldiers sent a secret deputation to the Porte, representing the tyranny of the pachas, their avarice, and the detriment resulting from it to the state, together with their misapplication of the funds sent from Constantinople, and the non-payment of the troops, which occasioned daily desertions; adding, that without a speedy redress of these grievances, the evil would be past remedy, and the Ottoman power soon brought to a period by the Arabians and Moors, who were continually plotting with the Christians. These deputies moved, that a person of judgment and good morals, of courage and experience, should be chosen out of the troops with the title of dey, who should be accountable for the public revenue, and the contributions raised on the Arabians and Moors for the payment of the troops, whose full complement should be constantly kept up; and that he should superintend all other branches of the state, which thus might stand by its own strength, without being burthenfome to the Ottoman court; engaging withal to remain in perpetual subjection to the grand seignior as sovereign of the kingdom, and to continue the usual honours, salary, and prerogatives to his pacha, provided that he should only be present in the general dowans without having any vote, unless required to give his advice. The deputies insisted that if these offers were rejected, the weakness and discontent of the soldiery would soon transfer the kingdom of Algiers to the first aggressor. This disposition was more agreeable to the grand vizir, as it would save considerable sums to the Porte, and yet the army be kept in a more respectable state. He therefore got it approved by the grand seignior, and an instrument was drawn up agreeable to the proposals of the deputies from Algiers. At their

arrival they communicated it to the pacha, who could not pretend to oppose it. The army proceeded to the choice of a dey, and instituted reciprocal laws both for him and his subjects, to the due observance of which he was sworn, under pain of death. Every article of the instrument was adjusted; the pacha had his houses, his retinue, and his salary out of the public funds, never concerning himself in any deliberation but when required. As all schemes are liable to abuses and mutations, the soldiery by degrees divided into factions concerning the choice of a dey: some by open force, or by their interest, upon the least disgust, got their dey deposed and strangled, setting up another, whom they expected to find more favourable to their designs. But Baba-Ali, who was bachaour, or grand provost, being chosen dey in 1710, in spite of the pacha, who was for intruding himself into state-affairs, clapped him on board a Tunis vessel, and sent him to Constantinople, threatening that if ever he presumed to come and cause any disturbance at Algiers, his life should pay for it. At the same time this artful dey sent an embassy to the Porte, with presents to the vizir, sultanas, and chief officers of the seraglio, with a detail of his complaint against the pacha. He humbly represented to the vizir, that this officer's turbulent practices began to raise to such a height, that it was only out of respect to the grand seignior and himself, that he had changed the death he had deserved into banishment; but that the faithful army was so incensed against the pachas, that in like case they would be uncontrollable, and undoubtedly cut them to pieces; which, as it would be a most execrable affront to the sacred orders of the Porte, the malcontents would improve such a confusion to their rebellious purposes; concluding, that since a pacha was not only an useless, but really a detrimental officer, it would be the best method to send no more, but confer the title of pacha on the dey, which was accordingly granted. Since this, the dey has looked upon himself as an independent sovereign, governing as such, and only an ally of the Ottoman Porte, from which he receives no order, though an envoy is sent on any important negotiation. They are, however, unwelcome guests to the government of Algiers, being entertained at its expence, and dismissed with considerable presents; besides their affecting a lofty deportment, which is extremely odious to the soldiery of Algiers, as being a kind of reproach on their meanness and dependance on the Porte: accordingly they dismiss them as soon as possible, and the coldness of the ceremonies paid them, intimate that they only proceed from custom and policy.”

All that remain worthy of remark, relative to the history of Algiers, is as follows:

In 1682 the Algerines made a treaty of alliance with England, and in the same year plundered the French coasts, which occasioned the court of France to send a fleet against them under the command of the Marquis du Quesne, who cannonaded Algiers; but a storm arising, his ships received some considerable injuries, which obliged him to return home. He was no sooner gone, than the Algerines sallied forth, put to sea, sailed for France, and committed the most dreadful ravages on the coast of Provence. This new insult so much exasperated the French monarch, that he ordered the Marquis du Quesne, and the Marquis d'Anfreville to sail for Algiers, in order to punish those pirates for their audacity. The French squadron came before that city in May 1683, and poured in such a shower of bombs, that the place was soon in flames; the dey's palace, many mosques, and other public buildings, with a vast number of private houses were destroyed; the slain and wounded were very numerous, and the people greatly distressed. This occasioned them to sue for peace; when one of the principal articles insisted upon by the Marquis was the delivery of all Christians taken under French colours. This was assented to, and 142 of them brought on board the next day, with a promise of sending the remainder; but unfortunately the negotiation broke off, and the Algerines again hung out the bloody flag. The Marquis accordingly renewed the bombardment, when great destruction and slaughter ensued; to revenge which the Algerines had recourse to the

the most bloody and savage cruelty, murdering all the French captives, and firing off the conful of that nation from the mouth of a mortar. This inhumanity the French admiral punished by destroying all the shipping and fortifications, and all buildings in the lower, with most of those in the upper part of the city; that is, in fact, all that his cannon or bombs could reach. Having done as much mischief as he intended, he sailed home, and a peace was soon after concluded between France and Algiers.

In 1686 the Algerines entered into a treaty with the English, (or rather renewed one entered into in 1682) which was often broke, and often renewed in subsequent years, till it was thought proper to chastise them for their perfidy; when Captain Beach attacked seven of their frigates, drove them on shore, and burnt them. This brought them to their reason; the treaty was revised in 1700, with the addition of these three articles:

1. "That the peace concluded in 1682 be confirmed, and more particularly the 8th article, wherein it is expressed that no ship belonging to Algiers shall cruise in sight of any port or place belonging to Great-Britain, or in any way disturb the peace or commerce of the same, nor shall any Algerine vessel enter the English channel.

2. "No passes shall be required from any English ship till the last day of September 1701: but after that time, if any English ship shall be seized, not having a pass, the goods of such ship shall be prize, but the master, men, and ship shall be restored, and the freight immediately paid to the master.

3. "Whereas Captain Munden hath complained that he was affronted some years past, by some rude soldiers at the Mole; it is promised, that at all times hereafter, when any British man of war shall come to Algiers, orders shall be given to an officer to attend at the Mole, during its stay, to prevent any such disorder; and if any such shall happen, the offender shall be punished with the utmost severity."

Soon after the two following additional articles were added, in a treaty with Sir George Byng, afterwards Lord Viscount Torrington.

1. "Whereas by those of the old treaties it was agreed that the subjects of England should pay 10 per cent. custom for goods they should sell at Algiers, or in the dominions thereof; for the better settling and maintaining a good commerce between the subjects of these two nations, the English should from thenceforth pay no more than five per cent. custom for such goods, and that such as were found to be contraband, should not pay any custom, as had been before concluded."

2. "That all prizes taken by any of the subjects of the said queen of Great Britain, and all the ships and vessels built or fitted out in any of her Majesty's plantations in America, that have not been in England, shall not be molested on account of their not having passes; but that a certificate in writing under the hands of the commanding officers who shall take any prizes, and a certificate under the hands of the governors or chiefs of such American colonies or places, where such ships were built or fitted out, shall be sufficient passes for either of them; and our faith shall be our faith, and our word our word. Signed at Algiers, Oct. 28, in the year of Jesus 1703, &c."

But the Algerines were never very punctual in the performance or due observance of their treaties with us, till we became possessed of the important fortresses of Gibraltar and the island of Minorca; for till then their faith was a farce, and their words but wind; but our having the command of the Straights, by means of those acquisitions, obliges them to act through fear, as they never would do by the impulses of conscience.

In 1716 Admiral Baker renewed and ratified all the former treaties with Algiers, in the same manner as he did with the states of Tunis and Tripoli, as we have already mentioned.

The Spaniards attacked Algiers with a very formidable fleet and army in the month of July, 1775; but by the misconduct of their principal officer, the Algerines obtained a conquest, and the Spaniards were obliged

to retire with great precipitation, after a loss of about 800 killed, and 2000 wounded; since which, though they have continued their preparations, no other attempt has been made.

SECT. V.

MOROCCO and FEZ.

BOTH these kingdoms were comprized in the ancient Mauritania, and at present compose one empire, which is situated on the western borders of Barbary. It is bounded on the south by the celebrated mountain called the Great Atlas; on the north by the Mediterranean; on the east by the river Mulvia, which separates it from Algiers; and on the west by the Atlantic Ocean; extending from 28 to 36 deg. north latitude, and from 4 to 9 deg. west longitude from London, being 500 miles in length, and 480 miles in breadth, where broadest.

The grand division of this empire is into three large provinces, viz. Morocco, Fez, and Sus: but a more common division makes Morocco and Fez contain seven provinces each, viz.

MOROCCO.	FEZ.
Hez,	Azgar,
Sus,	Chaus,
Gefula,	Erif,
Morocco Proper,	Fez Proper,
Ducala,	Guret,
Eicura,	Hazlear,
Telda.	Temefine.

The climate is extremely hot, particularly towards the south, but in general is tolerably healthy, being cooled by the sea breezes, and defended by high mountains from the sultry south winds, which give it a temperature not to be expected from its situation so near the tropic. Indeed Mount Atlas, whose head is covered with snow the greatest part of the year, surrounds it in the manner of a crescent to the southward, and in some measure prevents the passage of the damp vapours and pestiferous blasts from that quarter:

—"The fourth wind night and horror brings,
 "And fogs are shaken from his flappy wings;
 "From his divided beard two streams he pours,
 "His head and rheumy eyes distill in show'rs;
 "With rain his robe and heavy mantle flow,
 "And lazy mills are low'ring on his brow."

But if the rainy season, which begins in October, continues too long, it occasions pestiferous fevers; and the north-west winds which prevail in March, sometimes greatly affect the lungs and nerves, and injure the products of the earth. In other respects the sky is serene, and the air clear and wholesome. The country is well watered by fine springs that are found in moist moors, and fine winding rivers, which in general have their source in Mount Atlas, and disembogue themselves in the Mediterranean Sea, or Atlantic Ocean.

This country (saith a modern author) has been always famous for its horses, which, though inferior in size, make up that defect by their fine shape, fleetness, and particularly by their peculiar docility. The inhabitants have been no less celebrated for their dexterity in breaking, training, and riding of them, ever since the time of the Romans; and even to this day are allowed to excel all nations, and to be in some measure inimitable in both."

A most beautiful description of that noble animal the horse, is thus translated by Dryden, from Virgil's original:

"Upright he walks, on pasterns firm and strait,
 "His motions easy, prancing in his gait;
 "The first to lead the way, to tempt the flood,
 "To pass the bridge unknown, nor fear the trembling wood;
 "Dauntless at empty noises, lofty neck'd,
 "Sharp headed, barrel belly'd, broadly back'd,
 "Brawny his chest, and deep his colour grey,
 "For beauty dappled, or the brightest bay,
 "Faint white and dun will scarce the rearing pay.
 "The fiery courser, when he hears from far
 "The sprightly trumpets, and the shouts of war,
 "Pricks

“ Pricks up his ears, and trembling with delight,
 “ Shuts place, and paws, and hopes the promis'd fight:
 “ On his right shoulder his thick mane reclin'd,
 “ Rattles at t'ped, and dances in the wind:
 “ His horny hoofs are jetty black, and round;
 “ His chine is double; flouting with a bound,
 “ He turns the turf, and shakes the solid ground.
 “ Fine from his eyes, clouds from his nostrils flow,
 “ He bears his rider headlong on the foe.”

This noble, useful, and generous animal is thus emphatically described in the sacred writing, Job xxxix. ver. 19. *Hast thou given the horse strength? hast thou clothed his neck with thunder? Canst thou make him afraid a grasshopper? The gale of his nostrils is terrible.* 21. *He paweth in the valley, and rejoiceth in his strength; he goeth on to meet the armed men.* 22. *He mocketh at fear, and is not affrighted; neither turneth he back from the sword.* 23. *The quiver rattleth against him, the glittering spear and the shield.* 24. *He swalloweth the ground with fierceness and rage, neither believeth he that it is the sound of the trumpet.* 25. *He saith among the trumpets, ha, ha; and he smelleth the battle afar off, the thunder of the captains, and the shouting.*

These verses have been thus finely paraphrased:

“ Hast thou, O Job, given to the gen'rous horse
 “ His confidence, his spirit, and his force;
 “ The deep thick mane, that clothes the noble beast,
 “ The graceful terror of his lofty creel;
 “ Is it thy work? Canst thou his courage shake,
 “ And make him like a wretched insect quake?
 “ With native fire his dreadful nostrils glow,
 “ And smok and flame amidst the battle blow:
 “ Proud with excess of life he paws the ground,
 “ Tears up the turf, and spurns the sand around:
 “ Pleas'd with the martial noise he snuffs the air,
 “ And smells the dusty battle from afar,
 “ Neighs to the captain's thunder, and the shouts
 “ of war.”

M. la Condamine says, that the English racer can run with his rider faster, by some seconds in a mile, than a barb of Africa can without a rider.

The Barbary camel is larger and stronger than the camel of Asia, and the dromedary is exceedingly useful, on account of its docility and swiftness.

The soil of Morocco is so good, that it generally produces three crops annually; and it is said, would, with proper management, furnish every year 100 times more than the inhabitants are capable of consuming: but cultivation is very little attended to, except a few miles round the different cities and towns.

The chief rivers are, 1. The Mulviva, which is the boundary between Fez and Algiers, springs in Mount Atlas, and falls into the Mediterranean. 2. The Taga springs from the same source, and empties itself into the same sea. 3. The Sebu. 4. The Ommitabih. 5. The Tenifit. 6. The Sus; which four last rise in Mount Atlas, and disembogue themselves into the Atlantic Ocean.

With respect to mountains, the Great and Lesser Atlas are not only the principal in Barbary, but some of the most celebrated in the universe. The Great Atlas divides Barbary from Biedulgerid; and the Little Atlas extends along the Barbary coast to the Streights of Gibraltar. The coldness and inaccessibility render the Great Atlas in many parts uninhabitable; but some places enjoy a milder climate, contain many villages, numerous herds of cattle and flukes, are well cultivated, and inhabited by Arabs, Berbers, and other African people, who, in the severer parts of the winter, are obliged to retire into vast caverns, to preserve themselves and their flocks from being overwhelmed with the prodigious quantities of snow that fall, and from the inclemency of the weather. These people are in general fierce, cruel, and warlike, and are spread in numerous tribes over the various branches of this prodigious mountain. They can bring many men into the field, and have it in their power to be very troublesome to the neighbouring governments, it being as impossible to be entirely upon the defensive against them, as totally to subdue them.

24

This mountain gave rise to a thousand fabulous stories among the ancients; in particular, they say that Atlas, king of Mauritania, and son of Japetus, was forewarned by an oracle, that he should be ruined by one of the sons of Jupiter, which made him determine to give no entertainment to any stranger whatever. At length Perseus, the son of Jupiter, arriving in his dominions, was forbidden the court by Atlas: this so enraged the young prince, that he put his shield before the eyes of Atlas, and shewed him Medusa's head, which transformed him into the famous mountain that still bears his name:

“ Atlas, who turns the rolling heav'ns around,
 “ And whose broad shoulders with their lights are crown'd;
 “ Atlas, whose head sustains the starry frame,
 “ Whose brawny back supports the skies;
 “ Whose head with piny forests crown'd,
 “ Is beaten by the winds, with foggy vapours bound;
 “ Snows hide his shoulders; from beneath his chin
 “ The fount of rolling streams their race begin.
 “ A bead of ice on his large breast depends, &c.”

The abovementioned king Atlas was a very able astronomer, and the first who taught the doctrine of the sphere: hence originated all the fables concerning him, particularly that he supported the heavens on his shoulders, and that his daughters were turned into stars.

The inhabitants of this empire consist of,

1. Berbers, or descendants of the antient natives.
2. Arabs.
3. Moors.
4. Jews.
5. Renegados of many nations.
6. Christian slaves of many nations.
7. Turks and Levantines.
8. A mongrel breed, consisting of those who proceed from a promiscuous commerce of any of the above classes.

The principal cities are,

Morocco, the capital of the empire, is pleasantly situated on an extensive plain between two rivers, the Nephis and the Agmed, and is watered by a third, the Tenifit. It is, without doubt, one of the most opulent, populous, and important cities in Africa. The most received opinion is, that it was founded by Abutechihen, and finished by his warlike son Joseph, who, after obtaining many glorious victories in Spain, brought from thence 30,000 captives, whom he constantly employed in surrounding it with strong walls, which were 12 miles in circumference. It then contained 100,000 houses, and still hath 24 magnificent gates, and a great number of mosques, palaces, &c. but at present its pristine splendor is much decayed. It is 16 miles north of Mount Atlas, and 150 from the Atlantic Ocean, in 30 deg. 40 min. north latitude, and seven deg. west longitude. The walls are so strong, both with respect to the stones themselves, and the cement with which they are fastened, that they are impenetrable to the pick-axe, and other instruments; they are flanked with strong towers, bulwarks, bastions, &c. and surrounded with a deep ditch.

The imperial palace is within a spacious fortress, called the Al-Capava, which is situated on the outside of the city. It is defended by high walls, strong towers, a deep ditch, &c. and has only two gates, the one leading towards the country, and the other towards the city; both of these are handsome and well guarded; and that towards Morocco faces an elegant and capacious street, the vista of which is terminated by a large magnificent mosque, admirably embellished with carvings of marble, jasper, &c. and the noble gates of the church of Seville, which the celebrated Almanzor brought from Seville. On the top of its stately tower, four large copper balls, plated with gold, were fixed upon iron spikes; together they weigh 700lb. but are of unequal sizes, the smallest being capable of containing one, the next two, the third four, and the largest eight sacks of wheat: of these balls take the following account:

“ Some writers affirm, these four balls, or golden

3 X

apples,

apples, as they stile them, to have been the dowry of some queen of Morocco, who was daughter and heiress of the king of Cagoa, who, to eternize her memory, caused them to be thus planted on the top of that tower. Others say, that one of the wives of the famed Jacob Almanzor, sold all her jewels to defray the expense of this whimsical ornament. However that be, the notion that went for current among them was, that they were set up by some extraordinary conjurer under a proper constellation, and that it was either impossible, or at least extremely dangerous to attempt the taking them down, and would be attended with some fatal calamity. This notion the Altakis tell you was so impressed on the minds of the people, that several of their kings had attempted it to their cost, and particularly that A. D. 1500, Naker-Buchentuf, being exhausted by an expensive war with the Portuguese, Arabs, and Fezans, having ordered one of them to be taken down to pay his troops, the people surrounded him in a tumultuous manner, and told him they would sooner sell their all, even to their wives and children, to raise him money, than suffer it. Buchentuf was soon after treacherously poisoned by Muley-Hamel, and the people interpreted it as a just judgment for his avarice and irreligion. This did not deter Hamel, in a little time after, from attempting the same thing, and with better success, because he went more cunningly about it, for having caused it to be taken down in the night, and the gold to be taken off by a Jew, who gave him 25000 pistoles for it, he ordered it to be safely gilt, and set up again in its place, and the Jew to be hanged near it; and caused it to be given out, that the demon to whom the care of these balls had been committed, had inflicted that punishment on him for having attempted to take it down. A long while after, Muley Ismael, who reigned when Marmol (the geographer) was a slave in that capital, caused them all to be taken down, and turned to better advantage."

Beneath this mosque there is a capacious vault, originally designed for a cistern, but now converted into a granary. The battlements are exceeding lofty, and the spire rises 70 feet above them, from the summit of which the tallest men beneath appear to the beholder like small children.

The royal apartments, halls of audience, seraglio, &c. are noble structures, highly embellished and richly furnished; and the gardens, though neither well designed, or properly variegated, are extensive and magnificent, containing all kinds of trees, herbs, flowers, shrubs, &c. which can possibly grow in that climate; but the splendor still remaining is inconsiderable with respect to the former grandeur of the place, the evidences of which yet subsist in a variety of noble fragments. The innumerable ruins of many superb palaces, colleges, halls, baths, hospitals, and above 400 aqueducts, are the mournful monuments of the effects of despotism, the ravages of frequent wars, and the devastations of the tyrant time.

The houses in general are but in an indifferent condition, and a great part of them gone quite to decay. The inhabitants are about 25,000; but the Jews, the number of whom is about 4000, live in a particular quarter, which is near the palace, and surrounded by a wall, through which there is but one gate, and that is well guarded by Moors; yet foreign ambassadors, agents, merchants, &c. chuse to live in this, preferable to any other part of Morocco. The Jews have the art of growing rich, though they are exceedingly taxed; but they, politically, pretend to poverty, and for obvious motives make a very mean appearance. There is a handsome bridge over the *Teniff*, which runs through the city, and supplies the inhabitants with water.

Fez was originally the capital of the kingdom of the same name, and is at present a rich and populous city, standing in 38 deg. north lat. and 4 deg. west long. It comprises three distinct parts, viz. Beleyd, which contains about 4000 houses, and stands on the east side of the river Fez.—Ain-Alu contains about 4000 inhabitants, and stands on the west side of the same river; and Albegd, or White Fez, which was built by Jacob, king of the Beni-Mereri, and

contains 20,000 inhabitants. The two first form *Old Fez*; the latter *New Fez*: and at present they together form one city. *Old Fez* is nine miles in circumference, stands between two hills, is surrounded by strong walls, and flanked with magnificent towers. It is without suburbs, contains many excellent gardens, hath narrow streets, seven gates and two castles; the one old and gone to decay, the other new and in good condition; the latter is garrisoned with blacks, but neither have any cannon to defend them. The houses are of stone or brick, three stories high, flat roofed, encompassed with galleries; adorned on the outside with mosaic work, and embellished within with carving, painting, and handsome furniture; but it is to be observed, that in general the seragios are upon the turrets of the houses, from whence the women have a fine prospect, but they are never permitted to stir abroad.

The river Fez, in passing through the city, divides itself into six canals, over the various parts of which are 250 stone bridges, and 370 mills are turned by the several streams. In the city 336 ovens are daily employed; the mosques are computed at 500, 50 of which are of the first rank, and one in particular is a most amazing structure: it is a mile and a half in circuit, including the cloister and college belonging to it; the roof is 150 cubits high, and 50 in breadth; the stately gates are 30 in number, and the pillars which support the minaret, or tower, are 30 cubits in length, and 20 in breadth; the roof is sustained by 1500 pillars of white marble, and 17 arches; two curious lamps continually kept burning adorn every arch. In the cloister belonging to this mosque are 42 galleries, and 400 cisterns for the people to perform their ablutions. The college is the most eminent, and contains the best library in the empire; here are several other hospitals and colleges, which are large, magnificent, and well endowed; 600 water conduits, and 200 spacious inns. The principal magistrate of the city is styled provost of the merchants, besides whom there is a governor, a cadi, and their subordinate officers.

Fez is usually deemed the grand magazine, and principal mart of Barbary; the streets therefore swarm with merchants and tradesmen of all professions, and the warehouses, shops, &c. are filled with a great variety of commodities, viz.

Mequinez, in 34 deg. north lat. and 6 deg. west long. is situated in a capacious pleasant plain, on the river Sebu. It is three miles in circumference, surrounded with strong walls, environed by gardens, and embellished by many mosques, colleges, baths, &c. The markets are daily crowded with people, particularly Arabs, who bring honey, wax, butter, hides, and dates for sale. The emperor's palace is almost a town of itself, and though much decayed, is still exceedingly superb; the parks and gardens that surround it, with the number of halls, rooms of state, offices, pavilions, &c.

&c. are surprising to the beholder. It stands upon the most elevated ground; the city, consists of several squares, contains two mosques, an extensive seraglio, large magazines and store-houses, an armoury, barracks for the guards, and apartments for various mechanics, who are continually retained by the emperor to do business immediately before the palace. The Jews in this city have their principal quarter to themselves, in which, as in most other towns of the empire, they are shut up at night. Adjoining to Mequinez, being only separated by a road, is Negro-town, so called from the black troops in the emperor's service being quartered in it.

It is to be observed, that the Jews here are exceedingly ill used, as they are plundered, abused, and beaten, even by the very meanest of the Moors, and dare not resent the ill-treatment they receive. The great men horsewhip, or cudgel them whenever they come in their way, and they are not permitted to come out of their quarter with shoes and stockings on, being obliged to walk bare-footed in the streets frequented by the Moors.

Sallee, situated in 33 deg. 48 min. north lat. and 6 deg. 25 min. west long. is an ancient city, being mentioned by Ptolemy, and stands on the river Gueron, which divides it into two parts. The northern part, encompassed with a strong wall, and defended by battlements, towers, &c. is Salla or Salee, properly so called; but the southern part, named Rabat, comprises many farm houses, orchards, gardens, and corn fields; the latter being sufficiently extensive to yield wheat enough for the sustenance of 15,000 persons, yet the whole is surrounded by walls, which were erected by the captives that Almanzor brought from Spain. On the south east part there is a tower, which serves for a land mark in the day time and a light house at night: it is lower than it was originally, for some part of the top was struck off by lightning; it is 50 feet square, built of stone strongly cemented, and opens towards a magnificent mosque, 1400 paces long, and 300 wide, in the court of which is a well 30 feet deep, and 100 in width. Beneath the tower are two docks, the one for wintering, and the other for building of ships. The harbour is large, but so shallow that the piratical vessels are obliged to put into the island of Tedal near its mouth. The town is defended by two castles, which communicate with each other, but the fortifications are irregular and ill designed; all articles of commerce here pay a tenth part to the emperor, but the chief support of the place is the piratical trade.

Magazan, 30 miles south of Sallee, is a strong well built town, possessed by the Portuguese, who have a numerous garrison here; it is surrounded by a strong wall, above six yards thick, and well defended by cannon. The piratical ships often intercept the provision vessels, which puts the garrison to great straits, and obliges them to make excursions and rob the Moors, in order to obtain a subsistence.

Alezisar, which was supposed to have been built by the celebrated Almanzor, was a good trading town till the Portuguese took it in 1458; while they possessed it, which was not long, they did it great injury, and after it was recovered by the Moors it was suffered insensibly to run to decay.

Arzila is another ruined place, about 24 miles from the straits of Gibraltar.

Tangier is situated in 35 deg. 56 min. north lat. and 6 deg. 30 min. west long. on a good bay. Its ancient name was Tigris, being the capital of Mauritania Tingitana. It was once a noble city, containing many sumptuous edifices. The Portuguese took it in 1471, and considerably increased its strength, though they destroyed much of its beauty; they afterwards ceded it to the English, as part of the dowry of Catherine, princess of Portugal, upon her marriage with Charles II. king of Great Britain, when a mole was made at an immense expence, which ran 300 fathoms into the sea; but the parliament deeming it too chargeable an incumbrance upon the nation, it was abandoned in 1684, and the fortifications blown up; it still continues but a mean little fishing town, though the Moors have attempted

to re-people it. The inhabitants are great thieves, whenever they can find an opportunity, and are exceedingly cruel to those that they can get into their power; as the following curious narrative will evince, which we present to our readers as a genuine account of the sufferings of the crew of the Inspector privateer during their captivity.

On the 24th of October, 1745, captain Richard Veale, in the Inspector privateer, sailed from the Downs on a cruise, and having taken two prizes, entered the straits of Gibraltar on the 1st of January, and the next day the vessel sprang so bad a leak, that it was with the utmost difficulty the crew kept her above water till the 4th, when finding all farther efforts ineffectual, she ran ashore in the bay of Tangier.

As the emperor of Morocco was at that time under a treaty of peace with the crown of Great Britain, the crew expected a favourable reception, and immediate relief from the Moors; but in this they were greatly disappointed!

Those who escaped with their lives, and reached the shore first, were used in a very barbarous manner by the Moors, and stripped of all their cloths; and some who presumed to resist these Barbarians, were immediately drowned, or otherwise murdered, without mercy.

A small number of them got into the town of Tangier before night; but the greater part of them lay without the walls, and as the season was then very sharp and inclement, they were half perished with cold and hunger, abstracted from the barbarous treatment they received.

Twelve of the crew continued on the wreck all night, where they spent their time in the most melancholy manner, expecting every moment to be swallowed up by the waves, which swelled like mountains, and broke over their heads almost every minute.

In the morning the Moors sent out a boat to take them in, which was no sooner done, than they began to strip them of every thing that was of the least value, and at the same time insulted them in the most cruel manner, calling them Christian dogs, infidels, and unbelievers.

Early the next morning, as those who had lodged in the town were going to the beach to take a survey of the wreck, they found the dead body of Mr. Russell, their surgeon, extended on the ground with his face downwards, at a little distance from the town walls.

This unhappy gentleman had swam ashore, but the gates of the town being shut, he could not possibly get admittance, and having nothing to nourish him during the night, had fallen a sacrifice to cold, hunger, and fatigue.

Out of the whole crew, which amounted to 183 before the wreck, exclusive of Mr. Russell, 95 perished in the waves, or were murdered by the Moors; and the survivors, to the number of 87, with great difficulty obtained permission to go to the British consul's house in a body, in order to lay before him their unhappy circumstances, and obtain something towards their subsistence; but the consul being then at Gibraltar, they applied to the deputy consul.

In a few days Mr. Petierew, the consul, returned from Gibraltar in the Phoenix man of war, and went instantly to the alcaid, to persuade him to permit his unhappy countrymen to go over to Gibraltar; but the alcaid said that he could not comply with this request without orders from the emperor.

The captain of the Phoenix having lain one night at the consul's house, went on board the next morning; soon after which the consul paid a second visit to the alcaid, the consequence of which was, that he sent our unfortunate sufferers word, that there were no hopes of their getting out of the country, till the government of Great Britain had discharged an old debt due to the emperor of Morocco, for a ransom of a certain number of captives, who had been released by John Leonard Sollicoffe, esq. and carried to England about 17 years before.

Confounded at this shocking and unexpected news, captain Veale and four lieutenants who had private intimation of it before the rest, formed a project of making

ing their escape, and by the assistance of the captain of the *Phoenix*, who sent his boat well manned to fetch them, they got safe on board the ship.

As soon as they were on board, the captain sent off a boat in the night, which kept plying along the shore, to carry off as many of the crew as they could find; but they only found two, who had luckily hid themselves under a rock, without the walls of the town, all the rest having been hurried to prison.

The barge which conveyed captain Veale on board had no sooner put from the shore, than the whole town of Tangier was alarmed; and finding part of their booty irrecoverably lost, a whole legion of the Moors swarmed down on the English, vowing revenge for their loss, and drove them immediately to prison.

The jail in which they were confined was more leathsome than can be imagined: and as the consul had now abandoned them, they knew not whom to apply to for redress or assistance: a small pittance which had hitherto been allowed them was stopped, and they had nothing but famine and death before their eyes.

For near three days successively they received no kind of sustenance; and when their miserable condition as laid before the alcaid, he only answered, with a malicious smile, "If the unbelieving dogs are hungry, let them eat the stones."

At length a prison, who was not wholly divested of humanity, obtained the alcaid's permission for them to beg about the town in the day-time, under the conduct of a guard; but at night they were obliged to return to their dismal dungeon.

Though this, doubtless, was an act of indulgence, yet the inhabitants were so little disposed to deeds of charity, that their subsistence was very small and indifferent, inasmuch that if any one got a piece of bread or meat given him, the rest were ready to tear him to pieces, and could not help grudging him the delicious morsel.

They continued in this deplorable condition for above two months, begging all the day, and lying on the bare stones at night; but at length they were driven to the brink of despair, by being informed that they would soon be conducted to the emperor, whose presence they dreaded to such a degree, that they determined to attempt their escape; but in this they were unhappily discovered, and prevented from carrying their plot into execution.

After such an act of rebellion, as it was called, they could not reasonably expect the least indulgence; nor indeed did they meet with any, for large iron chains were immediately fastened round their necks, and twenty of them were linked together in one chain.

They were now locked up in a dungeon that was very nearly dark, and were almost wholly deprived of food, so that they began to entertain thoughts of casting lots who should die for the support of the rest till some relief should arrive.

Happily, however, this plan was not carried into execution; for on their complaining to the jailer that they were perishing with hunger, he represented their case to the people of the town, who sent them a small quantity of bread, and eight small sheep, two of which were instantly devoured raw; for at that time they had been four days and nights without any kind of food.

At this time Mr. Petticrew, the consul, was at Gibraltar; and the alcaid sent to the emperor, to know how he should dispose of the prisoners: he received orders to bring them under a proper guard to Buscoran, which was at the distance of 200 English miles; but Mr. Petticrew returning just at this juncture, desired the alcaid not to take them to the emperor till the arrival of William Latton, esq. who was daily expected, an ambassador from the king of Great Britain to the emperor.

The alcaid refused to comply with this request, unless Mr. Petticrew would go with him to the emperor, to satisfy him that an ambassador would so soon arrive: but this Mr. Petticrew declined, having no orders so to do, nor any present to carry with him to the emperor.

On the morning of the 18th of May, these unhappy

people were driven out of the jail, unchained, and placed on the outside of the town-walls, where they continued till the alcaid and his retinue came to them, and then they proceeded on their journey to Buscoran.

After a very disagreeable and fatiguing journey, during which they were confined in a prison at one town for several days, they arrived at the emperor's camp at Buscoran on the 9th of June.

When they came within half a mile of the emperor's tent, they staid about half an hour waiting his farther orders, during which they could observe, by the countenance of the alcaid and others, that there was something very dreadful to be expected from the emperor.

Just before the messenger came from the emperor, the alcaid and his principal attendants formed themselves in a line, and prayed in the devoutest manner. They were so terrified that their countenances changed every moment; the alcaid and several others wept much, which induced the English captives to imagine, that the miseries they had hitherto expected, were not near so great as what they should now experience.

A messenger soon came from the emperor, commanding their immediate appearance before his tent; on which the Moors were drawn up in one line, and the English in another, and stopping at about 60 paces from the tent, the guards immediately surrounded them, and in about a quarter of an hour his majesty came out, and sent a messenger to bid the alcaid and his attendants advance nearer him: to this they instantly answered, "Yes, master;" and ran to him in such haste that it might have been thought they were going to seize him.

When they were near enough to hear him speak, they fell on their knees, and bowed their bodies forward, with their faces to the ground, till he spoke to them; they then held up their heads, and informed him that they had brought him a present, consisting of powder, cloth and other things, besides the English captives.

The emperor having accepted the present, asked the alcaid where the captain of the Christian captives was? To which it was answered, that he had made his escape. The emperor then asked for the lieutenants? and being answered as before, told the alcaid, he thought him and his attendants a set of villains; and by his manner, the English captives imagined he suspected the alcaid had received a sum of money for the escape of captain Veale and the lieutenants.

Immediately after this the emperor sent for four Englishmen, who had been in the Spanish service, and deserted from Cadiz to Tangier, to conduct the new captives to a castle at a little distance from the camp, till farther orders.

They were not long there before the alcaid and all his guard were drove to the same place, and put in irons, which was so far from giving pleasure to the English, that notwithstanding the ill treatment they had received from that officer, they gave him and his people bread out of their poor allowance of two-pence a day.

When our unfortunate countrymen had been confined two days, they were drawn up in a line before the emperor's tent, when his majesty picked out six of the youngest of them, and sent them back to the castle, to assist the Moors that had the care of his arms; and to each of the rest was given a cut-throat, or a pickaxe, and they were sent to Buscoran castle, at the distance of about a mile, to enter upon that state of slavery which is so much dreaded by free-born Englishmen.

No sooner were they got to the castle, than they were set to pulling down a large house that was within it; when being in great want of the necessary tools, and perfect strangers to that kind of work, they were in the utmost danger of being buried under the rubbish.

The emperor now frequently came to give his orders, and would often stay within the castle five or six hours together, and sometimes the whole day, during which they were not permitted a moment's rest, nor even to stand upright to ease their backs, or get a drop of water, though the sun shone so hot that their heads and backs were an entire blister.

Their

Their sufferings were so great, that in less than a month 20 of them renounced their faith, and turned Mahometans, in order, at that dear price, to be exempted from a slavery which they considered as insupportable.

One morning, about seven o'clock, the emperor came to Bufcoran castle, and having surveyed the English slaves for about three hours, he went to the other castle, where the aleaid and his miserable companions were confined: and having reviewed them, he withdrew to about 60 paces from the castle, and then turned about, and gave orders for their being brought before him; which being done, the aleaid and four of the principal people were set apart from the rest.

After this, with all the composure and serenity imaginable, he called for his scymetar, which being delivered to him, he drew it out of the scabbard with a peculiar air, and ordered one of the delinquents to be taken out of his chain, and brought before him.

This unhappy victim now fell prostrate on the ground, and with tears implored his pardon: but the emperor, deaf to all his entreaties, stretched out his arm, and crying, "In the name of God," struck off his head at one blow.

This being done, he delivered his scymetar to his sword-bearer, to whom, and others, he gave orders for their following the example he had set them. And then retired to a small distance, where he stood to see his commands punctually obeyed.

At this time there were no less than 335 miserable wretches that lost their lives in this arbitrary manner, including 40 braves, who had been kept in chains several days before the English arrived at the camp.

In order to strike the greater terror into the minds of his surviving subjects, the emperor ordered the heads which had been cut off to be collected in hampers, and sent to the aleaid or governor of Mequinez, to be nailed on the walls of that city, and exposed to public view; while the bodies were dragged about a mile from the place of execution, and there left to moulder into dust, or be devoured by birds or beasts of prey.

Sometimes, however, these unhappy victims meet, after death, with an odd kind of favour from the emperor, who gives an order for the interment of their mangled carcases, which is signified by a messenger in the following words:

"O thou impudent, presumptuous and disloyal wretch! notwithstanding thou didst in thy life-time commit so many and such enormous crimes against God and thy king, I do now in his name, and by his express order, to shew his love and affection for thee, though altogether unworthy of the least of his royal favours, freely forgive thee all thy past transgressions; and in consequence thereof, as the same are from this time to be buried in oblivion, I am come to give thy remains a decent interment."

Without this permission, no person must presume to bury the body of any one thus executed, as the life of the offender would immediately pay the forfeit of so rash an action.

The reader will recollect, that the aleaid and four other persons were set apart from the rest, and reserved to be spectators of the abovementioned bloody scene, which being ended, the emperor addressed them in the following manner: "Behold your slaughtered friends there! Having given you this proof of my resentment of your rebellious proceeding, I shall carry my just vengeance to no greater length at present: I give you my royal word not to behead you, as I have your companions; but I expect, as a testimony of your sorrow for having mutinied against me without cause, that you send immediately to Tangier, and take care that I may receive the remainder of my dues; and on your compliance with this my just demand, I shall freely acquit you, in hopes that this my lenity towards you may produce a reformation in you, and teach you to become more loyal subjects for the future."

By this act of clemency the emperor hoped to have obtained a considerable sum from the aleaid and his unfortunate companions; but being disappointed in his

expectation, he determined that they should be sacrificed to his vengeance.

Wherefore summoning them before him a second time, he gave immediate orders for their execution; but previously told them, that "as he detested the guilt of a lie, they should not end their days by the stroke of the sword; yet as they had forfeited their lives a second time by their disobedience of his royal injunctions, he had determined that they should be all bow-stringed."

Hereupon he called out two of his guards, and gave them orders to fasten a cord about the neck of each prisoner, and strangle them one after the other; but to take time in the execution of their office; which they accordingly performed with the utmost deliberation, in order to aggravate the pains of these unhappy wretches, whom they spent near two hours in executing, the emperor himself being present all the while, triumphing over them, as traitors to him and their country.

This barbarous scene being ended, his majesty ordered the bodies to be dragged by the heels to a distance from the place of execution, and there to lie above ground for two days; but on the third day he gave orders for their interment.

Soon after this the English prisoners received the following letter from Mr. Petticrew, the vice-consul:

Laache, Friday 24th of June, 1746.

Mr. Kilbs and Countrymen,

"I SEND this courier to advise you of my arrival here, where I shall rest on account of my lameness till Sunday, and then proceed for Mequinez; and on Wednesday or Thursday next shall see you.

"By letters lately received from the ambassador, he was to leave England the 28th of May, so is hourly expected at Gibraltar; which I wish may be speedily, for your sakes, and God send you an immediate delivery.

I am, Sirs,

Your very humble servant,

W. PETTICREW."

On the 29th of June they received advice of Mr. Petticrew's arrival at Mequinez, whereupon they sent him several letters, describing their unhappy situation, and intreating him, in the most pressing terms, to use his utmost interest on their behalf, not doubting but that when he should be admitted to the emperor's presence, it would be in his power to procure some mitigation of their hardships.

On the same day that they dispatched these letters, the emperor having ordered them all into his presence, selected 16 of the youngest of them, whom he asked if they would turn Moors? which they refusing, he sent them under a proper guard to Fez, to assist such of the Moors there as were gun-smiths by profession; and the rest of the English captives were sent back to the castle, with orders that they should be kept close to their usual labours.

Those who were sent to Fez had an opportunity of paying their respects to Mr. Petticrew, at Mequinez, and lodged for one night in the house where that gentleman had taken up his quarters.

On the 30th of June, Mr. Petticrew was admitted to the emperor's presence, and having delivered him a present from his Britannic majesty, informed him that Mr. Latton, an ambassador from England, was daily expected at Gibraltar, where he proposed to wait for his majesty's directions respecting his landing at Tetuan, in order to settle a treaty of peace between the two crowns.

To this the emperor replied, that he had long lived in expectation of the arrival of an ambassador from the court of Great Britain, but had not yet had the pleasure of seeing any person invested with that character; wherefore he desired that Mr. Petticrew would instantly return, and take care that the ambassador came to him without delay.

Hereupon Mr. Petticrew took his leave, and repaired immediately to Mequinez; and though he was not above a mile from the castle where his unfortunate

3 Y country-

countrymen were at work, yet he did not favour them with one friendly visit.

As they were deprived of any opportunity of speaking to Mr. Petticrew, to lay before him their deplorable condition, they on the first of July sent him a letter, in which they inclosed a letter of attorney, to enable him to receive their shares of the prize money of a French vessel, which they had taken and carried into Gibraltar.

To this letter they received the following answer; but the power of attorney never was of the least service to them.

“GENTLEMEN,

“I THIS morning received your letter, with the power of attorney, and shall do all in my power to recover your parts of the prize, which shall be † Farthingly referred for you. I shall also endeavour to collect some charity at Gibraltar.

“I assure you I shall do and act in every thing in my power to get you out of the country as if the case was my own: so hope no more of you will be so mad as to renounce your faith. The people the emperor has ordered for Fez, lay with me last night. It makes my very heart bleed to see their naked, miserable condition; but one comfort is, it cannot be long, as I expect the ambassador will be at Gibraltar before I get even. I wish you all health and happiness, and am, Sir, your affectionate friend,

W. PETTICREW.”

The day after writing this letter, the sixteen persons abovementioned set forward for Mequinez, on their journey towards Fez; but as they had near 40 miles to march in one day, Mr. Petticrew kindly ordered each of them a pair of shoes, and gave them two loaves to refresh themselves with on their journey.

In the mean time the rest of the unfortunate Englishmen were kept to hard labour, without any thing to cheer them in all their oppressions, but the pleasing hope that advice of the ambassador's arrival would soon reach them, for which they put up their fervent and daily prayers to heaven.

Though the hardships they underwent were almost insupportable to those few who were in health, yet the afflictions of the greater part of them were aggravated by their being troubled with the bloody flux, which gradually growing upon them, impaired their strength to such that they could scarcely crawl upon the ground.

Sickness, however, is no plea for a captive to be relieved from his labour even a single hour in a day; for the overseers, if they had an inclination, durst not presume to favour them in the least, without an express order from the emperor, who, though he cannot be insensible of their tortures, seldom shows them the least favour; and no one dare presume to ask any at his hands.

At length Mr. Kilbs, having laboured till his spirits were quite exhausted, dropped down on the ground in the emperor's presence, and lay a considerable time as one absolutely dead, no one daring to afford him the least assistance.

When he had lain some time, without the least sign of life, the emperor demanded the reason of that captive lying in so indolent a posture, and why he was not compelled to work? When being informed of the cause, he ordered him to be brought forward, that he himself might form a judgment of the matter.

Three Moors instantly took him up, and carried him to the emperor, who, perceiving that there was no imposition in the case, gave orders for his being conducted to the outer part of the castle, where he lay in the agonies of death for four days successively, and then expired.

When the emperor heard he was dead, he indulged his companions so far as to permit some of them to attend him to his grave; and he was buried with as much decency as their situation would admit of.

† This is an odd phrase; but the meaning of it must be, that not a farthing of the money which he could pro-

Some little time after this, these unfortunate captives were removed from Buzoran castle, to another castle near the place where the emperor was then encamped. As soon as they arrived, some of them were employed in assisting the masons, and others in levelling such rock stones as obstructed the emperor's passage from the camp to the castle. As his majesty sat several hours every day to be a witness of the progress of the works, it is impossible for the reader to form an idea of the toils and fatigues they were obliged to undergo; nor is it in the power of words to express their hardships; for after the rocks were levelled to his satisfaction, all the pieces that were hewn asunder, were ordered to be conveyed to one corner of the castle: a work of incredible labour and difficulty!

The few cloaths which they had been worn to rags, they worked quite naked from the head to the waist; and the weather being excessive hot, their skins were at first blistered, and at length so perfectly tanned, that it would have been impossible for their most intimate acquaintance to have known them, for they looked like a parcel of negro slaves.

From this second castle the captives were removed to another at Mequinez, from which the emperor having been absent some time, they were, on his return, drawn up in order, to pay their homage to him as he passed by them.

On his near approach, he stopped and took a survey of them, and asked their overseer what place was set apart for their lodging; and the overseer, pointing to a wall at some distance, told him that was the place; the emperor, however, casting his eyes over the garden, and observing a large arch belonging to one of the walls of the palace, gave orders that they should be quartered there.

They thought themselves greatly obliged to him for indulging them with so convenient an apartment, where they could lay under cover, and were not exposed, as they had been before, to the cold dews of the night.

They now began to congratulate each other on the sudden amendment of their wayward fortune, and thought themselves happier than they had ever been since they came into the country.

Their pleasure, however, soon began to be interrupted; for the Moors, grudging them so comfortable an apartment, insulted them, by throwing stones and clods of earth into their lodging in the night, when they could not see from whom the injury was received.

This was a dreadful grievance, as they lay in manifest danger of having their brains beat out; but as they knew not whom to apply to for redress, they were obliged to take such measures as they could to screen themselves from the malice of their implacable enemies. Happily for these poor captives, several hedges of cane happened to grow within the walls of the palace: of these they gathered a large quantity, and made such a fence to the front of their lodging, that at length they were at ease, being totally secured from any injury that the Moors could do them.

Thus situated, and having no talk imposed upon them for a considerable time, some of them, who were in health, embraced that opportunity of mending what few rags they had to cover their nakedness: and those that were sick had sufficient rest to recover their strength, which had been impaired through excessive labour.

Their allowance was also better than it had been at Buzoran, being two-pence per day to each man, and they were permitted to go into the town whenever they pleased in the day time, to lay out their little stipend to the best advantage: and as they began to be acquainted with the mercenary disposition of the Moors, and to have a tolerable smattering of the language, they were not so easily imposed upon as they hitherto had been.

As the emperor had permitted them to enjoy a life of ease for some time past, they began to flatter themselves that he had received private intelligence of the English ambassador's arrival at Gibraltar; and they began to

hope for them should be diminished.

hope

hope that their toils were at an end, and that their deliverance was at hand.

In the midst of this pleasing reflection, they were sent for in haste to a year before the emperor, who immediately ordered them to remove a large pile of wood that stood in his way, to a place at the distance of about a quarter of a mile: for this piece of work two days were allotted; but notwithstanding their utmost endeavours, they found it impossible to clear it in that time without further help.

When the emperor found that a considerable part of the wood still remained on the spot where it fell, he was highly incensed, and ordered near an hundred of his foot-guard to assault the English slaves. Among these were two poor, old, worn out wretches, who were scarcely able to crawl along, and who, after two or three turns, determined to crawl from their labour, and trail to the emperor's clemency to make allowance for their infirmities.

They accordingly declined their work, which the emperor observing with apparent signs of anger, they approached him, trembling and shuddering, and told him they were too old and infirm to go through so laborious a task, and they therefore hoped, that as they had faithfully served both his father and himself for many years, he would consider their infirmities, and provide for them in such manner as he thought proper for the short remainder of their days.

To this the emperor in answer, that he plainly perceived they were past their labour, and therefore he thought it his duty to provide for them for the future; whereupon he instantly gave orders to two of his guards to shoot them through the head.

This cruel injunction being immediately obeyed, "Now, said he, I have taken sufficient care, in return for your past services, that you should not linger out your days in misery; your sorrows in this life are at an end!" And then, as a farther testimony of his kindness, he gave orders to one of his officers to see that they were buried with decency.

In a short time after this, the English slaves having completed the job they were set about, were remanded to their usual place of abode, where they had time to refresh themselves again; and from this time till they left Mequinez, which was about six weeks, their labour was to be inconsiderable that they had no reason to complain.

They had not lived long in this manner, before the emperor's noble camp came to them, and acquainted them that his Britannick majesty's ambassador was arrived at Gibraltar; notice of which had been given to the emperor by a letter from the alcaid of Tetuan.

The same night that they received this agreeable intelligence, one of the emperor's brothers visited them from their respective, and in a very obliging manner desired to know if they had received any tidings of the arrival of an ambassador from England; to which they answered in the negative, but told him that they lived in daily expectation of news from Gibraltar.

He seemed surprized at this answer, but told them an ambassador was actually arrived at Gibraltar, with an intention of paying down a ransom for them; and assured them farther, that he had lately had an interview with his brother the emperor, who spoke of them in the most favourable terms, and intimated, that he should release them with pleasure, if he approved of what the ambassador had to offer in their behalf.

The reader will believe, that on the receipt of such good news, they had not the least inclination for sleep; their eyes were too full of tears of joy to admit of their taking any repose, and they mutually congratulated each other till day-light, on the pleasing prospect they had now before them.

In the morning the report grew more universal, and almost every one they saw gave them hopes of a speedy release; and before noon the emperor's brother came to them again, and assured them that the emperor intended to send a letter to the alcaid of Tetuan, with orders for him to invite the ambassador to Barbary; and that afterwards he would send his black army to wait on him to the alcaid's house, and escort him to court.

Though this was doubtless very agreeable news, yet they should be a kind of dread upon their spirits, lest the report should be without foundation; and of this they were the more apprehensive, as they had received no notice of their intended redemption, either from the ambassador, or from Mr. Petticrew the vice-consul.

However, as they were not kept to such hard labour as usual, they could with the greater patience wait for the confirmation of the news that they so sincerely and constantly prayed for.

On the evening of the 24th of October, their overseer informed them that they must prepare to march to Fez the next morning; for the emperor had issued out orders for the alcaids, with their attendants, to be ready early in the morning, without the walls of the palace.

Early in the morning, therefore, our unfortunate countrymen were removed from their arch, the most commodious habitation they ever had in that country, and having marched about a mile, were ordered to halt till the emperor should overtake them.

About eight o'clock his majesty set forwards; a train of the ladies of his seraglio, the eunuchs, their attendants, and his baggage, moving in the van. As these ladies passed by, the English captives, as well as the Moors, wheeled about with their faces another way, for it is not allowable for any person whatever to look at a lady belonging to the emperor's retinue. When the ladies and eunuchs had proceeded about half a mile, the baggage began to move; after which followed the Christian captives on foot, and then a part of the emperor's army, consisting of about two thousand men, all mounted on mules. Next to these came the emperor himself, and then the remainder of the army, together with about two thousand of the inhabitants of Mequinez, who attended to shew their loyalty and respect to the emperor.

About eleven o'clock it began to rain very hard, upon which the emperor gave orders for the ladies and eunuchs to mend their pace, that the whole body might move faster. This order was highly incongruous to the poor captives, who were obliged to walk all the way, especially as the rain continued the whole day without ceasing.

As this march was little less than thirty-five miles, and as the weather and roads were extremely bad, the very mules themselves were perfectly pained, and their riders could with difficulty make them go forward; how deplorable then must be the case of the poor captives, five of whom in particular were very sick and weak.

About four-set they came within 11 miles of Fez, at which time the emperor passed them, in order, if possible, to reach the town before it was quite dark. As he passed by them, he called them good men, and gave orders for a detachment of his army to take care of them, and conduct them safe to the town, as soon as they were conveniently able to reach it.

No sooner, however, was the emperor out of sight, but the party who were ordered to conduct them, deserted from them, being anxious to get to the town as soon as they could.

Though it was now dark, and they were extremely fatigued, they kept moving forward with great labour and pain, and at length came so near the end of their journey, that they could see several lights at a distance, which were fires kindled by those who had already arrived, in order to dry and refresh themselves after the fatigues of so disagreeable a march.

The nearer they approached the town, the road became more stony, which proved no small mortification to them; for it was so dark they could not see the stones, so that they often kicked them with their toes, which being blistered before, caused a pain that was almost intolerable.

After all their endeavours, several of them were unable to reach the town till the next day, so that they were obliged to lie down on the cold wet ground, where they had a most miserable and filthy lodging; and even those who reached the town that night were as wet as if they had been dragged through a river; and having no change

change of raiment, were obliged to repose themselves, in that condition, on the bare ground.

The next day those who had been left behind dropped into the town, one by one, most miserably fatigued, and some of them so far spent, that they were unable to speak, or to communicate their distress otherwise than by their tears.

Some of them were so lame after this fatiguing march, that they could not walk without crutches for near a fortnight, and two of them actually sunk under the weight of their affliction; for though they did not expire immediately, yet they grew daily worse and worse, and in about three weeks ended their lives and their miseries together.

At the city of Old Tez, it is customary to allow the Christian captives only a penny a day, which the reader will imagine was no small aggravation of their distress; and, to render their case still more deplorable, provisions were there much dearer than in any other part of the country where they had been.

As the town had never before been visited by such a multitude of people, the price of bread in particular was so greatly advanced, that the same quantity which used to be sold for the value of an English halfpenny, was now valued at above five farthings; so that our unfortunate countrymen could not at any rate purchase enough to support life.

In this extremity they purchased a parcel of horse-beans, and laid them in water to soak; and during that interval, they launtered about the town, and picked up what sticks and other materials they could find proper to make a fire with, and boiled their beans as soon as they were sufficiently soaked. This expedient furnished them with one hearty meal a day, and, considering their pitiful allowance, they thought themselves happy with that.

On the 12th of September 1746, they received the agreeable news that the ambassador was arrived at Gibraltar, and would certainly exert himself to procure their release as soon as possible. This was most agreeable news: but they had the hard fortune to remain in slavery four years after his excellency's arrival at Gibraltar.

The emperor now began to put them to hard labour, in clearing rubbish out of an apartment that led to the rooms where he resided: they were kept very close to this work, beginning in the morning as soon as it was light, and continuing at it till it was quite dark, when they returned to their prison, where they had no other satisfaction than to repose their bodies on the bare ground, having nothing to eat, as they eagerly devoured their only meal before they began the labour of the day.

On the 22d of November they received a letter from the ambassador, who, with all the concern imaginable, lamented their melancholy situation, and informed them that, by the paternal care of their sovereign, he hoped they would in a short time be removed from their captivity.

Early the next morning, each man being furnished with a pick-axe, they were conducted to a castle called Doer Dabibah, which the emperor was going to rebuild; but at that time they little imagined that this fatiguing job would have fallen to their lot.

They were first ordered to pull down a wall at about 200 yards distance from the castle; on which they laboured from break of day till the close of the evening, without intermission, for near a quarter of a year.

When they had pulled down this wall, and dug up the foundation, they were set to work upon another, which was 18 feet thick, and cost them a deal of pains: their manner of pulling it down was by making trenches with their pickaxes, and raising pieces of a ton weight at a time, with wooden levers provided for that purpose.

Having entirely pulled down the last wall they were to set to work upon, the emperor ordered that they should dig a trench for the foundation of a new castle, 12 yards within the walls of the old one. In about a fortnight the trench was prepared, and they began to

build the walls, which were made in the following manner: a case being made, they put into it their materials ready prepared, which consisted of a fine kind of loamy earth, well tempered with lime and water, and the remains of the old wall, beat small and mixed with it: a quantity of this, to the depth of about 18 inches, being put into the case, was beat till it became as fine as paste; then another layer was put in, and beat in the same manner, and so on till the case was filled, which being done, it was taken away, and there appeared a fine smooth wall of one entire piece, which being hardened by the heat of the sun, became stronger than stone.

After receiving great and repeated insults from those who were set over them, our unfortunate countrymen completed the castle on the 20th of July 1748. The outer walls of this castle were about 1040 yards in circumference, four feet thick, 24 feet high in most parts, but in some upwards of 30, and inclosed about five acres of ground.

No sooner was this large piece of work completed, than they were again set to work, to fill up a very large pit, which had been dug for materials to mix among others, with which they built the castle.

On the 31st of October 1748, our captives received a letter from Mr. Petticrew, in which he acquainted them that the emperor had granted his licence for their coming to Tetuan, where he hoped for the pleasure of seeing them very shortly; and that he had given orders that they should be supplied with a jillabee* and bombouches †, and some mules to ease them on the road.

They received this most agreeable news with transports of joy not to be expressed; and in about seven days time a guard arrived from the governor of Tetuan, to conduct them to that place, which was about 160 miles distant, and which they reached in six days.

Before they set out, the emperor, who was then at Mequinez, sent an order that four of the youngest of the English captives ‡ should be stopped, and sent to him, to remain in his possession till the ambassador should pay his demands; and it was his intention to present those to the ambassador, in return for the present brought from his Britannick majesty.

On the morning of their departure, the Christians of different nations accompanied them almost to the gates of the town, shook hands with them at parting, and, with streaming eyes, wished them a good journey to Tetuan, and fate out of the hands of the barbarians.

They made their journey in the most cheerful and agreeable manner; and, to add to their satisfaction, they had the finest weather imaginable; but nothing material happened till they got within 16 miles of Tetuan, when they were met by another guard, who brought with them horses and mules for them to ride on, that they might not make it late the next day before they got into town.

They proceeded on their journey early in the morning, and at twelve o'clock had the pleasure of seeing Tetuan at the distance of about two miles. As they came nearer, they were met by the inhabitants, especially a great number of women, some mounted upon mules, and others on foot, and the women rolling aside, as the emperor's ladies do when they travel from one place to another.

Just as they were entering the first gate, they were met by Mr. Petticrew, and two or three English merchants who resided there, to whom they had paid their respects as they passed; and when they were within the gate, they were met by the alcaid and other principal people, with a guard of 200 soldiers; and as they passed by him they cried, "Long life to thee our master!"

Multitudes of the inhabitants crowded to see them pass, along, some of whom insulted them, by calling them unbelievers, dogs without souls, and other opprobrious names. But the guards did not trouble to knock down these abusive wretches, having orders to do so on such occasions.

They were now put into a prison provided for their reception, where Mr. Petticrew came, and gave them

* A jillabee is a garment made of coarse blanket stuff, in the form of a friza capuchin.

† Shoes.

‡ These four did not arrive in London till June 1751.

some mutton which he had got stewed for them, as also some bread, and to each man a cup full of wine.

About four o'clock Mr. Petticrew came again to the prison, wished them joy on their safe arrival at Tetuan, told them he hoped it would not be long before he should see the ambassador, and that he did not doubt but their redemption would be completed in a very short time after his arrival.

Having returned him their best thanks, they desired he would be so kind as to order them a daily allowance for their subsistence; which he immediately complied with, allowing them six-pence a day each, which is about what is customary to be allowed to prisoners of war.

As Providence had once more indulged them with a kind of plenty, they lost no time in procuring food and necessary refreshments; for though their journey had been highly agreeable, they had been by no means over-fed.

Guards were now placed at the door of their habitation, whose business it was to go either to buy provision, or on any other errand which the captives wanted; and if at any time they had a mind to walk about the town, these guards were obliged to attend them.

Soon after their arrival at Tetuan, the alcaid sent to the ambassador, to acquaint him, that as he had got the captives in his possession, he should be glad he would come and bring their redemption to a conclusion, which would oblige the emperor much more than any unbecomingly delay.

About the middle of December the ambassador sent a present to each of the captives, consisting of a soldier's coat and breeches, a shirt, a cap, a pair of stockings, shoes and buckles, which was of the utmost service to them, as they had been almost naked for a considerable time. On the Sunday following they appeared in their new cloaths, and began to think themselves the best dressed prisoners in the town.

On the evening of the second of January they espied a sail standing in to the bay; and early next morning they could discern, from the top of Mr. Petticrew's house, an union flag at the main head, which being a signal that the ambassador was on board, Mr. Petticrew immediately informed the alcaid thereof, and then went on board, and remained with the ambassador till he came on shore, which was on the following day.

As soon as the captives heard that the ambassador was debarked, they gave three huzzas, and upon a long pole hoisted an union flag on the top of their prison, having previously prepared it against the time that his excellency should land.

About eleven o'clock in the morning the alcaid sent down the bell horse he had for the ambassador to ride on to the town; at eight all the Christian merchants in the town went down to accompany his excellency; at nine the alcaid followed them, with the soldiers belonging to the town, firing with powder all the way they went; and about eleven they all set out in grand procession from the place where the ambassador landed.

By this time the walls were covered with people to see his excellency's entry; and when he entered the gates of the town, the cannon of the castle were fired, and every one who had a musket made use of it on the occasion, so that the firing in different parts of the town continued till it was almost night.

On the fifth of the month the captives wrote a letter to his excellency, congratulating him on his arrival; and representing that the prison in which they were confined was too small, and so old, and so much out of repair, that they daily expected it would fall on their heads; upon which another place was taken in that part of the town where the Jews live, and they were divided; half of them being moved to the new prison, and half remained in the old one.

Some time now passed away without any steps being taken towards their redemption; during which the alcaid several times desired the ambassador to bring the matter to a conclusion.

At length they had several conferences, but could not agree, which occasioned great uneasiness among the captives; for they were informed by the Moors, that in

case the ambassador should not very soon give the alcaid the satisfaction he expected, they would be all put into the moitmore or dungeon, of which mention will be made in its proper place.

Though the apprehension of being locked up in this shocking place struck them with a panic, yet they flattered themselves the ambassador would find some means of procuring their redemption, and not permit the Moors to exercise their tyranny much longer.

Filled with these hopes, they bore the bad news as patiently as possible, and lived in expectation of a happy turn of fortune; but no negotiation going forward for some time, they at length sent a memorial to the ambassador, signed by 52 of them; after reading which his excellency said, that "Nothing had been wanting to forward their redemption that lay in his power, and that every expedient that was agreeable to his instructions, should be put into execution for that purpose."

On the fifth of February 1748-9, the alcaid, being impatient to have the affair brought to an issue, sent for six of the captives, and, by means of an interpreter, addressed them in the following manner:

"It is a long time since you were cast away in the bay of Tangier, and I am sensible you have had a great deal of fatigue, which I am very sorry for. You know how dangerous it is for me to disturb the emperor; and I doubt not but you have seen many of his subjects lose their lives for a trifling disobedience."

To this the English answering in the affirmative, he continued thus: "Why then should I disturb him in this negotiation with your ambassador? In such a case, I should expect that the first time I should see him would be the last; therefore, for the sake of his preservation, if for no other cause, I shall lose no time in this affair."

"Yesterday, continued he, your ambassador and I had a long conference, when I represented to him the great trouble I had been at to procure the favour of your coming down to Tetuan; and now you are here, he does not seem to be under any concern whether you return to your own country or not. Before I sent for you down, his agreement was to deposit the money for your redemption, which he now refuses to do till such time as you are embarked; therefore I would have you go the ambassador, and inform him that this day is the last that you will be allowed the liberty of walking about the town."

They asked the alcaid if the whole money due for the redemption of the captives by the late John Leonard Sollicoffe esq. was mislaid on, whereof the Bishop Hamet had received almost two thirds: to which he answered, "I demanded no more than the ambassador's agreement, which was to pay for your redemption; and as to what is remaining due on account of the last slaves redeemed, he must dispute that with the emperor: I would therefore have you go to your ambassador and try what you can do in behalf of yourselves and your companions."

Hereupon they went to the ambassador, and informed him what the alcaid had said to them; to which his excellency replied, that he would not pay him all they were embarked, "For," said he, "I fear when he has got the money he will not send you away."

To this they replied, that "If his excellency contended with him ever so long, it would be to no manner of purpose; for as the tyrants had got both him and them in their power, they were a sufficient pledge for the money." Hereupon his excellency ordered them to go to the alcaid with his compliments, and inform him that he would send for the money that day, and at the same time to beg he would indulge them in their usual liberty.

They now returned to the alcaid, and having delivered this message, and informed him that the ambassador was in doubt whether he would let them embark after he had got the money in his possession; the alcaid answered, "Let the ambassador send for the money; and when I am satisfied that it is on board the vessel, you and your brethren shall embark; and when you are on board I shall expect the money, and not before: you may therefore return to your ambassador, and

and inform him what I have said to you, and assure him if I can oblige him in any other respect, I will; and that you shall have the same liberty to walk about the town with a guard, as you have had hitherto."

The emissaries now returned to their companions, with hearts filled with joy, to think that they had escaped being put into the dungeon: and there being a vessel in the bay ready to sail for Gibraltar, that circumstance gave them still greater spirits, as the ambassador had declared he would send for the money by the first vessel that should go from Tetuan to Gibraltar.

When the vessel had been sailed two days, they began eagerly to wish for its return, as the least delay might again plunge them into almost as bad circumstances as they had ever been in yet: but as during these two days the wind continued easterly, the alcaid had no reason to be uneasy, as he well knew that with that wind no ship could come from Gibraltar to Tetuan.

At length the wind coming about to the west, a ship arrived from Gibraltar, and the commander came to the town; but all they could learn from him was, that they need not doubt but they would in a very short time be at Gibraltar: but whether the money was brought for their redemption or not, they could not learn. This account therefore was by no means satisfactory; and this night all those that were abroad were driven to their prisons.

Their guards now began to treat them in a very different manner from what they had done before; and as they knew that this could not be done but by order of the alcaid, they were well convinced that the money for their redemption was not arrived.

The alcaid, however, being willing they should know why they were more closely confined than heretofore, sent for the six people who were with him before, and, by his interpreter, addressed them as follows.

"You all well know that your ambassador promised that the money for your redemption should be paid some time ago: but it could not be expected that ships should arrive from Gibraltar, as the wind was contrary; but now the wind is shifted, and there is a vessel come, but the money is not: I am surprized that your ambassador should trifle with me in this manner; therefore do you go to him and inform him, that I shall wait till to-morrow for his positive answer, whether he intends to pay the money, that you may go to your own country, or otherwise you must be sent back to the emperor in irons; for I cannot delay any longer without his majesty's express order."

They now begged of the alcaid that he would have a little more patience; and said they did not doubt but that the ambassador would soon have the money ready for him, and bring every thing to such a conclusion as would give him perfect satisfaction.

"Well then," said the alcaid, "go to your ambassador, and inform him that I will wait till another vessel arrives, to see if he will then order the money to be brought; for I would not have it said, that I am in the least a foe to him, or to any of you; and to-morrow you shall have your liberty again, as usual."

They now returned their best thanks, and going to the ambassador, told him what the alcaid had said; on which his excellency bid them not be discouraged on account of the money not being arrived, "For," said he "I now give you my promise, that it shall not be long before you are set at liberty."

Soon after this another vessel arrived, and then a second and a third, but brought no money: which made our poor captives extremely apprehensive that they should in a short time be put into the dungeon: but these vessels sailed again to Gibraltar, without the alcaid's taking any farther notice of the affair than he had already done.

On the evening of the 14th of March, 1748-9, arrived the *Brave Sherbeck*, captain *Hafwell*, from whom they were in the highest expectation of hearing some satisfactory news; but as the captain did not come on

† Martene is a place about seven miles distant from Tetuan, where all commodities to and from that town

shore till the next morning, they were obliged to wait with as much patience as possible.

The captain came to Tetuan about ten o'clock in the morning; and about two in the afternoon the alcaid sent for them all in the utmost haste, which made them apprehend some fatal consequence.

When they were arrived, he ordered them to stand in a line: and having picked out 25 of them, he acquainted them that those were to embark on the next day, and the rest were to remain some little time longer, for there was not money enough come to pay for the redemption of any more.

He then sent those that were to embark the next day to a house by themselves, and the others to a prison: and on the 16th of March about eleven o'clock the ambassador sent for those who were to embark, and gave every man a certificate, wishing them all safe to England: and about twelve o'clock, they were, by order of the alcaid, sent without the city walls, where they were met by Mr. Petticrew, captain *Hafwell*, and the alcaid; and 12 mules were provided to help them on the road, there having been a great deal of rain, which made the ways very bad.

They were not far out of the town before it began to rain very hard; on which the alcaid told Mr. Petticrew, that as the weather was likely to prove so bad, it would be proper for them to stay till the next day; but his true reason for desiring this delay was, that he had agreed for the departure of these people without the knowledge of the emperor; and the dread of his displeasure was evident enough in his countenance.

Captain *Hafwell* now told the alcaid, that the showers only came off the mountains in squalls, and would not last long; and if they did, it was not to be imagined that those who had been so long in captivity would delay a moment on account of the weather.

Still, however, it was evident that the alcaid was uneasy; upon which Mr. Petticrew desired to know if it was his intention that they should embark or not, "For," said he, "if you are apprehensive that the weather will be prejudicial to their health, send them back at once to their prison; for it is as bad for them to stand there in the rain, as to proceed in order to embark; but I imagine you do not care to part with them; and if so, when do you imagine you shall get the money into your hands; do you think that the governor of Gibraltar will send the money a second time? Indeed he will not; nor will he, for the future, ever take your word on any account whatever; and when the merchants of Gibraltar come to understand that you are not a man of your word, they will not think themselves safe in carrying on the least commerce with this town."

Hereupon, the alcaid, (who knew that if the merchants of Gibraltar should entertain a bad opinion of him, it would be of the utmost prejudice to the town,) directed that they should depart, which they joyfully obeyed: some mounted the mules, while others ran on foot; and indeed those on foot kept a-head of the mules all the way to Martene †.

When they came to Martene, the captain and two Moors who were commissioned to receive the money, went on board in order to bring it on shore; and when the money was in the boat, the Moors were to hoist and strike the ensign three times; on which the English captives were to put off, and the boat with the money was to come on shore.

Accordingly, about three o'clock, two boats, being prepared for them, the signal was given; on which they instantly jumped into the boats, and had the pleasure of tasting that freedom, for which they had so long and so ardently wished. As soon as they were embarked, they congratulated each other on the occasion, and with hearts full of joy and gratitude, returned their unfeigned thanks to Almighty God, who in his great goodness, had delivered them from the insults of the merciless barbarians.

are imported and exported.

On the next day they arrived at Gibraltar, where they remained a week, and then embarking on board his majesty's ship the Crown, sailed for England, and, on the 11th of May 1749, arrived safe at Portsmouth.

From Portsmouth they repaired to London, where they presented a petition to the king, setting forth the nature of their sufferings, on which his majesty was pleased to order them a bounty of five pounds each, and his late royal highness the prince of Wales, ordered fifty pounds to be divided amongst them.

Having now accompanied these 25 captives to England, let us return to their fellow sufferers, who were not redeemed till the 8th of December, 1750.

These, having with their companions a prosperous voyage to their native country, stood gazing on a hill till the vessel in which they sailed was out of sight, and then returned to their prison, where they lamented their hapless fate, thinking it extremely unfortunate that the whole redemption-money was not sent at that time, while the door of freedom was equally open to them all.

About 20 days after the departure of the 25 persons above-mentioned, the ambassador was informed that there was a ship standing into the bay; on which, with a few of the captives who then happened to be with him, he went on the roof of his house, and by the help of a glass, knew the vessel to be the Nightingale; on which he wished them joy, and told them that the money for their redemption was brought by that ship.

On the evening of the same day his excellency sent Mr. Pettierew to the alcaid, to inform him that the ship arrived in the bay had brought the remainder of the money for the redemption of the captives.

The captives were at this time inspired with new life, and the looks of freemen appeared in each countenance: but to their great mortification, when Mr. Pettierew returned he informed the ambassador, that the alcaid had received orders from the emperor not to part with one of the English captives, till he had received from the ambassador the former redemption money remaining due; and also that which the English said was paid to the bassa Hamet †.

On the following day the ambassador had a conference with the alcaid, when he represented that the money paid to the bassa Hamet was by compulsion; for that when the late Mr. Sollicoffre came from the emperor, and brought with him the British captives to Tetuan, the bassa, then governor of the town, insisted, before he would suffer the captives to embark, on bills for the payment of the money agreed on between the emperor and Mr. Sollicoffre for their redemption; and there could be no doubt but that Mr. Sollicoffre imagined, that when the bassa had received the money, he would immediately have remitted it to his majesty, as it was his duty to have done; but as he had not remitted it, it was proper that the bassa's family should be answerable for it, and that it should not be again demanded of his Britannic majesty. Thus, for three days successively, did the ambassador reason with the alcaid, in order to procure the liberty of his countrymen, but all he could say produced no good effect.

In this emergency his excellency knew not what to do, but to offer the payment of 4399 pounds, and one shilling, and the head-money, on condition that the captives were embarked on board the Nightingale; but this the alcaid refused to accept, because his instructions from the emperor were to insist on 8201 pounds, which was paid to the bassa Hamet, and the 4399 pounds and one shilling remaining due, together with the head money for the release of the captives.

The alcaid, finding he could not bring the ambassador to agree to these terms, told him he would put the captives into the dungeon, and in a short time send them back to the emperor in irons, and oblige him to go with them; besides which he would send out his

row boats and galleys to make reprisals on any English ships they could meet with: which, if he had done, must have increased the number of captives, and occasioned a considerable expence to the English government.

Hereupon, the ambassador desired the captain of the Nightingale to permit Mr. Stevens, his first lieutenant, to carry dispatches from him to the English ministry, for instructions how to act in this critical affair.

This request being readily complied with, Mr. Stevens left Tetuan on the 29th of April 1749; and during the time that he was going to England and back, which was about two months, the captives had the liberty of walking about the town in the day time with a guard, as before.

Mr. Stevens being returned, they were in hopes that they should soon obtain their liberty; but to their mortification they found that his voyage had not been attended with success.

The alcaid now again sent for the ambassador, and renewed his demand; but his excellency told him that he could not in the least exceed the instructions he had from the king his master; and therefore could not comply with his demands.

In this perplexity the ambassador had no method of prevailing on the alcaid not to send the captives back to Fez, but to sign an acknowledgement that their mercenary demands were justly due, and give an obligation for the payment of the money in two months time.

The complying with these demands, was also the only method by which he could prevent the row-boats and galleys from taking the English merchant-ships; and if he had not complied, he would have been unanimously blamed by the merchants, for not preventing the capture of their ships, while he was on the spot.

The two months being expired, and no money arrived, the alcaid stopped all commerce with Gibraltar, insulted the ambassador in the most scandalous manner, put the captives into the dungeon, and threatened to send them back to Fez in irons.

When they had been confined in the dungeon three weeks, a squadron arrived in the bay under the command of commodore Keppel, to whom the ambassador represented the dreadful consequences of the men being sent back to slavery, which must inevitably happen if the alcaid was not appeased: he likewise set forth the dangerous consequence of their taking the English merchant-ships, by which others would be reduced to the same dreadful state of slavery.

Hereupon the commodore promised the payment of the 4399 pounds and one shilling, which the alcaid then agreed to take, and contented himself to wait for the rest till an answer respecting it should be received from England.

This promise of payment released the captives from the dungeon, and procured them their usual liberty; but as the money was not paid according to promise, the alcaid put them into the dungeon a second time, and confined the ambassador to his chamber, at the door of which two ruffians stood centry, who had orders not to permit any Christian or Jew to converse with him; but the particulars of this affair will be more clearly shewn by the following letter, which was sent from Tetuan to the English ministry.

“ On the 23d of August 1749, a messenger arrived at Tetuan, from the emperor Muley Abdallah, to the alcaid, ordering him to demand of his excellency William Latton, esq. ambassador there from the court of Great Britain, the ballance-money due, being 4399 pounds and one shilling, for the redemption of the captives, now 36 in number; and the 8201 pounds that was paid to the late bassa Hamet, deceased, which, as

no instructions so to do.

The reason of its being again demanded, was, that soon after the bassa Hamet had got possession of the money from Mr. Sollicoffre, he rebelled against the emperor, and applied the money to his own use.

† The sum that remained due was 4399 pounds and one shilling, which the ambassador had agreed to pay, as well as 350 Mexico dollars, (equal in value to an English crown piece) as redemption-money for each man. The other sum that had been paid to the bassa Hamet, was 8201 pounds, which the ambassador refused to pay, having

the said emperor received no part of, he deems an illegal payment. The said alcaid declared to the ambassador, that if he was not forthwith paid the whole sum, or, at least, had not his note of hand, engaging to pay it in eight or ten days, he had positive orders to carry him and the English slaves up to Fez; which would not only greatly enhance the expence of the crown, disgrace his majesty's present, by confiscation, and his ambassador by a denial of audience, but render him, and his attendants, no less miserable than those he came to redeem.

"The ambassador answered, that he could not engage himself in that manner for the payment of such sums in so short a time; but did directly hire a polacre to carry over letters to the governor of Gibraltar, entreating him to send the former sum due of 4399 pounds and one shilling, which was in his possession.

"The governor sent back a letter to the ambassador, and a sharp one to the alcaid, but no money; whereupon the ambassador's house was immediately invested with a party of soldiers, who first violently dragged away his secretary, Mr. Charles Sturgis, tearing off his cloaths, and tumbling him into a dismal deep dungeon under ground, called the Mortimore, where he lay buried, without light of sun or moon, for above three weeks, which was not only so dark, but so chilly, that it might, but for the single favour of providence, have lost him the use of his limbs, or life itself."

"Afterwards, 27 of the English slaves were taken, in the like manner, out of their prison, and with a Portuguese, who was one of the ambassador's servants, carried into the said most dreadful interment; and the ambassador himself had irons brought into his house, wherewith he had been surely fettered, but for the opposition made against it by the English merchants; yet they had degraded him, and taken off his allowance."

"After 23 days, one of the guards brought word to the alcaid, that the secretary was very ill, and his life in danger; whereupon he appointed him to be led up before him; and when he understood how selflessly willing the young man was to suffer for, or with his master, the barbarian relented, and gave him a liberty to return home again."

"There was not a Moor, or a Jew, suffered to approach the ambassador; nor so much as the Jew who was wont to shave him. There was not a letter directed to the ambassador, which was not broke open before he saw it, and interpreted to the alcaid, by an English renegade or apostate."

"Two negro porters, who were planted at the ambassador's street door, had the keys of all his rooms above and below; and two ruffian soldiers were constantly posted to watch and sleep every night at his chamber-door, nor could his secretary go any where abroad without a guard."

"The alcaid, finding no money arrive from Gibraltar by the time haunted, and that the governor had paid no regard to his protest against the ambassador, gave him to understand, that he had compelled several English merchants to sell their goods; and also forcibly seized upon part of the king's presents, designed for the emperor, to fulfil his engagements with him; and the remainder thereof was expelled every moment to be also carried away."

"The English merchants were frighted from the coast at these severities, till, at last, that they might be induced to return and trade as usual, the alcaid ordered the captives to be released out of the mortimore, and remitted again to their prison."

"On the 28th of October arrived there the Brave Sherbeck, captain Hawwell, with letters from the governor of Gibraltar, to the ambassador, signifying, that no money could be sent by the said governor, till he had received a final answer from the government. The ambassador has not wanted courage becoming the honour of his country, or confidence, compatible with the dignity of his commission, enough to have

gained him both respect and affection among any humane and civilized people; but though it has been his generous ambition to diminish the number of our captives, it has been his misfortune to be made one himself; and thus are they waiting with Christian patience, until they can meet with some Christian relief."

Let us now return to our account of the captives, who lay buried for 50 days in the mortimore*, from whence they never expected any release, till they ascended in order to be sent back again to Fez.

Their sufferings here were multiplied, on account of the commerce being stopped with Gibraltar, from whence they could get no subsistence, and their allowance being reduced to two-pence per day, which, as they could not lay out themselves, on account of their close confinement, they were obliged to trust the Moors with it; and these rascally villains always cheated them of a part, and sometimes of the whole.

Provisions were also very dear, on account of a famine and plague, which at that time raged all over the country; so that their condition was no more deplorable than it had ever been during their captivity.

While in this dungeon, they were continually insulted by the Moors, who used to throw down upon them dead dogs, cats, flons, &c. and never thought themselves so happy, as when they were exercising their scandalous barbarities.

At length they were released from this damp and noxious cell, and put into their old prison, and in a few days afterwards were taken out early one morning, and conducted to a place without the town walls, where a galley was boiling for the use of the Moors, and on this they were set to work, which they continued all day, and at night were re-conducted to their prison; and this labour they continued till the alcaid was murdered by the Moors, of which mention will be made hereafter.

Mr. Petticrew, the vice-consul, being at Gibraltar in the beginning of September 1749, was dispatched to England by the governor, in order to lay a state of the affairs in Barbary before the ministry, and to inform them of the great necessity there was of bringing to a conclusion the treaty of peace then on foot with the emperor, that the remaining English captives might be released.

It was during the absence of Mr. Petticrew, that the plague raged at Tetuan, and through the adjacent country; but through the good providence of God none of the English captives caught the disorder, though they worked along side of the galley with those who had it, and died of it.

In the month of November 1750, Mr. Petticrew returned to Gibraltar, with full powers to pay the emperor all his demands, and release the captives; the news of which reaching Tetuan, inspired them with the utmost joy, to think that their miserable slavery was near a period, and that they were once more to enjoy the most invaluable of all blessings, Liberty!

Soon after Mr. Petticrew arrived at Gibraltar, he came to Tetuan in his majesty's ship Sea-horse, to acquaint the alcaid that he had orders from the king of Great Britain, to treat for the redemption of the captives, and conclude the treaty of peace between the two powers; whereupon they invited him to come on shore, with which he complied; and after having held a conference with the ambassador and the alcaid, he returned again to Gibraltar, and acquainted the governor that the matter was brought to a conclusion, and he was now come to fetch the money for the redemption of the captives.

During Mr. Petticrew's stay at Gibraltar, the heads of Tetuan, having quarrelled with the alcaid, employed some ruffians to murder him, which was executed in the following manner: At the alcaid was at prayers in one of the mosques, and kneeling at his de-

* The Mortimore is a place 25 feet under ground, where there is no light but what comes from a hole at the top, like a gully-hole in England; and it is always very damp, on

account of the springs rising in it, occasioned by its being dug to deep.

votion, one of the persons employed came behind him, and stabbed him in the neck; when the alcaid making a sudden resistance, some other villains joined the first, and stabbed him in several parts of the body, of which wounds he instantly died.

This unexpected piece of cruelty occasioned the whole town to be in confusion; for such a sacrilegious instance of barbarity was never before heard of, their mosques being deemed sanctuaries for the worst crimes that can be committed.

The death of the alcaid was some detriment to the English captives, because Mr. Petticrew would not land again till a new alcaid had orders from the emperor to receive him; which occasioned the loss of another month.

The people of Tetuan having chosen a new alcaid, he sent a present to the emperor, who on receipt thereof confirmed their choice, and immediately sent full instructions to the alcaid, to agree with the English ambassador, on the same terms that the late alcaid had done.

Hereupon the new alcaid sent a copy of his orders to the governor of Gibraltar, and Mr. Petticrew, which gentleman came into the bay of Tetuan on the 7th of September, on board the Sea-horse, and sent a message to the alcaid, to inform him that he intended to come on shore the next day; on which the captives, to their inexpressible joy, were ordered down to the water-side for their embarkation.

About six o'clock the next day Mr. Petticrew landed, and soon afterwards the alcaid gave orders for the captives to get into the boats that were to carry them on board: on which they ran into the water as high as their waists, striving who should first get into the boats; and when they put off, they gave three cheers to the ambassador, Mr. Petticrew, and some gentlemen that attended them; which being returned by the gentlemen, the others gave one huzza more, and in about half an hour were embarked on board the Sea-horse.

The wind coming about easterly, they sailed the same evening; and on the 9th of December, 1750, came to an anchor in the bay of Gibraltar, from whence, in a few days, they found means to return to their native country.

Melille is situated in 35 deg. 20 min. north lat. and 2 deg. 9 min. west long. 120 miles south west from Oran, and at the bottom of a bay, called Eutrefolcos; it received its name from the great quantity of honey, which the neighbouring territory yields. It was anciently capital of the province, and is still a considerable place, containing 2000 houses; it is defended by a citadel, and is now in the hands of the Spaniards.

Ceuta is advantageously situated at the entrance of the Mediterranean, on a kind of peninsula, which is the nearest point of land to the Spanish coast; the walls and fortifications are not so good as might be expected from its situation; nevertheless it is a considerable town, has a strong garrison, a magnificent cathedral, and a noble palace. It belongs to the Spaniards, is a place of great trade, and has good harbour. The Moors laid siege to it in 1697, but have never been able to take it, though they have blockaded it ever since. Near this city is a mountain with seven heads, which the ancients distinguished by the appellation of Septem Fratre, or seven brothers.

Tetuan is a little better than 20 miles from Ceuta, and built on the declivity of a rocky hill, at the freight's mouth; it is surrounded by a wall made of mud and water, and consequently is not very strong; the houses are not above 800 in number, but the inhabitants, between trade and thieving, are in tolerable circumstances; for when they are not strong enough to plunder a ship, they will traffic with the crew. The castle is strong, square, and flanked with towers; the garrison consists of 1500 men, that is, 1100 infantry, and 400 cavalry. The Christian slaves are here very numerous, very ill-used, and nightly locked up in a dismal dungeon, called Mortimore: the houses in general are white washed both within and without. The palace of the besla, in the city, and his villa, at about two miles distance, are

magnificent structures; and the mosques are as elegant as any buildings can be that are in the Morocco stile. The lanterns or monks have about 12 cloisters, which are places of refuge for all criminals, except those guilty of treason; the Jews are about 5000 in number, and have seven synagogues; all the inhabitants visit each other over the tops of the houses, which are flat roofed, as is the custom in Algiers and other parts of Barbary. The prospect either towards the sea or land side is very noble, the circumjacent country being exceeding fertile, and finely interspersed with orchards, gardens, lawns, villas, groves, &c.

Messa is situated at the foot of Mount Atlas, on the river Suz, at the place where it discharges itself into the sea. It is divided into three distinct parts, each being surrounded by a wall, and about a mile distant from each other. The adjacent territory is fertilized by the overflowing of the river, and whales have been frequently call upon the shore.

Tessut is about four miles from the last mentioned town, and like that divided into three parts. A branch of the river Suz waters it, and passes through a large mosque in the center of it, by which means the people have an opportunity of performing their ablutions in a running stream. The town contains about 4000 families; the principal commodities are sugar and Morocco leather, and the neighbouring territory is extremely fertile.

Tandarit is a small, but handsome, populous, and flourishing place, and the inhabitants are opulent, courteous and polite.

Tedli, famous for its sugar manufactory, contains about 5000 inhabitants. The chief aliaikis, who is supreme judge in all ecclesiastical matters, resides in the great mosque here: it has a good market on Mondays, the chief traffic being leather, linen, woollens, cattle, horses, sugar, wax, honey, butter, iron tools, &c.

Tagoll, the largest city in the province of Suz, is situated in a fertile plain, and contains about 8000 families, 400 of which are Jews. Here are two markets weekly, to which the Arabs and Moors resort with their commodities, and the negroes to buy apparel.

Taphilet, or Taflet, was once a kingdom of itself, but never very considerable; the limits and extent are uncertain, and in general the whole country is a long, dry, barren tract of land. The people here are miserably poor, the common sort living principally upon dates and camels flesh, the chief produce of the country being an excellent kind of indigo. Most of the dates which are sent to Europe come from hence, as the emperor will not permit them to be exported from any other part of his dominions; and it is affirmed that the leather manufactured here is tanned with the stones of that fruit. About 4000 horse are retained in this district, to keep the people, who are chiefly Berberes, in subjection, and it is usually governed by a prince of the blood.

The city of Taphilet, which stands on a river of the same name, is the residence of the governor, and has a strong castle to defend it. The inhabitants, about 2000 in number, are industrious in the manufactures of leather, silk, and linen; and in general possess a competency in camels, horses, cattle, date trees, &c. It is a great rendezvous of both African and European merchants, and the people are very sociable, though extremely superstitious.

Subordinate to the governor of Taflet is the province of Gelsa, a dry, barren country, the limits of which are not perfectly known. The mountains, however, yield plenty of iron and copper, and the inhabitants are famous for working in those metals, by the exchange of which they procure horses, linens, woollens, spears, &c. They have annually several fairs, but one in particular, which is kept on a large plain, lasts two months, and is resorted to by merchants from all parts of Barbary; and this fair is, perhaps, better regulated than any other in the universe; as the people, though naturally brutish, are under such restrictions, that a quarrel was never known to happen during fair time.

The weapons of the Gelsulans are scymetters, daggers, darts, spears, and short guns; they can bring 60,000

men into the field. Their dress is a striped jacket of linen or woollen, with short sleeves, over which they throw a gown of coarse woollen cloth. They have only one mode of punishment, that is, piercing the criminal to death with darts, and throwing his carcase to the dogs.

S E C T. VI.

Political, Civil, and Ecclesiastical History, Manners, Customs, &c.

THE emperor of Morocco is deemed the most despotical monarch in the universe, having an uncontrollable power over the lives and properties of his subjects, or rather slaves; for there is not a single person in the whole empire, who can pretend to the least shadow of freedom, or dares openly to avow his sentiments. But the insatiation of the people is still more strange, since the very crimes of their monarch are sanctified in their opinion; they think he does them a favour when he treats them with barbarity, and imagine to be murdered by him is a peculiar blessing, as it insures their immediate admittance into paradise. Where such notions prevail, the tyrannical cruelty of the sovereign, and implicit resignation of the subject, are not to be wondered at.

Besides the unbounded power over the people's properties during their lives, the emperor is the universal heir to all his subjects upon their demise; so that the greatest part of the wealth of the empire centers in the royal coffers. The emperor's titles are very high, he is called *The most Glorious, Mighty, and Noble Emperor of AFRICA, King of Fez and Morocco, Taphilet, Suz, Dabra, and all the Algarbe, and its territories in Africa, Grand Sharif* (that is descendant) *of the prophet Mahomet, &c. &c. &c.* In fine, his will is the only law, his passions the interpreters thereof, the judges his creatures, and the executioners his minions.

Besides robbing his subjects at pleasure while they live, and seizing all their effects at their death, the emperor's revenue is considerably increased by the piratical trade; for he is at no expence in fitting out the corsair vessels, yet has a tenth part of the effects and captives which they take; and after his tythe is deducted, is at liberty to purchase the remainder of the prisoners, if he thinks proper, at only 50 crowns per head. This produces immense profit to him, either by their ransom or labour, for he makes them all work, and supplies them with nothing but a scanty allowance of coarse bread and oil. If they fall sick, he gives them no assistance, but leaves that to the fathers of a Spanish convent, who supply them with necessaries and medicines; but even the benevolence of these is taxed, as they pay him a considerable annual stipend, for a toleration to act with humanity to their fellow-creatures. Another branch of the revenue is a tenth part of the cattle, corn, fruit, honey, wax, hides, rice, &c. extorted from the Arabs and Berbers, by his governors and ballas, who levy this tax with the utmost severity. The Jews pay a capitation tax, and all the commodities in which the Christians deal are heavily assailed.

The navy of this empire is nevertheless very considerable: it seldom consists of above 12 vessels, the largest of which carry no more than 20 guns and about 200 men, who are badly provided for, poorly armed, and very indifferent sailors into the bargain. It is happy for the Christians, that the whole coast of Morocco does not afford a single good harbour; Salce, which is the best of any, is but very indifferent, and at low water is almost dry. This is an insurmountable obstacle to their ever becoming formidable as a maritime power; otherwise their depredations would be much more dreadful, as they are exceeding faithless; and if they find in a vessel belonging to a nation with whom they are at peace a single person of another country, they make that a pretence to seize the ship. They are, besides, deemed great cowards, and will not fight but when they have a manifest advantage on their side.

The army consists of Moors, renegades, and negroes, who are badly paid and worse disciplined; the negroes, however, are deemed the best soldiers, being

brought from Guinea very young, and always educated for a military life. These amount to about 40,000, and the Moors and renegades together make about the same number. The emperor at any time can augment his troops with great ease, but the difficulty is to arm them, as his arsenal, in general, does not contain above 10,000 firelocks, and 150 pieces of cannon.

The commerce of Morocco is carried on chiefly by Jews and Christians in English and French bottoms, as few of the Moors either understand it, or have any trading vessels of their own. Roguery is so universal in Morocco, that an expert cheat is looked upon as a very ingenious, useful, and respectable person; and frauds in trade are so common, that cheating is studied systematically as a most necessary art. The land commerce is carried on by caravans, which go yearly to Mecca, Medina, and Guinea.

The coins of this country are, a *Rocce*, which is a copper coin less than a farthing, 20 of which make a *blanqueen*: this last is a silver coin of about two-pence value; and the *ducat* is a gold coin worth about nine shillings.

The learning of the people of this country is confined to reading, writing, and arithmetic, as few attempt any thing higher except the priests and doctors of law. The favourite science of the two latter orders, and what the common people admire without understanding, is astrology; so that superstition, and a belief in omens, predictions, &c. are general throughout the nation. Most of the towns have several public schools and academies, in which children are taught to read, write, cast accounts, and repeat a short catechism, which contains the principles of their religion. The Mahometan is here the established religion, but they have introduced a variety of innovations, and added several ridiculous ceremonies. Every Friday, which is their sabbath, both sexes visit the sepulchres of their ancestors and relations, in blue habits, blue being their mourning colour. They greatly venerate the dead, embellish their tombs as much as their circumstances will permit, and suffer no Christian to approach within a certain distance of them. They are very particular in the observation of the three following superstitious and whimsical notions:

1. To place viuals and drink upon the tombs of their ancestors and relations, at certain times, that the dead may not starve in their graves.

2. To bury gold, silver, jewels, &c. with the corpse, that he may not be in bad circumstances in the other world: and,

3. To dig the grave very wide, that the defunct may not be incommoded for want of room.

They have another notion, which is equally singular and absurd, that is, never to bury two persons in the same grave, lest they might have some difficulty in finding their own bones on the day of resurrection.

The Mahometans here pay a peculiar regard to both the pilgrims and their horses who have been at Mecca; but they profess the utmost abhorrence to Christians of all denominations: they seldom mention them without a curse tacked to their names; and the mildest epithet they bestow on them is that of dogs. They enforce the attendance on public worship with great rigour; for if a man is convicted of having absented himself from the mosque for the space of eight days, he is, for the first offence, rendered incapable of being a witness in any court of judicature; for the second fined; and for the third burnt as a heretic. Women are, however, excluded from places of public worship; and the prevailing opinion of the Moors is, that all persons of any nation or religion, and of either sex, are secure of salvation prior to the age of fifteen; but after that period they imagine that none but Mussulmen can be saved. Idiots and madmen are deemed saints, and their sepulchres, as well as those of the Mecca pilgrims, are sanctuaries for all crimes but treason. Games of chance are strictly forbidden, and those who are detected in playing for money, are liable to be severely punished. They are strict observers of the ceremonials of their religion, particularly of the great fast of Ramadan. But, to sum up the general character of the nation, all travellers

travellers agree in affirming, that the court is the most faithful, and the people the most perfidious and base of any in the universe.

The methods of punishing criminals are exactly the same as those used in the other piratical states of Barbary, already described; as are their dress, marriage ceremonies, burials, &c. Their language is modern Arabic, which prevails throughout the whole empire.

Hitherto we have described only the dark side of the character of these people; it is but justice, therefore, to mention their few good qualities, as a small balance against their many bad ones: they never use the name of God irreverently, or upon trivial occasions, and abhor the very idea of swearing, unless when they mention a Christian, when the execrations they use are chiefly in derision of, and to express their contempt for the Christians, on account of their propensity to this very vice; for the infamous, though common practice, of cursing and swearing upon the most trifling occasions, which prevails with many who are pleased to call themselves Christians, has contributed greatly to lower them in the opinion of these Infidels: nor is this custom less ridiculous than impious, as it is the only crime which human nature is capable of committing, that neither proposes pleasure or profit for its end:

- “ Of all the nauseous complicated crimes,
- “ Which most infect and stigmatize the times,
- “ There's none that can with impious oaths compare,
- “ Where vice and folly have an equal share.”

They seldom wrangle or quarrel with each other, very rarely come to blows; and murders (those committed by the emperors excepted) are never heard of. They are scrupulously obedient to their parents, pay the most profound respect to their superiors, and are loyal to their sovereigns even to a most absurd degree of veneration. They are, in general, exceeding temperate in eating and drinking; though the emperor, and some of the great men, who fancy themselves above all restrictions, lead very abandoned and debauched lives; but the people in general use a great deal of opium. It is singular, that in the most civilized nations in Europe, vast crowds of natives flock to see public executions, with a kind of unfeeling curiosity; but in Morocco it is quite the reverse, for all ranks of people carefully keep out of the way, and a criminal is often executed, without any persons being present except the officers of justice, who attend officially. They have one excellent political maxim in their government, which is, not to molest the consul and merchants who reside in their territories, though they happen to be at war with the nation to whom they belong.

To what hath already been said, relative to their treatment of Christian captives, we shall, for the entertainment of the reader, subjoin the following Narrative of the loss of his Majesty's ship the *Litchfield*, and the sufferings of the surviving part of the crew, during their slavery in Morocco:

On the 11th of November 1758, the *Litchfield*, commanded by Captain Barton, departed from Ireland, in company with several other men of war and transports, intended for the reduction of Gorce, under the command of Commodore Keppel.

They met with a prosperous voyage till the 28th of the month, on the evening of which day the weather turned out very squally, with rain. At nine o'clock it was exceeding dark, with much lightning, and at half an hour after nine they had an extreme hard squall, at which time Captain Barton came upon deck, and staid till ten, when he left orders to keep sight of the Commodore, and to make what fall the weather would permit.

At one o'clock in the morning of the 29th, the light, which they took to be the Commodore's, was right ahead bearing south, and the wind blew very hard at west south-west. At six o'clock in the morning the author of this account was awakened by a great shock, and a confused noise of the men on deck; on which he ran up, thinking some ship was run foul of them, having no thoughts of being near land, since, according to every person's reckoning, they were at least 35

leagues from it; but, before he could reach the quarter deck, he was too sensibly convinced of their dismal situation, by the ship giving a great stroke on the ground, and the sea breaking all over them.

Just after this he could perceive the land, at the distance of about two cables length, appearing rocky and uneven. The ship lying with her broadside to windward, the sea broke entirely over them; the masts soon went overboard, and some men were carried off with them.

It is impossible to conceive their distress at this time; the masts, yards, and sails hanging along-side in a confused heap, the ship beating violently upon the rocks, the waves curling up to an incredible height, and then dashing down with such force as if they would have split the ship to pieces, which they every moment expected.

But now Providence favoured them greatly; for some of the large waves breaking without the ship, the remainder of their force came against the starboard quarter; and the anchors that were cut away as soon as they struck, now assisted in bringing the ship's head towards the sea.

This gave a prospect of prolonging life, perhaps, a few hours, which was all at that time they could expect; however, their scattered senses now recovering a little, they saw it necessary to get every thing they could over to the larboard side, to prevent the ship from heeling off, and exposing the deck again to sea: and the waves for the most part breaking forward, they seized the opportunity, and got most of the starboard guns on the upper deck over, with what else they could come at.

Some of the people, contrary to advice, were very earnest to get the boats out; and at length, after much intreaty, one of the boats was launched, and eight of the best men jumped into her; and though at this time the sea was rather abated, she had hardly got to the ship's stern, when she was instantly whirled to the bottom, and every soul in her perished; and the rest of the boats were soon washed to pieces upon deck.

They now made a raft of the captern-hats, some boards, &c. which being done, they had only to wait with resignation for the assistance of Divine Providence. The ship was so soon filled with water, that they had no time to get any provision up. The quarter-deck and poop were now the only places they could stand on with any security, the waves being far spent by the time they reached those parts, owing to their being broke by the fore part of the ship.

At four o'clock in the afternoon, the sea being then much abated, as it was almost low water, and as there was reason to imagine that the ship could not withstand the violence of the next flood, one of the people swam safe ashore.

There were numbers of Moors upon the rocks, who beckoned much for them to come on shore, which they at first took for kindness, but they were soon undeceived, as these wretches had not the humanity to assist any one who was entirely naked, but fled to those who had any thing about them, whom they stripped before they were well out of the water, wrangling among themselves about the plunder, while the poor man was left to crawl up the rocks if he was able; if not, they gave themselves no concern about him.

Mr. Sutherland, with the second lieutenant, and about 65 others, got ashore before dark, where they were exposed to the weather upon the cold sand, and, to keep themselves from perishing, were obliged to go down to the shore to bring up pieces of the wreck to make a fire; and if they happened to pick up a shirt or a handkerchief, and did not deliver it to the Moors on the first demand, a dagger was instantly offered to their breasts.

The Moors having allowed them a piece of an old sail, which they did not think worth carrying off, they made two tents, into which they crowded, sitting one between the other's legs, to preserve warmth, and make room.

In this uneasy situation, continually bewailing their own fate, and that of their poor ship mates on the wreck,

wreck,

wreck, they passed a most turbulent, dark, and rainy night, without even a drop of water to refresh them, except what they caught in their sail-cloth covering.

On the 30th of November, at six in the morning, they went down on the rocks, to assist their ship-mates in coming ashore, and found the ship had been greatly shattered in the night. It being now low water, many attempted to swim on shore, some of whom got safe, while others perished.

Those on board got the raft into the water, and about 15 men upon it; but they were no sooner put off from the wreck, than it was quite overturned, but most of the men recovered it again, when it was instantly over-set a second time, and all perished except three or four.

About this time a good swimmer brought a rope ashore, and Mr. Sutherland running hastily over the rocks into the water, caught hold of it, just as the man was quite spent, and had thoughts of quitting it; and some others coming to his assistance, they, by the help of that, pulled a larger rope ashore, and made it fast round a rock.

They found this gave great spirits to the poor people on the wreck; for the rope being hawled tight from the upper part of the stern, made an easy descent for any who had art enough to walk, or slide upon the rope, with another above to hold by, in which manner they proceeded almost half way ashore.

The under rope was intended for a traveller to pull people ashore, being fastened to the large rope with an iron ring, to go backwards and forwards, but there being a knot in the large rope, when once they had pulled it over, it would not return; however, it was of great service, and was the means of saving a number of lives.

They continued coming by the rope till about eleven o'clock, though many of them were washed off and perished. The flood then coming on, raised the surf, and prevented any more coming at that time, and the ropes could be of no farther use.

They now retired to the rocks, and being extremely hungry, they began to broil some of the drowned turkeys, &c. which, with some fish mixed, and baked among the coals, made their first meal on this barbarous coast; and at about half a mile distant they found a well of fresh water, which was of the utmost service to them.

They had scarcely finished their meal, when the Moors, who were now grown numerous, drove them all down to the rocks, beating them if they lingered, (though some were hardly able to crawl,) to bring up empty iron-bound casks, pieces of the wreck which had iron about them, and other things.

About three o'clock in the afternoon, they had another meal upon the drowned poultry; and finding this was the best food they were likely to have, some of them were ordered to save all they could find upon the shore, others to raise a larger tent, and the rest were sent down to the rocks to look out for people coming ashore.

The surf greatly increasing with the flood, and breaking upon the fore part of the ship, she was now divided into three pieces; the fore part was turned keel up, the middle part was foun dashed into a thousand pieces: the fore part of the poop likewise fell at this time, and about 30 men with it, eight of whom got safe on shore, but so bruised that their recovery was despaired of.

A most melancholy prospect now appeared; nothing but the after part of the poop remained above water, with a very small part of the other decks, on which was the captain, and about 130 more, expecting every wave to be their last, for the wreck seemed as if it was instantly going to throw them all to the bottom, and every shock threw some off, hardly any of whom came on shore alive.

During this distress the Moors laughed very loud, and seemed much diverted when a wave larger than common threatened the destruction of the poor tottering souls upon the wreck.

Between four and five o'clock the sea was much decreased with the ebb; and the rope being still secure,

they began to venture upon it, when some fell off, and perished, but others got safe on shore.

About five o'clock those on shore made signs for the captain to come upon the rope, as that appeared to be as good an opportunity as any they had observed: but some who came lately off, said, that the captain was resolved to stay till all the men had made the best of their way to land, or at least had quitted the wreck; which bravery of his they at once admired and lamented.

However, they still continued to beckon him, and just before it was dark they had the pleasure of seeing him come on the rope; he was close followed by a good able seaman, who did all he could to keep up his spirits, and assist him in warping.

As the captain could not swim, and had been so long without any refreshment, he was no longer able to resist the violence of the waves, but had lost his hold of the great rope, and must unavoidably have perished, had not a wave thrown him within reach of the ropes held by those on shore, which he had barely the sense left to lay hold of: they pulled him up, and after resting a little while upon the rocks, he came to himself, and walked up to the tent, desiring the others to assist the rest of the people in coming ashore.

The Moors were for stripping the captain, though he had nothing on but a plain waistcoat, and a pair of breeches; but his people plucking up their spirits on this occasion, opposed them; on which they thought proper to desist.

The people still continued to come on shore pretty fast, though many perished in the attempt; but they plainly saw that their case was desperate, as the wreck must inevitably fall to pieces with the next flood.

The Moors at length growing tired with waiting for so little plunder, would not let them remain any longer upon the rocks, but drove them all up; whereupon Mr. Sutherland, with the captain's permission, went and made supplication to the bafia, who was in his tent with many other Moors, dividing the plunder.

Mr. Sutherland having by signs made himself understood, the bafia gave them leave to go down to the sea side, sending some Moors with them. They carried fire-brands down, to let the poor creatures on the wreck see that they were still ready to assist them.

Mr. Sutherland sees that he has no doubt but many perished while they were gone, for want of their help; for they had been but a few minutes on the rocks, when one came very near them before they saw him; and this was frequently a circumstance of as much horror as any they met with; for just as the poor wretches appeared in sight, they have been washed from the rope, and dashed to death against the rocks close to their more fortunate companions.

About nine at night, finding that no more men would venture upon the rope, as the surf was again greatly increased, they retired to the tent with hearts full of sorrow, leaving, according to the last man's account, between 30 or 40 upon the wreck.

They now thought of crowding all into the tent, and began by fixing the captain in the middle; they then made every one lie down on his side, as they could not afford him a breadth; but after all, there were many who took easier lodgings in empty casks that had been thrown on shore.

On the first of December in the morning, the wreck was all in pieces upon the rocks, and the shore quite covered with lumber. The people upon the wreck perished about one in the morning, as we learnt from one who was tossed up and down nearly two hours upon a piece of the wreck, and at last thrown upon the rock senseless; but recovered, and got to the tent by daylight, though greatly bruised.

The Moors were very busy in picking up every thing of value, but would not suffer the English to take the least thing, except pork, flour, and liquor, of all which they secured as much as they could in the tent. Some were now employed in enlarging the tent, and raising another; some in trying to make bread, and some in cleaning the drowned wreck.

At one in the afternoon they numbered the men; and placing them in ranks, found the number to be 225;

so that there were 130 drowned, among which number was the first lieutenant, the captain of marines, his lieutenant, the purser, gunner, carpenter, and three midshipmen. They now returned public thanks to almighty God for their deliverance.

On the second of December, at five in the morning, they found one George Allen, a marine, dead, close by the tent, which they imagined was occasioned by drinking brandy among the rocks, as several had got drunk that way, though they used what means they could to prevent it.

This day two men were whipped, by order of captain Barton, for their insolence, which was highly necessary, both to convince the Moors, and their own people, that they were still under command.

At two in the afternoon there arrived a black servant from one Mr. Butler, at Saffy, a town about 30 miles distance, to enquire into their situation, and give them assistance. This man having brought pens, ink, and paper, the captain wrote a letter to Mr. Butler; and the finding there was even one person who offered them help, was a circumstance of the highest satisfaction.

On the morning of the third of December, they assembled the people, and read prayers of thanksgiving. In the afternoon they received a letter from Mr. Butler, with some bread, and a few other necessaries, which were extremely acceptable. They now heard that one of the transports, and a bomb tender, were wrecked about three leagues to the northward of them, and a great many of the men saved.

On the fourth of the month the people were employed in picking up pieces of the tails, and what else the Moors would permit them. They now divided the people into messes, and served them with the necessaries they received the day before. In the afternoon they received another letter from Mr. Butler, who was factor to the Danish African company, and himself a Dane; and at the same time they had a letter from one Mr. Andrews, an Irish gentleman, who was a merchant at Saffy.

On the fifth the people were employed to gather mussels at low water, the drowned stock being all expended. Mr. Andrews arrived this morning, and brought with him a French surgeon, and some medicines and plasters, which many of the bruised men stood in great need of. In the afternoon one of the seamen died by his bruise mortifying.

The next day was delivered one of the country blankets to every two men, and a pair of flippers to such as stood in need of them: these flippers were brought by Mr. Andrews. The people were now forced to live on mussels and bread, the Moors having deceived them, though they promised to supply them with cattle.

On the seventh the Moors began to be somewhat civil, for fear the emperor should punish them for their cruelty to the English; and in the afternoon a messenger arrived from the emperor, at Saltee, with orders in general to the people to supply them with provisions. They accordingly brought some poor bullocks and lean sheep, which Mr. Andrews purchased; but at this time they had no pots to make broth in, and the cattle were hardly fit for any thing else.

On the ninth in the morning they saw several dead bodies upon the rocks. This day the people were employed in bringing up the oak timbers, &c. from the sea-side, the emperor having sent orders to save whatever might be of use to his cruises.

On the morning of the tenth they got every thing ready to march to Morocco, the emperor having sent orders for that purpose, and camels to carry the lance, and the necessaries. At nine o'clock they set out with about 30 camels, and at noon were joined by the crews of the two other wrecked vessels, when they were all mounted on camels, except the captain, who was furnished with a horse. They did not stop till seven in the evening, when the Moors procured them only two tents, which would not contain one third of the men; so that most of them lay exposed to the dew, which was very heavy and cold. They now found their whole number to be 338, including officers, men, and boys,

three women, and a young child, which one of the women had brought ashore in her teeth.

They continued their journey on the eleventh, attended by a number of Moors on horseback; and the alcaid, who had the conducting of them, now furnished several of the officers with horses. They did not travel straight for Morocco, being informed that they must meet the emperor coming from Saltee. At six in the evening they came to their resting place for the night, and were furnished with tents sufficient to cover all the men.

On the twelfth they set out at five in the morning, and at two in the afternoon saw the emperor's cavalcade at a distance. At three a relation of the emperor's, named Muli Adris, came to them, and told the captain it was the emperor's positive orders that he should instantly write a letter to the governor of Gibraltar, to send to his Britannic majesty; to know whether he would settle a peace with him or not.

Captain Barton sat down immediately on the grass, and wrote a letter, which being given to Muli Adris, he returned to the emperor. At six in the evening they came to their resting place for the night, and were well furnished with tents, but had very little provision.

On the 13th they had provision brought them, and were desired to remain in their present situation till the men were refreshed.

Having waited till the 16th, and the men being greatly recovered of their fatigues, they continued their journey as before; and at four in the afternoon came to their resting place, pitched their tents, and restuffed themselves with provisions.

Here some of the country Moors used the English ill, as they were taking water from a brook; the Moors would always spit in the vessel, before they would let them take any away; hereupon a party of English went to enquire into the affair, and were immediately saluted with a shower of stones. They then ran in upon the Moors, beat some of them, put them to flight, and brought away one, who attempted to defend himself with a long knife: his fellow was severely punished by the alcaid who had the conducting of the English.

On the morning of the 17th each of the people had a dram, as had been usual, and they then continued their journey; and at four o'clock in the afternoon came to the resting place for the night, and after some difficulty got tents and a proper supply of provision.

On the 18th of December, at three in the afternoon, they came to the city of Morocco, without having seen one dwelling house in the whole journey. They were here insulted by the rabble as they passed, and at five o'clock were conducted to the emperor, who was on horseback before the gate of his palace, surrounded by five or six hundred of his guards.

He told captain Barton, by an interpreter, that he was neither at peace nor war with the English, and that he would detain him and his people till an ambassador came from England to settle a firm peace.

The captain then desired that they might not be used as slaves; to which the emperor hastily replied, that they should be taken care of; and they were then directly thrust out of his presence, conveyed to two ruined houses, and shut up amidst dirt and innumerable vermin of several forts.

Mr. Butler, who was mentioned before, being at Morocco on business, came and assisted them with victuals and drink, and procured liberty for the captain to go home with him to his lodging; he likewise sent some blankets for the officers, with which they made a shift to pass the night pretty comfortably, as they were greatly fatigued.

On the morning of the 19th their centry was taken off, and the people had liberty to go out: the Moors likewise sent them some bread, and towards night some beef; but they had yet no conveniency to dress it, and the people were all day employed in clearing out the rubbish and destroying the vermin.

On the 20th some of their necessaries, which they had on the road, were brought to them, after being rummaged, and the captain's trunk robbed of 19 ducats, several rings, silver buckles, a watch, and other things,

mostly belonging to the foremost-men. Mr. Butler, and his partner, Mr. Dekon, did every thing in their power to assist them; and the people had now pots to boil their victuals, nor were they in any want of bread.

On the morning of the 21st the emperor sent money to the captain for the support of the men, at a blank-queen a day each, or two-pence sterling; but that being insufficient, captain Barton got money from Mr. Butler to make it up four-pence sterling, which he managed himself for them to the best advantage, allowing them one pound of beef or mutton, with broth, and one pound of bread every day.

At nine o'clock in the morning of this day, the emperor sent for the captain and every officer to appear before him; and they instantly repaired to his palace, where they remained two hours waiting in an outer yard: in the mean time he diverted himself with seeing a clumsy Dutch boat towed about a pond by four of the petty-officers.

About noon they were summoned before him, and placed in a line about 30 yards from him. He was sitting in a chair by the side of the pond, with only two of his chief alcaids near him. Having viewed them some time, he ordered the captain to come forward; and after having asked him some questions concerning the English navy, and the destination of the squadron of which the Litchfield made a part, he called forward the rest of the people by two and three at a time, as they stood according to the rank; then asking most of them some very insignificant questions, and taking some of them to be Portuguese, because they had black hair, and others to be Swedes, because they had white hair, he judged none of them to be Englishmen except the captain, the second lieutenant, the ensign of the soldiers, and Mr. Sutherland; but on their assuring him that they were all English, he cried hono, and gave a nod for their departure; to which they returned a very low bow, and were glad to get to their old ruined house again.

On the 22d of December, captain Barton provided the people with stoff for frocks, trowsers, and mats and pillars to lie on, with every other necessary that could be got: and they were all employed in making themselves cloaths in the best manner they were able.

On the next day the captain received a message from the emperor, with orders, that if any of the English should be guilty of a crime, he should punish them, the same as if they were on board his ship; but if they should quarrel with the Moors, they must abide by the Moorish laws, which are very severe against the Christians.

On the 24th, being Sunday, they were all assembled, and prayers were read in the same manner as if they had been on board, and they returned unfeigned thanks to God for the many favours he had bestowed on them. They had but one bible among them all, and that was a present from Mr. Andrews; and though they had no clergyman, captain Barton never omitted a single Sunday to assemble the men, and have service performed.

On Christmas day prayers were read to the people, as usual in the church of England; and this day the captain received a present of some tea, and loaves of sugar from one of the emperor's queens, whose grandfather had been an English renegade.

The next day they heard the disagreeable news that the emperor would oblige all the English to work in the same manner as the other Christian slaves, excepting the officers that were before him on the 21st of the month.

On the 27th, at seven in the morning, an alcaid came and ordered the people all out to work, except those who were sick; and, by intercession eight were allowed to stay at home every day, as cooks for the rest, which they took by turns throughout the whole number.

At four in the afternoon the people returned, some of whom had been employed in carrying wood, some in turning up the ground with hoes, and others in picking weeds in the emperor's garden. Their food was provided by the time they came home.

Next day all the people went to work as soon as they could see. They were allowed to sit down an hour and a half in the middle of the day: but had many a stroke from their drivers, when they were doing their best to deserve better usage. The captain endeavoured all that was in his power to get this remedied, which, with the assistance of their good friend, Juan Arbona, he was in hopes of effecting.

This Juan Arbona, who had been in the country eight years, was taken under English colours, and had a pass signed by general Blakeney at Minorca. For two or three years past the emperor had kept him near his own person, and put much confidence in him: he was much attached to the English, and did every thing in his power to assist them.

On the 29th the people were allowed a hot breakfast of porridge, sweetened with honey, before they went to their work: this work was sometimes to hoe the ground, and at other times to carry wood, or stones for building, and such other things as the slaves are commonly employed in.

The next day captain Barton received an obliging message from the emperor, with his permission for him to ride out, or take a walk in his gardens, with any of the officers.

The 31st of the month was Sunday, but the people were obliged to go to work as before, the captain not being able to obtain permission for them to stay at home on Sundays: at four o'clock they returned, and at five prayers were read to them as usual.

On the 1st of January 1759, the people were continued at their work as usual, but had not so much bad usage, and were in a fair way of having less, owing chiefly to the good offices of their friend Juan Arbona, who took all imaginable pains to make their work as light as possible. He now obtained leave for the Christians to quit their work at twelve o'clock on Sundays, which was no small favour, and such as was never granted in this country before.

The people kept their health as yet pretty well, having a cool air to work in at this time of the year; but it is scorching hot in the summer, when there is seldom any wind to refresh the labourers.

On the 2d of January a new moon commenced, whereupon the emperor sent captain Barton the money for the support of the people till the next moon.

By this time they were got into a settled way of living, so that it will be unnecessary to take notice of those things that occurred daily; we shall therefore only remark any extraordinary occurrences.

Nothing material happened till the beginning of February, when two soldiers died within a few days of each other; and the emperor enquiring into the cause of their death, Juan Arbona told him that it was occasioned by catching cold for want of cloaths; upon which he received immediate orders to give every English slave as much white linen as would make two shifts.

In the month of March, a Spaniard having some words with a Moor, who had first used him ill, was carried before the emperor, who ordered him to be immediately knocked on the head before his face, and the dead body to be exposed for two days afterwards, during which time the Moors and Jews shewed the brutality of their dispositions, by dashing the body to pieces with stones as they passed.

About the middle of April the English received letters which gave them hopes of speedy relief; but the men were not now so healthy as they had been, some being afflicted with a fever, and some with the flux.

On the 26th of May the emperor received a letter from Lord Home, offering 170,000 dollars for the freedom of the English, with which his majesty seemed very well pleased, and promised to send immediately for the ambassador, and let them go; but they found that there was no trusting to any thing he said.

On the 15th of June a courier set out with the emperor's letter to the ambassador: he was a Jew, named Toledano, and had orders to proceed to Gibraltar, and return with the ambassador.

About ten days after this, the emperor ordered that

the English should work only from day-light till nine o'clock, and then go home till three in the afternoon, when they should return and work till sun-set; the number that went to work was likewise limited to 100, which might soon enable them to make two gangs; for the people being kept from working in the excessive heat of the sun, the numbers of sick decreased daily.

On the 2d of July the emperor set out from Morocco, with an army of 6000 men, which was soon increased to 30,000, as great numbers joined him continually. He went to subdue some part of his dominions that would not acknowledge his sovereignty.

In about eight days time he sent to the city of Morocco the heads of 70 men, which were placed against one of the great gates of the city; there were also about 200 prisoners, the chief of whom, to the number of 40, were put into one of the towers of the wall, and about one third of their number put on the top of it, with large wooden rammers; they were then supplied with earth, which they were obliged to beat till the roof gave way with the load, and then they all perished together.

About the 10th of August orders came for 50 men more to go to work, by which the English found that the emperor was uneasy that their ambassador did not come.

On the 18th they heard from Gibraltar that the ambassador deferred coming; but on the 20th they had the agreeable news that he would set sail from Gibraltar in a few days. This good news kept their hopes alive till the latter end of August, when a courier arrived from Tetuan, who brought the news of admiral Boscawen's having beat the French fleet, and that the ambassador's ship being in the engagement, was obliged to stay some time at Gibraltar to rest.

During all this time the emperor's cruizers had passages from Lord Home, and were all out, and constantly sending in prizes; which gave the captives but little hope of bringing matters to an accommodation that summer; as the keeping his cruizers in port is the readiest way of making him hearken to reason.

Most of the cruizers being returned successful into port by the middle of September, the English had the assurance of the long expected ambassador being at Sallee, with his majesty's ships *Guernsey* and *Thebis*, having the money on board for their redemption, which the emperor was informed of at his camp; but being clad with his success both by land and sea, and having nothing to fear from the English till the next spring, he only trifled with the ambassador, by making extravagant demands, to detain him upon the coast, which is very dangerous in the winter time.

His last demand was 250,000 dollars, 27 pieces of cannon, and a large quantity of powder and shot. The ambassador had come up to 200,000 dollars to satisfy him for every pretension; but on hearing this last demand, he sent the emperor word that it never would be complied with, and immediately left the coast, having first lost two anchors in Sallee road.

When the emperor found there was nothing to be done by keeping the ship, he dispatched one of his alcaids to Gibraltar, with more moderate proposals; and desired that a gentleman might be sent to him, with authority from the ambassador to treat on the subject, and carry back his determined resolution.

Accordingly, Mr. Hasler, the ambassador's secretary, was sent with answers to the emperor's last demands, who used every argument to convince him that it was not in the ambassador's power to grant him any supplies of warlike stores, as that was contrary to treaties by which they subsisted between England and other nations then at peace with her: but the emperor would not be convinced, and suffered Mr. Hasler to return to Gibraltar, without giving him his determined resolution.

During this interval, there were eight or nine English passengers taken under Portuguese colours, and brought to Morocco, which the captives apprehended would be an additional subject of dispute.

About the middle of October the emperor again sent Toledano, the Jew, with more moderate proposals than

any of the former, and with authority to accommodate all differences.

In the beginning of February, 1760, Toledano returned, with Lord Home's determined resolution to give 200,000 dollars for the redemption of every British subject in the emperor's dominions, and 20,000 dollars to purchase warlike stores; which he might do by sending a vessel of his own to England.

About this time captain Barton was used very ill, which happened in the following manner. He had been allowed to keep a mule for some time past, and commonly used to ride from his house, which was near the palace, to the house where the men were lodged. The emperor happened to see him; but captain Barton thinking him so far distant that he should not be taken notice of, only put his hat under his arm, and rode on, as he was at that instant obscured by a wall.

The emperor sent two of his guards after him, and he was just going to alight at the house when they came up with him, and pulled him from off the mule, giving him several strokes with their straps, which they always have ready for that purpose. They seized him, one on each side, by the collar, and in that manner hurried him to one of the gates, and shut him up in a hole behind the door.

The mob would hardly allow his officers to follow him; however, Mr. Sutherland got in with him; but they had not been there a quarter of an hour, before the same two fellows that seized him, came and set him free, and wanted money for that favour, agreeable to the custom of the country; but captain Barton would not give them a blanqueen, and bid them go and tell their master so.

The men were now kept more strictly than ever to their work, and the alcaid came oftener to search the house; but the vigilance of captain Barton, and their good friend Juan Arbona, got the better of a number of difficulties and impositions, which would otherwise have rendered the peoples lives very unhappy.

For a fortnight past, the emperor had considered on the last proposals; and having discountered Toledano several times on the subject, he at length resolved to send him once more to Gibraltar, with his determined resolution to accept of 200,000 dollars for the redemption of all the English subjects, and 25,000 dollars for every other pretension; and as he now seemed to be more in earnest than ever he had been before, they began to think their deliverance was near at hand.

Toledano set out for Gibraltar about the middle of February, with orders to write to the emperor, immediately upon Lord Home's agreeing to his proposals; and upon receipt of this letter the captives were to set out for Sallee, to be ready for embarking when the ambassador arrived there.

On the 25th of March the emperor received assurances from Gibraltar, that his demands should be duly complied with, on the embarkation of the captives at Sallee, for which place the ambassador would sail with the first fair wind, with the money and presents.

Hereupon his majesty sent to captain Barton, who had also received letters, to inform him that he, and all the people who were cast away, should soon set out for Sallee. The joy they felt on this occasion may be better imagined than described. Captain Barton took up money from the merchants, with which they soon provided every thing that could be wanted in a journey of ten days, for 320 men; but they were still kept to their work.

On the 11th of April the men left off going to work; and on the evening of the 12th the emperor sent for captain Barton, Mr. Sutherland, and the second lieutenant, and told them they were to go away on the next morning, and that he would make peace with the English nation, if they were willing; if not, he did not care. He then gave a nod for their departure, on which they made a low bow, and walked off with lighter hearts than ever they had felt before.

The next morning they were all ready before sunrise, but waited till nine o'clock for the mules and camels: then they were all mounted, generally two upon a camel, and immediately went without the city, and

and when all were come, they proceeded on their journey, attended by a bashaw and 100 soldiers on horseback.

They were now treated in a more agreeable manner than when they came thither near 18 months before. Mr. Barton was now consulted how fast he chose to travel, and when to stop. In the evening they pitched their tents, which were all properly numbered, and formed an exact oval. In this good order they pursued their journey wanting for nothing.

On the fourth day of their march they had a skirmish with some of the Moors. It was occasioned by some of the men in the rear stopping to buy milk at a country village, for which the Moors wanted to make them pay an extravagant price after they had drunk it, which they would not comply with. Hereupon the Moors began to beat them, which the English returned, and others going to their assistance, they maintained a smart battle, till the Moors grew too numerous: in the mean time some of the English rode off to call their guard, who instantly repaired to their assistance with their drawn scymtars, and dealt round them pretty briskly: in the interim the English were not idle, but made the blood stream down the faces of many of the Moors.

The guards then seized the chief man of the village, and carried him to the bashaw, who conducted the English, who having heard the whole affair, dismissed him without further punishment, in consideration of his having been already well drubbed.

On the 22d of April they got to Saltee, and pitched their tents in an old castle, from whence they had the long wished for happiness to see three English ships lying at anchor, ready to receive them; but when they viewed the bar of the harbour, with a large roaring surf upon it, they began to think their embarkation would probably prove tedious, which accordingly happened; for it was the 4th of May before the bar was smooth enough for the boats to go out, and then only half the people could go, as there were not boats enough for all.

Captain Barton judged it proper to send off first all the soldiers, inferior officers, and some sailors, to make up 162 in number, over the bar. They came to a grapple, and waited till half the money was brought from the ship, and put into their boat, which returned over the bar, and the men got safe on board, where those who remained on shore cast many a wishful eye, till the 13th, during which interval they had much uneasiness, as the Moors were suspicious of the ambassador's not coming on shore, and wanted to detain some of the officers for a security; but at last the ambassador, and captain Barton's sagacity, surmounted this difficulty, and they all got over the bar, where they waited till the money was put into the Moor's boat; upon which they proceeded on board the Guernsey, with hearts full of gratitude to God and their country, for their deliverance from so barbarous a people.

They were most cheerfully welcomed by the ambassador and all his officers, whose kindness they experienced a full month, while they waited for the passengers, to the number of 25 men and women, whom the emperor wanted to keep till the ambassador came to him. This could not be complied with; but at length the emperor, after sending a person to settle that point with the English ambassador, consented to let them all go, except Juan Arbana and Pedro Umbert, whom he absolutely refused to part from; which occasioned a general grief, on account of the former, as he had been a steady friend to them in their adversity, and kindly assisted them in all their difficulties.

They arrived at Gibraltar on the 27th of June, and on the 29th sailed for England in his majesty's store-ship Marlborough, where they arrived in good health on the 7th of August, but remained in quarantine till the 19th of September, 1760, and on the 20th had leave to go on shore; captain Barton, and all his people, being honourably acquitted by a court-martial for the loss of the Litchfield.

REVOLUTIONS.

LITTLE or nothing is known relative to Morocco and Fez, the ancient Mauritania, till the conquest of those countries by the Romans, who found that absolute monarchy was the prevailing mode of government throughout Barbary. Bogud, the first prince of whom we have any authentic account, was cotemporary with Julius Cæsar. On the death of Bogud, this country became a Roman province, and was afterward conferred by Augustus upon the younger Juba, whose son Ptolemy was put to death by the tyrant Caligula. The Goths then over-run the country, and possessed it till they were driven out by the Saracens in A. D. 600. These were again subdued by the Arabians, who divided Barbary into many petty kingdoms, till the year 1068, when they were all united into one sovereignty under the family of the Almoravides; for Joseph, the second monarch of that race, founded Morocco, and not only subdued Fez, but the Moorish dominions in Spain. His grandson, Albo Hali, was a great friend to learning, but a tale for literature died with him. Mahomet, the fourth of this succession, lost the Moorish conquests in Spain, and after the reign of three succeeding monarchs, whose reigns were remarkable for nothing but domestic broils, the race of the Almoravides became extinct.

The race of the Merins then raised themselves to the regal dignity; but they were a set of unhappy monarchs, all meeting with untimely ends. Aboscent, the sixth of them, with an army consisting of 400,000 foot, and 75,000 horse, was defeated by the kings of Castile and Portugal at the head of only 20,000 foot and 14,000 horse. In 1540 the race of the Merins becoming extinct, the Sharrifs, or Cherrifs, the supposed successors of Mahomet, were advanced to the imperial dignity, or rather obtained it by artifice and cruelty.

Amec, the first monarch of this line, was deposed by his brother Mahomet; and the latter, after a reign of continual intestine broils, was murdered by his own guards.

Abdallah, his son and successor, put to death ten of his brothers out of twelve, for his security, and died unexpectedly, just at a time when a plot for his destruction was ready to be put into execution.

His son Mahomet flew to Don Sebastian, king of Portugal, who, together with the two competitors for the sovereignty of Morocco, were slain in 1578, at the famous battle of Alcazar. The reigns of the three succeeding princes of this line contained nothing remarkable; but the eighth monarch, named Silian, restored peace to his country. A gang of pirates, however, in his reign possessed themselves of the port of Saltee; when not having maritime strength sufficient to dislodge them, he applied for aid to the court of England. The reigning monarch, Charles I. complied with his request, and sent some ships to his assistance, by which the pirates were taken or destroyed; and the emperor in return sent 300 Christian slaves as a present to his Britannic majesty. This worthy monarch died in 1630, and was succeeded by his eldest son Muley Abdelmelech, who was remarkable for his cruelty and drunkenness, and was, after having reigned four years, murdered by a Christian slave.

He was succeeded by his brother Muley Elwaly, a prince of a sweet disposition, and generous spirit, who began his reign by releasing all state prisoners, and increasing the pay of his troops, and died much regretted, after having possessed the crown twelve years.

His brother Muley Hamed Cheyk succeeded him; but being murdered by the Arabs, they raised one of their own chiefs, named Crumel Hack, to the crown, who was, on his demise, succeeded by Shariff Muley, king of Taphlet. The latter engaging in a war with Sid Omar, prince of Illech, was defeated, taken prisoner, and closely confined: during his captivity, he was attended by a negro woman frightfully ugly, with whom he nevertheless cohabited, and she bore him two sons: the eldest, named Muley Archy, succeeded him in the kingdom of Taphlet. The reign of this prince was but short; for, drinking immoderately, he one day

mounted a spirited horse in a drunken frolic, and riding furiously into a grove of orange trees, he was thrown against the trunk of a tree, fractured his skull, and expired of the wound. His nephew Hamet caufed himself to be proclaimed fovereign at Morocco, while his half brother (by a white woman) took the same step at Taphlet: but Muley Ifhmael, his full brother by the negro woman, was too hard for both, got the crown from them, and began his reign in the year 1672. As this monarch's history is better known than any of the preceding, we shall be more ample in our account of it.

He was remarkable for an odd jumble of policy and absurdity, cruelty, and religion. An intelligent writer gives the following character of him: "His strictness was such during his whole reign, that he would never drink any wine or strong liquor; he observed the Ramadan, or Mahometan lent, four whole months every year, and with a more than ordinary abstinence. He was no less a scrupulous observer of the usual washings, public prayers, and other branches of his law; and never undertook any thing of moment, without prostrating himself a good while upon the ground, and praying for the divine protection and assistance, fully satisfied that Mahomet would obtain it from heaven; so that whatever was the result of his devotions, he firmly believed it to be the immediate direction of that prophet.

"In his administration of justice, in which province he always shewed himself very ready, and easy of access, he was very rigid and impartial, yet would sometimes run into some wild extravagancies, of which the following instance may serve for a tale; a poor farmer of the Berbers race, having complained that some of his negroes, whom, by the way, he was noted for keeping at short allowance, had stolen from him a yoke of oxen, which were his sole dependance; he ordered his whole negroes to pass before him, and shot every one whom the farmer accused: but asking him afterwards, what amends he could make him for the loss of so many stout negroes, and the man being at a loss what to answer, he made him undergo the same fate as the robbers."

He was for ever building and pulling down again, alleging, that he did it to keep his subjects so busy, that they might have no time to mutiny or rebel; for, says he, "if I have a bag of rats, unless I keep the bag stirring, they will eat their way through it." He had 3000 wives, 5000 concubines, 900 sons, and 300 daughters; all of whom, at times, felt the effects of his cruelty and caprice. He would frequently shoot, stab, or behead both slaves and subjects for his amusement; and was so avaricious, that he spent his whole life in plundering his people, and amassing wealth; every thing was made subservient to his insatiable temper. If any body complained to him of having been robbed or defrauded, the criminal was first ordered to make restitution of the property in question, not to the person aggrieved, but to himself, as he asserted that he was the only sufferer, his dignity being insulted by the crime; and then a considerable fine was levied upon the culprit, as a recompence to offended justice; but all went into his own coffers. Money was the most dangerous thing that a man could possess, as it was sure to be extorted from him, not only by unjust, but by cruel means: yet, with all his riches, he was so fondly mean as to keep the servants of his household at short allowance, and not allow his soldiers any thing to subsist on, of which take the following instance: "Not many years after his accession to the throne, he ordered his Moorish troops to join his son Muley Sidan, to go and retake the city of Morocco, which Muley Mahomet, another of his sons, had made himself master of: upon their officers applying to him for a stipend to maintain them, he gave them this brutal answer, "Do you see, ye Moorish dogs, any of my mules, camels, or other beasts belonging to my empire, ask me for any maintenance? Do not they take it where they can find it, without troubling me about it? Go march with all speed whither I send you, and do you maintain yourselves as they do." This, indeed, was a most effectual way to set both officers and soldiers to plundering all that came in their way, which they did upon all occasions.

Muley Mahomet, the most accomplished, and indeed the only one of his sons who had a princely education, raised a rebellion against him, but being taken prisoner by his brother Muley Sidan, his right hand and left foot were cut off by the emperor's order, of which wounds he died; and Muley Sidan was appointed heir to the crown, but his cruelty and drunkenness were such that he was murdered by his own wives, prior to the death of his father. At length Muley Ifhmael, one of the most infernal monsters of cruelty and avarice that ever existed, died a natural death in 1727, having reigned 55 years, which is truly astonishing in a country where insurrections, dethronements, and assassinations were so common.

Muley Hamet Dcby, one of Muley Ifhmael's sons, succeeded him, having been appointed by that emperor not for any peculiar merit, but because he was the most dissolute of all his children; for Muley Ifhmael fancied that his son's drunkenness and intemperance would be foils to set off his own sobriety and abstemiousness; for he imagined that his temperance in eating and drinking made amends for his insatiable avarice, his unbounded cruelty, and his excesses with respect to women. Muley Hamet was depofed by his favourite eunuch, and his brother Abdelmelech proclaimed emperor; but the latter soon rendering himself odious by his cruelties, Muley Hamet was again restored to the throne; Abdelmelech was kept in close confinement for some time, but at length strangled, by order of his brother; and Muley Hamet five days after, being March 22, 1729, died, having fallen a martyr to drunkenness.

Abdalla, another of the sons of Muley Ifhmael, succeeded; when the duke De Ripperda, having been driven from Spain, offered his services to Abdalla, who accepted them, made him a buffa, and cared him as his chief favourite. Ripperda then laid a plan before him, which was to drive the Spaniards from their possessions on the coast of Africa, and even to invade Spain; but for all his courage and abilities his designs were frustrated, by the bravery of the Spaniards, and the superior skill of their engineers. Abdalla at length increased daily in cruelty, killed multitudes of people, attempted the life of his own mother, who made a pilgrimage to Mecca, to be out of his reach, and was heard to express these sentiments, "My subjects have no other title to their lives but my will, and my greatest pleasure is to kill them with my own hand." At length his cruelties rendered him so odious that he was depofed by the black army, and his brother, Muley Ali, raised to the throne in his stead. But Muley Ali, being almost continually supplied by an immoderate use of a sudorific herb, called Archicha, they deemed him unfit to reign, and therefore depriving him of the crown, they again, in 1736, restored it to his brother, who was now unbounded in his cruelty, sacrificing many hundreds to his revenge, anger, or caprice, without the least regard to sex, age, or rank. This occasional Abdalla to be again depofed, and Muley Sidi, another prince of the blood royal, placed upon the throne. Abdalla, however, raised an army, gave battle to his rival, defeated him, and once more re-poffessed himself of the empire.

The most recent transactions with which we are acquainted relative to this empire are, the siege of Ceuta, which commenced Oct. 23, 1774, and the siege of Melille, which began on the 6th of December of the same year, by the troops of Morocco. The court of Spain had for some years past greatly neglected these places; so that neither the garrison or fortifications were in a proper condition to sustain a siege; but those disadvantages were overbalanced by the conduct of the Spanish officers, the bravery of the men, and the total want of discipline and experience in the Moorish troops, which occasioned the emperor's army not only to fail of success in their attack upon those two places, but even to be repulsed by the small garrison of Penon de Velaz, a less considerable fortress upon that coast. Warlike preparations were continued on both sides, though little was effected on either, and Melille was either blockaded or besieged till the middle of March, 1775, when the enterprize was abandoned by the Moors.

C H A P. II.

The D E S A R T.

S E C T. I.

BILEDULGERID.

WE come now to a vast track of land, whose soil consists chiefly of burning sands, the inhabitants of which are so inhospitable, and the country so desolate for want of fertility, that it has justly obtained the name of the Desert. This extensive district is divided into various provinces or kingdoms, the chief of which are, Biledulgerid, Zaara, and Tombuto.

Biledulgerid, the first of these, received its name from the Arabic Biled-el-gerid, signifying the land of dates, on account of the great quantity of that fruit which is peculiar to this country, and so plentiful as to supply the neighbouring kingdoms.

This province is said by some geographers to have been antiently known to the Greeks and Romans by the name of Numidia, and that it was then divided into two large provinces, whose inhabitants were distinguished by the names of Massilyans and Mafflyans, the latter of which were situated eastward of the former. That it was once called Numidia we have not the least doubt; but as the controversies of various writers relative to this point cannot afford any real entertainment to the reader, we shall pass them over, and instead of perplexing his mind with a relation of the *dubious*, shall only confine ourselves to that of the *certain*.

Biledulgerid is a very extensive desert, situated between 24 and 30 deg. of north latitude. It is bounded on the east by the inland parts of Africa; on the west by the Atlantic ocean; on the north by the empire of Morocco; and on the south by Negroland. Its extent is not with certainty known, but it is computed to be near 2500 miles in length, and 350 in breadth. It is in general a very sandy and barren country, and produces scarce any other sustenance than dates; the palm-trees, from which these are gathered, grow in such abundance that the principal part of the country is covered with them. The climate is exceeding hot, and though the inhabitants are in general very healthy and vigorous, yet they labour under great inconveniences from the burning sun-beams and scorching sands, inasmuch that their features are greatly shrivelled, and their complexion very swarthy; their eyes are also violently inflamed by the sands, which are frequently blown into them by the easterly winds; and these winds are so tempestuous that the sands are often found to be their graves.

There are very few rivers or springs throughout the country, and what there are produce water that is neither pleasant nor wholesome. So scarce is this article, that when they go a journey, half the number of their camels are laden with it. The inhabitants consist chiefly of Arab, who have no fixed situation, but live in tents; and being acquainted with the few springs there are, remove from one country to another with their flocks and herds at proper seasons, in order to find them water and pasture:

“ The weary Arabs roam from plain to plain,
“ Guiding the languid herd in quest of food;
“ And shift their little home's uncertain scene
“ With frequent farewell: strangers, pilgrims all,
“ As were their fathers. No sweet fall of rain
“ May there be heard, nor sweeter liquid lapse
“ Of river, o'er the pebbles gliding by
“ In murmurs: goaded by the rage of thirst,

“ Daily they journey to the distant clefts
“ Of craggy rocks, where gloomy palms o'erhang
“ Th' antient wells, deep sunk by toil immense,
“ Toil of the patriarchs, with sublime intent
“ Themselves and their posterity to serve,
“ There, at the public hour of sultry noon,
“ They share the bev'rage, when to waiting come,
“ And grateful umbrage all the tribes around,
“ And their lean flocks, whose various bleatings fill
“ Th' echoing caverns; then is absent none,
“ Fair nymph or shepherd, each inspiring each
“ To wit, and song, and dance, and active feats;
“ In the same rustic teene, where Jacob won
“ Fair Rachel's bosom, when a rock's vast weight
“ From the deep dark mouth'd well his strength removed,
“ And to her circling sheep refreshment gave.”

Though the Arabs are the principal people that inhabit this desert, yet there are amongst them some of the antient Africans, who live in towns and villages, and are supplied with most conveniences by the Arabs. The former think themselves the nobler race, and being independent, some of them for pay will serve neighbouring princes in war. The generality, however, either follow the employment of plundering or hunting, the latter of which is the most common, and their principal object is the ostrich, which is here of a prodigious size, and in great abundance. Though these birds are so large, they cannot fly, yet by the fluttering of their wings, and swift motion of their feet, they will for some time elude a fast that it is difficult even for a horse to overtake them, and when they find their pursuers near, they will throw back the stones and sand on them with prodigious force: their great bulk however, at length tiring them out, they are obliged to submit, when their pursuers quickly dispatch them by cutting their throats. They eat their flesh, barter their feathers for corn and other commodities, make pendants of the talons for their ears, convert their skins into knapacks, and use their fat or oil as a medicine. They likewise eat their eggs, which they sometimes find in great abundance in the sands, where it is said the birds deposit them, and then leave them; after which such as escape the search of their enemies are hatched by the heat of the sun, and immediately provide for themselves without the assistance of their parents.

“ Who in the cruel ostrich has subdu'd
“ A parent's care, and fond inquietude?
“ While far she flies, her scatter'd eggs are found,
“ Without an owner, on the sandy ground:
“ Call out on fortune, they at mercy lie,
“ And borrow life from an indulgent sky;
“ Adopted by the sun in blaze of day,
“ They ripen under his prolific ray,
“ Unmindful she that some unhappy tread
“ May crush her young in the neglected bed.
“ What time she skims along the field with speed,
“ She icons the rider and pursuing steed.”

We mention the above generally received opinion of the ostrich's laying its eggs in the sand, and there leaving them to be hatched by the sun, in conformity to what has been said by many authors in several ages, and various nations; notwithstanding which, Kolben, in his account of the Cape of Good Hope, affirms, that they fit on their eggs like other birds, and that the male and female take it by turns; that they do not abandon their young immediately after they come out of

the

the shell, but bring them grags, and are very careful in defending them from danger.

Besides the flesh of the ostrich they likewise eat that of goats and camels, and their drink is the liquor or broth in which the flesh is boiled. They chiefly use dates instead of bread, but they have some corn and pulse which they purchase from the neighbouring countries. They have small horses that are principally used in hunting, and are very serviceable in plundering expeditions; on both which occasions the better sort are attended by their slaves, and the rest by their wives, who look after their horses, and do other the most menial services.

They call themselves Mahometans, but seem to know little either of that or any other religion; and what they do is so intermixed with superstitious maxims, that they barely deserve the name of the religion they profess. They have some schools to which they send their boys, and if they become proficient in learning, they are raised to the dignity of cadi, or priest. Some of them are artificers, but the number of these is small, as they look upon such employments in the most contemptible light; and when they think proper to cultivate a piece of land, which is seldom the case, they will not touch it themselves, but leave it to be done by their wives and slaves.

Some of them wander from one end of the country to the other with their cattle, owning no superior; others have their particular lords or governors; and a third sort are subject or tributary to the Turks, who hold some parts of this territory, as those towards the west are to Morocco and Fez. On the whole, however, they are a wild and inhospitable people, and seem to be calculated only for the desolate country in which Providence has been pleased to place them.

Within the limits of the territory of Biledulgerid are two cities, which were once famous for their splendid buildings and numerous inhabitants. The first of these is called Toufera, and is situated about 20 miles south of the confines of Tunis, in 32 deg. 28 min. north lat. and 10 deg. 26 min. east long. It is said to have been originally built by the Romans, and was fortified with high walls, some remains of which are still visible. It is at present but a poor place, containing only about 500 families, whose houses are very low and mean, but the people are said to be wealthy; and several fairs are annually held here, which are resorted to by the inhabitants of the neighbouring countries. In the center of the city runs river, one side of which is inhabited by some of the antient Africans, and the other by the Arabs, who have settled in it since the contest between the Romans and Mahometans, the latter of whom plundered and destroyed the principal part of the city. The Africans and Arabs, who now inhabit it, are frequently at war with each other; but they have such a natural disgust to any foreign government, that where they suspect the least intention of being that way enthralled by neighbouring princes, they will immediately unite, and submit to any hardships, rather than lay themselves open to the loss of independence.

Capfa, the other city, is situated in 33 deg. 15 min. north lat. and 9 deg. 3 min. east long. about 90 miles north-west of Toufera. This was also a Roman city, and was formerly surrounded with high walls, towers, &c. but they were principally demolished by the Arabs. The walls of the citadel, however, are still standing: they are built of large square stones, and are 30 feet thick, and 150 in height. It was once a very populous city, and contained many stately mosques and other magnificent structures; but it is now very poorly inhabited, and the people live in a continued state of oppression under the Tunisian government. In the center of the city is an enclosed fountain, the water of which is hot, and serves not only to baths in, but when cool, to drink. The adjacent country is fertile, and abounds with palm, citron, olive, and other fruit trees; but the climate is very unwholesome, and the inconvenience the inhabitants labour under on that account makes them naturally of a peevish temper, and so churlish, that they will not speak to a stranger with the least good humour. Both sexes go well clothed, except about their

feet, on which they wear large coarse shoes made of the skins of wild beasts, but so void of all form, that they not only disfigure them, but are also exceeding inconvenient; so that when they are in haste, they are obliged to lay them aside and travel bare-footed.

S E C T. II.

ZAARA, OR ZAHARA.

THIS amazing track of land stretches itself from the Atlantic ocean on the west, to the kingdom and desert of Barca on the east, that is, from the 8th deg. of west, to the 26th deg. of east long. and from Biledulgerid on the north, to the river Niger, which separates it from Negroland on the south. It is about 2400 miles in length, and 660 in breadth. The Arabs divide it into three parts, by the names of Cabeh, Zahara, and Afigar, which names are given in affinity to the different soils, the first signifying sandy, the second stoney, and the third marshy. Modern geographers, however, have divided it into seven provinces, namely, Zahhaga, Zuenziga, Targa, Lempta, Berdoa, Bornou, and Gagoa.

Before we proceed to any particulars relative to these provinces, it will be necessary to take a general view of the country, with respect to its soil, produce, inhabitants, &c. The soil is in general very dry and sandy, and the climate being exceeding hot, it is deficient of those essentials produced in more fertile countries. Notwithstanding, however, the general barrenness of this desert, it is said to be so healthy, that the inhabitants live to a great age, and that the people of other countries, when afflicted with illness, retire to this for the benefit of their healths, which is generally attended with the wished-for success.

The most fertile parts of this extensive desert are those that lie on the banks of the river Senegal, which being better watered and well inhabited (on account of the great commerce arising from that river), produces several kinds of grain, as wheat, barley, and millet; they have also some vegetables, and a great variety of delicious fruits.

The most useful beast here is the camel, and in some parts they have very good horses: there is also a great plenty of a domestic animal, called Adrin-naim, which are about the size of an ass, and greatly resemble that animal about the ears, but in other respects they are like our sheep. The males are only distinguished from the females by having horns, but they are both of a size, and their wool equally good. They are not only exceeding tame, but also very strong, and will carry a man on their backs for several miles, besides which their flesh is very excellent food.

Many parts of the country are greatly infested with wild beasts, as lions, tygers, &c. There are also great numbers of scorpions, vipers, and other venomous creatures; and at particular seasons they are greatly pestered with locusts, which are so numerous as to destroy the principal part of their corn and other grain.

The inhabitants are chiefly Arabs, and the generality of them very illiterate and savage: they lead a wretched desolate life, wandering about the country, and feeding on the milk of their flocks, with a little barley meal and some dates. The men go almost naked, having only a piece of linen fastened round the waist, and a kind of bonnet on their heads made of black woollen cloth; but the women have a loose garment that reaches from the waist to the knees: the better sort, however, have a kind of gown made of blue calico, with large sleeves, which are brought to them from Negroland. The men are tall and thin, but the women are in general very robust; and both sexes are of a swarthy complexion.

Their tents or huts are low and mean, consisting only of a few sticks, covered with some coarse cloth made of camel's hair, and a rough kind of wool or moss that grows on the palm-trees. They lie on mats made of rushes, but have not any covering. They have neither laws or government, being only subject to the will of their cheyks, who are appointed as superintendents, but pay

pay as little attention to any kind of decorum, as the people they are supposed to direct.

Some of them are employed in hunting, but the principal part addict themselves to thieving, and plundering such passengers as they happen to meet with in their excursions. When they travel for these purposes, or in pursuit of pasture or water, they ride on camels, which are not only useful on account of their milk, and the great burthens they carry, but also for the immediate relief they yield in case of excessive drought; for such are the amazing deserts of this country, that they frequently travel a fortnight together without meeting with any water; so that when that is exhausted which they take with them on the backs of the camels, they have recourse to the beast itself, whom they kill, and drink the water they find in its stomach; it being the nature of that animal to swallow such a quantity at one time as will serve him for many days. In some places, indeed, there are wells of brackish water, which are lined with camels bones, and covered with their skins to keep out the sand; but there is great danger in going to them, for by the violence of the winds the mountains of sand are sometimes raised to such a height that whole caravans have been buried beneath them.

The wild Arabs here are continually at war with the Negroes, whom they endeavour to take alive, in order to sell them for slaves at Fez or Morocco; for which reason, when the latter happen to obtain a conquest, they butcher, in the most cruel manner, all that fall into their hands.

In one part of these deserts, there is a sort of people who are entirely different from the rest, as they are more sociable, and live in settled habitations. These carry on a kind of commerce with strangers, to whom they are very civil, and are in general tolerably honest in their dealings. Their religion, as well as that of the wild Arabs, is chiefly Mahometanism, but so corrupted that it hardly bears any thing more than the mere name of it. Christianity was once happily established in this country, but it has been quite exterminated for several centuries. Their language is in general a corruption of the Arabic, but it differs according to the different tribes and provinces. Their only commodities for traffic are, camels, dates, and fat and feathers of ostriches.

Having thus taken a general view of the country, we shall now be more minute, by describing the most essential particulars relative to the respective provinces into which it is divided.

Zanaga, the first of these divisions, is a large territory, extending itself from the river Sae, which parts it from Morocco on the north, to that of Senegal on the south. It is bounded on the east by the territories of Serem, Sunda, and Zuegiga, and on the west by the Atlantic ocean. The inhabitants of this province are of various nations, and among them are some tribes of Arabs, who chiefly live by plunder, and carry off great quantities of their neighbours cattle; which they exchange in different parts of the country for dates. There is one district here, called Tagazza, remarkable for producing vast quantities of rock salt, which the inhabitants carry not only to all parts of this desert, but also to Negroland, as it is found to be of infinite use in scorbutic disorders, to which the people are subject from the natural heat and dryness of the climate.

This country is very dangerous to travellers, especially in summer, there not being any water to be seen for 100 miles together; so that if a proper provision is not made, they are subject to perish with thirst. In one part of this province are two tombs, on each of which is an inscription, intimating that the unhappy persons there interred were, the one a wealthy merchant, and the other a poor carrier, who both died there with excessive thirst: that the former had given the carrier 10,000 ducats for a cruise of water, and died soon after drinking it, whilst the latter perished for want of it.

The inhabitants of this province live chiefly on dates and the milk of their cattle: sometimes, indeed, they kill wild goats and other game, but these are so scarce, as seldom to be met with, and for that reason are considered as a great rarity.

The whole country is so flat and barren, that in long journies travellers have the greatest difficulty in finding their way, there not being a building, tree, or any other mark to direct them. They generally travel in the night, owing to the violent heat of the sun in the day, and they are chiefly guided by the course of the stars: sometimes, indeed, they are directed by the flight of certain birds that go backwards and forwards at particular periods, but the former is what they principally depend on; for by justly observing the regular motions of the stars, they will as readily pursue the right track, as a mariner will by the assistance of the compass.

As when the stars in their ethereal race,
At length have roll'd around the liquid space,
At certain periods they resume their place.
From the same point of heaven their course advance,
And move in meanders of their former dance.

From these observations, it is little to be wondered at that they should have a tolerable notion of astronomy; but their system of it is so replete with absurdity that it is impossible for a stranger to comprehend their meaning. However, in their own way they will describe the number, situation, and division of the stars with amazing exactness: as is fully evinced by the benefits they receive from them in travelling through these dreary deserts.

They are fond of trade and commerce, in pursuit of which they will travel to the remotest parts, though at the hazard of their lives. In these expeditions, however, they generally go with large caravans, their goods and necessaries are carried on camels, and they are otherwise so well provided, that they seldom meet with any accident on the road.

The merchandize they bring with them principally consists of gold, ivory, gum, and ostrich feathers, which they sell to the merchants of Fez and Morocco.

Zuengiza, the next province, is rather more barren than the former, and both men and beast frequently perish on their journies for want of water, particularly in that part of it called Gogden, where they travel for ten days together without meeting with any refreshment to quench their thirst, except what may casually happen to fall from the clouds. The inhabitants are a mixture of Africans and Arabs, the latter of whom receive a kind of tribute from their neighbours for tilling their land; and they have abundance of cattle, with which they wander to various parts of the desert in search of pasture. They breed a great number of horses, and are so powerful that the kings of Barbary take some pains to preserve their alliance and friendship. Their food chiefly consists of milk and dates, the latter of which are brought here in great quantities from Bledulgerid.

The Arabs of this province, like some of those in the former, are justly hated by the Negroes, whom, when opportunity offers, they will make prisoners, and send to Fez as slaves: in return for which, when they get any of the Arabs into their hands, they murder them with the greatest cruelty.

The province of Tanga is not so dry or barren as the two already mentioned; nor is it either so sultry or unwholesome. It has many good springs of water, and the land produces several sorts of herbs, and many useful vegetables. In some parts are found great quantities of manna, which the inhabitants gather in calabashes, and export it for sale. The Negroes dissolve it in the water wherein they boil their meat, which they drink, and attribute to this the superior health they enjoy to the inhabitants of Tombato, though the climate of that country is much more healthy. The Arabs and Moors, who are very numerous in this province, carry on a great trade, by catching of Negroes, and sending them as slaves to Morocco.

Adjoining to this province on the south is the desert called Zanfara, which is tolerably fertile, producing corn, rice, Turkey wheat, and some cotton. The inhabitants are tall and well shaped; but they are quite black, and their faces large, flat, and very disagreeable. This desert was subdued by one of the kings of Tom-

buto,

bato, who caused the prince of it to be poisoned, and put to death a great number of his subjects.

Lempta, the next province, is situated to the east of Targa, on the north side of the river Senegal, and is more barren than any other part through the whole desert of Zahara. It is exceeding dangerous for travellers, not only on account of the excessive heat, and scarcity of water, but also from the natural ferocity of its inhabitants, who are a wild breed of the Moors, that rob and plunder all strangers they meet with, and if any resistance is made, they murder them without the least remorse. It is the high road for the merchants and caravans that travel from Constantina and other towns of Algiers, Tunis, &c. into Negroland; and notwithstanding the great danger of the journey, such is their attachment to commerce, that they hazard their lives with the most indefatigable intrepidity.

On the eastern borders of this province is the kingdom of Agades, the soil of which produces tolerable grass, and in some parts of it are found great quantities of manna. The inhabitants feed large herds of cattle, and live chiefly in the open country, in poor, wretched huts made of reeds, and covered with mats. The capital of this kingdom, which bears the same name, is situated in 18 deg. 50 min. north lat. and 12 deg. 36 min. east long. It is surrounded with walls, and in the center of it is the king's palace, which is a poor mean building. The inhabitants are chiefly merchants and strangers, the rest are artificers, or soldiers belonging to the king, the latter of whom is tributary to the prince of Tombuto, and is dependent on a tribe called Zuiniga, who have power to depose him, if they disapprove of his government.

The province of Berdoa is situated to the east of Lempta, and extends itself from the 16th to the 22d deg. of east long. and from the 20th to the 23d deg. of north lat. The country in general is very dry and barren, not producing any commodity that merits the least notice. The inhabitants are very illiterate and savage; and live chiefly by plundering merchants and travellers. The most considerable part of this province is a place called Zala, which lies on the northern confines near the mountains that separate this country from Tripoly. It is inhabited by a people called Levata, or Lebatai, who live mostly in tents; and it produces some valuable commodities, for the sale of which a fair is annually held, and numbers of people resort to it from the neighbouring countries.

To the south of Berdoa lies the province of Bornou, which extends itself from 13 to 22 deg. east long. and from 17 to 21 deg. north lat. It is more fertile than all the other parts of this extensive desert, and the inhabitants of it are much more sociable. There are many springs and rivers in it, and the soil produces good grass, with several sorts of grain, and a great plenty of fruits. One half of it is divided into mountains and valleys, the inhabitants of which live in tents, and are of so restless a disposition, that they are continually removing from one part to another. They are chiefly husbandmen, and not making any distinction in property, enjoy the whole in common with each other. In hot weather they go almost naked, having only a small piece of cloth wound round the waist; but in winter, when the winds blow sharp from the north-east mountains, they wear a garment made of sheep-skins. In the southern parts of this province are several good towns inhabited by people particularly distinguished for their politeness and hospitality, among whom are many artificers, and some merchants of different nations. The king resides at Bornou, the capital of the province, but his palace is a very mean building, and only remarkable for its furniture, the principal part of which is of solid gold; from whence it may be conjectured that a great trade is carried on here in that article with foreign countries, or that it is found either in this, or the neighbouring provinces.

As the inhabitants of Bornou are much more rational than those in any other parts of the desert of Zahara, we shall be a little particular in noticing their methods of living, manners, customs, ceremonies, &c.

They live, as before observed, in tents or cabbins,

which are placed together in the form of a circle, and in the center is a spacious area in which they keep their cattle. As they frequently remove from one place to another, they are consequently under disagreeable apprehensions from robbers and wild beasts; and in order to guard against any surprize from either, they always keep centinels without the tents, who, if any danger appears, give an immediate alarm, which is circulated throughout the encampment, and every person able to bear arms defends his own premises. They have but little difficulty in removing from one place to another, for each tent is so lightly constructed, and their furniture so small, that the whole is easily conveyed to a considerable distance on the back of a camel.

Their chief food consists of cakes made of millet, and their usual drink is milk or whey. They have wheat and barley, but they so naturally detest staying long in one place, that it is seldom reaped by the hands that sow it. If this was not the case, such is the natural fertility of the soil, that the country would produce a great abundance of these grains, which would certainly be not only servicable but very profitable to the inhabitants, as they must consequently have considerable demands for them from foreign nations.

They sit cross-legged at their meals, on a mat made of Morocco leather or palm leaves, and the dishes that contain their food are made of copper or ivory. They eat but two meals a day, one a little after sun-rise, and the other a little before sun-set; and the women are not permitted to eat with the men. They wash after their meals, and then regale themselves by drinking coffee and smoaking tobacco.

From their temperate method of living may be ascribed the natural strength of their constitution; for they are seldom ill, and generally live to a very advanced age. The only diseases they are subject to are the dysentery and pleurisy; but these are easily cured by simples, which they administer both internally and externally.

The dress of the poorer sort consists only of a piece of cloth tied round the waist, and reaching to the knees; but the better sort wear a large shirt made of black linen, and fastened round the middle by a sash. Their heads are covered with a red bonnet, or cap edged with white cotton; and they wear sandals of Morocco leather, which rise to the calf of the leg. Both sexes wear ear-rings and pendants, as also rings on their fingers, and bracelets on their arms. The men let their hair hang low, but the women tie it up in a knot, and ornament it in proportion to their station and quality.

They circumcise their male children at the age of 14, after which they may marry as soon as they can purchase a wife. Those who have many daughters consider them as being a capital estate, for when any suitor offers himself, he must make considerable presents to the parents, as on that only depends his success. They form a judgement of the suitor's affections by his liberality, and however well the parties may like each other, the parents will not deliver up the girl till they are satisfied with the presents made by the intended husband. If he does not approve of his wife after she is delivered to him by her parents, he may return her back; but in that case he is obliged to forfeit the presents made previous to their coming together.

When any one dies, the nearest relation alarms the whole camp, who immediately assemble round the tent of the deceased, and testify their sorrow indiscriminately by the most lamentable shrieks. This continues for some time, when the body of the deceased is washed, and placed on a stool, to be publicly viewed till the grave is made, when he is carried to it, attended by his relations, and the principal people of the village. When the ceremony is over they are all return, and an entertainment is provided for the attendants by the relations of the deceased.

Gaoga, the last province we have to mention in the desert of Zahara, is reckoned to be upwards of 500 miles in length from north to south, and 300 in breadth from east to west, extending itself from the 19th to the 28th deg. of east long. and from the 12th to the 22d deg. of north lat. It is bounded on the east by Nubia, on the west by Bornou, on the north by

of the same province, and on the south by the kingdom of Gorham, from which it is separated by the river Senegal.

The country is in general exceeding mountainous, and the inhabitants little better than mere savages. They go almost naked, and their chief subsistence arises from their cattle, but they sometimes get considerable possessions by the plundering of travellers. They live in small wretched huts, made of sflight a construction, that they frequently take fire, and the whole village formed of them is totally consumed. They have no sense of religion, nor indeed of any thing else that belongs to rational beings.

The chief and only city in this province is Gaoga, situated on the north side of the lake of the same name; but it is so wretched a place, and the inhabitants so rude and illiterate, that it does not merit the least attention

SECT. III.

TOMBUTO.

THIS is a very large kingdom, and received its name from Tombuto the capital, which is situated in 2 deg. 25 min. east long. and 14 deg. 32 min. north lat. The country is very fertile, being well watered by the river Senegal, which runs through it; and when that river overflows, the water is conveyed by sluices to Tombuto. Besides this, there are many springs, the water of which is exceeding good. The chief produce is corn and cattle, great quantities of which they export to the neighbouring kingdoms, particularly to Fez and Morocco.

The inhabitants of Tombuto, the only city in this kingdom, are in general of a mild but cheerful disposition, and spend a great part of their time in singing and dancing. Among them are many artificers and manufacturers, particularly weavers of cotton cloth; and some of them, especially strangers that settle here, are said to be exceeding wealthy.

The houses of the poorer sort are made of stakes and hurdles plastered over with clay, and in their shape resemble that of a bell; but those of the better sort are built with stone, and are handsome and lofty. There are also several elegant structures, particularly a stately mosque, surrounded with a stone wall. The king's palace is also a spacious building, and the architecture exceeding beautiful. It is furnished in the most elegant manner, the principal articles in it being of solid gold; and the king keeps his court with the greatest splendor.

When the king goes abroad he rides upon a camel, and his horse is led after him by one of his principal officers. In war also he rides on a camel, but all his soldiers ride on horses. His attendants consist of 3000 horsemen, and a prodigious number of foot, who, beside other arms, have poisoned arrows. They have frequent skirmishes with those who refuse to pay tribute, and when a conquest is obtained, the captives are sold to the merchants of Tombuto. Their horses are chiefly brought from Barbary, for those bred in the country are so few, and at the same time so small, that they are only used on very trifling occasions. With these beasts, however, the king is always well provided, for when a merchant comes there with horses, he orders the best of them to be picked out, and does not hesitate to pay whatever price the merchants demand.

The king receives the greatest homage from all his subjects; and when any stranger, or ambassador from other princes, obtains an audience of him, he must prostrate himself before him, and shew his submission, by taking up the dust with his hands, and sprinkling it over his head and shoulders.

The king has such a natural antipathy to the Jews, that he will not suffer any of them to be admitted into the city, and if a merchant is known to traffick with them, he immediately orders the goods to be confiscated.

They have no coin here, but instead thereof use pieces of gold, six of which weigh an ounce, and they have shells brought from Persia, 400 of which are estimated at the value of a ducat.

The Barbary merchants bring here great quantities of European cloth, as do also the merchants of Tripoli; besides which the latter also bring glass beads, coral, paper, copper basons, and other like wares. The articles exported from hence are, dates, sena, ostrich feathers, slaves, and gold.

To the south of Tombuto is a large town, called Cobra, pleasantly situated on the banks of the river Senegal. The buildings are much the same as those at the capital, and the inhabitants are no less mild and sociable, though not quite so temperate in their living: they are subject to many diseases, that carry off great numbers, which are supposed to originate from their food, that is composed of flesh, fish, milk, butter, oil and wine; besides which they addict themselves to spirituous liquors, and sometimes drink them to great excess. In this town is a judge appointed by the king of Tombuto to decide all controversies; but the people have the liberty of appealing from his decision to the sovereign.

CHAP. III.

N E G R O L A N D.

THIS extensive country lies between 18 deg. of west, and 150 deg. of east long. and between 10 and 20 deg. of north lat. It is bounded on the east by Abyssinia and Nubia; on the west by the Atlantic Ocean; on the north by the desert of Zahara; and on the south by Guinea and the kingdom of Benin, from both which it is separated by a long ridge of mountains. Its extent from east to west is upwards of 2200 miles, and it is about 840 miles in the broadest part from north to south.

The river Niger, or Senegal, runs entirely through it, on the banks of which are several settlements belonging to the English; as also on the borders of the river Gambia.

A general description of the soil and produce of this country cannot be given, as the respective kingdoms or provinces into which it is divided, differ from each other in many particulars. We shall therefore describe them separately, according to their different situations.

SECT. I.

Of the River Gambia.

THE river Gambia lies in 13 deg. 20 min. north lat. and in 15 deg. 20 min. west lon. from whence it is little to be wondered at that the climate should be excessive hot. The sun is perpendicular twice in the year, and the days are never longer from sun-rising to sun-set than 13 hours, nor ever shorter than 11. The rainy season usually begins in the month of June, and continues till the end of September, during which the air is generally pretty cool, the winds blowing very fresh from the east.

This river is navigable for small vessels upwards of 600 miles, the tides reaching to that distance from its mouth. It is divided by a number of islands and sandbanks, and in the broadest part is about nine miles across. The land on each side is chiefly flat and woody; but

but there are some parts very open, on which the natives plant rice, and in the dry season they produce pasture for the cattle. The wild beasts consist of lions, tigers, and elephants, and in the river are great numbers of crocodiles.

The English, French and Portuguese have all settlements on this river. The chief belonging to the English is in a small place called James's Island, which lies about ten miles from the north of the river. There is also another considerable factory at Gyllifree, a large town on the north bank of the river, near the before-mentioned island; and a third at Joar, higher up the river, in the kingdom of Barfally, all which will be more particularly mentioned hereafter. The chief settlement of the French is at Albedra, between James's Fort and the mouth of the river.

The principal trade carried on here is in gold, elephants teeth, bees-wax, and slaves; the latter of whom are either prisoners taken in war, or persons stolen or condemned for crimes. The gold is of an excellent quality, and much finer than sterling gold. The ivory, or elephants teeth, called by the natives morphel, is either found in the woods, or got by hunting and killing the beasts; and the larger the teeth, the more valuable the ivory: some of them are quite white, others yellow, but the difference of colour neither adds to, or diminishes the value. Bees-wax is sold in great quantities about the river, and is made in cakes from 20 to 120 lb. weight. Gum-drag is brought from this country: it comes from a tree called pau de sangue, or blood-wood, from whence, an incision being made in the tree, it oozes out drop after drop, till several lumps are formed, which are afterwards dried in the sun.

The different kingdoms on the banks of the river Gambia are inhabited by several sorts of people, under the following appellations, viz. the Mundingoes, the Jolloifs or Jalofs; the Pholeys or Foulies; the Faloops or Faloops; and the Portuguese.

SECTION II.

Of the kingdom of Mundingoes, with an Account of the Manners and Customs of the Inhabitants.

THE kingdom of Mundingoes is much larger than any other situated on the banks of the Gambia, and the inhabitants of it are much more numerous. It was conquered by the Portuguese in the beginning of the 14th century, when some of them settled in it, and their descendants having ever since intermixed with the natives, there is little difference between them either as to their colour or shape, the former of which is quite black, and the latter thick and clumsy; but as they still retain a corruption of the Portuguese language, and as they christen and marry by the help of the priest sent annually from St. Jago, one of the Cape de Verd Islands, they consider themselves as different from the Mundingoes, as if they were really natives of Portugal; and the calling them Negroes is the greatest affront that can be offered, it being a term they only use for slaves.

This kingdom is of considerable extent, but its exact distance cannot be ascertained. The natives are quite black, and have very disagreeable features, their lips being exceeding thick, and their noses remarkably broad and flat. In their dispositions they are rational and humane, and are particularly civil to strangers. They are in general very brisk and lively; but if affronted, are impetuous and revengeful; nor can any quarrel be adjusted otherwise than by the destruction of one or other of the parties.

They have a great sense of pride, the better sort keeping a prodigious number of slaves; but they treat them in so humane a manner, that it is sometimes difficult to know the servant from the master; they are frequently much better clothed, particularly the females, who are ornamented with necklaces, bracelets, and ear-rings, made of coral, amber, and silver, to a considerable value. Several of the natives have many slaves born in their families; and though in some parts of Africa these are sold, yet in Mundingoes it would be thought not only indifferet, but very wicked; nor is

ever any family slave sold, except for such crimes as would have authorized its being done had he been free. Indeed if there are many slaves in the family, and one of them commits a crime, the master cannot sell him without the joint consent of the rest; for if he does, they will desert him, and seek protection in another kingdom.

In most of the towns of this kingdom they have a kind of drum of a very large size, called a tang-tong, which they only beat on the approach of an enemy, or on some very extraordinary occasion, to call the inhabitants of the neighbouring towns to their assistance; and when this is beat in the night-time, it may be heard at the distance of six or seven miles.

When any European is ill treated by the natives, he applies to the alcaid, or head man of the town, who is appointed to do justice on such occasions; he is called the white man's king, and has otherwise great power; he also decides all quarrels, and has the first voice in all conferences relative to public transactions.

In this, as in the other kingdoms, there are several persons called Lords of the soil, and are considered as kings in the respective towns where they reside; to them belong all the palm and ciboa trees, which are here in great abundance; and no one dare use any leaves, or draw any wine from them, without first obtaining their consent. Those who have the liberty of drawing the wine, acknowledge the obligation by giving two days produce in a week to the lord of the soil; and white men are under the necessity of making a small present to them before they can cut leaves or grafts to make coverings to their houses.

As this is the most proper place, we shall make a small digression, to admit a description of the palm and ciboa trees. The palm-tree is very strait and smooth, and some of them grow to the height of 100 feet. From the trunk of the tree the natives extract a liquor called palm-wine, which in colour greatly resembles whey: to effect this they make an incision at the top of the trunk, to which they apply gourd bottles, and into these the liquor is conveyed by means of a pipe made of leaves. The wine is very sweet in its taste, and if drank as soon as drawn is very purgative, but if kept two or three days, it ferments, grows strong, and becomes not only palatable, but also very wholesome.

The natives climb these trees with surprising agility, the manner of doing which is thus: they take a piece of the bark of a tree, formed in the shape of a hoop, with which they enclose themselves and the tree, the hoop being afterwards secured; they then fix the hoop under their arms, and resting their back against it, and their feet against the tree, they climb up with surprising expedition. Sometimes indeed they meet with a fatal accident, which either arises from their missing their step, or the bark on which they rest not being properly secured.

The ciboa, or palmetto tree, greatly resembles the palm-tree, and runs also to a very considerable height; the wine extracted from it tastes something like that from the palm-tree, but not quite so sweet; and of the leaves, which grow on the top, they make coverings to their houses.

We shall now take some notice of the buildings, dress, customs, ceremonies, religion, &c. of the natives of this country.

With respect to their buildings, especially those of the common people, they are very low and mean, of a conical form, and have not any other light than what is admitted by the door, which is so low that they are obliged to stoop in entering it; they are formed of a kind of wicker-work, plastered over with earth, and covered on the top with leaves of the palm-tree.

Their furniture consists only of a few common necessities, such as earthen vessels for their food, wooden bowls, plates, dishes, &c. they have neither chairs, tables, or beds, a mat supplying the place of all three; for on that they sit, eat, and sleep. Among the better sort, indeed, the master of the house is distinguished by having a bed, which consists of a kind of hurdle laid upon pieces of wood, and elevated about two feet from the floor; on the top of it is laid a mat, on which they

they sleep, but without sheets, or any kind of covering.

Their principal food is rice, pulse, and Indian corn, which they mix with boiling water, or broth made from the flesh of crocodiles; they like the latter the best, and are not only fond of the flesh of the crocodiles, but also their eggs; their greatest dainty, however, is fish dried in the sun, or smoked, and the more it stinks the better they like it; in short, they are far from being delicate in their appetites, as they will not only eat what is already mentioned, but also snakes, monkeys, alligators, or any other thing chance throws in their way. Their common drink is water, but they sometimes use palm-wine and mead, and, if they can meet with it, they will not refuse rum and brandy. They make two meals a day, one about noon, and the other in the evening. They sit at their meals, and take up the victuals with the fingers of the right hand only, considering it indecent to touch either their food or lips with the left.

The poorer sort go almost naked, having only a piece of linen fastened round the waist with a girdle, in which they always carry a long knife. The better sort wear a kind of shirt, with drawers made of cotton, and they have also sandals to their feet, which are fastened on the instep with strings. Some of them have a sword slung over the right shoulder; others carry a long dart, and some of them have bows and arrows.

The dress of the women consists of a piece of cotton tied round the waist, from whence it reaches to the knees. The upper part of the body is naked, but, by way of ornament, it is stained or painted with figures of various colours. Some, indeed, have a loose piece of cotton thrown over their shoulders, but that is considered as a particular extravagance. The pride of both sexes is most conspicuous in a large bunch of keys, which they all wear hanging at the end of their girdles.

In this, as in most other hot countries, the people marry their daughters very young; some of them are even contracted as soon as born, and the parents can never after break off the engagement; the men, however, can refuse accepting them when at a proper age; neither dare the girl marry any other without his consent. Before a man takes his wife, he is obliged to make a present to her parents of 200 cola (a fruit that grows in the inland parts of the country, and somewhat resembles a horse chestnut) two iron bars, and two cows.

When a man takes home his wife, he makes a grand entertainment, to which those who think proper come without the ceremony of a formal invitation. The bride is brought on mens shoulders, with a veil over her face, which is not removed till the marriage is properly consummated; and during this time the company sing, dance, and exhibit every kind of the most ridiculous mummery.

Every man is allowed to take as many wives as he pleases; and if he finds any one of them false, he has the liberty of selling her as a slave. If any dislike arises, he may turn off his wife, and make her take all her children with her, unless he is inclined to keep any of them himself, in which case he generally chooses such as are able to assist him in the business he follows. He has also the liberty of going any time after they have parted, and taking from her such other children as he thinks proper.

The women pay such distinguished respect to their husbands, that it business calls them a day or two from home, when they return, their wives salute them on their knees; and they shew their humility by always placing themselves in that posture when they give them drink, either at their meals, or at any other time. A new-born child is dipped in cold water several times in the day, at each of which, after having dried up the water with a cloth, they rub it over with palm oil, particularly the back bone, small of the back, elbows, neck, knees and hips. When born, they are of an olive complexion, and sometimes do not become black till they are two months old. They are not born with flat noses, but, as that shape is greatly admired, their mothers, or nurses, whenever they wash them,

press down the upper part of their nose with their fingers, and, from its natural tenderness at that time, the comprellure has the wished-for effect.

They give them a name about a month after they are born; and the only ceremony attending this is, shaving the head, and rubbing it well over with palm oil.

A short time before the commencement of the rainy seasons, they circumcise their male children, who, after the ceremony is over, wear a peculiar habit adapted on the occasion. From the time of circumcision to that of the rains, they have the privilege of committing any kind of outrage without being called to account; but when the first rain begins, they must lay those follies aside, throw off the dress of circumcision, and put on the common habit of the country.

When any one dies, all his friends and acquaintance come and cry over him for two days; and such of his relations as are not on the spot, when they hear of it, though at a considerable distance, will testify the same kind of lamentation as if they were really present with the deceased. When they bury the corpse, they dig a hole about seven feet long, three deep, and about two feet in breadth. The body is wrapped in white cotton cloth, and at the time it is put into the grave, the whole assembly bow, and give one universal shriek. After the corpse is deposited, they lay sticks across the grave, even with the surface of the earth, on which they place straw, or the leaves of trees, so thick as to prevent the mould from getting into the grave, and on the top of these they lay the earth, which they trample hard down with their feet.

We have before observed, that the women here are under the greatest subjection to their husbands, the latter of whom, to render their power as complete as possible, compel them to obedience by all the force of fear and terror. For this purpose they have a figure about eight feet high, made of the bark of trees, and dressed in a long coat, with a whip of straw on the head, made in the form of a cap. It is called a Mumbo Jumbo, and when any controversy arises between a man and his wife, this strange figure is sent for to determine the dispute, which generally terminates in favour of the man. The best account, however, we meet with of the use of this singular bug-bear is thus given by Mr. Moore, in his Travels into the inland parts of Africa.

"When this figure, says he, is used, one who is in the secret, conceals himself under the coat, and bringing in the image, is the oracle on these occasions. No one is allowed to come armed in his presence. When the women hear him coming, they run away, and hide themselves; but if you are acquainted with the person concealed in the Mumbo Jumbo, he will send for them all to come, make them sit down, and afterwards either sing or dance, as he pleases; and if any refuse to come, he will send for, and whip them. Whenever any one enters into this society, they swear in the most solemn manner never to divulge the secret to any woman, or to any person that is not entered into it; and to preserve the secret inviolable, no boys are admitted under sixteen years of age. The people also swear by the Mumbo Jumbo, and the oath is esteemed irrevocable. There are very few towns of any note that have not one of these objects of terror, to frighten the poor women into obedience."

The fatal effects of revealing the secret by any one who has been admitted into the society, particularly to a woman, appears from the following story related by the same gentleman: "About the year 1727, says he, the king of Jagra having a very inquisitive woman to his wife, was so weak as to disclose to her this secret, and she being a gossip, revealed it to some other women of her acquaintance. This at last coming to the ears of some who were no friends to the king, they, dreading lest if the affair took vent, it should put a period to the subjection of their wives, took the coat, put a man into it, and going to the king's town, sent for him out, and taxed him with it; when he not denying it, they sent for his wife, and killed them both on the spot. Thus the poor king died for his complaisance to his wife, and she for her curiosity."

The Mundingoes have a language peculiar to themselves, which is more generally spoken on both sides the river than any other; one who is well acquainted with this language, may travel from the mouth of the river quite to the country of the Joncoes, or Merchants, so called from their buying yearly a vast number of slaves, and bringing them to the lower parts of the river for sale. They have also a corrupt kind of Portuguese, which is generally used by the natives when they trade with the Europeans.

They are chiefly Mahometans, and preserve many maxims of the most superstitious nature. When an eclipse of the moon happens, they believe it is occasioned by a large cat putting one of her paws between the earth and the moon; and during the time of its progress, they pay reverence to Mahomet.

They keep their sabbath on the Friday, when they pray three times, but on the other days of the week only twice. They have neither temples nor mosques, but are summoned to their devotions under the shade of a large tree by their marabuts, or priests, of which there is one to every village.

They pay the greatest reverence to their priests, inasmuch that if persons of the first distinction happen to meet with one of them, they immediately form a circle round him, and falling on their knees, solicit his benediction. From their superstitious notions they have such faith in their priests, that if they can but obtain a charm, or, as they call it, a grisgris, they think themselves secure from every kind of danger. This grisgris consists of nothing more than a few Arabic characters drawn on a piece of paper, or the figure of lizards, serpents, or some other animal, which they wear about them as the most valuable possession. They have such an opinion of the utility of this supposed charm, that the poorest Negro will not be without it; and he is particularly careful to have it about him whenever he engages in any hazardous enterprise, as supposing it a preventative to every danger; however, when it happens to prove ineffectual, which is sometimes the case, the marabut attributes it not to any defect in the charm, but to the bad conduct of him who possessed it. The priests reap considerable benefits by the sale of these charms, as they fix the price in proportion to the circumstances of the purchaser; and some of them carry on the richest commerce of the country, not only by trading largely in these articles, but also in gold and slaves.

On the borders of the kingdom of Mundingoes are a sort of people called Floops, who are in a manner wild, and inveterate enemies to their neighbours. Their country is of considerable extent, but they have not any king, and are entirely independent of each other; notwithstanding which, they are so numerous that the Mundingoes, with all their force, cannot conquer them. Their towns are surrounded by a kind of fortification made of sticks drove in the ground close together, and covered with clay. They have the character of being very grateful when they receive any favour; but if any injury is offered them, they will never forgive, or suffer it to pass unrevenged.

SECT. III.

Of the Gum Desert, and the Countries inhabited by the Jolloiffs and Pholeys; with a particular Account of one Job Ben Solomon, a Native of the Pholey Kingdom, who came to England, and had great Honours conferred on him by the Royal Family, Nobility, &c.

THE Gum Desert is situated about 100 miles above Fort St. Lewis, and is the place where the trade is carried on with the Moors. It is a large plain surrounded at a considerable distance by hills of red sand, and so barren that it produces only a few straggling shrubs. Near the side of the river is a large palmetto-tree; and there are a few huts built by the French to secure their merchandize from the depredations of robbers: they are surrounded by a ditch six feet in breadth, and encompassed with a kind of rampart and pallisadoes. This part of the country may properly be called the Desert, for it is generally destitute of inhabitants, and

is only visited at such times as the Moors have an opportunity of bringing gum to sell to the French, who then go down to it, and purchase what they bring, however great the quantity.

About 20 miles to the east of this desert, is a place called Engerbel, where the king of the Jolloiffs has his palace, which consists only of a large number of huts, built much like those of the other Negroes, but only more spacious. They are inclosed with pallisadoes made of reeds, and in the center is an open place well planted with trees, round which are the king's store-houses, stables, and apartments for his women and officers. The gate that leads to the palace is always guarded by a number of Negroes, who are relieved at certain times, and are armed with pistols and sabres.

The whole country, from the northern bank of the river Gambia, to the lake Cajor, is called in general the kingdom of the Jolloiffs, though divided among several petty princes. Its extent from north to south is about 300 miles, and from the sea-coast eastward it is near 400 miles.

The Jolloiffs, or people who inhabit this country, are blacker than the Mundingoes, and much better featured, their noses not being so broad, nor their lips so thick. Their dress consists of a loose garment made of callico, which reaches from the shoulders to the knees, and is fastened about the middle with a girdle agreeably ornamented. Both sexes are fond of decorating their hair, wearing rings in their ears, and bracelets on their legs and arms.

The men are naturally courageous, and addicted to arms; notwithstanding which they are good-natured, modest, and hospitable, particularly to strangers. No one, except the king, is allowed to sleep under tendres, (that is, cloths to keep off flies and musketoes) on pain of being sold as slaves should it come to the knowledge of the king. Those also are subject to the same punishment, who presume to sit on the same mat with the royal family, unless licenced so to do.

The power of the king is absolute, and the greatest respect is paid to him and his family; for when any one comes into their presence, they must immediately prostrate themselves with their faces to the ground.

The manners, customs, ceremonies, religion, &c. here, are much the same as in the kingdom of Mundingoes; and therefore it is needless to tire the reader with a repetition of them.

Adjoining to the kingdom of the Jolloiffs lies that of the Pholeys, or Foulies, many of the natives of which are dispersed in the different kingdoms and provinces throughout the whole country of Negroland. This kingdom extends along the river Gambia, from east to west, near 600 miles; but its distance from north to south cannot be ascertained with any certainty, that part of it being so desolate as to be little known.

The Pholeys are not so black as the Jolloiffs, but are rather of a tawny complexion, and greatly resemble the Arabs, whose language they generally speak, though they have one peculiar to themselves. The men are of a middling size, well shaped, and have good features; but the women are very short, and at the same time remarkably thin. They are all naturally of a weak constitution, notwithstanding which they are very assiduous in their professions, which principally consist in taking care of their cattle, and cultivating their lands. They live in herds or clans, and form their buildings on such a construction, that they are easily removed from one place to another. Their country is very fertile, and produces plentiful crops of large and small millet, cotton, tobacco, pease, rice, and other pulse. Their goats and sheep are exceeding fine, and their oxen so large, that the French buy up all their hides at a very great price. They are very fond of European merchandizes, and treat the traders that bring them with great civility. They use a variety of musical instruments, and are great lovers of dancing. The dress of both sexes consists of a kind of wrapper made of several slips of cotton, which is fastened round the waist, from whence it reaches to the knees; and they adorn their arms and legs with bracelets of amber, gold, pearls, and glass beads of various colours. Their houses are of a round form,

form, terminated by a cone: they are built in rows at some distance from each other, and are placed with great uniformity. They plant tobacco near their houses, and round their towns they plant cotton, beyond which are their corn-fields. The corn is of four sorts, viz. maize, or Indian corn, rice, and the larger and lesser Guinea corn, the latter of which is called by the Portuguese manfroke. They make no bread, but thicken liquids with the flour of the different grains. The maize they mostly use when green, and the rice they boil in the same manner as is practised by the Turks. They make flour of the Guinea corn and manfroke, and sometimes of the two former species, all which they accomplish by beating it in wooden mortars. The women that live among the Europeans make cakes of the flour, and convert it to such other uses as are generally practised in England.

The Pholeys are very temperate in their living, and remarkably industrious and frugal: as they raise much more corn and cotton than they consume, they sell it at a reasonable rate to strangers, to whom they are very civil and hospitable. They also supply the wants of their neighbours; and have been even known to distress themselves in assisting the Mundingoes, who in some bad seasons, would have otherwise been exposed to the ravages of dreadful famines.

Notwithstanding they are remarkable for the mildness of their temper, yet they are far from being deficient in courage, for they are as brave as any people in Africa. Their arms consist of the lance, bows and arrows, short cutlasses, and muskets, all which they use with great alertness.

They frequently remove their towns from one place to another, but commonly chuse a spot near the Mundingoes, who think themselves happy in having such useful neighbours; and indeed there is hardly any Mundingoe town of note up the river, that has not a Pholey town near it.

They are very expert in the management of cattle, and are excellent hunters: they not only kill lions, tigers, and other wild beasts; but they also go in companies together to hunt elephants, whose teeth they sell, and the flesh they dry in the same manner as bacon is cured in England.

Most of them speak the Arabic language; and in their religion they are strict Mahometans, for hardly any of them will drink brandy, or other spirituous liquors. In some particulars they are very superstitious; for if they know any person to have boiled milk they have bought of them, they will never after supply them again with that commodity, from a notion that by so doing they have greatly injured the beast.

The king of the Pholeys is very powerful, and not only receives homage from the king of the Jolloiffs, but all the great men of that kingdom are his vassals, and pay him every fourth year a tribute of a certain number of slaves, and as many oxen. He keeps a standing force of cavalry, and his infantry are armed with sabres, lances, and bows and arrows. The governors, or principal men of his kingdom, are dispersed in the several parts into which it is divided, and they are obliged, when commanded by the king, to join their forces with his; in which cases they have a right to make slaves of all the Negroes they meet with in their march, though the king has not that liberty over any of his subjects, unless they are convicted of some capital offence.

The most distinguished places in the kingdom of the Pholeys are as follow:

Queda, a village situated on a small river that runs from the lake Cajor into the Senegal; and Cajor, another village, which receives its name from the said lake. These two places have each their particular lord, who are vassals to the king of the Pholeys.

To the east of Queda is a place called Terrier Renge, and is famous not only for the gum-trade, but also for elephants teeth, hides, ambergris, and the feathers of ostriches.

Farther to the east from this is another trading place, called Hovalalde, situated on the southern bank of the Senegal. The whole country between these two places is exceeding pleasant, being laid out in large meadows,

which are very fertile, and abound with the best of cattle.

Guiorel is a large village, situated about 60 leagues from Hovalalde; it is the trading place of the sircie, or king of the Pholeys, though he has not any house there. His palace, or place of residence, is situated about 30 miles to the north-east of this village, near a large river, that swells much at the same time as the Senegal, and overflowing its banks forms a large marsh, where, after the waters are dried up, the Negroes plant rice, millet, pulse, &c.

About eight miles from Guiorel, towards the north-east, is Boucar, another considerable village, which belongs to the eldest son of the king of the Pholeys; it is situated on a hill in the center of a large plain, where the wind blows from all quarters, which renders the climate serene and wholesome. The whole country is well cultivated, and, besides other things, produces a great quantity of cattle. The inhabitants are numerous, and carry on a good trade with their neighbours.

The last place of any note in this kingdom is Laca, situated about 12 miles north of Guiorel; it is a very considerable village, and belongs to a near relation of the king, who is called lord of this part of the country. His huts or habitations are at some distance from the village, situated on a rising ground, planted with lofty trees that secure them from the violent heat of the sun. The whole buildings consist of three spacious courts, the first of which contains stables for several kinds of cattle, and is enclosed on three sides with reeds and thick briars; in the second court are the lord's huts, those of his wives, and of some of his servants; the rest have huts in the third court, where there are also others used as warehouses. Between Guiorel and Laca are several other villages, which almost join each other; and the whole country in this part is very populous, and well cultivated.

It may not be improper, before we quit this section, to admit a remarkable story of one Job Ben Solomon, of the race of the Pholeys, and son to the high priest of Bundo, in Forta, who was sold as a slave, came to England, and received distinguished honours from the royal family and nobility; the circumstances attending which we shall take from Mr. Moore, who particularly describes them, and whose relation must be the most genuine, as he was in company with him after his return to his own country.

In the year 1731, as this person was travelling on the south side of the Gambia, with a servant, he was robbed and seized by order of the king of a country a little within the land, who sold both him and his man for slaves to one captain Pyke, who sailed with them to Maryland. The Pholeys, his humane countrymen, would have redeemed him, had he not been carried out of the river before they had notice of his being a slave. Job, on his arrival at Maryland, was sold to a planter, who, finding he had very distinguished abilities, treated him with great respect; and at the expiration of twelve months, Job had the good fortune to have a letter of his own writing, in the Arabic tongue, conveyed to England. This letter coming to the hands of Mr. Oglethorpe, he sent it to Oxford to be translated; which being done, it gave him such satisfaction, and inspired him with so good an opinion of the author, that he immediately sent orders to have him bought of his master. This happened a little before that gentleman's setting out for Georgia; and before his return from thence Job arrived in England, where, being brought to the acquaintance of Sir Hans Sloane, he was found to be a perfect master of the Arabic tongue, by his translating several manuscripts and inscriptions on medals. Sir Hans Sloane recommended him to the duke of Montague, who being pleased with his genius and capacity, the agreeableness of his behaviour, and the sweetness of his temper, introduced him to court, where he was graciously received by the royal family, and most of the nobility, who honoured him with many marks of their favour. After he had continued in England about 14 months, he determined to return to his native country, from an earnest desire he had to see the high-priest his father. On his leaving England he received many noble presents

presents from her majesty queen Caroline, his royal highness the duke of Cumberland, the duke of Montague, the earl of Pembroke, several ladies of quality, and the royal African company; the latter of whom ordered their agents to shew him the greatest respect.

He arrived at James's Fort on the 8th of August 1734, at which time Mr. Moore, then employed in the service of the African company, was at that place, and finding the vessel came from England, he immediately went on board. What followed after the first interview was over between Mr. Moore and Job, is thus described by the former:

"Job, says he, desired that I would send a messenger to his country to let his friends know where he was. I spoke to one of the blacks whom we usually employed, to procure me a messenger, and he brought me a Pholey, who not only knew the high priest his father, but Job himself, and expressed great joy at seeing him returned from slavery, he being the only man, except one, ever known to come back to his country, after being once carried a slave out of it by white men. Job delivered him the message himself, and desired that his father should not come down to him, observing that it was too far for him to travel; and that it was fit the young should go to the old, and not for the old to come to the young. He also sent some presents to his wives, and desired the man to bring his little one, who was his best beloved, down with him.

"Job having a mind to go up to Joar, to talk to some of his countrymen, went along with me. We arrived at the creek of Damofeni, and having some old acquaintances at the town of that name, Job and I went there together. In the evening, as we were sitting under a great tree, there came six or seven of the very people, who three years before had robbed and made a slave of him, at about 30 miles distance from that place. Job, though naturally possessed of a very even temper, could not contain himself on seeing them; he was filled with rage and indignation, and was for attacking them with his broadsword and pistols, which he always took care to have about him. It was with great difficulty I could dissuade him from rushing upon them; but at length representing the ill consequences that would infallibly attend for rash an action, and the impossibility that either of us should escape alive, I made him lay aside the attempt, and persuaded him to sit down, and pretending not to know them, to ask them questions about himself; which he accordingly did, and they told him the truth. At last he enquired how the king their master did; they replied that he was dead; and by farther enquiry we found, that amongst the goods for which he sold Job to captain Pyke, there was a pistol, which the king used commonly to wear slung by a string about his neck; and as they never carry arms without their being loaded, the pistol one day accidentally went off, and the balls lodging in his throat, he presently died. Job was so transported at the close of this story, that he immediately fell on his knees, and returned thanks to Mahomet for making his persecutor die by the very goods for which he sold him into slavery. Then turning to me, he said, 'You see now, Mr. Moore, that God Almighty was displeas'd at this man's making me a slave, and therefore made him die by the very pistol for which he sold me: yet I ought to forgive him, because had I not been sold, I should neither have known any thing of the English tongue, nor have had any of the fine, useful and valuable things, I have brought with me; nor have known that there is such a place in the world as England; nor such noble, good, and generous people as Queen Caroline, the duke of Cumberland, the duke of Montague, the earl of Pembroke, Mr. Holden, Mr. Oglethorpe, and the Royal African company.

"After this Job went frequently with me to Cower, and several other places about the country. He always spoke very handsomely of the English; and what he said removed much of that horror the Pholeys felt for the state of slavery amongst them; for they before generally imagined, that all who were sold for slaves, were at least murdered, if not eaten, since none ever returned. His descriptions also gave them an high opinion of Eng-

land, and a veneration for the English, who traded amongst them. He sold some of the presents he brought with him for trading goods, with which he bought a woman slave and two horses. He gave his countrymen a great deal of writing paper, a very valuable commodity amongst them, and the company had made him a present of several reams. He used frequently to pray, and behaved with great affability and mildness to all, which rendered him extremely popular.

"The messenger whom Job had sent to his father, &c. not returning so soon as was expected, he desired me to go down to James's Fort to take care of his goods, and I promised not only to send him word when the messenger came back, but to send other messengers, for fear the first should have miscarried.

"At length the messenger returned with several letters, and advice that Job's father was dead; but had lived to receive the letters his son had sent him from England, which gave him the welcome news of his being redeemed from slavery, and an account of the figure he made in England. That one of Job's wives was married to another man; but that as soon as the new husband had heard of his return, he thought it advisable to abscond; and that since Job's absence from his native country, there had been such a dreadful war, that the Pholeys there had not any cows left, though before Job's departure his country was famed for its numerous herds. With this messenger came many of Job's old friends, whom he was exceeding glad to see; but notwithstanding the joy their presence gave him, he shed abundance of tears for the loss of his father, and the misfortunes of his country. He forgave his wife, and the man who had taken her; 'for,' said he, 'he could not help thinking I was dead, for I was gone to a land from whence no other Pholey ever yet returned; therefore neither he nor the man are to be blamed.' During three or four days he conversed with his friends without any interruption, except to sleep or eat."

When Mr. Moore embarked on board the company's vessel for England, Job waited on him to take his last farewell, which he did in the most affectionate manner. At the same time he gave him letters to the duke of Montague, the royal African company, Mr. Oglethorpe, and several other gentlemen in England, telling him to give his love and duty to them, and to acquaint them that as he designed to learn to write the English tongue, he would, when he was master of it, send them longer epistles. He also desired Mr. Moore, that as he had lived with him almost ever since he came there, he would let his grace and the other gentlemen know what he had done, and that he would endeavour to produce such an understanding between the African company and the Pholeys, that he did not doubt would be of great advantage to the English; and concluded by saying, that he would spend his days in endeavouring to do good to the English, by whom he had been redeemed from slavery, and from whom he had received innumerable favours.

S E C T. IV.

Of the European Settlements, and other particular Places, situated on the Banks of the River Gaamba.

THE principal settlement here belonging to the English is at James's Island, situated near the center of the river, which is here at least seven miles wide, and about 30 miles from the river's mouth. The island, at low water, is about three quarters of a mile in circumference. Though this island belongs to the English, yet it is subject to a small tribute paid annually to the king of Barrah. The fort is a square stone building, with four bastions, on each of which are seven guns well mounted. Under the walls, facing the water, are two round batteries, on each of which are four large cannon; and between them are planted small guns. Within the fort are convenient apartments for the governor, merchants, factors, and military officers; as also magazines and store-houses. Without the walls of the fort are strong barracks for the soldiers, artificers, servants, and slaves; they are made with stone and lime, and are surrounded with strong paliadoes. As a

proper

proper security to the fort, the soldiers are constantly on duty; and centinels are appointed night and day to patrol round it, and make their report to the governor. They generally keep here three or four sloops and as many long boats; some of which are constantly employed in fetching provisions and water from the main, for the use of the garrison, and the rest are employed in carrying goods up to the other factories, and bringing from them slaves, elephants teeth, and wax.

A little below James's Fort is a large town called Gillifree, where the company have a factory pleasantly situated; and here are large gardens that supply James's Fort with all kinds of vegetables. This town is inhabited by Portuguese, Mundingoes, and some Mahometans, the latter of whom have a neat mosque for the exercise of their religious duties.

Opposite to James's Island, on the north side, and about a mile and a half from Gillifree, is a small place called St. Domingo, consisting only of a few round huts belonging to the company, in which some of their slaves live, who cut wood for the fort, take care of a well, and fill the casks sent there daily for water.

Nearly opposite to the south side of James's Island, is another factory belonging to the English, situated on a river called Cabata, which falls into the Gambia; but little trade is carried on here, the chief use of the factory being to supply James's Fort with provisions.

About 20 miles above James's Fort is another English factory, at a town called Vintain, situated on a river of the same name, which also falls into the Gambia. The chief commerce of this factory consists in hides, ivory and wax. The town belongs to one of the kings of Fonia, and is pleasantly situated on the side of a hill near the river. The inhabitants consist of Portuguese and Mahometans, the latter of whom have a handsome mosque. The town is remarkable for having plenty of provisions, great quantities of which are brought by the Sloops who border on it. The people of this town are remarkably proud of their hair; some of them wear it in tufts and bunches, others cut it in crosses, and some string coral or beads upon it. The men wear a cloth round their waist, which reaches to the knees, and they have another cloth thrown over the right shoulder: on their heads they wear caps of cotton cloth, some of which are plain, and others adorned with feathers and goats tails. The dress of the women consists of a piece of cloth wound round the waist, and reaching to the small of their legs; they tie handkerchiefs round their heads leaving the crown bare, which some of them ornament with small horse-bells; and those who have not handkerchiefs supply their place by using a slip of blue or white cotton cloth.

Their huts are about 50 feet in circumference, built with sticks and clay, and covered either with long grass or palmetto leaves. Their furniture consists only of a small chest for cloaths, a mat to lie on, which is raised about a foot from the floor; a jar to hold water, and a callabash to drink it with; two or three wooden mortars, in which they pound their corn and rice, and a few large dishes, out of which they eat their food with their fingers, not having either spoons, knives, or forks.

They are very fond of smoking tobacco, which is of their own growth; and some of them, by being furnished with this article, will go two days together without eating. They make their pipes themselves, the bole of which is formed of a reddish-coloured clay, but the stems are only a piece of a reed, or a small stick bored through with a hot iron wire, and some of them are six feet in length. After they are bored, they polish them with rough leaves, till they are smooth, white and handsome. They fasten the bole and stem together with a piece of red leather, and sometimes the pipe is ornamented with a fine leather tassel that hangs from the center of it.

The kingdom of Fonia, in which this town is situated, begins where Cabata river falls into the Gambia, and reaches to the river Vintain. It is governed by two kings, who have each their separate districts; but it has not any particular place, except the town already mentioned, that admits of the least notice.

The next factory belonging to the English is at Tan-crowall, in the kingdom of Caen, situated about 35 miles from James's Fort. The town is about half a mile in length, pleasantly situated by the side of the river, and behind it is a fine hill beautifully variegated. It is divided into two parts, one of which is inhabited by Portuguese, and the other by Mundingoes. The former live in large square buildings, and the latter in round huts made of sticks and clay; they are about eight feet high and 20 in diameter, with a roof like that of a bee-hive, made either of straw or palmetto leaves, and so thick as not only to keep the rain from penetrating through, but also to secure them from the violent heat of the sun. This town is the residence of a priest annually sent over from St. Jago, one of the Cape de Verd Islands, who has a church here, in which, during his residence, mass is said almost every day. Here are many of the descendants of the Portuguese, who send canoes up the river once or twice a year; by which means they have made this town a place of great resort, and the richest on the whole river.

The kingdom of Caen reaches about 70 miles along the river, and is governed by an emperor and a king, who are both Mundingoes, and have their respective revenues arising from different commodities.

The next kingdom we come to is Barfally, which is a very noted country, governed by a king of the Jolloiff nation; and here the English have also a factory at a town called Joar, where they carry on a very considerable trade. This town is situated in a fine savannah surrounded with woods, in which are most kinds of wild beasts. It is about two miles from the Gambia, and is inhabited by a few Portuguese. It is very small, the whole number of houses not exceeding twelve; among these are included the factory, and a house belonging to the king of Barfally, which two take up more ground than all the other buildings. About a mile from the town is a ridge of high and rocky hills covered with trees, which runs many miles up the country. It is very pleasant walking on these hills in the summer; but in the rainy seasons it is exceeding dangerous from the wild beasts, who resort there in great abundance on account of the low grounds being overflowed. About the savannah are plenty of deer, buffaloes, and wild hogs; also a great number of partridges, geese, ducks and quails, which are exceeding good, and greatly admired by the natives. Here are likewise camelleons, and great numbers of crocodiles, which the people kill and eat, and consider them as one of their nicest dishes.

About 80 miles from the English fort at Joar is a place called Cohone, where the king of Barfally usually resides. As there are tolerable advantages to be made by the company at this place, provided their supercargoes are honest, they generally send a sloop there two or three times in the year. At these times the king frequently ransacks some of his enemies towns, makes prisoners of the people, and sells them for such commodities as he wants, which are commonly brandy or rum, gunpowder, balls, guns, pistols, and cutlasses for his attendants and soldiers, and coral and silver for his wives and concubines. The king, as well as his people, are of the Mahometan religion, notwithstanding which they are greatly addicted to drunkenness. The dress of the king consists of a garment made like a surplice, but reaches no lower than his knees, and a large piece of cloth gathered round his waist: he wears no stockings, and has only Morocco slippers on his feet. His head is covered with a small white cotton cap, and he wears large gold rings in his ears. His people as well as himself always wear white cloths and white caps, which being a direct contrast to their natural colour makes them look exceeding whimsical. This king's dominions are very extensive, and divided into several provinces, over which he appoints governors, called Boomays, who come annually to pay him homage; and though they have almost an unlimited power, yet they are beloved as well as feared by the people.

Adjoining to the kingdom of Barfally eastward, lies the country of Yany, which is very large, and divided into two parts, distinguished by the names of Upper

and Lower, each of which is under the government of a different king, the one a Mundingo, and the other a Jolloiff. In the Lower Yany the company have a small factory at a place called Yanamarew, which is kept by a black factor, whose only business is to buy corn and rice for the use of James's Fort. This is the pleasantest fort on the banks of the river, it being delightfully shaded with palm and cibera trees, the leaves of which the inhabitants use for covering their houses.

In the Upper Yany is a small town called Cuttejarr, situated about a mile from the river, between which the company had once a factory; but it being overflowed in the year 1725, and great quantities of goods destroyed, they removed it to Bany, about eight miles farther, where it has continued ever since. This town is about twelve miles from the mouth of the river, and is noted for a good trade, particularly in slaves.

Higher up the river is the factory of Fatadenda, at which place the river is exceeding broad, and deep enough to admit vessels of 40 tons burthen. The sides of the river are woody, and the land low, but the factory stands on an eminence, and is at least ten miles from any town. On each side of the factory is a pleasant prospect of the winding of the river for several miles, and in the front of it is an agreeable view of part of the kingdom of Cantore. The port here serves for a landing-place to Suteco, a town about nine miles distant; but it has not any house near it, except the factory.

The next factory belonging to the English is near a large town called Bruceo, about half a mile from the river, in the kingdom of Jemarrow. The town is inhabited by a people of the Mundingo race, but they are strict Mahometans. About half a mile below the town is a ledge of rocks that runs three parts across the river, and leaves so small a channel, as to render it very dangerous for large vessels to pass.

Nine miles from Bruceo is a large town called Dabocunda, situated on the south side of the river, and divided into two distinct parts; one of which is fortified by a wall made of palmetto trees fixed to the ground, and clay laid in between, so that it is little inferior in strength to those made of brick and mortar. The other town is only encompassed by a fence of canes fastened together by a number of stakes, in which manner most of the towns on the Gambia, as well as the factories, are surrounded. In peacable times the people live in the open town, but in times of war, they shut themselves up in that which is most strongly fortified. These are naturally a rebellious sort of people, and have a king of their own, called Soma, who has a great power over all the adjoining towns.

Adjoining to the kingdom of Jemarrow is that of Tomany, which is a very extensive country, and contains more towns than any other on the whole river. The English have a factory at a small place called Yanyamacunda, where a considerable trade is carried on, particularly in dry commodities. The town is on the north side of the river, but the factory is on the south, and is defended by a strong fortification. All vessels that pass this port pay a duty to the king of Tomany, who is a Mundingo, and lives at a place called Suti-mor, about three miles distant from Yanyamacunda.

Beyond Tomany is Cantore, a large and populous country, with many small towns dispersed about it, but not any one nearer the river than three miles; and they are all so insignificant as not to merit the least notice.

SECT. V.

Of the River Niger, or Senegal, with the principal Kingdoms and Places situated on its Banks.

THE river Niger takes its rise in the eastern part of Africa, and after a course of 300 miles nearly east and west, divides itself into three branches, under the names of the Senegal, the Gambia, and the Sierra Leona; all which, at a particular time in the year, overflow their banks in the same manner as the Nile.

The whole extent of this great river has never yet been ascertained, but from the farthest part that has been penetrated to the sea, it reaches near 2400 miles. It runs east and west till within about six miles of the

ocean, when it suddenly breaks off, and forms a curve that runs from north to south about 25 leagues, when it disembogues itself into the sea. The mouth of the river is about two miles across, but the passage here is often very dangerous, on account of the bar, which is not only continually shifting, but also chokes it up; and when the north winds blow, the stream is so rapid, and the waves run so high, that it is impossible for any vessels to pass it. The safest times for crossing the bar are, between the months of March and September, when the winds are changeable, and the bar is generally fixed till the commencement of the rainy season.

The banks of the Senegal are very fertile, and beautifully variegated. Near the river are lofty trees inhabited by various sorts of birds, some of which are very small, others large, and many of them exceeding handsome, and of the brightest colours. There are also great numbers of squirrels and monkeys; and the more distant parts abound with lions and elephants, the latter of which have not that ferocity in them that is natural to those in other countries, for they will not attempt to attack any one they meet unless first molested. Some parts of the low grounds abound with a sort of thorny trees which run to a prodigious height, and bear large bunches of yellow flowers that have an odoriferous scent. The barks of these trees are of different colours, some being black, others white, green, or red; and whatever colour the bark is of, the timber is of the same, and from its substance appears to be a species of the ebony.

The principal kingdoms and places situated on the banks of the Senegal are as follow:

1. Guber, or Gubur. This kingdom lies about 40 miles from the Niger, and is surrounded with very high mountains. It contains a great number of villages, many of which are inhabited by shepherds and herdsmen. The best of cattle are bred here, and the whole country abounds with rice and other grain. Among the inhabitants are many artificers and linen-weavers, the former of whom make sandals, which they sell to the people of Tombuto and Gago.

2. Zanfara. This country is bounded on the west by the before-mentioned kingdom. It is very large and fertile, the fields producing great quantities of rice, millet and cotton. The inhabitants are tall in stature, of a black complexion, have broad faces, and are naturally of a savage disposition. They are in general very poor, and are chiefly employed in the business of husbandry.

3. Cano is a large province situated near 500 miles to the east of the Niger. It contains many villages, the inhabitants of which are principally shepherds and husbandmen. Some parts of it produce great quantities of rice, corn and cotton; but other parts of it are very barren, consisting of deserts and woody mountains, in the latter of which are great plenty of wild citrons and lemons. In the center of the province is a large town of the same name, situated in 10 deg. 12 min. east long. and 15 deg. 30 min. north lat. The walls and buildings in this town are made of a kind of clay, and the inhabitants in general are of a civil and obliging disposition. Their king was once a powerful monarch, and had a prodigious number of troops always at his command; but he has for many years been subject, and pays a tribute to, the king of Tombuto; for the receipt of which one of that prince's courtiers constantly resides in the town.

4. Cafena. This country lies on the east of Cano, and principally consists of fields and mountains, which produce great plenty of millet. The inhabitants have broad noses and thick lips; and their complexion is a jet black. There are many villages in the province, but they are very small, and the buildings exceeding low and mean. They also had formerly a despotic monarch, but he is now subject to the king of Tombuto.

5. Zegzeg is a large kingdom, bordering on Cano, and is about 150 miles from Cafena. The country is divided into two parts, one of which is a plain, and the other mountainous: the air of the former is exceeding hot, but in the latter it is intolerably cold, inasmuch

that they are obliged constantly to keep fires in their houses, and when they go to sleep they put hot coals under their beds. Their fields are in general fertile, and there are many springs of excellent water. Their houses are poor wretched buildings, made of the same materials, and much after the same manner as those at Cafena. These people were formerly governed by a king of their own, but he being conquered and slain by one of the kings of Tombuto, they are now subject to the monarch of that kingdom.

6. *Guangara*. This province is situated to the north of the Niger, and is bounded on the south-east by the province of Zanzara. It is a large and populous country, and contains a great number of villages chiefly inhabited by husbandmen. About the center of it is a large town of the same name, which is ornamented with many handsome buildings, and the inhabitants carry on such a trade with some of the neighbouring nations, that many of them are exceeding wealthy, and live with the greatest splendor. They are governed by a king, who maintains a garrison consisting of a great number of horsemen and archers, and he receives considerable tributes annually from his subjects. Some parts of the country to the south of Guangara town abound with gold; and when the merchants travel to those parts for that valuable article, their goods are carried by slaves, the roads being too rough and dangerous for any beast. These slaves carry prodigious burthens, with which they will travel upwards of 20 miles a day. The great loads they carry is surprising, for besides the merchant-ware, they carry provisions for their masters, as also for the soldiers that guard them.

7. *Bito* is a small kingdom situated to the south of the Niger; and is bounded on the east by Temian, on the west by Tombuto, on the north by the kingdoms of Gubur and Zanzara, and on the south by Dauma. It is a large and fertile country, but has only one capital town in it called by the same name, the inhabitants of which are great traders, and many of them said to be exceeding wealthy.

8. *Temian* is another small kingdom, situated on the west of Bito, the inhabitants of which are said to be very savage; but there is not any particular relative to the kingdom itself that merits the least notice.

9. *Dauma*. This is also a small kingdom, and has not any thing remarkable to distinguish it, which is likewise the case with Brasana, situated to the south of it. This last kingdom is bounded on the north by the desert of Seth, which is a large space of barren ground, and reaches as far as the borders of the kingdom of Gago, where it joins another track of land called the Desert of Sin.

10. *Gago*. This kingdom is bounded on the east by Dauma, on the west by Melli, and the country of the Mundingoes, on the north by Tombuto, and on the south by Guinea, from which it is separated by a ridge of mountains. It is a very plentiful country, and contains a great number of villages principally inhabited by shepherds and husbandmen. The people are very illiterate, and in summer go almost naked, but in winter they wear garments made of the skins of beasts. The principal town in this kingdom is called Gago, and is of great extent. The houses are very mean buildings, except those belonging to the king and his courtiers, which are spacious and handsome. In this town are many rich merchants, and it is much frequented by the people of the neighbouring countries, who come to buy cloth brought here from Barbary and Europe. The country for some miles round the town produces great plenty of rice, millet, corn and cattle; as also abundance of melons, citrons, and other fruits: there are likewise many springs, which produce excellent water.

The king has a great number of slaves and concubines, the latter of whom are kept in a private place, and attended by eunuchs; and his body guards consist of a troop of horse, and a great number of foot; besides which he has upwards of 100 archers. The king determines all controversies between his subjects, in the execution of which he attends with great diligence. The place set apart for this purpose is between the outer and inner gate of the palace; and though he is as it

were judge himself, yet he has his counsellors and other officers; besides whom he has also secretaries, treasurers, factors, and auditors. Great trade is carried on here, but the people are in general very poor, owing to the enormous taxes continually laid on them by the king.

11. *Melli*. This kingdom is situated on an arm of the Niger, and is in length about 300 miles. It is bounded on the east by the kingdom of Gago; on the west by large woods and forests that extend to the sea there; and on the south by deserts and mountains that separate it from Guinea. It received its name from a large town called Melli, which was once the residence of a sovereign who reigned over the whole kingdom; and at that time the town is said to have contained 6000 families. At present, however, the kingdom is divided into different sovereignties and lordships, and but a small part of it retains the original name. The inhabitants are distinguished from all other Negroes by their civility, particularly to strangers; and they are likewise very industrious and frugal. The country produces great plenty of corn, rice, and millet; also good cattle, and some cotton. The people are generally employed in the business of husbandry, but there are amongst them some artificers and merchants, who carry on a considerable trade with the neighbouring kingdoms.

Between Melli and the kingdom of Gago, is a large track of land called Foute-Guilon, said to be the original country of the Pholays; but it is now a mere desert, being almost uninhabited.

Towards the sea-coast, however, there are several principal places, the first of which is Cachao, called by the French Cachaux. It is a Portuguese colony, situated on the river St. Domingo, or Cachao, which falls into the sea about 60 miles below the town. It stands in the country of the Papells, an idolatrous people, who sacrifice dogs to their deity, or idol, which they call Shina. The Papells have frequently been at open war with the Portuguese, for which reason the latter have encompassed the town on the land side with a strong palisado, terraced and defended by batteries; and they keep constantly a watch for fear of any sudden enterprise. The town is built on the side of the river, and consists chiefly of two long narrow streets, with a few small ones that cross them in different parts. The houses are made with earth, and are whitened within and without: in the rainy season they are covered with palmetto leaves, but all the rest of the year they are only covered with a sail-cloth to keep off the violent heat of the sun. They are very spacious, but low, not having any story above the ground floor.

There are but few natural Portuguese in the town, most of them being Mulattos, and so black as hardly to be distinguished from Negroes. The fairest of them, however, keep their wives under very close confinement: they never let them go abroad in the day-time, not even to mass; and the better sort have chapels in their houses, where, on high festival days, they hire a priest to perform religious duties. The black wives of the Portuguese are not thus restrained, for they are permitted to go abroad in the day-time; but they are so wrapped up, that no part of them can be seen except their feet. The Portuguese here particularly pride themselves in being jealous, and will sometimes carry that passion to the greatest excess.

They have a church and convent here, and the spiritual government of the place is vested in a visitator, or grand vicar, sent hither by the bishop of St. Jago, (one of the Cape de Verd islands) to whom all the Portuguese that inhabit this country are subject. The convent belongs to the capuchins; but from the unwholesomeness of the country there are seldom more than two or three friars that reside here, and when any of them die, it is a difficult matter to find another that will supply his place. The civil and military government is under the direction of one called captain-major, who has under him a lieutenant, an ensign, and an adjutant; besides whom there are other officers, as an intendant of the king's duties, a notary, and some serjeants.

The garrison consists of 30 soldiers, who are generally banished from their own country for the commission of some capital crime; and this banishment is of

the

the most horrid nature, for they are kept at such short allowance, and so miserably clothed, that if they had not some kind of business to assist them, they must inevitably perish. Some of them often follow the profession for which they were sent here; for after dark they will parade the streets, and rob all they meet; so that it is very dangerous to walk after sun-set, unless a person is well provided with arms; and this is the case in most of the other colonies belonging to the Portuguese.

The river before the town is at least a mile across, and so deep as to admit the largest ships, were it not for a dangerous bar that interrupts them at the mouth of the river. The country on the south side, where the town stands, consists chiefly of marshes, with a few fields in which they sow some rice; but they are so small, and so little cultivated, that they do not produce a sufficiency for the maintenance of the inhabitants. The north bank of the river is covered with mangroves, beyond which are some of the finest trees in Africa for thickness, height, and quality of the timber: the natives make their canoes out of these trees, which are all of one piece, and so large and strong that they will carry ten ton weight. According to the Portuguese, the Papells are esteemed the best rowers on the whole coast.

The natives of Kachao employ the principal part of their time in the cultivation of a plant called manioc, which is used instead of bread, not only here, but in several other parts of Africa. The nature of this plant, with the manner of its being brought to perfection, is thus described by a late author: "The manioc, says he, is a plant which is propagated by slips. It is set in furrows that are five or six inches deep, which are filled with the same earth that has been taken out. These furrows are at the distance of two feet, or two feet and an half from each other, according to the nature of the ground. The shrub rises a little above six feet, and its trunk is about the thickness of the arm. In proportion as it grows, the lower leaves fall off, and only a few remain towards the top; its wood is tender and brittle.

"It is a delicate plant, whose cultivation is troublesome, and the vicinity of all sorts of grass is prejudicial to it. It requires a dry and light soil; its fruit is at its root; and if this root is shaken by the motion the wind gives to the body of the plant, the fruit is formed but imperfectly. It takes 18 months before it grows to maturity.

"It is not rendered fit for use till after it has undergone a tedious preparation. Its first skin must be scraped; it must be then washed, scraped and pressed, to extract the aqueous parts that are slow poison, against which there is no remedy known. They then roast it, so that causes every noxious particle it might still contain totally to evaporate. When there appears no more steam, it is taken off the iron plate on which it was roasted, and suffered to cool; for it is no less dangerous to eat it hot than raw.

"The root of the manioc grated and reduced into little grains by roasting, is called flour of manioc. The paste of manioc is called cassava, which is converted into a cake by roasting, without moving it. It would be dangerous to eat as much cassava as flour of manioc, because the former is less roasted. Both of them keep a long time, and are very nourishing, but a little difficult of digestion. Though this food seems at first insipid, there are many white people who prefer it to the best wheat."

The manioc plant is also cultivated and brought to no less perfection by the inhabitants of the island of Bissac.

About 70 miles from Kachao, on the same side of the river, is another town called Farim, where a tolerable trade is carried on in wax and ivory; and in the months of October and November there are markets held for the sale of slaves.

To the north-east of Farim is a village called Hot, where most of the traders buy rice, which is here very plentiful, and exceeding good in quality; and a little farther is another village called Bole, where they sell millet and oxen.

The town of Gêves, so called from a river of the same name, is very considerable, and supposed to contain at least 4000 inhabitants, among whom there are not above 12 white families, the rest being all tawney or black. The trade carried on here consists of wax, ivory, and slaves. The Portuguese have a factory on the banks of this river; and the natives that live on it are partly Papells, and partly Mundingoes.

In this country is a province called by the Portuguese Kobo, the king of which resides at a small place about 30 miles east of the town of Gêves; and near the mouth of that river is a small town called Courbali, where a considerable trade is carried on in salt, ivory, and slaves.

To the south of the river of St. Domingo, or Kachao, is another called Cafamanga, which is said to be an arm of the Gambia, whose course is considerably long, and its stream very rapid. The Portuguese have two small forts on the banks of this river, but they consist of little more than a few wretched huts, surrounded with small moats, and the principal security of each lies in the difficulty there is to come at it, for they are both situated in marshy grounds, and are hid by mangroves, defended by legions of musketoes. The Portuguese are the only people that carry on any trade here, which consists chiefly in ivory and wax.

S E C T. VI.

Of Sierra Leona.

THIS country is rendered considerable by the river which gives name to it, whose banks are more fertile than most others on the western coast of Africa. It is bounded on the north and south by two famous capes, the former of which is called Cape de la Vega, and the latter Cape Tagrin, or Sierra Leona. These capes form a spacious bay, into which the river discharges itself. The flood in the bay runs seven hours, and the ebb five; it is between seven and eight fathom deep, and ships may ride in any part of it with the greatest safety. The river is said by some to have received its name from the noise of the sea against its rocky shores, resembling the roaring of lions; and others, that it was first called so by the Portuguese, from the great number of lions that infest the neighbouring mountains. It also goes by the names of Tagrin and Mitomba, the latter of which it preserves for about 80 miles above the mouth of the river. On the south side of it is a town, called las Mageas, where none but the Portuguese are permitted to reside for trade; and the natives come down the river to barter with the French and English, when there are any of their ships in the bay.

Near the entrance of the river is a creek called the Bay of France, where there is a basin or reservoir of fresh water, that falls from the adjoining mountains. It flows down in gentle murmurs or impetuous streams, and, in a country almost parched by the heat of the sun, produces a most agreeable scene; besides which, its beauties are considerably heightened by the surrounding hills, that are covered with lofty trees, which afford a perpetual shade, and render the whole one of the most delightful spots that can be met with in such hot countries.

Here are also several small islands, the principal of which are Tasso and Bente. Tasso is a large flat island, near three leagues in circumference, where the company's slaves have a good plantation. The chief part of the island is covered with wood, among which are silk cotton trees of a prodigious size; and some parts of it produce good indigo.

Bente is situated about nine leagues from the road; and here the English had once a small fort, whose advantages chiefly arose from its standing on a steep rock, the ascent to which was by a flight of steps. The fort was built of lime and stone, and before it was a platform with six guns. The garrison consisted generally of 20 white men, and 30 grumetoes, or tree blacks, who lived in a small village under the shelter of the fort. This fortress, however, was taken by two French men of war in the year 1704, who first plundered, and then

then razed it to the ground. Hense island is much smaller than the other, and the soil of it is very indifferant, producing only a small quantity of rice.

With respect to the climate of this country it is in general very unwholesome, particularly in the mountainous parts; where, during four months in the year, it rains, thunders, and is so intolerably hot, that the people are obliged to keep close in their huts; and the air is corrupted in such a manner by the lightning, that all animal food is reduced in a few hours to a state of putrefaction. The flat open country, however, is not so bad; for though in summer the heat is excessive in the former part of the day, yet it is very temperate in the afternoon, from the refreshing breezes that generally blow from the south-west.

The banks of the Sierra Leona are lined with mangrove trees, the leaves of which exactly resemble those of an European laurel. The branches of these trees are neatly of an equal length, but the shoots growing downwards, as soon as they touch the water or the earth, take root, and by that means make a hedge so thick as to be almost impenetrable. The whole country abounds in millet and rice, which is the principal food of the natives. It also produces great plenty of oranges, lemons, bananas, Indian figs, ananas, pumpions, water melons, yams, potatoes, wild pears, white plumbs, several sorts of pulse, and the kola fruit. This last fruit somewhat resembles a chestnut, and grows in clusters of ten or twelve together, four or five in a rind, each divided by a thin skin. The outside of the nut is red intermixed with blue, and the inside, when cut, is of a violet-colour mixed with brown. The Negroes and Portuguese use it in the same manner as the Indians do arek and betel. It is of a harsh sharp taste, and if put into water makes it exceeding pleasant.

The shores produce a variety of large trees, particularly the palm, the cocoa, and the cotton tree; and on the mountains an abundance of palm and laurel trees. Indeed, the whole abounds with trees of various sorts so close together, that it may be called one continued forest.

They have a great plenty of deer, hogs, goats, and fowls, which the natives sell to the Europeans for a small quantity of brandy, a liquor they prefer to all others.

In the mountains are great numbers of elephants, lions, tygers, wild-boars and roe-bucks; also apes of several sorts, and serpents, the latter of which are so large that it is said they will swallow a man whole. The apes, monkeys and baboons are so numerous, that they make great destruction in the plantations. There are three sorts of these animals, one of which is of a prodigious size, and remarkably sagacious. When taken young they are taught to walk upright, and by degrees are rendered very useful to the natives; they are taught to pound Indian wheat, to fetch water in calabashes or gourds, from the river or springs, on their heads, and to turn the spit. These creatures are such lovers of oysters, that, at low water, they go down to the shore among the rocks, and when the shells open with the violent heat of the sun, they put a small stone between and take out the oyster; sometimes it happens that the stone slips aside, or is too small, when the monkey's foot being caught, he is taken and killed by the blacks, who reckon their flesh delicious food, as they do also that of elephants.

In the woods are great numbers of pigeons, parrots, paroquets, and Guinea hens, the latter of which are about the size of a pheasant, and very beautiful; but it is difficult to catch them on account of the thickness of the trees. They have also several other sorts of fowl, among which are white pelicans as large as swans, herons, curlews, boobies, and a bird called ox-eyes.

The bay and entrance of the river abound with a great variety of fish, as saies, thornbacks, and a fish called old wives. There are also gar-fishes, cavaloes, sharks, and sword-fishes, dog-fishes, and one called shoe-maker, having on each side the mouth pendants like basbel, and the noise they make is something like that of a hog's grunting. Among the fish, however, caught here, the most common are, old wives, pil-

chards, the becune, the monk, or angel-fish, and the mullet.

The fish called Old Wife is shaped much like a tench, is about nine inches in length, and has large scales. It is mottled with red, yellowish and brown lines placed alternately, and running from the head to the tail, being five or six in number. The snout is oblong, and turns upwards; and the lips are thick, fleshy, and project from the jaws, but the mouth is small. The teeth are serrated, but not very sharp, and the fins are mottled with red, blue and yellow. The tail, when expanded, is roundish, and the fish altogether is exceeding beautiful.

The Pilchard is much like a herring, but not so large, and the body is broader. It has not any teeth either in the jaws, the tongue or the palate. The flesh is firmer, and by some preferred to that of a herring. They are fish of passage, and, like herrings, swim in considerable shoals.

The Becune greatly resembles a pike, but only larger, some of them being frequently caught upwards of eight feet in length. It is a greedy fish, and dangerous to be met with in the water, because it can bite much easier than the shark, and so fearless, that it will not be driven away by any noise that can be made. The flesh has the same taste as a fresh water pike, but there is often great danger in eating it; for unless the teeth are white, and the liver sweet, it is poisonous.

The Monk, or Angel Fish, is between a shark and a skate, and grows to a large size, often weighing upwards of 160 pounds. The colour on the back and sides is of a dusky ash, and the belly is white. The mouth is broad and placed at the end of the head, in which it differs from other flat grilly fish. The head is roundish at the extremity, and there are three rows of teeth in each jaw, each row consisting of 18, so that there are 54 teeth in all. The tongue is broad and sharp at the end; and the nostrils are wide, being placed on the upper lip, and filled with a sort of slime. The eyes are of a middle size, placed not far from the mouth, and do not look directly up, but sideways. Instead of gills it has holes like the thornback. Near the head are two fins that look much like wings, for which reason it is called the angel-fish. On the extremities of these fins, near the corners, there are short, sharp, and crooked prickles; as there are also on the lowermost fins, which are placed near the vent. Below the vent are also two fins, and the tail is forked. The flesh is so rank, and of so disagreeable a taste, that it is little used, and the chief value of the fish consists in its skin, which is used in making cases for instruments.

The Mullet greatly resembles a daer; the head is almost square, and flat at the top, the nose sharp, and the lips thick. It has large scales, not only on the body, but also on the head, and the covers of the gills. The back is of a bluish colour, and the belly white. The lateral lines are variegated alternately with black and white. The eyes have no other skin than their own coats, and the forward fin is radiated with five long spines. It has no any teeth, but the tongue is roughish, and there are two rough bones on each side of the palate. It has also a bone beset with prickles at each corner of the mouth, and when at its full growth is about 18 inches long. These fish generally go in great shoals, and are so sagacious, that when surrounded with a net the whole shoal will frequently escape by leaping over it; for when one takes the lead, the rest will immediately follow. Oppian, in his natural history, takes notice of this circumstance, and his observations on it are thus translated:

- “ The mullet, when encircling seines enclose,
 “ The fatal threads and treacherous buson knoweth.
 “ Instant he rallies all his vigorous powers,
 “ And faithful aid of ev'ry nerve implores;
 “ O'er battlements of cork upstarting flies,
 “ And finds from air th' escape that sea denies,
 “ But should the first attempt his hopes deceive,
 “ And fatal space th' imprisonment'd fall receive,
 “ Exhausted strength no second leap supplies;
 “ Self-doom'd to death the prostrate victim lies

“ Resign'd

"Resign'd, with painful expectation waits,
"Till thinner elements compleat his fates."

The mullet was in great estimation among the Romans, and bore an exceeding high price. The money given for one in the days of Juvenal is a striking instance of the luxury and extravagance of that age. It is mentioned by that author in his 4th satire, and is thus translated by Mr. Dryden:

"The lavish slave
"Six thousand pieces for a mullet gave,
"A fellece for each pound."

Pliny, however, who also lived in the days of Juvenal, mentions one *Festus Celer*, a man of consular dignity, who was infinitely more lavish than the epicure mentioned by Juvenal; for he gave 8000 nummi, or 64*l.* 11*s.* 8*d.* for a fish of so small a size as a mullet. Such indeed was the luxury of the times, that there were stew-pans in the eating-rooms, so that the fish could at once be brought from under the table, and placed upon it: they even put the mullets in transparent vases, that they might be entertained with the various changes of its colour while it lay expiring.

The great plenty of fish found in the bay and river of Sierra Leona are of infinite service to the European sailors, not only for provisions, but also traffick; for the natives are so indolent, that they will not be at the trouble to catch them, but content themselves with such as are left by the ebb tides among the rocks.

On the sides of the bay are great plenty of oysters, that appear as if growing on the mangrove trees, which are here in great abundance. Many of them hang down in the water, and are so thick covered with oysters, that at first sight it might be imagined they were produced from the tree. Some of these oysters are of such a size that one of them would serve a moderate man for a meal; but they are so tough as to be scarce eatable, unless first boiled, and then fried in small pieces. The trees that grow on the sides of the bay make excellent haunts for crocodiles; as also for the manatees, or sea-cow, which are here in great abundance. As these creatures are little known to Europeans, it may not be improper to give a particular description of them.

The Manatee, or sea-cow is supposed by some to be an amphibious creature, but this opinion has been sufficiently controverted; for it is always found in large rivers or bays, and feeds upon sea weeds that grow near the shore. It is covered with a very thick skin, which greatly resembles the bark of an old oak, for it is tough, wrinkled, without hair, and so hard as scarcely to be penetrated. Though the back is the smoothest part, yet it is covered with circular wrinkles from the top of the neck to the tail fin. They are in general about 25 feet in length, but the head is very small in proportion to the body. It is flat at the top, and goes off sloping to the snout, which is eight inches in diameter. The head is covered with a black hard skin, exceeding rough, but thinner than in other parts. The mouth is small, but large enough for its manner of feeding. The lips both above and below are double, and divided into the inner and outer: the upper lip terminates the snout, and appears like a semicircle at the end: it is very thick, being 14 inches broad, and 10 deep; and is white, beset with transparent bristles about four inches long. The nether lip is also double: the outer one is black, and forms a sort of chin seven inches broad, but without bristles. The inner lip is bony, and only a little separated from the outer, neither does it appear when the mouth is shut. The corners of the mouth are beset with thick white bristles an inch and an half long, which keep the water from washing away the food while the creature is eating. The bristles are like small quills, hollow within, and bulbous at the root. The lower jaw, which is only moveable, is shorter than the upper, and the lips move in the same manner as those of cattle. They have not any teeth, but instead thereof two strong white bones that run the whole length of both jaws. The nostrils resemble those of a horse, and are parted by a gristle above an inch thick; they are two inches

over, with wrinkles on the inside, and bristles half an inch long. The eyes are placed in the center of the head, between the end of the snout and the ears, and are not bigger than those of sheep. The neck is thick, and so short, that it can hardly be perceived, unless by its motion in feeding. From the shoulders to the navel the body is large, but from thence to the anus it grows slender. The circumference of the head is seven feet, and of the body next the shoulder twelve, but where it is largest the circumference is upwards of 20 feet. The fore-fin, or arms, are about two feet in length, and consist of two joints: they are covered with solid fat, intermixed with tendons and ligaments, with a thick skin resembling a horse's hoof; they are convex on the upper side and flat beneath, and are beset with rough bristles about half an inch long. The breasts are placed between the arms one under each, and are of a convex form, about a foot and a half in diameter. They are hard, rough, and wrinkled, and when they give suck the teats are four inches long. The stomach is exceeding large, being six feet long and five broad: it is smooth within, and has a gland about the size of a man's head near the insertion of the gullet. The skull greatly resembles that of a horse, and is much about the same size and thickness.

These animals keep together in large companies, and are very careful of their young. They bring forth their young in autumn, and have but one at a time. The Manatee has no voice or cry, and the only noise it makes is in fetching its breath. The fat, which lies between the cuticle and the skin, when exposed to the sun, has a fine smell and taste; it has also this peculiar property, that the heat of the sun will not spoil it, or make it become greasy. The taste is like the oil of sweet almonds, and the only effect it has on the body is that of keeping it open. The fibres and the lean parts are like beef, but more red and harsh, and may be kept a great while in the hottest weather without tainting. The fat of the young ones is like pork, and the lean greatly resembles veal. In the head are four stones of different sizes, which are somewhat like bones, and are used in medicine. They are said to be good against agues, and to cleanse the kidneys of gravel. Hoffman affirms they are exceeding useful in cases of epilepsy.

When the Negroes catch these creatures they go in a canoe, and paddle towards it with as little noise as possible, it being exceeding quick of hearing. As soon as they find themselves near enough, the man, who is placed ready at the head of the boat, strikes a harpoon fixed at the end of a long pole into it, and then lets go. The head immediately makes towards the mangroves, and the water being shallow they follow it close and renew the strokes till they have wearied it out, when they drag it ashore, and compleat their conquest.

The inhabitants of Sierra Leona are not so black as those of the neighbouring countries; neither have they such flat noses or thick lips. The men are in general tall and well made, of a cheerful disposition, and not given to quarrel; but the women are short and robust, owing to their being constantly employed in labour; for besides the business of hockwifery they work hard in tillage, make palm oil, and spin cotton. The poorer sort go naked till they are twelve years of age, when they wear a piece of cloth round the waist, or a kind of apron made of the leaves of trees. They also wear a leathern girdle, to which are fastened a long knife and a pounard. Persons of rank, especially when they appear abroad, wear a long flowing robe of striped calico tied round the waist with a silken girdle. They adorn their arms with bracelets, and wear a great number of rings on their fingers. Their ears are ornamented with various toys, and on their cheeks they have different figures made with red-hot iron. Both sexes anoint their bodies and limbs with palm-oil, and some use civet in order to give them an agreeable scent. They wear no hair on their eye-lids, and that of their head they cut in cresel lines, leaving square tufts standing erect; but the women in general have all close. They are naturally temperate in their living, and very sober; for though they are exceeding fond of brandy and other spirituous liquors, yet they never drink to excess, con-

drinking drunkenness as one of the greatest crimes that can be committed.

Their houses or huts are low, built with wooden stockades set in the ground, and thatched with straw; some are round, some square, and others oblong; and most of them are ornamented in the front with two wings of a spiral form. They are kept very clean, being swept at least once every day. Their furniture consists of two or three earthen pots to boil their victuals in, a gourd or two to fetch palm-wine, and half a gourd for a cup; a few earthen dishes, a basket or two for the wife to gather cockles in, and a knapsack for the husband, made of the bark of trees, to carry his provision when he goes abroad. Their bedstead is made of billets of wood laid across each other, on which they lay a mat, and sleep without any covering.

Some of them lie upon mats made of rushes on the ground, and have their arms or weapons by their sides, which, for the most part, are swords, daggers, darts, bows and arrows. The points of their arrows are infected with the juice of a poisonous fruit, which is so inconceivably subtle and quick, that wherever it strikes it is sure to prove fatal. Some of them have also guns, which they are very fond of, and use with great dexterity.

Their food consists chiefly of roots, herbs, fruit, cockles and oysters; and their common drink is water. They plant about their houses gourds, potatoes, pumpkins, and tobacco, the latter of which they are very fond of, particularly in smoking. Their pipes are made of clay, well burned, and the bowl is remarkably large. They put a small hollow cane, about a foot and a half long, into the lower end of it, through which they draw the smoke, and swallow it. They squeeze the juice out of the tobacco when the leaves are green, from an opinion that it would otherwise make them drunk; after which they fired it small, and then dry it on coals. They are very fond of dancing, and generally spend their evenings in that diversion. They make a ring in the open part of the town, and one at a time shews his skill in antic motions and gesticulations, but with a great deal of agility; and their music consists of two or three drums made of a hollow piece of wood, and covered with the skin of a kid.

Every town or village has one peculiar house, to which the women send their daughters at a certain age, who are there taught for a year to sing, dance, and perform other exercises, by an old man appointed for that purpose; and when the year is expired he leads them to the market-place, where they publicly exhibit such performances as they have been taught at school. During this time, if any of the young men are disposed to marry, they make choice of those they like best, without regard either to birth or fortune. When the man has declared his intention, the parties are considered as actually married, provided the bridegroom can make some presents to the bride's parents, and to the old man who was her tutor.

When they bury their dead they put into their graves all their best goods, and erect a roof over it, which they cover with linen cloth. The corpse is always attended to the grave by a number of people hired as mourners, who howl and cry in proportion as they are paid for their attendance.

They have courts of justice, which they call Pal-lavers, where the principal or elderly men assemble to settle differences amongst them, which generally arise in matters relative to trade, each salutes the other at meeting by a bend of the elbow and raising his hand to his face. When they have heard the parties, they determine the dispute by vote, and he that has the majority is accounted the innocent person. In case of fornication, the party, whether man or woman, is sold for a slave. On a charge of murder, the suspected person must drink of a red purgative water prepared by the judges, which is called *purging the criminal*: if he is known to have led a bad life, and to have borne malice to the deceased, notwithstanding a positive evidence may be wanting, his judges will give him such a quantity of the liquor as to kill him; but if they are inclined to spare him, they will give him less, or make it

weaker, that he may appear innocent to the friends and relations of the deceased. If a man has been defrauded by another, he has a right to take from him as much as amounts to his own loss, but he must make it appear before the judges that he has not exceeded those bounds, as in that case he would be subject to punishment.

The Mundingo Negroes, who are strict Mahometans, have frequently endeavoured to propagate their religion among these people; but they have ever rejected it, and still follow their own maxims. They acknowledge one Supreme Being, Creator of all things, whom they call Kanu: they also believe in a future state, but they do not worship any living creature whatever, nor even the sun or moon. They have many superstitious notions, and pay great respect to their fetiches, or charms, which they constantly carry in a bag about their necks, and other parts of their body. The number of these deities is not fixed, every one choosing his idol according to his own fancy; some have a horn, some a crab's claw, and others a snail's shell, a bird's head, or some such trifle. To these they pray with the greatest diligence, and at their meals always offer them a part. They never go to sea or on the rivers without these idols, considering themselves by those means secured from all accidents; for they suppose the fetich has a particular authority upon the sea; and after the voyage thank it for the ease it has taken of them.

The river of Sierra Leona separates this country into two kingdoms, that of Bulon, or Bulni, to the north, and that of Burre to the south. The former of these kingdoms lies very low and flat, but the soil is fertile, and produces great quantities of rice, millet, and maize, of which they make excellent bread. The natives are very fond of the English and Portuguese, many of whom inhabit that part of the country, and they take great pains to affect their manners and maxims.

The kingdom of Burre is a much more open country than that of Bulni, and near it is that long ridge of mountains called Sierra Leona, the admiration of all strangers. There are so many caves and dens about these mountains, that when a single gun is fired from a ship in the bay, the echo is so often and distinctly repeated, and the clap so loud and sharp, that they seem to be the report of several cannon. This is far from being disagreeable to hear; but when it thunders, the noise is at first dreadful, each clap being echoed with as much force as the real. Hence the Portuguese call them *Mountains that have a clean sound, or echo*.

At a small distance from these mountains there runs out into the sea westward a hilly point, much lower than the above mountains, forming almost a peninsula, over which the blacks carry their canoes on their shoulders when they design to launch out to sea, as it saves them the trouble of rowing round there from the bay. This point is called Cabo Leda, or Lagrais, and, according to the most exact observation, is situated in 8 deg. 30 min. north lat.

The town where the king of Burre resides is about eight leagues from the mouth of the river. It is composed of about 300 houses, which are round, and built all one way. The king's house, or rather his huts, are in the center of the village, and resemble those of his subjects. Some of them are a little larger, which he keeps for the Europeans, or strangers that visit him. The king is greatly beloved by his subjects, whom he governs with great justice and lenity.

The houses of the common people are made with side posts seven or eight feet high, supporting rafters that unite at the top in the form of a cone. They are covered with reeds, or palm-leaves interwoven through laths so close and thick, as to be impenetrable either to rain or the violent heat of the sun. The side walls are formed of reeds and small branches fastened between the posts, over which they lay a coat of lime made of burnt shells, which gives their huts a clean look, but does not last long, because they mix no sand with it. The fire place is in the center, and the smook issues through a hole in the top. The doors of the huts are square, the threshold being raised at least a foot from the ground; they are commonly about two feet broad and three high,

so that the generality of people must sleep to go in, and those who are corpulent must enter sideways. Although the climate is hot, yet the nights are cold and moist, so that the Negroes constantly keep fires in their houses.

The common language of the country is the dialect of Bulm, which is a hard, unpleasing tongue to strangers, and not easy to be described; but about the bay they speak either Portuguese, or *Lingua Franca*, and some understand a little English and Dutch.

The river of Sierra Leona has been long frequented by Europeans, particularly by the English and French, either for trade or refreshment in their way to the Gold Coast, or Whidah. The goods purchased here by way of trade are, elephant's teeth, slaves, sandal wood,

gold and bees-wax; with some pearls, crystal, ambergris, long pepper, &c.—The gold purchased here is brought from Mundingo, and other countries towards the Niger, or from South Guinea by the river Mombaba.

The goods brought here by the Europeans are, French brandy and rum, iron bars, white callico, Silesia linen, brass kettles, earthen cans, all sorts of glass buttons, brass rings or bracelets, bugles and glass beads of various colours, brass medals, ear-rings, Dutch knives, hedging bills and axes, coarse laces, crystal beads, red callicoes, oil of olives, guns, muskets, balls and shot, paper, red caps, all sorts of counterfeit pearls, red cotton, and various other articles.

CHAP. IV.

GUINEA.

THIS extensive region is divided into two large countries, distinguished by the names of Upper and Lower Guinea, the latter of which is more properly called Congo. These two together, reckoning from Cape Tagrin, near the mouth of the river Sierra Leona, in 9 deg. 18 min. of north latitude, to Cape Negro, in 16 deg. 45 min. of south latitude, extend upwards of 3500 miles, exclusive of all the turnings, windings, and bays on the coast: but the former only will be the subject of this chapter.

Upper Guinea, or Guinea Proper, is situated between 15 degrees west, and 15 deg. east longitude, and between 4½ and 10½ deg. north latitude. It is bounded on the east by the unknown parts of Africa, on the north by Negroland; and on the east and west by Congo and the Atlantic Ocean.

The whole country is divided into four parts, under the following appellations, namely,

- | | |
|---------------------|---------------------|
| 1. The Grain Coast. | 3. The Gold Coast. |
| 2. The Ivory Coast. | 4. The Slave Coast. |

SECTION I.

The Grain Coast.

THIS part of Guinea begins at Cape Tagrin, from whence it extends upwards of 400 miles south-east to Cape Palmas. It received its name from the Guinea pepper, called by the Spaniards *Malagueta*, which grows here in abundance. It also produces another species of pepper common in the West Indies, and generally known in England by the name of Jamaica pepper. Both the English and Dutch purchase great quantities of these articles; but the chief commerce consists in ivory and slaves.

The climate here is very unhealthy, owing to the periodical rains and winds; but the soil is tolerably good, and, besides pepper, produces plenty of vegetables and roots, as also various kinds of fruits, particularly oranges, lemons, cocoa-nuts, bananas, and dates. Their cattle consists of cows, sheep, hogs and goats; and they have a few horses, but they are very small, and of little use. There are also several kinds of wild beasts, as elephants, buffaloes, tigers, apes of various sorts, and great plenty of hares and deer. Their poultry consists of geese, turkeys, and ducks, with plenty of cocks and hens, the latter of which are esteemed as good in quality as those of Europe.

The natives here are in general tall and well-featured; they are tolerably sensible, and courteous to strangers, and are said to be the most honest in their dealings of

any on the whole coast. Their dress is called a paan, which consists of a piece of cloth about two feet broad, fastened round the waist; the better sort have an additional piece to this, which is thrown over the shoulders, but the arms, legs, and principal part of the body are entirely bare. Both sexes wear a great number of ornaments, consisting of rings, bracelets, and necklaces, made of gold, ivory, or copper, and some of them have girdles made of coral. They also take great pains in adorning their hair, particularly the women, who form it in various shapes, and dress it up with thin plates of gold, copper, tincl, beads, coral, and shells; some of them throw a veil over their heads to keep off the scorching heat of the sun, but the men go without any covering on their heads, except those who are so fortunate as to get an European hat, which, however paltry, they esteem above all their ornaments.

Their common food consists of rice, millet, fish and fruits; and their general drink is water mixed with a little palm wine, or the milk of cocoa-nuts. Most of them are very abstemious, and will not drink any strong liquors to excess; but such as do are severely punished by order of the king.

Their sovereign is a despotic monarch, who governs with such austerity, as to strike an awe in his subjects, who reverence him more from fear than affection. He is never seen abroad unless on particular occasions, and then he appears with the greatest pomp and magnificence.

They are all Pagans, but they believe in one supreme being, and seem to entertain some notions of a future state.

The chief part of them are employed in husbandry, but there are some artificers amongst them that are excellent workmen, particularly smiths, carpenters, and masons, the former of whom are so well acquainted with the nature of tempering steel, and other metals, that they make their various instruments to the greatest perfection. They purchase fire-arms, gunpowder, and bullets of the Europeans; but darts, arrows, lances, and broad-swords they make themselves. The carpenters make the canoes of various sizes with great neatness; and they also build their houses, or huts, which are made of wood and clay, and thatched with reeds, or branches of the palmetto-tree.

Among the natives of this place there are some of a mixed blood, called Malattoes, who are an abandoned set of people, and have proceeded from the intermixture of Negroes and Europeans; for when the Portuguese first discovered the south-west coast of Africa, they not only propagated their religion, but also their species in many

many parts of it. These are of a tawny complexion, and profess themselves Christians, notwithstanding which they retain many of the most superstitious notions of the Pagans. They imitate the Portuguese in their dress, but exceed both them and the Negroes in their vices. The men are great drunkards, lewd, thievish, and treacherous, and the women are the most abandoned prostitutes, sacrificing themselves at all times, and to all sorts of men, without the least degree of restraint.

As the Europeans have no settlement on this part of Guinea, the trade is carried on by signals from the ships; on the appearance of which the natives immediately go in their canoes, carrying with them their pepper, ivory, &c.

The river Sherbro, which is called by some authors Selhole, and by others Palmas, discharges itself into the great bay formed by the capes of Tagrin and Verga. It separates the country called Sierra Leona from that named Sello, and has its source in Upper Ethiopia; from whence it is conjectured by some either to be a branch of the Senegal, or of the river Gambia.

Large ships go up this river for about seven leagues from its mouth; but farther up it grows shallow, and is only navigable for canoes. The country round it is very mountainous, and the river has many turnings and windings, but the stream is not rapid, except at two or three cataracts or water-falls, one of which is exceeding large, and makes a prodigious noise, the water falling from the rocks upwards of 20 feet perpendicular. The Negroes that sail up this river, before they reach the cataract, are obliged to go ashore, and land their goods, which, with their canoes, they drag along the mountains till they have passed the cataract. The other two water-falls are trifling; notwithstanding which they frequently have their canoes overfit, especially when they are heavy laden; but as the canwood with which they are generally loaded, is very heavy, it sinks, and in the dry season they go and take it up, there being at that time hardly any water in the river. Their times of going up the river are in the latter end of the rainy seasons, which generally continue five months out of the twelve, when they cut the canwood, and search for elephants teeth.

Near the mouth of the river is a small island, called by the English Sherbro, and by the Dutch Mafacoy. It is surrounded by rocks, and before it lies a large sand-bank, so lofty as to be discovered at a considerable distance from sea. The west end of this island is called Cape St. Ann, and is exceeding pleasant, being covered with lofty trees on both sides. The soil of the whole is very fertile, and produces plenty of rice, maize, yams, potatoes, bananas, orange and lemon trees, citrons, pomegranates, and other fruits; besides which there are great numbers of poultry, and on the sides of the sea are found oysters that contain some of the most valuable pearls. The inhabitants are idolaters, and practise much the same maxims as those of Sierra Leona.

To the north-east of this island is another, called York Island, where the English had once a factory, and a good fort; but they abandoned it about the year 1727, when they removed to Jamaica, a small island about four miles farther to the west. This they also deserted, and for some years have not had any factory, either on the island, or river of Sherbro.

To the south-east of Sherbro river is that of Sello, or Seifre, the entrance of which is very rocky; but the rocks are all, except two, so deep in the water, that most vessels pass over them, and those two are so high above it as to be easily avoided. This river is pleasantly enclosed by lofty trees, and there are several small springs and rivulets that discharge themselves into it. The banks of it are very fertile, and in particular produce great quantities of excellent rice. In different parts are many pretty villages, among which is that where the king resides, called by the Dutch Konings-Dorp, situated about 12 miles up the river. It contains about 30 houses, which are all small buildings, except the king's, and that is not only handsome but spacious. About 100 yards from the mouth of the river is a pleasant village on a rising ground, which con-

tains about 60 houses, all neatly built, and some of them so lofty as to be seen many miles from the sea.

About eight miles below the river Sello is a large mountainous rock, on which grows a remarkable lofty tree; this place is called Little Seifre, or Sello; and about four miles from it, farther to the east, a point juts out into the sea, near which, on the land, appears a great rock, white at the top, which at sea looks like a ship under sail; it is surrounded by large sand-banks, and is called by the Portuguese Cabo Baixos.

The inhabitants of this country are in general very courteous to strangers; but they are idolaters, and practise some of the most superstitious maxims. Both sexes go almost naked, having only a small piece of cloth fastened round the waist. They live chiefly on fish, pulse, and fruits, and their usual drink is water; many of them are employed in fishing, and the king has a certain duty out of what they catch. They also breed great numbers of cattle and poultry, which they turn to great advantage by selling them to ships that frequent the coast.

In the method of saluting each other, they take the fore-finger and thumb into their hands, and putting them into a certain posture, pull them till they meet, when they say *agui*, which signifies *your servant*. They are but little ceremonious in their marriages; those who are able to purchase a wife, after agreeing with the woman, apply to the parents or relations, and if they approve of the bargain, the wife is delivered to the husband, who conducts her to his hut, and his other wives prepare a wedding supper. The husband stays all night with his new bride, and the next morning she goes to work with the rest, no further ceremony being observed.

The wife who is first delivered of a boy is distinguished as the favourite or chief; but this distinction is sometimes attended with fatal consequences, for if the husband dies first, she is obliged to follow him, and be buried alive in the same grave.

Monf. Marchais, who was once an eye-witness of this melancholy ceremony, has given the following particular description of it: "The captain, says he, or chief of the village, dying of a hard drinking-bout of brandy, the cries of his wives immediately spread the news through the town. All the women ran there, and howled like furies. The Inquinte wife distinguished herself by her grief, and not without cause. However, as several women in the same case have prudently thought fit to make their escape, the rest of the women, under pretence of comforting her, took care to watch her so closely that there was no means of escaping. The relations of the deceased all came to pay their compliments, and take their farewell. After the marabout had examined the body, and declared he died a natural death, he, with his brethren, took the corpse, washed, dried, and then rubbed it with fat from head to foot. After this, they stretched it on a mat in the middle of the house. His wives were placed round it, and his favourite at the head, as the post of honour. Several other women made a circle round them; all these endeavoured to outdo each other, tearing their hair, and scratching themselves methodically, like people who knew perfectly the part they acted. Sometimes they left off, and kept silent; at others they repeated the praise and great actions of the deceased, and then began their lamentations afresh. This mock music lasted near two hours, when four lusty Negroes entering the house, took the dead body and laid it on a hand-barrow made of branches of trees; then lifting it on their shoulders, they carried it through the town, running as fast as they could, and resting from time to time as if they had been drunk, with a thousand ridiculous gestures, very suitable to the exclamations of the wives of the deceased and the other women who attended the procession. In short, the noise was so great as would have drowned the loudest thunder. The parade being over, the body was taken from the hand-barrow, and deposited in its place; after which the songs, the cries, and extravagancies of the women began again. During this, the marabout made a grave, deep and large enough to hold two bodies; he also flayed and skinned a goat; the pluck served to make a *regout*, of which he and the

assistants ate; he also caused the favourite wife to eat some, who had no great inclination to taste it, knowing it was to be her last. She ate some, however; and during this repast, the body of the goat was divided into small pieces, broiled, and eaten. The lamentations began again; and when the marabut thought it time to end the ceremony, he took the favourite wife by the arms, and delivered her to two luty Negroes. These seizing her roughly, tied her hands and feet behind her, and laying her on her back, placed a piece of wood on her breast; then holding each other with their hands on their shoulders, they stamped with their feet on the piece of wood till they had broken the woman's breast. Having thus, at least, half dispatched her, they threw her into the grave, with the remainder of the goat, casting her husband's body over her, and filling up the grave with earth and stones. Immediately she cries ceasing, a quick silence succeeded the noise, and every one retired home as quietly as if nothing had happened."

The blacks here practise circumcision; but they give no other reason for it, than that it is an ancient custom transmitted to them by their ancestors. They pay great respect to their priests, who, beside their ecclesiastic function, are looked upon as the most able physicians.

Their language is so unintelligible, that they are obliged to trade with the Europeans by signs; and in this they are so expert, that bargains are made without much difficulty. Their principal commodities of traffic are; rice, Guinea pepper, elephants teeth, poultry and cattle.

The next considerable place we come to is Cape Monte, situated about 25 leagues from the mouth of the river Sherbro; it is called by the natives Wafli Kingo, and when first discovered at sea, appears like a lofty island. It contains a great number of villages, the inhabitants of which are remarkably industrious, particularly in the cultivation of rice and boiling of salt, which they do not only for themselves, but also for the benefit of their king, to whom they are under such subjection as to be accounted his slaves. Their chief cattle are sheep, and they have some fowls that are exceeding large and good. They have likewise a great plenty of various sorts of fish, the catching of which is the chief employment of many of the inhabitants. There are also great numbers of wild beasts, as elephants, tigers, buffaloes, harts, &c.

The men wear a white garment resembling a surplice; but the women have only a narrow piece of cloth fallen round the waist. Both sexes take great pains with their hair, or wool, which they twist into ringlets, and ornament the top of it with gold or precious stones. They wear also necklaces of several rows; and on their arms and wrists they have bracelets, as also above the ankles, where some hang bells of silver, the noise of which they are fond of when they divert themselves by dancing.

Their houses in general are mean buildings, but they are kept exceeding clean. Those belonging to the king, and principal men, are built long; some of them are two stories high, with a vaulted roof of reeds or palm-leaves, so thick laid as to render rain or the heat of the sun absolutely impenetrable. At the entrance is the hall of audience, which is also their place of eating; here is a kind of sofa, made of earth or clay, about six feet in breadth, and raised above 12 inches from the ground; it is covered with fine mats made of grass or palm-leaves, and dyed of various colours. In this place the principal people spend the chief part of the day with their wives, and amuse themselves with smoking, talking, and drinking palm-wine. Adjoining to the audience-room is the bed-chamber, where they have an estrade or sofa, consisting of a number of mats laid one on the other, and surrounded with pagnes sewed together, or printed linen like curtains. Their kitchens are very neat, and situated at some distance from the dwelling-house.

The inhabitants in general of this place are more cleanly in eating their victuals than their neighbours. They use bowls made of hard wood, and basons of pewter or copper tinned, which they keep exceeding neat.

When they roast their meat, they fasten it on a wooden spit, but, as they have not the means of making it turn round, they first roast one side and then the other. A man may marry as many wives as he can keep, for which reason some of them have a great number, for the expense is very trifling, as they make them work so hard that each nearly earns her own maintenance; they seldom quarrel, but in general live very happy; and so little jealous are the men, that if their wives bestow favours on others, it does not give them the least concern. Their religion consists chiefly in reverencing and obeying their king; and they have such little notions of ambition, that each live happy in their own way, neither exulting at the downfall of the poor, or envying the prosperity of the rich.

"He that from dust of worldly tumult flies,
"May boldly open his undazzled eyes
"To read wise nature's book; and with delight
"Survey the plants by day, the stars by night.
"We need not travel, seeking ways of bliss;
"He that desires contentment cannot miss;
"No garden walls this precious flow'r embrace,
"It common grows in ev'ry desert place."

Their military weapons consist only of bows and arrows, but they are kept more for ornament than use. They never go to war with their neighbours, for if any differences arise, they are amicably adjusted by treaty.

The Europeans that trade here buy many of their mats, which are of a bright yellow, and exceeding beautiful; also great quantities of ivory, which is equal good in quality to that of Sierra Leona; they likewise purchase the skins of lions, panthers, tigers, and wild beasts, as also a great number of slaves, which are brought here by the Mundingo merchants from the inland parts of Africa. The forests yield plenty of wood fit for dyeing, particularly camwood, which is cut, and bring it to the shore in blocks of about five feet in length; the Europeans, who buy a great deal of it, prefer it to Brazil-wood, thinking it much more solid and beautiful.

Near Cape Monte is a river called Rio Novo, on the banks of which are several good villages, and the soil is very fertile, producing great quantities of rice and other grain, with various kinds of fruits, as oranges, lemons, citrons, pomegranates, &c. Here are also several sorts of quadrupeds, as cows, sheep, goats, hogs, deer, and hares. In summer the water of this river is brackish about two leagues above the coast, on account of the flowing in of the tide; and in winter it sometimes swells so as to overflow its banks; before the mouth of it is a considerable sand-bank, which prevents large vessels from entering it, but small barks pass it without any difficulty: it is navigable as far as a village called Davaranja, to which place it is very deep, and at least 400 feet broad. Above this village the river is encumbered with large rocks, which occasion considerable waterfalls that are very dangerous, and greatly obstruct the navigation.

About ten leagues from Cape Monte, towards the south-east, is a prodigious hill called Cape Menfurado, though not quite so high as Cape Monte; it is round and very large, and is almost surrounded with water; that part next the sea is very steep and high, but that to the land is more gentle and accessible. On the east side of it is a bay of considerable extent, which is terminated by a high land covered with lofty trees. On the west side is another large bay formed by the river, whose mouth is in the center of it. These two bays are separated by a long narrow neck of land. The cape is situated in six deg. 34 min. north latitude; and that part of it which projects most to the sea runs south-east; from whence there is a small river that falls into the western bay, and is navigable for near 40 miles. The water of this river is always brackish, but it abounds with a great variety of excellent fish.

The top of the mountain is quite level, covered with lofty trees, and commands each of the bays, the bell of which is that to the north of the cape, about 100 yards from shore, where there is good anchorage in eight or ten fathom water between the point of the cape and the river's

river's mouth. Before the mouth of the river, along the bay, is a bar, which is dangerous in some places, but easily passed by those who are well acquainted with it. Near the foot of the cape is an ever-running spring, which yields excellent water: it issues from a rock in the bank of the sea, and forms a natural cascade; and here the sailors replenish themselves with that necessary article. To the west of this cape are three villages, containing about twenty houses each; these houses are low, and divided into three apartments; they are built with sticks and clay, and are covered with straw. In one of them are generally lodged at least 40 people, consisting of men, women, and children, of different families all confusedly intermixed together. The people here are very civil and good-natured, and the women remarkably handsome. The men are naturally very indolent, and leave the principal part of business to be executed by their wives. They are as careless about religion as their neighbours at Cape Monie, and only attend to the enjoyments of festivity and diversion. They live very peaceably with their neighbours, and are not apprehensive of any enemy except the English, their fears of whom arose from two large vessels that once stopped there, the crews belonging to which ravaged the country, destroyed all their canoes, plundered their horses, and carried off some of the people for slaves: since which time they have ever been fearful of, and have gained an enmity to, most Europeans, but particularly, the English.

The common people wear only a piece of cotton wound round the waist, and fastened between the legs, but the better sort have a striped frock that reaches to the knees; and if they can get an old hat, they think themselves equipped to the greatest advantage.

Their arms are lances about five feet long, with pointed iron heads; small bows and arrows, the latter of which are poisoned at the ends, and if they touch the blood it inevitably kills the object unless the part affected is immediately cut off. Their arrows have neither iron heads or feathers, and they always shoot them at random, notwithstanding which they seldom miss their mark. They carry square targets of thin board about four feet long and two broad, which are made to hang on their arms, but in so convenient a manner that they have free liberty of the hands to manage the bow.

Their chief articles of trade are palm-wine and rice, of which they have great quantities, and exceeding good in quality; in exchange for which they purchase cowries and small bars of iron.

The king's town is situated about eight miles up the river, and about a quarter of a mile from the side of it. It is surrounded with woods, and the entrance to it from the river is through a beautiful walk shaded with lofty trees. In the center of the town is the council-hall, where the king and his chief people meet to hear all causes, dispense justice, and settle the affairs of state. The floor of this building is of clay raised about a foot from the ground, and over it is a penthouse of a circular form supported by posts, and thatched with palm-branches to shelter them from the heat of the sun. The whole is above twelve yards in diameter, and open on all sides for the convenience of both light and air.

The houses in this town are about 40 in number, and though they are low buildings, yet they are very neat; they are open on one side, and walled on the other three with stakes intermixed with red clay, which bind well, and is very lasting. Their kitchens are even with the ground, but the bed-chambers are raised about a foot from it to avoid the inconvenience of the dews. The roof is raised like a tent, and covered with reeds or palm-leaves, so close interwoven as to admit neither sun or rain. In the center of the kitchen is the fire-place, which is raised about six inches from the ground; and they keep their fires constantly burning, in the day-time for dressing their victuals and the convenience of smoking, and in the night to secure them from the cold and moistness of the air.

Besides their houses, they have buildings for holding their provisions, as rice, millet, palm-oil, brandy, and other necessaries. These buildings are made round,

* Vey signifies *half*, and Berkoma, *land*; by which the term implies *half a nation*.

with a conic roof, and are secured by padlocks, of which the husband keeps the keys, and distributes daily or weekly such provision as he thinks necessary for his family. This does not give the least offence to his wives, who live amicably together, and spend their time in working abroad, or taking care of the children and other necessary business at home. The buildings belonging to each family are enclosed with a wall of earth, seven or eight feet high, and covered with reeds or palm-leaves, to secure it from the inclemency of the weather.

To the west of Cape Menfurado is a river called St. Paul, the entrance of which is about six feet deep, and is navigable, in calm weather, for vessels of a tolerable burthen. This river takes its course westward about three miles, and eastward to the river Sestos, whither the natives daily pass in their canoes, and trade either in the natural produce of the country, or elephants teeth, the latter article being brought to the river Sestos in considerable quantities.

To the south-east of Cape Menfurado is a river called del Punto, or Rio Junck, the entrance of which is so clogged with rocks, that it is impossible for any ships to pass them: on the other side of them, however, the river is navigable, and runs with a fine smooth current for several miles up the country.

Farther to the south-east from this river is another called the river of St. John, the banks of which are covered with lofty trees; and to the east of this river is a high mountain, in the form of a bow, but it is chiefly barren and uninhabited. Near the sea-coast, a few miles from its mouth, is a village called Tabo Carca, and not far from it is another, called, by the natives, Tabo Dagrou, and by the French Petit Dieppe, near which is a river of the same name.

To the south-east of the river St. Paul is a place called Sestre Cro, or Sestre Cruce, where there is a large and beautiful village inhabited by people remarkable for being honest in all their dealings, and preserving a more regular and prudent conduct than their neighbours. The country here is flat and low, but at some distance from the village the land is high, and covered with trees that afford excellent timber. Near the sea are two large rocks about a mile distant from each other, and these are the marks by which this place is known at sea. The houses at Sestre-Cro are built upon piles at least five feet high from the ground, not only to secure them from the unwholesome damp of the earth during the rainy seasons, but also from the wild beasts, which are so numerous here as to be a constant terror to the inhabitants.

About three miles beyond Sestre-Cro is a small village called Wappo, in which there is a piece of fresh water that is exceeding good and wholesome. This place is known at sea by several high trees that appear upon a hill behind the shore, the tops of which, at a distance, seem of a red colour. Before this place is a large rock, which, though actually on the shore, seems, as it were, separated from it.

Between this village and Cape Sestos are several others, the most considerable of which is Great Sestre, where there is a large basin of fresh water situated among a number of rocks. It does not, however, contain any thing else that is remarkable; and the rest of the villages are all too inconsiderable to admit of any notice.

Having described all that respects the Grain Coast, we shall now take a view of the countries adjoining to it, or the interior part towards the west and north-west.

These countries are divided into several territories or kingdoms; the principal of which are, Quilliga, Quoja, Hondo, Folgja, and the great empire of Manow.

Quilliga lies near a river called by the Portuguese Galinhas, and is a large territory subject to the king of Quoja.

Quoja is also a large kingdom, and inhabited by two distinct people, namely, the Vey-Berkoma*, and Quoja-Berkoma†, the former of which are the descendants

† Quoja-Berkoma signifies the land of Quoja.

of the ancient inhabitants of Cape Monte, who were once a populous and warlike people, but being conquered by the Quojoans, and reduced to subjection, are now very insignificant, and few in number. In this kingdom are many handsome towns and villages, the chief of which are situated on the river Maguiba, which plentifully waters the whole country.

In this river, and on its banks, are found great numbers of water-elephants; and when the natives catch them, they present them to the king, who claims them as his particular property, but usually compliments the persons who bring them with a handsome present. This creature is properly called the Hippotamus, or Sea-Horse. It is an animal that feeds upon grass, but frequently hides himself under water, where he continues for some time. When he raises his head from the water, he looks about to see if any danger is near, and can smell a man at a considerable distance. If any thing frightens him, he will immediately hide himself in the water, where he will continue for a considerable time before he again raises his head. As soon, however, as he appears, the hunter, who has patiently waited for the opportunity, levels his gun at his head, and if the animal happens not to see him, it seldom misses doing the wished-for execution. If he is killed, the colour of the water will discover where he lies, when they go with a boat, hooks, and cords, and drag him ashore. They then skin him, take out his bowels, and convey him away on a carriage; for his weight is very considerable, being, when full grown, from 2500 to 3000 lb.

This animal, in colour and shape, greatly resembles a rhinoceros, except the legs being somewhat shorter. The head is much like that of a common horse, but the mouth and nostrils are much larger. His ears and eyes are small, and his hoof is cloven like that of an ox; but his pasteris being too weak to support the weight of his body, nature has taken care to supply this defect, by placing two little hoofs about it, on which he rests in walking, and they leave on the ground the impression of four points. The body is very smooth, but the tail has hair on it, and is short like that of an elephant. The udder of the females hangs between the hind legs like a cow, but it is very small in proportion to the bulk of the beast. The hide is about an inch thick, and so hard that it can scarcely be penetrated with a musket ball, which is the reason that those who endeavour to catch them generally aim at the head. The most remarkable things about this animal are its tusks, which are four in number; they proceed from the lower jaw, and rise out of the mouth to a considerable length. They are as thick as the horn of an ox, and weigh about 10 lb. each. They are very white, and always retain their colour; for which reason they are much used by mathematical instrument-makers for scales, sectors, &c. Besides these, he has in all 44 teeth, viz. eight incisors, four in each jaw; four dog teeth, two on each side, which are all cylindrical; and 32 grinders, of which there are 16 above, and the same number below. The flesh of this animal is exceeding good, and in some parts is sold at 6d per pound. The fat is of equal value with the lean, being exceeding wholesome, and generally used instead of butter. This creature delights in rivers where the water is good, and chooses those parts whose banks are well furnished with grass. They feed chiefly on fish, in pursuit of which they go several of them in a body.

Their method is to plant themselves at the mouths of large rivers, by which they intercept all the fish that come down it. They do not sleep in the water, but among reeds or rushes on the sides of the rivers; and they frequently store so loud as to discover themselves to their pursuers. They bring forth their young on the land, where they suckle and keep them unless disturbed, when they immediately take to the water. The Negroes who have huts near the rivers, are obliged to guard their fields day and night, otherwise these creatures would do considerable damage to their rice and corn, not only by eating it, but trampling it down with their feet.

There is another animal sometimes found in this river that greatly resembles the above. It is much of

the same size, of a brown colour, with white streaks, a long neck, short body, small legs, and has horns like a bullock. They are only caught in the water; for though they are sometimes seen on the shore, yet they are so nimble that it is impossible for any beast to overtake them.

This river also produces a great variety of fish, among which is a remarkable one called the Sea-Woodcock. It is about 10 feet long, and five in circumference. It has a large fin on the back, and two of the same size below the gills. The tail is large, indented, thick and strong; the eyes full, big, red, and lively. The mouth is wide, armed with small teeth, close set, and sharp; besides which, it has a bill about 20 inches long, divided into two parts, proceeding from the upper and lower jaw. This bill is hard and boney, surrounded with a cartilage covered with a rough skin something like shagreen. The flesh of it is intermixed with fat and lean, and the taste of it is far from being disagreeable.

The territory of Hondo is divided into four principalities, the chiefs of which are appointed by the king of Quoja, to whom they pay annual tribute in presents of brass kettles, red cloth and salt.

The kingdom of Folgias, and empire of Manow are both very extensive, but the latter is the most considerable; and the Folgias are in the same manner subject to the emperor of Manow, as the Quojoans are to the Folgias. The emperor's authority extends over all the neighbouring nations, who acknowledge their submission by making him annual presents of cloth, bugles, iron-bars, slaves, &c. and he in return testifies his respect by presenting them with a certain quantity of red cloth. The Folgias pay the same compliment to the Quojoans, who do the like to the king of Hondo. The subjects of the emperor are called *menti*, which signifies *lords*; and the Quojoans are called *menti-manow*, that is, *the people of the lord*. Each of these kings has an absolute authority over his own district, and notwithstanding their subjection to the emperor, can make laws, declare war, or proclaim peace, without his consent.

These countries, besides rice and other grain, produce a great variety of vegetables and roots, as also plenty of panguavers, bananas, pine-apples, &c. In the woody parts are great numbers of elephants, tygers, buffaloes, and other wild beasts; but the only cattle they have are sheep, and they are indifferently supplied with fowl, except small birds, which they catch in the woods.

Among the birds found here is one called *klofi-fowkegboffi*, which is reckoned an ominous bird by the blacks. When they are on a journey, and happen to see one of these birds, or hear it sing, they immediately return home, and if any one dies soon after, they say *kegboffi* killed him. This bird is about the size of a sparrow-hawk, and black-feathered; and its usual food is *pinfires*.

Besides this there are two other birds, which, with the above, the blacks will never touch, but hold them in the most sacred light. The first of these is called the *Fanton*, and is about the size of a lark. When the blacks are hunting in the woods this bird will place itself on a tree near the spot where the animal is hid, and on the approach of the hunters will immediately begin to sing; when she is satisfied the people have taken notice of her, she immediately quits her place and flies to the covert where the animal is secreted.

The other bird is called a *Joxwa*, and is much the same size with the former. It lays its eggs in beaten paths, and the blacks believe that if any one breaks them, it is a certain sign that somebody in the family will soon die.

The inhabitants of these nations, particularly the Quojoans, are in general good-tempered and very obliging to strangers; they are exceeding fond of spirituous liquors, particularly brandy; but they are so penurious that they will not purchase it, and therefore seldom have it unless given to them.

Their houses are built round, in which form are also their villages; but of these they have two sorts, the open

open and the fortified. Their open villages are exceeding pleasant, being encompassed with lofty trees, that join so close together as to keep off the heat of the sun. The fortified villages are called San Siah, and have a fort of bastions, through which they pass in and out of the village, by a gate so low and narrow as to admit only one person at a time. These villages are enclosed with pales fastened to the surrounding trees, so that nothing can be seen through the inclosure. At each of the gates is a hut, where a centinel is constantly kept on guard; and when any danger is apprehended from an enemy, the people promiscuously retire to these villages, as a security both to their persons and property.

Their food consists chiefly of rice, in the cultivation of which they are principally employed. Their trade is very small, having but few slaves to dispose of; and the trifling articles they vend, consisting only of elephants teeth, wax and cam-wood, are soon purchased by the great number of European vessels that pass along their coasts.

The Quoja-blacks, between their harvests, employ themselves in fishing and hunting; but they must not follow the latter without permission from the king, who receives a moiety out of every thing they kill.

The women have a great share in cultivating the lands, it being their task to sow the rice, and keep it free from weeds. They also prepare it for use, by beating it in long deep mortars, made of the hollow trunk of a tree.

Both men and women are here subject to many diseases; but the most fatal is the bloody flux, which often carries off prodigious numbers in a very short time; and they attribute this affliction to the Sovah Morow, or forecress. The beasts are also subject to several sorts of disorders not known in Europe. The chief of these is called the Ibatheba, which kills a great number of elephants, buffaloes, wild boars, and dogs.

The common language used in these countries is that of the Quojas; but the Folgja language is the most elegant, and is chiefly spoken by the better sort in honor of the king. They are very circumspect in their conversation, and make great use of allegories that are sometimes very judiciously applied.

Polygamy is here allowed, as in most other negro countries; and the first wife has always the pre-eminence. The husband maintains the boys, and the girls are taken care of by the wives. Their ceremony of marriage consists chiefly in presents made by the parents of the parties to each other; but the ceremony of naming their children is very particular. When a boy is to be named, the father walks through the village armed with bows and arrows; he keeps continually singing, and as he passes along the inhabitants join him with instruments of music. As soon as the people are properly assembled, they form a ring, when the person appointed to perform the ceremony taking the child from the mother, lays it on a shield, and puts a bow into one hand and a quiver in the other. He then makes a long harangue to the people, after which he addresses himself to the infant, wishing he may be like his father, industrious, hospitable, and a good husbandman. He then names the child, and returns it to the mother, after which the company retire. The men go to hunt for game, and to gather palm-wine, which they bring to the house of the person belonging to the child, when the mother dresses the game with rice, and the evening is concluded with festivity and diversion.

When a girl is named, it is brought by the mother or nurse through the village, in the same manner as the boy is by the father, and when the people are assembled, it is laid on a mat on the ground, with a small staff in one hand. The person who is to name it then makes a long harangue, exhorting it to be a good housewife and a good cook; to be cleanly, chaste, and a dutiful wife: that her husband may love her above all his other wives, and she attend him at hunting. Such wishes being concluded, he names the child, and then delivers it to the mother; after which the whole company disperse, except a few select friends, for whom an elegant entertainment is provided.

When any one dies, all their friends and acquaintance

immediately assemble, and surrounding the corpse sing elegies, in which they set forth the praises and actions of the deceased. After this ceremony is over, the corpse is washed, and the body set upright, supported by props at the back and under the arms. If it is a man they put a bow and arrow in his hand, and dress him with his belt garment. His nearest relations and friends then make a sort of skirmish with their arrows, after which they kneel down with their backs to the corpse, and extend the bow-string to its utmost limits, intimating their readiness to fight against his enemies, or those who shall presume to speak disrespectfully of him. While these ceremonies are in agitation, the women attend on the widow to lament and console with her; in doing of which they throw themselves at her feet, and continually keep repeating these words, *Bgune, Bgune*, that is, *be comforted, or cease your lamentation*. After the whole ceremonies are over, previous to interment, the corpse is carried on a bier to the grave, which is generally made near the sepulchres of their ancestors in some desolate spot, and there deposited about three feet in the ground: they throw into the grave all the kettles, basons, and principal things the deceased was possessed of; the whole is covered with a mat, and they hang his armour on an iron rod, which they fasten in the center of the grave. If a woman is buried, the emblems placed on this rod are, basons, mugs, and other things necessary in house-keeping. They generally erect a hut over the grave to secure it from rain, as also the better to preserve the memory of the deceased.

After the funeral is over, it is customary for the relations and friends of the deceased to make a vow of abstinence, which is called *Ballu Guwe*; this vow is preferred for the common sort ten days, and for the king, or any very considerable person, thirty. Those who keep this fast, when they make the vow, lift up their hands and declare they will not eat any rice during that time, nor drink any liquor but what is kept in a hole made for that purpose in the ground, as also to abstain from connubial enjoyments; and the women vow to clothe themselves only with white or black rags, to go with their hair loose, and to sleep on the bare ground. When the time of abstinence is over, they lift up their hands again, to denote that they have very punctually fulfilled their engagements. After this the men go to seek for game, and if they meet with any, on their return, it is dressed for the entertainment of the company. All who have kept the fast are complimented by the nearest relation of the deceased with presents, consisting of a piece of cloth, a basket of salt, an iron bar, &c. but the better sort receive a mat, a staff, or some kind of weapon.

If they have reason to suspect the person did not die a natural death, they neither wash the corpse, or lament, till they are satisfied of their doubts, and the criminal detected. As soon as the suspected person is taken into custody, he is chained to a great block, and asked if he will acknowledge the fact: if he does, he is immediately put to death; but if not, they try him by making him swallow a large quantity of quony. This is the rind or bark of a tree so called, which, in the presence of the deceased's friends, is pulled off by the suspected person, that the sap or juice may be used without any deceit. The bark is pounded, and then put into a large quantity of water, which, after some time standing, is of an acid taste. Of this liquor they make the criminal drink three or four quarts on the following morning in the presence of the whole company. If he soon discharges it from his stomach, he is deemed innocent; but if it continues there long he infallibly dies, when his body is either burnt or thrown into a river.

Notwithstanding the Quojas-Berkoma are subject to the king of Folgja, yet that prince confers on the king of Quoja the title of *Dandagh*, which he also preserves, and which is conferred on him by the emperor of Manow; and the king of the Quoja gives the same title to the king of Bulm, who pays homage to him, and not to the king of the Folgias.

The king of Quoja is an absolute monarch, but his government is mild, and his councils are formed of the wisest and most experienced persons in the nation: how-

ever, he is jealous of his authority and prerogatives, and keeps a great number of concubines, most of whom are brought from the neighbouring countries.

When the king appears in public, he sits or stands on a shield, to denote that he is the defender of the country, the leader at war, and the protector of his people.

If a nobleman has been guilty of any misconduct, he is summoned before the king, and if he refuses to appear, the king sends his koredo, or shield, by two drummers, who are not to cease beating their drums till the party comes with them, carrying in one hand the koredo, and in the other some distinguished present. As soon as he comes into the king's presence, he prostrates himself on the ground, and throwing earth over his head, begs forgiveness, and acknowledges himself unworthy to sit on the koredo; but promises amendment in future.—The shield is sent to him by way of reproach, intimating, that as he refused to obey the mandates of the king, he might come and take his place, and bear the fatigues of government himself.

When a disgraced person of note is desirous of getting an audience of the king to obtain his favour, he first delivers presents to the chief of his wives, consisting of ribbons, elephant's teeth, &c. and these she carries to the prince, begging that such a person may be admitted into his presence. If the king chooses to grant the petition, the present is accepted, and the person admitted; but if not, the present is privately restored to the owner. However, he dares not return home, till, through the mediation of his friends, the king gives his consent, the present is accepted, and an audience granted; when, if his fault is not very considerable, he obtains forgiveness.

With respect to the punishment of offenders in criminal cases, those that are sentenced to death are executed in fume wood at a considerable distance from the village in which they resided. Here the criminal kneeling, with his head bent, the executioner thrusts a lance through his body; after which he cuts off his head with an axe or knife, and quarters him, delivering the limbs to his respective wives.

If a man is charged with theft, or perjury, and the evidence is not sufficiently clear, he takes the trial by bell, a composition made by the bell-mo, or priest, with the bark of a tree and herbs, which is laid on the person's hand: if it does not hurt him, he is supposed innocent; if otherwise he is deemed guilty; in which case he is sentenced to death, and executed in the manner above described.

In their religion they believe in one supreme being, though they cannot form any just idea of him. They call him Canno, and attribute to him an infinite power, and universal knowledge, and suppose him to be present every where. They also believe that the dead become spirits, whom they call jannanin, that is, patrons or defenders, and suppose them able to protect them in all calamities. Thus when a man happens to escape some imminent danger, he sacrifices at the grave of his supposed deliverer some kind of beast, and makes a feast for the entertainment of the relations of the defunct, as an acknowledgment for the protection he has received.

They believe that the jannanin, or spirits, reside in the woods, and when they receive any particular injury they repair thither, and repeat their grievances with cries and lamentations, entreating Canno and the jannanin to chastise the males of the party whom they name. In short, such is their veneration for those spirits, that they rely on them as well for their present as future welfare. They never drink palm-wine without first spilling a little of it for the jannanin, which custom is also practised even by the kings themselves; and though they appear to pay great reverence to Canno, yet their religious worship is chiefly directed to those spirits, whom they daily invoke.

They consider circumcision as a divine institution, and therefore practise it with great punctuality. In general they circumcise their children at the age of six months; but some defer the operation till they are three years old, that they may bear it with greater ease and safety.

They keep a festival on the day of every new moon,

when they abstain from all kinds of business, and will not permit any strangers to be with them; and they allege, that if they were not strictly to preserve these ceremonies, the moon would not only change the colour of their rice, but make it entirely useless.

They have two other ceremonies that are of a very peculiar nature, and are practised in all the nations of this part of the country. These form two societies or sects, the one of men, and the other of women, but they are entirely independent of each other. The first of these is called belli, and is properly a school or college established once in a certain time by order of the king for the education of youth, who are taught to dance, and to sing often what they call belli-dong, or the praises of the belli. When they have completed their education, and gone through all the ceremonies of the school, they are distinguished by the title of, *The marked of the belli*. After this they are considered as persons of great sagacity, and are admitted to give their opinion in all matters relative to the good order and government of the state.

These schools or seminaries are situated in a large wood, where proper barracks or huts are built, and the land is cultivated so as to produce a sufficiency for the scholars, that they may not have occasion to go to other places for the common necessaries of life. When those who intend to send their sons to the school, have given intimation of their intentions, proclamation is made, forbidding all females to approach the sacred wood during the continuance of the school, which is generally four or five years.

The foggonos, or elders, who are appointed by the king to govern the school, having taken their places, proclaim the laws to the scholars, forbidding them to stir out of the precincts of the college, or converse with any but their fellow-students, or such as have the mark of the belli, which is the first thing they receive after admission. This is done by making several cuts in the flesh from each side of the neck to the shoulder bone; the operation is painful, but they are soon cured by proper simples; after which they receive a new name, and obtain superior dignity.

When their time of education is expired, they are removed from the school, to huts built for the purpose at some distance, where they are visited by their relations, who endeavour to polish their manners, and make them fit for society; for, from their long confinement in this retreat, they are such utter strangers to decency and good behaviour, as to be mere savages. While under this tuition they are dressed with a particular garment about their waist, and their necks are ornamented with strings of beads, intermixed with leopard's teeth. On their head they wear a large cap with flappets, that hang over the face; their legs are loaded with brats bells and rings, and their bodies are ornamented with feathers of various colours. In this dress they are conducted to a place appointed for the purpose near the king's palace, where, in the presence of numerous spectators, they take off their caps, and then sing, dance, and exhibit such other performances as they have learned while at school; and if any be found deficient, they are ridiculed in a particular manner by the women, who exclaim, "He has spent his time in eating of rice!" the same kind of stigma is also laid on them by the men, and they are afterwards looked upon by both sexes with the greatest contempt. When the performance is over, the foggonos, or teachers, call each their own pupil by the name that was given him on his admission into the school, and then presents him to his parents, which name he preserves for the remainder of his life.

The other seminary is calculated for the improvement of females, and is called Nelloge; the ceremonies attending which are these: at a certain time appointed by the king, a number of huts are erected in the middle of a wood, for the reception of such unmarried women as choose to become members of the society. When intimation is given of the number of persons desirous of being admitted, the most ancient woman of the profession is appointed as a governess, and is called fogwilli. As soon as the scholars are assembled, she enters into her

office by giving them a treat, and exhorting them to be satisfied with their confinement of four months, which is the usual time allotted for their tuition. She then shaves their heads, and they having, by her orders, stripped themselves naked, she leads them to a brook, where they are washed all over, and their bodies anointed with palm-oil; after which they go entirely naked during their continuance at the school. The fogwilli, or governess, teaches them the dances of the country, and to recite the verses of the *Yoruba*, which gives name to the profession, they being called Sandi Simodifino, or the daughters of Sandi. These verses consist of certain encomiums which are chaunted, and at the time they exhibit strange gestures and motions of the body, some of which are not only ridiculous, but of the most indelicate nature. When the time of their education is nearly expired, the parents send them clothes, and various trinkets to ornament their bodies, as bugle strings, brass bells, rings, &c. On the proper day appointed, they are conducted by the fogwilli to the village where the king resides, whither prodigious numbers of people of both sexes resort, to see them perform the feats they have learnt at school. During the exhibition the governess sits on the ground, and the daughters of the Sandi dance one after another to the beat of a small drum, when each receives the applauses of the public in proportion to their merits; after which they are dismissed, and delivered by the governess to the care of their respective parents.

Many other strange maxims prevail among the Negroes of these nations; and to their superstitious notions may be added, the great faith they have in magicians and sorcerers, as also a sort of men, whom they call *Munufin*; these they believe can suck the blood from the body of either man or beast; at least they imagine that they can corrupt it in such a manner, as to occasion lingering and painful diseases. There are also other enchanters called *Pilli*, whom they believe can prevent the growth of their rice. Such men, they say, are possessed with the fohah, or devil, and that being overcome with melancholly, they seclude themselves from all society, by retiring to the most desolate parts of the woods and forests, where the devil shews them such herbs and plants as are to be used in their enchantments, as also the words, gestures, and grimaces proper for such practices. The blacks are so confident of there being such people as these in the woods and forests, that they will never travel there without company; and they always carry with them a certain composition, which they fancy secures them from the malicious machinations of these supposed enchanters.

We shall conclude our account of the strange notions entertained among these people, by describing the methods used in cases of adultery. When a woman is accused of this crime, she swears by the belli, wishing that if she is guilty, the spirit may destroy her. If she has sworn falsely, and is afterwards convicted, she is publicly led by her husband to the market-place, where the council sit to hear the merits of the case. They first invoke the jannanin, after which they cover the woman's eyes, that she may not see the spirits that are supposed to be waiting to carry her off; she then receives a severe reprimand for the disorderly life she has led, with the most dreadful threats if she ever does the like again. A horrid noise then ensues, after which her eyes are uncovered, and she is discharged by the jannanin, on promising to live chaste, and mortifying herself for the remainder of her life. If, however, she should relapse after this, and is again convicted, the bellino, with his attendants, go early in the morning to her house, and, making a strange noise with instruments adapted for the purpose, conduct her to the market-place, where the council again sit, round which they oblige her to walk three times, that the brotherhood may have an opportunity of properly seeing her: those who are not of the order must not presume to appear; nor even so much as to look out from their houses, for fear they should be taken away by the jannanin. After the criminal has walked three times round the market-place, she is conducted to the wood of belli, and is never after heard of. The Negroes in general

think such women are carried away by the belli; but it is most reasonable to conjecture that they are put to death; and indeed some of the more sensible part intimate the same opinion, but assert, in order to preserve their superstitious notions, that it is done to appease the indignation of the belli.

S E C T. II.

The IVORY COAST.

THIS coast receives its name from the great number of elephants teeth purchased here by the Europeans, the principal part of which are found on this coast and its vicinity. It is bounded on the east by the Gold Coast; on the west, by the Grain, or Pepper Coast; on the north by Negroland; and on the south by the Atlantic Ocean. The whole coast, which extends from Cape Palmas to Cape Apollonia, is about 250 miles in length, and is called by the natives the Quacqua Coast, the word quacqua, in their language, signifying a tooth.

Cape Palmas is situated in four deg. 27 min. north latitude, and in 5 deg. 55 min. east longitude. To the west of this cape are three round hills, and a little farther inland is a grove of palm-trees, which, standing on an elevated ground, is seen a considerable distance at sea, and was the occasion of this cape being called *Cabo das Palmas*, or, the Palm-tree Cape. Behind the cape is a bay, where ships ride safely at anchor, being sheltered from the southerly winds. About three miles eastward of the bay, is a shoal that appears like a long mountain; and opposite the western point of the cape is a long range of rocks, even with the surface of the water, which reach from south-east to south, about four miles into the sea. The coast here, besides abounding with rocks and shoals, is very muddy, and therefore dangerous for vessels to pass along it. The most favourable times of the year are the months of February, March, and April; during which the air is very serene, and the breezes gentle; but towards the end of May there arise violent storms from the south and south-east, attended with thunder, lightning, and heavy showers of rain, which often continue till the end of January following.

About five leagues from Cape Palmas is a river called *Cavadel*, to the east of which stands a very high rock: and about 12 leagues north-east of the cape is a town called *Ostend*, which name it probably received from the Dutch; but it is a very insignificant place, not having any thing about it that merits the least attention.

Near the mouth of the river *St. Andrew* was formerly a good town, called *Drewin*; but the inhabitants of *St. Andrew* having a dispute with those of *Drewin*, went to war with them, and burnt their town to ashes, making prisoners of all the men, women, and children, whom they sold to the European ships then lying at *St. Andrew's*.

The town of *St. Andrew* is very large, and since the demolition of *Drewin*, has become a place of considerable trade. It is situated on a fine river of the same name, which discharges itself into the sea about 25 miles to the north-east of Cape Palmas. This river divides itself into two branches, one running north-west by west, and the other east south-east; at most times of the year it is navigable for small vessels four leagues up; but in the height of the summer the entrance is so interrupted by a bar of sand, that no vessels can get into it. The country about it is easily distinguished by a number of land-marks and lofty trees, as also several villages, which are so close together, that the whole are seen at one view. The soil is exceeding fertile, and produces great quantities of rice, millet, maize, peas, and a great variety of fruits. The pasturage is excellent for cattle, of which they have great numbers, particularly oxen that are very large, and sold by the natives for a mere trifle. The other productions of this place, as also the manners and customs of the inhabitants are the same as those throughout the whole *Ivory Coast*, the particulars of which will be hereafter described.

To the east of *St. Andrew's* river are a number of

red

red cliffs, which extend many miles along the shore, and are very conspicuous several leagues at sea. Between the seventh and eighth cliff is a small village called Dromwa Petri, remarkable only for two large trees that stand in the center of it, by which it is discovered at a considerable distance.

Farther to the east is Cape la Hou, or Laho, which is the most considerable place for trade throughout the whole coast, the elephants teeth being not only the largest here, but in the greatest abundance. The town is extensive, running at least three miles along the shore, and is very populous. The country about it is fertile, and produces great plenty of most kinds of provisions, which are cheaper and much better than those on the coast of St. Andrew. The natives here are very civil, and easy to trade with; but they raise the price of their commodities in proportion to the number of ships they see on this part of the coast, which is resorted to by different nations, but particularly the English and Dutch.

About four miles west of Laho is a large river, whose main channel runs to that of St. Andrew's; and the smaller branch stretches a few leagues eastward up the country.

Three miles to the east of Laho are two villages nearly together, one of which is called Jack-la-How, and the other Corbi-la-How, but the soil about them is very indifferent. Between these two villages are several small rivulets; and to the west of the latter, about a league from the shore, is a track of the sea, called by the Dutch Kuyfsonder Grondt, but by others, the Bottomless Pit. It received this name from a supposition that there was no bottom; several attempts were at different times made to discover it by the natives but without success: at length, however, it was effected by the Europeans, when the depth appeared to be no more than 16 fathom.

At the eastern extremity of this coast is Cape Apollonia, situated in four deg. 50 min. north latitude. It received its name from the Portuguese, who discovered it on the festival of that saint; and is remarkable for its great height, and the lofty trees that grow on it. The cape runs out a little to the south, and towards the shore the ground is flat, but farther back it rises into three distinct hills, which, in clear weather, may be discovered 10 leagues at sea. On the top of these hills are several lofty trees, which, though situated in a straggling manner, renders the prospect very agreeable. Near these hills, on the shore, are three villages, but the landing is very dangerous on account of the swelling and breaking of the sea on the flat ground between the hills and the shore. The villages here are inhabited by some Negro natives, under the government of the Dutch, who prohibit them trading with any other Europeans but themselves, under very severe penalties.

Having thus noticed the most material places that form that part of Guinea called the Ivory Coast, we shall now take a general view of the country, and describe its various productions, with the customs and manners of the inhabitants, their method of trade, &c. &c.

The Ivory Coast is one of the most delightful divisions of Guinea. The rocky mountains, which are red, and the constant verdure of the trees that cover them, by their various colours, form an agreeable prospect, which is greatly heightened by the beauty of the valleys, that contain many villages encompassed with groves of lofty trees. The soil is in general very fertile, and produces great quantities of rice, millet, maize, and a variety of roots and vegetables; also several sorts of fruits, as melons, oranges, citrons, cocoa-nuts, &c. Here are likewise walnut-trees of a peculiar kind, bearing nuts smaller than ours, which are divided in the middle, and taste like the best almonds. Sugar canes also grow here very plentifully, and to great perfection, but they are not noticed by the natives, and only serve as food for the elephants, which are in greater abundance here than any other part of Guinea. Indigo and cotton are also so common to this country, that they grow without cultivation; and they have some tobacco, which, if carefully managed, might turn to great advantage.

Cattle of most sorts abound here, as oxen, goats, hogs, sheep, &c. A good ox is seldom sold for more than a few dozen of knives, and the inferior ones in proportion.

They have also great plenty of poultry, and the whole coast abounds with variety of fish. Among the latter are frequently found three remarkable creatures, namely, the sea-ox, the zingana, or hammer-fish, and the sea-devil.

The sea-ox, or horned fish, is about 11 feet in length from the snout to the end of the tail. The body is about five feet in circumference, and of the same thickness all over. The skin is hard, rough, and without scales, but full of unequal points, and marked with large spots of various colours. The head is shaped much like that of a hog, but has a protuberance at the end, like the trunk of an elephant, by means of which, like that animal, it receives its food. The eyes are exceeding large, and surrounded with prominent lids composed of hard, coarse, and rough hairs. On the fore part of the head are two horns of a bony substance; they are strong, round, and pointed at the ends, and are about 16 inches in length; they lay straight and parallel to his back, on the upper part of which, near the shoulders, are two excrescences, that continue from thence to within a foot of the tail. That part of the tail next the body is very fleshy, and covered with the same kind of skin; but the extreme part is composed only of a fin, strong and thick, of a brown colour, crossed with white rays, or parallel lines. This seems to serve as a defence to the fish, who has also two spurs at the extremity of his belly, each of which is a foot long, round, bony, and pointed like his horns. The gills are large, and to each of them is a fin, small in proportion to his bulk, but very strong. Besides these, and a smaller one beneath his belly between the two spurs, he has also on his back a rising lump, which supports a fin shaped like a fan, about a foot and an half in diameter, and the same height. The flesh is white, fat, and in its taste far from being disagreeable.

The zingana, or hammer-fish, is a voracious creature, and will feed on any thing it meets with, particularly human flesh: the head of this animal is flat, and extends itself on both sides like a hammer; at the extremity of each of these are placed the eyes, which are large and sparkling; the mouth is formed much like that of a shark, and contains two rows of long sharp teeth; the body is round, and terminates with a large sloping tail, but it has no scales, only a thick skin with rough spots; the fins are large and strong, and greatly assist him in seizing his prey, which he always attacks with the most surprizing eagerness: the flesh of this creature is so coarse and ill tasted that it is entirely useless.

The sea-devil may reasonably be supposed to have received its name from the ugliness of its form, of which it has the pre-eminence above all other creatures found in the seas: it has four eyes, and is about 25 feet in length, and 18 in breadth; on each side of it is an angular substance as hard as a horn, and very sharp; the tail is very long and taper, and terminates with a dangerous point; the back is covered with small lumps, about two inches high, and sharp at the ends; the head is large, but there is no appearance of any neck, and the mouth is furnished with a great number of sharp-pointed teeth; two of the eyes are near the throat, and are round and large, but the other two are placed above them, and much smaller: on each side the throat are three horns of an unequal length, the middlemost of which is three feet long, and an inch and a half in diameter, but they are flexible, and therefore can do but little harm: the flesh of this creature is harsh and ill-tasted, but the Negroes catch them for the sake of the liver, from which they extract large quantities of oil.

There is another fish of the same name that is only about four feet long, and broad in proportion; it has a bunch on its back covered with thorns and prickles like those of a hedge-hog, and the skin is hard, rough, and of a black colour, rising with several small bunches, between which there are two small black eyes: the mouth is very wide, and armed with several sharp teeth, two of which are crooked like those of a wild boar: it

has

has four fins, and a broad tail forked at the end; and over the eyes are two sharp horns that bend towards the back. This fish is also exceeding frightful, and the flesh of it is a deadly poison.

The Quaque blacks, or natives of the Ivory Coast, are tall, lusty, and well featured; but at the first view they appear rather frightful, which, in all probability, is the reason that some writers have described them as a savage and barbarous people; this, however, is a great mistake, for in general they are rational and well-behaved, and are very honest in their dealings, particularly with the Europeans that visit this coast. When they go to trade with any ship, they take some water into their hands, and let a few drops of it fall into their eyes; this is a kind of oath, by which they intimate that they would rather lose their eye-sight than cheat those they trade with. They are no less averse to drunkness than fraud; and though their country produces a prodigious number of palm-trees, yet they will not drink any palm-wine, but only a certain liquor called hordou or tombo-wine, which is much weaker, and rendered still more so by being mixed with water.

The common people wear only a small piece of linen cloth round the waist, but the better sort wear a kind of mantle or large linen sheet wrapped about them, with a scymetar or poniard by their sides. They file their teeth very sharp, but they are in general irregularly placed, and very crooked. They are fond of having long nails, and take particular pride in the length of their hair, which they plait and twist in different forms, and grease it with palm-oil mixed with red earth. With this composition they every day anoint their bodies, and continually chew betel, the juice of which they rub about their mouths and chins. They ornament their legs with a great number of iron rings, and in this consist their chief dignity, for the greater a man's quality is the more rings he wears.

The drets of the women consists only of a piece of cloth before, which hangs from the shoulders to the knees, but their backs are quite naked. They ornament their hair with little toys of pure gold, which are of various forms, and generally very thin; but the wives of some of the rich Negroes have such a quantity of them on their heads, as amount to a considerable value. There are sometimes of great use to their husbands, who, when they are debilitated from purchasing goods for want of cash, make no hesitation to strip their wives of their ornaments, and turn them into money for that purpose.

Their language is altogether unintelligible, and they speak hastily and by starts. When they meet each other they use the word quaque, at the same time each laying one hand on the other's shoulder, and taking hold of the fore-finger, pull it till it snaps, when they again, in a low voice, repeat the word quaque, which closes the salutation.

They are all idolaters; and though there are several petty princes in different parts of the coast, yet the whole are subject to a king, called Soccoo, whom they not only respect but dread. They look upon all their kings and priests as sorcerers, but in particular the king of Soccoo; and they imagine that if he would only make use of his fetters or enchantments, he would cause all his enemies to die.

One of the fundamental laws of this country is, that every one is obliged to continue all his life in the condition in which he was born; so that, for instance, one whose father was a fisherman, can never become any thing else but a fisherman; and to of all other trades and professions.

In some parts of the coast, particularly at Laho, they make a pretty sort of cotton fluffs, striped blue and white, about three quarters broad, and three or four ells long. These are much valued, and sell for a good price in most parts of Guinea.

The Negroes both here are very fond of trade, but they are cautious in going on board European ships, particularly those from England. When they see a vessel on the coast, they first examine it, and if they think they can deal safely, they carry their goods on board, such as gold, ivory, slaves, or provisions. How-

ever, they are always very mistrustful, and their fears are in some degree justly founded, since the Europeans have trepanned many of them, whom they have sold for slaves.

They generally go four or five in a canoe, but only one will go on board first, the others remaining in the canoe till he has satisfied them of their safety; nor can they, on any occasion whatever, be persuaded to go down between the decks. The most effectual method of alluring them on board is, for the master, or some of his officers, to take up a bucket of water from the sea, and with their hands sprinkle some of it on their eyes. This, they imagine, binds them like an oath, looking upon the sea as a deity, or object of religious veneration.

A modern writer says, "It is impossible to conceive what patience is required to trade with most of these people; and, what is worse, they cannot be understood, nor do they understand Europeans; so that all is done by signs and gestures of the hands or fingers, and by setting a quantity of goods against the teeth they offer to dispose of."

Besides the articles of ivory, gold, and slaves, the Negroes here carry on a great trade in salt, which they sell to their neighbours, who carry it farther into the inland countries, and dispose of it to great advantage, it being in those parts exceeding scarce.

The inland parts of this coast produce the largest and best elephants teeth to be found in the universe. Mons. Marchais says, "The quantity of ivory which this country affords is so great, that 10,000 l. worth has been sold here in one day. The inland country is so full of elephants that the inhabitants of hilly parts are obliged to dig their houses in the backs of the mountains, and to make their doors and windows narrow and low, that they are forced to use all kinds of artifices to drive them from their plantations, or to lay snares for them, and kill them. The reason of ivory being so plentiful here is, because the elephants call their teeth every three years; so that they find more loose teeth in the forests, than they get from those they kill."

Notwithstanding the elephants teeth are no less plentiful here at this time than formerly, yet the blacks have considerably enhanced the price of them, so that the advantages of that trade are much lessened. This, however, is in a great measure owing to the trade having become more general, for the coast is annually visited by prodigious numbers of ships, not only belonging to the English, French, and Dutch, but also to the Danes and Portuguese.

S E C T. III.

The GOLD COAST.

WE come now to the third division of Guinea, called the Gold Coast; but for what reason it is so named we cannot pretend to say, since the other parts of Guinea produce equally as much gold, and at least as good in its quality. The inland countries, throughout the whole coast abound with gold mines, and though the natives are not artful enough to follow a vein, yet they find great quantities of it in several of their mines; but they preserve them so secure that they will not permit any European either to see them, or to search for others. Besides their mines, those who live near the sea have another method of finding gold, which is thus: In the rainy seasons, after a wet night, they go to the sea-shore, each having a couple of bowls or platters made of calabashes, the largest of which they fill with earth and sand, such as is drove down from the mountains by the violence of the rain into the rivers, brooks, &c. This they wash with many waters by often turning the bowl round, so that the dirt which rises on the surface washes over the brim; if there be any gold it sinks to the bottom by reason of its weight; and thus they continue till they have washed all the earth and sand away, except a small quantity at the bottom, which they carefully take out and lay by for a minute inspection. They then fill their platter again, and wash on till they have gathered together a tolerable quantity of drags, which they carry home, and then search with great diligence. Sometimes they find as much as is worth

The Gold Coast is bounded on the east by the Slave Coast; on the west, by the Tooth or Ivory Coast; on the north, by Negroland; and on the south, by the ocean. It contains eleven different districts, namely, Axim, Anta, Adom, Jabi, Commany or Commando, Fetu, Saboe, Fantyn, Acron, Agonna, and Aquamboe. These countries contain some one, two, or more towns or villages lying on the sea-shore, either under or between the European forts and castles. However, these villages are only for the convenience of trade and fishing, for the principal towns lie within land, and are very populous. Seven of these districts are kingdoms governed by their respective kings or captains, the others are independent republics, under the direction of their own magistrates.

The Gold Coast being situated within the 5th degree of north latitude, the heat is excessive from October to March, but in the other six months it is tolerably temperate. The coast is very unhealthy, owing to the extreme heat of the day and the coolness of the nights; to which may be added the damp sulphurous mists that arise every morning from the mountains. Tornados are also frequent here, particularly in the months of April, May and June. These are violent storms of wind rising suddenly from the east and south-east, and sometimes from the north, with a few points to the west. They are generally attended with repeated claps of violent thunder and dreadful lightning, with prodigious showers of rain falling like a flood, and an uncommon darkness. They sometimes last an hour, and sometimes two or more; but as soon as they are over the weather immediately becomes clear and fine. If they happen in the summer season, which is sometimes the case, they are not so violent as in the winter, but they are more incommodious both to land and sea-faring people, being usually followed by cold rains, so heavy and constant for several days together, that they seem to threaten a second deluge.

The Negroes on the coast shun rain with the greatest care, thinking it very prejudicial to their bodies; this, indeed, the Dutch themselves experience, particularly in the tornado season. The rains that fall then are of so pernicious a quality, that if a person sleeps in his wet cloaths he is sure to contract a dangerous disease: it has been found that cloaths laid by wet, have in a short time been so rotten as to fall to pieces with the most gentle touch. The natives, for this reason, avoid the rain as much as possible; and when they happen to be caught in it they cover their shoulders with their arms across to keep it off their bodies. They are so fearful of the consequences of rain that they always sleep with their feet to the fire, and anoint their bodies with oil, through a persuasion that the frequent unclean keeps the pores shut so that the rain cannot penetrate; for to this it is they attribute the cause of all their diseases.

Natural History of the Gold Coast.

THE whole coast abounds with a variety of trees, some low and others very large and lofty; there are also many beautiful groves, which serve to render the malignity of the place more supportable. Some of the trees here grow naturally in such order as to appear as if placed by art, whilst others stand so thick, and extend their boughs so wide, as to form the most agreeable retreat; and these run for many miles into the inland parts of the country. One of the most remarkable trees, and which grows in great abundance all along the coast, is the papay-tree, the trunk of which is several feet thick, and composed of a spongy wood, or rather root, which it most resembles; it is hollow, and may be easily penetrated with an axe. The fruit at first is produced at the top of the trunk without any branches; but as the tree grows older it shoots out branches towards the top, which resemble young stocks, whereon likewise fruit grows. At the vertex of the trunk and branches shoot other small sprigs almost like reeds, a little crooked and hollow; and at the extremity of these sprigs grow large broad leaves, in their shape resembling those of the

vine. The fruit is about half the size of a cocos-nut, and of the same form: it is green both within and without; but after being some time gathered it turns red, and abounds with white kernels, which are the seed from whence the trees are produced. The fruit in its taste is something like that of a pompion, but of the two rather inferior. Some of these trees are very large, and run up to a considerable height. They are of two sorts, male and female; the males bear no fruit, but are continually full of blossoms, consisting of a long white flower: the female also bears the same blossom, though not so long; neither are they so numerous.

The inland countries on the coast of Guinea are in general fertile, and produce several sorts of grain, particularly maize and millet, which grow in great abundance. They have also several kinds of vegetables and roots, as cabbages, beans, wild purslain, potatoes and yams. These last are exceeding plentiful, and, next to rice, of the greatest advantage to the natives; they grow under the earth like potatoes, and are about two spans long, and as much in circumference. They shoot out a long green stem, almost like that of French beans, with little prickles, and they run up sticks placed by the side of them in the same manner, by which the Negroes know when they are ripe, and then dig them up. They are quite white within, and when boiled or roasted, eat exceeding well, and are used instead of bread, not only by the natives, but many of the Europeans. The taste is much like that of earth nuts, though not quite so sweet, but they are drier and much more substantial.

Palm-trees grow here in abundance, and are of infinite service to the natives, not only from the wine that flows from the trunk, but the oil which they extract from their nuts. They have also plenty of various kinds of fruits, as plumbs, pears, oranges, citrons, cocoa-nuts, and figs: to which may be added, ananas, water-melons, and the kormantin apple. The last fruit is more peculiar to this country than any other; it is about the size of a walnut, and has a green husk; but the outer rind is of a yellowish cast, somewhat inclining to red. In the core are four large flat kernels separated by the pulp, which is red and white, of a sweetish tart taste, but most inclining to the latter. It is a very agreeable and refreshing fruit, and of infinite service to those afflicted with the bloody-flux; for it is very altering, and when boiled with wine and sugar, is not only more useful, but more pleasant than tamarinds.

The tame animals of this country are, bulls, oxen, cows, sheep, goats, and hogs; but the pasture is so indifferent, that they are in general exceeding poor and small: the cows yield very little milk, and one of the best, when full grown, is so light, that it will not weigh above 250 lb. The sheep are not above half the size of those of Europe; but instead of wool, their bodies are covered with long shaggy hair. The goats are very plentiful, but small in proportion to those of Europe: however, the flesh is very fat and sweet, and greatly preferred to that of the sheep. The hogs are also exceeding numerous, but their flesh is very indifferent, and what little fat they have turns all to oil.

Their chief domestic animals are dogs and cats. The Negroes frequently eat the former, and are very fond of them, inasmuch that they will not only give a sheep for one of them, but also something to boot. They prefer dog's flesh to any other, and consider it in the same light as the Europeans do venison. The dogs here are much like our foxes, and have long, upright ears; their tails are long, but taper, and are without hair; the skin is also naked; and they never bark, but only howl. They are very disagreeable to the sight, but much more so to the touch. The blacks call them *Sabra de Matis*, which in the Portuguese signifies *a wild goat*; and so universally are they admired in this country, that in some places they breed them for sale, and carry them to the markets, where they fetch a much better price than the sheep.

Cats are also greatly esteemed by the Negroes, but they do not eat them, unless out of necessity. If they are good mouseters, they value them much, as they are prodigiously pestered with various sorts of vermin. They

are in general very handsome, and are called by the natives Ambaio.

The wild beasts, both on the coast, and in the inland parts, are of various sorts. Among these none are more distinguished than the elephants; for though in other parts these animals are rendered docile and useful, yet here they are never tamed. But notwithstanding this, they seldom hurt any one, nor is it an easy matter to provoke them. Mr. Bosman, in his description of Guinea, relates the following story of one of these animals: "In December, 1700, at six in the morning, an elephant came to El Mina, walking easily along the shore under the hill of St. Jago. Some Negroes were so bold as to go to him without any thing in their hands; he suffered them to encircle him, and went quietly along with them under mount St. Jago, where one of our officers shot him above the eye: but this, and the following shot, which some Negroes now poured on him, did not even make him mend his pace, and he only seemed between whiles to threaten the Negroes, by pricking up his ears, which were of a prodigious size. He, however, went on, and soon entered our garden. This drew the director-general and myself thither, and we were soon followed by some of our people. He had broke down five or six cocoa-trees, and in our presence he broke down five or six more; when the strength he seemed to use in breaking down a tree might be fitly compared to the force exerted by a man in knocking down a child of three or four years of age. While he stood here above an hundred that were fired at him, which made him bleed as if an ox had been killed. But this did not make him stir, he only set up his ears, and made the men apprehend that he would follow them. At length a Negro going softly behind him, wantonly got hold of his tail, and was going to cut off a piece of it; but the elephant giving the Negro a blow with his trunk, and drawing him to him, trod upon him two or three times, and, as if that was not sufficient, gored two holes in his body with his teth, large enough for a man's double fist to enter. He then let him lie, and even stood still while two Negroes ventured to fetch away the body, without offering to hurt them. At length the elephant, after he had been about an hour in the garden, wheeled about as if he intended to fall on us, on which we all flew to the fore door, in order to make our escape; but he followed none of us, but going to the back door threw it to a great distance; then turning from it, walked through the garden hedge, and proceeding slowly to the river by mount St. Jago, bathed himself. Having thus refreshed himself a little, he came out of the river, and stood under some trees by some of our water-tubs, where he also cooled himself, and then broke the tubs in pieces, as he did also a canoe that lay by them. The firing was here renewed, till the elephant at last fell; after which they cut off his trunk, which was so hard and tough, that it cost the Negroes thirty strokes before they could separate it, which must have been very painful to the elephant, since it made him roar, which was the only noise I heard him make. He was no sooner dead, than the Negroes fell on him in crowds, each cutting off as much as he could, so that he furnished great numbers with food. Those who pretended to understand elephant-shooting, afterwards told us, that we ought to have shot iron bullets; indeed, ours were not only of lead, but too small, and therefore most of them had rebounded from his hide, and very few penetrated his skull."

The elephants here are so numerous, that they are very prejudicial to the fruit trees, especially to the orange, banana, and fig-trees; the two latter of which they usually destroy, for they not only eat the fruit, but also the stem.

Tigers are also very plentiful all over the coast, and are exceeding dangerous, some of them being not only large, but of the most ferocious nature. Jackalls are also very numerous, and little less fierce and ravenous than the tigers. They are usually about the size of a sheep, but have longer legs, which are thick in proportion to their bodies. They are very strong, and their hair is short and spotted; their head is flat and broad, and their teeth exceeding sharp.

There are also some wild boars, but they are not so rapacious as in most other countries, and their flesh is exceeding good.

Apes and monkeys abound here, and are of various sorts. Some of these are called by the Dutch, bearded monkeys, from their having long white beards; the hair on their backs are of a light brown, that on the belly white, and the rest of the body is covered with spots. There are others called white-noises, from that part of them only being of a white colour. These animals, though of various sorts, are all very cunning, and ready to imitate what they see. They are fond of their young, always in action, and greatly resemble the human form; so that the Negroes call them cursed men, and say they could speak if they would. They are in general great thieves, and show a remarkable subtilty in what they steal, particularly millet, of which Momb. Barbot has given us the following relation: "They take, says he, one or two stalks in each paw, as much under their arms, two or three in their mouths; and thus laden they march away, continually leaping on their hind legs: but if pursued they hold what they have in their mouth, and let the rest drop to be at liberty to run. Every stalk they pluck is nicely examined, and if they do not like it, they throw it away, and pull another; so that this daintiness occasions more damage than their thievery."

One of the most remarkable of these species is called by the natives Boggo, and by the Europeans, Mandril: it is different to all others, and comes much nearer to the human shape. The body, when full grown, is as large as that of a man; their legs are much shorter, but their feet longer, and their arms and hands are in proportion. The head is very large, and the face broad and flat, without any other hair than the eye-brows. The nose is very small, the lips thin, and the mouth wide. The face is wrinkled as if with old age, and the teeth are broad and yellow. The hands and feet are white and smooth, but all the rest of the body is covered with long hair. They always walk erect, and when vexed or teased cry like children. While Mr. Smith was at Sherbro he received a present of one of these animals. It was a fine cub but six months old, yet larger than a baboon. He gave it in charge to a Negro slave, who knew how to feed and nurse it; but whenever he left the deck, the sailors began to tease it: one was loved to hear it cry, others hated its snorty nose. One of them hurt it, for which being checked by the Negro slave, the former told him he was very fond of his country woman, and asked him "if he should not like her for a wife?" To which the Negro readily replied, "No this, no my wife; this white woman, this fit wife for you." Mr. Smith supposed that this unlucky wit of the Negro hastened the death of the beast, for the next morning it was found dead under the windlass.

Besides the wild beasts of a voracious nature, there are others much milder, as harts, antelopes and hares. The former of these are of various sorts, some of them being as large as cows, others not bigger than sheep, and some even so small as cats. They are in general of a red colour, with a black stripe on the back, and some of them are beautifully streaked with white. They are all good to eat, and the flesh is particularly admired by the Dutch.

Here are also several sorts of wild cats, some of which are spotted like tigers, and are very fierce and mischievous. Among these is the civet-cat, called by the Negroes kankan, and by the Portuguese, gatos de algalia. They are about the size of a fox, but longer legged; and the tail is much like that of a common cat, except being longer in proportion to the body. Their hair is grey, and full of black spots: those who keep them for the sake of the musk generally feed them with raw fish, or entrails, as they yield much more from that than a drier food. When hungry they are very ravenous, and will even know through the wood of their cage. They are very cleanly, and always roll and tumble on their food before they eat it. Those who keep them generally vex and tease them before they take out the musk from the bag; for the more the animal is enraged previous to this operation, the better will be the civet. The bag

which

which contains the civet is in the middle betwixt the anus and the pudendum, both in the male and female; but it is much larger in the male. The liquor of which the civet consists appears to be excreted from certain glands, that lie between the coats that compose the bag, from which the civet is taken. The civet is valued as a great perfume, but it is not of any use in medicine.

Here are also some porcupines, which are in general about two feet in height, and their teeth are remarkably sharp. They are very daring, insofmuch that they will venture to attack the largest and most dangerous snakes. When irritated they shoot their quills at the enemy, and with such violence that they afterwards prove fatal. The Negroes eat them, and look upon their flesh as a great delicacy. Their quills are from eight to ten inches long, and pointed at both ends; they are of a horny substance, and in their colour much resemble tortoise-shell.

Besides those already mentioned, there are several other animals in this part of the coast of Guinea, and among the rest, that remarkable one, called by the natives potto, but more generally known by the name of the sloth, and is said to be the most ugly creature in the universe. This animal is so slow in its motion that it cannot travel above twenty yards in a day. The head is strangely disproportioned, and the fore-feet greatly resemble hands. The hair of the young ones is of a pale mouse-colour, but that of the old is red, and looks more like wool than hair. The female, when big with young, climbs the trunk of some old tree, in which there is an hollow, from some accidental decay, at a distance from the ground. Here she deposits her young, which are generally two in number; during the time she suckles her young she continues in the same hole, and though that period is very short, before it is expired she becomes almost emaciated. When the young are able to crawl after her, she leads them to the nearest branches of the tree, where they devour the leaves first of one and then another. When the tree is quite stripped they are obliged to seek a new place of abode; the journey, however, to the next tree takes up no small time in performing; and though the creature is fat and in good condition at the time he leaves his former habitation, yet before he has reached his new one he becomes so poor and lean as possible; and if the trees are high, or at any distance, and he meets with nothing on his journey, he inevitably dies with hunger. While it is thus travelling slowly on the ground, any beast may kill and devour it, for it is entirely defenceless, and when attacked only makes a noise like the crying of a kitten. The characteristics of this animal are, its slow pace, and its having the fore feet longer than those behind, with three claws on each foot.

In the woods is another four-footed animal, called by the Negroes Quogelo. It is about eight feet long, including the tail, and is covered from the neck to the end of the body with scales resembling the scales of an eel. The scales are placed very close together, and secure the creature from the attacks of its enemies, particularly the tigers and Leopards, who frequently pursue him, and as he is not very swift, they soon overtake him; on which occasion the animal rolls himself up in his coat of mail, when his enemies dare not attack him. The Negroes knock them on the head, fell their skins to the Europeans, and eat their flesh, which they say is exceeding white and palatable. It is a very inoffensive creature, and will not hurt any thing; it lives on pismires, catching them with its tongue, which is extremely long and glutinous.

There is another animal called the punno; it is an amphibious creature, and greatly resembles a crocodile; but it is very inoffensive, not hurting any thing except cocks and hens, among which it sometimes makes great slaughter. This animal is about four feet in length; the body is black peckled, the eyes are round and sharp, and the skin very tender. The Negroes eat their flesh, as do also the Europeans, and they all agree that it is exceeding good, and far preferable to that of their cocks and hens.

The tame poultry here consists of cocks and hens, geese, ducks, turkeys, and pigeons; the wild sort are,

mallards, pheasants and partridges; besides which they have peacocks, fieldfares, cranes, ring-doves, &c. There are also great numbers of parrots, paroquets, eagles, kites, green-birds, and several others peculiar to this country.

The most common are the cocks and hens, which are exceeding plentiful all over the coast; in some parts they are very fat and good, but in general they are so dry and lean, that few people chuse to eat them. The best birds here for use are the wild ducks, which are very plentiful, and little inferior to those of Europe. There are also various kinds of small birds, some of which are exceeding beautiful; among these there is one that has this remarkable circumstance attending it, that whenever it moults, it changes its colour; so that those which are black this year, become blue or red the next; they will be yellow the following year, and afterwards green; but they never vary from these five colours, which are always very bright, and never mixed.

The crown bird is also found on this coast, and is more beautiful than those in other parts of Guinea. They are about the size of a stork, and receive their name from a large tuft that grows on their heads, some of which are red, others blue, and some of a shining gold. Their bodies are chiefly covered with black feathers; the sides of their heads are beautified with purple spots, and the feathers of their wings and tails are of different colours, as red, yellow, white and black. Their tails are very long, and the Negroes pluck the feathers to ornament their heads.

The Gold Coast abounds with reptiles and insects, as snakes, toads, frogs, scorpions, coal-roaches, locusts, millipedes, caterpillars, gnats, spiders, beetles, bees, and ants. Lizards are also exceeding numerous, and there are many crocodiles, and some camels.

The snakes not only infest the woods, but also the houses of the Negroes, and even the European settlements. Most of them are very large and venomous; but there is one of a peculiar nature, and so inoffensive that it will neither hurt man or beast. It is called the horn-snake, from a horn, or rather tooth, that rises from the upper jaw, and projects through the nose. It is about five feet in length, variegated with black, brown, yellow, and white streaks very agreeably mixed. The head is broad and flat, and the horn is white, hard, and sharp-pointed. The Negroes often tread upon them, for they sometimes go to satiate themselves with food, that they sleep in a state of absolute insensibility, and the greatest noise will not wake them. The Negroes eat them, and think their flesh a delicious repast.

The toads here are remarkably large, and some of them so strong and venomous, that they frequently engage the serpents, and kill them.

The scorpions are in general about three inches in length; they have four legs on each side, besides two claws armed with fuppets, between which is the head. The body consists of nine joints, and the tail of six, which has a hooked weapon at the end. There are some on this coast as big as small lobsters, and have the same sort of claws and feet; but their bodies are covered all over with long black hair. All of them have a small bladder full of poison at the end of their tails, which they discharge either at man or beast, and the venom produces certain death.

The cock-roach is of a dark brown colour, and its shape somewhat like a beetle. They are in general about two inches long, and are said to be mortal enemies to bugs.

The locusts here are very numerous, and sometimes make great destruction among the corn and vegetables. This insect is about five inches long, and about the thickness of a man's little finger; it has a cowl over the neck, and a pyramidal head, from whence there proceeds two small horns or feeders, almost an inch long; the eyes are prominent, and of a dark red colour; the body is oblong, and of a bloody purple colour; and the tail is forked like a swallow's. It has four ash-coloured wings marked with dusky spots; the fore feet and thighs are very slender, but the hinder ones are long and thick, and marked with transverse streaks of

of a blackish colour. Besides the sort already described, there are other species of this insect, some of which are not above three inches in length; these are of the cowed or hooded kind; the upper wings are of a light green streaked, and the lower ones finely chequered with brown and scarlet.

The millepedes, or hog-lice, are very numerous, and though their sting is not so dangerous as that of the scorpions, yet it occasions a very sharp pain for some time. They are flat and red, intersected like other worms, and have two small horns or claws with which they strike. Their feet are 40 in number, viz. 20 on each side; from whence they are called by the Portuguese and English, forty-legs.

Among the insects here, the most remarkable are the ants. These are of various sorts and colours; some are white, others black, and some red. The white are as transparent as glass, and bite very forcibly; but the red are the worst, their sting being inflammatory, and the pain it produces of much longer continuance than that of the millepedes. They make their nests in the fields, and generally raise them at least 10 feet from the ground; but some build them in high trees, from whence they fly in such swarms to the European settlements, as to become exceeding troublesome to the inhabitants. They are very rapacious, and will sometimes attack a living sheep, which, in a night's time, they will reduce to a perfect skeleton, leaving not the least thing except the bones. Fowls and chickens frequently share the same fate, and even rats, though such active animals, are not able to escape. As soon as one of these animals is attacked by the ants, his destruction is at hand, for they gather in such prodigious numbers, that they soon overpower him; nor will they quit him, till they are sufficiently formidable to carry him off to some convenient place, when they immediately fall to work, and in a short time reduce it to a mere skeleton. A late writer says, "If these little animals have not a language, (as many believe they have) yet they have certainly some method of communicating their thoughts, as I experienced in the following manner: when I saw two or three straggling ants on the hunt, I would kill a cockroach, and throw it in their way. As soon as they found what it was, they went away for help, while the others staid and watched the dead body, till their comrade returned at the head of a large posse; who, if they found themselves too few to carry off the prize, detached a second messenger for a reinforcement."

The gnats are another plague on this coast, especially near woods and marshy grounds: they sting very sharp, and raise prodigious swellings, attended with violent pain; they are most troublesome in the night, and frequently oblige the inhabitants to desert their habitations.

The sea and rivers on the Gold Coast produce great quantities of various kinds of fish. Those of the former are, dorados, bonitas, cod, tunny, thorn-backs, the flying-fish, and several others; the most distinguished of which we shall particularly notice. There are also lobsters, crabs, prawns, shrimps, and mussels. The principal fresh water fish are of three sorts; the first of which is called carmon, and is a white fish about two feet long; but they are very fat and oily, otherwise their flesh would be exceeding delicious. The second is the mullet, which differs from the former only in its size, and not having so thick a head, and the flesh is of much the same quality. The third sort is called Bantavia, the largest of which are tolerably good, but they are apt to taste muddy: they are about a foot in length, and very proportionably shaped. There are also some plaice, and flounders are exceeding plentiful, but they differ greatly in their shape from those of Europe, neither are they so good.

The best fish of the coast caught in the sea is the dorado, the flesh of which is exceeding delicate, and in taste somewhat resembles that of a salmon. They are generally about four or five feet long, and have a sort of creel on the head, which joins to a large fin that runs to the extremity of the tail; there is also another that is shorter, and runs only from the vent to the tail. The belly fins reach almost to the vent, which is placed

in the center of the body; and the mouth is of a middle size, having small sharp teeth in the jaws, palate, and tongue. The eyes are large, the scales exceeding small, and the colour of a bluish green. They greatly resort about ships, and are esteemed the swiftest fish that swims. The liver, dried and pulverized, if taken in wine, is a cure for the dysentery.

The bonito is about three feet in length, and two in circumference. It has a sharp head, a small mouth, large gills, full eyes, and a tail like a half moon. It has not any scales, except on the middle of the sides, where there is a line of gold colour, that runs from the head to the tail. On this line is placed a double row of scales, which are smooth two-thirds of the length, but begin to grow rough near the tail. The back and sides are of a greenish colour, but the belly is white, and shines like silver. It has seven fins, two on the back, two at the gills, two on the belly joint below the gills, and one in the center of the belly, opposite to the largest on the back. From the last on the back proceeds a small narrow one, that reaches to the tail, and another that extends from the last on the belly to the tail in like manner. It is a good fish, but inferior in quality to the dorado. The sailors catch them with a hook baited with a white rag, which they snap at with great eagerness. They are caught in places where the sea is roughest, and, like the dorado, love to swim about ships.

The albicore is somewhat like the bonito, but the flesh is much drier, and not so well tasted. They are in general about six feet in length, and have yellowish eyes, with a forked tail. The bottom of the belly is blue, inclining to green; and near the tail, on the under part, are several short fins. The skin is smooth and white, and they have but one bone, which extends through the body: the fins are of a yellowish colour, and the fish, when in the water, appears exceeding beautiful.

The moon-fish is about two feet long, one broad, and near two inches thick. It is a flat fish, and would be almost oval, were it not for its tail, which is large and hollowed. The mouth is small, and contains two rows of teeth; over it is a little rising, which appears like a nose with nostrils, and the part above that looks like a forehead, with large wrinkles. The eyes are round, and very red; it has only two fins, but they are large, and placed at the sides of the gills, with two bristles, one about the middle of the back, and one at the tail, and the other running in the same direction beneath the belly. The flesh is white, firm, and well-tasted; and is particularly admired by the Europeans.

The horn-fish, or, as some call it, the cat-fish, is also much esteemed, and the flesh reckoned very wholesome. It received the first name from having an horn on the top of its head, or beginning of the back: it is about a foot long, with a very large head, and small mouth: the back is bluish, the belly white, and the fins and tail yellow.

The king-fish, when in season, is reckoned one of the best on the coast. They are in general about five feet in length, with a long forked tail, and the back and sides are full of brown spots, but the belly is white. They commonly harbour among rocks, and sometimes get into such shallow waters, that they are very easily caught.

Besides the fish already mentioned, there are others of a much larger size that infest the Gold Coast, particularly grampusses, sharks, and porpoises; but these are seldom caught by the natives. Here are also two sorts of sprats, which only differ in their size, one of them being much larger than the other. Both of them are very fat in the season, but the smaller ones are the best, and eat very pleasant either pickled or dried.

Persons, Dress, Manners, Customs, Religion, &c. of the Inhabitants of the Gold Coast.

THE blacks on the Gold Coast are in general of a middle stature, and well-proportioned; they have sparkling eyes, small ears, and lofty eye-brows; their teeth are very white and tolerably well ranged; their lips are red, and not so thick as those of the inhabitants in the

other part of Guinea. They are broad-shouldered, have large arms, thick hands, and long fingers. They anoint their bodies every morning with palm-oil, so that their skin is very smooth and sleek; but exclusive of this they consider that practice as very wholesome, and a preventive from vermin, which they are naturally apt to breed.

The women are rather shorter than the men, but very frail and well-proportioned; they have fine sparkling eyes, small nostrils, and beautiful teeth; their noses are in general high, and a little crooked, and they have all long curling hair. They are good housewives, very cleanly in their persons, and have excellent constitutions. They are naturally sober and industrious, but they are proud, artful, and covetous.

The men in general have excellent memories, and are very quick of apprehension; but they are naturally slothful and indolent, so that they are only industrious from necessity. They transact their affairs with great composure of mind, and always appear indifferent whether their rise to prosperity, or sink into adversity; and though they are naturally covetous, yet the loss of any considerable property does not seem, in the least, to affect them. This, however, appears to be a mere deception, for they are very proud, cunning, deceitful, and greatly addicted to theft; and to envious and selfish, that they will quarrel among themselves on the most trifling occasion. Those of consequence walk with their eyes fixed on the ground, seldom looking about, or taking notice of any one, except it be a person of higher rank; but to their inferiors they show such contempt, that they will not even deign to speak to them. They are generally very complaisant to strangers, but they do that for the sake of its being returned, which is a distinguished gratification of their pride. They pay great respect to the Europeans, and are highly pleased with their accustom'd civilities; but of these they frequently take advantage, by laying some scheme to deprive them of their property.

The dress of the common people consists only of a piece of cloth wound round the waist, and another between the thighs, fastened with a girdle. The better sort, however, wear a piece of silk taffaty, or Indian damask, two or three ells long, folded round the waist, the ends hanging down to their ancles. Some men they wrap another piece of stuff about them, which either reaches from the breast to the tail of the leg, or is thrown across their shoulders like a mantle. They take great pride in their hair, which they display in various forms; some have it long and straight, others curl and plait it together, or tie it up to the crown; and all of them smear it with palm-oil, and decorate it with various toys, the most distinguished of which is a kind of coral called *conta de terra*, and by them esteemed more valuable than gold. They adorn their necks, arms, and legs, with strings of gold, silver, ivory, shells, &c. some of which are of very considerable value.

The dress of the women is much superior to that of the men; and they are very careful of their clothes, for they have two sorts, one of which they only wear when they go abroad. Their common dress consists of a large piece of linen wound round the body, from the breast to the knees, and fastened with a girdle of red, blue, or yellow cloth, to which they hang their knives, purses, keys, &c. Their better dress is formed of a large piece of silk or stuff wound round the waist, and reaching from thence to the ancles; their favourite colours are red, blue, or violet, and they have generally a bunch of keys at their girdle, with bracelets of ivory or gold. They wear small ear-rings of brass, copper, pewter, or tin, artificially wrought, and on their arms and legs they have bracelets of copper or brass. They take great pains with their hair, which they form into various shapes, and decorate it with gold, coral, and ivory; and round their necks they wear strings of beads, beautified with small pieces of gold, in honour of their teeth.

Both sexes are cleanly in their persons, and where opportunity serves wash themselves several times a day, for which reason they commonly build their villages near the sea, or on the banks of rivers. This custom is exceedingly necessary, as it not only helps to take off the

disagreeable scent of the palm-oil with which they anoint themselves, but it also cleanses them from lice and fleas, to which vermin they are naturally subject.

Their towns and villages are composed of a number of huts irregularly placed; but those in the inland parts are much better, and more uniform, than those on the coast. Their houses are generally of a square form, and very low; they are made of wood, and covered with square mats of palm-leaves, or bull-rushes. The doorway is so low that a man must bend himself almost double to enter. The floor is smooth, made of red clay, as hard as if laid with stone, and in the center of it is the fire-place. Some of their villages are so constructed as to form narrow lanes, in the center of which is an open place, adapted not only as a market for the sale of provisions and other commodities, but also as a place of diversion for the inhabitants.

The houses of the better sort are generally situated near the market, and separated from other buildings. They are built of the same materials as those of the common people, but are more lofty and spacious. In the center is a portico open on all sides, but covered with a sloping roof made of the leaves of trees to shelter them from the heat of the sun; and here they divert themselves when they are disengaged from business.

All the houses have several small huts adjoining to them, most of which are divided into different apartments, by partitions made of rushes, bound close together; these apartments are adapted for their wives, each woman having one to herself.

The common people are at very little expence in building their houses; the materials, which consist only of timber, clay and leaves, being taken by the slaves wherever they can find them. They commonly erect a house in six or seven days, and the expence to the carpenters seldom exceed 4s. Each family has a granary, or store-house, without the town, where they keep their wheat, millet, and other grain.

Their furniture consists only of a few bowls, some earthen pots to hold water and dishes their vessels, and a few small wooden cups. The poorer sort have only a mat to lie on, which they spread on the ground, and some of them cover themselves with the skins of beasts. The better sort use quilts made of rushes, on which they lay a fine mat with a bolster, and by it a large kettle with water to wash them. They all keep a good fire in their bed-room, to preserve them against the damp of the rainy season, and they always lie with their feet towards it.

They are very filthy in their diet, and prefer either flesh or fish that stinks to that which is sweet and wholesome. Their common food is a pot full of millet baked to the consistence of bread; or, instead of that, yams and potatoes, over which they pour a little palm-oil, and mix with it some herbs, and a small quantity of stinking fish. They have another dish called *malaghetta*, which is composed of fish with a handful of Indian wheat, the same quantity of dough, and some palm-oil, all boiled in water. This they esteem excellent, and, indeed, if the fish is sweet, it is far from disagreeable.

They use neither knives, forks, or spoons at their meals, but take up their victuals with their fingers, and eat it very greedily. They lay it on a mat on the ground, and sit cross-legged, leaning on one side, or else with both their legs under them squatting on their heels. The husband generally eats alone in his own hut, and his wives separately in theirs, except by chance, when he invites his chief wife, or pays a visit to that which is his greatest favourite.

They make but two meals a day, one at sun-rising, and the other at sun-set. At their morning's meal they drink water, or port-wine, which is a kind of small beer; and in the evening they drink palm-wine.

The men are chiefly employed abroad, either in trade, fishing, or making palm-wine; and in quantities of which are every day sold at the markets; and the profits they get from their labour they give to their wives, who dispose of it with great frugality.

The women are excellent housewives, and are chiefly employed in providing for the family, under the direction

tion of the principal wife. The first thing they attend to, in the article of diet is, to make the bread. In the evening they set by the quantity of corn thought necessary for the family the succeeding day. This they beat in the trunk of a tree hollowed for that purpose like a mortar, or in deep holes of rocks, with wooden pestles; they then winnow and grind it on a flat stone, after which they mix it with flour of millet, and knead it to a sort of dough, which they divide into small round pieces, and boil like dumplings. Of the same dough they also make a sort of biscuit, which will keep for several months, and with this the large canoes are victualled when they go long voyages. They are also very careful in bringing up their children, particularly their daughters, whom they teach all domestic affairs, and every other matter that may tend to make them good and prudent wives.

Though the ceremonies of their marriages are in general much the same as those all along the coast, yet they differ in some particulars. When a father finds his son is able to get his own living, he seeks out for a wife for him, unless the latter should disappoint him by providing for himself. When the parties are agreed, the father of the bridegroom communicates it to the parents of the young woman, who readily agree to the marriage. A price is then set for, who, at administering the fetich, or oaths, obliges the woman to promise she will love her husband, and be faithful to him: the husband, in return, promises to love her, but omits the point of fidelity. After this ceremony is over, the parents make mutual presents, and the whole company spend the day in feasting and mirth. In the evening the husband leads his wife home, attended by some of her relations or friends, who stay with her a whole week to bear her company, after which they leave her, and she enters on her ordinary employment.

They sometimes dispose of their daughters when they are too young to consummate the marriage, the ceremony attending which are as follow: On the day appointed for the wedding, all the kindred on both sides meet at the home of the bride's father, where an elegant entertainment is provided. In the evening the bride is taken to the bridegroom's house, and put in her husband's bed between two women, where she remains all night. This ceremony is repeated three successive nights, after which the bride is sent back to her father's house, and there kept till she is of age to consummate the marriage.

As polygamy is allowed, some of them have from twenty to thirty wives, for the greater the number the more they are respected; but the common sort have seldom more than ten. All their wives are employed in tilling the ground, and managing the affairs of the family, except two, who, especially if the husband is rich, are always exempted from labour. The principal is called *Muliere Grande*, or the great wife; and the second is called, the *Hossum*, because she is consecrated to their deity. These two are generally the most handsome, and for that reason the husband is always jealous of them, particularly the latter. He sleeps with them on fixed days, especially on their 1st day, and alternately every Tuesday, which is their fetich-day, or Sabbath. The easy situation of these wives makes them sometimes envied by the other women, who are obliged to work hard, while their husband and his two favourites are enjoying themselves in indolence and dissipation. When the husband thinks proper to sleep with one of his other wives, he gives her private intimation of it, in order to prevent jealousy, when she returns to her apartment with the greatest privacy, and the matter is kept a profound secret from the rest of her companions.

Their children are named as soon as born, and they are naturally set to strong a constitution, that little care is required in nursing them. The poorer sort of women fallow them to their backs when they go to their daily labour, and suckle them at different times, by raising them up to their shoulders, and turning their heads over to them. They take great pains in washing them every night and morning, when they rub them well with palm-oil, which makes their joints flexible, and greatly facilitates their growth. They go quite

naked till they are ten or twelve years of age, when they wear a kind of clout fastened round the middle. When they arrive at that age, the father takes the boys under his care, and brings them up to his own business. The girls are taught to weave baskets, mats, caps, purses, and other things; as also to grind corn, bake bread, and carry it to market for sale.

The boys are chiefly brought up to fishing or agriculture, but some of them are put to trades, the principal of which are smiths, carpenters, and goldsmiths. The smiths make all sorts of tools for husbandry and household uses; and though they have no steel, yet they make them with great neatness. Their chief tools are, a hard stone instead of an anvil, a pair of tongs, and a small pair of bellows, with three or four nozzles, which is an invention of their own, and blows very strong. Their files are of various sizes, and well tempered; and their hammers they purchase of the Dutch.

The goldsmiths are excellent artists, and make a variety of articles of pure gold; such as breast-plates, helmets, bracelets, idols, hunting-horns, pattins, plates, ornaments for the neck, handbans, rings, buttons, &c. They also cast, in the most curious manner, the figures of all sorts of tame and wild beasts, the heads and skeletons of lions, tigers, oxen, deer, monkeys and goats. Their greatest ingenuity, however, is shewn in the gold and silver handbans made for the *Protopans*, the thread and texture of which cannot be excelled by any artist in the universe.

The carpenters are chiefly employed in making canoes, and the frame or timber-work of houses, the roofs being made by others called thatchers, who have a peculiar method of razing the leaves of palm-trees, the straw of Indian wheat or rushes, which they bind and fasten together on poles of different sizes. These they sell ready-made in the markets; so that those who have occasion to build or repair a house, are at no loss to supply themselves with a roof, as they are made in all forms, and of all sizes.

Some of them are also good potters, having learnt that art from the Portuguese. Though their earthenware is thin, yet it is very substantial, and equally good for use as any made in Europe. Their clay is of a dark colour, and the vessels made of it will endure the most violent heat.

As the natives here are very fond of dancing, so they have a great variety of musical instruments, all which they make themselves. They consist of copper batons, blowing horns, snappers or callinets, and an instrument with six strings something like a guitar; also handbells, flutes and flagglets. The blowing horns are made of elephants teeth, and ornamented with the figures of birds, beasts, fishes, &c. They blow at the small end, and reduce the sound to a kind of tune, by varying it as their fancy directs. Their drums are of several sorts, and are mostly made of hollow trunks of trees, covered at one end with a sheep's skin, but the other is left entirely open. They sometimes hang them about their necks with strings, but in general set them on the ground like kettle-drums. They beat them with two long sticks, and sometimes only with their hands; but either way the noise is very harsh and disagreeable.

These instruments are always used at their dances, a diversion so universally admired by both sexes, that it is the custom for them to assemble every evening at the market-place for that purpose. On these occasions they dress themselves in their best attire; the women have a number of small bells hanging at their feet and legs, and the men carry small fans in their hands, made of the tails of elephants or horses. Those who compose the dance divide into couples opposite to each other, and the dance commences by their throwing themselves into many wild ridiculous postures, advancing and retreating, leaping, flapping on the ground, bowing their heads to each other as they pass, and muttering some strange notes. The men then strike each other alternately with their fans, and the women by large circles of clay on the ground, into which they hiss, jump, and dance round them, then throw them up into the air, and catch them with their hands. Thus they divert themselves for above an hour, when they break up the dance.

retire to their respective habitations. This is the manner of their dancing in general, but they have some dances adapted to peculiar times and circumstances, particularly those in honour of their festives, which are of a very serious and solemn nature. In some towns they have public dances instituted by order of their kings, which are held annually for eight successive days, when people of both sexes resort to it from all parts of the country. This is called the dancing season, and the greatest mirth and festivity is preserved during the whole time of its continuance.

Notwithstanding the unwholesomeness of the climate here, the natives are troubled with few diseases. That with which they are most afflicted is the canker, or flesh-worm; they breed between the flesh and the skin, where they extend themselves till they force a passage; and not only men and women, but also cattle are subject to this disorder. Various conjectures have been formed relative to the causes of these worms; some attribute them to the great quantities of fish the Negroes eat, and others to the palm-wine; but the most reasonable opinion is, that they are occasioned by the unwholesomeness of the water, which is generally taken out of pools or ponds. This appears the more likely, as it is certain from that cause alone the inhabitants of the isle of Ormus are afflicted with the same disease; and to prevent it they drink fresh water, which is got at sea 18 fathoms deep, by the help of divers. These flesh-worms are of different sizes, but in general run about a foot in length, and are not thicker than a hair.

While they remain in the body they occasion the most excruciating pain, inasmuch that some can neither stand or walk, others are incapable of sitting or lying down, and others again are thrown into a state of insensibility. They disclose themselves in various symptoms, sometimes with cold shiverings, and at others with burning heats; in some they are accompanied by a large swelling, under which they may be plainly seen; and in others they break out with carbuncles and ulcers. They come in different parts of the body, but in general those that are the most muscular and fleshy. The Negroes do not use any remedy for them, but let them come out freely, and afterwards treat the part either by washing it with salt water, or anointing it with fresh butter intermixed with salt. As soon as the worm appears so far out as to be taken hold of, they fasten that end to a small stick, to prevent its shrinking in again; when it moves forward, a corrupted matter issues from the sore, which increases in proportion as the worm advances. During its progress the greatest care must be taken in winding it round the stick; for if it should be forced, and by that means happen to break, the swelling grows dangerous, and is often attended with fatal consequences. It sometimes happens that when one worm is extracted another immediately presents itself at the same opening; and many people have several of them at a time in different parts of the body, in which case the pain they feel is not to be conceived. A late writer, speaking on this head, says, "The pain of these worms is so excessive, that a man would for ever renounce all the profit of trading on this coast rather than endure it."

The other distempers the Negroes are subject to here are, the lues venerea, the head-ach, and fevers; but these they think little of, as they are in general very easily cured by compositions made of herbs and other simples.

If a judgment may be formed by their looks, they mostly live to be very old, but their age cannot be ascertained, as they never keep any account of time, when they begin to decline, their colour fades and looses a great part of its blackness; the hair turns grey, and the skin wrinkled; and the women in particular have the most disagreeable aspects.

When any one dies, the relations and friends immediately assemble, and surrounding the corpse, express the most hideous lamentations; they then wrap the body in an old cotton cloth, and put it in a coffin made of the bark of a tree, covering the face ever with the skin of a goat; in this manner they expose it in the open air for half a day, the favourite wife sitting by it all the time, and rubbing the face with a whip of thorns.

If the deceased is a woman, the husband uses the same ceremonies. During this time the nearest relations appointed on the occasion sing mournfully, and beat their brass basons, till the bearers come to remove the body and every thing is ready for the procession. In the interim, however, an old woman goes from house to house, and collects something for the funeral charges, towards which every person in the town or village is obliged to contribute in proportion to their circumstances: with the money thus collected they purchase a cow or an ox, which they present to the priest, that he may obtain repose for the deceased, and assist him in his journey to the other world: this beast the priest sacrifices, and sprinkles the fetid of the deceased with its blood, which with them is considered as a propitiatory offering for the dead.

As soon as the previous ceremonies are over, the corpse is laid on a board, and the company for a short time sing and dance round it; after which it is carried to the grave by men, but only women are suffered to attend as mourners. The chief, or favourite wife, walks immediately after the corpse; and if the deceased be a woman, the husband only follows it, no other man being permitted to attend. When they come to the place of interment the body is immediately laid in the grave, which is generally made about four feet deep; it is enclosed with stakes, and over it they raise a shed or covering, so that neither rain or beasts can come near it. When the body is deposited, the women creep beneath this shed, and renew their lamentations by way of a conclusive farewell. They then raise a square heap of earth over the body, on which they lay the principal tools and instruments used by the deceased in his life-time, as also his cloaths and weapons. The friends of the deceased also bring their gifts, which they either lay in the grave, or place over it, as tokens of their affection.

When a king dies, all his subjects express the most excessive lamentation; and as his condition and dignity require great attendance, he is provided with servants not only to accompany him in his journey, but also to wait on him in the other world. To effect this, each of his grantees, or chief men, present him with a slave, others give him one of their wives, and some one of their children, so that there is always a considerable number, who are all sacrificed previous to the interment of the royal corpse. The persons thus designed for victims are insured by stratagem, for, on the day appointed for the funeral, they are sent on a pretended errand to some remote place, where people chosen for the purpose lie in wait, and easily dispatch them. Their bodies are brought to the palace and publicly exposed, as a testimony of the great respect in which the king was held by his subjects; after this they are beheaded with blood, and carried with the royal corpse in great solemnity to the grave, which is previously made in a wood, or some other place equally private. Their bodies only, however, are interred, for their heads are severed off, and fixed on poles round the grave, which is considered as a very honourable ornament. Besides these, the king's favourite wives request to be sacrificed, that they may be laid with him in the same grave, in order to accompany him in the other world. They bury also with him his clothes and weapons, with such other things as he esteemed most valuable; and near the grave they place vessels containing victuals and drink, which they change as often as they find them empty.

Monf. Marchais, in his voyage to Guinea, gives the following account of the ceremonies observed at the funerals of the kings of Fetu, which though not directly the same as those above-mentioned, yet tend to shew the strange notions these people have of paying reverence to the dead. When one of these kings dies, says he, the people express their grief by mournful songs and outcries. They wash the corpse, dress it magnificently, expose it to public view, and serve up victuals to it at the usual hours, as if the deceased were living. When the body begins to corrupt, four slaves bear it, without ceremony, and inter it in the woods, for ever concealing where they put it. If any of the wives of the deceased follow them, they kill them, and bury them along with him.

In the same grave they lay his fetishes, his clothes, his arms; in short, whatever he was fond of when alive, with victuals and drink. When the slaves have covered up the grave, they return to the palace, and without speaking kneel down at the gate, stretching out their necks to the executioner, that they may go serve their master in the other world; in full persuasion that he will reward their fidelity, by giving them the first posts in his new kingdom. While the slaves are busy in the interment, the people make a cruel slaughter of those they think may be useful to their deceased king in the other world. Some kings who have been well beloved, have had four or five hundred persons massacred on this occasion, of both sexes. This barbarous custom is practised, more or less, all along the coast of Guinea.

With respect to the religion of the negroes on the Gold Coast, they are in general idolaters, notwithstanding which they believe in a supreme being, and have some ideas of the immortality of the soul. Every one has a fetish, or charm, to which they pay the greatest reverence; for thinking themselves too insignificant to be permitted to offer their petitions to God, they address themselves to their fetishes, supposing that to be a mediator in their behalf. These fetishes are formed of different things, according to each person's fancy: some have the tooth of a dog, tyger, elephant, or civet-cat; others have an egg, the bone of some bird, the head of a fowl, ox or goat; and others again, the bone of a fish, the end of a ram's horn, or a bunch of cords made of the bark of trees. Their regard for the fetishes is so great, that whatever they promise them, they perform in the strictest manner. Some, to show their respect to them, abstain from wine, others from brandy; some deny themselves certain meats, or kinds of fish; and others, rice, maize, or fruit. In short, all without exception do reverence their fetishes, that they deprive themselves of some pleasure by way of mortification, and they will sooner die than violate their engagement. They are very punctual in bringing their fetishes every morning a part of the best provisions in the house, believing that if they failed in this point, their existence would be but of short duration. They have also several days in the year set apart in honour of their fetishes, which they celebrate by dressing it, and making it some offering or sacrifice.

Besides the fetishes of particular persons, there are others common to each kingdom: these are generally some large mountain or remarkable tree, which if any person should be so indiscreet as to cut or destroy, they would be put to the most cruel death. Each village has also its guardian fetish, dressed at the common expence, to which they pray for general benefits; and for this purpose they erect, in the most public place, a kind of altar made with reeds, and covered with a roof of palm-leaves. These kind of altars are frequently met with in woods, and other private places: they are generally loaded with all sorts of fetishes, and before them are plates or pots filled with maize, rice, and fruits. When the negroes want rain, they place pitchers before them; if they are at war, they lay sabres and poinards to ask victory; if they want fish, they offer fish bones; to entreat for palm-wine, they leave the small chisel with which they cut the tree; and so on of other things, firmly believing the fetishes will grant their request.

Each priest has his peculiar idol or fetish, which chiefly consists of a large wooden pipe filled with earth, oil, blood, the bones of men and beasts, feathers, hair, and other such trifling articles. When the negroes have occasion to take an oath, they swear before one of these fetishes; which oath is deemed so solemn and obligatory, that they believe if a person should swear falsely, he could not possibly live another hour.

The blacks are exceeding fearful of the devil, to whom they ascribe all their misfortunes, and even tremble at his name. Such are their notions of the prejudice they receive from this fiend, that they have an annual custom of banishing him from every town and village; the ceremonies attending which are thus described by Mr. Bosman, who was twice an eye-witness of them: "This procession, says he, is preceded by a fast of eight days spent in all manner of singing, skipping, dancing, mirth and jollity; in which time a perfect Lampongung liberty

is allowed, and scandal so highly indulged, that they may freely chat out all the faults, villainies, and frauds of their superiors, as well as inferiors, with impunity. The only way to stop their mouths is, to ply them well with drink, which immediately alters their tone, and turns their satires into panegyrics on the good qualities of him who has so nobly treated them. On the eighth day in the morning they hunt out the devil with a dismal cry, all running one after another, throwing excrements, bones, wood, or any thing they can come at, as thick as hail, at Satan's posteriors. When they have driven him far enough out of town, they all return, and thus conclude their eight days ceremonies. To make sure that he does not return presently to their houses, the women wash and scour all their wooden and earthen vessels very neat, and free them from all uncleanness, and the devil." The same writer says, "Besides these notions of the devil, they steadfastly believe the apparition of spirits and ghosts, and that they frequently disturb and terrify some people; so that when any, especially a considerable person dies, they perplex one another with dreadful fears, from an opinion, that he appears several nights successively near his late dwelling."

They have generally two days of worship in the week, one of which is dedicated to their fetishes, and the other is called their Bollom-day, being that on which they were born. On the latter day they clothe themselves in white, and beset ear themselves with earth of the same colour, as emblems of innocence. The fetish-day, however, is observed with the greatest devotion; on these days they wash themselves more carefully than on others, and putting on their best cloaths, assemble at a particular place, in the middle of which is a large tree. At the foot of this tree a table is set, the feet of which is dressed with several garlands made of bougths, and on it they spread rice, millet, maize, fruit, meat, and fish, with palm-wine and oil, as offerings to their fetishes. In the middle of the table sits the priest, called Fetichero, who makes a long harangue to his auditors, which they hear with great attention. Near him is placed a pot of water with a live lizard in it; and when the harangue is over, he sprinkles or washes the table with some of this water, during which the people repeat certain words with a loud voice, clapping their hands, and crying out, Jou, jou, which concludes the ceremony, and they immediately disperse.

The negroes believe the Feticheros, or Priests, converse with the fetishes, whom they seem to consider as intelligent beings, and that they are acquainted with their most distant and private transactions. For this reason they always approach their priests with the greatest respect and reverence, and they reserve for them their choicest dainties. The priests are the only people that are exempt from labour; and indeed they have but little occasion to work, for they are fed at the public expence, and gather considerable possessions by the sale of their fetishes, the prices on which they vary in proportion to the circumstances of the purchaser.

The natives of the gold coast are divided into five degrees or classes. The first are the kings. The second are their nobility, who are men that have acquired great reputation by their wealth. The third may be called civil magistrates, their province being only to take care of the welfare of the city or village, and to appraise such lawsuits as may arise among the inhabitants. The fourth are the common people, employed in agriculture, fishing, &c. And the fifth and last are, the slaves, who are either sold by their relations, taken in war, or become so by poverty.

The different kingdoms are governed either in form of monarchies, or republics, whose kings are in general hereditary, but some few of them are elective. The government of most of them consists of two parts; the first of which is the body of the Kabokin, or chief men; and the other, the Mansros, or young men. All ordinary affairs fall under the administration of the latter, but the national concerns are determined by both parties together. Their chief justices or judges, as well in kingdoms as republics, are commonly chosen from amongst the most wealthy, and particularly the govern-

of towns and villages. These take cognizance of all civil and criminal cases; but their decision is not absolutely ultimate, as the parties have a power of appealing to the king.

Most offences of a criminal nature are punished by fine. A murderer, indeed, is sentenced to death; but it is seldom any one is executed, for if he has either effects himself, or friends to pay the fine, he escapes; but if not he suffers. In the latter case, as soon as sentence is passed he is delivered to the executioner, who blinds his eyes and ties his hands behind him; after which he leads him to some held without the town, where he makes him kneel down, lending his head forward, when he thrusts a spear through his body. This done he cuts off his head with a hatchet, and dividing the body into four parts, leaves it exposed to the birds of the air.

The fine for murdering a slave is generally 26 crowns, and that for the murder of a free negro 500; but it is frequently mitigated by consent of the relations belonging to the person murdered.

Robbery is usually punished by a restoration of the goods, and paying a fine, which is levied in proportion to the value of the goods stolen, and the circumstances of the person who commits the fact.

The crime of adultery, on the coast, is punished only by fine; for which reason many women, by consent of their husbands, sell their favours merely to take advantage of those who have been foolishly captivated by their charms. A late writer, speaking of this circumstance, says, "These men are truly contented cuckolds, who give their wives full orders to entice other men into their embraces; which done, those very devils immediately tell their husbands, who know very well how to steepe the amorous spark. It is incredible what subtilties they use to draw men, but especially strangers, into the net. To the latter they will pretend that they have no husbands, and are yet unmarried and free; but the fact is no sooner over than the husband appears, and gives them cogent reasons to repent their credulity. Others, says he, whose admirers know them to be married, will promise and swear eternal secrecy only with a design to draw them in; for as soon as they meet with their husbands they tell them what has happened. Should they conceal it, and he make the discovery himself, it might cost them very dear; but by this method they gratify their inclinations without danger, and promote their husbands interest into the bargain."

The inland Negroes, however, are much more strict in cases of adultery than those on the coast. He that debauches a negro's wife is not only entirely ruined, but his relations often suffer with him; and if the person injured be a man of property, the fine will not satisfy him, but he must also have the life of the offender. If the criminal be a slave, his death is inevitable, and that in the most cruel manner; besides which, a fine is levied on his master. A woman caught in adultery is also in great danger of her life, unless her relations pectly the enraged husband with a sum of money, or some valuable present; and the who is caught with her husband's slave is infallibly put to death, as also the slave her paramour; besides which their relations are obliged to pay the husband a considerable sum of money.

The stealing of men is punished with great severity, and sometimes with death; as is also the stealing of hogs, sheep, or other cattle. In those parts which are independent of the Europeans they will much sooner put a man to death for stealing a sheep than killing his neighbour.

In all cases of injury, the negroes are responsible not only for their children, but also their relations, who in such cases help one another by a mutual contribution, each giving something towards the fine, according to his circumstances, otherwise the offender would be condemned either to slavery or death. In like manner every man is obliged to make good the injury done by his slave; for whatever crime he commits, his master must pay the fine imposed.

If a very rich man commits an offence, the fine is exceeding heavy, for the levying of which they attain

two reasons; first, that he was not urged to it by necessity; and secondly, that he can better spare the money. On this account many negroes, though rich, will always plead the greatest poverty, as by that means if either they or their relations should commit any offence, the fine levied is very trifling to what it otherwise would be were their circumstances really known.

The princes of the different kingdoms on the Gold Coast being naturally proud and ambitious, contentions frequently break out amongst them; on which occasions war is formally declared, and the kings, by their governors, appoint a day for their subjects to assemble in arms. This being done, a herald is sent to denounce it to the enemy, at the same time fixing the day, the place, and hour of battle. The grandees, or nobles, then repair to court, and after complimenting the king proceed to the war, taking with them their wives and families; and if the motives of the quarrel be great, before they set out, they destroy their houses and towns, that the enemy, if victorious, may gain the less advantage of their conquest. The kings have a great number of guards, who constantly attend their persons either at home or in the field. These are well furnished with arms, and have a most formidable appearance: they paint their faces with red, white or yellow streaks, marking their breasts and the rest of their body with various figures of the same colour, and across their shoulders they hang a scuth string of glass beads as a preservative against danger. Round their necks they have a large collar made of the boughs of trees, to keep off the blows of their enemies weapons; and on their heads they have caps made of the skins of leopards. They carry a poinard in their girdle, and in their left hand they have a long broad shield that covers their whole bodies, with a dart or lance in their right hand.

The common soldiers have long fibres fastened in a belt girt round their waist, and they have caps or helmets made of the skins of crocodiles, adorned on each side with a red shell, and behind with a tuft of hoise-hair.

The nobles, who have the chief posts in the army, wear their fibres before them, with large knives hanging by their sides. Their slaves march by their sides or behind them, and are armed with bows, arrows and cutlasses; and the common people have fibres and hatchets.

Their fire-arms consist only of muskets or carbines, with which they are furnished by the Dutch, and are very expert in the use of them. Some of their fibres are made with two edges, and have broad wooden handles covered with thin plates of gold. They have also two sorts of allagayes, or lances, the smallest of which are thrown like darts, but the latter are long, and very substantial, being chiefly composed of solid iron. These they keep continually in their right hand, and while they are using it against their enemy, they defend themselves with their shield in the left.

Some of their shields are made of leather, but in general of the bark of trees interwoven: they are about six feet long and four broad, and strengthened within by a cross of wood plated with iron. Some of them are covered with the hides of oxen, others with leather gilt, and some with the skins of tygers. They are very expert in the use of this defensive weapon, which, with their fibre, they brandish in such a manner that it is almost impossible to come at them.

Their other weapons are bows and arrows, and these they use with such nicety, that they will hit a very small mark at a considerable distance. They are made of hard tough wood, and the strings are formed of the bark of trees. The arrows are feathered at the head, and pointed with iron; and their quivers in which they carry them are made of the skins of goats.

When they go to battle, they engage their enemy without paying the least attention to order: each commander has his men close together in a crowd, himself being hid in the midst of them, and in this manner they engage one heap of men against another. In case a few are killed, the rest immediately run away, unless surrounded by the enemy; and so natural is cowardice to them, that when one officer sees another

entranced, instead of advancing to assist him, he consults only his own safety by a speedy flight. They do not stand upright in battle, but stoop that the bullets may fly over their heads: as soon as they have discharged their guns they immediately run back to load them, and then return and resume the fire.

When one party has entirely defeated the other, they make as many prisoners as they can, which is the chief end of all their wars. Those who cannot raise their ransom are either kept or sold as slaves; if a person of rank is taken, he is well guarded, and his ransom is fixed very high; but if the person who occasioned the war falls into their hands, they will not admit of any ransom, for he is put to death, as the most effectual means of preventing his raising any future ruptures.

As soon as the war is over, and a treaty of peace is agreed on, the contending princes agree to meet each other on a certain day, to proclaim their determinations. The place is generally a large open plain, and each party appears as if armed for battle, bringing with them their fetiches. The priests, who are always the principal people in these ceremonies, make the chiefs swear reciprocally, to cease hostilities, to forget what has passed, and as a security for their promises, to give mutual hostages. As soon as these oaths are taken, the drums and trumpets begin to sound, the parties throw down their arms, and embrace each other with the greatest cordiality; after which they pass the remainder of the day in singing and dancing, and commerce is renewed as if no quarrel had happened.

Of the Provinces and Kingdoms that form the Gold Coast; with the different Settlements in each belonging to the Europeans.

IN describing these we shall begin at the most western part, namely, the kingdom of Axim, situated about 20 miles east of Cape Apollonia. This is a very plentiful country, for the land being naturally good, and the inhabitants very attentive to cultivation, it produces provisions of most kinds in great abundance. Rice in particular is so plentiful here, that it is exported to all other parts of the coast, in return for which the inhabitants bring millet, yams, potatoes, and palm-oil.

The chief village or town here is called Ackoombone, and is very populous and pleasantly situated. Near it is the Dutch fort of St. Anthony, which once belonged to the Portuguese, from whom it was taken by the former in the year 1642, and by the succeeding peace between Portugal and Holland, its being yielded to the Dutch India company, it has ever since remained in their possession. This fort is situated on a rock, and though small, is yet very commodious. It has two batteries on the land side, and one on the sea, with proper out-works, which as well as the walls, are all made of black stone found in the country. The gate of the fort is low and well secured by a ditch eight feet deep cut in the rock, over which is a draw-bridge defended by two padereos. The chief factor's house is neatly built of brick, of a triangular form, and very lofty: it has three fronts, before one of which is a small spot of ground planted with orange and palm-trees. The fort mounts 22 large iron guns, besides several small ones, and the garrison usually consists of 25 Whites, and the same number of Blacks, who are under a serjeant belonging to the company.

The natives of Axim are generally rich, from their carrying on a considerable trade with the Europeans for gold, which they chiefly dispose of either to the English or Dutch. Their dress, customs, manners, religion, &c. are the same as on the Gold Coast in general, the particulars of which have been already related; but with respect to their laws, they are subject to the chief factor, as governor of the fort, who preserves a kind of sovereign authority throughout the whole country. He determines all causes among the Negroes, and the fines being paid into his hands, he distributes them to the injured persons, first deducting his own fees, which are very considerable. For example, if a black is fined an hundred crowns, his dues amount to two thirds, and the other third goes to the assembly of Kabobhirs. Debtors among the blacks. But in cases of murder, robbery, or debt,

three fourths of the whole belong to the plaintiff, and the other fourth is for the Kabobhirs and the factor, who divide it into three parts, the former taking one, and the latter two. He also obtains considerable sums from the fishermen, who are obliged to give him an eighth part of all the fish they catch.

About seven leagues south-east of Axim is a large beautiful fort called Frederickburgh, which was built by the Brandenburgers, but now belongs to the Dutch. It has four large batteries furnished with 46 pieces of ordnance; and the gate leading to it is exceeding magnificent. The walls are thick, strong, and high, and within are several spacious dwellings for the officers and soldiers, as also good warehouses for the reception of their merchandize. The fort is well known by the name of Conny's Castle, which it obtained from the following circumstances: when the Prussians who were first possessed of it left the coast of Guinea, they committed the care of the fort to one John Conny, a black, with strict orders not to deliver it up to any nation but the Prussians. Soon after their arrival in Europe, the king of Prussia sold all his interest on the coast of Guinea to the Dutch India Company, there being another fort belonging to him, situated upon Cape Three Points. When the Dutch came to demand this fort, John Conny refused to deliver it up to them, which produced a war that continued for some years, and cost the Dutch much money and a great deal of bloodshed. On the other hand, Conny, flushed with his repeated victories over the Dutch, became a mortal enemy to them, and considered them in the most obnoxious light; to shew which he had a small path that led from the outer gate to the inner apartment of his castle paved with the skulls of Dutchmen who were slain in battle; and, as a farther mark of contempt, he had one skull tipped with silver, which he used as a punch-bowl. However, in 1724, he was completely conquered, when he fled into the country, and the Dutch took possession of the fort, in whose hands it has ever since continued.

The situation of this fort is one of the best on the coast; and the anchorage and landing are both safe and convenient. The climate is tolerably wholesome, and the country rich and well improved. A great trade is carried on here not only in gold, but also ivory and slaves. Their government is well regulated, and the Negroes more civilized and honest than in most other parts of the coast.

Cape Three Points, or Cape Puntas, is so called from its consisting of three little heads or hills, that lie at a small distance from each other, and between them are two convenient bays. The whole country about the cape is exceeding woody, and the hills are ornamented with groves of lofty trees, which are visible a considerable distance at sea.

About three leagues east of the Cape is a small fort called Dorothea, which formerly belonged to the Prussians, from whom it was taken by the Dutch in the year 1683. It consists only of a large house with a flat roof, on which are two small batteries, each containing ten guns. The apartments within are numerous, and most of them not only conveniently disposed, but very elegantly furnished.

Leaving the country of Axim, we come to that of Anta, which extends almost 30 miles from east to west, and is full of hills covered with large trees, between which are several considerable villages. The soil is well watered, and produces great quantities of excellent rice, the best sort of maize, sugar-canes, yams and potatoes. It also yields plenty of palm-wine and oil, cocoa nuts, papaws, oranges and small lemons. In the mountainous parts are great numbers of wild beasts, particularly elephants and tygers, the latter of which are so rapacious that they frequently visit the English and Dutch forts in the night to the great terror of the inhabitants, who sometimes sustain considerable injury in the loss of their cattle, sheep, &c. Bosman, who was chief factor of a settlement the French once had at Sakkundi, gives a singular relation of the audacity of one of these animals, which, as a matter of curiosity, we shall preserve in his own words: "Some of my sheep," says he, "as well as those of my

my neighbour, the English factor, were several nights devoured by a tyger, which at last grew so bold, that he came at three in the afternoon to the lodge, and killed a couple of sheep. Perceiving him in time, I went, accompanied by my gunner, two Englishmen, and a party of Negroes, all armed with muskets, in pursuit of him, and soon overtook him, though not before he had got into a small thicket of underwood, which we beset. The gunner went into the thicket to see where he lurked, but in a few minutes came running back frightened almost out of his wits, having lost his hat and slippers behind. The tyger had even bitten him, and was ready to seize him, when, to the man's good fortune, the beast happening to be affrighted by some falling branches, he retreated and gave the gunner time to escape.

"One of the Englishmen, impatient at waiting so long, resolved to march into the wood with his musket, if possible, to dislodge him. The tyger suffered him to approach close, and then fell upon him with extreme fury, seized him with his feet by the shoulder-blade, and, fixing his teeth in his side, would, doubtless, immediately have torn him to pieces, if, by crying out, he had not drawn us to his assistance, which obliged the tyger to quit his prey: yet the man was so miserably handled, that he lay senseless about half a day, partly by the venom of the bite, and partly by the fright.

"The Negroes were so terrified at this, that each quitted his post, and gave the tyger room to escape, which he soon attempted, but in his flight out of the thicket happened something truly tragic-comical: the un-

factor of the English fort, near which the adventure happened, had promised to come to our assistance, accordingly, the very moment the tyger quitted the wood, he advanced with his musket in his hand, attended by several of his own people; but seeing the tyger making up to him, he ran as fast back as his legs would carry him. This putting him out of breath, and being grievously affrighted, about a musket-shot from the fort, he fell over a stone, where the tyger had already overtaken him. The company stood trembling at a distance, looking when he would be torn in pieces; but the beast, to their surprize, instead of attacking him, turned off and fled. This I attributed to the cry which he and his followers made, for they durst not shoot, he stood so near the factory.

"This same tyger, however, was not deterred from coming again a few days after, and killing some sheep, which put me upon another way of trying to catch him. I made a fort of cage of strong pales, 12 feet long, and four broad, laying 1000 weight of stone on it, to prevent his breaking out above. I furnished it with a double plank door, and in one of the corners I put a lesser cage, which took up one quarter of the whole, with a couple of small hogs in it. After this I set the door like that of a rat-trap, so that the tyger could not come in to seize the hogs without shutting himself in, while the little cage secured the hogs from his fury.

"This stratagem succeeded so well, that three nights after the tyger was caught at midnight. Instead of roaring, as was expected, he immediately set his teeth to work, and had certainly eat his way out of limbo, could he have had but one half hour's time; for he had soon rent the inner from the outer door, and eaten the palisades half through; in short, I came seasonably to prevent his breaking jail. Not to dally with fruitless firing, I elapped the muzzle of my musket, laden with three balls, between the pales, which the beast furiously caught at, and so furnished me with a fine opportunity of dispatching him at one shot. He was about the size of a common calf, well provided with large teeth and claws.

"This success furnished the company with a feast of eight days; for, by the custom of the country of Anta, he who catches a tyger is privileged for eight days to seize all the palm-wine brought to market, without paying any thing. This was accordingly done, and the whole eight days were spent by the Negroes in shouting, dancing, leaping, and all manner of public jollity."

"The first remarkable place we meet with in the kingdom of Anta is Dickcove, situated about eight leagues

to the north-east of Cape Three Points. Here the English have a fort, which is a handsome and regular building, and is well defended with four good batteries, on which are mounted 20 pieces of ordnance. This, and all the other English forts are subordinate to Cape-Coast-Castle, they being allowed to hoist no other than the St. George's flag.

Near Dickcove are two villages commanded by one and the same cobocero, who always hoists the St. George's flag at his house, whenever that at the fort is displayed, as a compliment to the English.

At a small distance from these villages is a fort belonging to the Dutch, called Batentein. It is situated on a very high hill, and is built of an oblong form; it is a small building, and has only two batteries, on each of which are planted four guns. At the foot of the hill is a village called Boutou, or Boutri, the inhabitants of which are particularly distinguished for their honesty in all matters relative to trade. This village is watered by a river that comes down from the country, and discharges itself into the sea by the Dutch fort. The banks of it are exceeding pleasant, being adorned with lofty trees; and the sides of it are lined with mangroves, whose boughs are plentifully studded with excellent oysters. The river is navigable only about four leagues from its mouth; for though it reaches much farther, yet it is impassable, owing to the violent water-falls that pour down from the rocks. It affords great plenty of fish, but it is hazardous to catch them, owing to its being infested with prodigious numbers of crocodiles.

Tokorari is a pleasant village situated on the top of a high hill, which juts to the south-east into the sea, and is surrounded with several rocks. The country behind the town is exceeding pleasant, consisting of delightful vallies and plains, adorned with lofty trees, between which are agreeable paths covered with white sand. There was formerly a fort here, which was at different times possessed by the English, Dutch, Danes, Swedes and Prussians; but in 1685 the Dutch blew it up as a place of no consequence, and there are not any remains of it now to be seen. The natives here are famous for making the best and largest canoes on the coast, some of which are at least 30 feet long, and will carry above 1000 of goods. Ships bound from Whidah generally provide themselves with these; the piece of one of the largest is about 5000 fathoms.

About four miles east of Tokorari is the village of Sakkundi, or Sacundee, where the English and Dutch have each a fort, the latter of which is called Orange, and, like the former, is situated on the top of a hill. That belonging to the Dutch is very small, and poorly defended; but the English fort is large, and mounted with 20 pieces of cannon. The French had formerly a settlement here, but not finding it answer their expectations, they deserted it. This village is very rich in gold, and as healthy a place as any on the coast. The country round it is admirable, being diversified with hills and dales covered with lofty trees, which grow with such uniformity as to appear as if placed by art.

Between Sakkundi and Sama are two small villages, the one called Anta and the other Boari, but they are not of any note for trade, except in the article of palm-oil, great quantities of which are exported to most other parts of the coast.

Sama is situated on a hill, and is watered by a small river called St. George, which runs into the sea near the foot of the hill. It contains about 200 houses, or cabins, so placed as to form three separate villages. The place is populous, but the inhabitants are very poor, and chiefly employed in agriculture and fishing. The Dutch have a fort here about the size of that at Boutrou, and mounted with the same number of guns. It is called St. Sebastian's, which name was given to it by the Portuguese, who were first masters of it, and from whom it was taken by the Dutch.

The countries of Adom and Jabl are very fertile in maize, and have several mines of gold; but there are no European settlements in them, neither have they any villages that merit particular notice.

Commenda, or Commany, the next province we come to, is divided into two parts, distinguished by the names of Great and Little Commany, the inhabitants of which are chiefly fishermen, or brokers, it being a place of considerable trade for gold and slaves. In this district are two European forts, one belonging to the English, and the other to the Dutch. The former is a large quadrangular building, with three square bastions, and one round; and within the fort is a large tower, built of stone and lime. It mounts 24 guns, and has a garrison of 25 whites, and the same number of blacks. The Dutch fort is called Vredenburg, and was built in the year 1688. It is a square building strengthened by good batteries, on which might be conveniently mounted 32 guns within so many parts in the breast-work, though at present it contains only 20.

Leaving the kingdom of Commenda, we enter that of Fetu, which is a fine plentiful country, extending about 160 miles in length, and the same number in breadth. The principal part of the inhabitants are employed in agriculture, sowing corn, and drawing wine from the palm-tree; others in fishing and boiling salt; and some trade on their own account, or as brokers for the inhabitants of the inland countries.

The first principal place we come to in this kingdom, is the town or village of El-Mina, situated about nine miles from the Dutch fort of Vredenburg, and is remarkable for the castle of St. George, another strong fort belonging to the Dutch, who took it from the Portuguese in the year 1638. It is a large square building, with very high stone walls, so strong, that they are said to be cannon-proof. It has four large bastions or batteries within, and one very strong one on the out-works. Two of the bastions within lie to the sea, and are very lofty, the point of the peninsula on which they stand, being an high flat rock; but the other two are low, the ground descending gradually from the rock. These batteries are mounted with 48 pieces of fine brass cannon, and that on the out-works is filled with iron pieces, which are only fired as salutes, or on days of public rejoicings. The fort towards the land is adorned with two canals cut in the rock, which are always furnished with rain or fresh water sufficient for the garrison and ships. The inside of the fort consists of a large quadrangle, surrounded with handsome storehouses of brick and stone. The general's lodgings are in the upper part of the castle, the ascent to which is by a large stair-case of black and white stone, defended at top by two small brass guns, and four pateraros of the same metal, commanding the place of arms, and a corps-de-guard. Next to this is a great hall full of arms, and beyond it a long gallery wainscotted, and ornamented at each end with large glass windows. This gallery leads to the general's apartments, which consist of several handsome rooms and offices along the ramparts. On one side of these rooms is a very neat chapel, where service is not only performed on Sundays, but every day in the week, when all the officers of the garrison are obliged to attend under the penalty of 25 slaves, and double that sum on Sundays and Thursdays. On the ramparts is also an hospital for the sick, which is large enough to contain at least 100 people.

The town of Mina is situated just under the castle, and is tolerably long and populous. The houses are built with rock stone, and are in general very spacious and convenient. The inhabitants are a warlike people, and from their long correspondence with the Europeans, are the most civilized on the coast. Their usual employments are trade, husbandry, and fishing.

This town is watered by a small river called Bonja, which separates the two kingdoms of Commenda and Fetu; on the north side of which, opposite to Saint George's Castle, is the fort of Conradburgh, belonging also to the Dutch, and situated on a high hill called St. Jago; it consists of a handsome quadrangle, strengthened with four good batteries; the walls are 12 feet high, and strong, having four lesser batteries mounted with 12 guns. Within the fort is a large tower, with convenient apartments for the garrison, which consists in general of 25 men, who are relieved from El-Mina once in 24 hours. The ascent to the fort is easy on the

side of El-Mina, but on that towards Commenda it is steep and difficult. The bridge of communication over the river Bonja has a draw-bridge in the center, as well for security as to admit small ships to go up the river. At the foot of St. Jago hill are several tombs and monuments, which are supposed to have been erected by the natives to the memory of their kings or other distinguished personages. On the north side of the hill is a large garden belonging to the general of the fort; it is divided by spacious walls, and rows of orange, lemon, cocoa, palm, and other sorts of trees and uncommon plants of the country; as also a variety of European herbs, pulse and roots: in the center of the garden is a large summer-house, round and open, with a cupola roof, and the ascent to it is by a handsome stair-case. Some of the oranges that grow in this garden are little inferior to those of China.

At a small distance from St. Jago hill is a place called by the Portuguese Cabo Corio, but by the English Cape Corio, or Coast; it is formed by the shore jutting out a little, and making an angle, whose south and east sides are washed by the sea. On this cape is situated Cape Coast castle, which is the most important fortress of any belonging to the English on the coast of Guinea; it stands on a large rock that projects into the sea, and was erected by the Portuguese, who first settled here about the year 1610. In a short time after the Portuguese had built it, they were dispossessed of it by the Dutch, from whom it was taken in 1664 by the English, under admiral Holmes. By the treaty of Buda it was stipulated that the fort should remain to the English; and a charter being afterwards granted by king Charles II. to the African company, they immediately set about enlarging it, and formed it in the elegant manner it now appears.

The walls are built partly of rock-stone and partly of brick, and are very high and thick, particularly on the land side; the parade is 20 feet perpendicular above the rock, and forms a kind of quadrangle, being open on the east side towards the sea, which renders it very pleasant, and affords a delightful prospect of Queen Anne's Point, and the ships in Anamaboe road; on this side are 13 pieces of heavy cannon, which command the road and passage leading to the fort; the other three sides contain many spacious apartments and offices, particularly on the south side, where there is a very neat chapel, the back part of which joins to the castle wall, having the great body of the rock called Tabora on the outside of it. On the battlements are 10 guns, and 25 on the flankers, which are four in number. On the rock Tabora, which is about 20 paces from the castle, is a round tower, containing six 12 pounders, and serves to keep in awe the blacks of the adjacent town. The entrance to the castle is by a large well secured gate that opens into the square, which is large enough for 500 men to be drawn up and exercised. The apartments for the agents and officers are very spacious and convenient, as are also the barracks for the soldiers. The general's apartments communicate with the chapel, which is sometimes used as well to dine in as for the performance of divine service; in the front of the first story is a spacious balcony, that extends the whole length of the buildings, and in the center of it is a very elegant and commodious stair-case. Here are also spacious store-houses, and convenient counting-houses for the factors and other officers. At a small distance from the gate of the castle is a prison for the confinement of criminals; and under the square is a spacious vault cut in the rock, where those slaves are confined that have been purchased for exportation.

The gardens belonging to the castle are very extensive, being near eight miles in circumference, and are without any sort of inclosure, except on the south side; they are very fertile, and produce almost every thing natural to hot climates, particularly oranges, lemons, citrons, guavas, plantains, bananas, cocoa-nuts, cinnamon, tamarinds, pine-apples, &c. with several sorts of European vegetables, as fallads of various kinds, cucumbers, pumpkins, water-melons, and puffball; the best roots are yams and potatoes, and sometimes they have good turnips raised from English seed.

The

The Negro town at Cape Coast Castle is large and populous; and the inhabitants, though pagans, are very civil and industrious; some of them are employed in getting gold, others in fishing, and some attend to agriculture, by whose industry the rest are supplied with the necessaries of life.

In the neighbourhood of Cape Coast Castle are two small forts, which belong also to the English, and are each just three quarters of a mile from the castle; one of them is called Phipps's Tower, and the other Fort Royal, or Queen Anne's Fort; the former is a small round tower situated on the eminence of a steep hill by the side of Cape Coast gardens, and was built by general Phipps, from whom it received its name; it stands north-west from the town, and mounts seven guns. Fort-Royal stands near a small village called Manrow, and is built on a hill named Dacstein, or the Danish Mount, because the Danes had formerly a fort on the same spot; it is a square brick building, and has 18 guns, seven of which are mounted on the top of the fort, and eleven on the platform. The garrison consists of six whites and 12 blacks, who are daily relieved from Cape Coast Castle.

The town of Manrow is situated beneath the fort, and is almost inaccessible, by means of the great rocks that surround it; it is very small, and the few inhabitants that live in it are chiefly fishermen, labourers, or salt-boilers.

From this town begins the small kingdom of Sabu, or Sabot, which extends two leagues along the coast, and four inland to the north; however, it is a plentiful spot, and the inhabitants of it are reckoned the most industrious on the coast. The first place we meet with here is Queen Anne's Point, a small fort belonging to the English: it is situated on a hill about a mile from Fort Royal to the west, and two miles from a Dutch fort called Nassau to the east; it mounts five guns, and has a garrison of five whites and the same number of blacks.

The Dutch fort stands on a hill, near a small village called Mowri; it is almost square, and has four batteries, mounted with 18 pieces of cannon; the walls are higher than any fort on the coast, that of El-Mina excepted; two of the batteries, which are next the sea, are enclosed by a very spacious and convenient curtain; and the angles are ornamented with four beautiful square towers. It was built by the Dutch, and was their chief settlement on this coast at the time the Portuguese were in possession of El-Mina.

The village of Mowri contains about 200 huts, the inhabitants of which are chiefly fishermen, and pay a fifth of what they catch as a tribute to the Dutch factor.

Fantyn, the next division we come to, extends about 10 miles along the coast, and contains many villages well inhabited; it has no king, but is under the government of a brasso, or leader, whose power is greatly restrained by the old men, or counsellors, who frequently act agreeable to their own inclinations, without paying any respect to the brasso. The inhabitants on the coast carry on a great trade in gold, fish, and salt; but the inland people are chiefly employed in agriculture, and supply the markets with fruit, corn, and palm-wine.

The first material place we meet with here is Anamaboe, where the English have a small but very neat fort; it is seated on a rock about 50 yards from the sea, and is built of stone and brick; next the sea it is defended by two flankers, and on the other side by two turrets; it mounts 12 guns, and the garrison consists of

30 people, 12 of whom are whites and the rest blacks; within are several good warehouses, and the apartments for the principal officers are very elegant, and conveniently disposed. The landing here is very dangerous, the shore being lined with rocks; so that the goods from the ships are carried ashore in canoes to a narrow sandy beach under the fort, enclosed with a mud wall about eight feet high, within which are apartments for the blacks and other servants belonging to the company.

The adjacent country abounds with hills, five of which are close together, and very lofty, so that they make an excellent land-mark, being very conspicuous many miles at sea: the hills are intermixed with a great variety of trees, which make the prospect exceeding pleasant; but the most plentiful are the palm-trees, and the wine extracted from them is said to be superior to all other in Guinea.

The town of Anamaboe is very large and populous, containing at least as many people as are in the two kingdoms of Sabu and Commedia; the inhabitants are very stout and warlike, but they are desperate and treacherous, and the greatest cheats on the whole coast.

It was from this part of the Guinea coast that an English captain, in the year 1749, went up the country, with some of his people, to traffic, where he was introduced to a Negro king, who had 40,000 men; this prince, being captivated with the polite behaviour of the English, entertained them with the greatest civility; and at last reposed so much confidence in the captain as to entrust him with his son, about 18 years of age, with another sprightly youth, to be brought to England, and educated in the European manner. The captain received them with great joy, but they were no sooner safe in his possession than he basely sold them for slaves. In a short time after he died, and the ship coming to England, the officers related the whole affair; on which the government sent to pay their ransom, and they were brought to England, and put under the care of the right hon. the earl of Halifax, first commissioner of trade and plantations, who gave orders for clothing and educating them in a very genteel manner. They were afterwards introduced to his majesty, richly dressed in the European manner, and were graciously received. They appeared several times at the theatres, and one night in particular at Covent Garden, to see the tragedy of Oroonoko. They were received with great applause, which they acknowledged by a genteel bow, and then took their seats in a box. The seeing persons of their own colour on the stage apparently in the same distress from which they had been so lately delivered, the tender interview between Imoinda and Oroonoko, who was betrayed by the treachery of a captain, his account of his sufferings, and the repeated abuse of his placibility and confidence, strongly affected them with that generous grief which pure nature always feels, and which art had not yet taught them to suppress; the young prince was so far overcome, that he was obliged to retire at the end of the fourth act. His companion remained, but wept the whole time; a circumstance which affected the audience yet more than the whole play, and doubled the tears that were shed for Oroonoko and Imoinda.

These young Africans were baptized by the reverend Mr. Terrett, rector of the Temple, who took great pains to instruct them in the Christian faith. They appeared perfectly settled during their stay in England; but the young prince being desirous of seeing his royal father, he, with his companion, politely took their leave, and arrived safe at Anamaboe in the month of December 1750.

* The singular circumstances that occasioned the African prince to pay a visit to England, gave rise to several publications during his stay here. Among these was an admirable poem, intitled, *The African Prince now in England, to Zara at his Father's Court*; of which the following is an abstract:

"Princes, my fair, unfortunately great,
"Born to the pompous vassalage of state,
"Whene'er the public calls, are doom'd to fly
"Domestic bliss, and break the private tie.

"Fame pays with empty breath the tolls they bear,
"And love's soft joys are chang'd to glorious care;
"Yet conscious virtue, in the silent hour,
"Rewards the hero with a noble dower.
"For this alone I dar'd the roaring sea,
"Yet more, for this I dar'd to part with thee.
"Bleed the dread voyage, and the day decreed,
"When, dusky's victim, love was doom'd to bleed;
"Too well my memory can those scenes renew,
"We met to fight, to weep our last adieu.

The Negro sovereign, penetrated with gratitude for the paternal attention shewn to his son by the earl of Halifax, sent presents of a considerable value to that nobleman, among which were two Negro boys of the same age as the young prince and his companion. These his lordship took particular care of, and provided for them in a very decent manner: the one being exceedingly fond of, and properly initiated in the culinary art, became his lordship's cook; the other attended him to Ireland at the time he was lord-licutenant of that kingdom, when the office of serjeant-trumpet (a place for life of 100l. per annum) becoming vacant, his lordship presented it to his black. The former died several years ago, having fallen a martyr to excessive drinking: the latter, who died very lately, was universally esteemed for his affability and politeness, and was well known in London by the appellation of *The Gentleman Black*. He married a white woman of a considerable family, and some fortune, who broke her heart for the loss of him, and was buried in the same grave a few weeks after his interment.

About two miles from Anamaboe are two villages distinguished by the names of Great and Little Cormantin; the latter of which is a very insignificant place, but near it the Dutch have a small fort called Amsterdamsdam. It is a square building of rock stone, strengthened with three small, and one large battery, and is mounted with 20 pieces of cannon. In the center is a large tower, the upper part of which is formed like a cupola, and on the top of it is the flag-staff: within are convenient apartments for the officers of the garrison, which consists of 25 whites, and the like number of blacks. The prospect from the top of the tower is exceeding pleasant, as it not only commands the sea, but an extensive view of the adjacent country. This fort once belonged to the English, from whom it was taken by de Ruyter, the Dutch admiral, in the year 1665.

Great Cormantin is about half a mile below the fort: it is situated on a hill, and is very large and populous, containing at least 800 people. The lands about both villages are very fertile, and the inhabitants are chiefly employed in agriculture and fishing.

A little to the east of these villages is a place called Tantomquerri, where the English have a small but regular fort, having four flankers, on which are mounted 12 pieces of ordnance. It is pleasantly situated near the sea side, but the landing-place is inconvenient and dangerous.

" If in some distant land my prince should find
 " Some nymph more fair, you cry'd, as Zara kind—
 " Mysterious doubt! which cou'd at once impart
 " Relief to mine, and anguish to thy heart.
 " Still let me triumph in the fear express'd,
 " The voice of love, that whisper'd in thy breast;
 " Nor call me cruel, for my truth shall prove,
 " 'Twas but the vain anxiety of love.
 " How vainly prou'd the arrogantly great
 " Presume to boast a monarch's godlike state!
 " Subject alike, the peasant and the king,
 " To life's dark ills, and care's corroding sting.
 " From guilt and fraud, that strikes in silence sure,
 " No shield can guard us, and no arms secure,
 " By these, my fair, subdu'd, thy prince was lost,
 " A naked captive on a barb'rous coast.
 " What dreadful change! abandon'd and alone,
 " The shou'dered prince is now a slave unknown;
 " To watch his eye no bending courtiers wait;
 " No hailing crowds proclaim his regal state;
 " A slave, condemn'd, with unrewarded toil,
 " To turn, from morn to eve, a burning soil!
 " At night I mingled with a wretched crew,
 " Who by long use with woe familiar grew;
 " Of manners brutish, merciless and rude,
 " They mock'd my sufferings, and my pangs renew'd;
 " In groans, not sleep, I pass'd the weary night,
 " And rose to labour with the morning light.
 " But, from this dreadful scene, with joy I turn;
 " To trust in Heav'n, of me let Zara learn.
 " The wretch, the sordid hypocrite, that sold
 " His charge, an unsuspecting prince, for gold,
 " That justice mark'd, whose eyes can never sleep,
 " And death, commission'd, smote him on the deep:

The kingdom of Acron, which comes next, extends from the borders of Fantyn, to a famous place called the Devil's Mount. It is divided into Great and Little Acron; the former of which is a republic, and the latter a kingdom; and notwithstanding they are independent of each other, yet the inhabitants live in perfect amity. They are a very industrious people, and apply themselves with such diligence to agriculture, that great quantities of grain are exported from hence to other parts of the coast.

The country of Agonna is also very fertile and pleasant; and the inhabitants are distinguished for their ingenuity in making various articles of gold and silver. It contains several remarkable villages, the first of which is called Winneba, or Wimba, and is pleasantly situated, being surrounded with beautiful lofty trees. Here the English have a fort, of much the same size and form with that at Tantomquerri. It stands on a rising ground about 14 yards from the sea-side, from whence there is a handsome avenue encompassed by trees, that leads to the outer gate. It has also a large spur, which is of infinite service, as it not only contributes to the strength of the fort, but is a security to them by night from the ravages of wild beasts.

The kingdom of Agonna is remarkable for being always governed by a woman, who, to preserve the sovereignty in her own hands, lives unmarried; but that she may not want a proper companion, she generally purchases one of the handsomest slaves she can meet with, who is prohibited, on pain of death, from ever intriguing with any other woman. Her eldest daughter is next heir to the crown, her sons being all sold as slaves, or otherwise disposed of, so as not to interrupt the succession in the female line. The daughter is taught the same political maxims practised by her mother, and, when of proper age, is allowed the same indulgencies in having a male companion.

Aquamboe, the last place we have to mention on the Gold Coast, is situated chiefly within land, and is of considerable extent. The maritime part of it is called Acra, and was formerly a kingdom of itself; but in 1680, or 1681, it was conquered by the inhabitants of Aquamboe, to whom it has ever since been tributary.

The country of Aquamboe is not so fertile as the other parts described, there being very little fruit, or any kinds of grain; and what cattle they have, are brought from other parts. However, it is a good sporting country, and abounds with hares, rabbits, squirrels, red and fallow deer, wild goats, pintado hens, and other fowl. The hares are so plentiful, that the blacks kill

" The generous crew their port in safety gain,
 " And tell my mournful tale, nor tell in vain!
 " The king, with horror of th' atrocious deed,
 " In haste commanded, and the slave was freed.
 " No more Britannia's check, the blush of shame
 " Burns for my wrongs, her king restores her fame;
 " Propitious gales, to freedom's happy shore,
 " Wait me triumphant, and the prince restore;
 " Whate'er is great and gay around me shines,
 " And all the splendor of a court is mine!
 " And knowledge here, by plenty refin'd,
 " Sheds a blest radiance o'er my bright'ning mind;
 " From earth I travel upward to the sky;
 " I learn to live, to reign, yet more, to die.
 " O! I have tales to tell, of love divine—
 " Such blissful tidings! they shall soon be thine,
 " I long to tell thee, what, amaz'd, I see,
 " What habits, buildings, trades, and polity!
 " How art and nature vie to entertain,
 " In public shows, and mix delight with pain.

" O! Zara, here, a story like my own,
 " With mimic skills, in borrow'd names, was shewn;
 " An Indian chief, like me, by fraud betray'd,
 " And partner in his woes, an Indian maid.
 " I can't recall the scenes, 'tis pain too great,
 " And, if recall'd, should thunder to relate.
 " To write the wonders here, I strive in vain,
 " Each word wou'd ask a thousand to explain.
 " The time shall come, O shroud the ling'ring hour!
 " When Zara's charms shall lend description pow'r.
 " Farewell! thy prince still lives, and still is free;
 " Farewell! hope all things, and remember me."

them

them with sticks as they pass along on their ordinary occasions. Among the deer is one species that are exceeding beautiful, and perhaps the most delicate animal to be met with in the universe. It is about eight or nine inches in height, and the legs so small as not to exceed the circumference of a goose's quill. The males have two horns turning back on their head, about three inches long, without branches or antlers; they are crooked, and of a shining black colour. They are very tame and familiar, but of so tender a nature that they cannot bear the sea; for notwithstanding the attempt has been several times made, and every means used that could be thought of, no one was ever yet brought alive to Europe.

At Acra are two forts, one belonging to the English, and the other to the Dutch. The former is called Fort James, and is a strong, spacious building. It is situated on the top of a steep rocky cliff that hangs over the sea, and has a battery just under the wall of 20 pieces of cannon; besides which the fort has several large flankers mounted with 27 pieces of ordnance. The walls, which are of stone, are very thick and lofty, and in the center of the fort is a square tower, with a small spire, on the top of which is the flag-staff. The garrison consists of 20 whites and 30 blacks. Near the fort is a small village called Soko, the inhabitants of which make a point of trading only with the English.

The Dutch fort is called Creveccur, and is situated on a rocky head-land, about a musket shot from Fort James; and, though boats can come up to the strand with safety, yet the landing may be easily opposed by the guns of the fort, and the small arms of the garrison. The building is of a square form, with four batteries, which, with the curtains, are of stone, but they are neither so thick or high as those of the English fort. Within is a large, flat square house, with a platform, and the apartments are convenient both for the officers and garrison, which consists of 15 whites, and 25 blacks.

At a small distance from the Dutch fort is another called Christiansburgh, which belongs to the Danes, and is the only one they have on this coast. It is a square building strengthened with four batteries, planted with 20 guns. It appears very beautiful, and seems like one continued battery, for the roof being entirely flat, the cannon may be conveniently moved to any part of it.

A late writer says, "Considering the warlike disposition of the black on this part of the coast, it is strange they ever permitted the Europeans to build three such good forts so close together: but so great is the power of money in this golden country, as well as in other parts of the world, that one of the kings of Acra being gained by considerable presents, which the Danes and Dutch made him, granted them that liberty; at first, they asked to build each of them a storehouse to settle a factor in, under the obligation of seven marks of gold yearly for each house. The houses thus built, the Dutch and Danes never rested insinuating to the natives, that whereas they were continually exposed to the assaults of their mortal enemies, the Aquamboes, it would be for their safety to allow these houses to be turned into forts, to protect them and their families with their cannon. By this means they prevailed to have these places put in the condition they now are."

The country round Acra is exceeding pleasant, not being so woody as other parts of the coast; but it is much less fertile, owing to its being almost depopulated by the frequent wars with the Aquamboes. The European forts are chiefly supplied with provisions brought from Cape Coast, Anamaboe and Cormantin.

The trade carried on here consists chiefly of gold and slaves, which are more plentiful than in any other part of the Gold Coast. A market is held three times a week for the sale of these commodities at a village called Abeno, about 20 miles from the coast, where the Negroes resort from the inland countries. The gold is reckoned as good in quality as that at Axim, or any other part of the whole coast; and the slaves being so numerous is occasioned by the frequent wars with the neighbouring nations, which being very populous, most

of the prisoners taken on both sides are sold as slaves to the Europeans. The goods they take in return for their slaves consists of cowries, woollen cloth, Silecia linen, red and yellow bugles, knives, fire-arms, powder, chintz, &c.

The eastern boundary of the Gold Coast is terminated by the river Volta, so called by the Portuguese, from its rapid flux and reflux. It discharges its waters with such violence into the sea, that it is sometimes visible several leagues from the shore. The extent of its course inland cannot be ascertained, as it is impossible to penetrate it. From its amazing rapidity numbers of whole trees are frequently brought down with it, which sticking fast at the mouth of the river, occasion violent agitations of the waves; so that it can only be passed at certain times in the year, which are generally betwixt the months of April and November, this being the dry season, and the reflux of the river not so rapid. At the mouth of it is a small island, steep on each side, and covered with lofty trees. The shore is bordered all along with a large sandy strand, forming several small bays, which, about a league to sea, are at least nine fathom deep. On each side the river, a few miles from the mouth, the country is open, and adorned with a great number of palm-trees planted at equal distances; but farther up it is woody, and rises into hills and very steep mountains.

S E C T. IV.

The SLAVE COAST.

THIS part of Guinea is very extensive, but as the coast is remarkably winding, its distance, in a straight line, cannot be properly ascertained. It commences at the river Volta, from whence, to the river Beuais, are about 195 miles; from thence to Cape Formosa, 135; and from thence eastward to the mountains of Ambrises, 165; and thence southward to the river San Bonita, the utmost boundary of the country, 120; in all 615 miles. It is bounded on the east by the kingdom of Benin; on the west, by the Gold Coast; on the north, by Biafara, with the desert of Seth; and on the south by the Atlantic Ocean.

The whole coast contains four kingdoms, namely, Coto, Popo, Whidah, and Ardrah; but the two last form the principal part of it.

The kingdom of Coto (by some called the Land of Lampi) begins at the river Volta, and extends eastward to Little Popo, a distance of about 50 miles: it is a flat, sandy, and barren country, and the only trees to be found in it are the palm and wild cocoa. The town, or village of Coto, otherwise called Verbon, is about 14 miles from the river Volta, and was formerly the residence of the king. The inhabitants of this kingdom practise much the same customs and maxims as those of the Gold Coast, except being more fond of their fetiches, in the number of which consists their principal wealth. They are poor and illiterate, and their chief traffic consists in slaves, whom they steal from the inland countries, and sell to the Europeans.

The kingdom of Popo extends about 30 miles, and is divided into two parts, by the names of Great and Little Popo. The last is remarkably sandy, and so barren that the inhabitants are supplied with all their provisions from Whidah. They chiefly live by plunder and stealing slaves, in both which they exceed their neighbours of Coto, being of a more courageous and warlike disposition. They are also great cheats, and frequently take in the Europeans by deluding them on shore in expectation of slaves, at a time they have not one to dispose of, when they not only seece them, but sometimes detain them for several months before they procure the number wanted, and then take the advantage by fixing on them an exorbitant price.

The town of Little Popo is situated on the shore about 10 miles from Coto. It is a poor, miserable place, and consists only of a number of straggling huts, inhabited by people whose lives are chiefly spent in concerting measures for the destruction of their fellow-creatures.

The kingdom of Great Popo is not so barren as those already

already mentioned; for in the inland parts are great plenty of various kinds of fruits, as also cattle and poultry. The town stands on an island formed by marshes, and is divided into three parts, each distinct from the other. It is the residence of the king, whose palace is very large, consisting of a number of huts, inclosed by lofty trees. The passage to the royal apartments is through three courts, each of which is guarded by a number of soldiers. In the farthest of these is the king's audience room, where his nobles and principal officers occasionally assemble to consult his majesty on affairs relative to the government of the nation. The king has a great number of concubines, two of whom constantly stand by him with fans to cool and refresh him. He is very fond of tobacco, and spends the principal part of his time in smoking and conversing with his concubines. His dress consists only of a long gown of brocade, with an officer cap on his head, and sandals on his feet.

The town of Great Popo is the only place in the kingdom that merits the least notice, the rest being only small hamlets of five or six insignificant buildings, whose inhabitants, on the least apprehension of danger, immediately retire to Great Popo.

The blacks of this kingdom are not less attentive to plunder and rapine than their neighbours, neither are they very difficult in the objects they pitch on; for as they are thieves by profession, they will as readily steal from a friend as a foe. They carry on some trade in slaves, but their chief advantages arise from the fish caught in the rivers, which they not only sell to their neighbours, but also export great quantities of them to foreign countries.

The Dutch had once a settlement here, but trade being greatly injured by the frequent wars between Popo and Whidah, they suddenly left it, and have not traded there for many years. Since their time the French have settled a small factory at Popo, with two agents and some Negroes, who are subordinate to the director-general at Whidah, from whom they receive goods, and to whom they remit slaves. This trade is carried on by land, and every precaution is used to prevent the property being lost by the way: the common method is to oblige the person who sells the goods, to convey them to the frontiers of Whidah, where they are sure to be safe; but if any accident happens by the way, the seller is subject to the loss.

The Kingdom of WHIDAH.

THIS kingdom extends from the last about to leagues along the shore, and in the middle reaches six or seven inland; after which it divides itself like two arms, being in some places 30 or 40 miles broad, and in others much more. It is bounded on the east by the kingdom of Ardrah; on the west, by the river Volta; on the north, by the country of Dahomy; and on the south, by the Gulph of Guinea. It is a fine, fertile country, being watered by two excellent rivers, both of which take their rise in the kingdom of Ardrah. The southernmost of these runs within about a league and an half of the sea, and is called the river of Jakin, from a town of that name in the kingdom of Ardrah. It is only navigable for boats, some parts of it not being more than three feet deep. The other river is called Euphrates; it runs about a league to the south of Xavier, or Sabi, the capital of Whidah, and is much deeper than the former. The water is exceeding good; and the river would be navigable, were it not for the banks and shoals in the channel. At the mouth of this river is the road where the ships ride, but the landing is exceeding dangerous on account of the prodigious swell of the sea, particularly in the months of April, May, and July.

These rivers greatly contribute to the fertility of the country, which is acknowledged by all Europeans to be one of the most delightful spots in the universe. The coast part is ornamented with a variety of lofty and beautiful trees, which are planted in such order as to form the most agreeable retreats. From the coast the country rises with a fine easy ascent for the space of 50 miles, commanding, in most parts of it, a fine pro-

spect of the sea. The fields are every where cultivated, and instead of hedges or other fences, are divided by beautiful groves of trees; in short, the whole country appears as one continued garden, and its beauties may be much easier conceived than described.

The kingdom of Whidah is divided into 26 provinces or governments, which are given to the grandees of the country, and are hereditary in their families. The king is at the head of these, and has the government of the province of Xavier, so called from the capital of the kingdom. Each of these provinces has several small villages or hamlets that are subordinate to it; so that the whole kingdom appears to be one large and populous town divided into different parts by gardens, lawns, and groves.

Natural History of WHIDAH.

THE soil of this country is so fertile, that as soon as one harvest is over, the ground is sown with some other grain; so that they have two and sometimes three crops a year. They plough their land in ridges, by which means the dews falling in the hollows, and the sun heating the sides, whatever is planted soon comes to perfection. The grain consists of rice, millet, and maize, or Turkey corn. The Negroes are so industrious that they will not suffer any spot of ground to lie uncultivated; even the enclosures of their houses and villages are planted with melons and other fruits; and instead of highways they have only small paths that lead through the fields from one village to another.

The fruits here consist of oranges, lemons, bananas, ananas, plum-apples, water-melons, citrons, and tamarinds; there are also prodigious numbers of palm-trees, but they are chiefly cultivated by the natives for the sake of the oil, they being so little fond of the wine, that few of them take the trouble to draw it.

All the roots produced on the Gold Coast grow here; besides which they have cabbages, carrots, turnips, radishes, parsley, and various kinds of fallads, all of them little inferior in quality to those of Europe.

Among their pease is one species of a very peculiar nature; they produce small trees like those that bear the pimento, or red pepper, but they have no flower, and seldom exceed six feet in height; the pease grow in a bag or membrane, almost as strong as parchment, placed beneath the stem amongst the roots, which yield nourishment to the plant; the bag contains in general about 150 pease: when the leaves begin to grow yellow, they pull up the plant with the roots, open the bag, and extract the pease; but if they chuse to have them very tender, like those of Europe, they pull up the plant while the leaves are green. They sow these pease at the end of the rainy season, and they grow so fast that they are fit to gather in six weeks. They are as well tasted as the pease of Europe, are easy of digestion, and make excellent soup.

The country about Whidah being so universally cultivated, they are seldom troubled with wild beasts; but in the more inland parts there are elephants, buffaloes, and tygers; and a greater plenty of all sorts of apes and monkeys than in any other part of Guinea. There are also many deer and hares, the latter of which are much like those of Europe.

The tame beasts are, oxen, cows, goats, sheep, and hogs, all of which are much larger, and the flesh better tasted than those of the Gold Coast; the hogs in particular are exceeding large, and the flesh as white and sweet as those of England. This indeed is little to be wondered at, for the poorer sort of Negroes pay more regard to their hogs than to themselves, and feed them much better.

Their tame poultry consists of cocks and hens, geese, ducks, and turkeys; besides which they have great plenty of wild fowl, as partridges, pheasants, thrushes, pintados, wild ducks, teal, woodcocks, ortolans, and ring-doves. There are also many parrots, which are chiefly grey, with some red feathers on the head and the tips of their wings and tails.

The crown bird is likewise found here, but it is not so beautiful as those of the Gold Coast, which have been

already

already described; however, here are several other sorts of birds, whose peculiarities merit particular attention.

The first of these is the kurbalot, or fisher; it is a small bird, about the size of a sparrow, and its plumage is beautifully variegated; the bill, which is as long as the body, is very strong and sharp, and is furnished on the inside with small teeth, not unlike those of a saw. They build in high trees by the sides of the rivers, and their nests are composed of earth mixed with feathers and moss: they make their nests at the extremity of the most slender branches, where they hang by a reed or straw about a foot long; they are of an oval form, and are entered by a projection at the top that bends a little, so that the inside is perfectly secure from the weather. These birds not only fly in the air, but skim on the surface of the water with prodigious swiftness. They are exceeding numerous, and breed so fast, that sometimes a dozen nests are found on the same tree.

The aigret is a bird of the heron kind, but is remarkable for the colour of its legs and feet, which are of a deep red: the body is about the size of a goose, and the feathers are of a darkish colour intermixed with white; the neck is long, but the tail is remarkably short; the bill, near the head, is of a blueish colour, but towards the point it is black. They are little used by the negroes, their flesh being dry and ill tasted.

The bustard here is about the size of the Guinea hen, and the flesh of it exceeding good. The bill is of a whitish colour, and much longer than those of Europe. The eyes are large, the iris hazle-coloured, and the eye-lids of an ash-colour. The sides of the head, all round the eyes, are of a bright brown, but the top of the head and the whole neck, are covered with black feathers hanging a little loose, with narrow points. The back, rump and tail are of a bright brown; and the feathers on the latter have transverse black bars. The quills, or greater wing feathers nearest the back are brownish, with black spots, and the middle quills white, with transverse bars of black. The legs are long, and the toes short in proportion, being void of feathers some way above the knees. The toes are only three, all standing forward, and they are covered with scales of a white colour, but the claws are dusky.

The bird called the Numidian Damself is very delicate in its construction: the body is long and taper, as are also the legs. The feathers on the upper part of the wings and back are of a light colour, but the tail, which is long and ragged, is black. The sides of the head are white, and from the top of it behind hangs a long tuft, which reaches for several inches down the back part of the neck. It is a bird much esteemed among the blacks, the flesh of it being firm and well tasted.

The Monoceros is a very ugly bird, and the flesh of it harsh and disagreeable. It is short and thick, of a dark colour, except the wings and upper part of the back, which are white. The beak is long and very thick, and the tips of the wings reach to the upper part of the legs. The neck is short and thick, as are also the legs, and the claws in particular are remarkably large. It is a voracious bird, and lives chiefly on fish.

The Guinea hen, or pintado, has a round back, with a tail turned downwards like a partridge; and the feet are furnished with membranes or webs like water-fowls. The head is covered with a kind of casque, or helmet, and the whole plumage is black, or dark grey, speckled with white spots. It is of the size of a common fowl, and the casque on the middle of the head is of a horny substance, and a dusky red colour. Under the bill are wattles, but they do not proceed from the lower chap as in hens; they flow from the upper, and the head is bare of feathers, but on the upper eye-lids there are long black hairs that turn upwards. The bill is like that of a common fowl, but in some of them, at the root of it, there is a small tuft, consisting of twelve or fifteen threads, one third of an inch in length, and as thick as a pin, and in substance much like the bristles of a hog. On each side of the bill there is a blueish skin, which extends towards the eye, and surrounds it but becomes black in that place. This skin forms the eye-lids, and being lengthened and becoming double, make the appendices or wattles of the cheeks. They are of different shapes,

some being oval, some square, and others triangular. They are of a red colour in the female and blue in the male. The ears are placed behind the wattles, and are quite uncovered; but the apertures are very small. The feet are of a greenish colour, and covered with large scales before, but behind there is only a rough skin, like shagreen leather; and the hinder toe is short. They go together in large flocks, and feed their chickens indiscriminately, each attending to those that first come in their way.

The swans here are very different in shape to those of Europe. From the head to the shoulder of the wings they are white; but from thence to the tip the colour is a dark brown, as is also the tail. The legs are long and taper, and the back is also long and very thick, but terminates with a sharp point. Their flesh is very coarse, and rather obnoxious than grateful to the palate.

The rivers here produce great plenty of various kinds of fish, particularly eels, mullets, soles, thornbacks, and a sort of white fish, in shape much like our pike. They have also great quantities of shrimps, craw-fish, lobsters, scollops, and other shell-fish. The latter are found near the mouths of the rivers, where the water is brackish, and are reckoned much better than those caught in the sea.

Notwithstanding the sea runs violently high in the road of Whidah, yet it abounds with fish, which are caught by the natives with lines, they being strangers to the use of nets. Among the fish caught here is a remarkable one, called by the natives the ape or monkey fish. It is in general about ten feet long, and between three and four broad, from the extremity of the neck till within a third of its length, when it diminishes insensibly, ending in a long round tail. The head is round, the eyes small, and the chin short; and the upper lip is furnished with hair like whiskers. The neck is very distinct from the body, and on that part of it next the head is a round excrecence like a crown. It has four fins which resemble the beard or whiskers of a whale: the two foremost are so situated that they supply the place of hands, for he can convey any thing with them to his mouth. The hinder fins are placed beneath the middle of the belly, and are less than the former. It has no scales, but a skin spotted with small pimples like that of the shark. It is of a black colour, and shines when first taken out of the water, but when dead it loses its lustre. The flesh is tolerably good, and in its taste greatly resembles lean beef. It is a lively fish, and swims very swift. When he appears first on the surface of the water, before he takes the hook, his motions are truly diverting. He comes gently near it, looks at it, tastes it with the edge of his lips, and then quits it. After several evolutions he at length swallows it, and when he is entangled he throws himself into such postures, as to afford a most laughable scene to the spectators.

Among the reptiles here are great numbers of snakes, or serpents, but they are chiefly of two sorts. The first of these is black and poisonous, but the other is quite harmless, and worshipped by the natives as their greatest fetish. The poisonous sort are about twelve feet long, and three inches in diameter. They have a flat head, with two large crooked teeth; and always creep with their head erect and their mouth open, and attack their prey with great celerity.

The fetish snake has a large round head, with beautiful eyes; the tongue is short, pointed like a dart, and their motion is exceeding slow; their tail is slender and sharp, and the skin very beautiful, the ground of it being white, with wavy streaks or spots of yellow and brown agreeably intermixed. They are so gentle that they will not hurt any creature except the venomous serpents, to whom they have the greatest enmity, and seem to take a pleasure in destroying them. Both Negroes and Whites handle and play with them without the least danger.

The blacks consider these snakes in so sacred a light, that should either a Negro or a White man kill one of them, whether on purpose, or by accident, his life would pay for it. Of this the following tragical instance is recited by a late writer: "When the English," says he,

first settled in Whidah, a captain of that country having landed, and howled his cargo, his men found one night a snake in the lodge, which, not thinking any harm, they immediately killed and threw out before the door. The Blacks next morning seeing the dead snake, and the English as innocently owning they had killed it, the natives massacred all that were in the lodge, set fire to it, and destroyed all the goods." The English, deterred by this cruelty, discontinued from going to trade there for some time; but at length some of them again venturing, on their arrival, the Negroes shewed them some of these snakes, and desired they would not hurt them, by reason they were sacred: this request the English readily obeyed, and no material accidents have happened to them ever since.

The Portuguese once fell into a like dilemma with the English. One of their ships being to leave the place, the captain, out of curiosity, intended to carry one of these serpents to Brazil. Accordingly he got one, and when the vessel was ready to sail he put it privately into a box, and embarked with his prize in a canoe, which was to carry him over the bar to his boat. The canoe, however, notwithstanding the weather was calm, overfet, and the Portuguese was drowned. The Negroes having recovered their canoe, returned ashore with the box, which they broke open in hopes of plunder; but what was their confusion, when instead of merchandize, they found their fetish! By their outcries the people were soon informed of what had happened, and of the sacrilege the Portuguese had committed; but as the offender was dead, the priests and populace fell on the Portuguese, plundered their magazines, massacred all of that nation, who could not escape time enough to the other Europeans; and it was with great difficulty, and by considerable presents, that they were so far appeased as to suffer the Portuguese to continue in the country.

If a white man should happen by chance to kill one of these serpents, the only means to secure him are, to fly immediately to the king and satisfy him that it was not done designedly; in which case, and a handsome present made to the priests, he may probably escape the rage of the populace; but even then his situation is very dangerous.

Before we quit this subject we shall take notice of a whimsical story relative to one of these snakes, mentioned by Bolman. "A snake," says he, "once placed himself over the table where I always dined, and though he might be easily touched, yet no person could be found, who would venture to take him away. However, I was afterwards very well paid for his lodging; for some of the great men of Whidah dining with me one day, happening to talk about the snakes, I glanced my eye to that which was over their heads, and told them, that not having eaten any thing for fourteen days, he must certainly at last die with hunger, if he did not speedily remove his quarters. My guests answered, that although I was not aware of it, the snake undoubtedly had part of my victuals out of the dishes, which he knew how to come at. I took the hint, and next day told the king, in presence of the same persons, that one of his fetishes had made bold, uninvited, to eat at my table for fourteen days; adding, that I thought it was but reasonable that I should be paid for his board, otherwise I should be obliged to discharge my house of this bold intruder. The king, who was always diverted with such sort of discourse, desired me to let the snake remain where it was, and promised to provide both for him and me; which he accordingly did, by sending me a fine fat ox the same evening."

The same writer says, "If a fire breaks out, in which one of these snakes happen to be burnt, all that hear of it stop their ears, and give money to reconcile them to the consumed fetish, of whom they have been so careless; since they believe he will quickly return and revenge himself on those who have been the occasion of his death."

The methods in which the blacks particularly worship these serpents will be noticed when we come to treat of their religion.

Of the Persons, Dress, Manners, Customs, &c. of the Negroes of Whidah.

THE Whidah blacks of both sexes are generally tall, lully, and well proportioned; but their colour is not so shining a black as those of the Gold Coast. Their dress consists of three or four ells of a stuff called Paen, which is wrapped round the waist, and then descends to the middle of the leg. The ladies wear a silk garment, with two or three rows of fringes, the bottom of it covering the feet. Sometimes they wrap themselves round with a piece of the above-mentioned stuff Paen, and bring part of it over the head and round the shoulders like a mantle. The better sort of the men are distinguished by their hats, which they purchase of the Europeans; the larger they are the better they like them, and are particularly proud of them after they are old and rusty; others have bonnets made of deer or dogs skin. They wear fringes of pearls or coral on their necks, and have bracelets of the same materials on their arms and wrists.

They are in general very illiterate, notwithstanding which they are more polite and civilized than any other people on this part of the coast. When two persons of equal condition meet, they both fall down on their knees, clap their hands, and mutually salute, by wishing each other a good day. They pay particular respect to their superiors, for when they chance to meet these they immediately fall on their knees, and kiss the earth thrice, clapping their hands, and congratulating them by wishing them a good day or night, which the superior returns, by gently clapping his hands together, but without altering his posture; all which time the inferior continues on the ground till the other departs. The same kind of ceremonies are also used by the younger to the elder brother, the children to their father, and the wives to their husbands.

The Whidah blacks not only differ from those on the Gold Coast in good behaviour and colour, but also in industry; for as the former are naturally slothful and indolent, so the latter are cleanly and assiduous to business; nor will they ever leave any work they undertake till it is thoroughly completed. Besides agriculture, the men make calabashes, wooden utensils, hardware, and several other things, which they execute with great neatness. The women are employed in spinning, and in planting and sowing their corn, yams, potatoes, &c. The Whidah cloth is about two yards long, and a quarter of a yard broad: it is of various colours, but those most in use are either white or blue.

Those that are very wealthy, besides husbandry, in which their wives and slaves are employed under them, drive on a very considerable trade, not only in slaves, but in many other commodities.

Notwithstanding these people are so polite and industrious, yet, next to the Chinese, they are the most artful thieves in the universe; and, like them, are extremely addicted to gaming. When they have lost their money and other property, they will play for their wives and children, and when they have lost them, stake their own liberty, and thus become slaves to their countrymen, who sometimes sell them to the Europeans.

The customs of the natives here are most of them the same as those practised by the inhabitants of the Gold Coast. One of the most material that differs from them, and perhaps from all other countries in the universe, is, the indulgence given to polygamy. It is no uncommon thing here for a poor man to have forty or fifty wives; a chief, or grandee, three or four hundred; and a king as many thousands. These wives, however, may be considered only as so many slaves, and indeed the principal part of those belonging to the great people are probably captives that happen to please their masters, who therefore rather chuse to keep them, than sell them to the Europeans.

Their marriage ceremonies are very trifling. When a man fancies a young woman, he applies to her father, and

and desires her for his wife, which is seldom refused. He then presents her with a fine pagné, or garment, as also necklaces and bracelets; after which he provides a grand entertainment, which concludes the ceremony. If a slave has a mind to marry a girl, who is the slave of another, he asks her of her master, without applying to her parents. The boys of this marriage belong to the master of the wife.

The women here cannot be considered in any other light than as slaves. They are in general obliged to till the ground for their husbands; and even the favourites, who are kept at home, are not exempt from work; besides which, they are obliged constantly to attend on their husbands, and behave to them with the greatest submission.

It is little to be wondered at that there should be such a prodigious number of slaves to be had here; for from the multiplicity of wives each man has, a great number of children must reasonably be expected. It is no uncommon thing to see fathers who have 200 children living at the same time; and it often happens that a man has half a dozen children born in a day, for they never cohabit with their wives while pregnant, which indeed is the only reason that can be given for their being permitted to take so many. A man's principal wealth consists in the number of his children, whom he can dispose of at pleasure, except his eldest son. On the death of the father, the eldest son inherits not only all his goods and cattle, but his wives, which he immediately holds and retains as his own, except his mother, for whom, in case she desires it, he provides a separate subsistence and apartment. This custom not only prevails among the common sort of people, but also the king and grandees.

The Whidah blacks are equally fond of dancing with those on the Gold Coast; and the methods they use in that exercise are much the same. Their musical instruments are also of the like kind, but are much better made, and not so harsh in their sound.

Circumcision is practised here as in most other parts of Guinea; but the time of performing the operation is uncertain, some doing it at the most infant state, and others not till the children are five or six years old.

They are subject to several diseases, particularly malignant fevers, and the flesh worms, the latter of which has been already described in our account of the Gold Coast. Their fevers are most prevalent in the months of June, July and August, and discover themselves by violent pains in the head and reins, an inclination to vomit, bleeding at the nose, and such a thirst that the tongue appears quite black. They have excellent physicians, so that though these disorders are frequent, yet they seldom prove fatal. The worst and most difficult disorder to cure, is the dysentery, which attacks people at all seasons of the year. It commonly arises from eating the country fruit to excess, or making themselves too free with spirituous liquors.

In case of sickness, the people here are greatly alarmed, and the mention of death has such an effect on them, that it frequently facilitates their illness. It is a capital crime to speak of it before the king, or any great man.

The religion of the Whidah blacks is in most respects the same as that professed by the inhabitants of the Gold Coast, only the number of their fetiches is much more considerable. Those of a public nature are four in number, viz. 1. The snake, or serpent, which, as already observed, is the principal. 2. The trees. 3. The sea. And 4. Agoye, or the god of counsils.

The snakes are kept in fetich houses, built for that purpose in groves; and to these the people sacrifice hogs, sheep, fowls, goats, &c. The principal snake house, or cathedral, is situated about seven miles from the king's village, and is built under a beautiful and lofty tree. It is called the Grand Snake, being the largest of them all, and is chiefly worshipped by the king and great men. The offerings made to this snake are very considerable, consisting not only of various kinds of provisions, but also money, pieces of silk or stuff, and all sorts of European and African commodities. These offerings are presented to the priest, or grand sacrificer,

who reconciles the disposal of them with the idol in such manner, as to enhance his own emolument.

An annual pilgrimage is made to the grand snake by all the nobility and great men of the kingdom, among the richest offerings and most valuable presents are bestowed. The great master of the king's household also goes once a year in the king's name, and offers presents to the snake for the preservation of the government. But the greatest piece of devotion paid to this idol is the solemn procession made after the coronation of a new king, the particulars of which are thus related by the Chevalier de Marchais, who was a spectator of the whole ceremony in the year 1725.

As soon as notice is given of these processions, the crowds are so great from all parts of the kingdom, that it would be impossible to pass, if care was not taken to range them in order on each side. For this end a great number of beades, or constables, with large rods or switches in their hands, go foremost to keep order and make way. These oblige the people, gathered near the temple gate, to sit on their heels and keep silence. Next follow 40 of the king's musketeers, four and four, with their captain at their head; then the king's trumpet-major, with 20 trumpets; and after him the drum-major, with as many drums, beating as loud as they can; next the chief player on the flutes, with 20 musicians on the same instrument. These three bands are the king's chamber-music, and sometimes play separately, sometimes together. Twelve of the king's wives, two and two, carrying the king's presents to the serpent, which consist of bujis, brandy, linen, callico, and silk; the king's valet-de-chambre alone, with a cane in his hand, bareheaded, and clothed like the grandees, his pagné trailing on the ground; 21 trumpets, three and three; 40 soldiers with muskets, four and four; 20 drums, two and two; 20 flutes, ditto; 12 of the king's wives of the third class, with large baskets of reeds on their heads, with viçuals for the serpent from the king; three of the king's dwarfs richly dressed, and long pagnes trailing behind them, which makes them look less; the grand master of the ceremonies, bareheaded, his cane in his hand, dressed like the grandees; 40 musketeers, four and four; 20 drums; 20 trumpets; 20 flutes; 12 of the king's wives, carrying the queen-mother's presents to the serpent; three valets of the queen-mother carrying her arm chair; the foremost has the back of the chair fastened to his shoulder, the two other carry the feet: three of the king's dwarfs, dressed like the former: after them comes the queen-mother, walking alone, her cane in her hand, magnificently dressed, her pagnes trailing behind, and on her head a reed hat, neatly wrought: three ladies of the palace richly dressed, but bareheaded; 12 women trumpets, two and two; 12 women drums; 12 women flutes; the grand sacrificer, bareheaded, his cane in his hand, richly dressed like a grandee; lastly, a body of 40 musketeers closing the procession, with some beades, or constables, to keep off the mob.

As these several bodies arrived at the place of the serpent, without entering the court, they prostrated themselves with their faces to the earth at the gate, clapping their hands, throwing dust on their heads, and giving shouts of joy. Mean time the men and women musicians, ranged on each side, made an horrible noise, while the soldiers kept continually firing with their muskets. The king's wives, who carried his presents, and those of the queen-mother, waited, ranged in a line in the outer court, till that princefs entered, and delivered those presents to the grand sacrificer. In doing this, she was assisted by the king's valet-de-chambre, the master of the ceremonies, and the three ladies of the palace, who were the only persons admitted into the temple. It did not appear that this princefs was admitted to see the serpent, for that is a favour not even allowed to the king, who is not suffered to enter the first hall, but makes his addresses to the serpent by the mouth of the grand sacrificer, who brings back such answers as he thinks proper. After this the procession returned to Sabi with the same order and ceremony as before."

They

They invoke the snake, or serpent, on particular occasions, when they think their private fetishes have not sufficient power to protect them: these times are, when they are afflicted with drought or rain, famine, or other public calamities. The common people go daily in large bodies to their snake-houses, with drums beating and trumpets sounding, where they perform their worship, which consists of certain songs and dances to the honour of their idol, from whom they implore either a propitious journey, fair weather, a good crop, or whatever else they stand most in need of; to obtain which they present their offerings, and then return home.

The trees, which are their second public fetishes, are very lofty, and though they are formed by pure nature, yet they appear as if the greatest art had been bestowed on them. These trees are only prayed to and presented with offerings in time of sickness, more especially fevers, for the restoration of health. They believe this to be as much the business of the trees as the snake; but then the latter must not be forgotten, for they imagine (which is indeed certainly the case) that if he does them no good, he will not do them any harm. The sacrifices offered to the trees consist of leaves of millet, maize, or rice. These the priest places at the foot of the tree to which the patient is desirous of making his offering; if the latter compliments the former with a pecuniary present, he leaves them to be devoured by the beasts and birds; if not, when the patient is gone, he takes them home, and converts them to his own use.

Their third principal fetish, the sea, they firmly believe (and not without just cause) is able to do as much for them as the snake or the trees. But as no share of the offerings thrown into it can ever revolve to the priests, they teach the people to pay a small kind of distant adoration to it, which may be seen, and consequently worshipped in that manner at any part of the kingdom. Indeed, when the weather is so stormy as to hinder trade, the grand sacrificer is consulted, and according to his answer, a procession is made to the sea, where an ox or sheep is killed on the shore, letting the blood flow into the water, and at the same time throwing a ring into the sea as far as the strength of the arm will reach. The carcase of the beast sacrificed is the property of the priest, who disposes of it in such manner as he thinks proper; sometimes he divides it among the people, but in general he converts it to his own use.

Agoye, their fourth and last public fetish, is made of black earth or clay, and in form somewhat resembles a negro squatting. It is placed on a kind of pedestal ornamented with a slip of red cloth bordered with cowries: the head is crowned with lizards and serpents, intermixed with red feathers; and from the top issues the point of an assegaye that goes through a larger lizard, beneath which is a silver crescent. This idol is placed on a table in the house of the grand sacrificer; before it stands three wooden bowls, or half calabashes, in one of which are a number of small earthen balls. With this idol the people generally advise before they commence any capital undertaking, for which reason he is called the god of councils. Those who consult this fetish address themselves to the sacrificer, informing him of the business they are about to undertake; after which they present their offerings to Agoye, and give the priest, his interpreter, the fee. If the priest is satisfied with the present, he takes the bowls, and after several grimaces, throws the balls at random out of one bowl into another. If the number in each appears to be odd, the undertaking is declared prosperous, and the person who applies for advice returns home perfectly satisfied. This oracle, however, frequently proves erroneous, in which case, such is the prepossession of the Negroes, that they acquit Agoye, and lay the blame entirely on themselves.

The priesthood here is not confined to the male sex only, for there are more priestesses than priests, and both of them are held in such high veneration, that they are liable to no punishment for any capital crime whatever. The priestesses are not accountable to their husbands

either for disobedience or infidelity; on the contrary, they are uncontrollable, and must be served by the husband on his knee, with the same respect that other women pay their husbands. When girls are allotted to take upon them the order of priesthood, they are placed under the care of an old priestess, whose dwelling is secluded from all others; and, during their residence there they must not be seen by any one, not even their parents. For some days after their admission, they are treated with great respect, and are taught the dances and songs sacred to the worship of the serpent: after this the priestesses mark them, which is done by cutting their bodies with some iron points in the form of flowers, animals, and especially serpents. As soon as they are thoroughly cured and instructed, they are told it was the serpent himself that marked them, which, whatever they may think, they must pretend to believe. They are also forbid to reveal whatever they have seen or heard, otherwise the serpent will carry them off, and totally destroy them. When the whole ceremonies are fully completed, their mistresses deliver them to their respective parents, who seldom fail to receive them kindly, and return thanks to the serpent for the honour he has done their family, in admitting their children into his service, and stamping them with his mark. A few days after they are delivered to their parents, the old priestesses goes to them, and demands payment for their children's residence in the serpent's house, which she fixes at her own discretion: whatever the demand is, the parents, if able, immediately pay it, for should they make any hesitation, it would be doubled. The contribution thus exacted, they divide: one part of it they give to the grand sacrificer, another to the priests, and the third they divide among themselves. The girls continue with their parents for some time, going every day to the house where they were consecrated, to repeat the songs and dances they learned in honour of the serpent; after which they enjoy the peculiar privileges incident to their function; and if any of them happen to be afterwards married, their husbands must treat them with that respect we have before described.

The high priest, or grand sacrificer, presides over the rest, who pay him the greatest homage, and even the king himself considers him with equal respect. 'Tis he alone that is permitted to enter the king's private apartment, and that only once in his life, which is when the king presents him his offerings three months after his coronation. The priesthood of the grand serpent is peculiar to one family, of which the grand sacrificer is the chief, all the others being subject to, and dependent on him. The priests, as well as the priestesses, are easily known by the scars and marks on their bodies made at the time they were initiated into the religious order. In other respects they differ but little from the laity, their habit being much the same, though they have the privilege of dressing themselves like the grandees. They trade like other people, and gather considerable possessions by the sale of cattle and slaves; but their greatest gains arise from the credulity of the people, from whom they extort offerings and presents for the great serpent, which their deluded devotees imagine is religiously bestowed, but on the contrary it only contributes to the emolument of the priests, for they convert them to their own use; and in this they are so diligent, that they even sometimes leave the poor serpent without victuals.

Of the Government of Whidah, with the Punishments inflicted on Offenders.

THE government of Whidah, so far as it relates to civil and military affairs, is vested in the king and his principal men; but in criminal cases the king assembles a council, when he opens the indictment, and requires every person to declare his opinion what punishment the offender deserves; and according to the verdict the punishment is immediately inflicted. Under the king are several viceroys, whom he appoints at pleasure, and who, in his absence, have an unlimited power. He has also grand captains, who are viceroys over certain districts; besides these, there are a great number of honorary captains, and another sort that are entrusted with the care of the markets, slaves, prisons, &c.

The

The capital crimes here are only two, namely, murder and adultery. For the first offence the criminal is cut open alive, his entrails taken out and burnt, and his body fixed on a pole erected in the market-place, where it continues for some days, and is then carried to a remote place to be devoured by birds or beasts of prey.

The punishment for adultery is no less severe than that for murder, especially when it is committed with one of the king's wives. If the guilty couple happen to be surprized, the king pronounces sentence of death immediately; the manner of executing which, according to Bolman, is thus performed: the king's officers cause two graves or pits to be dug, six or seven feet long, four broad, and five deep, so near each other, that the criminals may see and speak together. In the middle of one they plant a stake, to which they fasten the woman, tying her arms behind the post: her legs are also tied at the knees and at the ancles. At the bottom of the other the king's wives lay bundles of small faggots, after which they retire; and two forks of wood being fastened by the officers at the ends, the man, stark naked, is tied to an iron bar, like a broad spit, with iron chains, that he cannot stir, and laid across the two forks. They then set fire to the wood, so that the flames may just reach the body, which is thus roasted by a slow fire. *This cruel punishment would be very lingering, if they did not take care to burn the criminal to with his face downward, that the smoke suffocates him before he is quite broiled. When they no longer perceive signs of life, they untie the body, fling it into the pit, and fill it up with earth. When the man is dead, the women issue from the palace, to the number of fifty or sixty, richly dressed as on a festival day. They are guarded by the king's musketeers, accompanied by his drums and flutes. Each carries on her head a large pot of scalding water, which they pour one after another on the head of the female criminal, dead or not dead, and throw the pot after it. This done, they loosen the body, take up the stake, and casting both into the pit, fill it up with earth and stones.

If the wife of a grandee is taken in adultery, the husband is at liberty to use his own discretion, either to put her to death, or sell her as a slave to the Europeans. If he determines on the former, she is strangled or beheaded by the executioner, and the king is sufficiently satisfied on being made acquainted with the fact. The injured husband, however, has not any power over the man that dishonoured him, unless he happens to catch him in the fact, when he has liberty to kill him on the spot. If otherwise, he must apply to the king for justice, who usually sentences the criminal to death. The Chevalier Marchais, who was present at one of these executions in the year 1725, gives the following account of it: "A grandee, says he, complained to the king that a private person had debauched his wife. His majesty, upon hearing the witness, passed sentence, that the offender should be beaten to death wherever he could be found, and his body exposed for food to the birds and beasts. The officers belonging to the governor of Sabi immediately went in search of him, and found him almost entering his own door, where they soon dispatched him with their clubs, and left the body as the king had ordered. The neighbours went to acquaint the captain of the frigate, that the body would infect all that quarter before it corrupted, and intreated he would obtain the king's orders to have it taken from thence, or thrown into the sewer, where it could not affect any body. The officer represented their complaint to the king, who replied, 'If I did not punish adultery with severity, no person in my kingdom could be safe. The body shall lie there till it be devoured or rotten. The people shall see it, and learn, at the expense of this wretch, how they invade their neighbour's bed. All I can grant is, that in the day-time they may throw a mat over the body, leaving the face uncovered, that the criminal may be known as long as his features can be distinguished.' Not content with this, the king gave to the grandee, whom the deceased had injured, all his effects, with his wives and slaves, to sell or dispose of as he thought proper."

30

For crimes of a more trifling nature the punishment is left to the viceroys, who generally inflict either some kind of penance, or a pecuniary mulct, which is always paid to the king.

Of the Succession to the Throne of Whidah, with a particular Account of the Ceremonies used at the Coronation of their Kings.

ON the death of the king, the crown descends to his eldest son, unless the grandees have reason to reject him: in which case they appoint the younger brother in his stead. These sons, however, must be born after their father's accession; those born before not having any right to it.

It is a fixed law, that as soon as the king's eldest son is born, he shall be removed from the court, and placed in the hands of some private person, who lives remote from the palace, and with whom he remains unacquainted with his birth, or the rank he is designed for. The person in whose hands he is placed is told the secret, and he is obliged to conceal it from him on pain of death. By these means it often happens, that when a prince is called to the throne, he is at the very time employed in some of the most menial offices; and it is with great difficulty he can be persuaded to give credit to those who inform him of his elevated situation. This is a political manœuvre of the grandees in order to preserve the government, at least for some time, in their own hands; for, from the obscure situation in which the prince has been brought up, he is consequently a stranger to all knowledge of government, and is therefore obliged to consult the grandees upon every occasion.

As soon as the old king is dead, the new one is immediately brought to the palace; but the time of his coronation is uncertain, that resting in the grandees, who fix it as best suits their respective interests; it is in general some months, and frequently several years; but seven years is the longest term for which it can be delayed. During this interval the government is rather in the hands of the grandees, than those of the king, for they execute all public business within themselves, and never consult him even on the most important occasion. In every other respect, however, he is treated like a prince, only with this distinction, that, previous to his coronation, he must not leave the palace.

When the grandees have fixed the time for the coronation, they give immediate intimation of it to the king, who assembles them in the palace, and after the council have deliberated on the measures to be used in executing the ceremony, notice is given of it to the public, by a discharge of cannon, and the news is soon circulated all over the kingdom.

The next morning the grand sacrificer goes to the palace, and demands of the king, in the name of the great serpent, the offerings due on the occasion. These offerings generally consist of an ox, a horse, a sheep, and a fowl, which are sacrificed in the palace, and afterwards carried in great ceremony to the middle of the market-place. As soon as they arrive there, the grand sacrificer erects a pole nine or ten feet long, at the end of which is a piece of linen in imitation of a standard or flag, and round the victims are placed small loaves of millet, rubbed over with palm-oil. After some trifling ceremonies, the company retire, and leave the carcasses exposed to the birds of the air, no person being permitted to touch them on pain of death. As soon as they arrive at the palace, about 20 of the king's wives march in procession from thence to the place of sacrifice, the eldest, or chief, carrying a large figure made of earth, representing a child sitting, which she places at a small distance from the victims. They are attended by a number of musketeers, with a party of the king's flutes and drums, and both coming and going they keep continually singing, the people prostrating themselves as they pass, and expressing their joy by the loudest acclamations.

When these ceremonies are over, the grandees repair to the palace, dressed in their richest apparel; and attended

4 P

ended

tended by their slaves. The king not being present, they enter it without stripping, and after having prostrated themselves before the throne, they retire. This part of the ceremony continues for 15 days, during which the king's women make the palace resound with their exclamations, and the public joy is testified by the firing of cannon, and an almost continued display of rockets from all parts of the town.

After the expiration of the 15 days, the grantees depute one of their number to go to Ardrah, with a magnificent retinue, to request one of the nobles of that kingdom (in whose family the right has continued time immemorial) to come and crown the king. The greatest respect is paid to this nobleman by all ranks of people, and the expenses of his journey are defrayed by the grantees of Whidah. When he arrives at the last village next the capital, he and his retinue must continue there four days; during which he receives visits from the principal people of the kingdom, who make him presents, and divert him with various kinds of entertainments. The king also sends him provisions twice a day, which are carried in great pomp by his wives, preceded by a guard of fulliers, and his majesty's band of music.

When the four days are elapsed, the grantees, attended by their usual train, and a prodigious concourse of people, go to the village, and conduct the Ardrah nobleman in great state to Sabi, where he is received by the firing of the king's cannon, and the universal exclamations of the people. After this he is conducted to the apartments prepared for him near the king's palace, where he is splendidly entertained by the king's principal officers, and receives visits from all the grantees. He continues here five days, on the third of which he enters the palace, with the chief of his train, without taking off any part of his dress or ornaments, and speaks to the king standing, and without prostrating himself. On the evening of the fifth day nine guns are fired at the palace, to give the people notice that the king will be crowned the following day, and that he will show himself in public, seated on his throne, in the court of the palace destined for that purpose; and that the gates of it will be open for the admission of all ranks of people. At the same time he sends one of his officers to acquaint the directors of the European factories with the time and place, and to invite them to be present at the ceremony.

About five o'clock in the evening of the sixth day, the king sets out from his seraglio, attended by 40 of his favourite wives dressed in the most sumptuous manner, and rather loaded than ornamented with gold necklaces, pendants and bracelets, foot-chains of gold and silver, and the richest jewels. The king is dressed in the most magnificent manner, and on his head he wears a gilt helmet, decorated with red and white feathers. He is attended also by his guards, and proceeds from the seraglio to the throne, which is placed in an angle of a court to the east of the palace, and is called, The Court of the Coronation. The throne consists of a large gilt arm chair a little elevated, with a velvet cushion richly laced with gold, on which the king sits, having another of the same quality at his feet. On the left hand of the king are placed his 40 favourite women; on the right his principal grantees, and on a line with them the chief Europeans of the English factories. One of the grantees holds in his hand an umbrella, which is more for ornament than use, as the ceremony is performed at night. It is made of the richest cloth of gold, the lining embroidered with gold, and the edges adorned with gold fringes and tassels. On the top of it is the figure of a cock as large as the life, and the pole that supports it is about six feet long, and gilt. Another grantee kneels before the king, and keeps fanning him during the whole ceremony. Opposite to his majesty are two of his dwarfs, who alternately represent to him the good qualities of his predecessor, extol his justice, liberality, and clemency, and exhort the king not only to imitate, but surpass him; and conclude their harangue with wishes for the king's happiness, and that his reign may be long and prosperous.

As soon as these ceremonies are over, the grantee from Ardrah is sent for, whose office it is to crown the king. When he arrives at the outer gate of the palace, the cannon are discharged, and the music plays. He enters the court with his attendants, who guard him to a certain distance, when he leaves them, advances singly to the throne, and salutes the king by gently bowing his head, but without prostrating himself. He then makes a short speech to the king relative to the ceremony he is to perform; and, taking the helmet off his head, which he holds in his hands, he turns to the people. A signal is then made, at which the music immediately ceases, and a total silence ensues. The grantee of Ardrah then, with a loud voice, repeats the following words three times: "Here is your king; he loyal to him, and your prayers shall be heard by the king of Ardrah, my master;" after which he replaces the helmet on the king's head, makes a low bow, and retreats: the cannon and small arms are immediately fired, the music strikes up, and the exclamations are renewed. The grantee of Ardrah is then conducted in great state to his apartments; after which the king, attended by his wives, his guards, and the Europeans, return to the seraglio, where the latter make their compliments to him as he enters the gate. The next day the king sends a handsome present to the Ardrah grantee; after which he must return home, not being suffered to remain three days longer in the kingdom.

The rejoicings that follow the coronation continue for fifteen days, and the whole is closed with a grand procession to the house or temple of the great serpent, the particulars of which have been already described.

Of the King's Household, his Method of Life, &c.

FROM the obscure state in which the king is brought up, it is little to be wondered at, that the exalted character of a monarch should dictate to him the paths of ease and dissipation, and that he should enjoy a peculiar relish for those pleasures, with which, had he been progressively familiar, he would, in all probability, have been satiated. He lives almost in a state of indolence, seldom going abroad, and only attending his grantees occasionally when they are assembled in the hall of audience for the administration of justice: all the rest of his time is spent in the recesses of the seraglio, attended by his wives. These are exceeding numerous, and are divided into three classes; the first consists of the most beautiful among them, whose number is not limited. She who bears the first son is the chief, and is distinguished from the rest by the name of queen, or, as they term it, the king's great wife. She has the sole management of all affairs belonging to the seraglio; nor dare any person controul her, except the king's mother, whose authority is superior to any other subject whatever. She has a separate apartment at court, with a stipulated revenue for her support; but she is under this restriction, that she must remain a widow during the rest of her life.

The second class of the king's wives consists of those that have had children by him, but, either from age, or other causes, are rendered incapable of contributing any farther to his future amusements. The number of these also is not limited.

The third and last class consists of those who serve as slaves to the king, and his other wives; and though they are employed in these menial offices, yet it is death for them to have any connexions with other men, or even to leave the seraglio, without permission from the king, or his great wife.

So jealous is the king of his wives, that if a man meets one of them in the street, and should accidentally happen to touch her, she is never permitted to enter the seraglio again, for both she and the man are immediately sold as slaves. If it appears there was any premeditated design in their touching each other, the woman is sold, but the man is put to death, and all his effects confiscated to the king. For this reason, such as have occasion to go to the palace, on their entrance immediately call out, *Apa*, which signifies, "Make way, retire, or take care;" when the women place themselves in a range

range on one side, and the men walk as close as they can on the other. In like manner, when the king's wives go to work in the fields, whoever meets them must immediately fall on their knees, and continue in that position till they have passed.

Although the people are obliged to pay such deference to the king's wives, yet his majesty has very little respect for them himself; they attend him on all occasions like servants, and instead of his shewing any affection he generally treats them with the most haughty contempt. As he considers them only as slaves, so, on the most trifling occasions, he will sell a number of them to the Europeans; and even sometimes, when ships are waiting on the coast for slaves, he will supply them with whatever number they want to complete their compliment. These deficiencies are supplied by the assiduity of his captains, or governors of the seraglio, who go about the streets, and seize such girls as they think will be pleasing to the king, nor dare any of his subjects make the least objection or resistance. These officers immediately present them to the king, and if they are the handsomest they can select, his majesty is sometimes particularly attracted by their beauties. When this happens to be the case, the object that most strikes his fancy is honoured with his company for two or three nights, after which he is discarded, and obliged to pass the remainder of her life in a state of obscurity; for which reason the women are so little desirous of becoming wives to the king, that they would rather prefer a life of celibacy.

The king's palace is magnificently furnished, and abounds with all the elegancies and luxuries of Europe. He observes great state on all public occasions, at which times he is dressed in silk and gold, and is attended by his principal officers, or those who hold employments under him. No subject is permitted to see him, unless his business be of a peculiar nature, and he has obtained the royal permission; in which case he is ushered in by the high priest, before whom he must prostrate himself as well as to the king. Even his grandees (except when a general council is called) find some difficulty in obtaining an audience, and when they do must appear before him in the most humiliating form: they advance creeping to a certain distance, till the king, by clapping his hands softly, gives them leave to speak, which they do in a low tone, with their face almost to the ground; after which they retire in the same manner they advanced. The captain of the seraglio, and the grand sacrificer, or high priest, are the only persons that are permitted to enter the seraglio without permission first obtained from the king, but if they want to speak to him they must pay the same homage as any other subject. The Europeans, however, are exempted from these slavish ceremonies, and are granted an audience whenever they desire it. They always salute the king in the same manner as they would do an English nobleman, and his majesty receives them with a distinguished familiarity. He takes them by the hand, makes them sit down, and drinks to them: if it be the first visit, and the persons be directors, or commanders of ships, they are generally saluted with five or seven guns, when they leave the palace. In the audience-chamber are two benches, one of which is broader than the other, covered with a cloth, and by it is an oval stool, whereon the king sits during the conferences. The other bench is covered with mats, on which the Europeans sit bare-headed, not by order, but from a voluntary desire of shewing proper respect. The king entertains them in the best manner he is able during their stay, and endeavours to make his company as agreeable to them as possible. If they dine or sup with him the table is set out and served with great elegance. While they are feasting the king's grandees prostrate themselves before him, and what provisions are left by the Europeans are given to them, which they seem readily and cheerfully to accept.

The king's revenues are very considerable, for besides what arises from his lands, he receives a duty on all commodities sold in the markets, or imported into the country. His lands not only furnish him with provisions for his household, but also for exportation, great

quantities of them being annually sold to the neighbouring nations. His property in this respect is not confined to the borders of Sabi alone, for his lands extend into several of the provinces. These are under the cognizance of the governors, who take care of their being tilled, get in the harvest, and lay up the produce in the king's magazines without the least expence.

The king also receives a moiety of all the tolls and fines in his vice-royalties; but this is inconsiderable from the iniquity of his collectors, who make such deductions on their trust that scarce one fourth of it comes to his majesty; though if any of them should be detected they are subject to be sold, and their family and effects confiscated to the king.

The revenues arising from the slave trade are very considerable, the king receiving three rix-dollars for every slave sold in his dominions. Every European vessel also pays him a pecuniary duty, exclusive of presents, which they make to the king for his protection and the liberty of trading.

Of the Markets at Whidah, with Observations on the inhuman Practice of trading in Slaves.

THERE are several fairs, or markets, kept in Whidah, not only for the sale of slaves, but also for most other commodities. Two of these are kept weekly, the one at Sabi, and the other in the province of Aplogua, both of which are resorted to by prodigious numbers of merchants. But the most considerable market is kept about a mile from Sabi, and is held twice a week, viz. on Wednesdays and Saturdays. The kings second wives have liberty to go to these markets to sell their cloths and other trifling articles, in the making of which their time is chiefly employed.

Great regulation is observed in the keeping of these markets, a proper place being allotted for the sale of every different commodity. In order to prevent disorder and confusion among the buyers and sellers, the king appoints a judge or magistrate to attend, who, with four officers well armed, inspect the markets, hears all complaints, and in a summary way decides all differences, having power to seize and sell as slaves all who shall violate the peace. Besides this magistrate, there is another appointed to inspect the money, which is called Toqua, consisting of strings of shells, to the number of forty; and if one of these strings happens to be deficient of a single shell, the whole are forfeited to the king.

Round the markets are erected booths, which are occupied by cooks, or butlers, who sell provisions ready dressed, as beef, pork, goats flesh, &c. There are other booths for the sale of rice, millet, maize and bread; and some sell pito, (a kind of beer) palm-wine and brandy.

The chief commodities are, slaves, oxen, sheep, goats, poultry, and fowls of most kinds; monkeys and other animals; various sorts of European cloth; linen and woollen, printed callicoes, silks, grocery goods, china, gold in dust or bars, iron in bars or wrought. The country manufactures are, Whidah cloths, mats, baskets, jars, calabashes of various sorts, wooden bowls and cups, red and blue pepper, salt, palm-oil, &c.

All the commodities, except slaves, are sold by the women, who are excellent accountants, and set off their goods to the greatest advantage. The men reckon all by the head, at which they are as exact and ready as the Europeans with pen and ink, though the sums are often so considerable as to render it very intricate.

The slaves are paid for in gold-dust, but the payments for other commodities are made in strings of cowries, which, as before observed, contain each forty in number. Five of these strings make what the natives call a *fore*; and fifty *fores* make an *alkoo*, which generally weighs about 60 pounds.

It would give pleasure to a stranger to see the various productions of these markets, and the regular manner in which the respective articles are disposed, were not slaves included; but to behold a number of men, women, and children linked together, and arranged like beasts, is a sight truly shocking to behold. The in-

famous

famous practice of trading in the human species has frequently exercised the pens of the learned and humane, some of whose sentiments we shall here preserve, as benevolent ideas cannot be too much propagated, nor philanthropy rendered too universal.

The bishop of Gloucester, (in his sermon preached before the society for the propagation of the gospel, on the 21st of February 1766) makes use of the following passages: "From the free savages," says he, "I now come (the last point I propose to consider) to the savages in bonds. By these I mean the vast multitudes yearly stolen from the opposite continent, and sacrificed by the colonists to their great idol, the god of gain. But what then? say these sincere worshippers of Mammon; they are our own property which we offer up. Gracious God! to talk (as in herds of cattle) of property in rational creatures! creatures endowed with all our faculties; possessing all our qualities but that of colour; our brethren both by nature and grace, shocks all the feelings of humanity, and the dictates of common sense. But, alas! what is there in the infinite abuses of society which does not shock them? Yet nothing is more certain in itself, and apparent to all, than that the infamous traffic for slaves directly infringes both divine and human laws. Nature created man free, and grace invites him to assert his freedom. In excuse of this violation, it hath been pretended, that though, indeed, these miserable outcasts of humanity be torn from their homes and native country by fraud and violence, yet they thereby become the happier, and their condition the more eligible. But who are you that pretend to judge of another man's happiness? That state, which each man, under the guidance of his Maker, forms for himself, and not one man for another? To know what constitutes mine or your happiness, is the sole prerogative of him who created us, and cast us in such various and different moulds. Did your slaves ever complain to you of their unhappiness amidst their native woods and deserts? Or, rather, let me ask, did they ever cease complaining of their condition under you their lords and masters? where they see, indeed, the accommodations of civil life, but see them all pass to others, themselves unbenefited by them. Be so gracious then, ye petty tyrants over human freedom, to let your slaves judge for themselves, what it is that makes their own happiness. And then see whether they do not place it in the return to their own country, rather than in the contemplation of your grandeur, of which their misery makes so large a part. A return so passionately longed for, that despairing of happiness here, that is, of escaping the chains of their cruel task-masters, they console themselves with seignifying it to be the gracious reward of heaven in their future state, which I do not find their haughty masters have as yet concerned themselves to invade. The less hardy, indeed, wait for this felicity till over-wearied nature sets them free; but the more resolute have recourse even to self-violence, to force a speedier passage.

"But it will be still urged, that though what is called human happiness be of so fantastic a nature, that each man's imagination creates it for himself, yet human misery is more substantial and uniform throughout all the tribes of mankind. Now, from the worst of human miseries the savage Africans, by these forced emigrations, are entirely secured; such as the being perpetually hunted down like beasts of prey or profit, by their more savage and powerful neighbours.—In truth, a blessed change!—from being hunted to being caught. But who are they that have set on foot this general hunting? Are they not these very civilized violators of humanity themselves, who tempt the weak appetites, and provoke the wild passions of the fiercer savages to prey upon the rest."

The number of slaves imported from the coast of Guinea, is computed to be at least 100,000 annually; but the import in our American colonies falls much short of that number, owing to the many deaths occasioned by the severe treatment they receive on their passage. A late writer says, "When the vessels are full freighted with slaves, they sail for our plantations in America, and may be two or three months in the voyage;

during which time, from the filth and stench that is among them, distempers frequently break out, which carry off commonly a fifth, a fourth, yea, sometimes a third or more of them: so that taking all the slaves together, that are brought on board our ships yearly, one may reasonably suppose that at least 20,000 of them die on the voyage. Besides this, it is supposed that a fourth part, more or less, die at the different islands, in what is called the seasoning. Hence it may be presumed, that at a moderate computation of the slaves who are purchased by our African merchants in a year, near 30,000 die upon the voyage, and in the seasoning. Add to this, the prodigious numbers that are killed in the incurious and intestine wars, by which the Negroes procure the number of slaves wanted to load the vessels. "How dreadful, then, says the writer, is this slave trade, whereby so many thousands of our fellow-creatures, free by nature, endued with the same rational faculties, and called to be heirs of the same salvation with us, lose their lives, and are, truly and properly speaking, murdered every year! For it is not necessary, in order to convict a man of murder, to make it appear that he had an intention to commit murder; whoever does, by unjust force or violence, deprive another of his liberty, and, while he hath him in his power, continues to oppress him by cruel treatment, as eventually to occasion his death, is actually guilty of murder. It is enough to make a thoughtful person tremble, to think what a load of guilt lies upon our nation on this account; and that the blood of thousands of poor innocent creatures, murdered every year in the prosecution of this cruel trade, cries aloud to heaven for vengeance. Were we to hear or read of a nation that destroyed every year, in some other way, as many human creatures as perish in this trade, we should certainly consider them as a very bloody, barbarous people. If it be alleged that the legislature hath encouraged, and still does encourage this trade, it is answered, that no legislature on earth can alter the nature of things, so as to make that to be right which is contrary to the law of God, (the supreme legislator and governor of the world) and opposeth the promulgation of the gospel of peace on earth, and good will to man. Injustice may be methodized and established by law, but still it will be injustice as much as it was before; though its being so established may render men more insensible of the guilt, and more bold and secure in the perpetration of it."

The unhappy situation of these wretches while on board the vessels is truly deplorable: they are all put in irons two by two, shackled together to prevent their mutinying or swimming ashore. Such is the horror of their minds at the thoughts of leaving their own country, that they frequently leap out of the canoe, boat, or ship, into the sea, and keep under water till they are drowned, to avoid being taken up and saved by their pursuers. The melancholy effects of this diabolical traffic are represented by captain Philips, who, though employed in that business, appears to have been impelled with the most humane sentiments. As he breathes the dictates of benevolence, we shall insert his narrative in his own words. "That I may contribute, says he, all in my power towards the good of mankind, by inspiring any individuals with a suitable abhorrence of that detestable practice of trading in our fellow-creatures, and in some measure atone for my neglect of duty as a Christian, in engaging in that wicked traffic, I offer to their serious consideration some few occurrences, of which I was an eye-witness; that being struck with the wretched and affecting scene, they may foster that humane principle, which is the noble and distinguished characteristic of man, and improve it to the benefit of their children's children.

"About the year 1749 I sailed from Liverpool to the coast of Guinea. Some time after our arrival, I was ordered to go up the country a considerable distance, upon having notice from one of the Negro kings, that he had a parcel of slaves to dispose of. I received my instructions and went, carrying with me an account of such goods as we had on board, to exchange for the slaves we had to purchase. spirits, a gun, and some trifles; which having accepted, and understood by an interpreter what goods we had, the next day was appointed for viewing the slaves: we found about 200 confined in one place. But how shall I relate the affecting sight I there beheld! How can I sufficiently describe the silent sorrow which appeared in the countenance of the afflicted father, and the painful anguish of the tender mother, expecting to be for ever separated from their tender offspring; the distressed maid, wringing her hands in preface of her future wretchedness, and the general cry of the innocent from a dreadful apprehension of the perpetual slavery to which they were doomed! Under a sense of my offence to God, in the persons of his creatures, I acknowledge I purchased eleven, whom I conducted tied two and two to the ship. Being but a small ship (90 ton) we soon purchased our cargo, consisting of 120 slaves, whom thou mayest, reader, range in thy view, as they were shackled two and two together, pent up within the narrow confines of the main deck, with the complicated distress of sickness, chains and contempt; deprived of every fond and social tie, and, in a great measure, reduced to a state of desperation. We had not been a fortnight at sea, before the fatal consequences of this despair appeared; they formed a design of recovering their natural right, liberty, by rising and murdering every man on board; but the goodness of the Almighty rendered their scheme abortive, and his mercy spared us to have time to repent. The plot was discovered; the ring-leader, tied by the two thumbs over the barricade door, at sun-rise received a number of lashes: in this situation he remained till sun-set, exposed to the insults and barbarity of the brutal crew of sailors, who had full leave to exercise their cruelty at pleasure. The consequence of this was, that next morning the miserable sufferer was found dead, flayed from the shoulders to the waist. The next victim was a youth, who, from too strong a sense of his misery, refused nourishment, and died disregarded and unnoticed, till the hogs had fed on part of his flesh. Will not christianity blush at this impious sacrifice? May the relation of it serve to call back the struggling remains of humanity in the hearts of those, who, from a love of wealth, partake in any degree of this oppressive gain; and have such an effect on the minds of the sincere, as may be productive of peace, the happy effect of true repentance for past transgressions, and a resolution to renounce all connection with it for the time to come."

Many other accounts might be mentioned of the dreadful consequences arising from the slave trade; but we shall only take notice of the following memorable instance which happened a few years ago on board a ship from Liverpool, then lying at anchor about three miles from shore, near Acra Fort. They had purchased between four and five hundred negroes, and were ready to sail for the West Indies. The men were shackled two and two, each by one leg to a small iron bar; these were every day brought on the deck for the benefit of the air; and lest they should attempt to recover their freedom, they were made fall to two common chains, which were extended on each side the main deck: the women and children were loose. Such was the situation of the slaves on board this vessel, when it took fire from the carelessness of a person who was drawing spirits by the light of a lamp; the cask bursting, the fire spread with such violence, that in about ten minutes the sailors, apprehending it impossible to extinguish it before it would reach a large quantity of powder they had on board, concluded it necessary to throw themselves into the sea, as the only chance of saving their lives. However, they first endeavoured to loose the chains by which the negro men were fastened to the deck; but in the confusion, the key being missing, they had but just time to loose one of the chains by wrenching the staple, when the vehemence of the fire so increased, that they all but one man jumped over board, when immediately the fire having gained the powder, the vessel blew up with all the slaves who remained fastened to the one chain, and such others as had not followed the sailors examples. There happened to be three Portuguese vessels in sight, who, with others from the shore, putting

out their boats, took up about 250 of those poor souls who remained alive; of which number about 50 died on shore, being mostly of those who were fettered together by iron shackles, which, as they jumped into the sea, had broke their legs, and these fracture, being inflamed by the violence of their struggling, mortified, and occasioned their deaths. Those who remained alive were soon disposed of, for the benefit of the owners, to other purchasers.

The slaves in general are obtained by means of the Negro kings going to war with each other; but it has been frequently known, to the great shame of the Europeans, that they have deluded these poor wretches on board their vessels, on a pretence of trading with them, and have then basely made them captives; which is the reason, as we have already observed, that the natives are so cautious of going on board European ships. A picture of this scene is beautifully represented in an admirable poem lately published, called *The Dying Negro*, which we shall here copy for the entertainment of the reader; and with which we shall conclude this melancholy subject.

Curst be the winds, and curst the tides which bore
 These European robbers to our shore!
 O be that hour involv'd in endless night,
 When first their streamers met my wond'ring sight!
 I call'd the warriors from the mountain's steep,
 To meet these unknown terrors of the deep;
 Rouz'd by my voice, their gen'rous bosoms glow,
 They rush indignant, and demand the foe,
 And poize the darts of death, and twang the banded bow:
 When lo! advancing o'er the sea beat plain,
 I mark'd the leader of a warlike train.
 Unlike his features to our iwarthy race;
 And golden hair play'd round his ruddy face.
 While with insidious smile and lifted hand,
 He thus accosts our unsuspecting band.
 "Ye valiant chiefs, whom love of glory leads
 "To martial combats, and heroic deeds;
 "No fierce invader your retreat explores,
 "No hostile banner waves along your shores.
 "From the dread tempests of the deep we fly;
 "Then lay, ye chiefs, these pointed terrors by:
 "And O, your hospitable cares extend,
 "So may ye never need the aid ye lend!
 "So may ye still repeat to ev'ry grove
 "The songs of freedom, and the strains of love!"
 Soft as the accents of the traitor flow,
 We melt with pity, and unbend the bow;
 With lib'ral hand our choicest gifts we bring,
 And point the wand'ers to the freshest spring.
 Nine days we feasted on the Gambian strand,
 And songs of friendship echo'd o'er the land.
 When the tenth morn her rising lustre gave,
 The chief approach'd me by the founding wave.
 "O youth," he said, "what gifts can we bestow,
 "Or how requite the mighty debt we owe?
 "For lo! propitious to our vows, the gale
 "With milder omens fill the swelling sail.
 "To-morrow's sun shall see our ships explore
 "These deeps, and quit your hospitable shore.
 "Yet while we linger, let us still employ
 "The number'd hours in friendship and in joy;
 "Ascend our ships, their treasures are your own,
 "And taste the produce of a world unknown."

He spoke; with fatal eagerness we burn,—
 And quit the shores, undestin'd to return!
 The smiling traitors with insidious care,
 The goblet proffer, and the feast prepare,
 'Till dark oblivion shades our closing eyes,
 And all disarm'd each saluting warrior lies.
 O wretches! to your future evils blind!
 O morn for ever present to my mind!
 When burling from the treach'rous bands of sleep,
 Rouz'd by the murmurs of the dashing deep,
 I woke to bondage and ignoble pains,
 And all the horrors of a life in chains,

Revolutions of WHIDAH.

THE kingdom of Whidah, as we have already observed, is a beautiful and fertile country; but the elegance of its towns, and the number of its inhabitants are very inferior to what they were before the conquest of the country by the king of Dahamoy, in the year 1726, when the town of Sabi, among several others, was totally reduced to ashes.

The then king of Whidah was of an indolent and pusillanimous disposition, and dedicated his time solely to luxury and dissipation; while the king of Dahamoy was brave and magnanimous, and had rendered himself famous by many victories gained over his neighbours. The cause of this rupture arose from the latter having sent an ambassador to the former, requesting to have an open traffic to the sea side, offering at the same time to pay him his usual customs on negroes exported; which being refused, the king of Dahamoy, fired with resentment, vowed revenge. His first determination was to make a conquest of the kingdom of Ardrah, as by that means he might be the better enabled to execute the project he had formed by cutting off all hopes the king of Whidah could have from that quarter. The king of Ardrah having received intimation of his designs immediately dispatched a messenger to his neighbour, the king of Whidah, to solicit his assistance; but the natural indolence and supineness of that prince rendered all applications of this nature ineffectual; for so far from paying any attention to the danger that threatened his neighbour, he was even indifferent as to the future welfare of himself. The king of Dahamoy accordingly entered Ardrah with a considerable body of forces, and though the king of Ardrah used his utmost endeavours to oppose him, yet his army was soon cut to pieces, and himself taken prisoner; when, according to the custom of the country, that prince was immediately put to death by his adversary.

The king of Dahamoy having thus obtained a passage into the heart of the country, he penetrated it as far as the borders of Sabi the capital; here, however, his progress was impeded by a river, from the disadvantages of which he was apprehensive he should not be able to make his wished-for conquest; for such was the situation of the river, that a small number of men might have defended it against his whole army. The pusillanimous Whidahs, instead of placing a proper guard, only went morning and evening to the river side, where they met their priests, and offered sacrifices to their grand fetish the snake, imploring him to protect them, by preventing the enemy from passing the river.

In the mean time the king of Dahamoy, who had encamped his whole army on the opposite side of the river, sent a messenger to the Europeans, then residing at Sabi, to assure them, that if they stood neuter, and were not found in arms, they should receive no injury either in their persons or goods, in case he proved victorious; and that he would make their trade more advantageous, by removing several impositions they were subject to from the king of Whidah; on the contrary, if they appeared against him, they must expect his resentment.

The Europeans knew not which way to determine on so critical a point: they first thought of retiring to their forts, about three miles from the capital, but as such conduct might have brought on them the resentment of the king of Whidah, they at length determined to continue where they were, and to subject themselves to whatever consequences might happen from the contending powers.

The king of Dahamoy had retired with about 2000 of his men into the interior part of the country; when his general, whom he had left with the rest on the banks of the river, finding that the Whidahs rested their whole confidence of protection on the power of the fetishes (enemies whom he little feared) he was at length encouraged to order 200 of his soldiers to ford the river, which having effected without opposition, they immediately marched towards Sabi. When they came to the borders of the town, which was about three o'clock

in the afternoon, the out-guards were almost all asleep, but being roused by the noise of the enemies' music and shouts, they hastily ran to the palace, and told the king that the whole army had forded the river. The pusillanimous monarch, instead of attempting to make any resistance, precipitately fled, with his wives and principal subjects, to an island on the sea-coast, that was parted from the main land by a river, over which they passed in canoes, but the multitude who followed them not having the same advantage, and being hurried on by their fears, were most of them drowned in attempting to swim over. Others fled into the countries, and secreted themselves in the woods and thickets; but many of them in their flight were killed by the enemy, and the chief part of those that escaped perished by famine.

As soon as the detachment of the king of Dahamoy's army entered the town, they immediately marched to the king's palace, where, not finding him as they expected, they immediately set it on fire, and sent word to their general what they had done, who the same evening made the whole army cross the river, and march to the capital.

The general was highly elated at the magnanimity of his men, and the success they had met with; while the Europeans stared with amazement at the cowardice of the Whidahs, who had so ignominiously quitted the town without making the least opposition, and had left them, with all their riches, in the power of the conquerors.

The day after the enemy had made themselves masters of the capital, the general sent the Europeans prisoners to the king of Dahamoy, who then lay encamped with another army about 40 miles off, in the kingdom of Ardrah. A few days after their arrival the king not only set them at liberty, but also permitted them to return to their forts, and at the same time complimented them with several presents, particularly a number of slaves. He likewise assured them, that as soon as his affairs were settled he should not only endeavour to promote their trade, but would always preserve a particular regard for their interests; and that they might assuredly depend on his future protection.

The king of Dahamoy now went to Sabi, where he continued some days, during which he received homage from such of the principal people as were left in the kingdom; but being at the time engaged in a war with a neighbouring prince, from whom he had obtained some losses, he left Sabi, and went with his army to oppose the machinations of his enemy.

During his absence one Testefole, a foreigner, who had been left by governor Wilson to manage the affairs of the English, and who had received distinguished favours from the king of Dahamoy, concerted a plan with the prince of Popo for restoring the king of Whidah to the throne. That prince, who was no friend to the king of Dahamoy, readily approved of the scheme, and immediately raised a considerable army, which he sent to the deposed king, at the same time assuring him that he would contribute every other assistance that laid in his power to replace him on the throne.

When the king of Dahamoy was informed of this revolt, he was surprized that a man who had so easily relinquished his rights, should now attempt to regain them by force of arms. He was at this time but badly furnished with men, and therefore not properly prepared to engage in a new war. Determined, however, not to lose the conquest he had made without some endeavours to preserve it, he thought of the following expedient. He assembled together a prodigious number of women, whom he clothed and armed in the same manner as the men. These he formed into companies, but that they might not be so much intimidated at the first attack of the enemy, the first line of each company was composed of men.

With this army he marched against the king of Whidah; but as soon as he arrived within sight of the Whidah camp, the men were so intimidated that they immediately abandoned the place, and took to flight, nor could the most persuasive arguments of the king prevail on them to return. Thus situated, the king of Whidah,

Whidah, not being willing to become a captive to his enemy, followed the example of his men, and again retired to the island where he had before fled for security.

Tettefote, who had been the projector of this attempt, conscious of what he deserved for his infidelity to the king of Dahamoy, secreted himself in the English fort; but being attacked by the enemy, he found means to make his escape, and secreted himself in the French fort at Jacken. However, he was soon after taken, and carried before the king of Dahamoy, when he received the punishment of his treachery, for he was first tortured, and then put to death.

The king of Dahamoy now made himself complete master of Whidah, and has preserved the authority he then attained ever since. It is at this time considered only as a province, and its king as a tributary prince; though the inhabitants are under the same laws and government, and possess the same indulgences in their religious maxims as before it was conquered.

The city of Sabi is very small in comparison with what it was before its being reduced to ashes by the king of Dahamoy. At that time it was at least four miles in circumference. The houses were neatly built, and the streets were long, spacious, and uniformly disposed. The houses belonging to the factors were built in the European taste, and contained many neat and commodious apartments: on the first floor of each was a spacious hall, with an elegant balcony in front; and beneath, on the ground-floor, were warehouses for the accommodation of their goods. The town was so exceeding populous, that notwithstanding the breadth of the streets, it was sometimes a difficulty to pass them. Markets were daily held in different parts of the city, where various sorts of European as well as African commodities, were exposed to public sale, as also abundance of all kinds of provisions. Near the European factories was a spacious place ornamented with lofty and beautiful trees, under which the merchants and governors of the forts every day assembled to transact business. But all these fine places were destroyed by the king of Dahamoy's army; nor is there a single remnant left of the magnificence and splendor that once graced this populous city.

About four miles to the south of Sabi is a small town called Whidah, where the Europeans generally land when they come to trade on this coast. Here the English have a large fort, called Fort William, consisting of four strong batteries, on which are mounted 17 pieces of cannon. At a small distance from this fort is another belonging to the French, which is encompassed by a thick mud wall, as is also that belonging to the English; and to each of them, at some distance from the wall, is a broad and deep moat, so that it would be a difficult matter for an enemy to surprize them without alarming the garrison.

The Kingdom of ARDRAH.

THOUGH this kingdom is not so considerable as that of Whidah, yet it is very populous, and contains many good towns and villages. It is bounded on the east by the kingdom of Benin; on the west by that of Whidah, and on the south by the Gulf of Guinea; but how far it extends northward, and what country it borders upon that way, is not known. It is very narrow towards the sea, but widens considerably, and is divided into two parts, distinguished by the names of Great and Little Ardrah.

The country in general is very flat, and being well watered by several small rivers in different parts of it, the soil is exceeding fertile, and produces great quantities of Indian wheat, millet, yams, potatoes; as also several kinds of fruits, particularly oranges, lemons, cocoa-nuts, bananas, and pine-apples.

The inhabitants of this kingdom differ but little from those of Whidah in their manner, customs, religion, &c. The dress of the men consists of several cloths, the manufacture of the country, wound round the waist, and fastened with a girdle; but the better sort wear two short petticoats, made of taffety, or other silk, and have silk scarfs in the form of shoulder-belts. They

mostly go with their heads and feet bare, though they are permitted to wear sandals, and hats or bonnets, except in the king's presence. The women of rank also wear petticoats and scarfs, but, like the men, they have not any covering either to their heads or feet. The poorer sort have only short cloths tied about their waist, the other parts of their body being entirely naked.

Both sexes are exceeding cleanly in their persons, washing their bodies every morning and evening in pure water, and anointing themselves with civet, or some aromatic perfume.

Their common food consists of rice, pulse, herbs and roots, with beef, mutton, and dog's flesh; and their ordinary drink is the beer called pito, which they generally mix with water; but the better sort drink palm-wine.

Those who live near the sea-side are employed in fishing, boiling of salt, and trading; but the inland inhabitants dedicate their time solely to the cultivation of their lands, and the breeding of cattle.

They are in general exceeding illiterate; few of them can either read or write; for which reason, in buying and selling of goods, they make use of cords tied in knots, each of which has a particular signification known only to themselves, and those who are accustomed to deal with them. Some few of the better sort understand the Portuguese tongue, which they not only speak fluently, but also read and write with great accuracy.

Polygamy is equally allowed here as at Whidah, every man being permitted to take as many wives as he thinks proper. As no deference is paid to birth or fortune, the poorest man has liberty to pay his addresses to a woman of the greatest quality; but if the rejects him on the first visit, he is not allowed to make a second. Little ceremony is used in their marriages, the chief thing consisting in the mutual consent of the parties, and their respective parents: when this is obtained, the bridegroom presents his bride with a calico pan, and invites all her relations, and his own, to an entertainment; when he declares to the company that he takes the woman for his wife; and this public acknowledgment concludes the ceremony.

The men of quality marry girls at 10 or 12 years of age, but they do not consummate the marriage till they have kept them several years in the character of servants: when the time is fixed for cohabiting, they present their brides with a piece of cloth, or a short frock, and an elegant entertainment is provided for the relations of both parties.

The ceremonies they use in burying their dead are much the same as those practised in Whidah, except in this particular, that they generally bury the deceased in a vault under the house he inhabited in his life-time. The king is the chief person excepted from this custom: he is buried in some remote place from the palace; and many unhappy slaves fall victims on the occasion.

Their religious maxims are also much the same as those in Whidah, only they do not worship the serpent; on the contrary, they not only kill them, but are exceeding fond of their flesh. Though they are such gross idolaters, they acknowledge one supreme being, who, they believe, appoints the time when every person shall come into, or go out of the world; notwithstanding which they are greatly alarmed at sickness, and tremble at the very name of death.

When a person is ill he sends for a priest, who immediately goes to him, and sacrifices some animal for the recovery of his health. The priest rubs the patient's feet with the blood, but the flesh of the animal is thrown away.

The fetishes belonging to the king and court are appointed by the high priest, and are birds of a black colour, not unlike the crows in England; prodigious numbers of these are kept in the gardens of the palace, and it is equally criminal to pay disrespect to them here, as it is to the grand serpent at Whidah. The common peoples fetishes consist of a particular stone, a piece of wood, or some other inanimate substance, which they always keep hid in their house under an earthen pot: every six months they make a public offering to the priest in honour of their fetish, at the same time asking the idol several questions relative to their

their future welfare. If the priest thinks the offering too insignificant, he tells the party that the fetish does not like it, and will not answer his questions till he has one to please him. On this the person enlarges his offering, and then the answers are delivered by the priest in a low voice, which the superstitious blacks imagine to be effected by some secret impulse of the fetish. The oracle thus delivered, the priest covers the idol with the pot, and sprinkles it either with beer or meal. The like is done to every person present at the ceremony.

The priests in general are considered by the people in the most respectable light; but the great marabut, or high priest, is perfectly adored by them. They imagine him to be an infallible diviner, and that he can foretell things by conversing with an awkward image, which he keeps in his hall of audience, where he receives visits from his credulous admirers. This image is painted white, and represents a child, which the marabut tells them can communicate to him such circumstances as shall arise from their future conduct. When they go to consult the marabut, they present him with the best offering their abilities will permit; and in proportion to the value of it, the intelligence of their future success or mischance is principally directed.

With respect to the laws of Ardrah, whoever disobeys the king's commands is beheaded, and his wives and children become the king's slaves. Insolvent debtors are left to the mercy of their creditors, who have liberty to pay themselves by selling them for slaves. The same punishment is also inflicted on him who has debauched another man's wife. The punishment for adultery committed by the women, and other crimes, are the same as at Whidah.

The most distinguished place in Ardrah is Affem, called so by the natives, but by the Europeans, Great Ardrah. It is the capital of the kingdom, and is situated about 16 leagues inland to the north-west from Little Ardrah, a spacious road leading from one to the other. It is encompassed with four walls of earth, which are very lofty and substantial: each wall has a large and deep ditch, but they are within, and over them are wooden bridges. The houses are in general well-built, and the streets regularly formed. The king's palace is a spacious edifice, though greatly inferior to the original building, which was destroyed by the king of Dahamoy in the year 1726. The palace then consisted of many large courts entirely surrounded with porticos, above which were apartments that had small windows. Some of the floors of these apartments were covered with mats, and others with large Turkey carpets; and the furniture consisted of easy chairs, screens, chests, cabinets, and porcelain brought from China. There was not any glass in the windows, but only frames of white linen, and taffety curtains. The gardens belonging to it were very extensive, and laid out in long vistas of thick and lofty trees, to afford a cool and shady retreat.

The present palace, however, is far from being contemptible, and the king's court is kept with great splendor, though his majesty, like the sovereign of Whidah, is dependant on the king of Dahamoy. He seldom goes abroad, and when he does, it is in so private a manner, that few of his subjects see him. He keeps a great number of women, with whom his time is chiefly employed; the principal of these has the title of queen, with this prerogative, that in case his majesty denies her any thing she has occasion for, she may sell some of his other wives to supply her wants.

The king always eats alone, and when he drinks, an officer makes a signal, by striking two small rods of iron together, in order that all who are within sight may turn away, and not look at his majesty; for to see him drink is a capital offence, and the punishment for it is death. An instance of this was once manifested in an infant, who being asleep by the king, was awakened with the noise of the rods; and his majesty observing that the child cast its eyes on him while the cup was at his mouth, he immediately ordered it to be put to death.

Whoever presents any thing to the king, offers it on his knee, and the like respect is shewn even to the privations set on the table. Those who happen to be in

the way of the officers when they carry them, prostrate themselves with their faces to the earth, and dare not rise till the dishes are out of sight.

The Europeans are treated by the king with a very distinguished respect. When any one goes to Affem to obtain an audience of his majesty for liberty to trade, (which must be done by every one that comes for that purpose) he is lodged in the palace, and a genteel provision is daily made for him at the king's expence. On the day fixed for the audience, he is introduced to his majesty by the captain of commerce: when he enters the hall where the king is seated, his majesty immediately rises, and advances some steps to meet him: he then takes him by the hand, presses it in his own, and three times successively touches his fore finger, which is the greatest token that can be here given of amity and friendship. After this, he desires him to sit down by his side on neat mats spread on the floor; which being complied with, he then lays his presents before the king, and, by an interpreter, communicates his business; the answers to which the king returns through the same channel. As soon as the audience is over, the European goes, with his attendants, to the house of the high priest, who, in respect to the king, provides an elegant dinner on the occasion; after which, he sends for his wives, and entertains his guests with dancing, music, and such other diversions as are usually practised in this part of the country. The following day a licence is granted to the European for liberty to trade, and the same is made known by the public crier, who receives for his trouble 40 bras rings, a goat, and a piece of cloth.

The chief commodity purchased here by the Europeans is slaves; and the articles they sell the natives consist of cowries, (which are the current coin of the kingdom) flat iron bars, gilt leather, white and red damask, red cloth, copper bowls or cups, bras rings, beads or bugles of several colours, looking glasses, firelocks, mullets, gunpowder, &c.

Little Ardrah, as it is called by the Europeans, and by the natives Offra, is a large and populous town, and, like the capital, is inclosed with mud walls. The Dutch had once a fort here; but their factor being killed, and the land laid waste by the inhabitants of Popo, they fled, and for some time deserted it; however, they have now a factor there, as have also the English, each of which has a very large and elegant house; and they both carry on a considerable trade in slaves, particularly the Dutch.

Between Great and Little Ardrah is a town called Jackin, or Jackin, which is of considerable extent, and inclosed with a thick and lofty mud wall. Here the English have a factory, and the governor's house is a neat and spacious building.

A little to the north of this is a large village, called Grand Foro, which is remarkable for having a kind of inn for the accommodation of travellers; a convenience of that sort not being to be met with in any other part of Guinea.

The other towns and villages of Ardrah are so trifling as not to merit any particular description.

The country of Dahamoy, whose powerful king conquered the kingdoms of Ardrah and Whidah, as before-mentioned, is situated to the north of the Slave Coast, and extends a considerable way inland. Its boundaries on the west, north, and east, are quite unknown. This country is very wholesome, as it lies high, and is daily refreshed by fine cooling breezes; and from it, though at a considerable distance, may be seen the kingdom of Great Popo.

The king's town, where he has his palace, is called Abomay, and is situated 200 miles up in the inland country. He is a very powerful prince, and always keeps a considerable standing army; but it consists only of foot-soldiers. He has for his enemies a nation called Joes, who live a great way to the north towards Nubia, and all fight on horseback. These two powers have been frequently at variance with each other; but a treaty was formed between them some few years ago, which being unanimously agreed to, they have ever since been on good terms.

C H A P. V.

The Kingdom of B E N I N.

LEAVING the kingdom of Ardrah, we enter that of Benin, the extent of which, from east to west, is about 600 miles; but how far it reaches from north to south cannot be ascertained. It is bounded on the east by the kingdoms of Mujac and Makoko; on the west, by Ardrah, and part of the gulph of Guinea; on the north, by part of Gago and Biafara; and on the south by Congo.

The country in general is very low and woody, but it is well watered with rivers, the most distinguished of which is that called by the English and French the river Benin; but by the Portuguese Rio Formosa, or the Beautiful River. Its length and source are not known, but its branches are supposed to extend through most parts of the neighbouring countries. Its banks are exceeding pleasant, being ornamented with lofty trees, and many small but neat villages. There are also several good towns for trade, an account of which will be given hereafter.

The climate of this kingdom is rather unwholesome, owing to the noxious vapours exhaled from the low grounds by the heat of the sun; but the soil is tolerably fertile, and well calculated for the produce of millet and rice; but as the inhabitants are not fond of those grains, little of them are cultivated. Their principal attention is directed to the produce of yams, which they use instead of bread; and they have also great plenty of potatoes and other roots. The chief fruits here are oranges, lemons, and bananas; and they have some cotton and pepper trees; the latter of which produce a tolerable commodity, but not in such quantities as those of the East-Indies, neither are the corns so large.

The wild beasts of this country are, elephants, tigers, leopards, bears, and monkeys. The tame ones consist of horses, cows, sheep, dogs and cats; the two latter of which the natives prefer to any other kind of flesh whatever. They have also great plenty of poultry, and the woods abound with game, as harts, hares, partridges, pheasants, turtle doves, &c.

Of the Disposition of the Natives of Benin; their Manners, Customs, Laws, Religion, &c.

THE kingdom of Benin is inhabited by several people, who have each their particular king; all of whom, except the king of Overri, are slaves or vassals to the king of Great Benin. The natives in general are good-natured and obliging, particularly to Europeans; and if the latter compliment them with presents, their liberality is sure to be doubly returned. When any favour is asked of them, they will use their utmost endeavours to grant it, even though it may in some degree be prejudicial to themselves. To use gentle measures is the only way to succeed in whatever is wanted; and in that case it is their greatest pleasure to oblige the person that applies to them: on the contrary, if they are treated with violence, no people in the world can be more refractory, and they will take as much pains to injure, as they otherwise would to serve you. Among themselves they carry the appearance of civility and complaisance, but in reality they are very close and reserved, especially in their dealings, not caring to trust each other. The traders are very attentive to business, and remarkably tenacious of their old customs, with which, if a foreigner complies, he may easily deal with them.

The inhabitants of this kingdom may be divided into four classes; the first of which is composed of only three persons, called Great Lords, or Great Men, who are always near the king's person; and whoever wants

to obtain any favour from his majesty, must apply to these people, who acquaint the king with their desires, and return his answer. As there is no intermediate person between these, the king, and he who solicits favours, they act on these occasions in such manner as best suits their own interests; so that in reality the whole government is entirely in their hands. However contradictory their conduct may be to the intentions of the king, yet it can never be known, as no other persons, except those in a public capacity, are admitted into his presence.

The second rank or class of people here, is composed of those called Ores-de-Roes, or Road Chiefs, who are of four sorts; the meanest preside over slaves; those a degree higher over the low rabble; the third inspect the conduct of those concerned in husbandry and agriculture; and the fourth, or superior order, superintend the military. These people are very numerous, from whom are chosen the viceroys and governors of those countries subject to the king. They are all under the command of the three great men, and are responsible to them on all occasions. They obtain their posts by the recommendation of these three lords; and the king, as an ensign of their honour, presents each of them with a string of coral, which they are obliged continually to wear about their necks. They are made of a sort of pale earth or stone, well glazed, and greatly resemble variegated marble. The possessors must be very careful of them, for if any should lose this badge of honour, whether by accident, or otherwise, the consequence would be not only degradation, but the loss of his life.

The third class of people are those appointed by the government to treat with the Europeans on behalf of the traders of Benin. They are called *Fiadors*, or *Brokers*; and their business is to see that all matters of commerce are fairly transacted between the respective parties.

The last class consists of the commonalty. The generality of these are very indolent, nor will they go to work but when necessity obliges them: the laborious part of their business is executed by the wives, such as tilling the ground, spinning of cotton, weaving of cloth, and other handicrafts. The principal artificers amongst them are smiths, carpenters, and leather-dressers.

The habit of the Negroes here (particularly the better sort) consists of a white callico or cotton cloth fastened round the waist, and neatly plaited in the middle, but the lower and upper parts of the body are entirely naked. The dress of the meaner sort is of the same form, and only differs in the quality of the stuff with which it is made.

The wives of the grandees wear callico panns, wove in this country, which are very fine, and beautifully variegated with different colours: these are fastened round the waist, and the upper part of the body is covered with a piece of cloth about a yard long, which serves instead of a veil. They wear necklaces of coral agreeably disposed, and their arms, legs, wrists, and fingers, are ornamented with copper or iron rings.

The men take but little pains with their hair; they let it grow in its natural form, except buckling it in two or three places, in order to hang a great coral to it; but the women's hair is artificially formed into large and small buckles, and divided on the crown of the head, so that the latter are placed with great uniformity. Some of them oil their hair, by which means it loses its black colour, and in time turns to a sort of green or yellow,

which they are very fond of, but it is far from being agreeable to the eyes of a stranger.

When a great man goes abroad, he is attended by a number of servants, all of whom are armed, some with spears, others with long darts, and some with bows and arrows. He usually rides on horseback, and sits on the best sideway, in the same manner the women do in England. One of his attendants holds an umbrella over his head to shelter him from rain, or the violent heat of the sun; and another goes before leading the horse. They use neither saddle or stirrups, and the only security of the rider consists in his resting the left hand on the shoulder of one of his attendants.

The buildings in most of the towns in this kingdom are very spacious and lofty, but they are differently constructed, some of them being square, and others of an oblong form. The doors are made high but narrow, and the windows are few in number, and exceeding small. They are all made with a flat roof, on the top of which is a covering raised several feet, to keep off the heat of the sun; and here they frequently regale themselves, when they pay a visit to each other.

The better sort of people live well, but not luxuriously: their principal diet consists of beef, mutton, or chickens, and for bread they use yams, which, after being boiled, are beat fine, and made into cakes. Their common drink is water, but sometimes they mix brandy with it. The poorer sort live on dried fish, yams, bananas, and pulse; and their drink is water, or a kind of beer somewhat resembling that called *bito* on the Slave Coast.

Polygamy is here allowed, with the same indulgence as on the coast of Guinea; and their marriage ceremonies consist only in the consent of the parents, a present to the bride, and an entertainment for the guests on both sides. The men are exceeding jealous, for which reason the wives of the poor people enjoy a pleasure to which those of the better sort are entire strangers; for while the former have their liberty, the wives of the great are close confined, to obviate all opportunities of transgression.

When a woman is delivered of a boy, it is presented to the king as his property; for which reason all the males of this country are called the king's slaves; but the females are the property of the father, who has liberty to dispose of them at his own discretion.

If a woman happens to bear two children at a birth, immediate information of it is given to the king, who orders public rejoicings to be made on the occasion. Such circumstances are considered as happy omens in all the territories of Benin, except at a place called *Arabo*, where they are productive of the most horrid cruelties; for the people there generally sacrifice both woman and children to a certain demon, which they say inhabits a wood near the town. Sometimes, indeed, they will spare the wife, by the husband's offering a female slave in her stead, but the children are condemned without redemption. Bosman says, that while he was at this town in 1699, he knew a merchant's wife thus redeemed, but her children were destroyed, whose sad fate she often deplored with tears. The following year, says he, the like happened to the wife of a priest: she was delivered of two children, whom, with a slave in his wife's room, the father was, by virtue of his office, himself obliged to sacrifice with his own hands.

This shocking custom is still prevalent in that town; but of late years, those that are enabled to defray the expence, avoid the consequences, by sending their wives, when they approach near the time of their delivery, to a more humane part of the country.

They practise circumcision on both sexes, which is performed when the children are about a fortnight old; but for this custom they give no reason, only saying, that it was handed down to them by their ancestors. They also inflict another punishment on the children by pinching their bodies; that is, making incisions in different parts, in a sort of regular order, and leaving the marks of birds, beasts, and other figures. The girls undergo the greatest punishment in this particular, being much more marked than the boys; for, as they are

considered as the greatest ornaments they can have, so their parents are very liberal in bestowing them.

The Negroes here are not so alarmed at the thoughts of death as their neighbours on the coast of Guinea. When a person falls sick, he immediately applies to the priest, who also acts in the capacity of physician, and furnishes him with medicines; but if these prove ineffectual, he has recourse to sacrifices. If the patient recovers, the priest is rewarded for his assistance; but no farther regard is paid to him: so that the priests here are generally poor, having little other dependence than what arises from their abilities as physicians; for each man offers his own sacrifices to his idols, and think they sufficiently acquit themselves of their religious duties, without applying to the priest.

When a person dies, the corpse is kept only one day before interment, except his death happens at a distance from his general place of residence; in which case, in order to preserve it for conveyance, it is dried over a gentle fire till all the moisture is extracted, when it is put into a coffin, and publicly exposed; after which it is carried on mens shoulders to the place of interment. When the funeral is over, the nearest relations go into mourning, and bewail their loss by cries and lamentations. The show of mourning consists only in shaving their heads, some half way, and others all over; and the men shave off their beards.

When a grandee is buried, many slaves are sacrificed on the occasion; but the greatest number fall victims on the death of the king. The ceremonies attending a royal funeral in this country are very singular, and are thus described by Barbot, who was once an eye-witness of them: "As soon, says he, as the king of Benin expires, they dig a large pit in the ground at the palace, so deep that the workmen are sometimes in danger of being drowned by the quantity of water that springs from the earth. This pit they make wide at the bottom, and very narrow at the top. They first let down the royal corpse into it, and then such of his domestics, of both sexes, as are selected for that honour, for which there is great interest made. These being let down into the pit, they shut up the mouth with a large stone, in the presence of a crowd of people, who wait day and night. The next morning they remove the stone, and some proper officers ask the persons inclosed, if they have found out the king? If they answer, the pit is shut up again, and the following day opened with the like ceremony, which continues till the persons are dead, and no answer returned. After this the chief ministers inform the successor, who immediately repairs to the pit; and causing the stone to be removed, orders all sorts of provisions to be laid on it for the entertainment of the populace. After they have regaled themselves, they run about the city in the night, committing the greatest outrages, and killing all the men, women, and children they find. They chop off their heads, and leave them in the streets, but they bring their bodies and throw them into the pit, with their garments, household goods, &c. as presents to the deceased king." This strange custom is still preserved in the strictest manner; and those who are allotted to fall victims on the occasion, are so far from lamenting their fate, that they think it the highest mark of honour that can be conferred on them.

The religion professed by these people is strangely absurd and perplexed. They worship various kinds of idols, some of which are made of elephants teeth, claws, dead mens heads, skeletons, &c. Each is his own priest, and addresses himself to such of his idols as he best likes. Many of them, however, have a tolerable idea of the Deity; for they ascribe to God the divine attributes, and believe that he governs all things by his providence. As he is invisible, they say it would be absurd to attempt to make any corporeal representation of him, for that could not be effected, as it would be impossible to make any image of what was never seen. The images of their idol gods they consider as subordinate deities to the Supreme Being, and believe that they are mediators between them and him. They believe also in the devil, and think themselves

obliged

obliged to reverence him lest he should hurt them. They make their offerings to him by the same idols they do the higher power, so that one image serves them in two capacities.

They believe that the apparitions of their ancestors appear to them, but it is only when they are asleep. They call the shadow of a man passadoor or conductor, which they believe really to exist, and that it will come time or other give testimony whether they have lived well or ill. If the former they are to be raised to great dignity; but if the latter they are to perish with hunger and poverty.

The poorer sort make daily offerings to their idols, which consist only of a few yams mixed with oil; sometimes they offer a fowl, but they only sprinkle the blood of it on the idol, for the flesh they convert to their own use. The great men make annual sacrifices, which are very expensive, and celebrated with great pomp: they kill multitudes of cows, sheep, and other kinds of cattle, and they provide an elegant entertainment for their friends, that lasts several days, besides which they give handsome presents to the poor.

They divide time into years, months, weeks and days, each of which are distinguished by a particular name; but in their division they make fourteen months to the year. They keep their sabbath every fifth day, which is solemnly observed, particularly by the better sort, who on the occasion sacrifice cows, sheep and goats, while the poorer sort kill dogs, cats, chickens, or whatever they are able to purchase. Those who are so distressed as not to be able to obtain any of these, are assisted by the others, in order that the festival may be universally kept.

Besides the festivals held on their sabbaths, they have two others which are kept annually. The first of these is in commemoration of their ancestors, when they not only sacrifice a great number of beasts, but also human beings; but the latter are generally malefactors sentenced to death, and reserved for these solemnities. If it happens that there are not so many criminals as are requisite on these occasions, (the number of which is 25,) the king orders his officers to parade the streets, and seize indifferently such persons as they meet not carrying lights. If the persons so seized are wealthy, they are permitted to purchase their redemption, but if poor, they are sacrificed on the day appointed. The slaves of great men so seized may be also ransomed on condition that the masters find others to supply their place. This custom is what chiefly contributes to the emolument of the priests, it being their province to redeem the persons so taken, from whom they receive a very ample complement on the occasion.

Their second annual festival, and which is by far the most considerable, is called the coral feast. It is celebrated in the month of May, and on the day it is held the king appears in public. As the ceremonies attending this festival are rather singular, we shall give the following description of them, as related by a person who was present, and saw the whole. This person says, that on the day appointed, the king came magnificently dressed into the second court of the palace, where, under a rich canopy, a seat was placed for him, as also others for his wives and a great number of his principal officers. Soon after the king was seated, the procession began, which being ended, the king removed from his throne, in order to sacrifice to the gods in the open air, and thereby begin the feast. This action was accompanied with the universal and loud acclamations of the people. After passing a quarter of an hour in this manner, he returned to the former place, where he sat two hours, in order to give the remainder of the people time to perform their devotions. This done, he returned into the palace. The rest of the day was spent in splendid treating and feasting, the king causing all kinds of provisions to be liberally distributed to the populace, and the grandees followed his example, so that nothing but joy was to be seen throughout the city. The reason why this is called the coral feast is, because at this time the king bestows the strings of coral on those whom he advances to any preferment, or post of honour, which he never does but

on this festival, unless a particular urgency of state requires it.

The sovereign of this kingdom is an arbitrary monarch, and his will is an absolute law; but the chief direction of government is vested in the three great lords. Their laws are in general very mild, and not attended with those distinguished impositions to which the inhabitants of some other countries are subject. When a person of property dies, the right of inheritance devolves to the eldest son, but he is obliged to present a slave to the king, and another to the three great lords, with a petition that he may succeed his father in the same quality, which the king accordingly grants, and he is declared the lawful heir of all the possessions left by his father. He is not compelled to make any allowance to his younger brother, that being wholly left to his own discretion; but if his mother be alive, he must allow her a maintenance suitable to her rank. He takes his father's other wives home, especially those that have not had children, and if he thinks proper he uses them as his own; those he disapproves of are obliged to work for their maintenance under his inspection, but he never cohabits with them. If the deceased leaves no children, the brother inherits the effects; and in case of deficiency of such heir, the next a-kin; but if no lawful heir appears, the whole becomes the property of the king.

Punishments are inflicted on criminals in proportion to the nature of the offence. We have before observed that the Negroes here pay particular respect to foreigners; the injury, therefore, of any European is considered as a capital crime, and the punishment for such offence is thus executed: they take the offender, tie his hands behind his back, and blindfold him. After this the judge raises him up, so that his head hangs towards the ground, which the executioner cuts off with a hatchet; and separating the body into four quarters, leaves it to be devoured by the wild beasts.

Theft is seldom committed here, the natives not being of so pilfering a disposition as the inhabitants of the neighbouring nations. However, when it happens that a person is found guilty of theft, he is obliged to restore the goods and pay a fine; and if he is unable to do the latter, he suffers corporally. If the robbery is committed on a grandee, the punishment is death.

Murder seldom happens, but when it does the criminal is punished with death, except the offence be committed by the king's son, or a grandee, in which case the offender is banished to the most distant part of the kingdom, and never permitted to return.

If a person kills another by accident, he may purchase his life, by first burying the deceased, and afterwards producing a slave to suffer in his stead. When this slave is sacrificed the offender must bend his body, and touch the slave's knees with his forehead; after which he must pay a fine to the three great lords, when he obtains his freedom, and the relations of the deceased think a sufficient atonement has been made for the offence.

Adultery is punished various ways, in proportion to the circumstances of the parties. If a common person surprizes his wife in the fact, he is entitled to all the effects of the person that has injured him; and the woman, after being severely drubbed by her husband, is totally discarded, being left to shift for herself the remainder of her life.

The better sort, in these cases, revenge themselves much the same way; but the relations of the offending party, in order to avail themselves of the scandal that might accrue to their family, frequently bring about a reconciliation, by paying a large, pecuniary complement to the injured husband, who, in this case, bulhes up the matter, and apparently seems to forget the once unbecomable liberality of his inconstant spouse.

Other crimes are punished by fine, which is proportioned according to the nature of the offence; and if the criminal is not able to pay the fine levied, he is subject to corporal punishment.

The fines paid on these occasions are thus disposed of: the person injured is first satisfied, after which the go-

vernor has his share, and the remainder of the five goes to the three great lords.

Having thus taken a general view of this kingdom, with the nature of its inhabitants, their manners, customs, laws, religion, &c. we shall now point out those places in it that are the most remarkable.

The principal of these is the town, or city of Benin, the usual residence of the king. It is a large town, pleasantly situated on the banks of the river, about 40 miles from its mouth. It contains a great number of streets, most of which are very spacious, and the houses uniformly built. The principal street is exceeding broad, and at least three miles in length: it is intersected by many cross streets and lanes, all of which are straight and of considerable extent; and the whole city is at least nine miles in circumference. The houses of the grandees are much higher than those of the commonalty, and are ascended by steps. At the entrance of each is a vestibule, or porch, which is every morning cleaned by the slaves, and spread with mats of straw. The inner chamber is square, with an opening in the center for the admission of light; and in these apartments they both sleep and eat, though they dress their victuals in other places separate, having many offices under the same roof. All their buildings are made of red earth tempered with water, which being dried by the sun, forms a solid wall, and they are covered with reed, straw or the leaves of trees. The houses of the common people are entered by a small door, which is in the center, and level with the ground; and instead of windows the light is admitted from an opening in the roof.

The king's palace is very extensive, and consists of several large squares surrounded with galleries, each of which has a portico or gate, guarded by soldiers. The first gallery, on entering the palace, is very long, and supported on each side by lofty pillars. At the end of this gallery is a large mud wall, with three gates, the center one of which is ornamented with a turret, about 70 feet high, terminated with the figure of a large snake cast in copper, and very ingeniously carved. These gates open to a large plain about a quarter of a mile square, enclosed by a mud wall. At the end of this plain is another gallery much like the former; this is terminated by a gate that opens to a third, the pillars of which are carved with human figures, and in one part of it, behind a cotton curtain, are eleven mens heads cast in copper, on each of which is an elephant's tooth. Leaving this, you enter a large plain, where there is a fourth gallery, beyond which are the king's apartments. The first of these is the king's audience chamber, where he receives the nobility, foreign ambassadors, &c. The sides of it are hung with tapestry, and the floor is covered with carpets of European manufacture. At one end of the room is the king's throne, which is made of ivory; it is ascended by three steps, and over it is a canopy made of the richest silk. All the other apartments are very spacious, and the furniture of them exceeding splendid.

The inhabitants of this city are all natives, no foreigner being permitted to reside in it. Some of them are very wealthy, and spend their whole time at court, leaving trade and agriculture to be executed by their wives and servants. These go to the circumjacent villages, and either trade in merchandize, or serve for daily wages, and they are obliged to bring the greatest part of what they get to their masters, otherwise they would be sold for slaves.

In the principal street of the city a market is every day kept for the sale of provisions and merchandize. The former consists of dogs, of which they are very fond, roasted baboons and monkeys, bats and large rats, parrots, hens, lizards dried in the sun, fruits and palm wine. Their merchandize consists of cotton, elephants teeth, wooden platters, cups, and other household stuff; cotton cloth, iron instruments for fishing and tilling the ground, lances, darts and other weapons. A place is allotted for each kind of merchandize, and they are all disposed with great uniformity.

The city of Benin was some years ago much more populous than it is at present. Its decay was owing to

the avaricious disposition of the then king, who, in order to increase his coffers, caused two of his road chiefs to be put to death, under pretence of their having conspired against his life. The wealth he accumulated by the death of these two, prompted him to make the like attempt upon a third; but this man was so universally beloved, that he had timely notice of the king's intentions, and accordingly took his flight, attended by the principal part of the inhabitants. As soon as the king heard of this, he dispatched an army to pursue them, and oblige them to return; but the army met with such a repulse, that they were obliged to return without having effected the business on which they were sent. The king, irritated at this, made a second attempt, by sending a much more considerable army; but here he also failed, for many of them were killed, and the rest precipitately fled to the capital.

The royal chief, flustered with success, determined to be revenged of his sovereign, and marched with all his men to the city, which he plundered, sparing no place except the king's palace. After this he retired, but continued for several years to rob those inhabitants of Benin that happened to fall in his way; till at length, at the intercession of some Europeans, a peace was concluded between him and the king, by which he was pardoned, and intreated to return to his former situation. Fearful, however, of the integrity of his majesty, whom he still considered as his most inveterate enemy, he did not think proper to comply, but settled at a place about three days journey from Benin, where he kept a court, was highly respected by the people that followed him, and lived with as much splendor and dignity as the king himself. Some few of the citizens returned to the capital, and were not only received by the king with great friendship, but were preferred to honourable offices, in order to induce the rest to follow their example: the multitude, however, were not thus to be deluded; they preferred a life of ease and freedom to that of tyranny and oppression; nor could the most pressing entreaties made use of by the king prevail on them to return. Such were the circumstances that occasioned the reduction of the inhabitants of this city, whose number is now at least one half less than before the above irruption.

The other towns in this kingdom are chiefly remarkable for trade, and are most of them situated on the river Benin. The first of these is called Awero, or Ouwette, and belongs to a king, who is the only one that is independent of the king of Benin. The town stands about six miles from the mouth of the river, and here the Portuguese have a church and factory.

At a small distance from this is a trading village, called Boedode, which contains about 50 houses, built with reeds and mud, and covered with the leaves of trees. It is governed by a viceroy and some grandees, whose authority extends only to trifling matters, as civil causes, and the raising of taxes for the king; but if any thing considerable happens, they must state the matter to the court, and wait their determination.

Near the mouth of the river is the village of Ogaton, pleasantly situated on a high island in the center of it, and surrounded with most kinds of fruit-trees. This was once a considerable place, but it suffered so much in the wars, that it was almost laid waste; however, from its delightful situation, the buildings of late years have considerably increased, and it seems as if time would restore it to its original importance.

The greatest place of trade on the river Benin is called Arco, and is situated about 50 miles from its mouth. It is a large populous town, and the inhabitants of it are remarkable for being very honest in their dealings. The Dutch and English had both factories here; but the latter having neglected their trade, the lodge fell down, and has never since been rebuilt; so that the former is the only European settlement in this part of the country.

Meiberg, the last town we have to mention on the river Benin, is a small but very neat place, and the houses are built with great uniformity. The Dutch had once a factory here, and were greatly respected by

greatly respected by the

the natives; but during their stay a melancholy circum-
stance happened, occasioned by the indiscretion of the
principal factor, that entirely overthrew them; the par-
ticulars of which are thus described by a late author:
"N. Beeldfnyder, their last factor, having cast a wan-
ton eye on one of the Negro-governor's wives, ravished
her, which so enraged the injured husband, that he
came with a body of armed men, and resolved to kill
the adulterer, who narrowly escaped on board a ship;
but in the flight was wounded so, that, by the sur-
geon's unskillfulness, he died. The company's director-
general on the coast, not being rightly informed of the
case, sent a vessel from El Mina, well manned, to Ben-
nin, with strict orders to revenge the murder. These
soldiers so stretched their commission, that they killed,
or took prisoners, every person in the town, who could
not escape. The king being informed of this, and the
occasion of the massacre, commanded the Negro-governor
to be brought before him; and though he had done
nothing but what seemed right, in defending the honour
of his family, yet the king caused him and his whole
race to be put to death in the most cruel manner. The
dead bodies of these miserable wretches were exposed to
be devoured by the beasts, and their houses were razed
to the ground, with strict orders that they should never
be rebuilt." The Dutch, however, from these circum-
stances, made no farther attempt, and there has not
been any European factory in this town ever since.

B. sides the river Benin, there are several other con-
siderable ones in this kingdom, particularly the river
Rio del Rey, which is very spacious and extensive, and
the shore on each side of it is low and marshy. It takes
its source from the north, and is very wide for a con-
siderable way up the country. On its banks are a
great number of villages inhabited by people divided
into two nations, one of which dwell along the upper
part of the river, and the other towards the mouth;
but they are always at enmity with each other. They
are a strong, robust people, but poor, dishonest, and
treacherous; and are very filthy both in their houses
and persons. They go quite naked, smeared their bod-
ies with oil mixed with a red colour: they plait
their hair in various forms, file their teeth, and orna-
ment their foreheads with strange marks made with hot
irons or pincers. In short, they are mere savages, and
their only employment is fishing, they being total stran-
gers either to mechanical arts or agriculture.

The Rio Kamarones is another large river, whose in-
habitants are governed by a chief of their own, called
Moueba. His seat, or palace, is situated on a delight-
ful spot that commands the adjacent country, which is
exceeding fertile, and produces great quantities of yams,
bananas, palm, and other fruits. The people here
carry on a considerable trade with the Europeans, hav-
ing plenty of elephants teeth and slaves, which they sell
at very reasonable rates. The goods sold in exchange
by the Europeans consist chiefly of iron and copper
bars, brass pots and kettles, bugles or beads, ox horns,
and steel files. The natives here are lusty, tall, well-
shaped, and have a remarkable smooth skin.

The river Rio Gabon is situated about fifteen leagues
from Cape de Lopo Gonfhalvo, or the utmost point of
the gulph of Benin. It is a very large river, and the
mouth of it is at least six miles across. About nine
miles up the river are two islands, one of which takes
its name from the king, and the other from the prince
of this river, two great lords of Benin. But these
islands have now but few inhabitants, the king having
left one, and the prince the other, each of them living
on particular parts of the river. The river is naviga-
ble for small ships several leagues up, but its spring and
course are not known. There are many villages on its
banks; and the trade carried on here consists in ele-
phants teeth, wax, and honey.

The inhabitants on this river are very large, robust,
and well-shaped; but in their dispositions they are
fierce and cruel. The men are great thieves, and the
women so abandoned that they care not on whom, or in

what manner, they bestow their favours. They are di-
vided into three classes; the first of which are under the
government of the king; the second under that of the
prince; and the third are totally independent. The
two former are always at variance, and though they will
not enter into a war, yet they take every opportunity
they can of making depredations on each other's prop-
erty.

Their dress consists of mats fastened round the waist,
made of the bark of trees, and painted red; besides
which they are ornamented with the skins of mon-
kies, or other wild beasts. Most of them go bare-
headed, having their hair strangely cut, or tied up:
some have small caps made of twigs, or the bark of the
cocoa; and others have feathers fastened on their heads,
with iron wire, or plates of iron. They dye their
bodies red, and have great quantities of rings in their
noles and ears. The women wear mats of reed round
their waists, and have bracelets of copper or pewter on
their necks and arms. Some of them sleep on mats
made of straw, but the generality lie on the bare
ground. Their food consists of yams, potatoes, and
bananas, with fish and flesh dried in the sun. Their
houses are very ingeniously made of reeds and canes,
covered with banana leaves.

The king's palace is larger than the other buildings,
and his dress greatly differs from that worn by his sub-
jects. It consists chiefly in beads of bone, and shells
dyed red, and strung together like a chaplet round his
arms, legs, and neck. Before the gate of the palace is
planted a brass cannon, with several small guns, the
appearance of which strike an awe in his subjects,
who, either from fear, or other motives, are very obed-
ient.

The Negroes here are perfect strangers to agricul-
ture, and chiefly live by hunting and fishing. The
river abounds with fish, besides which there are great
numbers of crocodiles and sea-horses; and on the banks
of it are prodigious numbers of wild beasts, especially
elephants, buffaloes, and wild boars.

About 18 leagues from the river Gobon is Cape
Lope Gonfhalvo, which is the extreme limits of the
Gulph of Guinea. It appears like a low flat island,
but it is a long, narrow peninsula, stretching from the
continent several leagues to sea. It has a good harbour
either for anchoring or careening ships, especially for
those homeward bound, provisions being not only plen-
tiful, but also very cheap. On the shore are several
huts, where the natives occasionally reside, as the Eu-
ropean vessels stop for the above purposes; but the town
they belong to is called Olibato, and is situated about
six miles from the Cape. It is the residence of a king,
and the town contains about 300 houses, which are
made with bull-rushes interwoven, and covered with
palm-leaves. The natives are much more civilized than
those of Rio Gabon, but they differ little in their dress,
manners, and customs. The country abounds with
wild beasts, as elephants, buffaloes, wild boars, apes,
monkies, and other mischievous animals.

All vessels, as soon as they arrive at the Cape, fire
off four guns, to alarm the country, and give notice of
their arrival; when the people immediately repair from
Olibato, and other inland places, to the Cape, and
carry with them such articles as they have to dispose of,
the principal of which are water, wood for fuel, and
provisions. They always keep a stock of wood by
them, that they may be ready to supply such vessels as
stop at the Cape: they cut it in billets about two feet
long, a boat load of which they generally sell for a bar
of iron. They get their water out of a large pond near
the Cape: it keeps good at sea, and is allowed by most
sailors to be exceeding wholesome.

The other goods purchased here by the Europeans
consist of elephants teeth, wax, honey, and camwood;
and the articles sold to the natives are knives, iron bars,
beads, old sheets, axes, brass basons, firelocks, powder,
ball, and shot.

CHAP. VI.

CONGO, or LOWER GUINEA.

THIS extensive country is situated between 28 deg. 30 min. and 40 deg. 10 min. east longitude; and between the equator and 16 deg. of south latitude. Its eastern boundaries are not known; but on the west it is bounded by the Atlantic Ocean; on the north by the kingdom of Benin; and on the south by the kingdom of Mataman. Its extent from north to south is upwards of 1700 miles.

The whole country is divided into four parts, or kingdoms, the names of which are as follow :

- | | |
|------------------|--------------|
| 1. Loango, | 3. Angola; |
| 2. Congo Proper, | 4. Benguela. |

As each of these kingdoms has some peculiarities subject to itself, we shall describe them separately, beginning with

SECT. I.

The Kingdom of LOANGO.

THIS is the most northern division of Congo in general: it is bounded on the east by the kingdom of Makoko; on the west, by the Atlantic Ocean; on the north, by the kingdom of Benin; and on the south, by Congo Proper; being upwards of 400 miles in length, and 300 in breadth. It contains many provinces, the principal of which are, Loangiri, Loango-Mongo, Chylongo, and Piri. Besides these, there are others much smaller, that chiefly lie on the coast, and are frequented by the Europeans; of all which we shall take proper notice hereafter.

Although this kingdom is situated near the center of the torrid zone, yet the climate is far from being unwholesome; and as it is watered by a number of small rivers, the soil is tolerably fertile; but it might be turned to much greater advantage than it is, were it not for the natural indolence of the inhabitants. However, it produces several sorts of grain, of which they have three crops annually; also peas and beans not inferior to those of Europe, with great plenty of yams and potatoes. They have likewise several kinds of fruits, as oranges, lemons, bananas, pumpions, cocoa nuts, and the kola fruit.

In the more remote parts of this kingdom are great numbers of wild beasts, as elephants, tigers, leopards, civet-cats, and various sorts of monkeys. Of the tame animals they have only two sorts, namely, hogs and goats; but this deficiency is supplied by the poultry, which is so plentiful, that a good fowl may be purchased at the value of an English farthing. They have also great plenty of wild fowl, and several uncommon birds peculiar to the country. Among the latter the most remarkable is that called the pelican, which being a bird little known to Europeans, we shall take this opportunity of describing it:

The Pelican is in length, from the tip of the bill to the end of the tail, about five feet, and weighs in general not less than 20 pounds. The bill, which is hooked, is about 14 inches long from the tip to the corners of the mouth. The feathers of the body are of a greyish colour, and those on the top of the head stand erect, and much longer than the rest. The tail and covert feathers of the wings are of a dusky ash-colour; but the ends of the quill feathers are black, of which there are 28 in each wing. The upper chap is flat and broad, and the bill near the head is of a lead colour, but yellowish toward the end. The lower chap is like two long ribs united at the extremity; and between them there is a thick yellow membrane or skin, which it can draw so close up to the bill, as hardly to be perceived; but notwithstanding this, it may be so dilated as to con-

tain a prodigious quantity of water; which is often of infinite use to the bird when it travels over sandy tracks, where that article is not to be obtained for many miles. The legs are bare above the knees, and the feet are webbed, having four toes. But the most remarkable circumstance belonging to this bird is the bones, which appear to be transparent, with many fibres and veins running up and down them throughout their whole length. To this may also be added another singularity, which is, that near the middle of the stomach the wind-pipe is divided into two branches, a circumstance not to be met with in any other bird whatever.

The inhabitants of Loango are called Bramas: they are tall, well-shaped, and of a shining black colour. In their dispositions they are tolerably civil, but they are exceeding jealous of their wives, though libidinous themselves: they are free and generous to one another, but very covetous to attain riches, and are greatly addicted to drinking.

The dress of the men consists of long garments, that reach from the middle to the ankles, at the bottom of which is a handsome border of fringe. They are fastened at the waist with a string made of the leaves of the Matombe tree; besides which they have two girdles, each three or four inches broad: one of these is made either of red or black cloth slightly embroidered, and the other of yarn wrought with flowers, and fastened before with double fringes. Some use girdles made of bullrushes, or palm leaves, which they weave and plait together; and all of them are obliged to have on the outside of their garments a piece of the skin of a leopard, or some other wild beast. They wear strings of beads about their necks, and their arms and legs are ornamented with brass, copper, or iron bracelets. When they go a-hunt, they throw a kind of sack over their shoulders, which is about three quarters of a yard long, with a little opening left to put their arms through. They have a cap on their heads, which is made to fit close; and in their hands they always carry either a great knife, a sword, or a bow and arrows.

The dress of the women differs from that of the men; their petticoats are much shorter, reaching only from the waist to the knee, and over them they wear a piece of European stuff, or linen. The upper part of the body is quite bare; but their arms, legs, and necks are ornamented with rings, beads, and other trinkets. Both sexes anoint themselves with palm-oil, and stain their bodies with a liquid made from a wood called takool, the colour arising from which is a dingy red.

Their food consists chiefly of dried fish, which they boil with herbs, and season with Brazilian pepper. They make their bread with the flour of millet, and their usual drink is water.

They use little ceremony in their marriages, the chief thing being to obtain the consent of the parents; if that is accomplished, they assemble together, and the parties agreeing to take each other, an entertainment is provided for the guests, and the whole ceremony is ended. Some have 10 or 12 wives; but the common people have in general only two or three.

The women here, as in other parts of Africa, do all the slavish work, and are kept under great subjection: they not only discharge their household duties, but are also obliged to cultivate the land, while their husbands live in a mere state of indolence. They must never eat till after their husbands have done, and then cheerfully take his leavings; nor must they ever speak to him in any other posture than on their bended knees.

When infants are first born here, their colour is much the same as that in Europe; but in two days it turns

to a perfect black. This circumstance greatly deceived the Portuguese for some time after they settled in these parts; for having commerce with the Negro women, when a child was born they took it for granted, by the colour, that it must have been theirs; but when they came to be undeceived, and convinced that it was the child of a Negro, they lost that satisfaction they had before imbibed: however, when a child is born that is between both, that is, a mulatto, they have not only a great respect for the infant, but a high veneration for the object that produced it.

There is one circumstance here relative to the birth of children that is very remarkable. Though both parties are Negroes, yet sometimes it happens that the offspring is very different in colour to that of its parents. These at a distance greatly resemble Europeans: they have grey eyes, and red or yellow hair; but when you are close to them their colour is like the corpse of an European, and their eyes appear, as it were, fixed in their heads. Their sight is very imperfect in the day, but at night they see clear, especially if it be moon-light. It is supposed that the birth of these is occasioned by the effects of imagination in the woman in seeing a white man, in the same manner as history informs us, that a white woman, by viewing the picture of a Negro, brought forth a black child.

Children of this nature are called by the natives *don-dos*, and are always presented to the king a few days after they are born. They are brought up in the court, and always attend his person: they are held in such high esteem by the king, that no person whatever dare offend them; and if they go to the markets they have the liberty of taking such articles as they think proper, without controul.

When any one dies, the relations immediately make it known by running about the town or village, and shrieking in the most hideous manner; after which they bring the corpse into the street, and wash and clean it: they then interrogate it, why he died? and such like questions, which they continue to put to it for several hours. After this the grave is dug, when they carry several of their household goods, and lay by the side of it, as also the most valuable things used by the deceased in his life-time. They then hastily take up the corpse, and carry it with all expedition to the grave, in which it is immediately deposited: some of the goods are thrown into the grave, and after they have heaved their lamentations by howling, and the most strange gesticulations, it is filled up with earth. The remaining goods are set over the grave on poles, being first cut to prevent their being stolen. The relations of the deceased bewail his loss by attending the grave, morning and evening, for six successive weeks.

It is remarkable, that they will not suffer any foreigner to be buried in their country: when it happens that an European dies here, his body is carried in a boat two miles from the shore, and thrown into the sea. This

* In the year 1663, a famous missionary, named Father Bernardin, an Hungarian, being at Loango, had some conferences with the then king, acquainted him with the doctrines of the Christian religion, and baptized him, his queen, his children, and some persons of his court. The people, however, could not be persuaded to follow the king's example, nor could the most forcible arguments make them relinquish the least particle of their superstitious maxims. They paid no respect to the king's mandates, who, in order to establish the new religion, commanded them not to work on Sundays, which they absolutely refused, nor would they pay the least attention to such matters as were derogatory to their own superstitious notions. This refractoriness produced a national commotion: One of the king's cousins, a man particularly zealous for idolatry, put himself at the head of the people, seduced some of the new-converted Christians, both by promises and presents, and became so powerful as to dare to offer battle to his sovereign. The king, who was naturally courageous, went with his army to attack the rebels, and a desperate engagement ensued; but the rebels having found means to bring over the principal part of his army during the battle, the king was obliged to retire with the few who had remained faithful to him. The conquerors offered to lay down their arms, and to pay obedience to him as formerly, if he would renounce the

custom took its rise from a Portuguese gentleman being buried here some years ago, soon after which the whole country was afflicted with a famine. The priests thought proper to attribute the cause of the general calamity to the interment of the foreigner, whole body, in consequence of their opinions, was taken up, and thrown into the sea; and from this circumstance they have never since permitted a stranger to be interred in their country.

With respect to the religion of these people, they are all idolaters, though an attempt was once made to bring them to a knowledge of Christianity*. They have some notion of a Supreme Being, whom they call *Sambian Pogn*, but their ideas are exceeding imperfect; nor have they any belief in the resurrection of the dead. Their idols, which they call *mokifios*, are of various forms: some of them are made to resemble the human species; others consist of a piece of wood about a yard long, with small bits of iron on the top, or else the figure of some animal carved at the end of it. The heads of their greater idols are ornamented with the feathers of hens or pheasants, and their bodies are decorated with various kinds of trinkets. All acts of devotion are performed to these idols, of which they have great numbers. Each has a peculiar name, according to its office or jurisdiction. To some they ascribe the power of lightning and the wind, and suppose that by praying to them it will preserve their corn from vermin and birds of prey. To others they give the command over fishes of the sea and rivers, their cattle, &c. Some they make protectors of their health and safety; others they consider as being able to secure them from evils and misfortunes. Thus every one has his peculiar province, and his power is limited to a particular place.

They have a notion that these idols are jealous of one another; for which reason they make their addresses to them all indifferently, as their protectors and guardians. They generally keep them in a pot of earth, with the figure half in and half out: they are made by their priests, who get considerable wealth by the sale of them, as they fix their value in proportion to the circumstances of the purchaser.

They have several strange notions relative to the disposition of the soul after death. Those of the royal family believe, that when any one dies, his soul is regenerated in some of the family, while others think that the soul and body have one determinate end. Some, like the Greeks and Romans, place the soul among the heroes, or else bring it into the number of their tutelar household gods; others give them a common place of resort under the earth; whilst a fifth sort make for them little receptacles under the roof of their houses, before which places, when they eat or drink, they make some offerings for the benefit of the soul of their departed friend.

Their superstitious notions, occasioned by the craftiness of their priests, lead them into the practice of the most absurd maxims. When a child is born they call a

new religion he had embraced, and put things again upon their ancient footing. The king, who appeared convinced in his mind of the truth of the Christian religion, made answer, that he would never renounce the worship of the true God, and would spill the very last drop of his blood in the defence of it. In consequence of this several other battles were fought between the king and the rebels, in the last of which the king's troops were entirely cut to pieces, and himself slain. On this the conqueror was acknowledged king, who used all his endeavours to root out the Christian religion, and re-establish Paganism; but his triumph and reign were of short duration. One of the late king's children, who had escaped from the last battle, raised a new army, protesting most solemnly, that he took up arms with no other view, but for the sake of the Christian religion; and that, after his father's example, he would defend it to his last breath. Accordingly, he engaged the rebels, and the event of the battle was such, that the new tyrant was defeated and killed, with almost all his troops; after which the young conqueror ascended the throne, and established the Christian religion for some time throughout his dominions. At his death, however, it was finally extirpated by his successor, and idolatry has prevailed from that time to the present.

fetifero, or priest to enjoin it to keep some particular thing as a law. The priest asks the parents what was their injunction and that of their ancestors; when being answered, he tells them that the oracle, by the mokisso, has ordered, that the child shall be enjoined not to do such things during the course of its life, which the mother takes care to inculcate in the mind of the infant as it grows up. These injunctions are of various kinds, as, that they may refrain from such particular flesh, herbs or fruit; or that if they eat such flesh they must eat it alone, leave none, and bury the bones deep, that they may not be scraped up again, and eaten by any beast. Some are forbid to go over any water; others to cross a river in a canoe, though at the same time they are permitted to walk, swim, or ride through. Some are forbid to shave either their heads or beards, and others are commanded to abstain from all kinds of fruits.

If an unmarried man has got a foolish child, he must not eat of the breast or udder of a buffalo; but if he afterwards gets another more sensible, he becomes free from that restraint. These, and such like idle maxims, they observe with the greatest exactness, firmly believing that if the command enjoined by the mokisso, or the promises made to him, are not fully performed, he hath power to kill, or otherwise punish them.

All circumstances that happen to them, whether good or evil, they suppose to arise from the power of the mokisso. If a man preserve a good constitution, y living chaste and temperate, he ascribes his health to the mokisso, and not to those virtues themselves. If a sick man recovers, they never impute it either to the force of nature, or the application of medicines, but the mokisso gets the credit of the cure which they performed; and if the patient happens to die of old age, or by any accident, they believe he was killed by force, for having violated the injunctions laid on him by the mokisso.

Besides their private mokissos, they have many public ones, that are kept in temples or huts, to which they daily repair to pay their devotions. One of these is at a village called Thiriko, and in figure resembles a man. The ganga, or high-priest, who is lord of the village, performs the service every morning, the manner of which is thus: As soon as the people are assembled, he sits down upon a mat, and with a leathern bag strikes his knee several times, having small iron bells fastened to his fingers. After this he strikes the bag several times on his breast, and then uses many strange motions and postures of his body, hands, head and eyes; sometimes he raises his voice, and then depresses it, frequently repeating the word Mariomena, to which the assembly answer, Ka. When this has continued for some time, the ganga appears as if distracted, and his rage becomes so violent that he is obliged to be held; but by virtue of a four liquor drawn from cane, with which they sprinkle him, he recovers, and then declares what he has received from the mokisso, and what must be done in cases of sickness and the like. After this, he recommends to the mokisso the health of the king, the welfare of the country, flourishing of the seed, success to the merchants, and full nets for fishermen. At the mention of the king's name the whole company clap their hands in token of affection; and then the ceremony is concluded.

They have another remarkable mokisso called Kikokoo, which is a black wooden image cut in the shape of a man sitting. They believe that this mokisso preserves them from death, and that he keeps them from being hurt by forerers. It is kept in a hut, which is always guarded, on account of its having been once stolen by some Portuguese sailors, who took it out of the house, and carried it on board their ship; but in the way the head and one of the arms broke off. When they came again to Loango they were afraid to venture on shore without restoring Kikokoo, so nailing on the broken limbs, they conveyed him at night to his old habitation. The next day a report was spread among the blacks that Kikokoo had been in Portugal, and that a ship with goods had carried him away thither. Some time after this a Portuguese ship happening to strike upon the rocks of Loango, the blacks said that Kikokoo had

broken the ship, because the Portuguese had driven a nail into his head. Such is the force of the superstitious notions imbibed in the minds of these people, who sacrifice every particle of reason to defend the honour of these ridiculous images.

The most distinguished mokisso is called Malemba, and is particularly esteemed on account of its being visited by the king. It is a mat of about a foot and a half square, on the top of which hang several small baskets, with scallops, feathers, iron bells, rattles, bones, and other trifles. The ceremonies belonging to this are performed with little drums or tabors, on which boys strike with their hands. After this a song is chaunted by the company, and a person appointed for that purpose dips a brush into some water that has been coloured with takoe, which he sprinkles on the king and the ganga, or high-priest. The nobility that attend receive a streak on their bodies out of the same pot; after which they have the honour to carry away Malemba, with his pots, brushes, &c. which they place in their proper situations.

They have another mokisso, called Knisse, which consists of a sack with some horns full of whitening. The service to this image is performed with rattles, long sticks, singing songs in the night, creeping on their knees, washing, spitting, shouting, tying rings and bands about their bodies, and the like. They say this mokisso preserves them from sickness, and secures them against the dreadful consequences of thunder and lightning.

They have many other images, which have different names, and are supposed to be serviceable to them on various occasions; but they are all equally ridiculous with those already mentioned, and only tend farther to confirm the folly and superstition of their deluded votaries.

Description of the City of Loango, and particularly the King's Palace; with an Account of the State and Dignity of the King, his Government, Laws, Revenue, &c.

THE city of Loango, the capital of the kingdom, is situated in four degrees and a half of south latitude, and is about four miles from the sea-coast. It is a very large and populous city; the streets are long and spacious, and on the sides of them are planted rows of palmetto and banana trees. The houses are built of an oblong form, with two gable ends and a sloping roof, which rests on long thick posts supported by itays. They are all built nearly of the same size, stand at equal distances, and appear with great uniformity. The inside contains the four or four apartments, which are all on the ground-floor, and only separated by a slight partition made of wicker or reeds. Their household furniture consists chiefly of pots, wooden trays, mats, small and great baskets for their cloaths, and a few other trifles.

Near the center of the city is a spacious square, surrounded with lofty trees, where a daily market is held for the sale of all kinds of provisions, as meat, poultry, fish, wine, corn and oil; also palm-cloths of various sorts, and great quantities of elephants teeth.

On the west side of this square is the royal palace, which consists of a number of detached buildings. The king's apartments are in front, and behind are those belonging to his women. The whole is surrounded with lofty palm-trees, and is at least a mile and a half in circumference. At a small distance from the front of the palace is the place where the king holds public audience, and transacts all business relative to the state. Adjoining to the entrance of the palace, on the east side, is the banquetting-house, where the king every day retires to drink palm-wine. It is a noble building, and the place where all difficult cases are adjusted in the presence of the king. The front of it is open for the benefit of the air, and about 20 feet backwards is a screen or partition quite across, to prevent the palm-wine being seen by the people. The room is hung with rich tapestry, and in the center of it, just without the screen, is the throne, which is supported by small pillars made of palmetto branches curiously wrought in imitation of

basket-

pronoun

basket-work. The throne is raised from the ground about a foot and a half, and on each side of it are two large wicker baskets, that contain several weapons kept there by the king for the security of his person. Behind the place, on the east side, are the king's gardens, and on the west side are those belonging to the queen.

At a small distance from the city are two mokifos, one of which is called Mokiffo a Loango, and is highly esteemed. It is kept in a small hut, and resembles a man in a sitting posture. The natives perform their services to this idol by dancing round it with rattles in their hands, and throwing themselves into the strangest positions.

At about the same distance from the east end of the city is a place called the Broad Way, where such as have been found guilty of any crime by the imbonda drink *, are dragged and executed.

The king hath a great number of wives, all of whom, except the principal one, are obliged to be very subservient to him. The latter, however, who is distinguished by the title of makonda, has not only the superiority over the rest, but indeed over the king, for he is obliged to consult her on all affairs of importance, nor can he act without her will. Such is her power that she has the liberty of choosing any other male companion her inclinations may direct, and whatever children she has by such connection are reputed of the royal race.

Notwithstanding the king is thus subject to his principal wife, yet he otherwise preserves a kingly dignity. He is a very powerful prince, and so circumstanced as to be able to bring into the field a considerable army, for all his subjects are obliged to equip themselves with arms, and immediately attend at his command.

His dress consists of a garment made of cloth or stuff, and both he and his nobles wear, on their left arm, the skin of a wild cat sewed together with one end stuffed. He makes two meals a day, the first of which is about 10 o'clock in the morning. His provisions are brought to his apartment in covered baskets; and with the people that bring them is a man with a large bell in his hand, which he rings to give notice that the king's dishes are arrived. The king then leaves his company, and as soon as he enters the apartment, the servants retire and leave him, when he shuts the door, and continues by himself during the whole time he is at dinner; for should any person happen to see him either eat or drink, he would be immediately put to death.—So punctual is this law observed, that even animals are subject to the same fate, which happened to a fine dog presented the king by a Portuguese. The creature not being very well fed by those who had the care of him, smelling the victuals one day when the king went to dinner, followed the scent, and his majesty not fastening the door properly, the dog, while he was at dinner, thrust it open with his feet, and entered the room, when the king immediately quitted the apartment, and ordered him to be killed.

Every day, after dinner, the king goes in state, accompanied by his nobles, and a great crowd of people, to the banquetting-houle in order to refresh himself by drinking palm-wine. As soon as he arrives there he seats himself on the throne, and on each side of him is a cup-bearer. He on the right hand reaches him the cup when he is inclined to drink, but at the time turns his head; notice of which is given to the company by him on the left, who strikes two iron rods, pointed at the ends, one against the other. At this signal the

people turn their backs to the king, and bend their faces to the ground, in which posture they remain so long as the irons continue ringing; after which they rise, turn their faces to the king, and wish him health, by clapping their hands.

After sun-set the king goes a second time to the apartment adapted for eating, where his provisions are prepared for him as before; after which he again visits the banquetting-houle, where he remains till nine or ten o'clock, when he returns, and retires to rest.

The king never appears abroad except on the above occasions; or when an ambassador arrives, or some strange accident hath happened; such as when a leopard is taken in the country, or else lodged about the city ready for the chase (for he is very fond of that diversion;) or, lastly, when his land is to be tilled, and his chief nobility bring him tribute. The place appointed for his appearance on these occasions is a large plain in the center of the city opposite to the palace. The stool, or chair on which he sits is raised about a foot from the ground, ornamented with black and white wickers, very artificially woven. Behind his back, on a pole, hangs a shield covered with European stuffs of various colours. Near him are placed six or eight fans fixed at the ends of long sticks run through the middle of them, which being moved with great force produce very refreshing breezes. Before the king a great cloth is spread on the ground, made of leaves very curiously woven; and on this no person dare tread except the king and his children. The nobility sit in ranks, some on the bare ground, and others on cloths made of the same stuff with the king's, each of whom holds a buffalo's tail in his hand, which he keeps continually waving to and fro. Behind the king stand all his great officers, and the nobles are enclosed by the multitude.

As soon as the king is seated, the music immediately plays, and continues during the whole time his majesty is on the throne. The musical instruments are of three sorts, the first of which is made of ivory, and is like a hunting horn. The second sort are drums made with a hollow piece of timber, covered at one end with leather, or the skins of wild beasts: and the last sort somewhat resemble tabors, having little bells fastened all round, and are played on with the fingers.

When the music has been some time playing, the most distinguished of the nobility rise from their seats, and compliment the king by leaping backwards and forwards before him two or three times, after which they clap their hands together, and then prostrate themselves on the ground, rolling their bodies several times over in token of subjection.

On one side of the king's seat stand three or four criers with iron instruments in their hands, upon which they strike with a stick to give notice when the king demands silence. These criers are likewise officers of the city, and not only proclaim the king's orders, but also go about the streets striking their iron instruments to give notice to the people when any thing is lost or found, in the same manner as the bellmen do in the principal parts of England.

In this public manner the king appears at the commencement of the seed-time, which is always on the 1st of January. He takes his seat at three o'clock in the afternoon, when the women who till the ground appear before him with their instruments of husbandry, and the men walk backwards and forwards armed and clothed in their military habits. The king generally stays about an hour, when he returns to his palace

* When any person is suspected of a crime, and it cannot be clearly proved against him, he is sworn by drinking a certain quantity of this liquor. It is made from the root of a small tree, or shrub called imbonda, which is about six inches long, and much resembles a carrot. The root is scraped into water, which is boiled in gourds. The liquor is as bitter as gall, and so strong that one root would serve to try an hundred people. When the person drinks the liquor, if it be too much infused it occasions a suppression of urine, and strikes up into the head, incriminating to such a degree that he falls down as if dead, in which case he is pronounced guilty, and is accordingly dragged to the Broad

Way and executed; but if he can stand upright, and make water, he is deemed innocent. The determination of this matter rests entirely in the imbonda-giver, or person appointed to administer the potion; for however innocent he may be that is suspected, yet if the imbonda has any dislike to him, or his accuser is a person of importance, he is sure to give him the liquor so strongly infused that its operation proves fatal, though he does it so artfully that it cannot be discovered. This ceremony is performed at Loango almost every week, so that in the course of a year many people are destroyed by it.

amidst the acclamations of the people, who spend the remainder of the day in mirth and festivity.

When any of the inhabitants have discovered a leopard in the woods adjoining to the capital, intimation of it is given to the king, who repairs to his public place of appearance, and a trumpet is sounded to give notice to the people to attend his majesty at the spot. If the place where the leopard lies be too far for the king to walk, he is carried on mens shoulders in a kind of chair made of wicker, and curiously ornamented. As soon as they arrive at the spot where the leopard is secreted, the people surround it, armed with bows and arrows, lances and darts, leaving only a small place open that the king may have a convenient opportunity of seeing the sport. Before this opening nets are spread, that if the leopard should happen to take his course that way he may be caught alive. When every thing is ready, the beast is roused by the people making an universal shouting, with the blowing of horns and beating of drums. As soon as he finds himself surrounded, he endeavours to make his escape, but is impeded by the volleys of darts and arrows that are discharged at him by the multitude, who follow him close, and if he happens not to take to the net, overpower and dispatch him. When the leopard is killed the king retires to his palace, before which the hunters bring the carcass, and triumph over it by dancing, singing, and exhibiting various kinds of diversions. The king then orders the beast to be flayed, and the skin is brought to him; after which the body is buried deep in the earth, except the gaul, which is taken out and thrown into the river, it being considered as a deadly poison; and thus end the ceremonies of hunting the leopard.

The common people of the city of Loango not only shew the highest respect to the king, but the greatest submission to the nobility; for when they happen to meet any one of them in the streets, they immediately fall on their knees, and turn their heads the other way, intimating that they are not worthy to look at him; and in this posture they continue till the nobleman has passed, when they arise, and proceed on their business.

With respect to the laws they are not complex, but some of the punishments are as severe as those of the neighbouring kingdoms. Theft is never punished with death unless it be committed on the king: in common cases, when a thief is detected, either he or his friends must restore the goods stolen, or atone for the want of them by an adequate compensation, besides which the thief is tied to a post in the middle of the street, where he continues an hour as an object of ridicule and contempt to the spectators. If he is unable either to restore the goods or pay the value of them, his relations must work for the party robbed, till such time as he thinks himself sufficiently satisfied for the loss he has sustained.

Adultery is only punished by a fine, which is levied in proportion to the circumstances of the offender, except it be committed on any of the king's wives, when the woman is burnt, and the man buried alive.

When the king dies the succession of the crown does not devolve to his children, but to his eldest brother; but for want of such kindred, it falls to his sister's children.

Those who have pretensions to the crown are five in number, and reside in towns or villages at some distance from the court; they preserve their titles agreeable to the names of the respective villages in which they live. The next heir to the crown is called Mani-kay, who resides at a large town of that name situated about five miles from Loango. The second is called Mani-Bokke, and lives at a town called Bokke, situated about fourteen miles up the country. The third, called Mani-Salloga, lives at Salloga, a large town situated about 35 miles north of Loango. Mani-Kat, the fourth, lives at the village of Kat, about 50 miles from Loango. And Mani-Inyani, the fifth and last, resides at the hamlet of Inyani, which is situated on the southern borders of the kingdom.

When the king dies, Mani-Kay succeeds him, Mani-Bokke removes to the residence of Mani-Kay, and the

rest all follow, a proper person being appointed to supply the place of the last. And thus by a regular rotation they succeed to each others villages, and afterwards to the crown.

After the decease of the king the Mani-Kay enters immediately upon the government, but he does not go to court till the funeral of the late king is over, the ceremonies attending which are these: They first make two vaults under-ground adjoining to each other, in one of which they lay the corpse, richly dressed, on a stool, and by it all manner of household stuff, as pots, kettles, pans, cloths and garments. They then place round it little images made of wood and red earth representing the household servants of the deceased. After this they leave the royal corpse, and go to the other vault, where they place the bodies of several slaves, who have been sacrificed to serve the king in the other world, and to make atonement in what manner he behaved during the course of his life. The two vaults are then closed, and over each is erected a covering to preserve it from the inclemency of the weather.

The king of Loango's revenues principally arise from elephant's teeth, copper and slaves. The greatest part of the copper is brought by stealth from an inland country, the inhabitants of which are always at variance with the king of Loango.

The goods sold here by the natives, consist of ivory, tin, lead, copper, iron, red wood, and several sorts of cloths, the manufacture of the country; in exchange for which they purchase of the Europeans, salt, Silesta ticking, cutlaries, looking-glasses, beads, and other articles.

Of the different Provinces in the Kingdom of Loango.

THE principal of these, as already mentioned, are four, namely, Loangiri, Loango-Mongo, Chilongo and Piri.

Loangiri is a large and populous province, and is well watered by several brooks and rivers, which render the soil exceeding fertile. The inhabitants live chiefly on fish, and employ themselves in making cloth and linen. They are in general a very courageous people, and more addicted to war than their neighbours.

Loango-Mongo is a large mountainous country, and particularly abounds with palm-trees. The inhabitants are merchants, and like those of Loangiri, employ themselves chiefly in making cloth and linen. In this province is the city of Loango, the usual residence of the sovereign of the kingdom.

The province of Chilongo is more extensive than either of the other three. Some parts of it are very mountainous, but in others there are large and extensive plains, which are very fertile, and produce good grain, as also abundance of palm-trees; it is a very populous part of the country, and though the inhabitants are not so well polished as their neighbours, yet they carry on a considerable trade, particularly in elephants teeth and cloth. The governor of this province is absolute, at whose decease the people have the liberty of choosing a successor, without the approbation of the king of Loango.

Piri is a very flat country, but it is well peopled, and produces great plenty of most sorts of provisions, particularly cattle and poultry. The woods are well stocked with timber; besides which there are fruit-trees in abundance. The inhabitants live chiefly on milk, and beasts which they kill in the woods. Some of them are great traders, and they are all distinguished for being very quiet and affable in their dispositions.

The other provinces in this kingdom are much less considerable in size than those already mentioned; they are all maritime places, and their coasts being frequented by European ships, makes them better known than the larger ones. The most distinguished among these are, Majumba, Sette, Kilungo, Cacungo, and Anguy.

Majumba, the first of these provinces, is situated to the west of Piri, between the third and fourth degrees of south latitude, and extends westward to the sea-coast, where there is a high promontory called Cape St. Catharine. The bay or port of Majumba lies two leagues

leagues to the south of Cape Negro, and into it runs a large river called Banne, on which are several small islands chiefly inhabited by fishermen.

The soil of this province is very barren, not producing any kind of corn or grain, so that the natives live on plantains, roots, nuts, and fish; and sometimes they catch elephants, whose flesh they greatly admire. The principal part of the country consists of woods and groves, the former of which abound with various kinds of wild animals, particularly baboons, apes, and several sorts of monkeys.

The town or village of Majumba consists only of one long street, built so near the sea, that the waves often oblige the inhabitants to desert their houses. On the north side of it is a river that is remarkable for producing great quantities of oysters. This river is very narrow at the mouth, and not above six feet deep; but higher up it is both broader and deeper, and is navigable for large canoes. It extends at least 50 miles up the country, and is very convenient for those who trade with the inhabitants of Sette.

In this town is a mokisso called Maramba, which is kept in a large house, or temple. It resembles the figure of a man, and stands upright in a high basket made like a bee-hive. When the lord or governor of the province goes abroad on any particular occasion, this image is always carried before him; and when he drinks his palm-wine, the first cup is poured at the feet of the idol.

Sette, the next province, is situated about 16 miles north of Majumba, and is watered by a river of the same name. It abounds with millet, palm-trees, and a kind of red wood, called by the inhabitants takuel. This wood is of two sorts, the best of which is very hard, and of a bright red colour. The chief trade of the natives here consists in the sale of this article, great quantities of it being annually purchased by the inhabitants of Majumba.

Between the river Sette and Cape Lopo Goncalvo, is a territory called Gubbi, which is full of lakes and rivers, all navigable for canoes. The chief town in it lies about 20 miles from the coast; but it is a small place, and poorly inhabited. The land of this province is very barren, but the rivers abound with various kinds of fish.

Kilongo is a large province, situated to the south of Majumba. It is a level, open country, and the soil is very fertile, producing great quantities of millet and other grain. Here are two small villages, that appear at sea like hills, and are the marks by which the sailors are directed to the port of Loango. This province was formerly an independent kingdom, but being conquered by the king of Loango, it became a part of his dominions. However, the inhabitants still enjoy their ancient customs and privileges, and only make acknowledgment of subjection, by paying an annual tribute to the king.

The kingdom or province of Cacongo lies to the southward of Loangiri: it is bounded on the west by the sea, and on the north by the river Loango. Towards the south and south-east it borders on the kingdom of Angoy; and eastward it extends from the coast upwards of 50 miles. The town of Cacongo, the capital of the province, is very agreeably situated, tolerably large, and well inhabited. The soil of the country is in general very fertile, and produces most kinds of provisions, with which the natives frequently assist their distressed neighbours, who live in those parts where the soil is less bountiful. The river Cacongo runs quite across the kingdom, and, after a course of 25 or 30 leagues, falls into the sea in the 5th degree of south latitude. To the south of this river, about four miles from the coast, is a village called Malemba, where the sea making a gulph, affords a safe road for shipping. All the rest of the coast from the river Cacongo to the river Zaire, is very dangerous, being full of rocks and flats. The principal part of the trade of this province is carried on at Malemba, where the Dutch and Portuguese sell several sorts of cloth, iron ware, and other commodities, to the natives, who dispose of them far-

ther up the country, and sell to the Portuguese, in exchange, elephant's teeth and slaves.

Angoy, the last province we have to mention, is the smallest of the whole, but the soil of it is much better, and would produce great quantities of grain, were it not for the natural indolence of the inhabitants, who sometimes, from this cause only, are obliged to apply for assistance to their neighbours. This province is bounded on the north and east by Cacongo; on the west by the sea; and on the south by the river Zaire. The capital town is called Bomangoy, and is situated on the north side of the above river, not far from its mouth. It is tolerably large and populous, but the houses are very mean buildings, being irregular in their form, and made only of reeds and mud, covered roughly with branches of trees. The chief port here is called Kabenda, and is situated to the north of the river Zaire. The bay is a very commodious place, and here most ships supply themselves with wood and water. At the point of the bay is the village of Kabenda, which is so poor and mean a place, as not to merit any other notice than the bare mentioning of it.

S E C T. II.

C O N G O P R O P E R.

THIS kingdom is situated between the 2d and 11th degree of south latitude, and between the 32d and 41st degree of east longitude, extending in length from north to south 540 miles, and in breadth, from east to west, about 420. It is bounded on the east by the kingdoms of Makoko and Matamba; on the west, by the ocean; on the north by the river Zaire; and on the south, by Angola, from which it is separated by the river Danle.

It is well watered with rivers; among which one of the most considerable is the Zaire above-mentioned, called by the natives the great river of Congo. This river is situated in five deg. 40 min. south latitude; it is three miles broad at the mouth, and runs with a very strong current into the sea. It is navigable for large vessels about 70 miles up the country; but beyond that it cannot be passed, owing to a prodigious number of rocks that lie in the center of it. From this river run several small brooks, which not only water the country, but are also very convenient for the merchants and other inhabitants, who can go in canoes from one village to another. In the course of this river are several small islands, the inhabitants of which are under the government of lords appointed by the king of Congo. The principal of these are two, situated near the mouth of the river, and called Bommo and Quintella, the first of which is remarkable for having many mines of iron. Though these islands are all inhabited, yet there is not a house to be seen, the ground being so low and marshy, that it is almost constantly under water; for which reason the Negroes live chiefly in their canoes, or under trees, round which they build their huts, raised several feet above the ground. These islanders are a strong and resolute people, but they are very unpolished in their manners. They have no marriage, or betrothing, but from their youth form such alliances as their inclinations direct, without any ceremony. They are under the government of particular chiefs and officers, who are chosen by a majority of voices.

The island of Quintella is remarkable for having an idol, which no one dare approach but the persons appointed to attend, and secure the way to it from being discovered. To effect this they are themselves obliged, as often as they go thither, to take such a path as they think no other person can find out. Many persons, particularly in cases of sickness, make rich offerings to this idol, all which are totally destroyed; for as soon as they are dedicated, the person attending conveys them to the idol, which is placed on a large plain surrounded with a wall made of elephants teeth, where they are hung on poles, and there left till time has entirely destroyed them.

The river Zaire receives its water from three lakes; the first of which is the Zambre, the second the Zaire, and

and the third a great lake from whence the Nile is supposed to have its source. The Zambre, however, is the most considerable, being, as it were, the center from whence proceeds all the rivers in this part of Africa.

The other rivers in this kingdom are, the Umbre, or Vambre, Brancare, or Bancare, Barbele, or Verbele, Lclunda, Ambrisi, Encocoquematari, Onza, Libongo, or Lemba, and Danda; but they are all too inconsiderable to merit any particular description.

The kingdom of Congo is divided into six provinces, the situations of which, together with their names and titles, are as follow:

Situations.	Titles and Names.
Along the coast,	{ The county, or earldom of Songo. { The Great Duchy of Bamba.
To the north-east,	{ The Duchy of Sundi. { The Marquisate of Pango.
Eastwards,	{ The Duchy of Bala.
In the middle,	{ The Marquisate of Pemba.

To these provinces must be added, the territories or lordships of Amalaca, Dambi Ambulla, Dembo Quingengo, Dembo Angona, the little Duchy of Ovando, and the territory of Sova Cavanga. These districts, however, are so very trifling, that they do not merit any particular notice; and with respect to the provinces themselves, which form the kingdom of Congo, we shall leave the particulars of them, till we have taken a general view of the country. To effect which we shall begin with the

Natural History of Congo.

THE climate of this kingdom is much less sultry than might naturally be expected from its equatorial situation. Their winter months are, April, May, June, July, and August, during which they have almost continual rains, whereby the rivers are so swelled as to overflow the principal part of the country. The winds in winter blow from north to west, and from north to north-east. These winds drive the clouds towards the mountains, where being gathered and compressed, they at length condense into water. In the summer the winds blow from the south to the south-east, and as they clear the southern skies, so they drive the rain into the northern regions. These winds are of infinite service in cooling the air, which otherwise would be so hot as to be almost insupportable; for even as it is they are obliged to hang coverings over their houses, to keep off the violent heat.

In this kingdom are mines of several metals, particularly iron and copper; and in the mountainous parts are large quarries, that produce not only excellent stone, but also porphyry, jasper, and marble of various colours.

The whole country being well watered with rivers, the soil is exceeding fertile, and produces several sorts of grain, particularly rice and maize. They have also great plenty of a grain called luko, which in its form resembles mustard-seed, but when ground produces flour little inferior to that from wheat. The manioc-root is likewise cultivated here, and much admired by the Portuguese, who, instead of making it into bread, bruise it very small, and either eat it raw, or else boil it in broth.

They have great plenty of various sorts of vegetables, most of which are cultivated with very little labour. Among these are turnips, cabbages, potatoes, radishes, cauliflower, carrots, and spinnage, besides others not known in Europe. They have also several useful herbs, as hyssop, thyme, sweet-marjoram, balm, sage, mint, &c.

This country produces a great variety of fruits, among which are oranges, lemons, citrons, guavas, ananas, bananas, pompions, melons, dates, and the kola fruit: the last of these is about the size of a pine-apple, and the fruit, which is inclosed within a thick husk, tastes much like chestnuts; it is not only valued for being pleasant to eat, but for its great efficacy in removing any disorder that particularly affects the liver.

There are several sorts of trees here that are distin-

guished for having medicinal qualities: among these is one called Angaria, the root of which, boiled in water, is an infallible remedy for violent pains in the sides.

Another tree of medicinal virtue is the khifeikka, any part of which being reduced to powder, and mixed with water, is good against fevers; and, in cases of fainting, if applied either to the forehead or temples, is equally efficacious as hartshorn.

The jakassa tree, which grows very tall, and is of a red colour, has the virtue of curing the tooth-ach, and sore gums: but it is very pernicious to birds, for if they once settle on its boughs, they soon fall dead to the ground.

There is likewise a tree which bears a fruit resembling a lemon. This very singular production of nature, called mignamigna, possesses two opposite occult qualities in the most eminent degree, being at once a deadly poison and powerful antidote. If a person is infected by the fruit, the leaves are a certain cure; if by the leaves, the fruit has the same effect; and the wood is deemed both as pernicious and efficacious as either.

The wild animals of this country are elephants, lions, tygers, leopards, buffaloes, bears, wolves, large wild cats, camelcons, apes, monkeys, &c. The tame animals are, oxen, cows, sheep, goats, and hogs; besides which they have great plenty of stags, fallow deer, roebucks, hares, and rabbits.

Poultry is here very plentiful, particularly cocks, hens, geese and ducks. They have also abundance of wild fowl, as partridges, pheasants, woodcocks, pigeons, doves, hens, &c. The wild hens are much more beautiful, and the flesh better tasted than the tame ones, but they are not esteemed by the natives. The birds of prey are, eagles, falcons, and sparrow-hawks. In some parts of the kingdom are ostriches, and on the borders of Angola is a wood encompassed with walls, where peacocks are bred for the use of the king. The feathers of these birds mixed together, and made in the form of an umbrella, are used in war instead of banners and ensigns.

In the woods are great numbers of parrots, most of which are very large, and either of a grey or green colour; but there is one species exceeding small, not being larger than sparrows, and their feathers are beautifully variegated. The most admired among the small birds, are those called Birds of Music; they are about the size of a canary bird, but they greatly differ in the colour of their feathers; some are all red, and others green, with their feet and bill only black: some again, are all white, grey, dun, or black. These last have the most agreeable note, and are kept in cages by the better sort of people, merely for the sake of their song.

The reptiles here are scorpions, millipedes, vipers, snakes, and serpents. Among the snakes there is one species so amazing large, that it will swallow a whole sheep. It is called the Great-Water-Adder, from its being chiefly found in the rivers. It goes, however, on land in search of prey, and climbs the trees, where it lies in wait for the cattle that come to pasture. As soon as a sheep or hog arrives near the tree, the snake immediately descends, and winding its tail round the hinder parts of the animal, secures it from moving, when he kills and devours it. When he has gorged his prey, he becomes for some time stupid, but as soon as he recovers, he immediately makes for the water, where he continues till necessity oblige him to seek for farther subsistence.

The seas and rivers abound with a great variety of fish: among others in the former are prodigious quantities of sardinias and anchovies; and in the latter are plenty of sturgeons, soles, barbel, trout, tench, and other excellent fish. They have also several kinds of shell-fish, as oysters, muscles, cockles, and large crabs, which are generally found at the mouths of the rivers.

Persons and Dress of the Natives of Congo; their manner of travelling, Houses and Furniture, Customs, Religion, &c.

some of them are very tall and robust, but the generality are of a middling stature: some again are of an olive complexion, while others are quite black. They have all black, curling hair, but their noses are not so flat, neither are their lips so thick as those of the Negroes in general. In their dispositions they are proud and haughty among themselves, but to strangers they are very affable and courteous. They have a natural propensity to theft, and whatever they get, either by stealing or otherwise, they spend in liquors, of which they are very fond, and frequently drink to the greatest excess. They have naturally a ready turn of wit, and, when sober, will converse with great circumspection. They are, however, very revengeful, and whenever they think themselves offended, nothing will satisfy them but destroying the object of their resentment, which they generally effect by poison. The dress of the common people consists only of a loose garment, made of cloth, which is fastened round the waist, from whence it reaches to the middle of the leg; and some have the bottom ornamented with a fringe. The upper part of the body is entirely naked, nor do they wear any sort of covering on their heads. The better sort have long and broad cloaks made of cloth or serge, and in form much like those worn by the Portuguese, under which they have a white shirt, and a kind of damask or satin petticoat, which reaches from the waist to the ankles; they have also gold or silver fishes, with necklaces of red coral, and on their heads they wear caps made of white cotton. Some of the ladies have a veil over their heads, and under it a velvet cap richly ornamented with jewels.

When the great men travel, they are carried in hammocks made either of net-work or strong stuffs, the manner of which is thus: the hammock is fastened to a long pole about a foot from each end; and when the person has got into the hammock, two men, one before and the other behind, take up the pole, and lay it on their shoulders, carrying the person in this manner a considerable way without resting. When they go long journeys they have four men, who relieve each other, in the doing of which they are so expert that they never stop, but shift as they walk, at the same time keeping their usual pace. This is a very easy method of travelling, the person sitting or lying in the hammock as he thinks proper; and they have sometimes a piece of calico thrown over the pole to shelter them from the heat of the sun.

Another method of travelling used here is thus: instead of a hammock, they fasten two ropes to the pole, one of which is much shorter than the other; they are each tied in two parts, and hang like swings; in the former the person sits, and at the bottom of the latter is a square piece of board, on which he rests his feet. The person carried generally holds an umbrella in his hand to shelter him from the heat of the sun, or the inclemency of the weather. The reason of their travelling in this manner is from their want of horses, there not being any of those animals in the whole kingdom.

The method of building here is much the same as that in the other parts of the western coast of Africa; they form little towns or villages by erecting several houses together in the midst of an inclosure. These buildings are made of wood, and covered with the branches of trees: each house is divided into several apartments, the innermost of which is adapted for the women; they are all on the ground floor, and are without windows; the only light they have being admitted at the door, which is so small that they are obliged to stoop when they pass it. The inclosure of the houses is formed by trees, which grow so close together, that they not only serve as a fence, but also to keep off the violent heat of the sun.

Their furniture consists only of a few necessary utensils, as pots, kettles, calabashes to hold their provisions, a mill to grind their corn, a hatchet to fell timber, and some instruments of agriculture. Some of them have beds made of coarse cloth stuffed with straw, or the leaves of trees, but the generality lie upon loose straw spread on the ground.

The food of the common people consists principally of rice, fish, potatoes, and other roots; but the better sort live chiefly on flesh and fowl. Their common drink is water; and sometimes they regale themselves with palm-wine, or brandy mixed with water.

Such of the natives here as reside near towns, live chiefly by trade; but in the country parts they are principally employed in agriculture, and the keeping of cattle. About the river Zaire some of them subsist by fishing, some by drawing palm-wine, and others by weaving. Towards the eastern borders of the kingdom are some excellent artists, who get considerable wealth by making various sorts of cloths, as velvet cut and uncut, cloth of tissue, sattins, taffata, damasks, farfenets, &c. The yarn is made of the leaves of palm-trees, which trees they always keep short, every year cutting and watering them, that they may grow small and tender against the next spring. The threads drawn from these leaves are very fine and even, and with those that are longest they weave the largest pieces. These stuffs are woven in several forms; some like velvet on both sides; others, called damasks, are made like leaves, or the figures of birds and animals. Their brocades, however, are by far the best; but no persons are permitted to wear them, without first obtaining leave from the king.

The natives of Congo are very fond of festivity and diversion. At most villages the people assemble every evening at some open place, where they form a ring, in the center of which is placed a large wooden platter full of provisions. The eldest of the company, who is called Makuluntu, gives to each his portion, which he divides with such exactness, that no person has the least reason to complain. They do not make use either of cups or glasses, but only a large flask, which, when any one wants to drink, the makaluntu holds to the person's mouth, and when he thinks he has drank enough, he takes the flask away. It is remarkable, that if any strangers happen to come by at the time of these festivities, they are equally welcome to participate with the rest of the guests, and always take their place in the ring, without being asked either who they are, or from whence they came.

They also make feasts on several particular occasions, such as gaining a law-suit, a marriage, the birth of a child, or any singular advancement in life. At these feasts they dance, and sing love-songs, which are attended with a variety of musical instruments, consisting of flutes, pipes, ivory trumpets, and drums, the latter of which are made of thin wood, and covered with the skin of a beast. One of their most ingenious instruments, and the most common in use, is called the marimba. It consists of 16 calabashes of several sizes, placed uniformly between two boards joined together, on a long frame, which is hung about a man's neck with a thong. Over the mouths of the calabashes are thin slips of red wood, which being struck with two small sticks, produce an agreeable sound, somewhat resembling that of an organ.

The kassito is another favourite instrument, and is always used in a concert. It consists of a hollow piece of wood about a yard long, covered with a board cut like a ladder, or with cross slits at proper distances; on these they gently draw a stick, which produces a harsh sound, and is distinguished from the rest of the music as tenor.

The longo is an instrument made with two iron bells, joined by a piece of wire archways, and is sounded by striking it with a small stick. This instrument is always carried before princes when they make public proclamations to the people, in the same manner as the trumpet is used in Europe.

Some of the natives of Congo having been converted by the Portuguese to the Romish religion, their marriages are celebrated according to the rites of that church; but the generality of them preserve their ancient idolatrous maxims, are married by their own priests, and have a number of wives, each taking as many as he thinks himself able to maintain. Their contracts of marriage are thus performed: when two parties approve of each other, the parents of the young man send

4 U present

present to those of the girl, at the same time requesting that they will let his son have her for a wife. If the parents of the girl retain the present, it is a token of compliance; in which case the young man, with his relations and friends, goes immediately to the house of his mistress's father, and conducts her to his own, when a priest is sent for, the marriage ceremonies are performed, and the evening is concluded with joy and festivity. If the husband afterwards discovers any material imprudence in his wife, or has reason to be disgusted with her, he sends her back to her parents, and has the presents restored: but if the fault appears to be on his own side, he cannot recover any thing. It is here to be observed, that when the father of the girl receives the marriage present, he must not complain be it ever so trifling, as that would be considered in the light of selling his daughter; for which reason, and to prevent such a crime, a tax is settled what every man shall give according to his circumstances.

A man who is detected in having a criminal intercourse with another's wife, is obliged, as a compensation for the injury, to give the value of a slave to the husband; but the woman receives no other punishment than asking pardon of her husband for the offence she has committed. Those who are detected in cohabiting together without the ceremonies of marriage are punished with a fine, which is levied in proportion to the circumstances of the offenders.

It is customary for the Pagan priests here, the same as in Loango, to lay certain injunctions on young people, such as obliging them to abstain from eating either some sorts of poultry, the flesh of certain beasts, fruits of different kinds, roots either raw or boiled after this or that manner, with the like ridiculous obligations, which they call kejilla. These rules are as inviolably kept as they are strictly enjoined: they would sooner fast till they perished, than taste the least bit of what has been forbidden; for they think, that if they commit the least trespass against the kejilla, they shall certainly die in a very short time. The prepossession of their minds on this head is evident from the following story mentioned by Merolla in his voyage to Congo: "A young black, says he, upon his journey, (who had received the kejilla) coming to a friend's house at night, his host next morning had for breakfast a wild fowl, which is much better than a tame one. The guest hereupon demanded if it was a wild hen? and being answered in the negative, he sat down and eat very heartily. Four years after, these two meeting together again, the country black asked his friend, who was not yet married, if he would eat a wild hen? the young man answering, that he had received the kejilla, and therefore could not, the other laughed, and asked, what made him refuse it now, when he had eaten it at his table so many years before? At hearing this the other began to tremble, and, by the effects of imagination, died in less than 24 hours."

As the heat here is less intense than in many other parts of Africa, the people are subject to few diseases, and what they have, they cure themselves by physic made of plants, roots, or the bark of trees. The most common distemper is the ague, which rages chiefly in winter, owing to the moisture of the earth from the continual and excessive rains. They cure this disorder by anointing the body two or three times from head to foot with the powder of a shrub or tree called sandal, mixed with palm-oil.

The head-ach is cured by bleeding the patient in the temples; in doing of which they first cut the skin with the edge of a shell sharpened, and then applying a small horn to the part, suck out the blood. The same operation is performed for complaints in other parts of the body.

When any one dies, the relations immediately kill a number of hens, with the blood of which they sprinkle the house both within and without, from a supposition that it will prevent the apparition of the deceased from appearing to any of the future inhabitants. As soon as this part of the ceremony is over, they shew their lamentation by howling over the corpse for some time; after which they regale themselves, and the corpse being

wrapped up in a piece of cotton cloth, is carried on mens shoulders to the grave, which is made in some remote spot at a considerable distance from the village in which the deceased lived. Over the grave is placed a certain kind of memento, according to the quality of the person interred: some have a large heap of earth raised on them; others a long and frail horn of some strange beast, an earthen platter, bowl, or any other vessel; and these things are held in so sacred a light, that no other person whatever dare touch them.

When the corpse of any great person is to be interred, they spread the way with leaves and branches of trees; he must likewise be carried in a straight line to the grave, so that if any house or wall happens to interrupt the passage, it must be immediately pulled down. On these occasions several slaves were formerly sacrificed to serve their master in the other world; but since the Portuguese have worked a reformation among the most distinguished part of these deluded people, that practice has been entirely laid aside; and it is only preserved by those who still strictly adhere to their original Pagan maxims. These, however, are obliged to do it by stealth, for should it be known they would not only be rebuked, but severely punished by those of superior power, who are strong advocates for the Romish persuasion.

The reformation effected by the Portuguese in this country originated in the following manner. Don John IV. king of Portugal, being desirous of discovering the coast of Africa, and finding out a way to the East-Indies, he fitted out a fleet for that purpose, the command of which was given to Diego Cam, a gentleman of the most enterprising genius, and one of the ablest seamen in his service. Cam, after many difficulties, at length arrived in the mouth of the river Zaire, where he cast anchor, not doubting, from the appearance of the country but there must be inhabitants on both sides of it. These conjectures he soon found to be just, for going with several of his people some way up the river he met with a number of the natives, who so far from being alarmed, were highly pleased with the sight of these strangers, and not only testified their satisfaction by their methods of address, but also by presenting them with fruits and other refreshments. Cam was for a considerable time at a loss how to understand them, but at length, however, by signs and actions, he discovered that there was some powerful king in the country, to whom they were subject.

Pleased with this information, and desirous of knowing who this powerful prince was, he prevailed on five of the natives to accompany the same number of his men to the king, with whom he sent considerable presents, and limited a certain time for their return. The men, however, not returning as expected, Cam, after waiting double the time allotted, took four of the natives, whom he found to be men of some rank and abilities, aboard his ship, and promising to bring them back within fifteen moons, sailed for Portugal, leaving his men behind.

From the care Cam took of these blacks during the voyage, and their quick conceptions, they became tolerably well acquainted with the Portuguese tongue; so that when they arrived at the court of Portugal, they were able to answer several important questions put to them by the king. This so pleased John, that after making them several considerable presents, he ordered Cam to take them back to their own country; and at the same time told him to use his utmost endeavours in exhorting the African king to become a convert to the Romish church, and to prohibit, throughout his dominions, the practice of idolatry.

During Cam's absence from Congo, the men he had left behind were treated with no less respect by that king than the natives were by the king of Portugal. On his arrival the second time at Congo, he first sent a formal embassy to the king, while the natives he had brought back related, in every place they went, the splendor of the Portuguese nation. Cam, a few days after, paid a formal visit to the king, by whom he was treated with great cordiality, and entertained with all the splendor and magnificence of an African court. The king asked him many questions relative to the grandeur of the Portuguese

Portuguese dominions, all which Cam answered in the most ample manner; and particularly informed him of the nature of their religion, which he said the king his master earnestly entreated that he would not only profess himself, but also propagate it throughout his dominions.

The result of this conference was, that the African king conceived the highest esteem for the Portuguese, and intimated a desire of becoming a profelute to the Romish church. An alliance was immediately formed between the two crowns, which, though often suspended by some intervening wars, has continued from that time to the present.

When Cam left Congo the king appointed one of the young nobles who had been with him before to Portugal, to go now as an ambassador from his court to his Portuguese majesty, requesting that he would immediately send proper persons to instruct him and his subjects in the principles of the Christian faith. The African ambassador was accompanied by several other nobles, who went in order to be properly educated; and with them the king sent some valuable articles as a present to his Portuguese majesty.

As soon as Cam arrived at Lisbon he presented the ambassador and his companions to the king, who received them in such a manner as fully evinced the satisfaction he felt at the success of the expedition. They continued for some time in Portugal, during which they were educated in a manner suitable to their rank, and particularly instructed in the principles of the church of Rome. The ambassador, at the request of the king, was baptized at Baja, the ceremony of which was performed with great magnificence, and the king himself vouchsafing to stand godfather, the ambassador was christened by his name. A short time after this, the king sent the Africans to their own country in a ship which he ordered to be fitted out for that purpose under the command of one Gonzalez de Souza, a man of no less rank and abilities than Cam; and with them he also sent several priests, together with founts, mitres, chalice, and other necessaries proper for discharging the ceremonies of the Romish persuasion. An accident, however, happened on their passage, for the plague having for some time raged violently at Lisbon, the contagion was carried on board the ship by some of those who had embarked, when several of them died, among whom was the commander; and this loss was soon adjusted, for, by consent of all the officers, Gonzalez de Souza, a near relation of the deceased, was appointed in his stead.

When they arrived at the river Zaire, they landed at Songo, where they were received with great joy by the governor of the province, who was uncle to the king, and had fixed his residence in that capital for the sake of carrying on a commerce with the Portuguese, and had been so well instructed by them in the principles of the Romish church, that he was baptized soon after their arrival by the name of Emanuel, which was that of the king of Portugal's brother.

Soon after this ceremony was performed, the Portuguese commander went to the king's court, where he informed his majesty of the conversion and baptism of his uncle, at which he was so highly pleased, that he gave him absolute power to destroy every thing that tended to Paganism throughout his dominions. The Portuguese commander then informed the king of his commission, and of the holy vessels and ornaments he had brought with him. The king appeared greatly pleased at this information, but much more so, when, at his request, they were brought to him, and exposed to the view of the whole court, amidst crowds of his subjects, who all beheld them with the greatest veneration, particularly the cross, before which the Portuguese falling on their knees, the king and nobility followed their example by prostrating themselves before it. His majesty was very particular in examining every vessel and vestment, and paid the most serious attention to the explication the priest gave of every article; the result of which was, that he immediately resolved on building a sumptuous church in his capital for the reception of the priests and utensils; and though he was obliged to get the chief materials for

it from some of the remotest parts of the kingdom, yet his zeal for the execution of it was so great, that by the number of hands employed, the edifice was completed in three months, when it was consecrated by the name of the Holy Cross.

This last solemnity was soon succeeded by another no less important, namely, the public baptism of the king and queen, with several of the nobility, which was performed in the new-erected church, with great magnificence. The king was christened by the name of John, and the queen by that of Eleanor, in compliment to the king and queen of Portugal.

The example thus set by the sovereign was followed by a great number of his subjects of both sexes; and the king the more strongly prevailed on the people in general to become converts on account of his being then at variance with a neighbouring prince. The king being determined to engage his enemy in person, Souza, the Portuguese ambassador, gave him a royal standard on which was the figure of a cross, and at the same time exhorted him to place his confidence in the protector of that religion he had so lately embraced, and to rely solely on his assistance for the success of the expedition. He also engaged to accompany him, with an hundred of his men, and to contribute every thing that laid in his power towards facilitating a conquest.

The king, highly pleased with the spirited behaviour of Souza, marched at the head of his troops to attack the enemy, who had planted themselves on a large plain in his territories. The engagement was but of short continuance, for as soon as it began the king's troops made such destruction in the front of the enemy, that those in the rear precipitately fled, leaving all their ammunition in the field. Thus did the king obtain a complete victory over his enemies, and had the satisfaction to see his newly converted troops behave with an intrepidity they had never before shewn. After the battle was over the king began to march with his troops to the enemies territories, in order, as is the custom of the country, to punish them with the greatest severity; but from this he was diverted by Souza, who informed him that such conduct would be inconsistent with the principles of that religion he now professed. The king readily took the advice of Souza, and by his mediation the enemies territories were preserved from destruction.

Soon after this Souza departed from Congo, leaving behind him a number of missionaries to propagate the new religion; and the Portuguese have ever since laboured with the utmost care to banish idolatry from the country. To effect this, they have established several persons as schoolmasters, by whom the inhabitants are taught to read and write, and are instructed in the principles of the Romish religion. They also maintain here several Portuguese and Mulatto priests, who officiate according to the rites of the church of Rome.

Notwithstanding, however, the inhabitants of the chief places in this kingdom appear outwardly to profess the Romish religion, yet the principal part of them are still idolaters in their hearts, and secretly profess their ancient superstitious notions. They are mere hypocrites, appearing only to be Christians when they are in the presence of the Europeans; they openly carry their beads and crosses, and inwardly their heathenish charms and amulets. Those who live near churches, and in sight of the Portuguese, are married according to the ceremonies of the church of Rome; but they will not fulfil their engagements, every one, as before observed, taking as many concubines as he can maintain.

The inhabitants of Congo are reckoned rather better Christians than those of any other part in the whole kingdom; they have a greater number of churches, where service is every day performed; their clergy are also more numerous, and the people are apparently such zealous catholics, that they never appear abroad without being loaded with beads, crosses, medals, and other religious utensils. However, even these are not without preserving the remembrance of their idolatrous customs, for if the saints, to whom they apply do not grant their petitions, they seldom fail of addressing themselves to their heathenish deities.

In short, notwithstanding the great pains taken by the Portuguese to establish their religion in this country, yet few of them seriously profess it, and even those appear to do it more from policy than being affected by religious sentiments. The chief of these are the king and those belonging to his court, as also the governors and principal officers of the respective provinces; but as for the people in general, more especially those in the eastern parts of the kingdom, they still retain their old maxims; nor can the Portuguese, with all their artifices, prevail on them to renounce their idolatrous principles.

Of the City of St. Salvador, the Capital of the Kingdom of Congo, Description of the royal Palace; the Authority of the King, his State, Revenues, &c. &c.

THE city of St. Salvador is situated almost in the center of the province of Pamba. It was formerly called Banza, which, in the language of the country, signifies court, from its being the usual residence of the kings. It received its present name from the Portuguese, by which it has for many years been known to all other Europeans. It stands about 50 miles from the sea, on a large and high mountain, which is almost all of rock: on the top is a plain about 10 miles in circumference, which commands a most extensive and delightful prospect, and is beautifully shaded with a great variety of fruit trees, as palm, tamarind, plantain, kola, lemon, and orange trees. The air is also exceeding wholesome, which was one of the motives that induced the kings to fix their seats here; another reason was, its lying in the center of the kingdom, by which means, if particular circumstances required it, relief might be quickly sent to any other part: a third reason was, the great elevation of the land, which renders it almost inaccessible to an enemy, and consequently neither easy to be surprized or attacked. The mountain hath also some iron mines, which are of singular use to the inhabitants, who fabricate it into weapons and instruments of agriculture. From all these conveniences it is little to be wondered at that the Congo monarchs should have made this spot their usual place of residence.

The town stands on an angle of the hill towards the south-east, and is so strongly situated by nature, that it hath not any walls, except on the south side. The surface of the hill is covered with houses, most of which belong to persons of quality, who have such a number of apartments and out-buildings belonging to them, that each house appears, as it were, a town of itself. Those belonging to the inferior people run in a strait line, and form very handsome streets: most of them are spacious, though they appear mean from their construction, being built only of clay and straw; but those belonging to the Portuguese are built of brick, and covered with thatch.

The king's palace is a spacious structure, surrounded with four walls, one of which is made of stone, but all the rest of straw: the walls of the inner apartments are made of the same materials, but covered with hangings or mats curiously wrought. Adjoining to the inner court are large gardens and orchards, adorned with arbours and pavilions, which are very commodious; and here the king spends a principal part of his time.

The most considerable buildings in the city, exclusive of the palace, are 12 churches, of which one is the cathedral; a college belonging to the Jesuits, where four of them are constantly employed in teaching the Latin and Portuguese, and in catechizing the people; and lastly, the Portuguese fort, which is a strong and spacious edifice.

The churches, and other public buildings, except the Jesuit's college, have stone foundations, but the roofs are very mean, being covered only with straw; and they are indifferently provided with utensils for the celebration of divine offices.

The city is well supplied with fresh water by two excellent fountains; the one is in a place called St. James's-street, and the other within the walls of the court; besides which there is, on the east side, near the foot of the hill, a spring of excellent water, called the Vese,

which falls into the river Lelunda, and serves to water the adjacent country.

Before the great church is a spacious square, on one side of which a large market is every day kept for the sale of provisions. The rest of the square is surrounded with elegant houses, chiefly inhabited by noblemen. The city is very populous, the number of inhabitants being computed at 40,000.

The adjacent plain, as also the vallies below it, produce several sorts of grain, the chief of which is an exotic brought thither from the banks of the Nile, called leuco, in shape and size like the millet: the meal of it, when ground, makes excellent bread, and is preferred by the natives to that of wheat, which last they only use at the performance of mas. There also grow here great quantities of maize, called by them Mazza Congo, or corn of Congo; but they only use this article as food for their hogs. Their pasture grounds yield excellent grass, and here a greater number of cattle are fed than in any other part of the kingdom.

The authority of the king of Congo is absolute, the lives and properties of his subjects being entirely at his disposal. They approach him, on all occasions, in the most submissive manner, and whosoever neglects paying proper respect and obedience to him, is punished with perpetual slavery. He has a council, consisting of twelve persons, who are his favourites, and with whom he advises in all matters relative to the affairs of state. All orders of a public nature are also made known by them, to which the people are obliged to pay the same obedience as if issued by the king himself.

The king is always attended by a number of the nobility, who dwell in and about the palace, besides his domestics, and other officers of his household. He has also a strong guard, which he keeps not only for the dignity of his court, but for the security of his person. He gives public audience twice a week, but no one is permitted to speak to him except his favourite nobles. His dress is very rich, being for the most part cloth of gold or silver, with a long velvet mantle. He generally wears a white cap on his head, as do also his favourites; but if any of the latter come under the displeasure of the king, he orders the cap to be taken off, which is the highest mark of indignity they can receive: this white cap being considered here as a badge of nobility or knighthood, and of no less honour than the star or garter in Europe.

When the king goes abroad he is attended by a numerous retinue; for not only his nobles accompany him, but likewise all the principal men of the city; some of whom go before and others behind. The king is preceded by musicians, and a numerous guard, some of whom are armed with muskets, and others with lances, or bows and arrows.

When he goes to the cathedral, the Portuguese, both temporal and spiritual, as well as the grandes, must wait on him, and return with him to the palace; but the Portuguese are not obliged to attend him on any other occasion. At these times the king is dressed in his richest robes, which consist of a long mantle, or cloak of silk velvet ornamented in the most sumptuous manner. On his head he wears a bordered cap, and round his neck are chains of gold intermixed with the finest coral; he has a sort of half boots on his legs, and his arms and wrists are decorated with bracelets of gold.

There are other times also when his majesty's pomp and grandeur are particularly displayed; and these are when he gives a public treat to such of his nobles as have distinguished themselves in his service. On these days he caules all the noblemen, then in the bounds of the palace, to be numbered, and a provision is made accordingly. The entertainment is prepared in the largest apartments of the palace, and the provisions are brought in pots, some of which contain boiled beans, others flesh and fish, and some are filled with millet, seasoned only with salt and palm-oil. When every thing is ready, the king sends to the greatest lords each his mess in a wooden platter, with a small flask of palm-wine; but the others are called up by their names, six or seven together, and such provisions are given to them

them as the king thinks proper to direct, with which they retire to an adjoining apartment. As soon as they have done eating, they come all into the king's presence, and, falling upon their knees, clap their hands, and bow their heads, in token of thanks and submission; after which they depart home, except the king's favourites, who smook tobacco and drink wine with him during the remainder of the day.

The king hath one lawful wife, who is called Mani-Mombada, that is, Queen; besides whom he keeps a great number of concubines, in violation of the principles of that religion he seems otherwise so seriously to profess. The queen is maintained at the expence of the public, an annual tax, called pintello, being gathered for that purpose from every house in the kingdom. This tax is collected on the king's wedding-day, when the proper officers of each province go to the respective houses, and measure the length and breadth of every bed, the owner of which is taxed according to its breadth, viz. for every span, he gives either a slave, or the value of one; which is the reason that most of the common people lie on the ground, and those who do not, have their beds exceeding small.

The queen lives with great splendor, having apartments in the palace peculiarly appropriated to her use: she has a great number of ladies, who attend on her alternately both day and night, and the king's concubines are obliged to pay her the greatest homage; for should they behave to her in the least disrespectful, they would be punished with perpetual slavery.

The king's revenue consists chiefly in the tribute that is paid to him by several vassal princes, as those of Angola, Loango, and some other inferior ones, and which the man, or governors of the six chief provinces are obliged to gather for him. There are others that make him a kind of free-will offerings, some of cattle, others of grain, wine, palm-oil, and the like, as acknowledgements for the lands they hold under him. He is also proprietor of all the zimbis, or cockle-shells, (the current coin of this and other neighbouring kingdoms) which bring him, in exchange, slaves, elephant's teeth, sanders, stuffs, cattle, millet, and other commodities. Fines and confiscations likewise bring him a considerable income; to which may be added, his power in levying taxes on his subjects as often as he pleases; but this he seldom does except in cases of necessity, the poverty of his subjects being so great, that if he were to repeat such oppressions often, it might subject them to revolt, and consequently produce some disagreeable consequences.

The king's forces are not very numerous, nor are they either well clothed or disciplined. The best of them are the musketeers, who, having been taught the use of fire-arms by the Portuguese, still retain the art of handling them with surprising dexterity. All the king's subjects may be said to be soldiers, for whenever there is occasion, and he thinks proper to command, they must all attend. Sometimes he orders a general review of them, when he attends himself; but their figure and variety of arms makes them appear more uncouth than can be conceived. Some of them are armed with bows and arrows of different makes and sizes, others with broad swords, daggers, and cutlasses; some without any other cloaths or arms than their long targets; others with their bodies covered with skins of various beasts, from the girdle to the knee; some have their face and body painted with figures of animals, birds, &c. In short, all of them are armed and accoutered according to their fancy or ability; and those who cannot obtain a broad sword of metal, will get one made of some heavy wood. What contributes towards making them look still more deplorable is, that their colours are generally little better than dirty rags torn and mangled; their steel and iron weapons eat up with rust, and their wooden ones very indifferently shaped. Their heads are dressed with feathers of various colours, and in almost as many different fashions as there are men; and all of them, besides their particular weapons, have some emblem of the business they follow.

These soldiers are taught to fall on the foe with a dreadful kind of bravery, or rather fury, which they

do accordingly upon all occasions; but as their arms are of little use in such violent and irregular onsets, for want of better discipline, they are sometimes put to the rout, and when that happens they are seldom able to rally; so that the breaking of the very first body is mostly attended with the loss of the battle. The flight of one army generally animates the other to an obstinate pursuit, the consequences attending which are dreadful, and the carnage always great. When the conquerors think proper to relinquish the pursuit, they return, and plunder the enemy's camp, seize all the men, women, and children they meet with, and sell them to the Europeans for slaves. They look upon this as the most considerable part of the spoil, and therefore dispatch them as soon as possible to the sea-side, or to some inland market. Few of those wounded in the battle survive, their arrows and darts being infected with so deadly a poison, that if they draw blood, and the person is not provided with some extraordinary antidote, it is sure to cause a speedy and unavoidable death.

After a conquest, terms of peace are proposed by the victor, which, though favourable on his own part, are generally accepted by the vanquished; but they are no longer attended to by the latter, than while he becomes sufficiently formidable to renew the war.

With respect to the succession to the crown of Congo, no order is observed, neither legitimation nor seniority taking place farther than the ruling nobles think proper, who esteem all alike honourable, and choose him among the king's sons for whom they have the greatest respect, or think the most proper to govern. Sometimes they set aside all the children, and give the crown to a brother, nephew, or some other distant relation.

When a successor is pitched on, and the day appointed for the coronation, all the grandees are summoned to appear on a plain near the metropolis; from whence, with the male children and relations of the deceased king, they proceed in great pomp to the cathedral, which, on these occasions, is richly ornamented. At one end of it is erected an altar, by the side of which is a stately throne for the bishop or priest, and at the other end is a chair of state for the principal officer, who is surrounded by the respective candidates for the kingly office; but neither they nor the people yet know which will be the person elected.

The principal officer, previous to his naming the person, rises from his chair, and proceeds to the altar, where he kneels down and makes a short prayer; after which he resumes his seat, and makes a long harangue to the people on the duties of a monarch, and the necessary care that is required to discharge so important a trust. He then declares to the assembly, that he and the other electors having maturely weighed the merits of each respective candidate, think such a one the most proper to be elected to the sovereign dignity.

After this the officer takes the new monarch by the hand, and leads him up to the altar, where they both prostrate themselves before the priest, who gives the king a short but pathetic admonition, in which, among other duties, he exhorts him to be a protector of his people, obedient to the catholic church, and a strenuous promoter of christianity. The king then receives the usual oaths, after which he is conducted to the throne by the priest, who puts the royal standard into his hand, and the crown upon his head. This done, the whole assembly prostrate themselves on the ground, and acknowledge him for their king, which is testified by the clapping of hands, and the sound of martial instruments.

When the whole solemnity is over, the king, preceded by his principal nobles, and followed by all that attended the coronation, proceeds to the palace, where his chief nobles throw earth and sand upon him, not only as a token of joy, but also as an admonition, intimating, that though he is raised to so elevated a character, yet he must in time become dust and ashes.

The king does not stir from his palace for eight days after his coronation; in which time all the nobility, and the Portuguese, come to visit and wish him success. The blacks do him homage on both knees, by clapping their

their hands, and kissing the king's right hand: the Portuguese and clergy do it only on one knee.

After the expiration of the eight days, the king appears in the market, attended by his nobles, where he makes a speech to the people, declaring his resolution to perform what was propounded to him at his coronation; and assuring them that it shall be his constant study to promote the welfare of his kingdoms, and the propagation of the Romish religion.

Of the Laws and Trade of CONGO.

THE king, in order that justice may be administered throughout his dominions, appoints a judge in every particular province, to hear and determine all causes, whether of a civil or criminal nature. These are called royal judges; from whom, however, an appeal may be made to the king, who for that purpose, presides twice a week at the supreme court.

Each of the royal judges have twelve assistants, who are considered in the same light as the juries in England. In civil cases, the plaintiff and defendant are the only pleaders, each of whom represents the state of the dispute in the best manner he is able to the judge, who also examines the evidences on both sides with great deliberation. When all parties have been fully examined, the judge addresses himself to his assistants, and after recapitulating the whole of the evidence on both sides, asks their opinion, from whose answer sentence is generally pronounced, and the parties dismissed. The person in whose favour judgment is given, pays a fee to the judge, and then prostrates himself, with his face to the ground, in token of gratitude.

Notwithstanding, however, there is the appearance of equity in the determination of all affairs in these courts, yet in reality it is all a deception, for the principal matter rests in pecuniary compliments paid to the judge previous to trial, who, if any disputes arise among his assistants, can readily bring them over to his side. Thus is real justice subverted, and the poor sacrificed to the superior wealth of their opponents.

There are only two offences here that are deemed capital, namely, treason and murder; in both which cases the punishment is solely invested in the king, who generally condemns them to the loss of their heads and estates, the latter of which are confiscated to his use.

The pretended crime of forcery is very prevalent among the lower sort of people in the unconverted parts of the kingdom; and when any one is detected in practising that supposed art, he is severely punished by the Christians, being, immediately after conviction, burned alive.

In trifling matters the offenders are punished various ways: if they are poor, they are either hallooed or whipped; but if rich, as in most other arbitrary governments, they are punished by fines, which are levied at the discretion of the judge, who is always a considerable sharer of the money paid.

There are many instances of cruelty and oppression which the poorer sort are subject to from their superiors in this kingdom, owing to the great defect of their laws: among these are the following; if a poor man happens to contract a debt with a rich one, he is not only liable to be stripped of all he hath, (not excepting his wife and family, who, in such cases, are often sold for slaves) but to be also hallooed, dragged to a jail, and there inhumanly treated, in order to oblige some of his friends to procure him his liberty at an exorbitant rate.

Another circumstance no less unjust is, that if an insolvent debtor secretes himself from his tyrannic creditor, or flies into some other country, either to avoid a jail, or being sold for a slave, it is looked upon as a flagrant crime; in which case the creditor makes no hesitation to seize on some wealthy relation of his, and imprison him in his stead, till he hath extorted, by the most cruel usage, a sufficient sum from his other friends to satisfy him for the debt.

This arbitrary power extends even so far as to debts contracted by gaming, a vice to which the people of

Congo are greatly addicted; for, should one of a lower rank happen to lose two or three pistoles with a superior, and not be able to pay him, he would be equally exposed to the same hardships and ill treatment; as if he had borrowed, and given his bond for it.

The Portuguese here enjoy very distinguished privileges, and such as are not granted to any other Europeans. They are allowed a judge of their own nation, who not only determines all controversies among themselves, according to the laws of Portugal, but also between them and the natives.

The Portuguese principally reside at St. Salvador, where they carry on a considerable traffic with most other parts of the kingdom. The goods they sell to the natives are, various sorts of grain, fruits, plants, and other provisions, which they bring from Brazil. The articles from Europe are, English cloth, and other stuffs; copper and brass vessels, several kinds of earthen ware, rings, and other ornaments; tobacco, wine, brandy, and other spirituous liquors; light stuffs made of cotton, linen, and woullen; with a great variety of tools and utensils.

The Portuguese, in return, purchase of the natives elephants teeth, furs, and other commodities of the country; but the chief article is slaves, prodigious numbers of which they annually export to the plantations in America. The best and most serviceable of these are brought from Angola, the country of the Jaggas, and other adjacent parts, where they are naturally very robust and strong; whereas those in the provinces of Congo, being for the most part brought up in sloth and indolence, either die in their passage, through misery and sickness, or soon after their arrival, through the change of climate, or the severe treatment they receive from those to whom they are sold.—The cruelties exercised on these unhappy wretches, with the dreadful consequences attendant on such inhuman traffic, has been particularly noticed in our description of that part of Guinea called the Slave Coast.

Of the principal Provinces into which the Kingdom of Congo is divided.

IN describing these, we shall begin with the province, or, as it is otherwise called, the county of Songo. This province is bounded on the east by Pango and Sundi; on the west by the Ethiopic sea; on the north by the river Zaire; and on the south by the Lelunda. The soil is dry and sandy, and were it not for the great quantities of salt, which are gathered on the sea-coast, the governor or count's income would be very trifling. The chief produce of the inland parts are palm-trees, on the fruit of which the inhabitants principally subsist.

The capital of this province is called Banza, or Banza-Songo, and is situated about nine miles from Cape Padrone, on the south side of the mouth of the Zaire. It contains about 400 houses, which are built so irregular and straggling, that they take up a large compass of ground. They are generally thatched, and the sides of them are fenced with palma branches, or leaves neatly interwoven. The infides are hung with mats of various colours, and the ceilings are made of rushes. The count of Songo's palace, which is made of wood, is very spacious, and distinguished from the rest not only for its size, but for its front, which is always painted with a colour resembling mahogany.

In this town is a church remarkable for its antiquity, it being supposed to have been built ever since the Portuguese first came into the province, which was about the year 1482. If this supposition is justly founded, it is very remarkable, the edifice being built only of timber plastered on both sides with clay.

Besides the above, there are three other churches in this town, the first of which stands within the inclosure of the count's palace, and is dedicated to the Virgin Mary; the second is situated at some distance from it, and is the burial-place of those governors; and the third, which is dedicated to St. Anthony, adjoins to a monastery belonging to the capuchins, and serves them not only as a chapel, but also as a parish church. There are several other inferior chapels not only here,

but

but in other parts of the province, every sava, or inferior governor, being obliged to maintain one in the place where he resides.

The dignity of the count, and the splendor of his court, are little inferior to those of the king: he has under his dominion many other petty lords, who were formerly independent, but are now subject to his government; and, except being tributary to the king of Congo, he may be said to be an absolute monarch.

His dress differs according to the various feast days, as also on other particular occasions. His usual habit is a garment of straw cloth girt close about him, but of such workmanship that no other person dare presume to wear the like without having first obtained his permission. This garment reaches from the shoulders to the ankles, over which is a long bays cloak that hangs trailing on the ground. On the feast days he changes this cloak for a short scarlet one, fringed all round with the same cloth pinked. On the most solemn days he puts on a shirt of the finest linen, as likewise yellow or crimson silk stockings, and a cloak of flowered silk. When he goes to communicate at the altar, he has a cloak all white, which is so long that it trails on the ground as he walks. In going to church, which is at least three times a week, he has a velvet chair and cushion carried before him, being brought himself in a net on the shoulders of two men, each with a staff in his hand, one all silver, and the other ebony tipped. The hat he then wears is covered first with taffaty, and above that a sort of very fine feathers, under which he has a small white cap neatly stitched with silk. On his breast is a large massy cross, and from his neck hang several strings of coral, with a large chain of pure gold. Before him march a number of musicians, one of whom is distinguished above the rest by having several small round bells fixed to an iron about a yard long, which he keeps continually jingling as he walks. On each side of him is a man holding an umbrella fixed on the top of long poles, to shelter him from the heat of the sun. After mafs, his guards, who always attend him, fire a volley, which is followed by the found of drums, and other martial instruments.

The count is chosen to the earldom only by nine electors, who are the principal men in the province, and generally attend his person. The choice is always made, between the death of the count and his interment; but during the vacancy, the government is in the hands of the electors.

It sometimes happens, that on the death of the count, his son, or some other person of the family, will immediately raise a faction in the province, in order to get possession of the throne, and exclude the electors from their accustomed privilege; for which reason his death is always concealed as much as possible, and sometimes the eucharist has been neglected to be given to him, for fear of discovering his situation by the priest's going to court.

On the feast of St. James, all the count's subjects show their allegiance by complimenting him with some present in proportion to their circumstances. On the same day the civil offices are disposed of to those who are thought most worthy of holding them; and such as have misbehaved are removed from their employments.

The second province of Congo Proper is the duchy of Bemba, which is situated between the rivers of Ambrisi and Loza, the latter of which separates it from the marquisate of Pemba on the east, and the former from the county of Songo on the north. Along the sea-coast it extends itself much farther, viz. northward to the river Lelunda, and on the south to that of Danda, which parts it from the kingdom of Angola.

This province is one of the largest and richest in the whole kingdom: its soil is naturally fertile, and would produce abundance of all the necessaries of life, were the natives industrious in cultivating and improving it. The sea-coasts produce likewise a prodigious quantity of salt, inasmuch that they have not only a sufficiency for their own consumption, but they also export it to foreign countries, which makes this article yield an extraordinary revenue to the crown. The inhabitants in ge-

neral profess the Romish religion, and keep for their service several jesuits and other priests.

The capital of this country is called Banga, or Panga, and is situated about 30 miles from the sea-coast. It is a large town, but the houses, like those in Songo, are built in a very straggling and irregular manner. It stands in a hilly country, and is watered by two rivulets. Here are several churches, but they are all very mean buildings, the walls of them being made with clay, and the tops covered with thatch.

The lord of Bamba is the most powerful of all the king's vassals, and is paid the greatest respect at court, being also captain-general. All his majesty's forces.

The province, or duchy of Sondi begins about 40 miles north-east of St. Salvador. It is bounded on the east by the province of Pemba; on the west, by that of Pango; on the north, by the river Zaire; and on the south by the duchy of Batta. Its capital is called Banza Sondi, which was given to distinguish it from Banza, (now called St. Salvador) the capital of the whole kingdom, in the province of Pemba.

This province is divided into several particular governments, most of which being far distant from the capital, and in places surrounded with mountains almost inaccessible, the people pay obedience to the governor according to their own discretion. They are always armed, and keep the whole province in a constant state of trouble and agitation; for, as the Portuguese have not been able to propagate their religion amongst them, they are more refractory than any other people in the whole kingdom.

The soil of this province is watered with so many rivers, that if it was cultivated it would be one of the most fertile spots in the universe; but the inhabitants are so indolent, that they rather chuse to live almost in want, than give themselves that trouble, and what provisions they have are purchased from the adjoining provinces.

The mountains here abound with the most precious metals, but by reason of the turbulent spirit of the inhabitants, they are not suffered to be opened. They work only the iron mines, and one mine of copper, which is found in the mountains on the north side of the Zaire. This last is of a beautiful yellow, and great quantities of it are purchased by the inhabitants of Loango.

The marquisate of Pango was formerly called Panga Logos, at which time it had the title and prerogative dignity of kingdom, but it hath lost both ever since the kings of Congo subdued and reduced it to the rank of a province. It is bounded on the east, by the mountains of the Sun; on the west, by Pemba; on the north, by Sondi; and on the south, by Batta. Its capital is called Banza Pango, and is situated on the banks of the river Barbela, which runs through the center of the province. The town, however, as well as the province itself, hath not any thing remarkable; the nature of the inhabitants, as also their dispositions, manners, and customs, being the same as those of Congo in general.

The duchy of Bata, or Batta, is situated on the south-west of Pango, and hath the salt-petre mountains on the east: on the south it is bounded by the Montes Quemados, or Burning Mountains; and on the west, by the province of Pemba. It is of considerable extent, and was formerly a kingdom of itself, till it voluntarily submitted to the kings of Congo; for which reason it enjoys more privileges than any other province in the kingdom, the government being always conferred on a person descended from the ancient kings of that country.

The soil of this province is very fertile, and produces several sorts of excellent grain; the inhabitants are more civilized and affable than their neighbours, and were more easily converted to Christianity, the principles of which they have ever since retained in a most distinguished manner.

The capital city of this province is called Batta, but is not considerable for any thing except the fertility of its boundaries, and its being the residence of the governors

governors of the province, who are allowed to have a number of musketeers in pay to defend it from the incursions of the wild Jaggas, who inhabit near its eastern frontiers beyond the mountains of the Sun and Saltpetre, living chiefly by ravaging their neighbours on all sides, and would do the same by this, were they not overawed by those troops. The road between this capital and that of the whole kingdom hath a great number of houses and hamlets on both sides, a circumstance very uncommon in these countries.

The mani-batta, or governor of this province, is considered as the second person in the kingdom. Whatever he says must not be controverted by any of the rest; and on failure of the royal line, the succession devolves upon him. He sometimes eats at the king's table, which is a privilege not granted even to the king's sons. His court and attendants are little inferior to the king's, for, when he goes abroad on any public occasion, he is preceded by trumpets, drums, and other warlike instruments.

The last province we have to mention in this kingdom is called the marquisate of Pemba, which, though smaller in extent than any of the rest, hath always had this singular advantage, that its capital hath ever been the native country, seat and burial-place of all the kings of Congo, whether Idolaters or Christians. This province is well watered, not only by the Lelunda, which runs quite through it from east to west, but also by the river Ambrisi and some others, which equally contribute to its fertility, and the riches and happiness of its inhabitants. The constant residence of the king and his court, which is very numerous, emulates the people to industry, whilst the great consumption of provisions, and other merchandizes improves their commerce, encourages their diligence, and increases their wealth; the fruit of which they quietly enjoy, without being exposed to the extortions of foreign viceroys, or the excursions of barbarous neighbours, by being so happily situated in the heart of the country.

The city of St. Salvador, the capital of the kingdom, is the only place that merits any notice in this province, the particulars of which, with every thing relative to it, have been already given.

S E C T. III.

ANGOLA.

THIS kingdom was originally called by the natives *Dongo*, but the Portuguese afterwards called it *Angola*, in compliment to the prince of that name, who first usurped it from the king of Congo; which name it hath ever since retained. It is bounded on the east by the kingdom of Matamba; on the west by the Ethiopic ocean; on the north by Congo, from which it is separated by the river Danda; and on the south by the kingdom of Benguela. It lies between 7 deg. 30 min. and 10 deg. 40 min. of south lat. and between 32 and 41 deg. of east long. being about 360 miles in length from east to west, and 250 broad from north to south.

The country in general is very mountainous, there being but few plains to be met with, except on the maritime side, and between the ridges of the mountains. However, it is well watered with rivers, the most conspicuous among which are the Danda and Coanza. The former of these is very large, and capable of receiving vessels of an hundred tons. It is well stored with most kinds of fish, but it is dangerous to catch them on account of the river being greatly pestered with crocodiles. The Coanza is also large, deep and rapid, and empties itself into the same ocean with the Danda, about 9 deg. 20 min. south lat. and about twelve leagues south of Loanda San Paulo, the capital of the kingdom. It is navigable as far as a place called Cambamba, which is about 150 miles from its mouth, where the Portuguese have a fortress, or settlement, under the direction of a governor styled by them captain. It hath a good depth of water all the way to the above place, but afterwards it is full of rocks and dreadful cascades, which render its course so rapid that it is impossible for any vessel to advance much farther. It receives many rivers in its

course, the chief of which are the Mocos, the Luente, and the Caluaca. It forms also several islands that are pleasantly situated and very fertile. The principal of these are the Massander and Motchama, the former of which is about nine miles long and two broad. The soil of it is so fertile that they have generally three crops a year of maize, millet and other grains. It produces also great quantities of the maniocroot, which the inhabitants use instead of bread; as also prodigious numbers of palm and other fruit-trees. The other island is about five miles in length, and one in breadth; it is mostly level, and produces variety of roots and herbs, as also great plenty of cattle.

The natural produce of the kingdom of Angola in general, as well as the persons, manners, customs, religion, government, &c. of its inhabitants, being much the same with those of Congo, already described, it would be unnecessary to tire the reader with a repetition of them, as the principal difference will be naturally pointed out in our description of the respective provinces into which it is divided.

The kingdom of Angola is divided into sixteen provinces, the names of which are as follow:

- | | |
|--------------|----------------------|
| 1. Chissama. | 9. Lubolo. |
| 2. Sumbi. | 10. Loanda. |
| 3. Rimba. | 11. Benga, or Bengo. |
| 4. Seetta. | 12. Danda. |
| 5. Bemba. | 13. Mofche. |
| 6. Temba. | 14. Ilamba. |
| 7. Oacca. | 15. Oarii. |
| 8. Cabezzo. | 16. Embacca. |

1. *Chissama*. This province is situated in 11 deg. of south lat. near the mouth of the river Coanza; and in it is a settlement belonging to the Portuguese. It is divided into three parts, each of which is governed by a person deputized by the king; and these preserve so despotic a power that they behave more like tyrants than inferior officers over the natives. It is in all probability from this cause that the country, which is very mountainous, is so poorly cultivated, the principal part of it being entirely barren. However, it is famous for producing a peculiar salt made by the natives from a briny kind of water which they dig for, and being congealed, they form it into oblong square cakes like bricks, about six inches in length; and these they exchange with the Portuguese for meal, oil, and other commodities. The merchants make considerable advantage by exporting this salt to most parts of Ethiopia, as it is not only excellent for food, but also in physic, it being a very pleasant diuretic. This province also abounds with fine honey and wax; but it labours under considerable disadvantages from the want of fresh water, as they have seldom any rain from May to October, and their mountains are without springs or rivers. Those who live near the Coanza, fetch it from that river, but it is very dangerous, owing to the number of wild beasts that infest that part of the province.

2. The province of *Sumbi* is for the most part flat, and well watered by several small rivers, particularly those called *Rice*, *Calba*, and *Calacombola*. The natives are tall and strong, but so lazy and indolent that they will not be at the trouble of cultivating the lands, though the soil is naturally so well calculated not only for breeding cattle, but also producing various kinds of grain. The most industrious part of them are those towards the mouth of the river *Calacombola*, the soil of which is remarkably fertile, and the country more free from wild beasts than any other part of the province. The inhabitants here cultivate their lands, which produce several sorts of excellent grain. They also breed vast quantities of cattle, with which, and other provisions, they supply their more indolent neighbours.

3. The province of *Rimba* is bounded on the east by *Temba*, on the west by *Sumbi*, on the north by *Lubolo*, and on the south by *Seetta*. It is divided into twenty lordships or districts, whose governors always keep a great number of militia. The land is fertile and produces great quantities of grain, with plenty of cattle; and the rivers abound with most kinds of fish. The inhabitant.

inhabitants are chiefly idolaters, but they are industrious, very tractable, and not addicted to any particular vices.

4. *Secotta*. This is one of the most rocky and mountainous provinces in all the kingdom, particularly on one side of it, where a ridge of perpendicular rocks covers a space of thirty miles in length without interruption. The surface of these rocks, however, is well inhabited and cultivated, enjoys a serene and wholesome air, and is plentifully supplied with fresh water. The low lands are also well watered, and produce excellent pasture for cattle, great numbers of which are bred by the inhabitants; but they often sustain considerable loss from the number of wild beasts that infest this part of the country. The torrents that flow from the hills bring with them great quantities of iron ore, which the inhabitants gather carelessly by laying straw and other such materials across the streams to receive it; and afterwards, by dint of fire, convert it into excellent iron. In this country are also found great quantities of a kind of transparent ore, which the natives call *tare*, and when wrought is in appearance much superior to iron. The governor of this province has his residence on the declivity of a high mountain called *Lombo*, on the frontiers between this and the province of *Kimba*. He has twenty-two inferior officers under him, and is one of the most powerful governors in the whole kingdom.

5. The province of *Bembea* extends itself on one side along the sea, and on the other divides the kingdom of *Angola* from other nations on the south. The great river *Lutano*, or *San Francisco*, waters most part of this province; but it is of little other use, for though it abounds with fish, yet the inhabitants dare not venture to catch them, owing to its being infested with great numbers of crocodiles, sea-horses, and monstrous serpents, which not only destroy great quantities of fish, but also do considerable mischief to the adjacent grounds. The country is very large and populous, and abounds with small cattle, with the hides of which the natives make their garments, and they anoint their heads and bodies with the fat. These people are much more savage than their neighbours, are almost all idolaters, and have a language peculiar to themselves. They are very artful, and use a singular stratagem in war, which is to drive great numbers of cattle towards that side on which the enemy is expected, whilst they secrete themselves at a small distance either by laying flat on their bellies in the high grass, or among the heath or copses: the cattle seldom fail of exciting the enemy to advance in order to make a capture, when they suddenly rise, and furiously fall on them with their armed clubs: this scheme is generally attended with success, the enemy soon surrendering, when their conquerors sell them for slaves to the Europeans.

6. *Temba* is a flat and low country, and is well watered by a number of small rivers. The *Rio Longo*, or *Long River*, is the most remarkable; it springs out of a rock, on the top of which the Portuguese have a fortress that defends the whole district. The province is divided into 12 lordships, whose chiefs, though under the protection of the Portuguese, live free and independent, being only obliged to furnish them with a certain number of militia in cases of emergency. The whole country abounds with wild cows and mules, which the inhabitants hunt and kill for food: it also produces several excellent roots, among which one in particular resembles parsnips, but is much finer in taste, and is said not only to attenuate phlegm, but to be also an admirable purifier of the blood. Most of the inhabitants are idolaters; but those that have been converted strictly adhere to the principles of the Roman catholic religion.

7. The province of *Oacco* is bounded on the south-west by *Lubolo*, and on the north-east by the river *Coanza*. It is beautifully variegated with hills and plains, and is so well watered with rivers and springs, that it is one of the most delightful provinces in the kingdom. These advantages, however, are of little use to the natives, as they are restrained by the lords from cultivating any more of the land than what is absolutely necessary to produce provisions for their fami-

lies. The chief business of this province has twenty others under him, whose principal business is to discipline and exercise the militia; for which reason this is one of the most martial provinces in the whole kingdom.

The natives of this province are subject to a distemper peculiar to the climate of this part of the country. It generally begins with a violent headache and vertigo, and is followed by convulsions, which soon reduce the patient to a mere skeleton. The medicine for this disease is made from a plant something like our hyssop, which they pulverize, and drink the infusion; they also extract an oil from it, with which they anoint the parts convulsed.

They are likewise subject to a kind of swelling, which begins at the mouth, and spreads itself all over the face, which often swells to the bigness of the head, causes excessive pain, and is frequently attended with suffocation. It is generally cured by anointing the parts with the oil extracted from the abovementioned plant.

In this province is a very singular insect, somewhat like our horse-flies, whose sting is so dangerous, that if a quantity of blood be not immediately drawn from the part affected, the person is thrown into a violent fever, attended with excessive tortures, that commonly end in a total delirium, and, if not speedily relieved, in convulsive death. The most remarkable circumstance attending this is, that when a person is cured he seldom fails of a relapse, owing merely to the bare remembrance of what he felt during the time he was affected; and some of them undergo such excessive torture, that they close their miseries by putting an end to their existence.

When the poor idolaters happen to be stung by these insects, they have recourse to their priests, who seek out for an insect of the same kind, which having found, they dig a hole in the earth and put it in, adding sundry fumigations, exorcisms, and superstitions, known only to themselves; after which they fill the hole with water, and replenish it as that sinks, stirring it, and letting the earth settle again several times: at length, without staying till it is quite clear, and divested of its disagreeable earthy taste, they give the patient plenty of it to drink. This occasions a violent fit of vomiting, by which so great a part of the poison is thrown out, that the natural strength of the patient enables him to get rid of what is left behind. Many, however, who are cured by this strange method are some time after seized with pains and convulsions in their nerves, which frequently end in a settled lameness, and sometimes in a dead palsy.

Though the above method of cure is altogether superstitious, yet from its being sometimes effectual, the Europeans, unable to bear the excessive pain arising from the sting, will have recourse to it, in spite of the express prohibitions of the church.

8. *Cabezzo*. This province is very populous and fertile, producing not only abundance of cattle, but also most kinds of provisions. In one part of it is a high hill called *The Iron Mountain*, from its yielding great quantities of that metal, which the Portuguese have taught the natives to purify, and work into various kinds of instruments. In this province are many large and lofty trees, particularly palm and cocoa trees: there is also one sort that greatly resembles our apple trees, the bark of which, when cut with a knife, yields an odoriferous juice of the colour and consistency of honey: it is very useful in medicine, but being of a hot nature, it must be first qualified by some cooling drug.

The Portuguese have taken great pains to propagate the Roman catholic religion in this province, and not without success, for there are less idolaters in it than in any other in the kingdom.

9. The province of *Lubolo* is situated on the southern banks of the river *Coanza*, between the provinces of *Cabezzo* and *Quissama*. Its climate is very wholesome, and its soil remarkably fertile, producing great plenty of most sorts of provisions. It is chiefly noted for its excellent palm-trees, which produce better wine, oil and timber, than is to be met with in all the other parts of the kingdom.

The greater part of the people of this province are Christians, and are tributary to the Portuguese. 10. Loanda. This province is situated in 8 deg. 30 min. south lat. and 13 deg. 6 min. east long. It is one of the most considerable places belonging to the Portuguese settlements on this side of Africa, and is remarkable for having in it the capital of the whole kingdom of Angola. It is a large city, pleasantly situated on the declivity of a hill near the sea-coast. It is strongly defended by a spacious fortress, in which is a church dedicated to St. Amaro, and a convent of Sesterrians, besides several bulwarks that serve to guard the entrance of the port.

This city is called by the Portuguese San Paulo de Loanda, and was built by them in the year 1578, under the direction of Paulo dias de Novais, the first governor of this part of Angola. It is very populous, and greatly resorted to, not only on account of its being the residence of the Portuguese governor, but also for its containing the chief courts of judicature for the whole kingdom. The churches and other public buildings are sumptuous, as are also those of the merchants and officers both spiritual and temporal. The streets are straight, wide and regular, and are always kept exceeding clean. The houses belonging to the Portuguese are built of stone, and most of them very elegantly furnished; but those of the natives are very mean, being built only of earth, and thatched with straw.

In the center of the city is a large convent belonging to the Jesuits, who are here held in the highest esteem. It is a stately edifice, and endowed with a considerable revenue. On one side of it is an hospital called the Misericordia, which hath 24 wards or rooms for patients, besides convenient apartments for the directors, physician, surgeon, apothecary, and other attendants. On the other side of the convent is a church belonging to the fraternity of St. John the Baptist. At a small distance from these three buildings is the cathedral, which is a large stately structure dedicated to Our Lady of the Conception, under which is another dedicated to the Holy Sacrament. There are also many monasteries and chapels belonging to the Capuchins, Carmelites, and Friars, which, with other parochial churches, surround the city as to answer the end of walls and fortifications.

In the city are kept prodigious numbers of slaves, who are employed in tilling the ground, carrying of burthens, and fetching water from springs in an adjacent island called Loanda; the city not having the convenience of being watered by any kind of river. The country round it, however, is very fertile, well cultivated, and beautifully variegated with villas, gardens, and a variety of fruit trees.

On the north side of the city, at a small distance from it, is a lofty hill, on which the original city stood. It still bears the name of San Paulo, and upon it are some few houses, together with the ruins of a monastery, which formerly belonged to the Jesuits. The present city suffered much by the Dutch, who took it from the Portuguese in the year 1641; but the latter soon after retaking it, restored it to its pristine grandeur.

The island of Loanda is situated about half a mile from the city; it is very disproportionate in its form, being sixteen miles long, and only one broad. The Portuguese have many houses on it, as also a great number of gardens, which they keep well stocked with most sorts of fruit-trees and vegetables. They have also on this island several handsome churches, besides which there is a spacious convent belonging to the Jesuits.

In the neighbourhood of the capital are many elegant seats and villas belonging to the Portuguese, most of which are richly furnished, and adorned with gardens, orchards, and other embellishments: in some of them are also very handsome chapels, in which service is performed by priests, who are allowed a sufficient salary for that purpose.

The city is well supplied with most kinds of provisions, particularly mutton and pork, the latter of which is greatly esteemed by the Europeans. They have also

plenty of fish, which are caught on the coasts of the island of Loanda. The bread used by the Europeans is made of millet and Indian wheat; but that used by the natives is made from the manioc root. The latter also prefer dogs fish to any other, for which reason numbers of those animals are fattened up, slaughtered, and exposed at the public shambles.

Small payments here are made either in zimbis, (the shells of a small fish) or else beads, the latter of which are of various sizes, colours, and fashions, and are worn by some of the natives as ornaments to their arms, necks, and wrists. Larger payments are made with pieces of cloth of their own manufacture, of a stated length and breadth; and where the sum is considerable, it is usually paid in slaves.

11. The province of Benga, or Bengo, is situated on a river of the same name; it is bounded on the west by the sea, and on the east by the province of Moseche. It is a good fertile country, and produces great plenty of maize and millet, as also a prodigious number of banana and cocoa trees. The province is divided into many districts, the chiefs of which are natives, though tributary to the Portuguese. Here are eight churches, three of which are called parishes; and one of them belongs to the Jesuits, who celebrate their festivals in it with the greatest pomp and magnificence.

12. Danda, the next province, is situated to the north of Bengo, on the south side of the river of that name, which separates the kingdom of Angola from that of Congo. As this province is well watered, it is very fertile, and produces plenty of grain, with various kinds of fruits; but it is greatly infested with crocodiles and large serpents, which harbour in the river Bengo. The inhabitants are mostly Christians, for which reason here are several churches regularly served by secular priests. The chief of these is situated at the mouth of the Danda; and at some distance from it is another, as also several chapels and oratories, all which belong to the Jesuits, who take great pains in endeavouring to bring over the unconverted to a sense of Christianity.

13. The province of Moseche is situated on the northern banks of the river Coanza. The soil is very fertile, and besides grain is remarkable for producing the manioc root, which is so plentiful, that large quantities of it are annually sent to the city of Loanda. In this province are two considerable fortresses, called Massangano and Cambamba, each of which is under its particular commander. The two have twelve foves, or native chiefs, under them, who are obliged to maintain a numerous militia, not, as is generally supposed, for the defence of the kingdom, but for the service of their Portuguese masters.

In this province are mines of several metals, particularly in the government of Cambamba. What is very remarkable, each mine tinges the complexion of the inhabitants who live in that territory; for though they are all naturally black, yet those near the silver mines differ in their complexion from those that live near the mines of gold and lead, which cannot be otherwise accounted for, than from the effluvia that exhales from the different metals.

As the inhabitants here are chiefly Christians, there are a great number of churches, the most considerable of which are those of Massangano and Cambamba. These bear the title of royal chapels, and the priests that belong to them are endowed with many distinguished privileges.

14. The province of Ilamba is divided into two parts, distinguished by the names of Higher and Lower. The former is situated between the rivers Bengo and Calucata; and the latter between the Danda on the north, and the Bengo on the south. They are both very fertile, and the natives, who are chiefly Christians, pay a tribute to the Portuguese.

The Higher Ilamba hath mines of excellent iron, and is almost covered with small hills. In the center of it is a large mountain, from the summit and sides of which flow a prodigious number of springs and rivulets of clear and wholesome water, which is not only exceeding;

ceeling good to drink, but of infinite service in contributing to fertilize that part of the country. This province pays a considerable tribute to the king of Portugal, and the governor of it is obliged to maintain a numerous militia for his service.

15. Oarii, the next province, is situated on the northern banks of the river Coanza, and adjoins to the province of Mofchee. It is watered by a great number of small rivers that fall into the Coanza, but which, in the time of the great rains, become large, rapid, and dangerous. In this province are two fortresses belonging to the Portuguese, at each of which they keep a strong garrison. One of these is built at a place called Maopongo, and the other at Quiongo, an island of great importance on the river Coanza.

Maopongo is situated on the top of a number of large rocks, and at a distance appears like a considerable city, surrounded with high walls, and variegated with steeples, turrets, pyramids, obelisks, triumphal arches, and other eminent structures: on a nearer approach, however, it shews itself to be no more than a heap of gigantic rocks, parted from each other by intervals of a vast depth, and several fathoms wide; and the summit of it, exclusive of a small part round the fortrefs, is a large, barren, and uncultivated plain. Though this place is near 100 leagues from the sea, yet it abounds with a variety of springs of brackish water very proper to make salt, and which, rising and falling with the tide, mount up at high water in large streams above the level of the plain. A circumstance still more singular than this is, that these springs are intermixed with an equal number of fresh ones, the waters from which are both clear and well-tasted. About six miles from this place are still to be seen the sepulchres of the ancient monarchs of Angola, called by the Portuguese, Las Pubuillas de Cobazzo.

16. Embacca, or Membacca, the last province we have to mention, is situated on the north side of the river Lucala, and between that and the Higher Ilamba. It is wholly subject to the Portuguese, for though the lord who governs it assumes a claim to a kind of independency, yet it is granted him only on condition that he shall maintain, at his own expence, a numerous militia for their service. These troops, though idolaters, are stout, warlike, and well disciplined, and never betray any fear of death when they engage an enemy; for which reason the Portuguese value them above all the rest in the kingdom.

From what has been observed in describing the above provinces that form the kingdom of Angola, the reader will find that the Portuguese are masters of the chief part of it. We say the chief part, because there are some of them that neither pay tribute to, nor acknowledge any dependance on them, except when they want their assistance in cases of emergency. Those that acknowledge a real subjection to the king of Portugal are as follow, viz. Danda, Mofchee, Bengo, Higher and Lower Ilamba, Oarii, Embacca, Seetta, Cabezzo, Lubolo, and Oacou.

The trade carried on in this kingdom by the Portuguese and other Europeans, consists chiefly in purchasing slaves; and indeed it was this inhuman commerce that first invited the Portuguese to this part of Africa. The commodities brought in exchange are, broad cloths, crimson and other silks, velvets, cambrics, and hollands of all sorts, gold and silver lace, broad and narrow striped tickings, black ferges, Turkey carpets, threads and silks of all sorts and colours, Canary and other wines, brandy and other spirituous liquors, oil, spices of all sorts, loaf sugar, knives, fishing hooks, pins, and needles, small bells, variety of other trinkets and baubles, glais beads of all sizes and colours, rings of the same, or other materials, fire-arms, swords, cutlasses, and other weapons.

We have now only a few particulars to mention relative to the kingdom of Angola, which being peculiar to itself, must not pass unnoticed.

The inhabitants of every province, or, as they are called by the natives, Mirindo, are divided into four different classes. The first is that of Macotas, who are a kind of nobleman. The second consists of those styled

the children of Mirindo, who are the original natives of the country, of either sex, whether merchants, artificers, or husbandmen. The third is that of the Quificos, or slaves, who are the property and inheritance of the lords of that province, which devolves, like all other real estates, to their heirs and successors. And the last is the Mabicas, who are the slaves either taken in war, purchased, or condemned to forfeit their freedom for some crime or misdemeanour.

Though this country was formerly subject to Congo, yet it is quite different now, the king of Angola not acknowledging any subjection to that monarch. He is entirely independent, and, from the protection he receives from the Portuguese, preserves an absolute authority. He obliges all the lords under his dominions to keep up a certain number of troops for the common service of the realm; but they are very indifferent either for their discipline or bravery, their arms or accoutrements. They are only a kind of national militia, in which every man that is able to bear arms is obliged to be enrolled; and they seldom appear before their commanders, except when they are summoned on any particular expedition, at which time the best appearance they make consists chiefly in their number.

When they go to engage an enemy, they divide themselves into three bodies, at certain distances from each other. In the center one is the general, who directs all their motions by the sound of several warlike instruments. They then move forwards, retire, or wheel about as those direct, and fall on the enemy with great fury, making at the same time the most hideous noise. If they find themselves likely to be disconcerted, they take flight, (for they are errant cowards) nor is it possible for their general to rally them; so that the fate of a battle depends on the success of the first onset.

Their musical instruments used in war are of several kinds and sizes. One of the loudest of them somewhat resembles the drums in Congo: it is covered at one end with the skin of a wild beast, and is beaten with ivory sticks, which make it give a greater and more warlike sound.

They have another instrument that resembles an inverted pyramid, with the point fixed on the ground, and consists of a certain quantity of pieces of metal, thin and round, like bells turned upside down. This instrument is of such importance in an engagement, that the persons who touch it with wooden sticks, frequently crack the metal by endeavouring to make it give a loud and more dreadful sound.

The third sort is made of elephants teeth: they are of various sizes, and in their form somewhat resemble our German flutes. This instrument is much more musical than either of the former two: it gives a sound like that of the cornet, but has a greater variety of notes, and, when played on by a skilful hand, affords very agreeable music. This instrument is supposed either to have been first introduced, or else greatly improved, by the Portuguese, who have also introduced the use of kettle-drums, trumpets, hautboys, and other European instruments; but the three first are those principally used in war.

All their instruments, as before observed, are of different sizes: the largest are appropriated to the head general, whose orders, by means of these, are heard by the whole army. The next in size are used by those who command the several bodies into which it is divided, and the lesser sizes are for the use of the captains and other inferior officers; so that the sound of the larger instrument is no sooner heard, than all the others answer in concert, and by this method the general's orders are communicated to the whole army.

The dress of the military officers is very grand, and they appear much taller than they really are, as well as more terrible, by the length and variety of ostrich, peacock, and other feathers, with which they ornament their caps. About their necks they wear several links of iron chain, to which are fastened great quantities of rings that make a loud jingle at every motion: for the same purpose also, they hang a number of bells about their middle, the noise of which they suppose animates the soldiers to fight with more ardour, and at the same

time

time gives themselves a greater air of pomp and grandeur. They wear buskins on their legs after the manner of the Portuguese. Their weapons are the bow, sword, target, and dagger; those, however, who carry the bow are not allowed to wear the target, but only the sword and dagger.

The common soldiers, who go naked from the waist upwards, fight with bow and dagger, and in their girdles they wear large crooked knives. Some of them use broad swords, muskets, and pistols, which they purchase of the Portuguese.

The language of the people of Angola and Congo is radically the same; but the dialects of the different provinces differ essentially in pronunciation, that it is difficult for those born in places remote from each other to converse together. This, however, is not to be wondered at, in a country where there is no regular grammar, since England and France, which abound in polished writers, labour under the same inconveniences, as the jargon spoken in many of the counties of the former, and the several provincial dialects of the latter, render it impossible for a pure speaker of either to understand many of the natives of the same country.

The remaining particulars we have to mention of this kingdom are relative to the mountains, of which there is a remarkable ridge extending itself north-east from Cape Negro. Some of these, on account of their prodigious height and coldness, are called by the Portuguese Monti Freddi; and some others, which are still higher, they call Monti Nevosi, on account of their snowy tops, the waters of which, falling in great plenty during the summer season, form a considerable lake below. But the most considerable one of all is that called Cambambo, on which there is a mine that produces excellent silver. The Portuguese have long since made themselves masters of this place; and in order to secure it, have built a very strong fortress. It is under the direction of a governor, who carries on a great trade here in slaves, the place being very conveniently situated for that purpose, by reason of its vicinity to the great river Coanza.

S E C T. IV.

BENGUELA.

THIS country is bounded on the east by that of the Jaggas, from whence it is separated by the river Kuneni; on the west by the Ethiopic ocean; on the north by Angola; and on the south by the kingdom of Mataman. It is about 430 miles in length, from east to west, and 180 from north to south. The coast part begins near the mouth of the river Coanza, and extends to Cape Negro. About the center of it is the bay of Cows, which, though not very large, is yet a good harbour, and able to receive most ships of burden. It receives its name from the many herds of that sort of cattle that are bred within its environs. The country is plain, and produces most kind of provisions: in some parts of it are also found different sorts of metals, particularly silver and lead.

The climate of Benguela is exceeding unwholesome, and so prejudicial to strangers, that few choose to land there. Even the provisions are affected by the ill quality of the air, so that those who eat of them at their first coming, run the hazard of their lives, and if they escape, generally contract some disagreeable and lasting distemper. The Europeans that reside here are mercenary, looking more like companions of the dead than the living.

There are but few places in this kingdom that merit any particular notice. Among those that do, the most material is Old Benguela, from whence the kingdom receives its name, and is so called to distinguish it from New Benguela, a small town built by the Portuguese, on the north side of the bay of Cows.

Old Benguela is situated in 10 deg. 35 min. south latitude, and 13 deg. 10 min. east longitude. Besides the kingdom, it gives name also to a province, which extends about 10 leagues along the coast, from Cape St. Ilas, to the Bay of Pullets and Fowls, so called from the great quantity of poultry found there. The land here is very low, but the soil is fertile, and pro-

duces abundance of cattle, as also several kinds of grain and roots. Here the Portuguese have built a strong fortress, called Fort Benguela, in which they maintain a garrison to keep the savage Jaggas in awe, who would otherwise ruin the whole country. The fort is surrounded with houses, and shaded with orange, lemon, banana, and other fruit-trees.

In the neighbourhood of Old Benguela are seven villages, the most considerable of which is called Manikafomba, and is so large and populous, that the inhabitants, in cases of emergency, can raise 3000 men at a very short notice.

To the south of the town of Benguela is the bay, which is about two leagues broad at the entrance, and so deep as to admit very good anchorage for ships of burthen.

About 20 miles from the mouth of the bay is a village called Manikongoe, where the Portuguese have a warehouse for the reception of various commodities. The village is situated at the foot of a hill, and is very large and populous. The chief articles sold here by the Portuguese to the natives are, fine lincens, cotton cloths, guns, and gunpowder.

To the south of the above village is the mouth of the river called Caton-belle, which is formed by two or three small rivers united together. The water here is exceeding brackish, so that the natives convey it into ditches, where they let it evaporate, till it becomes salt. Though this salt is of a very inferior quality, yet it is of such esteem, that the merchants load their vessels with it for exportation. The mouth of the river is sheltered from the wind, and ships anchor in it with the greatest safety, it being at least 15 feet deep, and quite clear of rocks.

A little to the north of this river is a bay, where the anchoring is so safe, that the Dutch have given it the name of the Good Bay. The coast here is low and fertile, and the inhabitants breed great plenty of black cattle and hogs.

The inland parts of the country are covered with forests, which are inhabited by prodigious numbers of wild beasts, particularly lions, tygers, elephants, rhinoceroses, and wild mules. But the most remarkable animal found here, and which is peculiar only to this country, is called by the natives Abada. It is of the wild kind, very shy, and swift-footed, and of the size of an half-grown colt; but what makes it most singular is, its having two horns, one of which grows on the forehead, and the other on the nape of the neck; the former is about three feet in length, and sharp at the point, but near the root it is about the thickness of a man's leg, and bends downwards; that on the nape of the neck is flatter and shorter, and of a blackish, or dark brown hue. The head is not so long in proportion as that of a horse: it is short and flat like that of an ox, only more hairy, and the hair much stronger. Its tail is also like that of an ox, though not quite so long, and the hair more like that of the horse; the feet are cloven like those of a stag, but they are much larger. When this creature is young, the front horn is straight, but as it advances in age, the horn bends gradually up like the tusk of an elephant. The natives hunt it for the sake of the front horn, which they esteem as an excellent antidote against poison. They look on the virtue of it to be greater or less, according to the age of the animal when killed; and the Portuguese, in order to know the goodness of it, make use of the following expedient: they set the horn upright on the ground, and suspend a naked sword over it point to point; if the horn be good and hard, the point of the sword will not penetrate it, whereas when the horn is soft and young, the sword immediately sinks into it, which shews that it is not arrived at its full perfection, and of course greatly lessens its value. They also make a poultice of the pulverized bones of this creature mixed with water, which they say is a sovereign remedy against all aches and pains of the body, by drawing away the peccant humours not only from the part affected, but also from the whole mass of blood.

The current coin of this kingdom consists of glass beads about an inch long, and of various colours, which

With respect to the inhabitants of Benguela, we find nothing particularly remarkable concerning them, their manners, customs, religion, &c. being much the same with those of Congo. We shall therefore leave this kingdom, and proceed to a description of those countries and nations that border on Congo and Angola.

S E C T. V.

Of the Kingdom of Anliko, and the Country of the Jaggas'

THE kingdom of Anliko is bounded on the east by the river Umbre, which runs into the Zaire; on the west by the borders of Loango; on the north, by some of the deserts of Nobia; and on the south, by the province of Songo. It is 285 miles in length, from east to west, and 180 in breadth from north to south.

In this kingdom are many mines of copper, of which considerable advantages are made by the Portuguese. It is in general a very barren country, and the inhabitants of it mere savages. They have no lands or inheritance, but wander, like Arabs, from one place to another, regardless of life, and intrepid in their undertakings. They pay no attention to agriculture, or use any endeavours to preserve their existence, but by plundering all who happen to fall in their way, some of whom they kill, and others they keep as slaves. They are dreaded for their extreme brutality, and are so irrational that few Europeans can trade with them. Their language is barbarous, and so unintelligible that it cannot be understood, even by the inhabitants of Congo.

Both sexes go naked from the waist upwards, but the better sort distinguish themselves by wearing red and black caps made of Portuguese velvet; and, in order to preserve their health, they all anoint their bodies with a composition made of white sandal wood pounded, and palm-oil.

They are absolute cannibals, their chief food being human flesh; and there are public markets where whole bodies are hung up and exposed for sale. They believe themselves possessed of a right to dispose arbitrarily of their slaves; and those taken in war are fattened, killed, and either used by their conquerors, or sold to the butchers.

However shocking these circumstances may appear, yet they are indubitable facts; for the people of this country feed on each other with as much indifference, as those of other countries do on the respective animals appropriated by Providence for the sustenance of mankind. Here discontented slaves offer themselves for food to their masters; fathers and sons, brothers and sisters, reciprocally feed upon each other without the least remorse; and infants just born are eat by their unnatural and inhuman parents. Here are no graves for the dead, except the bellies of the living, who eat the deceased as soon as he has expired.

The arms used by these cannibals are battle-axes, and small but very strong bows, strengthened and adorned with the skins of serpents; the strings are made of supple and slender shoots of trees, and the arrows are of a hard but very tight wood, pointed at the ends with iron. They shoot with the most surprizing agility, in so much that they will discharge near a dozen arrows from the bow, before the first falls to the ground. They manage the battle-axe with equal dexterity: one end of this instrument is very sharp, and the other flat like a mallet, with a handle between about half the length of the iron, rounded at the end, and covered with the skin of a serpent; with the flat end they screen their bodies, and ward off the darts of their enemies. They have daggers also in scabbards made of the skins of serpents, which they carry by their sides fastened in leathern girdles.

Their religion, as may reasonably be supposed, is strict idolatry. They worship the sun as their chief deity, whom they represent in the figure of a man, and the moon under that of a woman. They have also an infinite number of inferior deities, each keeping one peculiar idol, to whom he offers sacrifices, and con-

stantly invokes before he proceeds on any dangerous enterprise.

The current coin among these people are zimbis, or small shells, which are gathered on the coast of Angola; in exchange for which they give slaves, as also for salt, silk, glass, knives, and other merchandise.

To the southward of Anliko is a small kingdom called Matamba, which is inhabited by the Jaggas, a savage and cannibal people, who have also considerable territories that lie to the south and east of it.

From whence these people originated is uncertain, but it is supposed they first settled about the kingdom of Anliko, and from thence spread themselves along those spacious wastes that lie between Anliko and Loango. From thence it is imagined they spread by degrees along the eastern frontiers of Loango, Congo, and Angola, and from thence eastward to the kingdom of Matamba, of the latter of which, with the territory adjoining, they made themselves complete masters, and have ever since preserved, to the great injury of their more rational and peaceable neighbours.

The territories belonging to these people extend from north-east to south-west, along Matamba and Benguela, about 900 miles; but they are very narrow in proportion, being in some parts 150, and in others not above 100 miles broad. They are inclosed between the kingdoms of Matamba and Benguela, from whence they are separated by the great river Kumerio on one side, and by the empire of Moni Muji on the other. The only town throughout all these dominions is called Kassarji, and is situated at the north part of them, near the frontiers of Matamba, where the great jagga, or king, occasionally resides.

Exclusive of this, they have neither towns nor houses, but roam from place to place with tents, removing as inclination directs, or necessity obliges them.

They neither sow nor plant, but seize every thing that comes in their way, and live entirely by plundering their neighbours. In their persons they are tall, lusty and strong, yet nimble and swift of foot, climbing up the steep mountains and craggy rocks with the most astonishing agility. Their women are stout, well shaped, fertile, warlike, and active; and both sexes are so intrepid, that no enterprise is thought too hard or dangerous for them to venture upon; and whenever they meet with an opportunity of plundering, they rush on their adversaries at all hazards, and with a fearless unconcern for their own lives. They consider it as the greatest mark of bravery to attack the fiercest and strongest creatures, and a still greater one to be more fierce and inhuman; and this savagery not only extends to the people of the nations they invade, but to those of their own, and even to their relations and children, whom they make no scruple to butcher and eat when they are in want of other food.

Their kilombos, or camps, are built of such materials and on such a construction, that they are easily removed on the shortest notice. When they go on any capital expedition they are always accompanied by the great jagga and his court; at which times their camp is formed in the following manner: The officers, who are the chief directors of them, having pitched upon a proper spot, divide it into seven distinct quarters, each of them under the government of its own particular commander: in the center one is the royal pavilion, surrounded by those of the ministers, officers, and servants belonging to the court, the whole of which composes a spacious square, and is surrounded by a strong hedge, so disposed as to appear more like a labyrinth than a circular fence.

The next quarter in rank is that inhabited by the kalambolo, or general of the army; this officer is called nuta-aita, or chief of the war, and on these occasions is the next in authority to the king; he orders and directs all military expeditions, encampments, engagements, and retreats; and must therefore be an experienced and intrepid warrior, cruel, and destitute of every humane sensation.

The chief person belonging to the third quarter is called tendela; he is the officer who commands the ecoona, or rear-guard, and is the chief of all the electors,

as well as supreme officer during an interregnum, for which reason he is held in the highest esteem next to the king.

The officer that commands the fourth quarter is called mani-lumbo; he is the chief engineer of all the fences and hedges with which the camp is fortified, and particularly that part of it belonging to the royal family: he is the only person who is permitted to come into the royal presence whenever he thinks proper; and from this distinguished privilege he is particularly respected at court.

The fifth quarter is commanded by an officer who is intrusted with all private commissions, and charged with the execution of them: in case of any failure, he is immediately put to death, and another appointed in his stead.

The officer that commands the sixth quarter is called illunda, or the captain of the baggage, whose business it is to take care that every thing is in proper order for the use of the army. In times of peace, which seldom happen, he is entrusted with the care of filling the magazines with arms, and is to keep them in proper order ready to be delivered to the soldiers upon any emergency.

The seventh, or last quarter, is commanded by another illunda, or keeper of the royal wardrobe and baggage. As this place is considered of great trust, it is generally given to one of the king's relations, who has particularly distinguished himself for his courage and loyalty.

Another distinguished officer belonging to the camp is the manicurio, or superintendent of the provisions, who is usually chosen for his singular dexterity in the art of plundering; he hath a great number of officers and slaves under him, who are all equally qualified for that business. It is to be observed, however, that this officer is only purveyor to the court; for as to the soldiers they are obliged to provide for themselves. They generally do this by force, but sometimes they purchase provisions from the Europeans in exchange for slaves; the latter of whom, being very active, often give their new masters the slip before they can properly secure them.

The last officers belonging to the camp are those called pumbis, or fore-runners. These are a sort of spies, whose business it is to be in continual motion, and to endeavour to discover the situation, strength, and number of the enemy; to skirmish, oppose, or even attack them, as occasion offers, and to support the van on the first onset. They are usually chosen from amongst the most intrepid of the whole army, and accordingly fight with the most determined resolution.

The king, who is a man of great courage and resolution, never undertakes any thing without previous enchantments, and consulting his mokisso, or devil, by sacrifices, from whence he pretends to foreknow the event of his enterprize. On these occasions he rises before day-break, and sets himself on a stool, attended by two of his conjurors, one on each side, and about 50 women standing in a circle round him, waving the tails of beasts, and singing. In the center is kindled a great fire, over which is placed an earthen pot containing some white powder or paint, wherewith his conjurors besmear his forehead, temples, breast and belly, using at the same time many enchanting terms, and continuing their ridiculous ceremonies till sun-set; at which time they bring him his casengala, or hatchet, and put it into his hands, bidding him be strong against his enemies, for the mokisso is with him. A male child is then brought to him, which he immediately kills; after which four men are brought to him, two of whom he slays, and orders the other two to be killed without the camp. He also orders 10 cows to be killed, five within and five without the camp, with the same number of goats and dogs: the blood of these animals is sprinkled on the fire, but the flesh is eaten with great festivity and triumph. The same ceremonies are likewise used by the inferior officers of the army on the like account; but neither they nor their chief make use of idols: these or any other occasions, pretending that the mokisso frequently appears and speaks to them.

The soldiers are neither well disciplined, armed, or clothed. Their offensive weapons are bows and arrows, spears, darts, daggers and clubs; but they are taught rather to use their defensive weapons than their missile ones, being particularly instructed to cover their bodies, which are almost naked, with their large oval shields made of thick hides; and this method is singularly serviceable in a retreat; as it preserves them from being wounded by the arrows and lances of their pursuing enemy. Their chief excellency consists in the strength and activity of body, in the artfully covering themselves, and the throwing their missile weapons, by which they generally annoy the enemy, and make them spend their shot against their shields; after this they renew the onset with such vigour, as seldom fails of putting the enemy to flight, which is always followed by a general slaughter, no respect being paid either to persons or sex.

When they invade a country where they expect any considerable opposition, they intrench themselves very quietly for some time, and only alarm the inhabitants with frequent skirmishes, till they think they have sufficiently harried them; or, if these assault them, they stand on the defensive for two or three days, till the others have spent their strength and fury; when the commanding officer sends out a large detachment in the night, to lie in ambush at some distance from the enemy's camp. On the following morning they begin the attack, when the poor natives being suddenly surprized, are easily put to the rout, and leave their country at the pleasure of their merciless invaders.

The Great Jagg, or king, preserves a distinguished dignity, no person being permitted to sit before him, except the kalambo, or head general, who is supreme judge in all cases, whether civil or criminal. This officer is allowed to sit in a chair with a back to it; but the tendela, who likewise sits as a judge, is only allowed a small stool about a foot high. Those of a certain rank are permitted to sit in the king's presence on a carpet, but they must spread it with their own hands. Those who obtain audience of the king, must speak to him with their bodies bent almost double, and if of an inferior rank, must prostrate themselves on the ground. If the king happens to sneeze, cough, or break wind, the whole assembly must wish him health and long life; and those who are nearest to his person, must give notice to those at a distance to do the same; on which they all express their good wishes, by clapping their hands and bending their bodies.

The common people of both sexes go almost naked, having only a piece of cloth fastened round the waist, and so small, that it barely covers half their thighs. Persons of rank, indeed, dress themselves in gaudy apparel; but they do it rather from pride than any affectation of modesty.

In order to furnish the reader with a proper idea not only of the dress, but also the importance of the most distinguished among these people, we shall present the following account, as given by Battel, of the dress, &c. of the kilambo, or head-general, under whom he served for several months. "He wore, says he, long hair, set off with many knots of bamba shells. His neck was adorned with a collar of masos, which are another kind of shells found along the Ethiopic coast, and sold among them for about the value of twenty shillings. His middle was covered with a girdle of lardes, or beads made of ostrich eggs, and under it a palm cloth as fine as silk. His body was painted with various figures, and anointed every day with human fat. He wore across his nose a piece of copper about two inches long, and two others of the same sort in his ears." This writer, however, does not mention his wearing any thing either on his hands or feet, but adds, "That he had about thirty wives, who followed him when he went abroad, one of whom carried his bow and arrows, and four others his cups and drinking utensils; and whenever he drank, they all kneeled down, clapped their hands, and sang. He kept his men under the strictest discipline, and if any of them turned their back to the enemy, he was condemned to death, and his body eaten; and, the more effectually to deter them from cowardice, he used

to make an oration to them from a kind of scaffold every night, in dispraise of it, and in commendation of intrepidity."

The same writer has also furnished us with a description of the method in which they bring up their young soldiery. "These," says he, "are not their own offspring, but those of such captives as they make in their excursions; for though they allow themselves to have many women, and these are no less fertile than those of other African nations, yet they suffer few of them to rear up their children, but order them to be buried alive as soon as born; and in lieu of them make choice of such as are the most promising from among those of their prisoners, to be trained up to arms, and to the plundering trade. These they commonly choose at about the age of 12 or 13 years, the females for procreation, and the males for war. The latter are no sooner enrolled than they have a collar hung about their necks in token of slavery; which is to be worn by them till they bring home the head of an enemy, when it is publicly taken off, and they declared freemen of the cannibal commonwealth. The remainder of the captive train of both sexes are inhumanly reserved to be killed and eaten, not in time of scarcity of cattle and other provisions, but out of cruel wantonness, and in preference to all other flesh. This privilege of being accounted men, and freed from their badge of slavery, seldom fails of inspiring the youths so chosen with an uncommon ambition to obtain it at all hazards, and to face the greatest dangers with an intrepid boldness for the sake of it. It is by this method they keep up their number complete, and the fierce savage nature of the Jaggas republic from recoiling into humanity and compassion."

Though the women of rank only wear a cloth about their middle, yet they take great pride in adorning their hair, necks, arms and legs, with shells and beads of various sorts; but they have a strange custom of pulling out four of their teeth, two above and two below; and those who refuse to do this are so despised by the rest, that they are not permitted to associate with them.

They have no ceremonies of marriage, intermixing with each other according to their inclination. But they have some particular maxims in the interment of their dead, especially those of the male kind, and which evince farther tokens of their savage cruelty. The deceased is not only washed, anointed, and bedecked with all his most valuable finery, but accompanied by two of his most beloved women, who are conveyed with him to his grave, with their arms broken. The body is carried to the grave in a chair, between two men, and placed in it as if still alive, and the two women, one on each side of it. As soon as they are thus deposited, the grave, which is commonly very deep, is covered on the top with earth; and the relations, who are there present, sprinkle it with the blood of slain goats and palm wine; after which they make a funeral lamentation over it for several succeeding days. Those of higher rank are interred with more pomp, and the ceremonies and libations reiterated a longer or shorter number of days, weeks, &c. according to their quality.

History of the incursions of the Jaggas.

What we know of the history of this people is but of a recent date, yet the circumstances are so surprising, and the events so interesting, that it would be unpardonable not to record them; as they will at once gratify the curiosity of the reader, and fully evince what we have already advanced concerning the ferocious savageness of this nation.

About the middle of the 15th century, one Zimbo, at that time a principal leader among them, made a proposition of invading the vast empire of Congo. The people, in hopes of enriching themselves by the plunder of these nations, readily approved of his proposition, and, elated at the prospect, stocked to him in such numbers, that he soon found himself at the head of a numerous army, who all promised to obey him in every thing, and to follow him wherever he thought proper to lead them. He took with him a favourite woman

named Tem-ban-dumba, who served him at once as a concubine and a counsellor; and with these he penetrated, without any considerable opposition, to the very center of the Congolese empire, committing the most dreadful ravages and laughter wherever he came; leaving nothing behind him but desolation and destruction. What added to the inhumanity of their proceedings, was, being accustomed to feed on human flesh, they made no less havock among the unhappy people that fell into their hands, whom they wantonly put to the most excruciating deaths, merely to give a higher relish to their flesh.

The success this monster met with daily increased his army, the wretched Congolese flocking to him in hopes of preserving themselves from the famine and destruction with which they were threatened. Zimbo accordingly grew more powerful, till having one day mustered up all his forces, and finding them too numerous to continue longer in one body, he thought proper to divide them into several parts; and having left some of his most intrepid officers over them, dispersed them into various parts of Ethiopia, enjoining them to spread desolation wherever they went. One of those officers, named Quizzuva, a man no less brutish than martial, had the insolence to go and attack the Portuguese at one of their fortresses named Teto in the kingdom of Monocmugi: but he there met with the fate he justly merited, being totally defeated and killed, with a great number of his men; and the rest were either put to flight or taken prisoners.

In revenge for this, Zimbo, who had heard of the defeat of his officer and men, marched in all haste to the fort with a fresh supply of forces, engaged the Portuguese commander, and after an obstinate struggle on both sides, defeated and killed him, making also a dreadful slaughter among the rest of his forces. Those whom he took prisoners underwent a more cruel fate, being put to the most horrid deaths, particularly their chaplain, whom he had observed to be singularly active during the engagement. He ordered all their heads to be stuck on lances, and carried away as trophies, together with all their church vestments, himself marching at the head, dressed in a priestly habit in derision to their religion.

Zimbo, elated with this success, made a descent upon the island of Quiloa, where after plundering the place, he put 3000 of the inhabitants to the sword: the rest he took prisoners, some of whom were made slaves, and others he ordered to be sacrificed to his idols.

The next attempt he made was on the kingdom of Melinda, the inhabitants of which, at the first news of his approach, determined to save their lives and properties, by betaking themselves to the woods. They were prevented, however, from carrying their design into execution by their generous monarch, who represented to them, in the strongest terms, the impropriety of abandoning their country to a set of robbers, who had neither religion, honour, nor humanity; protesting at the same time, that whatever they might resolve on with regard to their own safety, he was determined to meet and engage them, and to defend his country and subjects to the last drop of his blood. This declaration so animated the people, that they determined, one and all, to stand by him to the last man; and the king, having made every necessary preparation, set out with them to engage the enemy.

Having advanced some distance from the capital, he met Zimbo at the head of his victorious cannibals, who immediately engaged the king's troops with his usual fierceness and assurance of success. The engagement lasted several hours, during which it was so obstinate and bloody, that prodigious numbers were killed on both sides. At length, however, the savages, despairing of success, betook themselves to flight; when the king thinking it most judicious, if possible, to extirpate so diabolical a race, ordered his men to pursue, and kill all that fell into their hands; which orders they so readily obeyed, that very few, except some of the most active, escaped their fury. Among these was Zimbo their general, who retired with them into the woods, where he continued some time, in expectation of recruiting his army.

During

During his stay here, he formed a resolution of making a tour round the coasts of Africa, in which there was a prospect of daily increasing his army with new volunteers amongst the savages, and enriching himself with such spoils as might fall in his way. Accordingly he set out, and steered his coast southward to the Cape of Good Hope, without meeting with any opposition or disaster; and, as he found his army considerably augmented, he divided them into several columns for the better convenience of ravaging; but charged them not to separate farther than that they might be immediately assembled together in case of any emergency.

After being a short time at the Cape, he proceeded northward as far as the river Cuneva, on the banks of which he formed a camp, distributing his men into several bodies under proper commanders, and reserving to himself the supreme command over the whole. During his stay here he greatly increased his army, which so animated him, that he made all necessary preparations for some grand expedition, when death put an unexpected end to all his designs, and soon after carried off likewise his favourite concubine Tem-ban-dumba, the faithful companion of all his travels.

On the death of Zimbo, the surviving commanders, not choosing to submit, or become dependant on any other chief, readily agreed to break off the community, and each of them took upon himself the command of his own troops. Some of them continued in their former stations, while others moved off in quest of new settlements.

Among the chiefs that separated was one named Dongis, who was principally remarkable for being the father of the most infernal virago that ever existed. She was born at the camp which Zimbo chose for his last retreat, and was named Tem-ban-dumba, in compliment to that general's favourite concubine. Dongis, her father, removed with his small army to the province of Ganghella, situated on the south side of the kingdom of Matamba, where dying soon after, his wife Muffaza, a bold and enterprising woman, took the command into her own hands; and having been brought up in the plundering trade from her youth, gave them such manifest proofs of her intrepidity, that they readily submitted themselves to her conduct, and followed her in her most dangerous expeditions. She always appeared armed and dressed like a male warrior; and perceiving her daughter to be possessed of natural courage, she dressed her in the same manner, and took the young virago with her in all her excursions, hoping thereby to initiate her in the infernal business she herself was then prosecuting.

Though Tem-ban-dumba was at this time very young, yet she discovered such prudence and presence of mind on the greatest emergencies and difficulties, that Muffaza, her mother, made no hesitation to entrust her with the command of some of her forces, while she herself led the rest on to some important exploits. The young virago was so elated at this, that she began to think herself of too much consequence to be under any kind of subjection to her mother. She therefore claimed an independent power, and soon displayed that infernal disposition that afterwards distinguished her as the most inhuman and abandoned of her sex.

Being of a no less amorous than warlike temper, she had indulged herself in the embraces of several gallant youths of her army, of whom, through the sickness of her sex, she no sooner became tired, than she caused them to be privately put to death, to make way for new ones. For this imprudent, as well as inhuman, conduct, she had been often severely reprimanded by her mother; till at length, being no longer able to bear such constraint, she broke out into an open rebellion against her.

This resolute step, added to the intrepid bravery she had shewed on many occasions, made her the more admired, as well as dreaded, by the whole savage army, who began to think her something more than human, and expressed the utmost eagerness to come and fight under her banner; so that the greatest part of her mother's forces came gradually over to her, and she soon found herself at the head of a numerous army, by

whom she was more punctually obeyed than any general of the other sex could have been, as they imagined her to excel all in prudence and magnanimity.

In order to inspire her men with veneration and dread for her, she ordered her whole army to be drawn up in arms before her, and, appearing in her masculine, military dress, she harangued them in a long speech, in which she acquainted them with her sanguine views of making them victorious and happy under her conduct, and, by their valour and assistance, to lay the foundation of a powerful and glorious kingdom. The better to accomplish her future projects, she told them that she must and would instruct them in the laws and rights of the ancient Jaggas, their ancestors, as the most infallible means to make them no less successful than their late leader Zimbo, without the danger of exposing them to the same misfortunes.

To convince them how much she was in earnest, and expected to be obeyed, she told them she would immediately let them an example worthy of their attention, unless they were greatly degenerated from the natural courage and intrepidity of their celebrated race, and that if they were, it would infallibly revive it in them. Having thus far raised their expectations, while they fixed their attentive eyes and ears on her, she ordered an only son, whom she had by one of her paramours, to be brought to her, together with a large pestle and mortar, in which, instead of treating it with the caresses of a young and tender mother, as might naturally have been expected, she, to their great surprize, and without the least shew of remorse, pounded the innocent babe alive, till she had reduced the bones, flesh, &c. into a pulp, among which she mixed several kinds of powders, herbs, roots, oil, and other ingredients; and thus, having formed the whole into a kind of ointment, she stripped herself, and ordered some of her maids to anoint her with it from head to foot, before all her men. After this was done, she resumed her martial dress, and told them, that was the sovereign balm that would render them not only strong, and fit for martial exploits, but invincible, and consequently a terror to other kingdoms.

This instance of diabolic heresim was universally admired by her barbarian subjects, who immediately followed her example, by murdering many thousands of male infants in the same horrid manner, and for the same infernal purposes.

Soon after this she made several laws, which she strictly enjoined her subjects to observe. Among these, one of the most detestable was, that none of her subjects should undertake any thing of consequence, or even consult about any enterprize, till they had previously anointed themselves with the shocking composition above described, which she said would inspire them with wisdom to choose, and courage and resolution to execute, all their projects with undoubted success: and that there might never be wanting a supply of it, she enacted some other edicts, by which several sorts of male children were excluded from being admitted into the camp, or even from being brought up; some of which were ordered to be pounded and boiled for the use above-mentioned, and others, that were either deformed or defective, to be thrown to the dogs.

In the course of some time, however, she found herself under the necessity of reducing the force of such of her laws, as were either detrimental to the increase of the male kind, or too shocking against the natural affection of parents, fearing that such barbarity might at length terminate in a general discontent, or perhaps an open rebellion; and instead thereof she introduced others more agreeable to the natural cruelty of the people, among which was that of feeding on human flesh, and preferring it to every other kind of diet. In this law, however, she made an exception against killing any of her own sex for that purpose, or even to eat their either when they died a natural, or were put to a violent death.

Besides these, she gave them several other laws, all of which were of the same inhuman nature, and calculated to encourage and inure her subjects to all manner of rapine, bloodshed, and remorseless cruelty. In short, she

had at length hardened all her forces in their debauched trade, that they spread fire and slaughter all over the western parts of Ethiopia, without mercy, or almost any opposition: and if at any time they met with a repulse, or even defeat, from her warlike neighbours, instead of being discouraged, she only grew more fierce and desperate, reinforced her army with all possible speed, and fell upon them with such eagerness and fury, that every thing was forced to give way to her, or flee from her victorious arms. What effectually animated her troops to follow her through the most arduous and dangerous enterprizes was, the applause and recompence they were sure to meet with on their return to the camp, especially with respect to the distribution of the plunder and slaves, which she divided amongst them, without reserving any distinguished emolument to herself.

We come now to the sequel of the life and reign of this desperate and inhuman monster, who, after having filled the greatest part of Ethiopia with terror, blood, and slaughter, at length fell a victim to lust and incontinency.

Having murdered great numbers of her paramours, in order to prevent the discovery of her private debaucheries, she at length grew enamoured with a fresh one, in whom, though then only a private soldier, she discovered such excellencies as made her overlook the great disparity of situation between her and him. His name was Kulembo, he was in person tall, strong and well shaped: in his disposition bold and intrepid, and no way inferior to his mistress in craftiness and cruelty. As he was not ignorant of the fate that had attended so many of his predecessors, so neither did he accept of her condescending offers, but with a fixed resolution to retaliate it upon her, as soon as he found her affection for him in the least to decrease. In the mean time, however, he used every means he could project to please her, and in a short time he worked upon her passions, that he prevailed on her to marry him. The nuptials were accordingly celebrated with great pomp after their manner, that is, with the death of a great number of human and other victims, for the entertainment of their numerous guests; yet neither could this, nor the many other favours she heaped upon him, prevent his keeping so watchful an eye over her, that he became more and more apprized of her feckle, inconstant, lewd, and tyrannic disposition; insomuch that he at length perceived, in spite of her female address, he was become at least indifferent, if not wholly disagreeable to her.

He now thought it high time to ward off the blow that threatened him, by renewing and doubling his caresses to her, by sumptuous banquets, and such other entertainments and diversions, as he knew were most likely to suspend her treacherous intentions against him. He topped her in particular with variety of European wines, and with the most delightful cordial waters, till he found an opportunity of conveying a strong dose of poison into one of them, of which she had no sooner drank, than, as he expected, she expired in his arms.

Kulembo, after this, appeared so highly afflicted, and conducted himself with such artful success, that he passed altogether unsuspected of having any hand in the death of a spouse, whose loss he seemed so deeply to lament, that he affected to attempt, in order to put the better gloss on it, more than once to sheath his sword in his own breast. This counterfeited excess of grief, joined to his well-known courage, made so deep an impression on the minds of the Jaggas, that he was declared her successor, and soon after proclaimed their king.

In order to give his new subjects a fresh proof of his pretended affection for his late spouse, he buried her with the most distinguished magnificence. The place which he chose for her interment was on a distant eminence, where he caused a spacious cave to be dug, and divided into several large apartments, all of which were hung with some of the richest cloths of Europe, and the floors covered with the finest furs, and most curious matting. That designed for the corpse was well stored with all the choicest meats and liquors. She was bedecked with all her costly ornaments, and seated on a throne

in a commanding attitude. The throne was carried by the first ministers of state, guarded by the militia, and followed by the king and the whole court, who accompanied it with their most dreadful outcries, heightened by the sound of all their martial music. The procession was closed by the unhappy human victims, which were to be either butchered over her grave, or buried alive with her in it.

When they came to the cave, the corpse was deposited in the apartment prepared for it, amidst the most hideous cries of the court and soldiery, and the horrid sound of the martial instruments; after which the victims were slain, and their blood scattered plentifully on the corpse. Those victims that were designed to serve her in the other world, then went down into the grave, the bodies of the slain were thrown in, and the whole place immediately filled up with earth. As soon as the ceremony was over, the company retired to the camp, and the new monarch took upon himself the reins of government.

Kulembo distinguished the beginning of his reign by his frequent excursions and ravages, but he was soon stopped in his career. He became captivated with a beautiful slave, who soon persuaded him to exchange the martial trade for the pleasures of the matrimonial life. He sent his officers and forces upon new exploits, while he enjoyed himself at ease with his queen, till he at length suddenly expired in her embraces, and was afterwards honoured by her, and all his subjects, as an inferior deity.

The successor of Kulembo was named Chingarii, who was not only equal to him in valour, but of a more savage disposition. The ravages he committed were attended with much greater cruelty than had been exercised by any of his predecessors; and such was his thirst after this shocking business, that he did not hesitate to engage in the most hazardous enterprizes, till at length venturing to try his bravery against the Portuguese of Angola, he was defeated and slain, and a great number of his men taken prisoners.

Chingarii was succeeded by Caluximbo, a man of great courage and conduct, but of so gentle and humane a disposition, that he could never be prevailed upon to eat any human flesh either before or after his election. His barbarian subjects, from this circumstance only, conceived an invincible aversion against him; and, under pretence that their late queen Temban-dumba resented his open violation of her laws, (a notion which the priest took care to spread about) he was assassinated to appease her anger, and 300 victims of each sex were ordered to be butchered at his funeral obsequies.

Caluximbo had many successors, all of whom, in a greater or less degree, committed the usual ravages of their predecessors, leaving nothing behind them, wherever they went, but the melancholy marks of utter desolation.

The most distinguished that succeeded Caluximbo was named Calanga, a man of no less prudence than courage. This chief, having entered into an alliance with the Portuguese governor of Angola against queen Zingha, who then headed another party of desperate Jaggas in the kingdom of Matamba, was prevailed upon by that governor to abolish some of the laws made by queen Temban-dumba, particularly such as related to the destroying their own children, and bringing up in their stead those which they brought away captives in their excursions. This degradation on their laws was so ill approved of by the savage Jaggas, that it cost Calanga his life, for he was soon after assassinated by one of his sons, and interred with the usual ceremonies. The patricide, however, did not long enjoy the high dignity he had so infamously acquired. The Jaggas, according to their laws, claimed their right of election, and set up another son of the deceased in his stead. He was named Cassange-Canguin-Gurii, and entertained so high an opinion of the Portuguese, that in order to obtain their friendship, he caused himself to be instructed in the principles of the Roman Catholic religion, and was baptized by the name of Don Paicale.

This prince, however, whether through fear of being dethroned, or from a natural propensity to the Jaggas customs,

customs, soon after relinquished his new persuasion, and became more cruel and blood-thirsty, and committed greater ravages than the fiercest of his predecessors, spreading death and desolation wherever he went.

This is the last king of the Jaggas of whom we have any particular account: all we know farther is, that

different tribes of these people, under their respective chiefs, still inhabit those parts of Africa already described, and that they strictly preserve their ancient and infernal maxims. We shall therefore take leave of so diabolical a race, and proceed to the next chapter.

C H A P. VII.

C A F F R E R I A, or C A F F R A R I A.

WE now come to a part of Africa as finely situated as any in the universe for navigation and commerce, yet as much neglected, in both these respects, as any place in the world. It wants no advantage, except being an absolute island, yet is less known than most interior continents. The country is fertile, but wants the advantages of civilization. The inhabitants are naturally sagacious, but their faculties are absorbed in indolence. Thus both the lands and minds of the people require improvement; but the politic Dutch, who possess the principal parts of the coast, wish to give to neither, any farther than their own conveniences require, lest cultivation in the first should introduce luxury, and infirmation in the last produce disobedience.

The whole of this country extends about 780 miles from north to south; that is, from Cape Negro to the Cape of Good Hope: from the last mentioned Cape, turning north-east, to the mouth of the river Spiritu Santo, it runs about 660 miles; and from thence proceeding up the country almost to the equinoctial line, it is about 1740 miles farther. In some places it is 900, and in others not above 600 broad. Cape Negro is in 15 deg. 30 min. south latitude, and the river Del Spiritu Santo in 25 deg. south latitude.

Cafferia is so named from the Caffres, its inhabitants, though some authors affirm, that this name is merely an opprobrious term given by the Arabs to all who have but confused notions of the Deity, and which the Portuguese, by mistake, have applied to the people residing in these countries.

This considerable region is usually divided into,

1. The kingdom of Mataman, or Climbede.
2. The inland countries between Mataman and Monomatapa.
3. The country of the Hottentots.
4. Terra de Naal.
5. Terra dos Funos.

But before we enter upon a local description of the country, it is necessary to mention the discovery of it.

The most southern point of Africa, called the Cape of Good Hope, was unknown till so late as the year 1493, when it was first discovered by Bartholomew Diaz, the admiral of a Portuguese fleet, who, on account of the boisterous weather he met when near it, distinguished it by the name of Cabo dos toros Tormentos, or, the Cape of all Plagues; since which time no place in the universe has been more spoken of, though little of the country, except the coast, has been penetrated or known. The reason why it has so much attracted the attention of the mariners of all nations, is their being under a necessity of doubling it in their voyages to the East-Indies, and frequently of calling there for water, or other refreshments.

John, king of Portugal, not liking the name which his admiral had bestowed on this huge promontory, changed it to that of the Cape of Good Hope, by which appellation it hath been ever since distinguished.

However, neither Diaz, or his successor Vasco de

Gama, though they saw the Cape, thought proper to land at it. But in 1498 the Portuguese admiral, Rio del Infante, was the first who ventured on shore; and from his report, Emanuel, king of Portugal, on account of the eligibility of the situation, determined to establish a colony there; but the Portuguese, who are by nature cowards, having taken it into their heads that the inhabitants of the Cape were cannibals, were too much afraid of being devoured, to obey their sovereign in making the intended settlement.

The next time these timid people landed here, was under the conduct of a viceroy of Brazil, named Francis D'Almeida, when the Portuguese were shamefully defeated by the scarce armed, and unwearied natives; the viceroy and 75 of his men being killed in the engagement, and the rest obliged to make a precipitate flight to their ships.

The Portuguese were much chagrined at this disaster, and greatly abashed at the idea of such martial superiority in a people by them deemed at once savage and despicable. They determined to be revenged, but not having magnanimity enough to shew a brave resentment, they contrived a most inhuman, and cowardly expedient. Touching at the Cape about two years after, they landed with all the tokens of amity, and brought on shore with them a large cannon loaded with grape shot. Knowing the fondness of the unsuspecting natives for brass, they pretended to make them a present of this engine of destruction, which was of that metal. The poor people, overjoyed by the gift of so great a treasure, began to drag it away by the help of two long ropes which had been previously fastened to the muzzle. Great numbers laid hold of the ropes, and many others went before by way of triumph, when the treacherous Portuguese firing off the cannon, a prodigious slaughter ensued, as most of the people stood within the range of the shot. Many were killed, several wounded, and the few who escaped, abandoned the fatal present with the most precipitate terror.

About the year 1600, the Dutch began to touch at the Cape, in their way to and from the East-Indies; and becoming annually more sensible of the importance of the place, in 1650 they effected a settlement here, which since that time, hath risen to great power and opulence, and been of essential service to the United provinces in general, which will be evinced in the course of this chapter.

S E C T. I.

The Kingdom of Mataman, or Climbede.

THIS kingdom extends from 16 deg. 30 min. south latitude, to the river Bravagbul, in 24 deg. south latitude, crossing the tropic of Capricorn, being in length 450 miles from north to south, and 260 miles broad from east to west. The river Bravagbul bounds it on the east and west; Benguela on the north; and the Atlantic Ocean on the south. The first place worthy of observation in this kingdom is Cape Negro, or Black Cape, which receives its appellation from its fable appearance to mariners, when at a considerable distance

ance at sea. At the extremity of the northern angle is a bay about six miles broad, and on the summit of the mountain is a pillar, of alabaster, with the arms of Portugal upon it. Beneath the 18th deg. of southern latitude lies Cape Ruy-Piz, which extends about 10 leagues north-west. Gulfo-Frio, and the Cape of the same name, lie in 18 deg. 35 min. and the Bay of St. Ambrose in 21 deg. south latitude.

The coast here is very sandy, but the climate is tolerably mild, considering the tropical situation of the country. The inland parts are fruitful, and a variety of trees abound towards the north. The Dutch judge of their approach to this coast by the flight of the birds called mews, as these never fly above 20 leagues from land. There is likewise another token by which sailors know when they are near the shore, that is, the floating of the weed called fargossa upon the surface of the waters. To conclude, Climbede is very little known; but, according to the few writers who have mentioned it, the government is despotic, and the whole country subject to one sovereign, subordinate to whom are a few petty lords, who stile themselves princes, though their dominions consist only of a small number of scattered towns towards the sea coast.

S E C T. II.

The interior Country of the Caffres.

THE Europeans are but very little acquainted with this part of Africa; it is, however, agreed, that the country called Mozumbo Acalongo is bounded on the north by the province of Olitia, on the south by the country of the Hottentots, on the east by Monomotapa, and on the west by Mataman, or Climbede.

The provinces of Olitia and Abutua have been little known, and less described, by white people; the latter, however, is said to abound in Gold Mines. The province of Foncea contains many iron mines, and in the middle of them is a surprising fabric, being a capacious square cattle, built of polished free-stone. The stones are very large, and placed upon each other without any kind of cement. The walls are near nine feet thick, and contain several inscriptions, which none have yet been able to explain, or even guess to what language the characters belong. As the inhabitants are unacquainted with the name of the founder of this extraordinary pile, they compliment the devil with the honour of having been the architect. The nearest stone building to this cattle is a Portuguese fort, which, however, is 200 leagues from it. The town of Fatuca, near this place, is rich in gold and precious stones. Boro and Quetzi likewise abound in gold mines; and Chitcova, which lies more to the north-east, contains many silver mines.

S E C T. III.

Of that Part of Caffreria, called the Country of the Hottentots.

THE country of the Hottentots extends towards the north to the tropic of Capricorn, and on all the other parts is bounded by the Southern Ocean. It is divided into 20 parts, or provinces, which being independent of each other, are termed nations. These Hottentot states are as follow:

1. The country of Heykams. This territory abounds in cattle, though there is no fodder but flags and reeds, nor any water but what is brackish. The few valleys are fertile, but the mountains are many, and barren. Game and wild beasts are plenty, but the greatest inconvenience is the want of fresh water.

2. The Chamouras district contains the finest and most lofty trees of any in the Hottentots country: the land in general is flat, the soil rich, and the water excellent. Here is plenty of sea and river fish, abundance of cattle, great quantities of game, and a variety of wild beasts.

3. The Houteniquas land contains many fine, shady woods, and fair, fertile meadows; the soil are luxuriant in abundance of medicinal herbs; and the latter are beautifully crammelled with a great variety of fragrant flowers.

4. The country of the Gauriques, or Gauras, is a small, but plentiful territory. Wild beasts abound more here than in any other place of the vicinity of the Cape.

5. The people called Damaquas inhabit a district which is flat and fertile. It abounds particularly in cattle, game, hemp, and water melons. Wood is very scarce, and salt-pits are at once numerous and useless; for the Hottentots never eat any salt, and the pits are too far from the coast to be of any service to the Europeans. Those who travel through this territory are much obstructed by the serpentine river Palamites, which meanders through the whole country, and is passed upon floats, or in canoes, as the people have not the least idea of building a bridge.

6. Dunquas land is the least uneven, and most fertile place in this part of Africa. It is watered by several fine streams, which disembody themselves into the river Palamites. Here is a profusion of cattle, game, fish, herbs, and flowers.

7. The Sonquas are but few in number, and inhabit a very barren, rocky country; but their poverty renders them more industrious than the rest of the Hottentots, and their natural wants make them excellent hunters. They are active and intrepid; and when they find it impossible to subsist in their own country, they let themselves out to hire as soldiers, to fight the battles of some of their more lazy, and less warlike neighbours: so that they may be termed the Swiss of the Cape. Cattle is so scarce among them, that they never kill any but upon certain solemn occasions; their food being either the game they provide themselves with in hunting, or such roots, plants, and herbs as their poor country furnishes. Many employ themselves in fetching hollow trees for honey, which they barter to the Dutch for brandy, tobacco, and hardware. Though unimproved by art, they are the philosophers of nature: deeming this life a shadow, they never shun any danger, as they imagine it may facilitate and hasten their journey to a state of bliss which they ardently expect in the next.

“ His fortune cannot sink, nor much late,
“ Whose views extend beyond this mortal state;
“ By age when summon'd to resign his breath,
“ Calm and serene he sees approaching death,
“ As the safe port, the peaceful silent shore,
“ Where he may rest, life's tedious voyage o'er;
“ He, and he only, is of death afraid,
“ Whom his own conscience has a coward made;
“ Whilst he who Virtue's radiant course has run,
“ Descends like a serenely-setting sun;
“ His thoughts triumphant Heav'n alone employ,
“ And hope anticipates his future joys.”

8. The Hessequas, or Gassaquas, one of the richest, and most polished of all the Hottentot nations; that is, they have the greatest quantity of cattle, the only criterion of riches, and are the most luxurious in their living, the sole mark of refinement which can be added in this country. But their wealth and luxury are their greatest misfortune; for the former, by raising the envy of their neighbours, encourages them to commit depredations in their territories; and the latter, by having enervated, has rendered them incapable of defending themselves. Hence they are obliged frequently to solicit the assistance of the Dutch, and to pay part of their wealth in support of their effeminacy; for it is well known that the Dutch never do a good turn to others, without being peculiarly interested in themselves. Their kraals, or villages, are larger, and better built; their bakkeleys, or oxen for carriage, stronger and handomer; and their country better inhabited than any other about the Cape. They have abundance of game, and, indeed, every thing that is necessary to convenience and pleasure in that tropical situation. Some of these people article themselves as servants to the Dutch for a certain term of years, and, during the stipulated space, set with the utmost integrity.

9. The Koopmans possess a large, fertile territory, which contains many European settlements, and is well supplied with wood and water.

10. The Chainouquas territories are small, and fertile;

tile; the people consist of only about 400 persons: they are, however, very rich in cattle, and generous to strangers.

11. The Cabonas inhabit a country situated near the tropic of Capricorn, and are reported to be anthropophagi, or men-eaters. But as these people are very little known, it is probable that what is said of their disadvantage may be owing to the total ignorance of their real characters, and the supposition taken upon some vague report.

12. The country of the Hancuniquas, which adjoins to the former, and lies about the 26th degree of south latitude, is likewise very little known: we shall, therefore, not preserve the conjectures of others, as we mean to adopt nothing but what is well authenticated.

13. The Henfaquas differ from the other Hottentots in applying themselves to agriculture, as well as the breeding of cattle. They cultivate a singular root called dakha, the juice of which is sharp and spirituous. The substantial part serves them for food, and the fluid is an intoxicating liquor, of which they are very fond. These people catch lions by traps, and have the peculiar art of taming them, so as to render them sociable and domestic. Some of the strongest and hercel they breed for the purposes of war, and so perfectly well discipline them, that they are obedient to command, and attack furiously when ordered by their masters; so that by the assistance of these tremendous light troops, the Henfaquas are exceeding formidable to their neighbours.

14. The Attaquas are poor, having but few cattle, which is owing to the barrenness of the country, and the want of water. This poverty of soil is, however, their grand security against invasion, as none care to steal that which is not worth having, or to run the hazard of their lives with a certain prospect of being losers.

15. The Chirigriquas inhabit a country bordering on the bay of St. Helen's, and are a strong, active, bold people. The territory is watered by an excellent stream called the Elephant's River, on account of the great number of elephants which frequent its banks. This district abounds in mountains which are flat on the top, and the summits of some of them have all the verdure of the finest meadows. The vallies are admirably enamelled with the most beautiful flowers; but it is dangerous to enjoy their fragrance, on account of the prodigious number of snakes with which they abound: that called Ceraustus is particularly venomous.

“ With curling crest, and with advancing head,
 “ Waving he rolls, and makes a winding track;
 “ His belly spotted, burnish'd is his back;
 “ While springs are broken, while the southern air,
 “ And dropping heavens the moisten'd earth repair;
 “ He lives on standing lakes, and trembling bogs,
 “ And fills his maw with silt, or with loquacious frogs.
 “ But when in muddy pools the water links,
 “ And the chapp'd earth is turrow'd o'er with chinks,
 “ He leaves the fens, and leaps upon the ground,
 “ And hissing rolls his glaring eyes around,
 “ With thirst inflam'd, impatient of the heats,
 “ He rages in the field, and wide destruction threatens.
 “ O let not sleep the closing eyes invade,
 “ In open plains, or in the secret shade,
 “ When he, renew'd in all the speckled pride,
 “ Of pompous youth, hath cast his sough aside,
 “ And in his summer liv'ry rolls along
 “ Erect, and brandishing his fork'd tongue,
 “ Leaving his nest, and his imperfect young;
 “ And, thoughtless of his eggs, forgets to rear
 “ The hopes of poison for the following year.”

The Chirigriquas are very numerous, and are celebrated for being the most dextrous of any of the Hottentots in throwing the assegaye or half pike, which they do with a most critical exactness. This weapon is made of a taper stick about four feet long, armed at one end with an iron plate sharp at the edge, and tapering to a point; the blade is always kept bright and clean, and when used in war is dipt in poison.

16. The people called Namaquas are divided into two nations; the greater Namaquas inhabit the coast, and the lesser Namaquas extend more to the eastward.

Though the government of these two nations differ, the characters of the people are much the same; they are more polished, and possess a greater degree of reputation than any of the other Hottentots. Their strength, valour, fidelity, and discretion are much admired even by the Europeans. It is computed that the two nations can, together, bring 20,000 men into the field. They always deliberate before they speak; use very few words, and give a laconic, but pertinent answer to all questions. The women are the fondest of finery and the most artful in their behaviour of any of the natives about the Cape. The country through which the Elephant's river winds, is mountainous, stoney, and barren. There are but few woods, yet wild beasts abound. A beautiful deer is found in this part, which is small, exceedingly swift, and furnishes delicious venison; its make is graceful, and its hide admirably marked with white and yellow spots. Herds, consisting of several hundreds of these animals, are frequently seen, but they are never known to go singly.

17. The Odiquas inhabit a district to the north of Saldana Bay. They are in perpetual alliance with the Salliquas, in order to defend each other mutually from the Chirigriquas, with whom they are continually at war.

18. The Saffiquas inhabit a country adjoining to the last mentioned nation: it is mountainous, but at the same time covered with verdure, and the vallies are finely enamelled with flowers. The great scarcity of water hath, however, induced many of the natives to quit it, and others have been driven away by the Dutch freebooters, so that it is now but thinly inhabited, though it was once a very populous country.

19. The territory of the Ceehaquas is a fine country, particularly in pasture; on which account a great extent of it is occupied by the Dutch farmers, who have the care of furnishing the Dutch East-India ships with provisions, which they are enabled to do, by means of the abundance of cattle, and excellent salt-pits found in this territory. A Dutch guard is placed in this country for the security of the salt-pits and cattle, and to send notice to Cape Town when any ship comes within view of the coast. These people, and indeed most of the other Hottentots, move from place to place in their respective districts, for the benefit of fresh pasture. When the grass in any meadow is rank, they set fire to it, and the ashes meliorate the soil, and improve the next crop. Hence the country is frequently seen in a blaze for the space of several miles round; and if the flames in their progress enter into any other territory, it infallibly occasions a war between the two nations. The Dutch at the Cape burn the grass for the same reason, but stop the progress of the flames with much more discretion. In order to impede the fury of the fire, they cut trenches round the place, which limits it to the spot designed to be manured, but the indolent Hottentots would rather cause an universal conflagration, than give themselves so much trouble.

20. The Gorenhaiconas, or Ghunjemans, dwell promiscuously with the Dutch, as they sold their country to those people, only reserving to each family a small portion of land just sufficient for the maintenance of their cattle, and retaining the privilege of hunting in the grounds belonging to the Europeans.

The above names of the several Hottentot nations were not given to these people by the Europeans, but are rendered agreeable to the sound of those appellations by which they distinguish each other. Nor is the word Hottentot a word of derision, as some suppose, but the name by which these people have called themselves time immemorial.

The Hottentots and the Caffres have been often confounded together by writers, but they are a different people, having a considerable dissimilarity even in person and features, as the Caffres are totally black, and the Hottentots of a dark olive colour.

S E C T. IV.

The Natural History of the Cape of Good Hope, and the adjacent Country.

AT the Cape of Good Hope the weather is considered as divided into two seasons only, viz. winter and summer; or, the wet monsoon, and the dry monsoon. The wet monsoon begins in March, and the dry one in September; so that summer commences at the Cape about the time that it concludes with us. The inconveniences of the climate are, excessive heat in the dry season, and heavy rains, thick fogs, and unhealthy north-west winds in the wet season. Thunder and lightning are never known here but in March and September. Water seldom freezes, and when it does, the ice is but thin, and dissolves upon the least appearance of the sun. In the hot weather the people are happy when the wind blows from the south-east, because it keeps off the sea-weeds, which otherwise would float to the shore, corrupt there, and be very troublesome by infecting the air, and causing dreadful head-aches.

The inhabitants of this country usually prognosticate what weather will happen by the appearance of two remarkable clouds which frequently hang over the summits of two mountains, called Table-Hill and Devil-Hill. These clouds are at first but small, but gradually increasing, they at length unite, and envelop both mountains, when a terrible hurricane soon succeeds. The violence of the winds does great damage to the corn and fruits, and endangers any shipping that happen to be near the coast; but at the same time it purifies and occasions a brisk circulation of the air, which greatly contributes to the health of the inhabitants.

A gentleman who resided many years at the Cape, says, "The skirts of this cloud are white, but seem much compacter than the matter of common clouds. The upper parts are of a lead colour, owing to the refracted rays of light. No rain falls from it, but sometimes it discovers great humidity; at which time it is of a darker colour, and the wind issuing from it is broken, raging by fits of short continuance. In its usual state the wind keeps up its first fury unabated for one, two, three, or eight days, and sometimes a month together. The cloud seems all the while undiminished, though little fleeces are seen torn from the skirts from time to time, and hurried down the sides of the hills, vanishing when they reach the bottom; so that during the storm the cloud seems supplied with new matter. When the cloud begins to brighten up, those fleeces fall, and the wind proportionably abates. At length, the cloud growing transparent, the wind ceases. During the continuance of these south-east winds, the Table-Vally is torn by furious whirlwinds. If they blow warm, they are generally of short duration, and in this case the cloud soon disappears. This wind rarely blows after sun-set, and never longer than towards midnight, though the cloud remains, but then it is thin and clear. But when the wind blows cold, it is a sure sign it will last for some time, an hour at noon and midnight excepted, when it seems to lie still to recover itself, and then lets loose its fury anew."

The water of the ocean near the Cape is of a green colour, owing principally to the coral shrubs, and the weed called *tromba*. The first, while in the water, are green and soft; but, when exposed to the air they grow hard, and change their colour to white, black, or red. The latter are 10 or 12 feet in length, hollow within, and when dry become firm and strong. They are often formed into trumpets, and produce an excellent sound.

The rivers of this country, which have their source in the mountains and glide over a gravelly bottom, are clear, pleasant, and salubrious; but most other streams are dark, muddy, and unwholesome. Here are a few brackish springs, whose waters, medicinally used, greatly purify the blood, and several natural warm and hot baths, which are singularly efficacious in various disorders. In Waveren colony are three hot springs, the most particular of which is Black-Hill Bath. The

mould of this hill is of the colour of jet, light, greasy, and so soft, that the feet of horses sink into it. The waters are used in scorbatic, leprous, and chronic disorders, being strongly impregnated with saline and steely particles. In fine, the reputation of the Cape waters is so great, that every Danish ship returning from India is obliged to fill a large cask with the clear sweet water which abounds here, for the particular use of the king of Denmark.

The Cape yields excellent clay both for the purposes of making bricks and earthen ware; white and red chalks are found in abundance; the former is used by the Dutch to whitewash their houses, and the latter by the Hottentot women to paint their faces. Various bituminous substances of several colours are found in Drakenstein colony, particularly a kind of oil which trickles from the rocks, and has a very rank smell. It is medicinally used as a purgative by the Hottentots, who indiscriminately take it themselves, and give it to their cattle. Many of the hills yield excellent stones of a hard nature, and very proper for building. Sand stones are found in the running waters, and the country produces many quarries of lime stone, which, however, is but seldom used, as the mortar in general is made of muscle shells. Whetstones, touchstones, and flints are common; but the most valuable stone is found in a quarry near the Cape. This is of a red colour, veined with white and spotted with blue; it takes an admirable polish, and in beauty exceeds the finest marble. With respect to minerals, silver ore has been found in some of the hills; the Namaqua Hottentots bring copper to trade with the Dutch from some mountains which are situated about 300 miles from the Cape; and iron mines are common.

The soil in general about the Cape consists of a clayey earth; and is so fat that it requires but little manuring. It produces all the necessaries, and most of the luxuries of life.

All kinds of European grain, oats excepted, thrive well here; but many of the vegetables in the cultivated parts suffer greatly from caterpillars, mildews, and the incursions of wild beasts. The elephants in particular often break the inclosures, and do great mischief among the corn.

In speaking of agriculture, it is to be observed, that the Europeans of the Cape, and their lands, are implied; for the Hottentots in general detest the very idea of cultivation, and through their beloved indolence, would sooner starve than till the ground.

Ploughing is here so laborious, from the stiffness of the soil, that it frequently requires near 20 oxen to one plough. The sowing season is in July, and the harvest about Christmas. The corn is not threshed with a flail, but trod out by horses or oxen on an artificial floor made of cow-dung, straw, and water, which, when mixed together, cements, and soon becomes perfectly hard. It is laid in an oval form; the cattle are confined by halters, which run from one to the other, and the driver stands in the middle, where he exercises a long stick to keep them continually to a quick pace. By this method half a dozen horses will do more in one day, than a dozen men can in a week. A tythe of the corn belongs to the Dutch company as a matter of right, and the rest they purchase at a price stipulated between them and the husbandmen, according to the kindness of the season, and nature of the crop.

Besides what trees might originally grow here, many exotics have been transplanted from Europe and India; so that the Cape now produces oak, fir, camphire, pine, cypress, orange, lemon, citron, quince, pomegranate, apricot, apple, pear, peach, fig, plum, chestnut, walnut, and almond trees. The cinnamon tree hath likewise been brought from Ceylon, and succeeds tolerably. The vines of Germany and Persia have been introduced, and thrive exceedingly; so that the most inconsiderable husbandman is not without a vineyard. The rocks are planted in rows, but that they should not be injured by the south-east winds, they are never suffered to grow above two feet high, or three at the farthest. It is remarkable that they produce more here in the third year, than the European vines do in the fifth. The wine itself is strong, mellow, and delicious; the vintage continues

tinues from the beginning of February to the latter end of March, and the wine bears a great price all over India. Aloes are the spontaneous product of the place, and afford an agreeable fragrant. The cripple tree has broad leaves, knotted branches, and bears fruit like a pineapple. The bark is used by tanners, and sometimes medicinally by the Cape physicians. The amauqua tree grows to the height of about ten feet, it produces white blossoms, and a fruit like the pea, only very large, which grows in pods, is of a brown colour, oval form, and astringent taste. When a branch of this tree is lopped, a beautiful gum flows from the aperture, and the wood, when dry, is exceedingly hard. Here is a tree as large as the oak, which is with great propriety denominated the stink-wood tree, because whenever the carpenters cut it, or attempt to work it with a tool, it yields such an abominable stench, that they can scarce endure it; yet it is so finely clouded, and takes such a beautiful polish, that great quantities of furniture are made of it, and especially as the bad smell subsides in time.

The dakha, a kind of wild hemp, is used as a substitute for tobacco, and when mixed with the latter is called bulpach, and smoked in great quantities by the Hottentots. The karma-root has many qualities of the Chinese ginseng, and produces the same effects as opium, on which account the Hottentots hold it in the highest esteem. The spiræ or bukhu plant, is another favourite vegetable, for the Hottentots pulverize the leaves when dry, and with the powder, which is yellow, powder their hair; in fine, of the trees, plants, shrubs, roots, and flowers at the Cape, the natives are of various kinds and admirable qualities, and most of the exotics thrive so greatly, that they exceed those of the same species in the countries from whence they were brought; in particular, the head of a Cape cabbage will often weigh 40, and a potatoe 10 pounds, though the seeds of both originally came from Europe.

The various colonies and settlements at the Cape are well stocked with tame cattle and domestic animals, as the woods and mountains are with wild beasts. The oxen are large and fine, and the sheep numerous, with tails weighing near 20 pounds; the mutton is excellent, and the fat is used by the Hottentots in general, and even some Europeans, as a substitute for butter. Both are sold exceeding cheap to the Dutch, but the latter make any other Europeans, who touch at the Cape, pay dear for them. The horses, which were brought originally from Persia, are of a bay or chestnut colour, and rather small, and the dogs have a very unpleasing appearance, and are of little use.

With respect to wild animals, the elephant claims the first place, but differs in nothing from those found in other parts, and which have already been described. When the Hottentots can neither procure tobacco, or dakha, they smoke elephants dung, and seem to relish it highly.

The rhinoceros has a hard skin, which is difficult to pierce with a sword, is of a dark ash colour, and has a snout like a hog; a horn projects about two feet from his nose, resembles a plough-share, and is of a dingy grey colour; with this he tears up the ground, rips up the elephant, to whom he is a mortal enemy, pulls up trees by their roots, and throws large stones over his head to a great distance. Another horn of about six inches in extent, turns up from his forehead. His legs are short, his ears small, and his sense of smelling surprizingly acute. When he scents any thing, he pursues in a right line, and tears up every thing in his way; but it is one happiness that his eyes are exceedingly small, and so fixed, that he can only see straight forward, so that it is easy to avoid him by slipping aside, as he is a long time in turning himself, and longer still in getting sight again of the object. He will not however attack a man unless provoked, or unless he is dressed in scarlet. When he has killed him, he licks the flesh from his bones with his rough tongue, which is like a rasp. He feeds principally on shrubs, thistles, and a plant which resembles the juniper, and which, from his fondness of it, is called rhinoceros-bush. The blood, skin, and horn of this animal are medicinally used, and are said to be very efficacious in various disorders. Wine poured into cups

made of the horn, bubbles up in a strange kind of fermentation, and appears as if boiling. If a small portion of poison is put into the wine, the cup spits; but if poison only is poured into the cup, it flies into a thousand pieces. Hence cups made of the horn of the rhinoceros, are deemed excellent safeguards to such as drink out of nothing else; and, on that account, independent of their salutary qualities, are highly valued.

The Cape wolves are of two kinds, the one resembles a sheep-dog, is spotted like a tyger, and has a head like a bull-dog; his hair is frizzled, his tail short, and his claws sharp. The other is like an European wolf; but both generally conceal themselves till night, when they prowls about and do great mischief.

The Cape likewise abounds with lions, tygers, leopards, &c. which are so troublesome, that the perion who kills one of either species, is rewarded with 25 florins, or 50 shillings. The fat of the lion is much valued here, and his flesh esteemed equal to venison.

The buffalo is much larger than in Europe, and of a brown colour. The horns are short, and curve towards the neck, where they incline to each other. Between them there is a tuft of hair upon the forehead, which adds to the fierceness of the look. The skin is exceedingly hard, and the flesh rather tough. He is a strong, fierce creature, and, like many other animals, enraged at the sight of any thing red.

The elk is very large here, being five feet high, with horns a foot long. It is a very handsome creature, having a beautiful head and neck, slender legs, and soft smooth hair of an ash colour. They run swift, and climb the rocks with great agility, though they usually weigh about 400 pounds each. The upper jaw is larger than the other, the tail about a foot long, and the flesh, by the Cape epicures, is said to exceed the best beef.

One of the most singular animals at the Cape is, the creature called stink-breeches, or stink-box. It is about the size of a common house dog, and made much like a ferret. This beast receives its name from its horrid stench both living and dead. When pursued it can stink away those who follow it, and if killed the smell is so odious, that none can approach the carcase.

The horns of the hart do not branch like those of Europe; but the roebuck is, in every respect, like ours. The goats are of various species, particularly one called the blue-goat, which is of a fine azure colour. The spotted-goat is larger than the other, and beautifully marked with brown, white, and red spots. The horns are a foot long, and the flesh is fine eating. The tame-goat is much like the European. The rock-goat is no larger than a kid, but very mischievous in the plantations. The diving-goat is much like the tame one, and receives its name from its method of squatting down in the grass to hide itself. There is another animal called a goat, but without any additional appellation; it is of the size of a hart, and extremely beautiful; the hair on the back and sides is grey, streaked with red, and that on the belly white; a white streak passes from his forehead to the ridge of his tail, and three others surround his body in circles. The female hath no horns, but those of the male are three feet in length, and the flesh of both is exceeding delicate.

Here are several sorts of wild cats; the first the Dutch call the civet-cat, not that it is really the animal so denominated, but because of the fine scent of its skin. The next is called the tyger-cat, from its being very large, and spotted like a tyger. The third species is termed the blue-cat, from its colour; as it is of a fine blue tinge, with a beautiful red list down its back. A fourth sort is the mountain cat, which, as well as the tame cat, exactly resembles those of Europe.

The rats and mice are like ours, and indeed some have affirmed, that there were none at the Cape till the Europeans carried them thither. But this must be a mistake, as there is a species peculiar to the country, called the rattle-mouse, which is about the size of a squirrel, and makes a rattling noise with its tail, on which account it receives its appellation; it is very nimble, resides among trees, lives upon nuts and acorns, and purs like a cat.

The

from one of its protuberances, without great care, turns to a mortification.

The sea-spout resembles a piece of moss sticking fast to the rocks; it is of a green colour, emits water, and within is like a tough piece of flesh. It exhibits no signs of animation, but by distilling clear water from several small holes on being touched.

Some affirm that sea-lions are found here; and an accurate author says, "a sea-lion was shot basking on the rocks in Table-bay in 1707: it measured about 15 feet long, and as many in circumference; his head much resembled that of a lion in shape, but had no hair, nor had he either hair, or scales on his body. The tongue was all fat in a manner, and weighed above 50 pounds. The colour of his skin was yellowish. Before, he had two short legs footed like a goose, in the place of hind legs; he had two broad fins, each about eighteen inches long; his body tapered to a tail, ending like an half moon. He yielded several barrels of oil."

That singular production of nature, the torpedo-fish, or cramp-ray, is found at the Cape. The body is circular; the skin soft, smooth, and yellow, marked with large annular spots; the eyes small, and the tail tapering. It is of different sizes, and weighs from five to fifteen pounds. The narcotic, or benumbing quality of this fish, was known to the ancients, and hath furnished matter of speculation to the philosophers of all ages.

If a person touches it when alive, it instantly deprives him of the use of his arm, and even has the same effect if he touches it with a stick. Kempter, in speaking of this creature, says, "The instant I touched it with my hand, I felt a terrible numbness in my arm, and as far up as my shoulder. Even if one treads upon it with the shoe on, it affects not only the leg, but the thigh upwards. Those who touch it with the foot are seized with a stronger palpitation than even those who touch it with the hand; this numbness bears no resemblance to that which we feel when a nerve is a long time pressed, and the foot is said to be asleep; it rather appears like a sudden vapour, which passing through the pores in an instant, penetrates to the very springs of life, from whence it diffuses itself all over the body, and gives real pain. The nerves are so affected, that the person struck imagines all the bones of his body, and particularly those of the limb that received the blow, are driven out of joint. All this is accompanied with an universal tremor, a sickness of the stomach, a general convulsion, and a total suspension of the faculties of the mind. In short, such is the pain, that all the force of our promises and authority, could not prevail upon a seaman to undergo the shock a second time. A negro indeed that was standing by, readily undertook to touch the torpedo, and was seen to handle it without feeling any of its effects. He informed us that his whole secret consisted in keeping his breath; and we found upon trial, that this method answered with ourselves.* When we held in our breath the torpedo was harmless, but when we breathed ever so little its power took place."

The powers of this fish decline with its strength, and entirely cease when it expires. This benumbing faculty is of double use to the torpedo; first, it enables it to get its prey with great facility, by rendering other fishes insensible with its touch, and consequently incapable of getting from it; and secondly, it is an admirable defence against its enemies, as by numbing a fish of superior force with its touch, it can easily escape. The narcotic power of the torpedo is stronger in the female than the male, but the flesh of both is good to eat, not having the least pernicious quality.

According to Appian, it will numb the fishermen through the whole extent of hook, line, and rod.

- "The hook'd torpedo ne'er forgets its art,
- "But soon as struck begins to play its part,
- "And to the line applies its magic fides;
- "Without delay the subtle power glides
- "Along the pliant rod, and slender hairs,
- "Then to the siltier's hand as swift repairs.

* Experience hath since proved, that this expedient will not always prevail, as the shock hath been sometimes found

"Amaz'd he stands, his arms of fence bereft,
"Down drops the idle rod; his prey is left:
"Not less benumb'd than if he'd felt the whole
"Of frost's severest rage beneath the Artic pole."

S E C T. V.

Of the People called Hottentots.

THE Hottentots have a very strange idea of their origin, as they imagine their first parents came into Caffreria through a little window, by the command of Tikwoa, or the great Deity; that their principal business was to keep cattle, and consequently the business of their descendants ought to be the same.

Some have affirmed, that the Hottentots, when born, are as black as Negroes, and others have insisted, that they are as white as Europeans. But more recent and authentic information hath contradicted both these assertions; for from the best authorities, we find that they are of a bright olive colour, which by continual greasing, gradually grows darker, and at length imbibes a tinge nearly approaching to a jet black.

The Hottentots are well made, of a good habit of body, and very robust. The men are from five to six feet in height, the women rather shorter; the feet of the former are broad and hard, those of the latter small and tender. Both sexes have large eyes, thick lips, and flat noses; but the last mentioned are so made by being depressed in infancy; their hair is short and woolly, and the nails of their fingers and toes are like claws, as they never cut either; they are seldom known to be deformed by any unnatural distortion, yet nature has bestowed on the female Hottentots an exuberance which to all other people, by being disgusting to the eye, appears as a deformity; this is an excrescence of callous flesh, which, in the form of a short apron, covers such parts as decency teaches others to hide, and thus shields from view in those who have not the least idea of modesty, what a kind of innate delicacy instructs all other females to conceal. These people are exceeding strong, surprisngly active (when they choose to stir), and amazingly swift of foot, which latter circumstance renders them excellent huntmen; and obliges the Dutch governor of the Cape continually to keep a good troop of light-horfe, to pursue them upon various occasions. In the use of their arms they are very dextrous, directing their arrows and rackum-sticks with astonishing exactness, and using their assegays with such inimitable address, as to ward off stones, arrows, &c. the same as with the most ample shield.

Idleness is the most sublime pleasure the Hottentots wish to enjoy, and strong liquors the greatest delicacy their inclinations can prompt them to crave. Thus habitually addicted to laziness and drunkenness, it is no wonder that they look upon business as the worst of torments, and sobriety as the saddest misfortune. A certain author says, "reasoning with them is working, and working is the capital plague of life. Though they are daily witnesses of the benefits and pleasures arising from industry, nothing but the utmost necessity can reduce them to work. This love of indolence and liberty is their all; compulsion is death to them." Sometimes indeed their idleness will give way to their propensity for drinking strong liquors, and they will sacrifice the former to obtain the latter. But this purpose is no sooner effected than they again sink into their beloved indolence, and take no pains about any thing, but how to get drunk with all convenient expedition. "Supply them (says the above cited author) with brandy, or strong liquors, and tobacco, and they will drink till they cannot stand, smoke till they cannot see, and roar till they cannot hear." Both sexes are equally guilty of this vice, and the consequences of intoxication are frequent quarrels. When well heated with liquor, they usually find something to fall out about; words produce blows, a battle royal ensues, and after having drubbed each other heartily, they lie down altogether like beads, snore

very great, though the breath was held. Climates, however, in this may make a difference.

like swine, and having slept like dormice, get up, give themselves a shake, and part as good friends as ever.

Odious as this description may appear, more polished nations are not without innumerable members, who, to the scandal of human nature, can drink as much, and be as brutish, as a Hottentot; who, as Shakespeare says, love "to put an enemy into their mouths to steal away their brains; and with joy, pleasure, revel, and applause, transform themselves to beasts." And another ingenious writer justly observes, in speaking of drunkenness, that

"It makes the king and
"The peasant equal; for if they are both
"Drunk alike, they are both beasts alike.
"Drunkenness brings all out; for it brings all
"The drink out of the pot, all the wit out
"Of the pate, and all the money out of the purse."

Indeed the Hottentot, in the pursuit of this beastly sin, is much more excusable than the European; since the former looks upon all that gives him a transitory pleasure as a blessing, and therefore deems drunkenness a laudable practice. But the latter sins against conviction. He knows he is offending against Providence, nature, and the laws of society; yet he pursues the crime with as much avidity as the other, and will even argue in its defence, by pretending that he finds drink efficacious in driving corroding care from his breast, and disgusting reflections from his mind. Fallacious idea! Deluding hope! The guilty and unfortunate will in vain seek a remedy in drunkenness for their terrors, or fears, and look for the consolation which can only be found in repentance or patience; for after the intoxication fit is over, reflection returns with double force, and renders every pang much keener.

"I drank, I lik'd it not; 'twas rage, 'twas noise,
"An airy scene of transitory joys;
"In vain I trusted that the flowing bowl
"Would banish sorrow, and enlarge the soul.
"To the late revel, and distracted feast,
"Wild dreams succeeded, and disorder'd rest;
"And, as at dawn of morn, fair reason's light
"Broke through the fumes and phantoms of the night;
"What had been said, I ask'd my soul, what done;
"How slow'd our mirth, and whence the source begun?
"Perhaps the jest that charm'd the sprightly crowd,
"And made the jovial table laugh so loud,
"To some false notion ow'd its poor pretence,
"To an ambiguous word's perverted sense;
"To a wild sonnet, or a wanton air,
"Offence and torture to a sober car.
"Perhaps, alas! the pleasing stream was brought
"From this man's error, from another's fault;
"From topics which good-nature would forget,
"And reason mention with the last regret.
"Unhappy man! whom sorrow thus, and rage,
"To different ills alternately engage;
"Who drinks, alas! but to forget; nor sees
"That melancholy sloth, severe disease;
"Men's confus'd, and interrupted thought,
"Death's harbingers, lie latent in the draught;
"And in the flowers that wreath the sparkling bowl,
"Fell adds his hiss, and poisonous serpents roll."

PRIOR'S SOLOMON.

Strong as this propensity to drunkenness appears in the Hottentots, yet their integrity is so great, that they will not touch any liquors committed to their charge; so that the Europeans at the Cape would sooner intrust a Hottentot, than one of their own people, with the care of their brandy, as they are certain that the former will sacrifice his desire to his fidelity, but dubious whether the latter will not dispense with his fidelity to gratify his desire. Hence the character for moral honesty of a drunken Hottentot, is superior to the character of any other drunkard in the universe.

When poverty compels a Hottentot to work for a Cape European, or when necessity obliges him to labour for a wealthier person of his own nation, he agrees, for a certain time, to be the servant of either; and during the stipulated term, is faithful, diligent, and obedient; but

as soon as the time of his servitude is expired, neither intreaties, menaces, or promises, can induce him to do any thing more. He receives his wages, but finds the greatest recompence in being permitted to retire to privacy, and enjoy them in his darling and delectable indolence.

The Hottentots, when they have more children than they can maintain, or when their parents grow too aged and infirm to maintain themselves, expose them in some lone hut to be starved to death, or devoured by wild beasts, and these cruelties they practise under the pretence of kindness, affirming it is better that children should die than be brought up in poverty; and that diseased age should perish, than continue longer in misery. Some indeed will not give those reasons, but plead the customs of their ancestors, of which they are scrupulously tenacious; and this palliate serves them not only upon these, but upon many other occasions; for as a Hottentot hates to think, and will not argue, the plea of custom furnishes him with an excuse upon all occasions, and serves him as a general answer to all questions.

As nastiness is the natural consequence of laziness, it is reasonable to conclude, that these are a very filthy people; in fact, they are the most disgusting in the universe, both with respect to dress, and diet; and so exceedingly nauseous to an European, that it is disagreeable to converse with them except in the open air; and then to gain the windward of them is necessary.

Yet with all his faults, a Hottentot has many virtues. He is sincere in friendship, disinterested in his professions, and endued with universal philanthropy, in the case of old people and children excepted; he looks upon himself as the brother of any one in distress, and relieves him to the utmost of his power with the most benevolent freedom; in fine, according to the poet, he seems exquisitely

"To feel the luxury of doing good."

The integrity and strict regard to justice of the Hottentots, are the admiration of the Cape Europeans. Their manners are simple, and their hearts unknown to dissimulation. If a stranger travels through their country, he is cheerfully and humanely received every where, and injured no where. Every village contributes to his accommodation, but not an individual will do him the least wrong.

The Hottentots have only ten numerical terms, which they repeat twice to express the multiplication of the first term, and three times to express the re-multiplication of the latter. Their language is very inarticulate and defective; one word signifies several things, the definitive meaning being determined by the manner of pronouncing, and the pronunciation is so harsh and confused, that they seem to stammer in all they speak. Hence, though they are easily taught to understand other languages, they can seldom be brought to speak them with any degree of intelligibility. For the satisfaction of the curious, we shall here subjoin a small

HOTTENTOT VOCABULARY.

Khauna, a lamb.	Koukuri, iron
Kgou, a goat.	Konkerekery, a hen.
Bunqvaa, trees.	Thoukou, a dark night.
Knoum, to hear.	Tkounce, rice.
Quaqua, a pleasant.	Ghouldie, a sheep.
Ikaka, a whale.	Toys, the wind.
Horri, beasts in general.	Ttkaa, a valley.
Knabou, a fowling-piece.	Ikoonoklau, gunpowder.
Qu-are-ho, a wild ox.	Kamkamoua, the earth.
Ounequa, the arms.	Quouuw, thunder.
Quienkha, to fall.	Duckatere, a duck.
Likhancee, a dog.	Kamina, water.
Konkequa, a captain.	Quayha, an ass.
Quas, the neck.	Naew, the ears.
Quan, the heart.	Kirri, a stick.
Kgoyes, a buck or doe.	Nombha, the beard.
Tikqupa, a goat.	Ka-a, to drink.
Komma, a house.	Durie-ka, an ox.
Khoaa, a cat.	Hek-kaa, an ox of burden.

Ounvie,

Ounvie, butter.
Houtoo, a sea-dog.
Bikqua, the head.
Kamma, a flag.
Kouquil, a pigeon.
Anthuri, to-morrow.
Kou, a tooth.
Khamouna, the devil.
Hakqua, a horse.
Koo, a son.
Kammo, a stream.

Tika, graze.
Toqua, a wolf.
Koonqua, the mouth.
Khoo, a peacock.
Gona, a boy.
Gois, a girl.
Khoakamma, a haboon.
Kerbanhou, a star.
Mu, an eye.
Tiquafouw, a tyger.

NUMERICAL TERMS.

O'ku, one.
K'kam, two.
Kouna, three.
Kakka, four.
Koo, five.

Nanni, six.
Honko, seven.
Khiffi, eight.
Kheffi, nine.
Ghiffi, ten.

We shall now proceed to describe the dress of the Hottentots: that of the male consists of a mantle, made either of the skin of a tyger, a wild cat, or sheep, according to the circumstances of the wearer. These mantles, or crosses are worn either open, or close, as the weather requires: in summer the hairy side is turned outwards, and in winter inwards: and these garments serve them not only for apparel in all seasons, but for quilts at night, and winding sheets when they are dead. In fine weather they go bareheaded, but in rainy seasons they wear a kind of cap or bonnet made of some skin, fastened with two strings and tied under the chin. In saying bareheaded, we must except the fat, dirt and filth, with which they perpetually load their hair without ever thinking of cleaning it, and which forms a kind of crust resembling black mortar, that envelopes the head in a very filthy and strange manner. Impending from a collar about their neck is a greasy pouch which contains their pipe, tobacco, knife, dakha, and a little stick burnt at both ends; the latter being to preserve them against the effects of witchcraft. On the left arm they have three ivory rings, an oval covering before them, leather stockings when they herd their flocks, and sandals made of the hide of an ox, or elephant, when they cross rivers.

In travelling they carry a stick of about three feet in length, and an inch in diameter, which is called a kirtl, and serves both as a walking stick, and defensive weapon: another stick called the rakkum, which is a kind of dart, is their offensive weapon, which they throw with great exactness; and to a third little stick they tie the tail of a fox or wild cat, and this is their substitute for a handkerchief, for with this they blow their nose, or wipe away the sweat; when dirty they wash it in the first water they come near, and afterwards trundle it about like a mop till it is dry.

The Hottentot women sometimes wear spiral caps, but in general they go bareheaded; they usually make use of two mantles they go bareheaded; they usually make use of two mantles over their shoulders, and wear an apron both before and behind, fastened round the waist; before them they generally carry a bag to contain provisions, tobacco, and other articles. Girls wear rings of bull-rushes tied round the legs, but after passing 12 years of age, slips of sheep, or calf skin, are substituted; and of these some women have four or five score, which are compacted together with great nicety, and by continual wearing contract extreme hardness: These rings are deemed great ornaments, and at the same time are mighty useful in preventing the legs from being scratched in passing through the woods.

The Hottentots are fond of brass buttons, or other pieces of the same metal, and bits of glass to them are as valuable as diamonds to other nations. They admire ear-rings, and any trinkets for the head, particularly those made of glass or brass, and some even ornament their heads with blown up bladders of the beasts they kill, which they fasten to their hair, and leave to dangle behind them. Both sexes powder their heads and faces with a gold coloured dust, made of the herb spiraea; and the women spot their faces with a kind of red chalk. The Hottentots in general rub themselves from head to

foot with sheep's fat, or butter, mixed with the black soot from their boiling-pots or kettles; and the greasy jet-gloss it gives them is deemed the most essential mark of beauty. The difference in this respect, between rich and poor, is, that the former procure fresh butter to rub themselves, and the latter are content with ranc butter or stinking fat. These anointings at once gratify their vanity, supple their limbs, and by filling up the pores prevent the intense heat of the sun from penetrating to exhaust their strength and vigour.

The general food of the Hottentots is of several kinds, viz. roots, fruit, milk, the flesh and entrails of wild beasts, and of their domestic cattle: but the latter they seldom make use of, except pressed by necessity. Entrails they look upon as much more delicious than the flesh itself of any animal: these they dress in blood and milk; and the epicures, among them, deem this a most savory dish. They often go a fishing, and sometimes eat the fish they catch, provided they have scales, as fish without scales are prohibited; the fat of fish, however, they hold in the utmost abhorrence. The women cook their victuals, except upon certain occasions, but neither sex eat at any particular hour, always leaving it to their appetites to point out the time. The flesh of swine is forbidden to both sexes, but women are permitted to eat hares and rabbits, though men are not; and on the contrary, men may drink the pure blood of beasts, and eat molts, though both are forbidden to women.

They are in general so exceedingly filthy in their appetites, that they eat the vermin with which they swarm; and if reproached for this nauseous custom, make the law of retaliation their plea, and gravely answer in a proverbial expression, which may be thus rendered,

Is it not just, to catch, and eat

Those things that wou'd make me their meat:

If they bite me, and I bite them,

Think who's to blame, and then condemn.

The Cape-Europeans wear a common sort of shoes made of the raw hide of an ox; these when old and thrown away, the Hottentots carefully gather up, soak them a considerable time in water, and after broiling them on a fire, make a very hearty meal of them. None of these people use salt in their diet natural to them, and those who by residing in the European colonies accustom themselves to seasoned dishes, are not near so healthy as their countrymen.

Their common drink is milk or water, but they always prefer wine, or spirituous liquors if they can get them. And it is observable that the men and women never eat or drink together. Both sexes are fond of tobacco; and when a Hottentot lets himself out to hire, a certain quantity of this weed is just to be a part of the stipulated wages.

The villages of these people are called Kraals, each consisting of about twenty or thirty small huts, removable at pleasure: the huts are built close to each other, forming a circle; and some Kraals are so populous as to contain 500 inhabitants; there is only one narrow entrance to each village, which is usually situated near some river; the materials of which the huts are built, are sticks and mats; the latter being made by the women of bull-rushes and flags, in so compact a manner as not to admit the rain to penetrate. The huts themselves are of an oval-form, 14 feet by 10, and the richer Hottentots not only cover them with mats in common with the rest, but with skins likewise. The entrance is only three feet high, and too wide, so that they are obliged to creep into these hovels on all fours, and squat down when they are there. The door is only a skin which draws up, and lets down; the fire place is a hole in the center; and the bedsteads are separate holes round the sides: the residue of the furniture consists only of a few pots for cookery, cups for drinking, and earthen vessels to hold butter and milk. We must not omit as one of the family a guard dog, which every master of a family keeps to mind his cattle.

Upon the failure of pasture, or the death of an individual, the Hottentots always remove their Kraals, and on mixing upon a new spot kill a sheep or an ox, in order

Ounvie,

order to have an † *Anderfnaaken*, or feast; indeed upon all remarkable occurrences they have an entertainment, upon which occasions, a booth is erected of new materials, adorned with boughs and flowers, and situated in the center of the kraal: The flesh of the beast killed is served up to the men in the booth, and the broth is given to the women and children without. These festive meetings usually conclude with music, singing, and dancing. The musical instruments are, the greater gongom, which is a bow of iron, or olive wood, strung with sheep sinews; at one end of the bow a quill is placed upon the string, and a cocoa shell is fastened to it by two holes; the mouth is applied to the quill, and the player blows, and modulates his breath, as if playing on a Jew's harp. The lesser gongom differs from the former only in being smaller, and wanting the cocoa shell. The Hottentot drum is made of earthen ware, and covered with sheep skin, braced on with sinews. And the vocal music is confined to about half a dozen songs, and a frequent repetition of the word ho, by way of chorus. In dancing, the men squat down in a circle, "when, (says a modern author) the gongoms are heard, the women begin to rub with their fingers on the por-drums; all the rest sing, ho, ho, ho, and clap their hands; then several couple present themselves to dance, but only two couple enter the ring at a time, performing face to face; when they begin, they stand at about ten paces distant, and are about fifteen minutes dancing before they meet; at times they dance back to back, but never take hands, and one dancing bout lasts about an hour." They dance in their religious ceremonies, when a peace is made, when a wild beast is killed, when they have received any peculiar benefit, or are released from any particular calamity, &c. &c.

The Hottentots, from their uncommon activity, and great dexterity in discharging and throwing their missive weapons, are excellent hunters. In hunting an elephant, rhinoceros, or any other wild beast, they attack him with their assegays, and goad him till he drops down with the loss of blood. If the beast turns upon any one, he nimbly avoids him, and another immediately attacks the animal behind, in order to draw his attention from the first; thus he is harassed to death by his nimble enemies, and wounded in many places by an unceasing attack. Elephants are sometimes taken by digging a hole, in the path through which they go to their watering places, fixing a stake in the center, and covering it over with boughs. When an elephant falls into one of these holes, the stake runs into him, and entangles him, till the Hottentots surround the place and kill the beast; when dead the flesh serves to feast the kraal, the skin is applied by the hunters to various uses, and the teeth are usually sold to the Europeans.

When a single Hottentot kills a wild beast he is knighted, the ceremony of which thus: All the men of the village squat down and form a circle; the champion squats upon a mat in the center, and the most ancient person of the kraal covers him with a copious stream of urine, which the champion rubs in with great avidity; a pipe of tobacco is then lighted, which the company alternately smoke round, and then the ashea are strewed on the new knight. After receiving this honour, his wife must not approach him for three days, at the expiration of which time he kills a sheep, treats his neighbours, receives his wife again, and fastens the bladder of the beast killed to his hair, which he ever after wears as a badge of his knighthood. Thus we may perceive that honours are sought for in all regions, and the lowest people aim at peculiar distinctions.

- † From frozen poles, to parch'd and burning plains,
- † Wide o'er the world, the thirst of glory reigns;
- † Inspires alike the savage and the sage,
- † Glows in each breast, and shines through ev'ry age;
- † Mounts from the lowly cottage to the throne,
- † Spreads far, and wide, and bears thro' ev'ry zone."

In sitting, either with net, or angle, the Hottentots by

far exceed the Europeans in skill; and they are deemed some of the most expert swimmers in the universe.

Hottentot marriages are made by the parents, or nearest relations; if the female does not approve of the match, she is obliged to remain with the bridegroom all night; if he forces her to consummation, she is compelled to be his wife; but on the contrary, if she preserves herself uncohabited, she is ever after free from him. The day after the nuptials an ox is killed to feast the company, who not only eat the flesh, but smear themselves with the fat, powder each other with bukhu, and paint themselves with red enalk.

The marriage ceremony itself is thus performed; the men squat in a circle, as indeed they do upon most other occasions, and the bridegroom is placed in the center; the women squat and form another circle, to surround the bride; the priest then goes from one circle to the other, and alternately urines on both bride and bridegroom, who make furrows with their nails in the graze with which they are plastered, in order to rub in the precious libation. The priest then pronounces the benediction in these words, "May you live happily together, may you have a son before the year's end, may he be a good huntsman, and a great warrior."

They boil meat in the same manner as the Europeans, but in roasting they make a stone red hot, then wiping the ashes off, they lay the meat upon it and cover it with another hot stone; then making a fire round the whole, the meat is soon ready. In eating, they are very nasty, instead of plates they use filthy earthen pots, their greasy krosses serve them for table cloths, and their substitutes for knives, forks, and spoons, are shells of fishes.

When they have dined, a pipe is filled with tobacco, which they smoke all round, every one taking two or three whiffs, and then handing it to the next. It is singular, that though the Hottentots are immoderately fond of spirituous liquors, music and dancing, yet they do not drink the first, or practise the latter at weddings. Polygamy is permitted, yet the richest seldom take above three wives, and marriages are prohibited between first and second cousins on pain of death. The portion of a son is usually two cows, and two sheep, and of a daughter one cow and two sheep; but the latter are to be returned to the father, if the bride dies without having had any children; on the contrary, if she ever bore any children to her husband the portion becomes his, even though the children are desunct.

Divorces are admitted, if the party can shew sufficient cause to the heads of the village, but adultery is punished by death. A man who hath been divorced may remarry, but a woman may not while her husband lives; and when a widow has a mind to marry again she must give a severe proof of her inclination to enter a second time into the nuptial state, for she is obliged to lose a joint of her little finger. And this is repeated for every husband she happens to marry after the first.

A new born child, after having had its nose crushed, is always rubbed over first with fresh cow dung, afterwards with the juice compressed from the stalks of the African fig, then with sheep's fat or melted butter, and lastly, he is well powdered with bukhu. Male twins occasion great joy to the parents; if the twins are female they destroy the weaker, and most ill favoured, and if male and female, the latter is sure to be put to death. When a child is still born they deem it a bad omen, and immediately remove their kraal to another place. After a child has been smeared, daubed, greased and powdered in the manner above mentioned, the mother gives it what name she thinks proper, which is usually the name of some wild beast, or domestic animal. When the woman is well again, and able to leave her hut, she rubs herself all over with cow dung; and this filthy daubing is by these delicate people termed a purification. Being thus delightfully perfumed, and elegantly decorated with sheep's guts, she is permitted to go abroad or see company at home.

The eldest son hath great privileges in the family, and is encouraged to be a kind of tyrant over his brothers

† This is a Dutch term, which they have adopted,

signifying... No change for the better.

and sisters. At about ten years of age, the males are always deprived of their left testicle; the operation is performed with a dexterity that would surprize an European surgeon, and bad consequences are seldom or never known to ensue. A sheep is killed, and great rejoicings are made upon the occasion, but it is to be observed, that the men devour all the meat, and allow the women nothing but the broth. The reason of this absurd custom of mutilating their male youth is unknown, some of the Hottentots say it is to make them run swift; but the greatest part of these people give their general reason, which they use upon all occasions, when they are unable to account for any of their absurd practices, viz. *That it had been the custom of their ancestors time immemorial.*

At the age of 18, the male Hottentots being deemed men, are thus admitted into male society: The men of the village squat down and form a circle, as is usual upon most other public occasions; the youth squats down without the circle, at some distance. The oldest man of the kraal then rises from the circle, and having obtained the general consent for the admission of a new member, he goes to the youth, acquaints him with the determination of the men of the kraal, and concludes his harangue with some verses, which admonish him to behave like a man for the future; and which may be thus rendered into English.

Since this fair day, you man commence,
Learn mainly actions, manly sense;
No trifling thoughts should now infect
Your mind, or discompose your breast:
Your mother's company refrain,
And, till you wed, the female train;
Their haubles poison will impart,
Unhinge your mind, unman your heart,
Draw you from actions that will raise
Your fame, and gain you greatest praise,
Depart not from your noble plan,
But be in *thought—word—deed*—a man.

The youth being then daubed with foot and fat, and well sprinkled with urine, is congratulated by the company in general in a kind of chorus, which implies the following wishes:

May good luck thy steps attend,
May'st thou live long and dally mend;
Soon may a beard thy chin adorn;
To thee may many babes be born;
Till 'tis conspired throughout the nation,
You're useful in your generation.

A feast concludes the ceremony, but the youth himself is not permitted to participate of any part thereof till all the rest are served. Being thus admitted into male-society, it is expected that he should behave ill to women in general, and to his mother in particular, in order to evince his contempt of every thing feminine. Indeed it is usual for a youth as soon as admitted, to go to his mother's hut and engulf her heartily, for which he is highly applauded by the whole kraal, and even the suffering parent herself admires him for his spirit, and protests that the blows do not give her so much pain, as the thoughts of having brought such a mettlesome son into the world afford her pleasure. The more ill-treatment he gives his mother, the more esteem he obtains; and every time he strikes her, she is in the highest raptures, and thanks Providence for having blessed her with such a spirited child. So ingregiously will custom impose upon the understanding and counteract the very dictates of nature.

A Hottentot never obtains an establishment, or in other words, never is permitted to have a hut or cattle previous to his marriage, but lives immediately under the direction of his father after 18, as he did with his mother before that age. As soon as he is married, his wife becomes his slave, does all the drudgery, and has all the care of domestic affairs upon her hands. The husband sinks into supineness, and gives himself totally up to idleness; if he ever stirs, it is now and then to go a hunting or hunting for a little amusement, or if he knows a mechanical business he may perhaps teach it to his eldest son. Upon no other occasion will he quit his beloved indolence, or show the least alacrity, unless indeed he happens to receive an invitation to get drunk. Then

joy sparkles in his eyes, and elates his heart, and he thinks he never can make too much haste to render himself a greater brute than nature hath thought proper to make him.

The Hottentots who continue to live up to their ancient simplicity, are seldom afflicted with diseases; but those who are servants to, or reside among the Cape-Europeans, and eat and drink as they do, contract many disorders, unknown to their ancestors. Physic and surgery is but one profession among them. Their physicians are excellent botanists, and often perform cures that astonish the Europeans, by their skill in the knowledge of herbs, plants, &c. In bleeding they are only provided with a common clasp knife and a strap; when they have taken away as much blood as is thought necessary, the orifice is closed and rubbed with mutton fat, and then the leaf of some herb is bound over it. In pains of the stomach and cholicky complaints they use cupping, the cup being made of the horns of an ox. They understand how to expel poisons by poisons, or to prevent their effects by antidotes; and with respect to dislocations they are exceeding skilful, compressing the joints, and rubbing it with warm fat till they reduce it to its proper situation. Fractures they are unacquainted with, for, by Kolben's account, the oldest Hottentots he had ever conversed with could not recollect an accident that had ever occasioned one. The head-ach is cured by shaving the head in furrows, which operation, like bleeding, is performed with a common knife only; as is likewise the amputation of the widow's fingers when they would marry again. And for a foul stomach or stomaclic pain, the juice of aloes taken in warm broth is used.

The Hottentots are exceeding superstitious, and fond of divination. In order to know the fate of a sick person they slay a sheep alive; after having its skin entirely taken off, if the poor animal is able to get up and run away it is deemed a propitious omen; but on the contrary, if the execrating pain kills it, they imagine that the patient will certainly die, and accordingly give him up entirely to nature, without taking any farther care of him.

The Hottentot physicians are much more disinterested than those of politer countries, as they prescribe gratis, and think the honour of having done good a sufficient recompence for their pains. Each village hath usually two, who are chosen from the wisest and most experienced of the people, to be the guardians of the public health. The Europeans who reside at the Cape, are in general healthy; the small-pox and measles are not so malignant as in most other countries. The bloody flux usually attacks new comers, and the principal disorders among the Cape-Europeans, are sore eyes and sore throats in both sexes, and sore breasts in the women; but the country produces many efficacious remedies, which are usually applied with success when wanted. When a Hottentot falls sick, his friends make a doleful noise around him; but when he expires, their howlings become truly hideous. A corpse is always bent double, and being tied neck and heels, it is wrapped up in the kros, or mantle of the deceased: they usually bury the body in a cleft of the rock, or the den of some wild beast, as they are too lazy to dig a grave, if they can find one ready made. They inter their dead six hours after they expire, or at least six hours after they fancy they expire; for it is imagined that many are buried alive by this precipitation. Previous to the funeral, the men and women squat down in separate circles before the hut of the deceased. The body is then brought out, not through the door, but through the side of the hut, the mats being loosened for that purpose; sluring the whole ceremony, the company clap their hands, and cry *ha, ha, ha*. The corpse is then followed without order, only each sex keeps separate from the other, when the howlings and grimaces are truly ridiculous. The grave is filled up with the mould of ant-hills, and well secured from the depreduations of wild beasts, by being heavily covered, and defended with wood and stones. The company then return to the hut, squat down as before, each sex in a circle, and renew their yellings; a signal is then given for them to cease this hideous noise, when the two oldest men in the village step into each circle, and urinate upon the company, who tub in the precious liquor with singular satisfaction. Afterwards entering the hut of the deceased, these elders take

up a handful of ashes each, with which they powder the mourners: This ceremony, at the decease of rich persons, is repeated several times, but the poor have it only once performed; the latter likewise only mourn by shaving their heads, but the former give an *anderfaken*, or feast; when the lamentations are concluded, at which time a sheep is killed, and the cawl, well powdered with bakhu, is put about the neck of the heir to the defunct, who is obliged to wear it till it rots off, as a memorial of his respect for the dead.

S E C T. VI.

Political, Civil, Ecclesiastical, and Military History of the Hottentots.

EVERY Hottentot nation, or tribe, is governed by a chief, who is the general in war, the president of the public assembly in peace, and the ambassador to negotiate with other tribes or nations upon all occasions. This officer, who is called *Konquer*, is highly esteemed in his public capacity, and his office is hereditary, but not regal; for as soon as the public business is dispatched, he sinks into a private character, and has no other respect shown him, but as being an elder of his own particular village. The *konquers* of the nations in alliance with the Dutch, are upon public occasions distinguished by wearing coronets made of brais, which the Dutch governors present them with in token of friendship.

When a *konquer* is installed, he is obliged to engage to do all in his power for the service of the community, and to guard the privileges of the people from infringement: an ox and two sheeple are then killed, and an entertainment given, in which the men have the flesh, and the women the broth: but the next day the case is reversed, for the *konquer's* wife gives another treat, when the men have the broth: and the women the meat.

The next subordinate officer is the *kraal-captain*; every village hath one, who is the magistrate of his own district, and his office is hereditary. In time of war he leads the men of his own *kraal*, and acts as their captain, receiving his orders from the *konquer* or general; his badges of distinction are the skin of a tyger thrown over his shoulders, and a walking cane with a brais head in his hand. In his civil capacity he tries the people of his village for all crimes, except treason; charges of that nature being heard before the *konquer*, and all the *kraal-captains* in a general assembly, when a majority of voices decides the matter. After the *konquer* and *kraal-captain*, the physician of the village is the most distinguished person, and the two former as well as the latter are perfectly disinterested in what they do, not receiving the least pay or reward for their trouble; but considering their offices as wholly honorary, and consequently deeming it their duty to serve the community without any recompence. Hence in legal matters, neither corruption or delay are known; justice is summary, plaintiffs and defendants plead their respective causes, and judgement is usually given according to equity. In cases of murder, adultery, theft, &c. if the delinquent's conscience tells him that the evidence is so plain that conviction must follow of course, he avoids a trial (if possible) by making his escape, and flying for protection to the *hulhis* or *banditti*, as any of the other villages would deliver him up again. When a criminal is seized upon the first accusation, or in attempting to escape, the elders of the village proceed directly to trial, and if the culprit is convicted, a public execution upon the spot is the immediate consequence; the *kraal captain* is the principal executioner, and strikes the delinquent on the head with the *kirri* stick, when the rest rush upon the captive, and complete the execution, by beating the body almost to a mummy, and breaking many of the limbs. After this public example, and retribution to the laws, the memory of the deceased suffers no stigma, his corpse is as honourable interred, as if he had rendered some signal service to the state, and the surviving relations never receive any reproach on account of the delinquency of the dead.

A celebrated writer tells us, "When a difference happens between two villages of the same nation, it is referred to the judgement of a national court, who, when it forms its resolutions, executes them with as much steadiness and rigour as a Roman senate. The Europeans may boast of their learning, arts, and politeness;

but where among them can they show so wise, so happy a government as that of the Hottentots; owing entirely to this, that it has for its basis the most perfect liberty of the people."

The father's inheritance generally descends to the eldest son only; and legacies bequeathed to any other person are void without the will of the heir. If a parent means to provide for his younger children, he must do it by giving them cattle in their life time; sometimes indeed the eldest son is not so well provided for as another child who happens to be a greater favourite; for the father will by various artifices persuade the former to resign his birthright to the latter; after which resignation the elder born can never recover his patrimony. The heir has an absolute power over his sisters, who dare not marry without his consent, and is under no obligation, but to maintain his father's wives till they die or marry again.

In war the Hottentots have very little conception of discipline, nor indeed is it possible they should, for the only method of raising an army is for the *kraal* captains to order the people to follow them; the only method of maintaining one is by hunting as they march; and the only way of deciding a dispute between two nations, is by fighting one battle; the success of which determines the whole affair. In an engagement they attack with an hideous yell, fight in great confusion, and put more confidence in their war-oxen than their own skill; for these animals when trained to the business are better disciplined, and much more formidable than the Hottentots themselves. The motives of war with these people are usually three, viz. 1. Trespassing on each others districts. 2. Stealing the cattle, or 3. Running away with the wives of their neighbours. The first is the most general cause of quarrel; but it is to be observed, that by trespassing upon each others grounds, the trampling over fields, or feeding cattle in meadows belonging to others, is not the only thing meant; the principal offence being setting fire to the grass in one district, and suffering it to extend to another. In these wars it is common for the weaker or vanquished party to apply to the Dutch, and the appearance of an European detachment soon reconciles them; when the Dutch are rewarded for their interference with a quantity of cattle. In the wars of the Hottentots, the different nations shew great generosity of sentiments; they never plunder the dead, but suffer their friends to bury them, and dispose of their arms as they think fit. They give no encouragement to deserters, but put them and spies indiscriminately to death.

Besides *kirri* and *rakkum* sticks, they are armed with bows, arrows, and *assagayas*: the bow is usually made of olive wood, strung with the sinews or guts of some beast, and fastened by iron hooks at each end; the arrow is about 18 or 20 inches long, made of cane, bearded, and pointed with iron; the quiver is made of the hide of an elephant, ox or elk, and fastened to the shoulder by a strap; the *assagay* is a kind of half pike, about five feet in length, with a plate of iron tapering to a point fixed at the end. These weapons they make with tolerable neatness, use them with amazing dexterity, and generally poison them previous to the attack of an enemy, or a wild beast.

An Hottentot's idea of riches is the possession of cattle and according to the number possessed, the wealth of the possessor is estimated. These people when poor let themselves out to hire for a certain stipulated time, their wages to be wholly paid in cattle, and a daily allowance of tobacco, or *dakha*, at least. Having thus procured cattle, at the expiration of their time of servitude they set up for themselves, and sink into the embraces of their beloved indolence.

The cattle of every village feed in common in two herds, the great in one, and the small in the other; the men of the *kraal* watch them alternately, and the women milk them morning and evening. Cows milk is indifferently drank by both sexes, but the milk of ewes only by the women, as the other sex deem it a mean beverage. They make butter in the following singular manner: The churn is the skin of a wild beast, with the hair turned inwards, which being made into a kind of sack, is filled with milk, close fastened, and shook about by two persons till the butter comes. This butter is exceedingly filthy, yet the Cape-Europeans, who purchase great quantities of it, have a method of cleansing it, so

as to render it saleable to the crews of ships that touch there; the butter-milk is given the calves and lambs, and sometimes, though abominably nasty, drank by the Hottentots themselves. At night they secure their cattle, by placing the smaller within the area of the kraal, and the larger fastened two by two to the outside of the huts: upon the approach of any wild beast, the latter, by their exquisite smell, are sensible of it, and begin a general lowing, which gives the alarm, and rouses the hottentots to prevent the mischief that might ensue. These people are singularly skillful in training their bakkeisers, or wa-oxen, who will fetch in strayed cattle like a bulldog, and, when ordered, attack men or wild beast with great fury; yet their masters can whistle them off from an antagonist at their pleasure: each village has about half a dozen of these, who well know and are obedient to every person belonging to that kraal, but will run with great fury at any stranger. The young ones are taught by having their horns fastened to and being obliged to go about with an old one; upon the whole these animals are exceedingly serviceable to the Hottentots, both in war and peace. The carriage oxen are likewise very useful, and quite tractable, being managed by reins fastened to a sled which runs through their nostrils.

Every village hath a cattle doctor, but if any of the cattle die naturally, every individual of the kraal claims a share, and let the disorder be what it will they devour the carcase. When a hottentot disposes of his cattle he usually chooses to sell the oxen and rams, not caring to part from cows or ewes. At certain times they thinly spread fire over a large piece of ground, some of the men make a lane on each side, and others drive the sheep through it, as a kind of purification; * if the sheep are frightened and break through the ranks it is judged an ill omen, if they go quietly through it is deemed a good.

Thus the riches of the Hottentots consist wholly in cattle, their commerce is carried on entirely by barter; they therefore trade with the Europeans at the Cape with the produce of what they rear up, or what they hunt down; such as cattle, great and small, skins of wild beast, elephants teeth, ostriches eggs, &c. in return for which they receive brandy, wine, tobacco, tobaccopipes, daks, coral, beads, small looking-glasses, kaffina-root, bits of brass and copper, iron, knives, &c. A Hottentot will not sell a set of his arms, or even a single weapon, upon any consideration.

It is the general urbanity of these people, and their integrity when any confidence is placed in them, that an European in company with the Hottentot may travel through the whole country in the most perfect security. The bulshis or banditti are indeed sometimes dangerous, but the Hottentot nations in general hold them in abhorrence, and unanimously concur in seizing, and punishing them upon all occasions.

From the dexterity the Hottentots shew in some few handicraft trades, it is evident that did not their prevailing indolence prevent it, they would be very expert at others.

The Hottentot smith and brazier not only works in iron and copper, but melts the ore himself. This he effects thus: after making two holes in the ground, the one to melt the ore, and the other to receive the metal, which is to pass through a small communicating channel, he kindles a fire round the former, and when it is thoroughly heated, puts in the ore, and heaps the fire upon the whole. The ore soon melts, and the metal runs into the smaller hole. When cool it is taken out, broken to pieces, heated again, and heat into the form wanted. But the most surprising circumstance is, that the workman, in all these operations, has nothing but a little fuel, and a few stones to work with. His anvil is a stone, his hammer a stone, his file a stone, and his burnisher to polish his work a stone.

The butchers are skillful, but cruel in killing a beast, as they think the longer the creature is dying, the greater relish it gives to the flesh. To kill a sheep they rip its belly open, take out the entrails, broil some of them, and stew the rest in the warm blood of the animal. They skin very quick, dissect with dexterity, and boil the bones of all the cattle they kill, in order to extract

* Some affirm it is to make their fleeces smell of musk, and that while that scent remains wild beasts will not attack

the marrow to anoint their bodies therewith. Hides and skins they rub well with fat as soon as taken from the beasts, to render them tough, smooth, and secure the hair from falling off: this is the only operation if they are intended for sale; but if they design the skin for their own wear, it is afterwards covered over with cow-dung, and dried in the sun. When the skin is caked, and the skin sinks abominably, it is deemed fit for wear: for a Hottentot cannot endure a garment that does not fend forth a most horrid stench. The tanner, indeed, rubs the hair with wood ashes, sprinkles it with water, rolls up the hide, and lets it dry in the sun; which expedients effectually bring off the hair: the skin is then well greased, stretched out, and dried again, when it is deemed good leather.

A Hottentot taylor works with a needle made of the bone of a small bird: his thread is the sinews of beasts split, and dried in the sun; while shears, scissars, and knife are all comprised in a sharp shell. With these he is exceeding dextrous, and works with great expedition as well as exactness.

The ivory turner makes the ivory rings that are worn ornamentally about the arms; and considering that his only tool is a common clasp knife, which he procures from the Dutch, the workmanship has great merit.

The women are the mat-makers, and these they weave in so compact a manner, that rain cannot penetrate them, though they are only made of bulrushes, flags, or reeds. Of the same materials their ropes are made, yet they are very strong and durable.

All the Hottentots make their own arms, and their own earthen-ware; so that all the men at least are armours and potters. Their earthen ware is made entirely of ant-hills, in this manner, they cleanse the earth from stones and gravel, and then knead together the mould and the ant eggs which are found among it. This paste is then made into vessels with the hand, which, when dried, are very strong, and of a shining jet-black colour. It is remarkable that all the Hottentot vessels are of one form, which is exactly that of a Roman urn.

It is not an easy matter to come at a Hottentot's religious notions; he is sparing of his words, and laconic in his answers upon all occasions; but when religious topics are introduced, he generally conceals his sentiments in silence. Some on this account have doubted whether the Hottentots have any religion at all; but the most intelligent among the Dutch at the Cape positively affirm, that they believe in a supreme being, whom they stile *Gounya Tequoa*, or *God of gods*, and fancy that his place of residence is beyond the moon. They allow that *Gounya Tequoa* is a humane benevolent being, yet they have no mode of worshipping him; for which they give this reason, "That he curst their first parents for having greatly offended him, on which account their posterity have never paid him adoration since."

They, however, adorn the moon, and at the full and change sacrifice cattle, and make offerings of milk to that luminary. Their mode of adoration is by strange grimaces and distorted postures, singing, dancing, screaming, and prostration, which they continue the whole night.

The gold beetle is another of their deities, for whatever place this insect lights upon is deemed sacred. Whenever it happens to fly into a kraal, they pay it the greatest respect, a sheep is killed as a thanks offering, the people of the village are in the greatest raptures, and the women is supposed to insure them some future happiness. If it lights upon a Hottentot of either sex, that person is ever after deemed a saint; a fat ox is killed on account of this strange canonization, and the new-made saint is obliged to wear the caul twisted round his or her neck till it rots from thence; so that the stench from this, added to the usual fumes, renders the person so distinguished a favourite saint indeed, as to oblige an European to keep a most reverential distance. Deceased persons, if they have done any thing remarkable in their lives, are likewise venerated by the Hottentots, who consecrate mountains, woods, groves, rivers, trees, &c. &c. to their memory, and shew particular respect whenever they pass them.

them; which is very probable, for as these animals are terrified as fire, they may be alarmed by the scent of the musk. They

They say the evil deity, or, in other words, the devil, whom they call Tonquo, is a crooked, crabbed, malicious, mischievous being: that he is their peculiar enemy, and occasions all the misfortunes they suffer. They therefore worship him to put him in a good humour, and sacrifice to him, that he may pass by them without playing some unlucky trick. All misfortunes that come unexpectedly, diseases which they cannot cure, or accident whose cause is beyond their comprehension, they ascribe either to Tonquo, or witchcraft; for which reason they have many ridiculous charms, incantations, amulets, &c. to avert, mitigate, or drive away the evil. They have not any notion of future rewards and punishments, heaven or hell, but they entertain some faint glimmering ideas of the immortality of the soul.

The Dutch represent the Hottentots as exceeding obdurate of heart, and difficult to be convinced of the propriety of any opinion but their own; for, says an accurate writer, "If you attempt to reason with them, they hear you sullenly, or quit you abruptly. They avoid, if possible, entering on any religious topic. Some of them have dissembled a belief of Christianity; but when the motive was removed, they always returned to their native idolatry. In spite of all the endeavours of the Dutch missionaries at the Cape, they have not been able to make a single convert. M. Vanderfel, governor of the Cape, took a Hottentot child, and had him educated in the Christian religion, and in the manners and customs of the Europeans: he was clothed richly in the Dutch fashion, learned several languages, and discovered a very promising genius. The governor seeing him so qualified, sent him to the Indies with a commissary-general, where he was employed in the company's affairs till the commissary died, when he returned to the Cape; a few days after, at a visit among his Hottentot relations, he stripped off his European dress, and equipped himself in a sheepskin. In this wretched figure he bundled up his cloaths, and presenting them to the governor, said, 'Be pleased, Sir, to take notice, that I for ever renounce this apparel; I do likewise for ever renounce the Christian religion. It is my design to live and die in the religion, manners, and customs of my ancestors: I only beg you will grant me, as I am sure you will, the hanger and collar I wear, which I will keep for your sake.' Without waiting for a reply, he flew to the woods; where he mixed with his relations, studied their customs, degenerated into their manners, and could never after be drawn from that mode of life by the most persuasive eloquence of the greatest promises, though both were frequently used to recover him to civilized society."

SECTION VII.

Of the Dutch Possessions at the Cape of Good Hope, and the M^ode by which they are governed.

THE scheme of settling a colony at the Cape was not entered into by the Dutch till the year 1650, when M. Van Riebeck, a surgeon on his return from India, observed the conveniency of the place for a settlement, and laying before the Dutch East-India company a plan of its eligibility, the scheme was approved, and the proposer appointed governor. This gentleman sailing with four ships to the Cape, entered into a negotiation with the people, who, in consideration of various commodities to the value of 50,000 guilders, or 4375l. sterling, agreed to yield up a considerable tract of country about the Cape to the Dutch.

To secure his new purchase, Van Riebeck immediately erected a strong square fort; and, to render the place as commodious and agreeable as possible, he laid out a large garden, and planted it with a great variety of the productions of Europe.

The settlement being thus successfully begun, the Dutch company, in order effectually to establish it, proposed that every man who would settle three years at the Cape, should have an inheritance of 60 acres of land, provided that during that space he would so improve the estate, as to render it sufficient to maintain himself, and contribute something towards the maintenance of the garrison; and at the expiration of the time, he might either keep possession of it, or sell it, and return home. Induced by these proposals, many went to seek their fortunes at the Cape, and were furnished on

credit with cattle, grains, plants, utensils, &c. The planters at length grew weary of their habitations for want of conjugal society, and the governors of the company, to prevent their leaving the place, provided them with wives from the orphan houses, and other charitable foundations. In process of time they greatly increased, and spread themselves farther up the country, and along the coast, till they occupied all the lands from Saldanna Bay, round the southern point of Africa, to Noffel Bay on the east; and afterwards purchased Tierra de Natal, in order to spread their limits still farther. Hence the Dutch possessions may be considered under four different heads, viz.

1. Cape
2. Stellenbost
3. Drakenstein
4. Waveren

} Colony.

Of these we shall respectively treat, after having prefixed a few particulars concerning the Dutch government at the Cape.

The public administration of affairs in this celebrated African settlement consists of eight establishments, viz.

1. A grand council.
2. A court or college of justice for capital matters.
3. An inferior court for the discussion of petty affairs.
4. A matrimonial court.
5. An orphan court.
6. An ecclesiastical council.
7. A common council.
8. A board of militia.

The governor presides over the great council, has a double vote, and is assisted by eight of the company's principal officers resident at the Cape.

The second court, or college of justice, is composed of the members of the grand council, in conjunction with the three chief burghmasters of the Cape town.

The inferior court consists of a president, who must be a member of the great council; of three Cape burghers, one of whom acts as vice-president; of the company's clerk; and three other of their immediate servants.

The matrimonial court inspects different matters, but consists of the same members as the last-mentioned court.

The orphan court is composed of seven members, viz. the vice-president of the great council, three of the company's servants, and three Cape burghers.

The ecclesiastical council consists of the three pastors of the three reformed churches here, six elders, or churchwardens, and twelve overseers of the poor.

A court of common-council is established in every Cape colony; each of these is composed of burghers, chosen out of the lists prepared by the burghesses of each colony.

The boards of militia are two in number, viz. the Cape-town board, which consists of a member of the great council, and nine of the principal military officers of the Cape colony; and the board for Stellenbost and Drakenstein colonies, in which the land-drost of Stellenbost colony presides, and is assisted by nine military officers of both colonies.

With respect to the power of these several courts, The first takes cognizance of every thing which concerns commerce; institutes, and repeals laws, and likewise hath authority to declare war, or make peace with the nations in the vicinity of the settlement.

The second tries all capital cases in civil and criminal causes; but an appeal lies from this court to Batavia and Holland.

The third is instituted for the determination of actions for small debts, and for trespasses; so that no action can be entered here which exceeds 100 crowns.

The fourth inspects the validity of the marriages of Europeans at the Cape, or grants permission for their celebration.

The fifth takes care of orphans, and prevents those who have fortunes from marrying before the age of 25.

The sixth distributes money to, and takes care of the poor.

The seventh collects taxes, and punishes criminals, particularly slaves, within its own jurisdiction.

The

The eighth cloaths the militia once a year, and sends out horsemen in pursuit of runaway slaves.

A tithe of the produce of all lands is paid towards sustaining the government. The duties on brandy, wine, tobacco, and beer, are farmed at 5250*l.* per annum; and the profits of other merchandizes amount to 75 per cent. The expences of the government are estimated at 30,000*l.* annually, out of which 600 servants, and 600 slaves are maintained, and the governor's income is valued at 450*l.* a year.

The Dutch are very indulgent to those who settle here, and give great encouragement to the Cape Europeans upon all occasions; nor are they less solicitous to cultivate the friendship, and conciliate the affections of the different Hottentot nations. They generally live in amity with them, and are so much respected as to be chosen arbiters in most of their quarrels. Deputies from the principal of these nations frequently wait on the Dutch governor with presents of cattle, &c. when they are hospitably entertained, and sent back again laden with what is equally agreeable to themselves in return.

We however find, that on the first settlement of the Dutch at the Cape, all the Hottentot nations did not acquiesce in the sale of the country to foreigners; for the Gonyemains dissented from the agreement of the others, and in 1659 disputed the possession of the purchased territories with the Dutch. They always made their attack in stormy and boisterous weather, as thinking the fire-arms then of less use and efficacy; and upon these occasions they would murder indiscriminately all the Europeans they could meet, burn down their houses, and drive away their cattle. A Hottentot, named by the Dutch Donnan, who had resided for some time at Batavia, and afterwards lived at Cape Town, at length retired to his countrymen, persuaded them that it was the intent of the Europeans to enslave them, and stirred them up to this war. They accordingly took up arms, and being headed by this Donnan, and another chief called Garabinga, committed great depredations. The Hottentots themselves at last grew tired of the war, when 100 of them, belonging to one nation, came unarmed to the Dutch fort, with a present of 13 head of excellent fat cattle, in order to sue for peace. Thus, it may be imagined, was readily granted them by the Dutch, who were heartily sick of a contest, in which themselves were the greatest losers.

Soon after a chief of another nation, with a considerable number of attendants, came in a friendly manner to the Cape, when, according to the Dutch writers, "the governor, for their entertainment, ordered a tub full of brandy, with a woollen dill in it, to be set among them: when the men began to be intoxicated, about two or 300 little pieces of tobacco were thrown among them, in scrambling for which they made a horrible noise. The noise and hurly-burly over, they began to leap and dance with several strange gestures; the women in the mean while clapping their hands, and continually singing, or rather roaring out, *Ho, ho, ho, ho.*" Having slept till they were sober, they were dismissed with presents of coral, copper, brass, tobacco, &c.

I. CAPE COLONY.

THIS colony extends from the Cape itself to False Bay, and is separated from Stellenbosch colony by a desert of considerable extent, which reaches from the Cape to Saxeburgh, a plantation so called.

The hills of this district are, the Tyger-Hills, Cow-Hill, Lion-Hill, Table-Hill, Wind-Hill, Blue-Hill, or Blue-Mountain, the Norwegen-Hills, and Bush-Hill.

The Tyger-Hills receive their denomination from their singular appearance, as they seem spotted and coloured exactly like the skin of the animal after whom they are named. These hills have great fertility, are near 25 miles in circumference, and the farthest is about four miles distant from the Cape. Upon these eminences are 22 estates, the possitors of which have not only a good mansion-house to each, but great quantities of cattle; some having three or 400 hundred head of large cattle, and above 1000 sheep.

Cow-Hill is near 20 miles from the Cape, but the

land and water being very indifferent, it is not so well settled as the former.

Lion-Hill extends northward from Table-Valley to the ocean. Its name is deduced by some from the resemblance it bears to a lion, when viewed from the sea; but others affirm it was so called from having formerly abounded with lions. In a declivity between this and Table-Hill are two centinels continually upon duty, a cottage being erected there for their residence. Their business is daily to ascend to the summit of this hill, which they do alternately, by means of rope-ladders. The person at the top is able to descry a sail at the distance of 13 or 14 leagues at sea. As soon as he perceives a sail, he gives a signal to his comrade below, who goes to the forrests to give notice to the governor, while the remaining centinel hoists the Dutch flag, and discharges a two pounder. At the foot of this hill a little fort, mounted with four guns, was erected by the governor Simon Vander Stel, at the head of a small creek; it is, however, now gone to ruin.

The Table-Hill is the highest of any, being near 2000 feet in height. It is very fertile, being covered with vineyards, plantations, cattle, &c. The governor, among others, has a charming seat at this place, and two gardens, the one named Round-Bush-Garden, and the other Newland, are delightfully pleasant. The former receives its name from the fine lofty trees which agreeably shade it, and render it a cool retreat in the sultry months.

"Here waving groves a chequer'd scene display,

"And part admit, and part exclude the day;

"As some coy nymph her lover's warm address

"Nor quite indulges, nor can quite repress."

The latter hath its appellation from having been more recently made than the other. The scene is romantically charming, from its woody appearance; so that a stranger might fancy that the genius of the woods resided here, and imagine that he heard him thus exclaim in the words of Milton:

"Know that by lot from Jove, I have the power

"Of this fair wood, and live in oaken bowers

"To nurse the saplings tall, and curl the grove

"With ringlets quaint, and wanton winding wove;

"And all my plants I save from nightly ill

"Of noisome winds, and blasting vapours chill;

"And from the boughs brush off the evil dew,

"And heal the harms of thwarting thunder blue;

"Or what the cross dire-looking planet finites,

"Or hurtful worm with canker'd venom bites:

"When evening grey doth rise, I fetch my round

"Over the mount, and all this hallow'd ground;

"And early, ere the od'rous breath of morn

"Awakes the slumbering leaves, or tassel'd horn

"Shakes the high thicket, haste I all about,

"Number my flowers, and visit ev'ry spout."

This hill is finely watered, and, upon the whole, is very profitable to the company. In the center there is a prodigious chafin, where a number of trees grow in a very romantic manner; and, during the rainy season, the torrents gushing down here have a singular appearance.

Kolben informs us, that a short time previous to his arrival at the Cape, the people had observed, for near a month together upon this hill, something very shining and resplendent, which they fancied resembled a serpent with a crown upon his head, resembling a carbuncle. It frightened many, and none it seems had courage sufficient to attempt the discovery of what it was. But this absurd whim of imagining that a luminous vapour on the summit of a mountain resembles a serpent with a carbuncle on his head, is not peculiar to the conjurors at the Cape, for an ingenious writer informs us of a recent example of similar folly: "On the cape of Samos, says he, a very bright light is seen, which much resembles a star. The captain's mate said he had seen this light several times in his voyages by this island, and that it was said to be a large serpent, with a diamond on its head. Some of the Turk passengers said it was universally believed to be so, and that the Grand Signior had caused several attempts to be made in order to discover what it was; but that every one of them proved ineffectual, on account of the steepness of the cape; till in

the Holy Land,

* Hayne's Travels in several parts of Turkey, Egypt, and

the year 1763, some men contrived something like ropeladders, fixed iron hooks at the ends, and, by means of very long poles, hung them as high as they desired, then climbed up them, and discovered a monstrous serpent with young ones about it; but did not perceive any diamond on its head."

A silver mine was once discovered upon the top of this hill between two groves, known by the respective names of Hell and Paradise; but the Dutch have left off working it, as the profit was not found adequate to the expence.

The Wind-Hill, or Devil's-Hill, as it is termed by sailors, stands near the Lion-Hill, from which it is separated by a chafin or valley. It receives these appellations from the boisterous winds which break from the white cloud that often hovers over it; for when these hurricanes sweep down its sides, and issue through the cleft or chafin, they do great mischief to corn, fruit, houses, shipping, &c.

"The waving harvest bends beneath the blast;
"The forests shake, the groves their horrors cast;
"He flies aloft, and, with impetuous roar,
"Pursues the foaming surges to the shore."

This hill extends to the sea-side, and, together with Table Hill and Lion-Hill, encompasses a plain called Table-Valley, which, as well as the eminences, is tolerably fertile.

Blue-Hill, which is so called from the colour of its soil when seen at a distance, stands at about the distance of 25 miles from the Cape, and, by not being well provided with water, has only a few plantations about it, but it abounds in wild beasts.

The Norwegian-Hills are very craggy, and many in number; but as they are at a considerable distance from the Cape, four only are settled, and on these great quantities of cattle are reared; but on a fertile spot here the governor Vander Stel built a handsome country-house, a tith-house, a capacious stable, &c. &c.

Bush-Hill is so called from the trees and shrubs with which it abounds, and runs down to the coast to a place called Wood's Bay.

Of the rivers which water this colony, the Salt River is the principal: this is so called, because the waters towards its mouth, at Table-Bay, are brackish, but at its source in Table-Hill it is sweet, salubrious, and clear. Simon Vander Stel attempted to cut a canal of communication between this river and Falzo Bay, but soon desisted, on being convinced that it would neither answer the design, or reimburse the expence.

The Mussel or Mussel River is only a temporary one, which is formed in the rainy season, and falls from the mountains into the Salt River. Another stream, called Keyser's River, (from a German of that name drowned therein) is always stopped up in the dry season by the sand-banks which are raised by the violent south-east wind, and this, by throwing the water out of its channel, forms a considerable lake, till the wet season demolishes the sand-banks, and occasions it to flow again in a regular manner.

Besides these, many parts of the country abound with smaller streams, springs, fountains, cascades, natural and artificial canals, ponds, &c.

2. STELLENBOSH COLONY.

THIS colony was originally a wild country, overrun with shrubs, brambles, and brush-wood, and called at first by the Dutch Wild-Forest. At length the governor, Simon Vander Stel, cleared and settled it, when it received from him the name of Stel's-Bush colony, which was afterwards corrupted to its present name of Stellenbosh. This colony, which is separated from Cape Colony by a large sandy desert, is divided into four districts, viz.

1. Stellenbosh,
2. Hottentot Holland,
3. Mottegate,
4. Hottelary.

Of these we shall respectively treat in their proper order. 1. Stellenbosh district is surrounded by hills, has a wholesome air, fertile soil, and abounds with wood, pas-

ture, herbs, flowers, &c. The plantations are subdivided into vineyards, corn-fields, orchards, and gardens. The banks of Stellenbosh river, which falls from the mountains, are adorned with many commodious houses, and pleasant estates; the stream itself yields various kinds of small fish, and near Falzo Bay, into which it discharges itself, many of a larger sort are taken. A fine bridge passes over this river, which was erected by a public spirited gentleman at his own expence, in the room of one of a very narrow and inconvenient construction. Adrian Vander Stel erected another over a different part of this river, which has since been suffered to run to decay.

Stellenbosh village was accidentally burnt to the ground in 1710, but has since been rebuilt with redoubled lustre, and is now in a flourishing situation.

2. Hottentot-Holland is the most fertile part of Stellenbosh Colony, on which account great quantities of cattle are bred here for the company's use; besides the pastures there are many vineyards, gardens, and houses belonging to the several plantations.

This district, though formerly inhabited by scarce any thing but wild beasts, is now in general cultivated, and those voracious animals have been either destroyed, or driven to more remote and sequestered places.

Three rivets which rise in the hilly country and disembogue themselves into Falzo Bay, water this district; the one called Lawrence river, frequently overflowed, till a reservoir was made to receive its rapid waters, by which the mischief was prevented, and plenty of water retained against the dry season; a stream from this basin turns a corn mill, and a fort was formerly built upon the banks of the river, but the latter hath been suffered to run to decay. The other two rivers are less considerable, and have not as yet obtained any name; but it is singular, that fresh water fish will not live in either of the three, though the waters themselves are sweet.

From the Cape two roads lead to Hottentot-Holland, the one over the Sandy Downs in Tyger Valley, and the other over a mountain which has not yet been distinguished by any peculiar appellation; the former is the most commodious, and the latter the most pleasant, on account of the fine prospect it affords.

Falzo Bay is formed by the circumjacent mountains, viz. The Hottentot-Holland Mountains, the Norwegian Mountains, the Stone Hills, &c. It is about 30 miles in circumference, and has in the center a large rock rising considerably above the water, upon which a great number of sea birds breed, and have their habitations. The bay abounds with fish, and had once an established fishery here, which the company, for cogent reasons, thought proper afterwards to drop. Stellenbosh and Hottentot-Holland rivers empty themselves into this bay; and the rock which terminates it to the east, is called Hang-Lip Rock, from the affinity it bears to a lip hanging over a chin.

About the month of November, 1710, a most dreadful hurricane, which blew from the south-east, put the waters of this bay into a terrible commotion, and occasioned a flood which spread far into the country, where having done considerable damage, on its return to the bay incredible numbers of fish were left on dry land.

Sea-Cow-Valley, which is situated on one side of the bay, received its denomination from the number of sea-cows that formerly frequented it; so many however were continually killed here, that the rest grew shy of the place, and have found out much more secure retreats. In one part of this valley is a lake of about three miles in circuit, the waters of which in their natural state are sweet; but at certain times the waves of the bay overflow the valley, and mixing with the waters of the lake, impregnate them with salt, besides leaving a quantity of fish behind; these on the return of the sea water live while the saltness continues, but as soon as the lake water recovers its natural sweetness, they die for want of saline nourishment. This lake is prodigious reedy, and a great number of wild ducks, with various birds, breed among the flags.

3. Mottegate district lies to the north of Hottentot-Holland, and was so called on account of the mellowness of the soil, occasioned by the frequent floods which entirely overflow it, and render it muddy; for the word motter implies muddy. The waters, however, at the same time that they make the roads bad, give an uncon-

mon degree of fertility to the soil; so that this district is not inferior to any of the others with respect to houses, inhabitants, produce, &c. The advantages of these inundations are many, and the few inconveniences might be easily remedied, or at least palliated by the erecting of bridges, and cutting dykes; which improvements, as necessity must point out their utility, and the inhabitants have both timber and industry, we have reason to believe will take place.

4. Bottelary district, which is the most northern part of the colony, receives its name from the quantity of hay made in it, which exceeds all that is made at the Cape besides. On an elevated ground, called Joffen Hill, are several plantations, consisting of vineyards, orchards, pastures, farms, cattle, nurseries, &c. Fuel and water are very scarce here; of the latter they have little but what the rains afford them, and this in the hot weather turns brackish in the dykes where it is preserved. To remedy the inconveniences arising from the want of wood, the company hath planted several acres of this district with trees, and enacted a law, that if any person presumes to cut a single twig, he shall be publicly and severely whipped by the common hangman.

3. DRAKENSTEIN-COLONY.

THIS colony was settled in 1775, principally with French refugees, and is under the direction of the governor, Simon Vander Stel, who gave it its present name, in compliment to his great friend and patron the baron Van Rheeden, lord of Drakenstein, in Guelderland.

This is a very large colony, extending northward to Saldanna bay, southward to the Turn-again mountains, eastward to the Drakenstein-mountains, and westward to Horse-mountain. The Drakenstein-mountains are high, steep, and rugged; hence travelling over them is tedious, fatiguing, and dangerous; on which account some term them the Vexatious-mountains.

A church and a water-mill are the only public buildings in this very extensive country, which though it contains many scattered farms in the several settlements, has not a single village.

The principal river is one which has its source in the mountains, whence it is named the Mountain-river. On both its sides are many good plantations, but it has no bridge over to facilitate communication. The waters of this river, after meandering through several districts, empty themselves into the bay of St. Helena.

The soil here is fertile though mountainous, the air serene considering the situation, and the water remarkably salubrious.

The road from Turnagain-mountain to the church is deep, narrow, and dangerous, being full of precipices, and infested by wild beasts; so that many have leaped down the former to avoid the latter, and perished by one danger in plunging another. Near this road a silver mine hath been discovered, but no permission hath been yet given to work it; and a noble mansion hath been erected, which is supposed to be one of the finest seats in Africa.

Simon's Valley is a noble estate, containing a stately dwelling-house, commodious wine-house, mill, gardens, orchards, vineyards, corn-fields, &c. And near here is a mountain called, from its height, the Babylonian Tower, on which are many good plantations.

Drakenstein church is one of the meanest buildings imaginable; the walls are exceeding low, and the roof is only made of reeds; nor are the decorations within superior to the appearance without. Near this plain salubrick is a market for the sale of groceries, small wares, &c. In the vicinity is the Pearl-mountain, so called from the vulgar notion of its summit resembling a pearl; it produces excellent mill-stones. The mountain named Riebeeck's Castle in high, steep, and deficient in water; once barracks were built, and troops posted here, as an advanced check upon the Hottentots; but recent treaties, and the amiable behaviour of those people having rendered such precautions unnecessary, the latter have been withdrawn, and the former suffered to run to decay.

At about a day's journey north of Riebeeck's castle is a district, called *Twenty-four Rivers*, from the variety of streams which water it, and render the passage excellent. The land is not cultivated, but granted by licence,

ver it is well inhabited, fertile, and abounds in cattle; the people here not being accommodated with either wind or water mills, grind their corn in little hand mills.

At the distance of a day's journey from Twenty-four rivers, are the Honey mountains, so called from the great quantities of wax and honey found in the clefts, which the Hottentots obtain with imminent danger of their lives, and sell to the Europeans. The white people here are greatly infested with the Hottentots fraily, idlers; they seldom cultivate any land, depending chiefly on their cattle; and what is singular, instead of eating bread with meat, they eat meat with meat, that is, a piece of dried venison with a piece of fresh mutton or beef. Their drink is water, milk, or honey-beer, which are so salubrious that they are seldom visited by diseases. About a day's journey from hence a few cattle feeders inhabit some high hills, called the Piquet-mountains, from the first settlers having been immoderately given to gaming, and in particular to playing at Piquet. The Hottentots intermix with the inhabitants of these two last places, and the greatest harmony subsists among them.

4. WAVAREN-COLONY.

THIS colony, which was settled in 1701, by the governor, William Vander Stel, is named after the illustrious Waveren family, to which he claimed relationship, and is the most easterly colony from the Cape; being the youngest settlement, the boundaries are uncertain; the mountains, which surround the greatest part, are not named; the lands are only licensed, the habitations are but huts, and the people in general but servants, as they have no cattle of their own, but take care of the cattle of persons belonging to the other colonies.

Between this colony and the Cape is a high, steep mountain, called the Red Sand Mountain from the colour of the soil; there is such difficulty in travelling over it, that the waggons are taken to pieces on one side, packed up and carried on the backs of the teams, and put together on the other side: near this mountain is a fertile place, called Blackland.

Having neither church, or council house, the inhabitants of this colony go for worship to Drakenstein church, for marriages or christenings to the Cape; and on account of legislative matters to Stellenboth.

The waters of this colony in general are good; and here are two hot baths, but it is dangerous to go to either, on account of the wild beasts which swarm in these parts.

S E C T. VIII.

TIERRA DE NATAL.

THIS country, which was likewise purchased by the Dutch, is inhabited principally by the Caffres, who are very different in many respects from the Hottentots, not greasing their bodies, or flaming in utterance. They, unlike the Hottentots, sow corn, brew a kind of beer, and build square houses with a sort of plaster. These people trade with the Arabians and rovers of the Red Sea, for silk, elephants teeth, coffee, &c. which they barter with the Europeans for cordage, anchors, tar, and other maritime stores; and again exchange with the former for various articles. As this district hath been but little penetrated by intelligent travellers, and is not yet properly settled by the Dutch, only a very slender account of it can be given, yet the most copious and ample that we have been able to trace we shall here present to the reader:

That part of the country which lies towards the sea is plain, champaign and woody; but within land it appears more uneven, by reason of many hills which rise in unequal heights above each other. Yet it is intermixed with pleasant valleys and large plains, and is chequered with natural groves and savannahs or meadows. Neither is there any want of water; for every hill affords little brooks, that glide down several ways; some of which, after several turnings and windings, meet by degrees, and make up the river of Natal, which discharges itself into the eastern ocean, in the latitude of about 30 deg. south. There it opens pretty wide, and is deep enough for small vessels. But at the mouth of the river is a bar, which has not above ten or eleven feet

water

water on it in a spring-tide; though within there is water enough. This river is the principal of the country of Natal, and has been frequented by some of our English ships. There are also other streams and rivers, which bend their courses northerly; especially one of a considerable bigness about 100 miles within land, and which runs due north.

"The woods are composed of divers sorts of trees, many of which are of very good timber, and fit for any use, they being tall and large. The savannahs are clothed with kindly thick grass. The land animals of this country are lions, tigers, elephants, buffaloes, bullocks, deer, hogs, conies, &c. Here are also abundance of sea-horses; buffaloes and bullocks only are kept tame, but the rest are all wild. Elephants are so plenty here, that they feed together in prodigious herds. Mornings and evenings they are seen grazing in the savannahs; but in the heat of the day they retire into the woods; and they are very peaceable if not molested; deer are very numerous here also, they feed quietly in the savannahs among the tame cattle; for they are seldom disturbed by the natives.

"Here are fowls of divers sorts, some such as we have in England, viz. duck and teal, both tame and wild, and plenty of cocks and hens, besides abundance of wild birds, wholly unknown to us. Here are a sort of large wild fowl as big as a peacock, with many fine-coloured feathers; they are very rare and shy. There are others like curlews, but bigger; the flesh of these is black, yet sweet and wholesome meat.

"The sea and rivers abound in fish of divers sorts, yet the natives do but seldom endeavour to take any, except tortoisés or turtles, and that is chiefly when they come ashore in the night to lay their eggs; though they have also another very odd way to catch turtle: they take a living sucking-fish, or remora, and fastening a couple of strings to it (one at the head, and the other at the tail) they let the sucking-fish down into the water, on the turtle ground, among the half-grown, or young turtle; and when they find that the fish has fastened itself to the back of a turtle, as he will soon do, they then draw him and the turtle up together. This way of fishing, they say, is also used at Madagascar.

"The natives of this country are but of a middle stature, yet have very good limbs; the colour of their skins is black, and their hair crisped; they are oval-visaged; their noses neither flat nor high, but very well proportioned; their teeth are white, and their aspect altogether graceful; they are nimble people, but very lazy, which probably is for want of commerce; their chief employment is husbandry. They have a great many bulls and cows, which they carefully look after; for every man knows his own, though they run all promiscuously in the savannahs; yet they have pens near their own houses, where they make them gentle, and bring them to the pail. They also plant corn, and fence in the fields, to keep out all cattle, as well tame as wild. They have Guinea corn, which is their bread; and a small sort of grain, no bigger than mustard-seed, of which they make their drink. Here are no arts or trades professed among them, but every one makes for himself such necessaries as need or ornament require; the men keeping to their employment, and the women to theirs; the men build houses and huts; plant, and do what is to be done abroad; and the women milk the cows, dress the victuals, &c. and manage all matters within doors. Their houses are not great, nor richly furnished; but they are made close, and well thatched, so that neither wind nor weather can hurt them.

"They wear but few clothes, and those extraordinary mean; the men go in a manner naked, their common garb being only a square piece of cloth made with silk-grass, or moho-rind, and wrought in form of a short apron; at the upper corners it has two straps to tie round their waists; and the lower end being finely fringed with the same, hangs down to the knees. They have caps made with buff graised, of about nine or ten inches high; they are a great while in making these caps; for the grease must be made very pure before it is fit for this use; besides, they lay on but a little at a time, and mix it finely among the hair, and so it never afterwards comes off their heads. When they go a hunting, which is but seldom, they pare off three or four inches from the top of

their caps, so that it may fit the snigger; but the next day they begin to build it up again, and so they do every day till it is of a greater and fashionable height. It would be a most ridiculous thing for a man here to be seen without a greasy cap, but boys are not suffered to wear any till they come to maturity; and then they begin to build up their heads. The women have only short petticoats, which reach from the waist to the knee; when it rains they cover their bodies with a simple cow-hide, thrown over their shoulders like a blanket.

"The common subsistence of these people is made of Guinea corn, beef, fish milk, ducks, hens-egg, &c. They also drink milk often to quench their thirst, and this sometimes when it is sweet, but commonly they let it be four first. Besides milk, which is their common drink, they make a better, but of the same grain before-mentioned, purposely to be merry with, and when they meet on such occasions, the men make themselves extraordinary fine with feathers stuck in their caps very thick; they make use of the long feathers of cocks-tails, and none else. Besides these head-ornaments, they wear a piece of cow-hide made like a tail, and it is fastened behind them like a tail, reaching from their waist to the ground. This piece of hide is about six inches broad, and each side of it is adorned with little iron rings of their own making; when they are thus attired, their heads a little intoxicated, and the music playing, they all skip about merrily, and shake their tail briskly; but they are very innocent in their mirth.

"Every man may have as many wives as he can purchase and maintain; and, without buying, here are none to be had; neither is there any other commodity to be bought or sold but women. Young virgins are disposed of by their fathers, brothers, or nearest male relations; the price is according to the beauty of the damsel. They have no money in this country, but give cows in exchange for wives; and therefore he is the richest man who has most daughters or sisters; for to be sure he will get cattle enough. They make merry when they take their wives; but the bride cries all her wedding day.

"They live together in small villages, and the oldest man governs the rest: for all that live together in one village are a-kin, and therefore willingly submit to his government. They are very just, and extraordinary civil to strangers.

S E C T. IX.

TERRA DOS FUMOS.

THIS is but a small trifling country, bounded on the south by the river Dellagoa, which separates it from Terra de Natal; on the north by Zanguana; on the west by the country of Naomtas; and the eastern ocean on the east. It extends from the mouth of the river Dellagoa, to the mouth of the river De Ladroon, or Teude; the first appellation signifying the river of robbers, which is in 26 deg. 40 min. south lat. The only places worthy of notice here are, Cape Pedras, which is in about the 29th deg. of south lat. Putto de Pe Pequeria, or the Filling-place, which is a little beyond the former; and the bay of St. Lucia, which is between the latter and the Ladroon river. The Portuguese, who either named places from the saints day in which they discovered them, or from some trivial circumstance which they observed when they first saw them, gave this country the name of Terra dos Fumos, or the Land of Smoke, from perceiving some smoke on their first approaching this shore. The Europeans as yet have not made any settlement here, and the Caffres who inhabit the place live in a simple state of nature, without towns, villages, or settled habitations, and frequently indeed without even movable goods; so many are the artificial wants of men and so few the real necessities. In considering the lives of these people we may perceive the propriety of the words which Shakespeare puts into the mouth of Lord Timon.

"Why should you want? Behold the earth hath roots;

"Within this idle break forth an hundred springs;

"The oaks bear mast, the briars scarlet hips;

"The bounteous housewife Nature, on each bush

"Lays her full mess before you—Want? Why want?"

S E C T.

S E C T. X.

A Description of the CAPE TOWN.

WE shall now proceed to a description of Cape Town, which is situated in Cape-Colony, in 34 deg. 15 min. south lat. and 16 deg. 5 min. east long. This place is large, commodious, pleasant, and populous; the streets are spacious, and regularly laid out; the houses are built of stone, and tolerably handsome, but they are very low, and only thatched; both which circumstances are owing to the stormy weather, for were they built high they would be blown down, and if tiles were used instead of shach, the people would be knocked on the head with them as they walked the streets. The houses in general have pleasant gardens behind, and neat court-yards before them. Building, as well as tillage, is greatly encouraged at the Cape, and land given for either purpose to those who chuse to accept of it; but then the government claims an annual tenth of the value of the former and produce of the latter; and a tithe of all purchase-money when estates are sold. The town extends from the sea shore to the company's garden, spreading along the Table Bay. The fort is in a valley at a little distance, its form is pentagonal, it commands the landing-place, and is garrisoned by 200 soldiers; the government store-houses are within it; the governor and other officers have apartments here, as well as 600 servants; the same number of slaves are lodged in a commodious building in the town, which is divided into two wards, the one for the men, and the other for the women; and the dissolute of either sex are sent to a house of correction.

The hospital for sick seamen is of essential use to the Dutch fleets in going to or returning from India. The church is a large commodious edifice, elegantly plain, but the roof and steeple are thatched, for the reason already mentioned. Thatching indeed, from the nature of the hurricanes, seems absolutely necessary, but from the method in which it was formerly done it appears that it was frequently attended with danger, as we are informed that there were formerly shelving pent-houses erected on

both sides the streets, to shelter passengers in rainy weather; but these brought the inhabitants under such dangers and inconveniences, that they were quickly all pulled down by order of the government. Sailors and Hottentots were continually crowding and smoking their pipes under them, and sometimes through carelessness set them on fire. The government very dextrously laid hold of that occasion to rid the streets of those fellows that were continually pestering them, by publishing an order, which is still kept up, and from time to time republished, that no Hottentot or common sailor shall smoke in the streets: with a declaration, that the sailor or Hottentot who should presume to do so, should be tied to the whipping-post, and severely lashed. This cleared the streets at once, and keeps them clear to this day of all sailors and Hottentots who have no business there: for it is with great difficulty that either a Hottentot or a Dutch sailor, if they have tobacco, and they are seldom without it, can forbear smoking while they are awake.

“But (says an intelligent author) what is the most admired of any thing at the Cape is the company's garden, where they have introduced almost all the fruits and flowers that are to be found in Europe, Asia, or America; and most of them are improved, and flourish more than they did in their respective climates and countries from whence they were brought; and the garden is watered by springs that fall down from the Table-Mountain just above them. The apples and pears of Europe are planted here, with the grapes of Asia as well as those of Europe; all of a delicious flavour. Here are also lemons, oranges, citrons, figs, Japan apples, and an infinite variety of other fruits, all excellent in their kind.”

It has been surprising to many that a situation so singularly advantageous as the Cape, was not planted by the English, since they well knew the importance of the place before the Dutch began their settlement. Indeed several English navigators touched here; but St. Helena, though inferior in many respects, was deemed the most eligible, and is now the place where the English East India ships take in refreshments in going to, and returning from India.

C H A P. VII.

MONOMOTAPA.

THE Empire of Monomotapa is one of the largest in all Africa. It is bounded on the east by the kingdom of Sofala; on the west, by the mountains of Caffraria; on the north, by the river Cuama, which separates it from Monocumgi; and on the south, by the river del Spiritu Sancto. It is situated between the 14th and 25th deg. of south lat. and between the 41st and 56th of east long. being 670 miles in length from east to west, and 615 in breadth from north to south.

This country is divided into six provinces, or petty kingdoms, the governors of which are vassals to the king or emperor of Monomotapa. The names of these provinces are, Monomotapa Proper, Quiteve, Manica, Inhambana, Inhambor, and Sabia.

Monomotapa Proper is the most considerable of the whole, and particularly distinguished for containing the capital city of the empire. It is situated in 18 deg. 27 min. south lat. and 31 deg. 10 min. east long. from London. It is a large and populous city, and the streets very long and spacious. The houses are built with timber and earth, and are of different sizes, some being much more lofty than others, according to the quality of those that occupy them: the roofs are large, and formed in the shape of a bell; and all of them are neatly white-washed both within and without. But the greatest ornament of the city is the imperial palace, which is a large spacious fabric, well flanked with towers, and has four avenues, or stately gates,

constantly kept by a numerous guard. The inside consists of a great variety of sumptuous apartments, spacious and lofty halls, all adorned with a magnificent kind of cotton tapestry, the manufacture of the country. The floors, ceilings, beams and rafters are all either gilt or plated with gold curiously wrought, as are also the chain of state, tables, benches, &c. The candlesticks and branches are made of ivory inlaid with gold, and hang from the ceiling by chains of the same metal, or of silver gilt. The plates, dishes and bowls belonging to the emperor's table are made of a sort of porcelaine, curiously wrought on the edges with sprigs of gold resembling those of coral. In short, so rich and magnificent is the whole furniture of this palace, that it may be said to vie with that which distinguishes the grandeur of an eastern monarch.

There are several other towns in this province, but they are all very insignificant, except one called Tete, which is large and populous, and remarkable for being the residence of the Portuguese jesuits.

Quiteve lies to the south of Monomotapa Proper, and is bounded on the east by Sabia, on the west by Caffraria, and on the south by Manica. The capital city is called Lambave, and is situated about 120 miles from Monomotapa Proper. It is a large and populous city, and the place where the king or governor of the province usually resides.

The province of Manica is bounded on the east by

Sabia, on the west by Cafferia, on the north by Quin-teve, and on the south, by the river de Spiritu Sancto, or the Holy Ghost. The capital town is called after the name of the province, but it is a small place, and very poorly inhabited. The river of the Holy Ghost, by some called Manica, springs from the mountains of Lupata situated in 19 deg. south lat. and 26 deg. east long. It runs first from north to south, after which it bends its course to the south-east, then walks along the kingdom of Manica, and empties itself into a small gulph, which immediately communicates with the sea.

Inhabana lies southward from the above province under the tropic of Capricorn, so that the air here is exceeding sultry. The capital town is called Tongue, which, though small, is very populous, owing to the number of Portuguese that reside there.

The province of Inhamior is very extensive, but it doth not contain any thing that merits particular notice. Its chief town is of the same name, and is the constant residence of the king, or governor of the province.

Sabia is also very large, and is well watered by several excellent rivers, one of which is called Sabia, and the other Aroc. On the coast of this kingdom is the island of Boticca, and the capes of St. Sebastian and St. Catharine.

With respect to the climate of Monomotapa, it is much more wholesome than many other parts of Africa, and the soil is to fertile that it produces a great plenty of the principal necessaries of life. It abounds with pasture grounds, on which are bred prodigious quantities of cattle, especially oxen and cows. The chief grains are rice and millet, and they have plenty of various kinds of tropical fruits. In the woods and forests are great numbers of wild beasts, particularly elephants, the latter of which the natives kill not only for their flesh, but also for their teeth: the former furnishes them with food, and the latter they make considerable advantage of by selling them to the Portuguese.

The rivers of this country are very numerous, and on the banks of most of them grow many fine trees and sugar-canes without any culture. They abound with a variety of excellent fish, and in some of them is found gold that is swept away from the mines through which they run in the more inland parts of the country.

The natives here are in general tall, well-shaped, strong, and healthy: they are quite black, and have woolly hair, which they ornament with a variety of trinkets. They are of a very sprightly and docile disposition, notwithstanding which they are fond of being engaged in war, and prefer that employment to any other. The poorer sort are brought up to diving, and their chief business is to get the sand or mud from the bottom of the rivers, ponds and lakes, from which they separate the gold that is intermixed with it, and sell it to the Portuguese in exchange for cotton and various other articles of merchandise.

The dress of the common people consists of a piece of cotton cloth of various colours, which is fastened round the waist, from whence it reaches to the knees, but the upper part of the body is entirely naked. The garments of the better sort are of the same form, but much richer, being made of Indian silks, or of cotton embroidered with gold, over which they generally wear the skin of some wild beast.

Their common food is the flesh of oxen and elephants, with bread made of rice or millet, which is baked into thin cakes; and their drink is either four milk or water. The better sort use strong liquors made from honey, millet, rice, and several sorts of fruits; but they mostly esteem palm-wine, which is reckoned a royal liquor, and greatly used at court.

Polygamy is allowed here, as in most other parts of Africa, every man being permitted to take as many wives as he can maintain; but the first wife is the principal, and the children borne by her inherit the father's estate.

They pay a religious worship to the dead, every one preferring the bones of the most distinguished of his family. These they hang up in a court, and know to whom they belonged by fixing certain marks on them. Every seventh day the relations go and visit them, being all dressed in white, which is the mourning of the country. They spread a table before them with provisions, then pray to the deceased for the king's prosperity, and

afterwards sit down and regale themselves, which they look upon as the greatest honour that can be paid to the defunct.

Some of the inhabitants here profess the Roman Catholic religion, to which they have been converted by the Portuguese; but the principal part of them are idolaters, and practice the most superstitious maxims. They hold a festival on the first day of every new moon, as also on the anniversary of the emperor's birth. They shew a singular veneration for a certain virgin, whom they call Al Firoo, and have temples erected in honour of her: they have also many nunneries, in which some of them confine their daughters to perpetual celibacy.

The king, or emperor of Monomotapa, has a prodigious number of wives, the principal of whom are the daughters of some of his vassal princes; but the first only is called empress, or queen. He always wears the same kind of dress, which consists of a robe made of a silk stuff manufactured in the kingdom; it reaches from the waist to the knees, and is fastened with a girdle richly bedecked with diamonds and other precious stones. He has also a brocaded mantle over his shoulders, and on his legs he wears buskins, richly wrought and embroidered with gold, pearls, &c. His neck is decorated with a magnificent karkanet, or collar, enriched with diamonds, rubies, emeralds, and other precious stones; and on his head is a turban, the band of which is ornamented with the same valuable materials.

He is exceeding fond of palm-wine, great quantities of which he always keeps by him in vessels made of horn, curiously wrought; but he generally mixes with it manna, musk, or some other high-scented perfumes, of which also the courtiers and better sort of people are great admirers, and use them not only in their victuals and drink, but also in their apartments, walks, &c.

The princesses and ladies of the highest rank always dress the emperor's victuals, and bring and serve it at his table: they discharge this business in their turns, and think it the highest honour to be so employed. During his meal, he is accompanied by a band of musicians; but these, before they come into his presence, must be hood-winked, or have a veil before their faces, to prevent their seeing him either eat or drink. He is commonly attended also by a great number of officers, who keep a most profound silence, except when he drinks, or happens to sneeze or cough, at which times one of them cries aloud, "Pray for the health and prosperity of the emperor!" as soon as the words are repeated they all kneel, then rise, and testify their joy by the loudest acclamations.

When he goes abroad he is generally carried in a stately sedan or chair, over which is a magnificent canopy richly embroidered, and bespangled with pearl and precious stones; and if the weather happens to be cloudy or misty, four lighted torches are carried before him to clear and perfume the air. He is always attended by a prodigious retinue, besides his own guards, and a numerous band of musicians. On these occasions his subjects pay him the most profound homage and respect, wishing him all imaginable success and prosperity, and shewing their attachment to him by sacrificing, at proper distances on the road through which he passes, a deer, or some other victim.

As the emperor has many powerful vassals, far remote from his capital, he takes care to bring up their successors at his court as hostages of their fidelity. They have colleges and academies appropriated for their education at his expense, and he endeavours to win their affection by the greatest acts of munificence.

He also takes great pains to preserve the respect of his subjects: he exacts no taxes or tribute from them, instead of which he is satisfied with a trifling present when they apply to him for any particular favour. This is an universal custom from an inferior to a superior of every rank or denomination, and is esteemed the highest mark of respect that can be shewn. If at any time he orders his subjects to labour either at the gold mines, or any other service, as is sometimes the case, he always sends them cows and other provisions, so that instead of attending with reluctance, they obey his commands with the greatest cheerfulness.

His ministers and officers, both civil and military, as well as his soldiery, who subsist by his pay, are indeed obliged, instead of taxes, to pay him a kind of service of seven days in every month, either in cultivating his grounds,

The emperor maintains a numerous army of foot, for he has no cavalry, there being but few horses, and those not fit for the purpose, throughout his dominions. The weapons used by the soldiery are, bows and arrows, the javelin, scymetar, cutlafs and dagger, and some of them carry a hatchet, all which they handle with great alertness, being trained up to it from their youth. Wherever the emperor encamps, they always erect a large wooden house, in which a fire must be kept constantly burning during his stay. Neither he nor any of his soldiers are permitted to wash their hands or face while the war continues; and when it is over, and they have gained a complete victory, the spoil is divided, the emperor reserving one part to himself and distributing the rest in proportionable shares to his officers and men. This equitable distribution has an excellent effect, as it animates the men, and makes them fight with distinguished intrepidity.

The laws of this country are very few, and so little occasion is there for the confinement of criminals, that there is not a single prison throughout the whole empire. Justice is administered in every part of it with the greatest expedition: the judges hear the reasons and depositions on both sides, and then pronounce sentence, which the emperor either confirms or annuls; and every criminal is executed in the open fields immediately after conviction. If the complaint or crime be of such a nature that it cannot be so quickly adjudged, and there be any danger of the person accused making his escape, he is ordered to be tied to a tree, and a guard is set over him till he is either acquitted or condemned. Those found guilty of murder are punished with death; but in trifling matters they only inflict corporal punishment, which is done by giving the party a certain number of strokes with a knotted cord, according to the nature of the crime.

Before we quit this empire it may not be improper to give some account of the gold mines in the inland parts, which have produced such considerable advantages to the Portuguese. The chief of these are in the province of Manica, near the capital of the same name. They extend themselves through a large spacious champaign, wild, sand and barren, about nine miles in circumference, and surrounded with high mountains. They are situated about 150 miles west of the mart, or place where the commerce for it is carried on. The natives that work at them find great difficulty in gathering the metal, which is here in dull for want of water to separate it from the earth, so that they are obliged to take the whole as they dig it out to other distant places, where they keep large cisterns and reservoirs for that purpose. They have one convenience, however, which is, that they need not dig deeper for the ore than six or seven feet, all the rest beneath being a hard solid rock.

Besides the above, there are other mines in different

parts of the empire that produce excellent metal, particularly those near Batua, a small place bordering on the province of Manica, and extending itself from the Mountains of the Moon to the river Magnico, whose governor is a vassal to the emperor. These mines are reckoned the most ancient in the whole empire, on account of some castles in their neighbourhood, which carry the greatest marks of antiquity, and are supposed to have been originally built as a safeguard to them. The most distinguished of these buildings is situated in the middle of a large spacious plain, and surrounded by the mines above-mentioned. Its walls are not high, but of the thickness of twenty-five feet; the stones are laid regularly one upon another, but without either cement, or any other materials to fasten them together. On the front, just over the great gate, is a larger stone than the rest, and upon it an inscription in characters, or rather hieroglyphics, which are so unintelligible that no person hath been yet able to decypher them.

At some distance from this building are several others, all situated on some eminence or rising ground, and amongst them is a tower about 70 feet high. The natives, being unable to conceive how such structures could be raised, imagine them to be the works of demons.

Between the mines and the sea-coast are several considerable places, where fairs and markets are held for the sale of gold, particularly at those towns which lie on the river Zezebe and Cuama, and where the Portuguese have built fortresses to keep the natives in awe, who come to those markets to exchange their gold for European and other commodities. In each of these markets they have an officer of their own, who decides all contests and differences that arise about their traffic; they have likewise, in most of these towns, churches and monasteries of the Dominican order.

The emperor of Monomotapa first permitted the Portuguese to build their forts here, in gratitude for the service they had done in contributing to reduce some revolted vassals to return to their obedience, as well as to enable them, on all such exigencies, to be near at hand to assist him. This was about the year 1640, since which time they have been on such good terms with the sovereigns of the empire, that they have made themselves masters of a track of land on both sides the river Cuama for above 160 miles; besides which they have obtained some of the most considerable mines in the empire, and engrossed the whole commerce to themselves, not only of the coasts, but also the inland parts.

The commodities which they bring the natives are chiefly cloths of various sorts, glass beads of different sizes and colours, and other trifling trinkets; in exchange for which, besides gold, they receive great quantities of ivory, furs of sundry wild and tame beasts, and other valuable articles, which makes their commerce here very advantageous.

C H A P VIII.

S O F A L A.

THE kingdom of Sofala is very extensive, and, like the empire of Monomotapa, is remarkable for containing many excellent mines of gold. It is bounded on the east by the Indian sea, on the west by the province of Manica, on the north by the empire of Monomotapa, and on the south by the kingdom of Sabia. It is, properly speaking, a continued coast, extending itself from the river Cuama on the north, to that of Magnico, or Del Spiritu Sancto, on the south. The inland parts are very trifling in extent, being confined on the

west by the empire of Monomotapa, notwithstanding which the whole kingdom is computed to be at least 2250 miles in compass.

This country is well watered by rivers, the most considerable of which are the Cuama and the Del Spiritu Sancto, both of which are supposed to take their rise from the lake Goyama. The former received its name from the Portuguese, but it is generally called by the natives Zambeze. It receives in its course, among others of less note, the Mangania, Mazeno, and Suabo; and after being divided

divided into two branches, discharges itself into the Indian sea at four channels, from north to south, distinguished by the names of Kilimano, Linda, Cuama, and Luava. It is navigable upwards of 150 leagues, and hath many large islands besides those formed by its several channels. This river wathes down great quantities of gold, which the negroes gather when the waters are low, by diving to the bottom of such parts of it as, from practice, they know contain the greatest abundance. They bring up the mud in buckets, which, being properly levigated, easily discovers the metal.

On the coast are several capes, the principal of which are called Corientes, St. Catharine and Sebastian. The former is situated under the 23d degree of south latitude: it is noted for the many rocks, sands and shelves that lie between it and the island of St. Laurence, or Madagascar, and which cause frequent shipwrecks along that channel.

The climate of this kingdom is exceeding unwholesome, occasioned by the vast number of marshes, which being in summer dried up by the scorching heat of the sun, infect the air with pestilential steams. The soil, from the mouth of the river Del Spiritu Sancto to Cape Corientes, is very uneven, barren, and desert; but from thence to the mouth of the river Cuama, it is very fertile, and produces great plenty of several sorts of grain, particularly rice and millet; in some parts of it there is also excellent pasturage, and the cattle bred here are larger than in any other part of Africa. The inland parts abound with various sorts of wild beasts, but particularly elephants, great numbers of which are annually killed by the natives, not only for the sake of their flesh, which is the chief part of their food, but also for their teeth, which they sell to great advantage to the Europeans. The number of these animals destroyed here by the natives is said, one year with another, to amount at least to 4000.

The inhabitants of this kingdom are in general well-shaped, and have short curled hair: they cover themselves only from the waist to the knees, with a garment made of silk or cotton; but they adorn their arms, wrists, legs and ankles, with rings of gold, amber, or coloured beads; and the better sort wear a turban on their heads, and have swords by their sides, the handles of which are made of ivory curiously inlaid with precious stones.

Their food consists of the flesh of elephants, large and small cattle, and fish, with which the rivers abound; and instead of bread, they use rice and millet. The drink of the common people is water, but the better sort have a kind of beer, which is made of rice and millet; they have also some strong liquors made from honey, palm and other fruits.

They mostly speak the language of the country, but they also understand the Portuguese and Arabic. The coasters in general speak the latter tongue, which is indeed their natural language, for they are not the original natives, but the descendants of the Arabs, who left their native country, and settled themselves more or less upon this whole western coast.

The king and his court, with a great number of the principal people, are also the descendants of the Arabs, and not only speak that language, but also strictly profess the Mahometan religion; but the original natives are permitted to retain their ancient customs, as also their religious maxims, the latter of which are much the same as those practised in the principal parts of Africa.

The metropolis of this kingdom, and the only place of any note in it, is called Soiala, pleasantly situated on a small island at the mouth of the river Cuama. Before the Portuguese visited this part of the coast, it was a very inconsiderable town, neither large nor walled, but fenced only with a thorny hedge; since their arrival, however, it has been greatly improved, and is now a very large and populous place. The Portuguese have also built a strong fortress here, which is of infinite service to them, as it secures their ships in the harbour when they stop here in their passage to and from India. The articles they purchase of the natives are, gold, ambergris, slaves, and elephants teeth; in exchange for which they supply the natives with silks, stuffs, cotton, glass beads, and other such trinkets. Both the fortresses and island are tributary to the king of Portugal.

Near the town of Soiala are two others on the coast, one of which is called Harlema, and the other Dardema; there are also several villages, but they are all insignificant places, and do not contain any thing that merits particular notice.

The king keeps a great number of soldiers, who are all paid in gold dust, each according to his rank. Their original weapons were bows and arrows, the scymetar, javelin, dagger, and hatchet; but since the arrival of the Portuguese they have been taught the use of fire-arms, of which they are very fond, and exercise them with great dexterity.

The inhabitants of Quiloa, Mombaza, and Melinda, come to this country in small boats called tambues, with stuffs of blue and white cottons, silk stuffs, yellow and red ambergris; which they exchange with the people here for gold and ivory; and these again sell them to the inhabitants of Monomotapa, who give them gold in return, without weighing it, so that the profit of the exchange is very considerable. This is the reason that when the Monomotapans come to purchase these articles, as soon as the Sozialans perceive their vessels at sea, they signify their joy, and bid them welcome, by lighting fires on the shore.

It is said that the gold mines of this kingdom yield above two millions of metgals per annum, each metgal amounting to fourteen livres; that the ships from Zidm and Mecca carry off above two millions a year in time of peace; and that the governor of Mosambique, whose office lasts but three years, has above 300,000 crowns revenue, without including the soldiers pay, and the tribute annually paid to the king of Portugal. From hence many learned men are of opinion that this is the Ophir, whither Solomon sent ships every three years from Esiogeler to fetch gold; Esiogeler being thought to be Suez, a sea-port on the Red Sea. This conjecture is supported by the remains of several stately edifices, which are found in the different parts where the gold mines are situated, and from their appearance are supposed to have been originally palaces or castles built by that opulent prince the king of Israel. It may also be confirmed by the authority of the Septuagint, who translate the word Ophir (1 Kings ix. 28.) into Sophira, which has some resemblance to its present name of Soiala. As a farther confirmation of these conjectures, Lopez, in his voyage to India, says, the inhabitants of this country boast that they have books which prove that in the time of Solomon the Israelites sailed every third year towards these parts to fetch gold.

C H A P. IX.

M O N O E M U G I.

THIS is also a considerable empire, but being an inland country, is very little frequented by the Europeans. It is bounded on the east by part of Zaangubar, on the west by Matamba and Makoko, on the north by Abyssinia, and on the south by the empire of Monomotapa.

What particulars we have relative to this empire are chiefly founded on the authority of the Negroes, who carry on a commerce with it, European travellers not daring to venture themselves in it, not only by reason of the unwholesomeness of the climate, but also for fear of the inhuman Jaggas, who infect the more interior parts

TH
which
the Ind
35

of it, and massacre all that happen to fall in their way.

The extent of this empire cannot be ascertained, but that it is very great appears from the distance of its confines. The emperor is a powerful and rich prince, and hath subdued most of the petty kingdoms about him to obedience; but some of them, especially on the north side, frequently revolt, and put themselves under the protection of the Abyssinian or Monomotapan emperors. He is said to have many rich gold, silver, and copper mines in his dominions, by means of which he carries on a kind of commerce with those two empires, as also with some of the eastern coasts, with whom he is forced to exchange gold for Indian and European commodities, for want of having some sort of his own on either the eastern or western sea. This obliges him to preserve a constant friendship with the maritime kingdoms of Quiloa, Mombasa, and Melinda, whose merchants furnish him with a variety of silks, cotton cloth, and other such merchandises. He also lives in friendship with the grand makoko, another prince on the north of him, on account of the Negro merchants who trade with the Portuguese, and by passing through his dominions carry on a considerable traffic with him and his subjects.

The empire of Monoemugi is divided into five kingdoms or provinces, all of which are governed by petty princes subject to the emperor. The names of these are as follow, viz. Mujaco, Gingiro, Cambate, Alaba, and Monoemugi Proper.

Mujaco is bounded on the east by Abyssinia, on the west by Congo, on the north by Nubia, and on the south by Makoko. It is a large kingdom, but very poorly inhabited, neither does it contain any thing that deserves particular notice.

Gingiro, which is also a very large kingdom, lies between Narea, the most southern kingdom of Abyssinia, and Makoko and Cambate. Father Anthony Fernandez, who travelled through this kingdom, says, the king preserves an extraordinary dignity, and that he contends with the sun; for which reason he never goes abroad, or gives audience, but before the sun rises, alledging that two suns cannot appear at once. His palace, says he, is no better than a cottage, which, when he dies, is always burnt, and the successor has a new one built for him, which is dedicated with the blood of two or three men of a certain family killed at the door, and on that account the said family is free from all other duties, which are so heavy, that they render this cruel composition acceptable; for when the king buys any thing of foreign merchants, he pays them in slaves, and these are the sons and daughters of any family, which he takes at pleasure without any contradiction.

Cambate, the third division of this empire, joins to the above kingdom on the west, and is bounded on the east by Alaba, on the north by Abyssinia, and on the south by Makoko. This country pays a voluntary acknowledgment to the emperor of Abyssinia. The principal town in the kingdom is called Sangara, but it is a very poor place, and wretchedly inhabited.

Alaba is a very large kingdom, and situated to the east of Cambate: it reaches to the coast of Zanguebar, and is inhabited by a cruel people called Gallas. The prince is a Mahometan, but many of his subjects are idolaters, and of the worst sort, for they offer human sacrifices.

Monoemugi Proper, the last province of the empire, is

bounded on the east by Congo, on the west by Tranquebar, on the north by Monomotapa, and on the south by Makoko. This is the largest division of the whole, but is not otherwise remarkable, except from its being the residence of the emperor.

The chief production of this country, exclusive of the respective mines of gold, silver, and copper, are, palm-wine and oil; and honey is here so plentiful, that the Negroes cannot consume one third of it, so that they suffer the rest to be lost. The great misfortune is, that the air and climate is so unwholesome, that no missionaries, or other Europeans, dare venture so far into the inland parts, more especially, as we before observed, on account of those desperate cannibals the Jaggas, who infect them.

The natives here dress themselves in silks and cottons, which they buy of strangers, and wear collars of transparent beads brought them from Camboya: these beads serve also instead of money, gold and silver being so common that it is considered by them as of no value.

With respect to the laws, customs, ceremonies, and other particulars relative to the people, we have not any account; all we farther know is, that they are most of them idolaters, and in their dispositions are refractory and cruel.

The Portuguese inform us, that on the east side of this empire there is a great lake full of small islands, from whence issue several rivers. They say that these islands are inhabited by Negroes, and that they abound in all sorts of fowl and cattle.

The authors of the Universal History, in their observations on the little knowledge attained of this empire, and the parts that border on it to the southward, say thus: "The farther we move southwards towards the Cape of Good Hope, the farther we may be said to travel in the dark; though all our maps unite to embellish both coast and inland with such prospects, and pompous names of empires, kingdoms, and countries, crowded close to each other, as might induce an unwary reader to imagine those countries to be as fully known as those of Europe; and were he to compare the vast shew in those maps with the little he finds in the relations and accounts of the African writers, he might be apt to conclude from the former, that the far greater and most considerable part of the latter, like those of the ancients, have been unaccountably lost or destroyed. And this we think ourselves bound to apprise our readers of, lest they should be induced to ascribe our leaving over such a vast tract of land, overlooking so many seeming-considerable kingdoms and states, to our neglect, rather than to what it is really owing, the want of proper intelligence, and to lose their time in a fruitless search after them, amongst that variety of authors that have written on this part of the world. The truth is, the Arabs, as well as the natives who inhabit this whole eastern coast, are too jealous of, not to say incensed against, all Europeans, to give them any intelligence of the inland parts; much less to let any of their missionaries penetrate into them, as they have more luckily done in the western. So that all the knowledge we have been able to get of them is chiefly founded on the precarious report of those trading coasters, and extends little farther than the names and situations of those kingdoms, which make so fine an appearance in our maps; and might probably be represented by them in such a light as rather to deter than encourage strangers to attempt any farther discoveries about them."

C H A P. X.

Z A N G U E B A R.

THIS country is called by some Zangibar, but by the Arabs Zanguebar, from the word Zangue, which, in their language signifies black, all the inhabitants being of that colour. It is bounded on the east by the Indian Ocean, on the west by Monoemugi, on the

north by Anian, and on the south by the river Cuama, which separates it from Monomotapa. It is very disproportionate in its extent, being 1200 miles in length, and not more than 350 in the broadest part.

The coast of Zanguebar is very extensive, and in the

course of it has many rivers and islands. This part of the country is best known to the Europeans, owing to the conquests made here by the Portuguese. The inland parts consist of a large, barren, and unhealthy track, the lands lying low, and intersected by rivers, lakes, thick woods, forests and marshy grounds. Most of the inhabitants are Arabs, they being the descendants of those who were banished here from their own country, on account of their adherence to the sect of Ali, of which they are still zealous professors.

Among the rivers that water this country is that called Kilmanzi, or Quilmanca, the latter of which name was given to it by the Portuguese, from a fort and town so called, built by them at the mouth of it. This river hath its source near the mountain of Gravo, in the kingdom of Narca, subject to the Abyssinian empire, and near a village called Bochia, or Boxia; it is one of the most considerable in all this part of Africa, especially on account of the length and vast winding of its course, making a kind of circle toward the north and east, as it were to inclose into a kind of peninsula the kingdom of Gingiro, and divides the settlement of the wild Jaggas from Abyssinia; and thus far it is called by the name of Zebea. After this it winds its course through the country of the Makorites, which it leaves on the east side, then crosses the equinoxial line, continues its course along the coast of Zanguebar, and discharges itself into the ocean in the kingdom of Melinda. This river is by most authors supposed to be the Rapte, mentioned by Ptolemy in his description of the coast of Africa.

The continental part of Zanguebar is divided into two kingdoms, namely, Mofambique and Melinda.

The former of these kingdoms is divided into several provinces and lordships, each of which has a peculiar dialect to itself. The climate here is exceeding sultry and unwholesome, but the soil is very fertile, producing plenty of millet, rice, and several sorts of pulse; as also abundance of orange and lemon trees. It abounds likewise with wild beasts, particularly boars and elephants, the latter of which are so numerous that the inhabitants are obliged to kindle fires round the fields to prevent them from devouring the corn; nor dare they go abroad at night without carrying lighted torches in their hands to frighten them away. They have likewise here great plenty of black cattle, and in some parts of the country are gold and silver mines.

The inhabitants of Mofambique are of a low stature, very black, and have short curled hair; they are naturally cruel, deceitful, and great enemies to strangers; but as they are very fearful, the Portuguese keep them under tolerable subjection. The men go quite naked, except only a small piece of cloth fastened round the waist; but the women have a kind of petticoat of coarse cotton cloth, which reaches from the waist to the knees. Their ornaments consist in three or four necklaces of coral beads of several colours, with brass rings in their ears, and bracelets of the same metal on their arms. They ornament their bodies by making incisions in different parts, in which are represented the figures of birds and animals.

Their towns are very small, and the buildings low and despicable. Their common food is the flesh of elephants, with bread made of millet and rice; from the latter of which they also make a kind of beer.

The chief wealth of these people consists in gold, ebony, ivory, and slaves, all which they sell to the Portuguese; only, for they will not suffer any other foreigners to enter their country.

With respect to the religion of these people, some of them are Christians, and others Mahometans; but the principal part of them are idolaters, and use all those superstitious and ridiculous maxims practised in other idolatrous countries.

Adjoining to the kingdom of Mofambique are two small districts, called Mongalo and Angos: the former is situated near the mouth of the river Cuama, and is chiefly inhabited by Arabs; the other is also situated on a bank of the same river, about 160 miles from the former. Both these places are fruitful, producing abundance of rice and millet, as also great quantities of cattle. The inhabitants are chiefly Mahometans, but intermixed with Negroes, who are idolaters, and remarkable for the lowliness of their stature. They have no covering to the

upper part of their bodies, but round their waists they wrap pieces of cotton or silk; and some of the better sort wear a turban on their heads.

The people of both these places carry on a commerce with the inhabitants of Monomotapa in gold, elephants teeth, gums, &c.

The kingdom of Melinda is situated partly under the equinoxial line, and partly on both sides of it; for its southern boundaries lie under the 2d deg. and 30 min. south latitude, and its northern extremity extends to the river Quilmanzi, the mouth of which lies some minutes to the north of the equator. Its extent westward is not certainly known, but it is supposed to be bounded on that side by the country of the Mollegayas, a barbarous race of the Caffres, and on the east by the western ocean.

As this kingdom is well watered by rivers, the soil is in general very fertile, and produces great abundance of the principal necessaries of life. It abounds also with a variety of fruit trees, particularly orange, palm and citron trees, the latter of which constantly perfume the air with an odoriferous scent. They have likewise several sorts of cattle, with plenty of game and poultry. Some of their sheep are remarkable for having large tails, which, upon an average, weigh from 20 to 30 pounds. They have but little wheat or rice, so that instead of bread the poorer sort use potatoes, which are here exceeding large, fine, and in great plenty.

The inhabitants of this kingdom greatly differ in their complexions, some of them being quite black, some of an olive-colour, and others almost white, particularly the women. The common people wear only a loose piece of cloth about their waists, but the better sort have a garment made of cotton or silk, which reaches from the waist to the knees, and on their heads they wear a turban. The ladies of quality always appear in silk, and ornament their necks and arms, the former with strings of gold, and the latter with bracelets made of the same metal.

The city of Melinda, the capital of the kingdom, is situated in a very agreeable plain, and contains a great number of houses, most of which are well built with freestone. It is the residence of the king, and in it are a great number of rich merchants, who trade with the Indians of Cambaya in gold, ivory, copper, quicksilver, and all sorts of stuffs. The Portuguese are so numerous in this city, that they have built no less than seventeen churches and chapels in it; and before one of the churches they have also erected a stately cross of gilt marble.

The king's palace is a very spacious edifice, built of stone, and neatly ornamented; the apartments within are large, and decorated with very rich furniture. The king is an arbitrary monarch, notwithstanding which he is greatly revered by his subjects, whose affection he obtains by being always ready to listen to, and redress their complaints.

Whenever he goes abroad he is carried in a sedan, on the shoulders of four of the greatest men in his kingdom, and incense and other perfumes are burned before him as he passes along the streets. When he goes on any particular expedition, he rides on a horse richly caparisoned, amidst the universal acclamations of his people. On these occasions the priests sacrifice a hind before him, and whilst the king's horse is passing over it, they observe very narrowly the motions of the victim's entrails, and from these observations they pretend to foretel whether his expedition will be attended with success. They also offer a sacrifice of the same kind, and with the same views, whenever an ambassador arrives from a foreign prince, to treat with the king on any important business. At every town the king enters, he is always met by a number of beautiful women, some of whom present him with flowers, and others go before him scattering various kinds of perfumes; some of them make a kind of music by beating sticks upon brass basons, while others join the melody of their voices with the sound of other instruments, singing the praises of the king; in short, they all endeavour, to the utmost of their abilities, to please and divert him as he passes.

The laws of this country are but few, and those wholly vested in the power of the king. If any one is found guilty of murder, he is immediately punished with death; but thefts and trifling offences are punished only by fine. If any of the king's grantees are detected in having im-

posed

posed falsties on him, they are either sentenced to pay a fine, or to receive a number of blows from the king's own hand, more or less, according to the greatness of the offence; in the latter case, the method of inflicting the punishment is thus; they strip the criminal naked, and lay him on the ground, in the apartment of the palace assigned for that purpose; the king then gives him a number of blows on his back and breech with a kind of whip made with two long pieces of leather fastened to the end of a stick: as soon as the king thinks he has sufficiently scourged him, he desists, when the criminal rises, puts on his cloaths, kisses the king's feet, and thanks him in the most respectful and submissive manner. After this the king orders him into his presence chamber, when he grants him a pardon in the presence of his whole council, and forbids every one from reflecting on him for what has passed: the criminal is then conducted out of the palace with great pomp, perfumed torches being carried before him by the rest of the nobles. Those who calumniate their neighbours are also chastised in the same manner; but when this happens among the lower rank of people, the punishment is inflicted by the king's officers.

The weapons used by the people of this kingdom are bows and arrows, darts and spears. They are said to be the best soldiers on the whole coast of Zangubar; notwithstanding which they would certainly have been overpowered by their neighbours, who have made several attempts on them, had it not been for the protection they have constantly received from the Portuguese.

Some of these people are Mahometans, but the principal part are idolaters. The Portuguese have made but few proselytes in this kingdom, the people being obstinate in preserving their own religious principles. The former have used many efforts to bring them to a sense of Christianity, but as these have proved ineffectual, they have long since desisted from any farther attempts, and now satisfy themselves with the enjoyment of exercising their own religion without controul.

On the coast of Zangubar are many islands, but as a description of these would here be inconsistent with our plan, we shall postpone taking any farther notice of them till we have inspected the remaining part of the African continent, when they will naturally follow in the course of the large catalogue of islands with which the greatest part of this quarter of the Globe is surrounded.

C H A P. XI.

The Republic of B R A V A.

THIS is the only republican state on the whole coast of Africa. It is pleasantly situated on the coast of the same name, being bounded on each side by a river, supposed to be two branches of the great river Quilmanca. Its extent inland is very trifling, and the chief thing that renders it remarkable is, its capital, which is called Brava, and situated in the 11th degree of north lat. between the two rivers abovementioned, where it has a tolerable good harbour. It is a large city, and, with the whole republic, was founded by seven Arabian brethren, who fled hither to avoid the impending danger that threatened them from the tyranny of their king, one of the petty monarchs of Arabia Felix.

The city is surrounded by strong walls, and is otherwise well fortified. The houses are very spacious, and built after the more easy style: they are chiefly inhabited by rich merchants, whose principal traffick consists in gold, silver, cotton, and other cloths, elephants teeth, gums and other drugs, particularly ambergris, with which this coast abounds.

The government of this republic is aristocratical, the inhabitants having a right to chuse twelve Chiefs from among the most ancient families, whom they trust with the management of all affairs, and the administration of justice.

The inhabitants are chiefly Mahometans, but subject to the king of Portugal, to whom they pay an annual acknowledgment.

The manner in which this republic became tributary to the Portuguese is thus related: Tristram de Cugna admiral of the Portuguese fleet, having set on shore at Melinda three embassadors, sent by king Emanuel to the emperor of Abyssinia, and recommended them to the care and protection of the king of it, continued his course northward along the coast, till he came to the city of Brava, where he cast anchor at the port. Here he dispatched, according to the Portuguese custom, one of his officers, named Lionel Codigos, to wait on the heads of the republic, and offer them peace, and the friendship and alliance of the king his master. To this the Chiefs answered, that they had no objection to enter into such a treaty; but this answer was only a piece of dissimulation, and calculated to detain the fleet to its destruction, the season being then near at hand when such boisterous winds usually blew in these parts

as would dash in pieces all their ships, even in the very harbour.

Cugna, having discovered this artifice, resolved immediately to assault the city. Accordingly, before day-break, he drew up his men on the shore, and formed them into two lines, the first whereof consisted of 600 men, the command of which he gave to Alphonso Albuquerque, whilst he reserved to himself the command of the others, which consisted of about 600 soldiers.

Brava was at this time garrisoned by 4000 men, half of whom immediately sallied out against them. The conflict was severe on both sides; but the Portuguese charged them with such fury, that they found themselves obliged to give ground, and made a very regular retreat into the city; after which they shut all the gates to prevent the enemy from following them.

The Portuguese immediately surrounded the place, examining, with the utmost diligence, where they could best force an entrance; but were all that time terribly annoyed from within by burning torches, and other missile weapons.

In the mean time Albuquerque having discovered a weak part in the wall, began his attack there, but was quickly opposed by the besieged, who stocked thither with all speed, and defended it with surprising intrepidity. The contest was kept up with great fury on both sides, when, luckily for Albuquerque, the admiral came up, at whose approach the Moors were struck with such a panic, that they fled with the greatest precipitation; whilst the Portuguese soldiers, eager for their prey, would have pursued them into the city, but were restrained by their commanders.

The city, however, was soon after entered, and plundered of a very large and valuable booty, which the Portuguese immediately carried on board their ships. Great numbers of the besieged were slain and wounded, and many of them taken prisoners; but most of these were soon after released. The Portuguese had about fifty of their men killed, and many dangerously wounded, besides eighteen others who perished in the long boat, which, through their insatiable avarice, they had loaded so immoderately as to occasion it to overset. Such, indeed, was the inhumanity of the Portuguese soldiers and sailors, and such their thirst after spoil, that they cut off the arms of seven women to come the more readily at their rings

rings and bracelets; but Cugna, having severely punished the perpetrators of this cruelty, thereby deterred the rest from the like barbarity.

After the city was plundered, Cugna ordered it to be set on fire; and it was soon reduced to ashes in sight of the inhabitants, who stood at a small distance, beholding the dismal spectacle. From this catastrophe they

were forced to become tributary to their conquerors; for the Portuguese would not permit them to rebuild their city, or enjoy their ancient privileges, on any other condition than that of paying the king of Portugal an annual acknowledgment, which they have continued to do from that time to the present.

C H A P. XII.

The Kingdom of MAGADOXA, or MAGADOSKA.

THIS kingdom is situated on the coast of Ajan, and is of considerable extent; reaching from 5 deg. 40 min. of north latitude quite to the equinox, where the river or gulph of Jubo separates the coast of Ajan from that of Zanguebar. It is bounded on the east by the ocean; on the west, by the kingdom of Alaba; on the north by the kingdom of Adel; and on the south, by the territories of Brava. It receives its name from its capital, situated at the mouth of a river of the same name, and which river is called by the Arabs, the Nile of Magadoxa, by reason of its annually overflowing like that of Egypt.

Besides this river, the country is well watered by a number of canals that are cut from it; so that the soil is exceeding fertile, and produces great quantities of several kinds of grain, as also a variety of excellent fruits: it likewise affords good pasturage, for which reason the natives breed great quantities of cattle, particularly oxen and sheep: they have also numbers of horses, and in the inland parts are various kinds of wild animals, particularly monkeys, baboons and apes. The rivers also produce several sorts of fish, which the inhabitants catch without any fear, they not being, as in most other parts of Africa, infested with crocodiles, or any other dangerous animals.

The inhabitants greatly differ in their complexion, some of them being quite black, others of a tawny colour, and some almost white. They are very robust, and of a courageous and warlike disposition. Their weapons are darts and lances, as also bows and arrows, the latter of which are infested with a poisonous quality.

The city of Magadoxa is tolerably large and well inhabited. It is resorted to by great numbers of merchants from the kingdoms of Adel, Camboya, and other parts, who bring hither stuffs of various sorts, as also drugs and spices, in exchange for which they receive of the inhabitants gold, ivory, wax, and other commodities.

The king and his court are all Mahometans, as are also the chief of the inhabitants of the city; but those in the interior parts of the country are all idolaters, and strictly adhere to their heathenish superstitions.

These are the principal particulars we have relative to the kingdom of Magadoxa. With respect to the historical part of it, we have only to observe, that an hostile at-

tempt was made on its capital by the Portuguese fleet, under the command of Admiral Trifiran de Cugna, who, as mentioned in the preceding chapter, reduced the city of Brava to ashes; the circumstances attending which were as follow:

After the reduction of that place, Cugna proceeded as far as the city of Magadoxa, which he caused to be summoned, as usual, to accept of peace and friendship, or, in plainer terms, of subjection and tribute to Portugal. But here he found the inhabitants ready prepared to give him a suitable reception; great numbers of foot were patrolling along the shore, the walls were covered with armed men, and a considerable body of troops were drawn up before the town, which made Codingo, the officer sent with the summons, afraid of going on shore; instead of which he dispatched one of the Bravan captives to assure the Magadoxans that the Portuguese came not to denounce war, but to offer peace to them. They, however, knowing what dreadful execution had been made at the city of Brava, fell furiously upon the messenger, and tore him in pieces: they also threatened to serve Codingo in the same manner, if he offered to land, which obliged him to return to his admiral, and acquaint him with the ill success he had met with, and the insolent menaces of the enemy.

Cugna, upon this information, was so enraged, that he determined to bombard and storm the place, but was happily diverted from his design by the persuasion of his officers and pilots. The former represented to him the natural strength of the place, the number of the garrison, the great plenty of ammunition, and the valour and resolution of the inhabitants: the latter pointed out the extreme danger that must unavoidably arise to the ships, both from the fire of the town, and the violence of the sea, especially as winter was then coming on, and the season for sailing nearly expired; so that if his troops should miscarry in their attempt against the place, their fleet and army must inevitably perish. From these reasonable observations Cugna immediately relinquished all thoughts of attempting the design he had so precipitately formed, and immediately gave orders for sailing to the island of Socotora, where he soon after arrived with all his ships, leaving the brave Magadoxans in the peaceable enjoyment of their own possessions.

C H A P. XIII.

The Kingdom of ADEL, otherwise called ZEILA.

THIS kingdom is bounded on the east by part of the eastern ocean; on the west, by the kingdoms of Dancall and Balli; on the north, by the straits of Babel-mandel; and on the south, by the kingdom of Magadoxa. Its full extent on either side is not certainly known; but along the coast, from east to

west, it is supposed to reach about 160 leagues, and about 72 from north to south.

It receives its second name from its capital called Zeila, which is situated to the south-east of the mouth of the straits of Babel-mandel, near a very spacious and convenient bay. The city is tolerably large, and the streets regularly

regularly formed: the houses are built of stone and mortar, and are in general very spacious, and divided into convenient apartments. The soil round the city is very barren, and so distressed are they for water, that they are obliged to go many miles to fetch that useful article. At some distance, however, from the city, the country is very fertile, and produces most of the necessaries of life, particularly corn and fruit, which are so plentiful, that the natives have not only a sufficiency for their own consumption, but also export great quantities to the neighbouring countries. They have likewise abundance of excellent cattle, especially oxen, sheep and hogs; and in the woods are plenty of various sorts of game. Besides these, the country also produces gold, ivory, frankincense, and pepper, which the natives sell to the merchants of Arabia and Cambaya, who come hither with cloths, amber, necklaces, glass beads, raisins, dates, &c.

Along the northern coast of this kingdom the inhabitants are of a tawny complexion; but farther to the south they are quite black. Both sexes are strong and well made, and have naturally good constitutions. They go almost naked, having only a loose piece of cloth hanging from the waist to the knees; but they are very fond of ornaments, especially the women, who decorate their arms, necks and ankles with bracelets made of glass and amber beads. The king and nobility are distinguished in their dress from the commonalty by wearing caps on their heads, and having a kind of loose garment, which covers the whole body from the shoulders to the ankles.

The inhabitants of this kingdom are naturally of a warlike disposition, and are frequently at enmity with those who inhabit the remote parts of Abyssinia, as well out of zeal for religion, as in hopes of plunder; the former being all staunch Mahometans, and the latter a pusillanimous sort of Christians, no ways equal to them either in valour, discipline, or warlike weapons. The arms of these people consist chiefly of bows and arrows, lances and javelins, all wretchedly fabricated, and the ordinary sort amongst them have hardly any thing better than long staves sharp pointed at one end; whereas the Adelites are furnished, by the Turks and Arabs, with variety of fire-arms and other offensive weapons, in exchange for which they give them slaves, gold dust, and such other articles as they obtain by plundering their neighbours.

Besides Zeila, there are several other large towns in this kingdom; but the only one that merits any notice is called Barbara, situated at the bottom of a convenient bay, on an island of the same name. It hath been continually a kind of rival in commerce with Zeila, and is no less resorted to by foreign merchants, who carry on the same kind of traffic. It is situate opposite the city of Aden, and was once much more considerable than it is at present, being plundered and a great part of it destroyed by the Portuguese fleet under admiral Tristram de Cugna, mentioned in the two former chapters, who expected to have found a considerable spoil in it, but were greatly disappointed, the inhabitants having had time enough not only to make their escape, but also to carry with them their most valuable effects.

The island on which this town is situated is very fer-

tile, and produces abundance of different kinds of grain, as also plenty of fruits and cattle, great quantities of which are exported by the merchants to foreign countries.

The more interior parts of the kingdom of Adel are chiefly flat, so that they have seldom any rains; but this defect is supplied by the number of rivers that water the whole country. Among these the most considerable is called Hawash, which is very broad and deep, and hardly inferior to the Nile, except in the length of its course; for it does not extend above six miles from its mouth, before it is divided into such a number of canals as to be in some measure exhausted before it reaches the sea. This renders the soil so exceeding fertile, that it produces great plenty of wheat, barley, and miller, as also prodigious numbers of sheep, cows, and other beasts.

The principal traffic of the natives in these parts of the kingdom consists in gold-dust, elephants teeth, frankincense, and slaves, all which they get chiefly from the inhabitants on the borders of Abyssinia, with whom they are continually at war, and miss no opportunities of making inroads into some of their provinces, from whence they seldom return without great quantities of different kinds of plunder. These they convey to the port of Zeila, where they seldom fail of meeting with merchants from Arabia, Cambaya, and other parts, who readily take them off their hands, and in exchange furnish them with cloths of cotton, silk, linen, bracelets, amber, chrysal, fire-arms, and other commodities.

Before we conclude this chapter, it may not be improper to observe, that most geographers have, by mistake, included the republic of Brava, with the kingdoms of Magadoxa and Auel, under the general name of Ajan, though that is but a term accidentally given by the Portuguese to the whole tract of coast called by that name, which extends itself from the heights of Habes-mandel quite to the utmost verge of Africa on that side, or to the cape called Guardafui; and on the eastern side from the said cape, in the 12th degree of north latitude, quite to the equinoctial line, which divides it from the coast of Zanguebar.

All the eastern part of this coast is a mere sandy and barren tract, producing neither corn, grain, fruit, or any animals, except wild ones; for which reason it is generally called the Desert Coast. The northern part of it, however, makes amends, the soil being very fertile, and producing most kinds of provisions, in which the inhabitants carry on a great commerce. It is particularly remarkable for producing an excellent breed of horses, which are chiefly purchased by foreign merchants, in exchange for which the natives take silks, cottons, and other commodities.

On the coast are great numbers of Negroes, who live and intermarry with the Bedowin Arabs (an idolatrous and superstitious sect among those people) and, like them, are inveterate enemies to the Abyssinians, on whom they are continually making inroads. They are brutish, and errant thieves, but more particularly those who live nearest to the trading coasts. They carry on a considerable traffic in gold, slaves, horses, ivory, &c.

C H A P. XIV.

A B Y S S I N I A.

THIS extensive empire is situated under the torrid zone, and lies between the 8th and 17th degrees of north latitude, and between the 31st and 40th of west longitude from London. It is bounded on the east by the Red Sea and the coasts of Abex, or Habesh, which have been dismembered from it, and now make a province of the Turkish empire; on the west by the

river Maley, which divides it from Sharkala, or the country of wandering Ethiopians, and falls into the Nile, after it hath run a considerable way into the Nubian dominions; on the north by the kingdom of Nubia, and on the south by Alaba.

This country has been known by the different names of Abyssinia, Abbedinia, Abassia, and Habessinia, the

latter of which it obtained from the Arabic word Habesh, signifying a mixture, or confusion, it being inhabited by people of various nations. The inhabitants, however, reject these names, and call themselves Itjopians, and their country Manghesta Itjopia, or kingdom of Ethiopia. They are likewise fond of the name of Geer, or the land of Ag-Azi, that is, Freemen, either from the freedom they enjoy under their government, or that which they formerly took of transporting themselves from place to place, for the word carries with it both meanings; and it is beyond a doubt that they originally came hither from Arabia Felix. Some of the antients called this country *Æthiopia Africana*, or *Ocidentalis*, or *Æthiopia sub Ægypto*, in opposition to the eastern or *Asiatic Æthiopia*. The name of *Æthiopia*, however, is rather an epithet than a proper name, and was given by the Greeks to all countries inhabited by blacks. The diversity of names hath heretofore made great confusion, till at length that of *Abyssinia* prevailed, and by which it hath been universally known for ages past.

Before we quit our observations on the etymology of the name of this country, it may not be improper to say something concerning the title that hath been absurdly given to its monarchs, namely, that of *Preflor John*, and which seems to have thus originated. In the kingdom of *Tenduc*, in *Tartaria Proper*, was an antient race of Christian princes, who bore the title of *Preflor*, or *Prebyter John*, as it was corruptly called by the Europeans, though chiefly owing to an epithet, which *Ung-Chiang*, one of the first of those monarchs, either took of *Prebigan*, or was complimented with by his subjects; that word signifying apostolical or orthodox; but which had, by the Europeans, been corrupted into *Preflor John*, on a supposition that he was a priest as well as king. The fame of this monarch was become so great, in the time of *John II.* king of *Portugal*, when the discovery of *India* was made, that he sent *Peter Covillan* by land to make enquiry after him in *India*; but as he could hear nothing of such a prince there, he (being informed that there was a potent Christian emperor in *Africa*) took that country in his way home, and was so kindly treated by the reigning monarch, that he took it for granted this was the kingdom so much sought after, though he could find nothing like the title of *Preflor John*. This point, however, hath produced much controversy among the learned abroad; some affirming the empire of *Abyssinia* to be the real *Preflor John's* country; while others, with much more reason, have treated that notion as absurd and chimerical. As the dispute is more a matter of curiosity than moment, and as it is impossible properly to adjust it, we shall here quit the subject, and proceed to

S E C T. I.

Natural History of Abyssinia.

FROM the situation of this country, it may reasonably be supposed that the climate, in general, is exceeding sultry; but the extreme heat is only felt in the valleys or low lands, for the hills, or ridges of mountains, most of which are of a prodigious height, enjoy an agreeable coolness; inasmuch that there are some parts where the summers are less sultry than in *Portugal*, and others, where the inhabitants are more afraid of cold than heat. This difference of climate, is, however, frequently productive of violent storms of thunder and lightning, which are sometimes so terrible as to be very destructive both to man and beast. These storms are also generally attended with excessive rains, which are frequently so violent, that their streams carry away with them trees, houses, and even hills, whilst all the rivers overflow, and lay the country under water; and after the water retires, the lands and roads are so covered with a thick slimy mud, that they become for some time entirely impassable. But the greatest inconvenience that attends these rains is, that they infect the air with a dangerous malignancy; for, falling on a ground that hath lain dry and almost parched up for a considerable time, they naturally raise such vast quantities of unwholesome vapours, as seldom fail producing some violent distempers, from which, even those that keep themselves altogether at home, are seldom exempted.

The seasons here are, properly speaking, three, viz.

the spring, which begins at the latter end of *September*; the summer, which commences on the 25th of *December*; and the winter, which begins on the 25th of *June*. The summer they divide into two parts, of three months each; the first of which they call *Tzadai*, and is the most sultry and disagreeable; and the other they call *Hagai*, which is much more moderate and pleasant.

As the climates and seasons of this empire differ, so do the winds: some, especially on the high lands and lofty mountains, are very refreshing and pleasant; while others on the low lands, where the air is less agitated, are hot and very unhealthy. They are subject to one in particular, which is rather a hurricane, and is called in their language *Sengo*, or *Serpent*. This is sometimes so violent, that it overturns houses, tears up trees by the roots, and is frequently very prejudicial to the shipping. Notwithstanding these inconveniences, yet this wind has some good tendency, as it clears the air of the lower grounds, which would otherwise stagnate, and prove infectious both to man and beast.

The whole country is intersected with prodigious high mountains, between which are such dreadful precipices as mult naturally strike terror in the beholder. Some of them have very large plains on the top covered with trees and other verdure, and afford springs of excellent water; and some of them are so well cultivated as to produce most of the principal necessaries of life. These mountains are exceeding numerous, and in general so very lofty, that we may justly say with the poet,

“Ridges of high contiguous hills arise,
“Divide the clouds, and penetrate the skies.”

Or, as *Pope* has so less beautifully expressed it,

“Behold the mountains, less’ning as they rise,
“Loft the low vale, and steal into the skies.”

What is very remarkable, these stupendous hills, which the natives call *Dambas*, appear at a distance with a delightful variety of shapes. Some of them resemble pyramids, and others look like towers of various shapes: some are of an exact square, others as perfectly round as if they had been turned or wrought with the chisel. Some again so deceive the eye, that when you arrive at what you supposed to be the top, you discover it to be only the foot of another, equally high, craggy, and difficult to ascend.

In order to form a proper idea of one of these strange natural productions, and the great danger and difficulty there is in ascending them, we shall present the reader with an account of that called *Guza*, situated in the kingdom of *Tigra*, which travellers who come from the *Red Sea* are obliged to cross in going to *Dambara*. This remarkable mountain is thus described by the authors of the *Universal History*: “When you have gained the top, say they, it presents to you a handsome spacious plain, in the midst of which stands another mountain of equal height, which you must also go over, after you have sufficiently refreshed yourself on the fertile and delightful top of the *Guza*. The ascent takes up about half a day’s journey, and goes winding all the way up; the paths are very narrow, and cut into the side of the solid rock; and all the way you go presents you with a most deep and dreadful precipice, the bottom of which cannot be reached by the naked eye, but only offers a gulph, which at once makes the head quite giddy, and fills the heart with a continual dread. Should any of the caravans that keep going up and down these steep and narrow roads chance to meet another in its way, they are in the greatest danger, both man and beast, of being thrown down the precipice, and broken into a thousand pieces before they reach the bottom, unless they take the utmost care in passing by one another. The mules are by far the best for those that ride, because they are the surest footed; but they have an ill faculty with them, that they will always go close to the edge of the precipice, and cannot without great risque be turned to the other side of the road, or be kept to it when they are. What adds still more to the horror of the journey, whether it be up or down the steep declivity, is, that at the bottom of the valley below, there commonly runs a swift torrent of water, with a most hideous roar, which being echoed by the adjacent rocks, and often heightened by loud winds, as well as by the continual trampling of the men and

and beasts upon the rock, increases the horrid din to such a degree, that one cannot possibly hear one's self, much less one another, speak, though ever so loud, or ever so near.

“ But the wished-for summit once attained, (which is reckoned above 300 fathoms perpendicular above the plain top of Guza, and the most difficult part of all the way, being only provided by nature with a sort of steps like winding stairs, two or three cubits high, and uncouth, on both sides of the rock) one is made ample amends by the beautiful prospect it at once presents to the view, which is not that of rugged and intersected peaks above, and deep gaping valleys beneath, as might be expected, but of a small, though delightful, plain, about two miles in compass, and a musket-shot in breadth, and terminated at one end by a new, flat, and upright rock, like the back of a chair, of which this little plain is the seat; so that take the whole mountain together, that of Guza seems to be a kind of pedestal to this; and the latter, which the natives call Lalalmon, represents, in some measure, a chair without arms, the back of which is the upright rock at the end of the plain, which is as perpendicular as if it had been hewn out with a chisel. Along what we may call the feet of this wonderful and supererogatory chair, is pleasantly situated a town of the same name, whose inhabitants make a decent livelihood by helping the caravans to load and unload the beasts of burthen a good part of the way of the craggy ascent before-mentioned, in order to help them to leap from one step to another; so that one would be surprized to see with what facility they make the beasts climb and keep their feet, while they themselves convey their burthens from one stair to another through every difficult part of this extensive ascent.”

There are other mountains in this country of much the same nature with the above, particularly one situated between the kingdoms of Amhara and Oleca. But the most considerable amongst them all is that called by the natives Thabat Mariam, or more properly Taabaha Mar-jam, whose summit greatly exceeds all the rest, and is at the same time very spacious. This remarkable mountain, whose bottom is watered by two large rivers descending from it, hath on its summit seven handsome churches, one of which, dedicated to St. John, is exceeding beautiful, having been formerly the burial place of the Abyssinian emperors: withinside are at this time five monuments erected to the memory of those monarchs; they are covered with tapestry, on which are represented the arms of Portugal.

We cannot quit these singular productions of nature, without taking notice of a remarkable hollow and high rock situated in the kingdom of Gojam, directly opposite to which, at a small distance, is another much of the same height and bulk, so exactly placed by nature, that it echoes back a word barely whispered in the former with amazing force; and the joint voices of three or four persons speaking together, produce a sound not inferior to that arising from the shouts of a numerous army.

- “ Echo in others words her silence breaks,
- “ Speechless herself, but when another speaks.
- “ She can't begin, but waits for the rebound,
- “ To catch his voice, and to return the sound.
- “ Hence 'tis the prattles in a fainter tone,
- “ With mimic sounds, and speeches not her own.”

This country is well watered, having a great number of excellent rivers; the most considerable of these, exclusive of the Nile, which takes its rise here, are as follow:

1. The Tacazee, supposed to be the Astabores of Ptolemy; it rises in the kingdom of Angot, and after many considerable windings, first east, then north, then west, and then north again, discharges itself at length into the Nile. This river, though not so large as that it runs into, is in many places very deep, and abounds with crocodiles and sea-horses, as also that remarkable fish called the torpedo, a description of which has been given in our account of the Cape of Good Hope.

2. The Mareb, or Moraba, which comes down from the coasts of Habash, or Abex, and runs mostly north-west through the kingdom of Tigra, and other provinces, and at last falls into the Tacazee.

3. The Maley, which rises in Damut, and after a course of some score leagues to the westward, turns northward towards Narea, waters Bifamo and Fafela, westward of the Nile, and then disembogues itself into the White River.

4. The Howash, or Ilawache, which runs through the kingdoms of Gan, Fatagar, Bally, &c. and loses itself at last in the sandy desert in the kingdom of Adeli. This river makes ample amends to the inhabitants for the want of rains, as they seldom fall in this part of the country; and being, like the Nile, drawn into numerous channels, enriches all that tract, by watering their fields, and fertilizing their vallies, so that they produce not only plenty of corn and cattle, but also most other articles necessary for the preservation and enjoyment of the inhabitants.

5. The Zebec, which arises in the kingdom of Narra, and is little inferior to the Nile: it takes its course first westward, then eastward, and after that southward; when it surrounds in some measure the kingdom of Gingiro into a peninsula, as the Nile doth that of Gogam; after which it continues its course southward, and at last empties itself into the Indian Ocean.

6. The Bahr el Abiad, or White River, which springs in Bifamo, receives the Maley, and surrounds the kingdom of Changara on the west, dividing it from those of Gorham and Gagoa, and falls into the Nile about 60 leagues below Nubia.

Besides the above, there are great numbers of smaller rivers, the chief of which fall at length into the Nile, and the rest into the Indian sea. From these rivers the people cut canals to water their lands, which in some parts are made so rich and fertile, that they yield two or three crops in one year.

Here are also several large lakes, the most considerable of which is that called by the Europeans Dambea, and by the natives Bahr Tzana, or sea of Tzana, from the chief island in it of that name. This lake is situated in the kingdom of Dambea, and is computed to be about 30 leagues in length, 12 in breadth, and 150 in compass, exclusive of its deep bar, creeks, and other windings. The country round about it is plain, fertile, and pleasant; and the inside of the lake abounds with a multitude of islands of different sizes, the largest of which are inhabited by Abyssinian monks. About seven or eight of these islands contain the remains of large monasteries, which appear to have been formerly stately edifices; and among the natural productions of them are such fine citron and orange trees, as are not to be equalled in any other part of the empire. One of those islands, and the most barren of them all, is called by the natives Dek, and is the place adapted for the confinement of state prisoners.

The natives sail on this lake in flat-bottomed boats, which they call tanceos; they are not made of wood, but of a kind of rushes that grow on its banks, each of which is about the thickness of a man's arm, and about two yards in length. These rushes they call tanhua, the like of which grow also on the banks of the Nile, and are used for the same purposes. These last are those which the antients called papyrus, and were serviceable to them not only in making their paper, but also their boats, sails, and other tackle.

The only inconvenience belonging to this lake is, that it breeds great numbers of sea-horses, which not only endanger the navigation, but destroy the fish, and sometimes make considerable ravages on the land. However, the people that live on its banks, make it their business to destroy these animals, not only to secure their corn and other grain from being destroyed by them, but also for the sake of their flesh, of which they are very fond; they also cut their skins into long straps, called allengas, which they use instead of whips to scourge their horses.

The soil of this country is various, according as the ground is higher or lower, stoney, sandy, or flat; in general, however, it is tolerably good, and those parts in particular that are well watered, produce large crops of wheat, barley, millet, and other grain. But the most remarkable grain here, and which is in some measure natural to the country, is a small one called tell, which in taste and flour greatly resembles rye. It is very thin and slender, and the grain much smaller than those

those of the mustard. The natives make it into bread, and prefer it to that made with any other grain, for which reason they are more careful in the cultivation of it.

They have a great variety of fruits, but those most cultivated are, the black grape, peaches, pomegranates, almonds, citrons, and oranges. They have also a great plenty of roots and herbs, which, notwithstanding the heat of the country, grow naturally. Sugar-canes are likewise very plentiful, and they have prodigious quantities of honey, which is here very excellent, and of many different sorts.

Most of the medicinal plants found in Europe grow naturally here, besides which they have several others peculiar only to this country. Among the latter the most distinguished are those called the amadmagda, and the asaf. The former of these hath the specific virtue of healing dislocated or broken limbs, and of drawing out splinters of broken bones left in the flesh. The latter is a most singular antidote not only against all poisons, but likewise all venomous creatures, inasmuch that the very touching them with it stupifies and deprives them of all their powers; and what is still more surprizing, it is said the very shadow or scent of it affects the most poisonous serpents, that their limbs are immediately benumbed, their venom is no longer poisonous, and they may be handled without the least danger. This extraordinary plant is of infinite service in those parts, as there are prodigious numbers of serpents, one sort of which is so singularly prejudicial, that even its breath only, at several yards distance, generally proves destructive: they are short, but remarkable thick, especially about the middle; their mouths are very wide, at which they suck in a great quantity of air at once, and then breathe it out with such prodigious force against man or beast who fall in their way, that it generally proves fatal to them.

Exclusive of the plants already mentioned, this country produces great quantities of fenna, as also abundance of cotton, which grows on shrubs the same as in India. Here are likewise various sorts of flowers, that grow in such abundance that the banks of the rivers are ornamented with them the principal part of the year. Many of these are peculiar to the country, but the generality are those natural to Europe, particularly jessamines, lilies, jonquils, and roses: among the latter is one sort that grows on trees, and are much more odoriferous than those produced from shrubs. These flowers not only contribute to the beauties of the country, but also to the enjoyment of the inhabitants. Here

- “ Within the chambers of the globe they spy
- “ The beds where sleeping vegetables lie;
- “ Till the glad summons of a genial ray
- “ Unbind the globe, and call them out to day.
- “ Hence pancies trick themselves in various hue,
- “ And hence jonquils derive their fragrant dew:
- “ Hence the carnation and the balsful rose,
- “ Their virgin blushes to the morn disclose:
- “ Hence the chaste lily rises to the light,
- “ Unveils her snowy breast, and charms the sight.”

The animals of this country are both various and numerous: those of the tame kind are, horses, mules, camels, dromedaries, oxen, cows, sheep and goats. The oxen in particular are of such a prodigious size, that at a distance they have been taken for elephants; and their horns are so large, that the inhabitants make them into pitchers, and other necessary utensils.

The horses here are of various colours, but the black ones are most esteemed; they are in general exceeding fleet, and very docile, but are seldom used except in times of war. The beasts of carriage are, the mules, camels, and dromedaries, all which they train up to an easy yet quick pace. They use the mules when they travel over the craggy mountains, those beasts being not only very gentle but also sure-footed: and the camels and dromedaries they use when they travel through hot and sandy deserts.

The Abyssinians prefer riding on mules to horses, not only on account of that beast being more gentle and sure-footed, but also out of respect to their own pedigree; for as they boast themselves to be descended from the Jews, whose princes and great ones are recorded to have

chiefly rode upon mules, so they esteem it an honour to do the same here, and to have their horses led by the bridle, till some martial engagement obliges them to mount.

The wild animals of this country are, lions, tigers, leopards, wolves, foxes, various kinds of apes, and other beasts of prey; all which are very numerous, fierce, and mischievous, but they have not any thing particular in them from those of other hot countries.

The lions here are exceeding numerous, and of several sorts and sizes, but the most remarkable are those styled of the kingly or royal breed. As these do a considerable deal of mischief among the larger cattle, the inhabitants are very assiduous in endeavouring to destroy them, and will even encounter them with no other weapons than their lances and daggers. They are in general so large, that some of them killed by the inhabitants have measured 14 feet in length from the neck to the tail. One of this prodigious size was some years ago destroyed by a shepherd in the open field with his dart, the circumstances attending which are thus related: This fierce creature was coming down from the mountains, all covered with the blood of animals it had torn in pieces, when the shepherd seeing him at a great distance making towards him, retreated to a large hole that had been made in the ground, and upon his approaching within reach of his weapon, he threw it at him with such force, that it pierced him through the shoulder: the monster, after many dreadful roars and leaps, fell luckily into the pit, where he was dispatched by the victorious countryman, though not without receiving many wounds, as well as being in the most imminent danger of his life.

Elephants are also very numerous, and may properly be ranked among the wild animals, as none of them were ever known to be brought to that docility common to those in other countries. They generally go in large droves, and frequently make dreadful havoc among the corn and other grain. They also make great destruction among the forests, by rooting up large trees, and breaking down small ones to feed on their leaves.

Rhinoceroses are also very plentiful here, and are great enemies to the elephants; the zebra, or wild ass, is likewise a native of this empire, but as both these have been already described in our account of the Cape of Good Hope, we have little to say about either, except that the latter is so much admired for its beautiful shape, colour, and stripes, that kings and emperors look upon them as very valuable presents. It is said that 2000 zebras was given for one of these animals by an Indian Moor, in order to make a present of it to the Great Mogul.

We shall conclude our account of the wild animals of this country with the mention of a very singular one, which does not appear to have any name, but is thus described by Mont. Ponce, in his voyage to Ethiopia: “ This extraordinary animal, says he, is no bigger than one of our cats, and hath the face of a man, with a white beard, and its voice mournful; it always keeps upon a tree, and the people assure us, that it is there brought forth, and there it dies. It is so very wild, that there is no possibility of taming it. When they have caught one of them, with a design to bring it up, all the care they could take of it could not prevent its pining itself to death: they shot one of them in my presence, which hung fast to the branch of the tree, twining its legs about; and though it was taken alive, yet it died a few days after.”

They have great plenty of poultry, particularly geese, ducks, turkies and hens; they have also abundance of wild fowl and game, with a variety of uncommon birds peculiar only to this country. Among these we shall select the following:

The pipi, so called from the sound of its voice resembling those two syllables: this bird hath a remarkable instinct in directing huntsmen to their game, and will not leave them till they have arrived at the spot where it lies. It is a small bird, but very beautiful, its feathers being variegated with several colours.

The abagon, or flatly abbot, is remarkable for its beauty, as also for a kind of horn that grows on its head instead of a crest; this horn is short and round, and is divided at the upper end in the shape of a mitre.

The feitan, favez, or devil's horse, resembles a man armed with feathers, and commonly walks with a majestic gravity, or runs with surprising swiftness; but when too closely pursued, it expands its wings and flies away. It is about as high as a stork, but its shape is much more genteel and beautiful.

The cardinal is a very handsome bird, all its feathers being of a beautiful crimson, except those on its breast, which appear of the colour, and have the smooth gloss of the finest black velvet.

The white nightingale is also a very curious bird; the tail, which is very long, is of the same colour with the body, and when the bird flies it appears like a large piece of paper fastened to its rump.

The last distinguished bird we have to mention in this country is that called the maroc, or honey-bird; it receives its name from having a particular instinct in discovering the hidden treasure of the industrious bees, of which they have prodigious numbers, and of various sorts; some of them are domestic and kept in hives; others are wild, and lay up their honey in hollow trees; and a third sort hide it in small holes and caverns in the ground, which they take surprising care to cleanse for their use, and afterwards to stop them so close and artfully, that it is almost impossible to find them out, though they chiefly lie along the most public highways. This last is the sort that the maroc discovers to the inhabitants, by an unusual noise and fluttering of its wings, which, when perceived by the palkinger, he has nothing to do but to follow him to the place, where the feathered guide begins a more delicious note, which he continues till the man hath taken possession of the hidden store; in the plundering of which he takes care to leave a small quantity behind for his follower, it being the chief food on which he exists.

The sort of bees that deposit their honey in this manner are the most numerous; and it is said that the reason of their thus laying it under-ground arises from their not having any sting; the wax is whiter than that produced from the other bees, and is more fit for chyrurgical applications; the honey is also far superior, and much more useful for physical compositions.

Besides the sort of serpents before mentioned, they have many others, some of which are exceeding large; as also prodigious numbers of insects and other vermin. But the most destructive creatures here are the locusts, which sometimes fly in such swarms that they destroy all before them, and leave whole kingdoms and provinces desolate. They are bred in the rocky and mountainous parts of the country, and go in such multitudes, that they appear like thick clouds, and cover so large a space of the earth, as even to eclipse the light of the sun at noon-day. They commonly range the whole summer, shifting from place to place, till about their Michaelmas, which is in the month of November, when a strong westerly wind begins to blow, which drives them into the Red Sea.

Before we conclude our account of the natural productions of this country, it is necessary to observe, that in the mountainous parts there are several mines of salt; as also others that produce gold, silver, lead and iron. The natives, however, do not work either the gold or silver mine, on account of the fear they are in of tempting their neighbours to seize on them, should they be once apprized of their having such valuable possessions; so that though this country might produce plenty of these metals, yet they prudently chuse to have so tempting a treasure concealed from strangers, and content themselves chiefly with what is brought to them from Caffreria, Nigritia, and other parts, rather than to hazard the enslaving of their country, by acknowledging they have any of their own. What little they otherwise get is brought by the torrents from the mountains, which is often found in grains as large as peas, and of a very fine and pure nature.

The salt mines are very numerous in many parts of the country, but especially on the confines of the kingdoms of Tigra and Angot. This salt is not made either from sea-water or salt springs, but is ready prepared in their hands, and in such prodigious quantities, that the mines, which are no other than huge rocks or mountains of solid salt, are in some measure inexhaustible. These rocks are hewn in pieces somewhat in the shape of our bricks, but of different sizes and weights; the salt,

though very solid and hard on the surface of the rock, is much softer within the mine, till consolidated by the sun, and is no way inferior in taste and quality to the best in Europe. These pieces are dispersed through the whole empire, and are bought, especially at their fairs, not only as a necessary commodity, but as the most current money, by which they can furnish themselves with all other goods they want, and where they bear a greater or less value according to the distance of the place from whence they are brought.

In some parts of this empire are also large spacious plains, whose surfaces are incrueted with another kind of salt, in the fetching of which many hundreds of camels, mules, and asses are constantly employed. This salt is made in the same shape as the former, and is very white and hard.

There is also a third sort of salt, which is of a reddish colour, and hewn from an entire rock: this is generally used in physic; and the mountain must be worked by night, the heat being so violent in the day that it is impossible for either man or beast to bear it.

S E C T. II.

Of the Inhabitants of Abyssinia, their Manners, Drss, Customs, Religion, &c.

THE empire of Abyssinia is inhabited by various people, whom, for the sake of distinction, we shall general divide into Christians, Jews, Mahometans, and Gentiles. By the first are meant not only those of the Abyssinian church, who are the principal natives of the country, but those whom the Roman missionaries brought over to their own communion, and still continue in their adherence to it.

The Jews have been settled in this empire from time immemorial, though various revolutions have happened amongst them, from the natural disgust taken to them by the respective emperors. Many of the ancient Jews embraced Christianity from the earliest period of its being propagated in this empire, which considerably lessened their number; and many others were slain in the respective wars that have at different times happened for a series of years between the emperors of Abyssinia and a neighbouring, but barbarous nation, called the Gallas. From these and other causes, they have gradually decreased in number, being much less considerable now than they were even in the last century; and the few that remain are looked upon with such contempt, that they are obliged to detach themselves from the rest, living chiefly in some of the most mountainous and craggy parts of the country.

The Mahometans are dispersed all over the empire, and are so numerous as to form at least one third part of the whole inhabitants; they live in great friendship with the Christians, and the chief employment of most of them is agriculture and farming.

The Gentiles, who inhabit several considerable parts of this empire, are chiefly the descendants of the Gallas, some tribes of whom the emperors have suffered to settle in their dominions, on condition of their assisting him to oppose that nation at such times as they offered to make incursions, as they frequently have done in different parts of this empire.

The Abyssinians in general are a well made people, and of a lively and tractable disposition: some of them are black, but the principal part are of a brown, or olive complexion; they are very tall, and their features well proportioned; their eyes are large, and of a sparkling black, their noses rather high than flat, and their teeth white and uniform.

In their dispositions they are a sober temperate people, and less addicted to vires than the inhabitants of Europe. They seldom quarrel with each other; but when such circumstances do happen, they first proceed to blows, and as soon as their heat is allayed, either by those means or the intervention of cooler reason, to which they are very ready to listen, they immediately submit to an arbitration, or lay the whole cause of their quarrel before the ruler of the place, and he who is declared to have been in the wrong, faithfully stands by the judgement of the ruler, without grudge, murmuring, or appeal.

The dress of the common people consists of a kind of scarf, which hangs loose from the shoulder to the waist, from whence they have a pair of cotton drawers that reach

to the ankles. The better sort wear a long vest made either of silk or cotton, and tied about the waist with a rich girdle. The ladies dress in the best silks and broadsides, and ornament their heads various ways; their necks are decorated with chains, jewels, and other embellishments, and in their ears they wear the richest pendants. Both sexes take particular pains with their hair, which is the only ornament they have to their heads, none but the emperors being permitted to wear either cap or any other covering.

The women in general are very subservient to their husbands, especially those of the meaner sort, who execute the most laborious offices of the family; particularly that of grinding all the corn used in it, which even the male slaves will refuse to do. This work is exceeding hard, for as they have no mills they are forced to grind all by the hand, whether it be for bread or drink; and this must be repeated every day, for what is made one day will not serve the next.

They mostly live in tents or camps, and remove from one place to another as best suits their convenience; so that, exclusive of a few royal palaces and ancient churches, there are few public structures or private buildings to be met with. The houses, or rather huts, that form their camps are wretched mean buildings, being made only of bask and clay, and covered with straw. Their furniture is equally mean with their houses, consisting only of a large table to sit round at their meals, and a few trifling utensils. The more wealthy lie upon couches, and cover themselves with their upper garments, but the poorer sort lie on mats on the ground, and wrap themselves up in the skins of some beast.

They are all very temperate in their eating, but are far from being nice in the choice of their food, for none can be well carter, or more disgusting than theirs, even among the better sort; it generally consists of a piece of flesh, which is sometimes parboiled, but for the most part quite raw: this is served up on an *apas*, or cake of bread, ground and made by the women, of wheat, pease, millet, rye, and other sorts of grain, according to their circumstances, so that this *apas* serves them not only instead of a dish or plate, but likewise instead of a napkin or table-cloth, neither of which they ever use at their tables. When they boil mutton or chickens to make broth, they serve it up in black earthen porringers, covered with what they call *escambias*, which are like caps made of fine straw. Those of the greatest quality have no better than these at their tables, and the older they are the more they value them. The sauces they use to their meat are no less disagreeable than the flesh itself, being chiefly butter turned into oil, with which are mixed some ingredients, whose taste and smell are so disgusting, that no stranger can eat with them, not even a Spaniard or a Portuguese.

Their greatest regale is a piece of raw beef brought in recking warm from the bask; and if they invite company to eat with them, the whole quarter is served up at once, with plenty of salt and pepper. The gall serves instead of oil and vinegar. Some add an ingredient called *malta*, which is made of what they draw out of the paunch of the ox or cow. This they stew some time on the fire, with pepper, salt, and sliced onion, before they bring it to table, which, when covered with such a large piece of warm raw beef, is esteemed by them a most delicious repast. This dish, however, can only be purchased by the rich, on account of the pepper, which in this country is very scarce and dear.

They are exceeding filthy in their manner of eating their victuals; it is esteemed amongst them a piece of high breeding to gobble large pieces, and to make as much noise as they can in chewing their meat; it being a common saying amongst them, "That none but beggarly wretches chew their meat only on one side; and none but thieves and robbers eat without making a noise."

However, it must be observed that they have one cleanly custom at their meals, which is always to wash their hands before they sit down, because they take up their victuals with their fingers; and those of high rank are still more nice in this particular having their meat cut into pieces, and conveyed to their mouths by their most favourite attendants.

They never drink till they have finished their meals,

holding it as a proverbial maxim, that it is most proper "first to plant, and then to water;" but after their meals they give a loose to dissipation, and sometimes, especially at feasts, drink to the greatest excess. Their general liquor is *mead*, the manner of making which is thus: they take five or six quarts of water, and one of honey; these they mix together in a jar, and throw into it a handful of parched barley meal, to make it ferment: after this they put into it some chips of a wood called *fardo*, which in two or three days takes off the cloying taste of the honey, and makes it very wholesome and palatable. They have also a kind of beer made of barley meal, with which, instead of hops, they mix some intoxicating drugs.

The laws of this country allow of polygamy, but the canons of the church forbid it; so that those who indulge themselves in it, are only punished by being excluded from the holy communion. All their marriages must be celebrated before a priest, his benediction being esteemed essentially necessary. The previous ceremonies are very trifling, the parties only engaging to cohabit and join their flocks together, as long as they like each other; but, if any differences afterwards arise, they shall be at liberty to part. This, added to the consent of the parents, and the interchange of a few presents, concludes the contract, and the parties proceed to the door of the church, where they are joined by the priest, who performs the ceremony, and bestows on them his blessing. His custom of the priest meeting and marrying the candidates at the church doors, is certainly of great antiquity, and has been used in various nations and by persons of very opposite religious persuasions. In particular, something of this kind was formerly practised in England, as appears by the following distich, written by old Chaucer, in his "Wife of Bath:"

She was a worthy woman all her life,
Husbands at the church door had she had five.

From the conditional engagements made by the parties before marriage, it is little to be wondered at that either one or the other should be frequently desirous of obtaining a divorce, which, though reckoned unlawful, except in case of breach of conjugal fidelity, is yet very readily granted, even where no such plea is so much as pretended. The reasons they chiefly urge for soliciting a divorce, are the want of children, a mutual dislike, or bodily infirmities; in all which cases each hath the privilege of abrogating the marriage contract. When either party has obtained permission from the priest to be divorced (which is seldom denied) they next petition for a licence to contract a new marriage, and this is as readily obtained as the divorce; and in such case the party is liable to be excluded for some time from the communion, according to the discretion of the priest.

When either party has been guilty of infidelity, they generally adjust the matter by making such presents to the person injured as the latter thinks a sufficient compensation for the offence committed: but where such a composition cannot be agreed on between the injured and injured, if the man be the offender he is punished by paying a fine, which is appropriated to the use of the wife: if the woman offends she is condemned to lose all her goods, and to go out of her husband's house in a ragged dress, with an express prohibition never to come into it again; and all that she is permitted to take with her is a sewing-needle, by which she may be enabled to get her livelihood.

The paramour of an adulteress, if convicted, is only punished by a fine; and if he is unable to pay it, he becomes a slave to the husband till he can either obtain the money, or has compensated for it by servitude.

They have but few ceremonies in the interment of their dead: as soon as the person has expired he is immediately washed, sprinkled with holy water, then wrapped up in a sheet, and laid on a bier. When this is done, the relations order a grave to be made, into which, as soon as finished, the body is hastily carried and thrown, when the priest reads the service, and the grave is immediately filled up. The relations bewail their loss by the most hideous lamentations, and by laying themselves flat on the ground, and beating themselves with great violence against it. The funerals of the competitors and grandees are performed

formed with great pomp and magnificence*, and are accompanied with all the insignia of their dignity, and with the most solemn and doleful music, which is in a manner drowned by the loud cries and lamentations of the retinue. But they use neither torches nor any other lights, either in the procession, or in the church.

The common people chiefly employ themselves in tilling the ground, keeping of oxen, cows, goats, horses, mules and camels; and the better sort in merchandize and the use of arms. They have few manufactures amongst them, the principal being only weavers and smiths; and though their country is well calculated for the produce of several advantageous articles, particularly linen and cotton, yet such is their natural indolence, that they manufacture no more of it than will just serve their present wants. Their silks, brocades, velvets, carpets and other costly stuffs, are brought to them by the Turks, in exchange for which they give them gold dust, emeralds, and fine horses.

The sovereigns of this empire have ever been sensible of the great advantages a variety of trades would be of to their dominions; but it seems they dare not force their subjects to what they would deem an insupportable slavery. This appears evident from the letter which David, one of their monarchs, sent to John III. of Portugal, wherein he desired him to send over to him some armourers, cutlers, architects, carpenters, masons, goldsmiths, miners, bricklayers, and jewellers. By the churches and other ruined buildings, they seem, indeed, as if they had heretofore encouraged architecture; but the workmen that did them were sent for from other countries, and were forced to do all themselves; so that when those fabrics were rare, the people flocked from all parts of the empire to view them, and admired them as new wonders of the world. We have only to observe, on this subject, that the few trades they have amongst them are always conveyed from the father to the sons.

The Turks, besides silks, brocades, &c. mentioned above, bring the Abyssinians several sorts of spices, and amongst them pepper. The last article is the most coveted by them, for which reason the Turks take the advantage by fixing to high a price on it, that it can be only purchased by them that are very rich. In exchange for these articles, the Turks receive skins, furs, leather, honey, wax and ivory.

As this empire contains a number of kingdoms and provinces, so a proportionate variety of languages may reasonably be expected, most of which are only known to themselves. The Jews that still remain here speak a kind of Hebrew, but exceeding corrupt; and the Moors use their own, Arabic, but no less short of the purity of their ancient tongue. Every province, and almost dis-

* To give the reader a proper idea of the solemn magnificence used at the funerals of the Abyssinian monarchs, we shall preserve the following description of the interment of the emperor Segued, as given by Father Emanuel de Almeida, who was a principal assistant at the ceremony: "The body, says he, was placed on a square bier, or bed, with steps to ascend to it, which had been made by an Egyptian. He was clothed in his royal robes, and covered with a pall of rich stuff of several colours, and conveyed from Dancanz, where the imperial camp then was, to the great church called Caneta Jesu, in a town in the kingdom of Gojam. The corpse was preceded by all the imperial standards, not inverted as with us in Europe, but upright, and displaying their various colours in the air, but without any arms or devices. On each side of them marched several people with kettle-drums, beating in a solemn manner. These were followed by some few of the finest horses which he used to ride upon, with their richest furniture, and attended by the imperial grooms. Next to these came the pages and other servants, carrying the imperial robes, and other ornaments: one carried his veil, another his sword, and a third his crown; others his faith-beads, javelin, target, &c. These were frequently taken from them by turn by proper officers, who showed them to the people, in order to excite their tears; among whom even the empress herself marched a considerable space, wearing his crown upon her head. Both she and her daughters, and other princesses of the blood, with their attendant ladies, rode on mules, with their heads shaved, and a ribband, or slip of white cloth, about two inches broad, tied about them, the ends hanging behind. The remainder of the retinue affected to appear in the most ragged and dirty attire, as the most

trick, hath its own dialect: that which is used at court, and amongst the polite, is the same as spoken in the kingdom of Amhara, and more or less corruptly in other provinces. That, however, spoken in the kingdom of Tigra, comes nearest to the old Ethiopic. This last almost retains its pristine dignity, and is still in use not only in all their religious and learned books, in the emperor's letters patent, and all their records, but in their liturgies and religious worship.

The religion of the Abyssinians is a mixture of Christianity, Judaism, Mahometanism and Paganism; but the former is by far the most prevalent, and, as it were, the established one of the country. They pretend that it was introduced by the famous eunuch of Candace, who, as they affirm, was queen of this vast empire; as Judaism had formerly been by another eunuch called Makeda, who, they said, received it from king Solomon. This, however, they have only by tradition; and though indeed we read, in Acts viii. 27, &c. of such an eunuch being baptized by Philip, yet whether he converted only some part of the nation, or whether it afterwards apostatized in part from it, certain it is, that in the 4th century the great St. Athanasius, then patriarch of Alexandria, was obliged to send thither Frumentius, whom he consecrated bishop of it, and who soon after, converted the greatest part of the nation: from which time there hath always been, and still is, a great number of monks and religious men all over the empire.

About a century ago the Romish missionaries got such footing in this country, that they were very near establishing their religion in it, having so far ingratiated themselves with the emperor and his court, as to obtain a proclamation from that monarch in their favour, allowing, if not enjoining, the Abyssinians to embrace the doctrine of the Roman church. The people, however, proved so tenacious of their old religion, that a dreadful insurrection ensued, which was not quelled without much bloodshed. Finding, therefore, their first attempt so strenuously opposed, and the shocking consequences that had attended it, they forbore making a second; and the people were more than ever confirmed in their ancient rites. Even the emperor, who had shewed himself so zealous a proselyte of the church of Rome, found himself obliged to return to his former belief, and to give free liberty to all his subjects to do the same, and to regain the almost lost affection of the people, ordered all the Roman missionaries to depart out of his dominions; since which no farther attempt has been made to convert them to the Roman Catholic persuasion.

The Abyssinians now own themselves subject to the Metropolitan of Alexandria, though they do not admit of any order amongst them superior to that of a presby-

ter, expressive marks of real grief and mourning, especially black, and followed in the rear, with their hair likewise cut close.

"There were no candles carried in the procession, nor lighted in the church, as is done in that of the Remish, but much weeping and howling heard in both: at the church door the corpse was met by six or seven monks, who sang their psalms and hallelujahs till the body was interred. On the next morning the whole cavalcade returned to Dancanz; and, as soon as they came within sight of the imperial camp, began to marshal themselves in the same order they had gone in the day before, bringing the empty bier with them; by the side of which rode an officer on a mule, clad in the imperial robes, and wearing the imperial crown, an umbrella held over his head, and in all other respects representing the deceased emperor. Before him marched another, with that monarch's helmet and javelin, mounted on his best horse and his richest accoutrements. On their approaching near Dancanz, they were met by four or five bodies of armed troops, and other persons of rank belonging to the court, who received them with the most distinguished tokens of grief, and proceeded with them to the new emperor's pavilion. Here again they renewed their lamentations for the deceased all the time they were alighting, when some of the first ministers of state, and other noblemen, attended by Diego de Mattos and myself, entered the large tent where Facildas the new emperor was, and continued the same mournful lamentations near the space of two hours; which being ended, the whole ceremony was turned into loud acclamations and congratulatory prayers for the new monarch, who was crowned soon after with the accustomed ceremonies."

ter,

ter, excepting their Abuna, or suffragan to the Alexandrian patriarch. They retain many of the Jewish ceremonies, as well as some other very absurd and superstitious maxims. They circumcise their male children, and have several ways of baptizing them. They keep the Saturday, or seventh, as well as the Sunday, or first, and abstain from swine's flesh, blood, and things strangled: they also observe other ceremonies, which though they pretend to be only ancient customs, and to be performed on no religious account, yet greatly favour of the old Jewish leaven. In other things they hold the scripture to be the only rule of faith, and the canon of it to consist of 85 books, whereof 46 belong to the old, and the rest to the New Testament. They are but imperfectly versed in the apostles creed, and in lieu of it use the Nicene, or rather Constantinopolitan. They acknowledge the emperor to be supreme in all matters as well ecclesiastical as civil. They reject the doctrine of transubstantiation, purgatory, divine service in an unknown tongue, auricular confession, the use of images in the church, celibacy of priests, extreme unction, &c.

Their religious worship consists chiefly in reading the holy scriptures, with some sorts of homilies, and singing of psalms; all which they perform with great decency and devotion, and without any thing of that pomp and ceremony which is used in the church of Rome. The vestments they use in divine service are suited to the dignity of the person that officiates, but are greatly inferior to those worn by the Romish priests. Instead of the alba, or white linen garment, used by the latter, they have a tunic, which they purchase of the Turks, and is generally of gold and threadbare. They use neither girdle, stole, maniple, &c. as those of the Romish church do; and as to their chafuble, or upper garment, it is much narrower than theirs, and trails about half a yard on the ground.

They go to their churches betimes, and never enter them without taking off their shoes, neither do they sit down, except on the bare ground. They carefully observe the hour of prayer, and even the very peasants will leave their work and attend that duty before they have broke their fasts. In a word, the generality of them express, in many respects, a deep sense of religion, and are much inclined to the giving of alms, visiting the sick, and other religious duties.

Before we quit this subject, it may not be improper to take notice of the different orders of the Abyssinian clergy. The most dignified of these is the abuna, or patriarch, who is wholly subject to that of Alexandria, as all the rest of the clergy are to him. His office is very lucrative, for having no bishops under him, nor any other person to controul him, he disposes of all dispensations, which bring him very pecuniary emoluments. He has likewise the sole privilege of ordaining, which also produces a considerable income, few being received into holy orders without a previous offering to obtain their admittance. Besides these advantages he has also certain lands assigned him in the kingdoms of Tigra, Gossan, and Dambea. The first of these is computed to bring him in 40 or 50 ounces of gold per annum: those of Gossan and Dambea afford him a more than sufficient quantity of provisions for his table, the remainder of which he disposes of to his own profit. To these may be also added, a kind of public gathering of salt and cloth, which is annually made for him throughout the empire, and amounts to considerable value; all which put together make up a very large revenue, and the more so as the lands are free from all taxes to the emperor.

The next order of ecclesiastics, and who are held in great esteem, are those called Debaras. These are neither priests nor deacons, but a kind of Jewish levites, or chanters, who assist at all public offices of the church, and whose head, or superior, called Barca Guyta, hath the care and direction of the sacred pavilions in the imperial camp. As they boast themselves of Jewish extraction, they pretend, by the songs, dances, and beating of their drums, to imitate the service of the Jewish tabernacle, and temple of Jerusalem, and the dancing of king David before the ark. These debaras always attend on grand festivals, when they begin their music and dancing long before day, and continue it till noon, without appearing to be in the least fatigued.

The komos are the next in order, and in point of dignity follow the abshira. Every parochial church hath one of these, who is a kind of hagumanus, or archpriest-byter, and hath all the inferior priests and deacons, as well as the secular affairs of the parish, under his care and government: and as they have no bishops over them, they preside in chief at divine service, distribute the several offices of the inferior clergy, and reconcile their disputes. The office of the inferior priests is to supply the place of the komos when absent, and if present, to assist him in the divine service, to baptize, marry, visit the sick, inter the dead, and perform other religious duties.

The deacons are the last order of the priesthood, and likewise assist at divine service, though in a lower sphere than the priests; and both have their proper offices and vestments when they officiate. This order is conferred by the abuna on the emperor, princes, grandees, and even on their children; not that they may have the privilege of officiating as such, but only to assist at the divine service, and receive the communion in the chancel with the clergy, and be separate from the laity, who always stand in the body of the church.

All these orders are allowed to marry, and may even so after they have been ordained priests. Their sons also are allowed to succeed them in their church benefices. In general, however, they are all, except the abuna, exceeding poor, inasmuch that they are obliged to apply themselves to labour and industry, but chiefly to farming and pasturage; all which renders them less respected than the clergy in other countries, especially as they wear no particular dress, or other mark of the priestly office, except a small cross, which they carry in their hand and bless the people with, and a small round cap of any colour, which they wear on their heads. Neither have they the privileges enjoyed by priests of many other countries, being subject to be punished by the lay magistracy in the same manner as secular persons, should they commit any thing derogatory to the laws of their country.

Most of their churches appear to have been formerly large and elegant structures, but they are now so decayed that it is impossible to form a proper idea of their original magnificence. The most distinguished, and which claim the attention of all the curious, are the following ones, viz. St. Emanuel, St. Saviour, St. Mary, the Holy Cross, St. George, Golgotha, Bethlehem, the Martyrs, Marcocoos, and Lalibela. However incredible it may appear, yet certain it is, that these ten churches were all cut out of a solid rock, by dint of the hammer and chisel. The last of them bears the name of their founder, who being desirous of having them executed, sent for a number of workmen from Egypt, and so expeditiously was the undertaking carried on, that it is said the whole were completed in 24 years. A short time, considering the number of them, and the stately manner in which they are constructed, being proportionable in all their parts, as gates, windows, pillars, arches, channels, &c.

Besides the churches, they are many monasteries in Abyssinia, most of which contain two chapels, one for the men and the other for the women; but how they came to be introduced, and of what order the first founders of them were, is not known. At present there are only two different orders, who are called by the names of their founders, viz. those of Tekla Haymanout, an of Abba Eustatius; the former a native of Ethiopia, and the other of Egypt. All the monks belonging to these monasteries live in a very reclus and austere manner; their cells are very mean, being built only of clay and covered with straw, and their furniture within is equally despicable: they lie only upon mats on the floor, and follow every thing that is answerable to a monastic life. In their work of mortification they are peculiar to themselves, for instead of those practised by the monks of other countries, which perhaps rather stimulate than damp the fleshly appetites, they plunge themselves into the coldest rivers, and continue in them, with the water up to their chin, for several hours together; and this kind of mortification they practise even in the coldest weather. They have all of them the privilege of carrying a cross in their hands, and blessing the people; the first of the abbots or superior orders of convents are distinguished from the rest by being much larger and better shaped; and when they go abroad are usually carried before them by some inferior

inferior monk, as a token of their dignity. Such as preserve a life of celibacy are much more esteemed than those who marry; and are often, especially their abbots, consulted by the emperor in matters relating to the welfare of the state.

S E C T. III.

Of the Government of Abyssinia with the power and grandeur of the Emperor; their laws, punishments, &c.

THE government of Abyssinia hath ever been monarchical and despotic, under an emperor, who hath always claimed an absolute right over the lives and properties of his subjects, and hath preserved an uncontrollable authority in all matters as well ecclesiastical as civil. There never were any written laws formed for the government of this empire, much less any to restrain the absolute power of the monarchs; so that their will hath ever been the universal law.

The emperor of Abyssinia prides himself, on a like supposition preserved by his ancestors, of being descended by lineal succession from Merrilebeck, or David, the son of the great Solomon king of Israel, by the queen of Sheba. In consequence of this he assumes several vain and pompous titles, such as, the Beloved of God; the Offspring of Judah; the Son of David; of Solomon; of the Pillar of Zion; the Seed of Jacob; of the line of Mary; of Nahu after the sect; of St. Peter and Paul after the spirit, &c. &c. He likewise bears in his arms the lion of the tribe of Judah holding a cross, with this inscription in Ethiopic: *The lion of the tribe of Judah is conqueror.*

The respect paid to him by his subjects is answerable to the titles and dignity he preserves, none of them daring to approach him without the deepest marks of submission, and such as are little inferior to those shewn to Indian monarchs. He does not, indeed, affect, like them, that majestic piece of grandeur of being seldom seen by his subjects, for he will often shew himself to them in public, and even admit them into his presence; but this is always done with the greatest solemnity, and those who are thus far honoured are obliged to fall prostrate on the ground before him, and kiss it as they approach his person. They also pay adoration to him even in his absence, for they never hear his name mentioned without bowing their bodies very low, and touching the ground with their hands.

The emperor, like his subjects, lives altogether in tents, and removes from place to place. He is always followed with a numerous retinue, and his camp takes up a great tract of ground, as his court is very numerous, and attended by a considerable guard, besides common soldiers and the vast numbers of sutlers who supply them with all necessaries. This spacious camp is so well laid out that it looks like a large city composed of many handsome streets. In the center of it, or on some convenient eminence, is the imperial pavilion, and about it those of the empress, the royal family, lords and ladies of the court, &c. In some parts of the camp are stately tents adapted, instead of churches, for the performance of divine service: these are very large, and elegantly adorned both within and without. In other parts of the camp are market places for the sale of provisions, as also courts of judicature, and other tribunals of justice.

When the emperor removes his camp from one place to another, whether in time of peace or war, he is always attended by his azaques and chief ministers. He wears a kind of cap or hat, made after the Indian manner, on the top of which is a crown formed of gold and silver, and embellished with pearls. In times of war great order is observed in marching: the army is ordered to keep close, the van-guard and rear drawing up close to the main body; the wings spread themselves out, and the emperor keeps in the center with his guards, great officers, ladies, &c. At other times little order is observed, excepting that there is always a number of warlike instruments, and a proper guard marching before and after the emperor.

The succession to the crown of Abyssinia is hereditary, but it is not absolutely tied to the primogeniture, for the emperor, if he pleases may set aside his eldest son, or any other, and leave it to such one as he thinks most deserving of it.

This privilege has heretofore proved the cause of much jealousy and misunderstanding among the young princes; and sometimes produced long and cruel wars between them. And it is supposed that this gave rise to a custom that was long preserved in this empire, of confining all the princes of the blood to the fortrefs or rock called Amba Geuxen, where they were kept under such a very strict guard, that no creature belonging to the court was permitted to come near them; nor could any message or letter be conveyed to them till it had undergone the examination of their jailors, whose business it was to keep them under the strictest and severest discipline; neither were they permitted to have any other clothes than those worn by the common people, lest a more distinguished dress should inspire them with ambitious thoughts.

Father Tellez has furnished us with the following anecdote relative to the behaviour of one of these jailors in the above particular, and the conduct of the prince to him after his advancement to the throne: "One of these guards, or jailors, says he, who was naturally very rigid, observing that one of those young princes was better clothed than the rest, and was more nice and careful in his dress, not only severely reprimanded him for it, but tore it off his back; and threatened him, that if ever he caught him again in such finery, he would provide him a dress that would not please him. Some years after, this prince was raised to the imperial throne, and ordered that guard to be brought before him; who, coming with a heart full of the deepest apprehension, cast himself at his feet, and begged pardon for what he had formerly done to him. His fears, however, were soon turned into joy and gratitude, for the prince, bidding him rise, presented him with a rich suit, and a gold bracelet of great value, and dismissed him with words to this effect: "You did your duty as became you, and I am highly pleased with it; and as you have served my father so faithfully, so I doubt not you will do the same by me: return to your former charge." This behaviour, which afterwards made those guards more rigid and severe, plainly evinces, that though the prince might think his condition hard whilst under that cruel restraint, yet he did not deem it politic or safe, now he was on the throne, to mitigate any part of that severity and harsh confinement to which these princes had been so long subject.

As the circumstances that gave rise to this unnatural custom are no less singular than those which occasioned it to be abrogated, we shall, as a matter of curiosity, lay them before the reader.

This rigorous custom was introduced about the year 1260, and took its rise as follows: the emperor dying a short time before, bequeathed his dominions among his sons, of whom he had nine in number, with a restriction that they should reign alternately, every one his year, according to seniority. The youngest of them, being of an ambitious disposition, could not have patience to wait till it came to his turn to govern; he could not brook the distinction made between those of his brothers who had governed, and those who were to govern, the former being always seated at an upper table, whilst he and the others were obliged to put up with a lower one, and to wash their hands in another tocm because it was thought unseemly so to do before their betters; all these circumstances joined together inspired the agitated prince with a design to abolish the thisting annual government, and to grasp it all into his own hands. He found, however, that it was difficult to carry on such a project without imparting it to some friend; and that friend found it no less dangerous to keep his secret; so that, instead of succeeding, he found himself at last catrapped in his own snare. When it came near his turn to mount the throne, as he was studying proper measures to secure all his brothers in some such strong place as that of Amba-Geuxen, his confidant revealed the whole secret to the then reigning brother, who liked the project so well, that he sent both the projector, and all his other brethren, under a strong guard, to that place, as the fittest for his purpose: soon after which, growing jealous of his own sons, he sent them also to the same dismal confinement. These were the circumstances that gave rise to this unnatural custom, which continued to be practised for more than two centuries.

The occasion of this custom being afterwards abrogated

gated was as follows: Nahod the prince then on the throne, and the father of Onak Segued, the last prince of this country, who came out of that dreadful confinement, had a son about eight or nine years old, of whom he was exceedingly fond. A counsellor, who came to court one day, seeing him stand by his father's side, could not forbear taking notice to the emperor, how big his son was grown; whereupon the young prince, who had a ready apprehension above his years, was struck with terror at the expression, and fixing his weeping eyes upon his father, said in a moving tone, "What am I then grown up for Amba-Gieuzen?" These words, and the manner in which they were spoke, made so deep an impression on the father, that he immediately resolved to abolish that inhuman custom; and not only swore himself, but obliged his counsellors, and officers of the court to do the same, viz. that no son of his, nor of any other emperor, should thenceforth be ever confined to that place; which oath was afterwards so faithfully observed, that no prince of the blood hath ever been sent thither from that time to the present. It is much to be doubted whether any thing less than the extreme grief and tears of so tender and young a prince could have prevailed upon the emperor Nahod his father to have abolished a custom of such long standing, and which had been, till then, considered as one of the greatest securities to the reigning monarch. Thus we see the happy consequences that sometimes arise from the most unexpected causes. Had it not been for tender (or more properly speaking, the sympathetic) feelings that were displayed by this mere infant, the princes of this vast empire had still lived in a state of bondage; but certainly Providence here interposed, and by the lips of the child, converted the slave into the prince.

Quickness of thought hath made and unmade kings,
And great effects arise from trivial things;
A sudden turn may revolution cause,
And small events reform a nation's laws:
Truth from the mouth of innocence prevail,
And babes succeed where mighty warriors fail:
It does to Providence alone belong
To make the weakest overcome the strong;
Against the pride of man to aim the blow,
And in the race give conquest to the slow.

The Abyssinian monarchs indulge themselves in having a plurality of wives, the generality of whom are the daughters of the most distinguished families in the empire. The ceremonies previous to the nuptials, as also the celebration of them, are as follow: As soon as the emperor has intimated his desire of having the daughter of such a one in marriage, he is immediately removed from her parents to an apartment in the house of one of his most distinguished courtiers, where she continues some time, the emperor visiting her occasionally to form a judgment of her mental as well as personal accomplishments. If he is satisfied in these particulars, a day is appointed for the celebration of the marriage, when he takes her with him to church, from whence, after assisting in the divine service, he leads her to the imperial pavilion, where the marriage ceremony is performed by the abuna or chief priest, in the presence of the whole court. The emperor, as at other times, dines by himself in his own apartment, and the in hers; but the guests are sumptuously entertained at tables provided for them in tents, and the remainder of the day is spent in festivity and mirth.

The bride does not receive the title of empress till some time after marriage, according to the pleasure of the emperor; neither is she permitted to dwell with him in the royal pavilion, but has one assigned her near at

* Father Tellez says, "As harsh as the word *slave* may sound in our ears, it is in such common use among them, that even the emperor's own kindred and brethren have it given to them; so that when he raises any of them to any dignity, such as that of viceroy, which is the highest under him, their commission always runs, We have constituted—our slave, viceroy, or governor, &c. without giving them the title of brother or kinsman: and well may he style them slaves, seeing they are all such to him, from the highest to the lowest; and their lands, lives, &c. are wholly at his disposal."

hand, from whence she comes to the emperor at such times as he thinks proper to enjoy her company. On the day she is to be installed litque, or empress, she appears in his tent seated on a couch near the imperial throne, on which the emperor sits likewise, but higher by one step: they are both dressed in the richest apparel, as are also the nobles and officers of his court, who assist at the ceremony. On a signal made, one of his dignified chaplains goes out of the tent, and standing on a chair, proclaims her empress, in these words, *Anagasma danguetera hem, that is, We have ordained our slave to reign; or The king hath raised his servant queen.* This is immediately answered by the loudest acclamations of the people; after which she receives her dignified title of litque, or empress, and this she retains during the remainder of her life. The empress never receives the ceremony of coronation, unless it happens that the emperor dies without issue, and in that case it falls to them, when they receive not only that honour, but are solely invested with the imperial dignity.

No person whatsoever is permitted to see the emperor ear, except the pages that attend him, who cut his vic-tuals into bits, and convey them to his mouth, for he considers himself of too much importance to be at the trouble of feeding himself: even the empress is denied that privilege; and when he gives audience to foreign ambassadors, he is concealed behind a curtain, so that they may hear, but cannot see him.

The chief officer belonging to the emperor is called Rath, who is generalissimo of all his forces: he hath under him two officers, one of whom is stiled Bellatinoche Goyta, that is, lord of the servants, and is a kind of high steward: his power extends not only over all the viceroys, governors, and generals of the army, but also over the azagues and umbares, who are the civil judges of the empire. The other officer is stiled Tahah, that is lord of the lesser servants: he is only a kind of under steward to the king's household, which is commonly composed of men of lesser rank.

The viceroys and governors of the kingdoms and provinces are, as before observed, under the Bellatinoche, as are also the military commanders and civil magistrates, or judges. All these hold their several courts of judicature, in which causes, whether of a civil or criminal nature, are brought and decided. Those of a martial kind have martial officers to preside over them; but the others are tried before the civil judges, who are called umbares, or chairs, because they alone are allowed to sit, the plaintiff, defendant, &c. being obliged to stand. Both plaintiff and defendant plead their own cause; the former first states his complaint to the court, and when the latter has answered to the allegation laid against him, the judge, after commanding silence, addresses himself to the court, and asks their opinion, when the majority of voices determines the cause, and sentence is immediately pronounced. In some cases the sentence is without appeal, but in others it may be removed to a superior court; as first, to the viceroy or governor; thence to the Bellatinoche, or lord high steward; and lastly, from him to the emperor.

In capital offences they have three sorts of punishments; the first of which is burying the criminal alive, which they do by digging a large hole, putting him into it upright, and then filling it with earth up to his mouth; after which they cover the head with thorns and briars, and over the whole lay a heavy stone. The second is, by beating the criminal to death with thick clubs: and the last and most common is, by piercing them through the bodies with their assagayes or lances.

When a man is accused of murder, and it cannot be sufficiently proved against him, all the inhabitants of the

The same writer says, "But as little undervaluing as they think the title of slave is among them, it was not so accounted by the Portuguese when they were here: one of whom having obtained some great post from the emperor, and, as a subject of the king of Portugal, who calls them all his children, disdainful to be stiled a slave to that of Ethiopia, offered a large sum of money to the herald, or crier, who was to proclaim his promotion, to leave out that odious title, and call him only by his name; but that was more than the officer dared to do."

place

place are severely fined, or put to some corporal punishment; so that a murderer here seldom escapes.

The common standing army kept by the emperor of Abyssinia to guard the remainder of the empire (for a great part of it hath been dismembered, especially towards the south, where the Gallas, which lie between it and the line, have laid waste a number of kingdoms and provinces) is computed to amount to no more than 35000 foot and 9000 horse, which is but a small number considering the still vast extent of this empire. But it is said that he can raise upon occasion a million of men, in as little time as his orders can reach the provinces under his obedience; for, upon the receipt of them, they are obliged to appear in arms under their respective generals or governors, and be ready to march to whatever part they are allotted, none being exempted from bearing arms at such times but religious persons, mechanics, and husbandmen.

Some of the horse wear coats of mail and head pieces, but the rest are very indifferently accoutred, having no other arms, offensive or defensive, than a spear and buckler. They are very little acquainted with fire arms, and as indifferently furnished with powder and ball. Their spears are of two sorts, the one like our halberd, or short pikes, the other like a halbert or partisan. The staves of the former are very thin and the iron narrow, like our pike; the iron of the other is broad and thin: the first is to be thrown by dint of strength, and the last to be used in close fight with one hand whilst the other holds the buckler, which is usually made of the hide of some beast.

The foot soldiers have likewise two of those spears, one of which they dart with such strength and fury that they will often pierce a coat of mail or buckler; and the other they keep to continue the fight, as some do the sword and buckler.

Those of higher rank wear swords, but they seldom make use of them in battle, having them chiefly as a mark of distinction. They likewise wear a kind of dagger under their girdle, with the hilt towards the right and the point towards the left hand. Some also carry a large club of hard wood with a dagger in it: this weapon they call *balota*, and commonly use it when they come to close engagement with the enemy, and sometimes throw it at them with all their strength.

Those of the horse that wear the coat of mail lay aside the buckler as an incumbrance. They are said to be all very good horsemen, and mount and fit their horses to admiration; but in other respects they are very indifferently disciplined.

The martial music here consists of kettle drums, which are exceeding large, trumpets, hautboys, flutes, and other instruments. In times of war the emperor, as before observed, is always in the center of the camp, surrounded by his nobles and chief officers. He is likewise attended by a vast number of troops, who not only perform the divine service in pavilions assigned for that purpose, but also escort and attend the sacred utensils that are used in it with great pomp and ceremony, and with vocal and instrumental music: among which those belonging to the imperial court are carried about with the greatest solemnity.

The emperor of Abyssinia's revenues chiefly arise from four branches; the first of which is the tribute paid him by the governors of such provinces and kingdoms as contain gold mines, particularly those of Narea and Gojam, from which he receives a certain weight yearly of that metal.

The second branch of the revenue arises from the sale of all the great places in the empire; such as the viceroys, governments of kingdoms and provinces, and other offices and posts of trust; the yearly tribute they pay to him for being continued in them, as likewise for the product of those lands which are in their respective governments; for as all the lands in general appertain to him in chief, these governors do, in some sense, farm them from him, and pay him a yearly proportion of their product.

The third branch consists in a tenth levied every third year upon all the cattle in the empire. By this last, which it appears was unknown till about the middle of the last century, every man that hath cows is obliged to pay him one out of ten every third year; and the coun-

try breeding vast quantities of them, makes it perhaps by far the most considerable branch of the three. It is called the burning or branding tax, because the emperor's officers brand those with a particular mark which they set aside for his use.

The fourth and last branch of the emperor's revenues arises from a duty laid on every loom of cotton cloth. If it belongs to a Christian, he pays one piece of cloth; and if to a Mahometan, a piece of eight per annum. By this duty are gathered, in the kingdom of Dambea, and parts adjacent, about 1000 of these pieces, and in that of Gojam 3000; besides about 200 *billetes*, which are a thicker and stronger cloth, and all flagged on one side. The like tax is gathered in all the other kingdoms and provinces throughout the empire; and though it does not produce so much as either of the other branches, yet the annual amount of it is very considerable, and would be more so, were it not for the depredations made by those appointed to collect it.

S E C T. IV.

Of the different Kingdoms and Provinces that now form the Abyssinian Empire.

THE empire of Abyssinia was formerly much more extensive than at present, several of its kingdoms and provinces having been dismembered from it by the incursions of the Gallas, a barbarous people, of whom we shall take a proper notice hereafter. These kingdoms and provinces that at present belong to it are as follow, viz.

1. Tigris, or Tigre.
2. Bagameder, or Bagamedri.
3. Amara, or Amhara.
4. Oleca and Choa.
5. Damota, or Damut.
6. Goyam, or Gojamit.
7. Dainha.
8. Narea, or Enarea.

1. *The Kingdom of Tigris.*

This is the most considerable kingdom in the whole empire, and is remarkable for having in it the remains of the city of Axum, which was formerly the residence of the emperors, and though now abandoned by those monarchs, and reduced to a mere village, is still the place where they repair to be crowned. It is bounded on the east by the Red Sea, on the west by Dambea and part of Nubia, on the north by Barnagaf, and on the south by the kingdoms of Angot and Bagameder.

The most extensive part of this kingdom is that which lies towards the Red Sea, and is thence called *Medra Bahr*, or *Maratime Land*; besides which it hath 27 prefectures, exclusive of seven others belonging to Barnagaf. These prefectures are not to be considered as so many districts, each under a particular prefect or governor, because some of these prefects have two and others three of those districts under them; however, we have little to say about them, being all insignificant places, and not containing any thing sufficiently remarkable to attract the notice of a traveller.

The chief place of note in this kingdom is the city of Axum, which was formerly an opulent place, and the metropolis of the whole empire. When in its prosperity it was a large and well-built city, as appears by its few remains; and situated on a spacious and delightful plain, watered by several rivulets, and was adorned with stately palaces, churches, obelisks, arches, &c. There are particularly the ruins of a spacious and magnificent structure, some of the stones of which are of a prodigious size: one of them, which is still to be seen in the form of a pyramid, is 104 cubits high, on a basis of ten cubits, and raised on a plinth about two feet high. Besides this there were many other superb buildings, all of which were reduced to a mere heap of ruins during the wars between the Gallas and the Abyssinians; after which, the imperial court being removed, it still farther declined, and at present it does not contain above 200 mean houses very poorly inhabited.

This city is situated about 40 English miles from the Red-Sea; and though the way to it was so rocky and mountainous that it took up seven days journey, yet it was

was well supplied from thence with various necessary articles. The Abyssinians say, that it was anciently the residence of queen Candace, and even of the famed queen of Sheba.

About ten miles south-west of Axum stands the town of Madgoga, so called originally from the murmuring noise of a neighbouring rivulet. It afterwards received the name of Fremona, from the Jesuit missionaries who had their residence in it, on account of one father Fromentius, the first of their order that came into these parts. This place became more celebrated by the long residence and death of father Andrea de Oviedo, sent thither patriarch of Abyssinia by the pope; after whose death it still continues the residence and seminary of all the missionaries of that order that came into the country, (the greatest part of whom lost their lives for the cause they came to preach there, the supremacy of the church and pope of Rome) until their final expulsion out of the whole empire. The town is situated on a hill, and in it are the remains of a large monastery that formerly belonged to the Jesuits.

About a day's journey from Madgoga is a town called Ambacant; and a little farther to the southern frontiers is another called Mandela; but they are both insignificant places, and very indifferently inhabited. To the northward of the latter, however, are two of the finest monasteries in the whole empire: the largest of them is called Hallelujah, and the other Abugarina, both of which were formerly occupied by the Jesuit missionaries.

Barnagats is the utmost extent of this kingdom, and reaches to the coast of the Red Sea, where it had formerly a famous sea-port called Arquico, which rendered its commerce very considerable. This port, however, was some years ago seized by the Turks, since which Barnagats has progressively dwindled, and is now become so insignificant as not to merit any further notice.

To the north east of Tigra is the kingdom of Angot, which was one of those wrested from the Abyssinian empire by the Gallas, who broke into it from the southern parts, where they mostly spread themselves up to, or even beyond, the line, and made themselves compleat masters of it. It hath some few towns in it, viz. Angot, the capital; Dofarzo, said to contain near 1000 houses; Abugana, once famed for having in it a handsome church called Inbre Christus, and for being the capital of a considerable territory of its name. Besides these, there are many others of less note, but they all contain wretched building equally detestable as the people that inhabit them.

2. The Kingdom of Bagameder.

THIS kingdom is bounded on the south and south-west by Tigra; on the east by Angot; and on the west by Gojama and Dambea. Its extent from east to west is about 90 miles, and its breadth, from north to south, about 60. Some parts of it are very rocky and mountainous, but others are exceeding fertile, being well watered with rivers. The inhabitants of the mountainous parts consist of wild and wandering people, some of whom are Gallas, and others Caffres, whose principal employment consists in the breeding of cattle.

Bagameder, the capital of this kingdom, is pleasantly situated on a delightful plain on the banks of the river Baehilo, and bears the title of a royal town, from the viceroy being obliged to go and receive a fresh crown, besides that with which he is crowned at the emperor's court on being appointed to his office. The buildings in this town are tolerably good, but there are not any that merit particular notice.

The other towns in this kingdom are, Alata and Al-fana, the former of which is remarkable for having in its neighbourhood a bridge over the Nile; but the latter hath not any thing to render it particularly conspicuous.

3. The Province of Amara, or Amhara.

THIS province is bounded on the west by Gojama, from which it is separated by the Nile; on the north by Bagameder; and on the south by Oleca. It is a very mountainous country, and is divided into 36 districts. In this province the inhabitants speak a distinct dialect that differs from all the rest, but which by a new line of monarchs brought up in it (for it has long been the residence of the Abyssinian emperors) is now become that of

the court, and the most in vogue not only among the nobility, but also the politer part of the people.

Though this province is the smallest of the whole divisions of the empire, yet it is rendered the most considerable on account of its being the residence of the emperor and his court. It contains, however, but few towns, none of which have any thing remarkable in them; and the chief matter that otherwise renders it singular is, that it contains the famous rocks of Amba-Gucxen, where the princes of the blood were formerly confined previous to their accession to the throne.

4. The Provinces of Oleca and Choa.

THE first of these lies to the south of Amhara, and is bounded on the east by Angot, and on the west by Gujama, from which it is separated by the Nile. It is a very small province; and has not a single town in it that contains any thing remarkable.

The province of Choa lies to the south of Oleca, and is indifferently called Choa, Xoa, and Sheva. It hath part of the country of Marabot on the north, Ist on the east, and Gojama on the west. It is divided into Upper and Lower Choa, and is the last province on the south-side that now acknowledges subjection to the emperor of Abyssinia. The river Sambo, which runs into the Nile, parts it on the north, the Rema on the south-west, and the Yema on the south-east; all which rivers spring from those mountains that stand on the eastern confines of the province.

Here are several towns, but scarce any worth notice, except Korkora, the capital, once the imperial residence, at which time this province flourished superior to any other in the empire. Some remains of the imperial palace are still to be seen, as also those of a church, and a large monastery called Nazareth.

There are also some other towns here that have monasteries in them, particularly those called Debia Lebanos, or Mount Lebanos; Menghestra Samajat, or Kingdom of Heaven, and some others of less note. The monastery at Lebanos was that where the general of the Monks usually resided.

5. The Kingdom of Damota, or Damut.

THIS kingdom hath neither cities nor towns, the principal part of it being covered with high mountains; notwithstanding which it is so well peopled and cultivated, that the inhabitants of it were the first that made an insurrection against the emperor, on account of the Portuguese missionaries, which could not be quelled till that monarch had totally extirpated them.

Among the lofty hills in this kingdom is one called the Dead Mountain; this is the highest and coldest in all Abyssinia, and the place to which prisoners of state, and such others as the emperor determines to rid himself of, are sent; for here they are soon starved with cold and famine. The river Maleg hath its spring-head under one of the mountains in this kingdom, and runs across it in its course towards the Nile.

The Jesuits had formerly two places of residence in Damota, from whence, in the insurrection above-mentioned, they were driven by the inhabitants.

6. The Kingdom of Goyam, or Gojama.

THIS country is tolerably large, and almost of an oval figure; and so surrounded by the Nile that it looks like a peninsula made by that river. It is parted by it on the east from the kingdoms of Bagameder, Amhara, Oleca, and Upper Choa; on the south from those of Cafates and Bizamo; on the west from those of Goaga and Agaus; and on the north from that of Dambea.

The extreme parts of this kingdom are mostly level, but the middle of it is exceeding mountainous, and inhabited by a people said to be descended from Hagar, Abraham's Egyptian bond-maid; especially near the springs of the Nile, which are situated on the western part of the kingdom.

About the neck, or isthmus, made by the Nile, is a very steep and almost inaccessible mountain, on the top of which is an oval plain 250 fathom in length, and 130 in breadth; to which there are two paths as ascents across the rocks, and on one side a spring of excellent water, farther towards the Nile is another plain separated from

this mountain by a natural trench, where the viceroy resides in a kind of camp.

The northern parts are also very mountainous and rocky, and principally inhabited by Jews, who retain their ancient rites and customs without interruption.

The kingdom of Gojam has but few towns of note. The chief, and only one worthy notice, is that called Nebessa, in which the empress Helena, governess to the emperor David, erected a magnificent church, which was afterwards destroyed by the Gallas, but rebuilt by the Jesuits, who resided in several parts of the kingdom. Some remains of this church are still to be seen, but they are too trifling to convey any idea of its original grandeur.

7. The Kingdom of Dambea.

THIS kingdom is bounded on the south by Gojam, from whence it is separated by the Nile, and the lake of its own name; on the north by Nubia; on the east by Tigra; and on the west by Changalia. It is one of the flattest territories in all Abyssinia, so that it is frequently overflowed, not only by the lake of Dambea, but also the rivers that run through it from the higher lands; and on this account it is intersected almost every where with deep ditches and canals. Its length from east to west is about 90 miles, and from north to south about 36, exclusive of the lake, or 70 including it.

On the eastern confines of this kingdom is a remarkable mountain called Dancas, or Dancaton: it is very high, and on the top of it is a spacious and fertile plain, where the emperors formerly resided, with their court and retinue. Here were also an elegant building erected after the European manner, for the residence of the Portuguese patriarch Mendez; a monastery for the Jesuits; a church called Gambianet; and about 900 stone huts, or barracks, covered with straw, for the soldiers attending on the emperor. But they have all, for many years past, been totally destroyed.

Opposite to this mountain is another of extraordinary height, and so steep that the natives used to flee hither for security when attacked by their enemies. On the east side of it is the monastery of St. Eustatius, so called from that person being originally abbot of it.

Most geographers have informed us that there are many cities and towns in this part of the Abyssinian empire; but these relations appear absolutely fabulous, there not having been a single town in any part of it ever yet discovered by an European. As a farther confirmation that these assertions are erroneous, Ludolph assures us, that the people here not only prefer the living in scattered villages and hamlets to towns where houts are contiguous, but likewise own themselves at a loss to conceive how it is possible to live in large or walled towns, and be there supplied with all the necessaries of life; such utter strangers are they to those conveniences used in other countries for the carrying on of commerce.

The kingdom of Dambea is divided into 14 districts, and governed by a viceroy, who has the title of Dambea Cantiba. The things most worthy of notice here are the following. In the eastern part of the kingdom is a famous monastery called Ganeta Jesu, situated on a low ground, but very pleasant, and being well watered is exceeding fertile. In the church belonging to this monastery are the monuments of the Abyssinian emperors for ages past. Father Pais, a Portuguese Jesuit, was so pleased with this spot, that he built here a church, as also a palace for the emperor, after the European manner; but they have both been long since destroyed.

Between Ganeta Jesu and the frontiers of Hagemeeder, is a small but pleasant territory, and remarkable for having kept in it a kind of market or fair for cattle, to which the inhabitants of most parts of the kingdom resort. It is about nine miles in length from east to west, and about six from north to south. It was heretofore granted to the patriarch Mendez for his subsistence, and that of his fraternity.

Adjoining to the kingdom of Dambea is a small barren province called Fatigar. It was formerly a part of the Abyssinian empire, but was dismembered from it by the Gallas, who so ravaged it that it hath not any thing now worth mentioning, except two high hills, one of which is called the Mountain of the Fravers; it is situated near a plain, to which the Europeans have given the name of

Market, because most of the merchants of the neighbouring kingdoms resort hither. The other is called the Mountain of the Lake, because at the foot of it is a lake about nine miles in compass, and about it are several monasteries.

To the west of Fatigar are several other small kingdoms, all of which belong to the Gallas; and on the east and north-east are the rivers Haowach and Machi, which join their streams in the kingdom of Fatigar, and thence take their course eastward through the vast territories of the eastern Gallas, and the kingdom of Adel.

8. The Kingdom of Narea, or Enarea.

THIS is the last kingdom that merits any particular notice in the Abyssinian empire, and is situated the farthest of them all, being under the 9th and part of the 8th degree of north latitude, and under the 30th and 31st of west latitude. It is surrounded by the countries of the Gallas, notwithstanding which, it hath continued faithful to its ancient monarchs, though often attacked, not only by the Gallas, but also other invaders. What renders their fidelity to their princes still more conspicuous and praise-worthy is, their being situated so far from the Imperial residence, and not receiving any assistance from the emperor, to protect them against the attacks of the Gallas. To this may likewise be added, that they had formerly a king of their own, and were not the natural subjects of the Abyssinian monarchs, but were subdued by one of them named Melech Sagled, at the time when their own prince had embraced Christianity, and when they were rich, populous, and sufficiently strong to have shook off the yoke. In short, the true character given of them is, that they are not only loyal subjects, but also the wisest, and bravest people in all Abyssinia; sincere and strictly true to their word; and in their dealings faithful and honest.

The kingdom of Narea is in general very rich and fertile, producing not only abundance of cattle, but also most of the principal necessaries of life. The inhabitants carry on a considerable commerce with the Caffres, who supply them with gold, in exchange for which the Nareans sell them cloths of various sorts, salt, and other commodities of the country.

The most considerable town in the Abyssinian dominions is called Gondar. It is about ten miles in circumference; but the houses consist only of one story, and are built in the form of a funnel, with the narrow end upwards. They have no shops, but carry on their trade in a large square, where they expose their merchandise to sale on large mats. They have several churches here, and their patriarch is subject to that of Alexandria.

S E C T. V.

History of Abyssinia.

WHAT we know of the Abyssinian history is from the materials collected by the Jesuits missionaries while in this empire. It is less copious and more vague than the histories of many other countries; we shall, however, give our readers all the satisfaction that the detached fragments which they have preserved will permit.

According to the ancient records from whence they obtained these fragments, and which to this day are kept in the great church at Axum, the most material transactions relative to their sovereigns, as well as the chronology of them from the earliest time, are as follow:

The first who ruled the Abyssinian empire was the queen of Sheba, who went from thence into Judea in or about the year before Christ 902, and of the world 3012. She reigned 25 years after her return, and was succeeded by her son.

Menitecheh, who reigned in conjunction with his father 29 years, and 18 more with his son Rhehobann, after which he died.

Saglar, the son of Menitecheh, succeeded him, from whom proceeded, in a lineal descent, 24 princes; but the length of their reigns is not recorded, nor any particulars relative to either of them, except that in the 8th year of the last, whom the chronicle calls Phceen, our Saviour was born, A. M. 4004.

From this period to the year 327 were 13 emperors,

whose names, and the length of time each reigned, are omitted; but it was in the above year that St. Athanasius sent Frumentius into Ethiopia to convert the Abyssinians to the Christian faith.

After the above circumstance the records furnish us with a remarkable account of three brothers who agreed to reign jointly. Their names are, Atzfa, Atzfed, and Amay; that it is said, that in order to prevent discord between them, they projected a very strange expedient, which was, to divide the day into three parts, and to hold the reins alternately, each his third part, or eight hours.—This was certainly a most uncommon mode of government, notwithstanding which, if we give credit to the Abyssinian legends, it proved very successful; for if at any time one of the brothers differed or fell out with another, the third was ready to interpose, and act as umpire between them.

These monarchs were succeeded by several others, but we have not any account of their lives or reigns, only that in the three last of them, whose names were Arado, Alaloba, and Alamid, great numbers of monks and anchorites came hither from Egypt, with a view of propagating Christianity and the monastic life.

Alamid was succeeded by Tacna, and he by Cateh, in the latter of whose time new tribes of monks came from Ruma, and settled in the kingdom of Tigra. This was about the year after Christ 521, and the time that Justinian was emperor of Rome. Cateh was some time at war with the Sabean or Homerite kingdom; but at length totally subdued it by the defeat and death of the Jewish king Dunavas, whose crown he is said to have sent to Jerusalem, to be there suspended in the great church of St. Sepulchre, in memory of his signal success over that distinguished persecutor of those who professed the Christian religion.

Cateh was succeeded by Galba Nefket, a very peaceable prince, who, it is said, formed an alliance with the emperor Justinian. His two next successors were, Constantine and Fritzena; and after them sixteen more, all the descendants of Solomon. The last of these was named Del-Noad, who reigned till about the year 960, when the succession passed into the Zagean family, and the usurpation began, which continued for 340 years.

This usurpation was commenced by the infamy of a woman named Tredda Cabex, who, for her impiety, cruelty, lewdness, and other enormous vices, was otherwise called Ellas, or Fire-brand. This woman formed a plan not only to destroy Del-Noad, the then emperor, but also the whole imperial family; and this she concerted in order to raise a son of hers, whom she had by the governor of Bagna, to the Ethiopian throne. So effectually did she succeed in this diabolical plot, that only one of the whole family escaped, who fled for security into the kingdom of Xava, where his posterity were preserved with the utmost privacy by the viceroys of that kingdom, who were strongly attached to the line of Solomon during the whole time of the Zagean usurpation.

The only princes of whom any notice is taken while the imperial throne was in the hands of the Zagean family, are the following, viz. Lalibela, Degna Michael, Newaja Christos, and Naacu Luabo. The first of these terminated his name by many glorious actions, and particularly distinguished his piety in causing ten churches to be hewn out of a solid rock for the performance of divine service.—See before, p. 404. The last of the above monarchs was also of a very pious disposition, and greatly extolled by his subjects as a peaceable, magnanimous, and beneficent prince.

Who the rest were that filled the throne during the Zagean usurpation, we are not informed; neither do we know by what means the crown returned to the descendants of Solomon; but only that, about the year 1300, the Zagean family being driven from the throne, Ieon Aquac, whose predecessors had been preserved in the kingdom of Xava, during the whole time of the usurpation, recovered the Abyssinian throne; from which period it hath ever since continued in the Solomonic line.

Ieon Aquac reigned about 15 years, and was succeeded, according to the chronicles, by 16 other princes; but there are not any particulars mentioned of either of them, till we come to the last, whose name was Zaara Jacob. This prince began his reign in the year 1437,

and was greatly esteemed as a man of learning and deep penetration. He died in 1465, and was succeeded by

Boeda Marian, who, after reigning only ten years, died, and was succeeded by

Alexander, or Elexander, who reigned 15 years and six months, that is, from 1475 to 1491. It was in his reign that Peter Covilian arrived in the empire of Abyssinia, and was the first Portuguese that ever penetrated so far into the inland parts of the country.

The next emperor to Alexander was named Amda Jeygon, who reigned only six months, and then dying without male issue, left the crown to his uncle

Nahol, the son of Boeda Teriam, who, at the time of his accession, was confined on the rocks of Amba-Guexen, where he had been placed by the emperor Alexander. He reigned 13 years and nine months, and died about 1507; he was succeeded by

Ezana-Denghel, or Leha-Denghel, but more generally known by the names of Onag-Segued and David; which last he took on his accession to the crown. This prince lived in a tranquil state for some years after his accession, but was at length so oppressed by the cruel depredations made on his dominions by his Moorish neighbours, that he had recourse to the Portuguese for assistance, which gave them an opportunity of enlarging the

endeavours they had already made of propagating the Romish religion in the Abyssinian empire. The zeal this prince showed for the church of Rome, and the pope's supremacy, had not only occasioned his subjects in general to hate him, but in particular rendered the whole

Abyssinian clergy his most inveterate enemies, and at last brought on those complicated troubles which occasioned his death. Notwithstanding the assistance the Portuguese gave him, yet so powerful were his enemies, such depredations had they made on his territories, and so closely did they follow him, that he was reduced to the necessity of seeking for shelter among some of the desert mountains, where he continued for some time, but was routed, and obliged to retire to the top of the Damo. Here, having

some of his bravest men with him, he endeavoured to defend himself for some time, hardly able to bear the name, much less to support the dignity of a monarch. In this fortress, however, all his troubles ceased, for here he yielded up his crown and life in the 42d year of his age, and the 33d of his reign; the first 20 of which had been as happy and prosperous, as the last 13 had proved distressed and unfortunate. He began his reign in 1507, and died in the year 1540.

The emperor David was succeeded by his son Claudius Sagood, or Atgnat-Segued, whose reign was little less unfortunate than the latter part of that of his father's. He was harried on all sides by the Gallas and Mahometans, and his whole empire must have been totally destroyed, had it not been for the interposition of the Portuguese. Segued, however, lost his life in an engagement with the Gallas, in the month of March 1559, after a tiresome reign of little more than 18 years. As he left no male issue, he was succeeded by his brother's son, called

Minas, but who, at his coronation, took upon himself the name of Adama Segued. This prince reigned only three years, when he was murdered by his own soldiers in an engagement against one of the revolted governors of the maritime provinces, in the month of April 1562. He was succeeded by Melech Segued, a wife and valiant prince, who was blessed with a long, and, for the most part, successful reign, tho' hardly ever free from wars, either against some of his revolted subjects, or against his powerful and inveterate enemies the Gallas, and Mahometan Moors. He died in 1595, after reigning a little more than 33 years; and having no sons by his wife, had designed a natural one, named Jaacob, for his successor; but altering his mind a short time before his death, he left the crown to a son of his brother, named

Zedenghel, who proved the fatal cause of a most bloody and civil war, many of the grandees taking Jaacob's part against him, on account of his too great propensity to the Roman church, though, in other respects, a brave and noble prince. Peter, the then abuna, was the principal leader of his rebellion; and having absolved the Abyssinians from their oath of allegiance, they took up arms against him, whilst he, with the few forces he had left, and a small number of Portuguese, venturing

some

to give them battle, was defeated and killed in the month of October 1604, after a short and troublesome reign of nine years.

On the death of Zedenghel his competitor Jaacob was invited to, and accepted, the imperial dignity; but had not enjoyed it long before he found himself strenuously opposed by the great grandson of Etana Denghel, whose name was Sufneus, or Socinius, a young prince, no less artful than brave. The contest lasted some what longer than two years, when it was decided by an obstinate fight on the 10th of March 1607; in which Jaacob, and the abuna Peter, were killed on the spot.

Sufneus having obtained the crown, immediately displayed his strong attachment to the Roman Catholic religion, notwithstanding it had been very prejudicial to several of his predecessors. He gave such encouragement to the Popish missionaries, that great numbers flocked thither during his reign, who, in all probability, would have universally established the pope's authority in this empire, had not a stop been put to their progress by the unexpected death of that monarch, who took leave of the empire and the world, in the month of November 1632.

Basilides, the son of Sufneus, succeeded to the crown, at which time he took upon himself the name of Adzain Segued. Soon after his accession he issued out a decree against the Roman Catholics; and through the whole course of his reign proved as great an enemy to the missionaries as his father had been a friend and patron to them; inasmuch that before his death he totally extirpated them from the empire. He died about the year 1644, and was succeeded by his son

John, who, on his accession, took the name of Adaf Segued. This prince, after reigning peaceably for 16 years, died suddenly, and was succeeded by his son

Jawfo, or Adyan Segued, who ascended to the throne in the year 1660, and after reigning upwards of 25 years, was dethroned by his son

Taklimenoth, who took possession of the crown in the year 1706; but he enjoyed it but a short time, for the people entertaining an universal disgust against him for his perfidy, caused him to be massacred by his own troops about two years after.

On the death of Taklimenoth, his brother Tefilis usurped the throne. His reign, however, was little less permanent than that of his predecessor; his prime minister, named Oufas, the son of a sister of Jawfo Adyan Segued, having dethroned them in the third year of his reign, and seized upon the crown. The Abyssinians, however, would not suffer him to hold the imperial dignity longer than till they could raise another prince, named David, to the throne; but this was not effected till great slaughter had been made by both parties, as appears by letters received from Moka, dated in the month of June 1718. After David had got entire possession of the throne, he enjoyed it without interruption during the remainder of his life; and the revolutions occasioned by his accession, were the last of any consequence that have happened in this empire, his successors having regularly taken the imperial dignity, and quietly enjoyed their honours, from that time to the present.

Such are the particulars we have been able to obtain relative to the history of the Abyssinian empire; to which, as a matter that materially connects with it, we shall add a concise detail of the strenuous attempts made by the Portuguese to establish their religion here, the destruction it occasioned, and their final extirpation.

The Portuguese first resorted to Abyssinia about the latter end of the 15th century, when they brought over a great many of the natives to their religion, and persuaded the then emperor not only to acknowledge the pope's supremacy, but to admit a patriarch among them, sent thither from Rome. The government also consented to abolish their ancient rites and ceremonies, and conform entirely to the ritual of the Latin church; but many of the nobility and governors of the provinces, with the greater part of the common people, having the greatest abhorrence of those innovations, rose in arms against their emperor, which occasioned civil wars in Abyssinia that lasted upwards of a century, during which many thousands fell on both sides. Though the court, with the assistance of the Jesuits, European engineers, and some Portuguese troops, was generally victorious, yet

the principal part of the people still adhered to their ancient religion; and several provinces revolted entirely from the emperor.

The Abyssinian monarchs, however, continued still to profess the tenets of the Latin church, and to submit to the dictates of Rome; till at length the Jesuits, under pretence of maintaining the pope's ecclesiastical jurisdiction, took upon them to direct most secular affairs, treating the prince rather as a viceroy to the pope, than sovereign of the country; and having erected and garrisoned several forts, were striving for European forces to maintain their usurped power, when the emperor, as well as the nobility, taking the alarm, agreed at once to abolish popery, and restore their ancient religion.

After this determination the Romish priests were generally sacrificed to the fury of the people, and their patriarch very narrowly escaped out of the country with his life. Three capuchins some time after came to Squaquena on the Red Sea, from whence they sent letters to the emperor of Abyssinia, to obtain leave to come into his territories again; when that prince requested the Turkish bassá, who commanded on the coast, not to suffer any Franks to come that way into his territories, and to send him the heads of the capuchins. The bassá not only complied in every particular with the emperor's request, but also sent him their skins tanned and stuffed, that he might know them to be Franks by their colour, and priests by their shaved crowns. Thus, by these, and such like severities, the Romish missionaries were totally extirpated from the Abyssinian empire.

SECT. VI.

Of the Gallas, a barbarous and neighbouring people, who have made great devastations in the Abyssinian empire.

HAVING had frequent occasion to mention these people in a former section, it may not be improper to give the reader some account of them, especially as they have got possession of so considerable a part of this country, and are still a terror to the Abyssinian monarchs.

They are divided into eastern, western, and southern, according to their situations. Those who inhabit the eastern parts are seated along the frontiers of the kingdom of Tigra and Danicali, and have seized the greatest part of the left, together with those of Angot, Dowaro, Xoa, &c. The southern extend themselves along the river Howas, from the frontiers of the kingdom of Adel westward, and have made themselves masters of the greatest part of the kingdoms of Gomer, Bergum, Camlate, Ganzá, &c. The western spread themselves along the river Maleg, where they possess the kingdoms of Bizamo, Gassá, Gongá, and some part of that of Gojan; but how far they have penetrated northwards is not known.

The origin of these people is variously conjectured; the generality of the learned supposed them descendants of the Jews; but whether from those whose Saluamezer king of Aegyria, or Nebuchadnezzar king of Babylon, transplanted from Palestine, or from those whom Titus Vespasian, Adrian, or Severus, expelled from thence, they are not agreed. These suppositions, however, do not appear admissible, when we consider that there is not any thing in their manners, language, &c. (except circumstances, which is common to most of the African nations) that bears any affinity to those of the Jews.

Others conjecture, and, indeed, from circumstances, with great probability, that they are of the Celtic or Gallic race. One principal reason in support of this supposition is the name of them, which, in the Gallic language, signifies stout or warlike; this epithet the ancient Celtes, or Galli, took much pride in, and made themselves famous by, not only in Europe but in Africa, where they erected a powerful kingdom, which they held for some centuries with a distinguished bravery, till being at length driven from it by the Romans, they might go in search of new habitations farther towards these mountainous parts, as was customary for them to do rather than submit to a foreign yoke. What confirms this opinion is, the conformities of the manner and customs, &c. of these modern Gallas with those of the ancient Gauls and Celtes, which will appear from the following general description of them.

The Gallas are a very robust, hardy, and resolute people,

people, and are naturally of a very ferocious disposition; all which arises from the little care taken of them by their parents when children, they being left to wander about at random like to many little savages. The natural hardness and ferocity thus acquired in their infancy, is afterwards improved by their being so early initiated into the martial trade, from whence they become not only stout and intrepid, but in a great measure savage and cruel.

They are taught the use of the sword, and that it is an honour and happiness to live by it, as giving the best title to every thing they possess, and being the most effectual means of preserving it: they are brought up to a desire of glory and conquest, and are taught to look with contempt on slavery and death.

As, by their maxims, the cutting off their hair constitutes them men, the young males are not permitted to receive that honour till they have deserved it, either by killing an enemy, or some wild beast, such as a lion, tiger, leopard, &c. after which they are allowed to cut their hair, leaving only a single lock on the top; and this inspires them with an unobscured ambition to signalize themselves by their bravery, as the most effectual means of acquiring esteem, and obtaining the more honourable seats at their councils, festivals, &c. for the greater number of heroic actions they perform, the more are they respected. For this reason they take care to save all the heads of those enemies they have killed, as trophies of the greatest value; and when any contest or doubt arises about them (which is sometimes the case) as when there is no heard upon them, and may be supposed to have belonged to a female, they have a law which obliges the person to produce a more decisive part along with it, otherwise they are not admitted. To prevent, therefore, all disputes, they are obliged to lay those trophies that are gained in battle before their proper officers, at the head of their tribes, as soon as the engagement is over; there they are publicly viewed and examined, and, if approved, are entered into the common register; after which the owner hath liberty to carry them to his own tent, together with his share of the spoil or plunder, which is allotted to him in proportion to the degree in which he has distinguished himself in the engagement. By this method all collusion and deceit is prevented, or else discovered and punished; it being considered as every man's duty to detect all false pretences to merit, as well as that of their commanding officers, who inflict a punishment on the delinquent adequate to the falsities they may have endeavoured to impose.

Those who show the least signs of cowardice are punished in the most exemplary manner. It is death to give way after an engagement is begun; so that they all fight with the most undaunted courage and resolution, and are so furious in the attack, not giving or taking any quarter, that it is hardly possible to make head against them; and this is the reason why they have obtained so many signal victories over the Abyssinians, though the latter are much superior in number, and better provided both with horses and arms.

The emperor Segued, who had often experienced their intrepidity with considerable loss, at length projected measures whereby he became more successful than any of his predecessors. He knew it was impossible to stand the first shock of the Gallas; "for which reason," says Ludolph, he always suffered them to penetrate a good way into the country, that they might have time to plunder and cool; and at their return, when they had loaded themselves with booty, and were thinking only how to convey it home and enjoy the prizes, and their first fury much abated, he then lay in wait for them in the way, and called them to account for what they had got; by which means he not only recovered the booty, but often sacrificed their lives to his resentment."

The Gallas had formerly no horse, but since they have made such conquests in Abyssinia, they have as well cavalry as foot, and though their horses are very inferior to those of the Abyssinians, yet they keep their ranks so close, and engage in such good order, that they are seldom overpowered by their antagonists. When they fight at a distance, they use bows and arrows, and darts, in the discharge of which they are very expert; and when they come to close engagement, they have a club, which is remarkable heavy at one end; they have

also shields made of the hides of buffalos, and instead of a club, those of higher rank use a sword.

Their government, as well as martial discipline, appears also of Gallic extract. They have no kings, but are divided into a great variety of tribes, each of which chuses a chief, or general commander, whom they call *Lova*, and him they obey as a sovereign. These chiefs are chosen every eight years, and if any of them die in the time, others are immediately elected to supply their place. Their authority reaches only to military affairs; that is, to convene the great council at proper seasons to determine on peace or war: when the latter is the result of their meeting, each *Lova* heads his own army, and distributes to the respective officers under him their several posts and commands. In like manner, when the war or expedition is over, he assigns to each man his proper honours and rewards, according to his merit, but if any dispute, or matter of complaint arises, it is adjudged by the national council, who alone have a power to confirm, alter or abrogate the sentence or decree of the *Lova*.

To give the reader an idea of the mock dignity preserved by these ostentatious chiefs, as well as the singular method in which they treat those who request audience of them, we shall relate the following particulars, as given by father Lolo, who had an opportunity of seeing the whole. "Being, says he, obliged to pay my respects to the *Lova*, or chief, in order to discover a new way into Abyssinia, I found him with all his wives and hocks about him; the place where he received me being a hut thatched with straw, but somewhat larger than those of his subjects. He appeared with all the seeming consequence of an eastern monarch, and his attendants paid him the most reverential respect. His manner of giving audience to strangers is somewhat singular: he appears seated in the middle of the apartment, with all his courtiers about him, sitting against the wall, each with a goad or staff, or club in his hand, longer or shorter according to his rank; the longer are the more dignified. As soon as the stranger enters the place, all these courtiers fall foul of him, and bastinadoe him, till he has regained the door, and got hold of it with his hand; upon which they return to their seats, and he is complimented as if nothing like it had been done to him. I myself, says he, did not fare one jot better, notwithstanding the peaceable and friendly offices that had passed between us; and when I asked the meaning of so strange a ceremony, I was answered, that it was to make those that came among them sensible of the valour and bravery of their nation above all others, and how reasonable it is for them to behave submissively to it."

The Gallas are naturally very proud, but at the same time they are exceeding indolent: they neither till, sow, plant, or gather any thing that the land produces; so that all their spacious plains and vales only serve to afford their cattle such food as the earth naturally brings forth. They look after their cattle for the sake of their flesh, which they eat raw, and is their principal food. They have neither bread nor any thing else to supply the want of that necessary article. When they meet with any in their warlike excursions, they eat it with great ravenousity; and tho' they admire it, yet they will not trouble themselves to cultivate the grain to make it.

They give a political reason for this piece of indolence, which is, that if their lands produced plenty of corn, the Abyssinians, and other enemies, might be tempted to invade them, and reap the benefit of their labour. If any neighbouring states make incursions on their territories, they immediately retire to some remote parts, taking with them their families and cattle, in the latter of which consists their principal wealth; so that the enemy finding the country thus barren are obliged either to return, or perish for want.

Although the Gallas are a cruel and barbarous people, yet they are not without some good qualities: they are honest and true to their promise, and are never known to violate an oath. They consider this as the most solemn of all engagements, the ceremony of which is thus performed: they bring a sheep to a proper place appointed, where they take an oath with butter; after which the persons, or if it be taken in the name of a tribe, or family, the heads of it lay their hands upon the head of the sheep and solemnly protest, that they will religiously observe

every part of their engagement. The explanation they give of this ceremony is, that the sheep is, in some sense, the mother of all that swear, and the butter is an emblem of the mutual love of the mother and her children; and, consequently, that a man ought never to violate an oath, which he hath taken upon the head of his mother.

With respect to religion, they only acknowledge one supreme being, but have not any mode of worship. When the Roman missionaries were here, many of them were converted to Christianity, to which, for some time, they strictly adhered; but after the expulsion of the Jesuits, that religion was laid aside, and they have ever since followed their original maxims.

Such are the particulars we have been able to get relative to the people called Gallas, who have greatly weakened the Abyssinian empire, and stripped it of so many large and considerable provinces, exclusive of a great number of small ones, which, being intermixed with them, have shared the same fate. The principal of these have been already mentioned; all, therefore, we have to add is, that the Gallas might, in all probability, have carried their conquests much farther, had not some misunderstandings happened between their tribes, and weakened their power by dividing their interests. To this may be added, that the dreadful devastations and slaughter which they (more particularly the southern ones) committed in their former incursions, in which they destroyed all that came in their way, without distinction of age or sex, hath obliged both the Abyssinian, and other neighbours, to be farther on their guard against them, and to insure themselves to a more active and martial life than they had formerly been accustomed to, in order to suppress their bloody prowls for the future.

S E C T. VII.

Of the Coast of Abex, or Habesh.

HAVING, in the preceding sections, described every particular relative to the Abyssinian empire, we shall now take a view of the above coast, which formerly belonged to those monarchs, from whom it was taken by the Turks in the beginning of the last century. At the time they made these depredations they likewise seized on all the bays and ports belonging to it, from Egypt quite down to the straits of Babelmandel; so that ever since the Abyssinians have been totally excluded from having any intercourse with the Red Sea.

The climate of the coast of Abex is exceeding sultry, and the land so sandy and parched by the sun that the principal part of it is quite barren. The coast is intersected all the way by a long chain of mountains, so that there is no way to come from thence into Abyssinia but by two strait passes, one of which is called Arkiko, and the other Suakin; and even these are so difficult to pass that travellers cannot go above five or six miles a day. Here are great numbers of lions, tigers, elephants, and other wild beasts; they have also plenty of deer, and sheep of a prodigious size; but grain and other necessary articles are either brought from Abyssinia or the Red Sea.

The coast is divided into two parts, one of which, viz. the northern, is called Beglebergate, whose governor keeps his residence at Suakin. The southern part reaches quite to the end of the coast, where it includes the ancient kingdom of Dancale. Both parts labour under great inconvenience for the want of water; and though the air is sultry, yet, after sun-set, it is generally very foggy and unwholesome. The inhabitants are a mixture of Turks, Arabs, Caffres, Abyssinians and Egyptians, and differ equally in their religion, manners, dress, &c.

The principal towns along the coast are, Suakin and Arkiko. The former is situated in 19 deg. 45 min. north lat. and 37 deg. 30 min. east long. and is built on a small island of its name opposite to, and at a small distance from the bay of it. It is one of the best sea-ports on this coast, and very large and populous. The houses are built of stone, and in general very spacious and convenient. The town was formerly the residence of a Caffrean prince, but now only of a Turkish governor, under the badge of Cairo.

Arkiko is also a sea-port town situated in 16 deg. 5 min. north lat. and 39 deg. 20. min. east long. It is defended by a castle, but is much smaller than Suakin, and very indifferently inhabited.

In the southern parts of the coast of Abex are several small kingdoms, the principal of which is called Dancale, situated on the Red Sea, between the kingdom of Adcl on the east, and a small territory named Dokin on the west. Its extent along the coast is very small, neither is it well cultivated or inhabited. The king is a Mahometan, as are also most of his subjects; but he is in strict alliance and friendship with the emperor of Abyssinia. The most remarkable produce of this part of the country is salt, great quantities of which are made by the inhabitants, who carry on a considerable traffic in that article both in the inland parts and on the Red Sea.

The capital town of Abex is situated in this kingdom, and is called Dancale. It is tolerable large, but the houses are ill built, and very indifferently inhabited.

The chief sea-port here is that of Balyur, situated a little to the west of Babelmandel. It was at this port that the patriarch and his Jesuits, (sent to Abyssinia by the king of Portugal) first landed; and as the manner in which they were treated by the chief, or king, was rather singular, we shall preserve a relation of it, which we have obtained from father Lobo, who was one of the principal Jesuits in this embassy. As soon as the king heard of their arrival, he sent to invite the patriarch and his retinue to his court, which was about three or four days journey from Balyur, and dispatched his own son to meet them in the way, and conduct them to the royal palace, or rather camp, which they found to consist only of half a dozen tents, with about a score huts fenced in with a thorn hedge, and shaded by some wild kind of trees.

The hall of audience where they were received by the king, was a large tent, or hut, about a musket shot from the rest. At the upper end was a kind of throne about two feet from the ground, made of stone and clay, and covered with a carpet and two velvet cushions. At the other end, opposite to the throne, was the king's horse, with the saddle and other accoutrements suspended on one side. Round the hall were about fifty young men sitting cross-legged on the ground; and when the Portuguese ambassadors were admitted, they were made to sit down in same posture.

In a short time the king entered the hall, preceded by some of his domestics, one of whom carried an earthen pitcher full of hydromel, or wine made of honey; another a drinking cup made of porcelain; a third carried a cocoa-nut shell filled with tobacco; and a fourth a silver tobacco-pipe and some fire. Next to them came the king dressed in a light silk stuff, with a turban on his head, from the edges of which hung a parcel of rings that dangled before his forehead. Instead of a sceptre he held in his hand a short kind of javelin: he was followed by all the chief officers of his court and household; and among them were his lord high steward, the superintendent of his finances, and the captain of his guard. The respect paid him at his coming in was, by standing on their feet, and squatting down again twice; after which they went towards the throne to kiss his hand. The audience was short, but full of the most bombastic professions of love and esteem on his side, and of respect and gratitude on theirs; but this behaviour soon altered, when, on the next morning they came to make their presents to him, for, instead of the king's accepting them, father Lobo, who was the person that brought them to him, met with a severe reprimand, for daring to affront a monarch like him with such trifling presents, and was bid to take them away out of his sight. Lobo readily obeyed, without betraying either fear or any other emotion than that of disdain, after having given him to understand, that they were of more value than he ought to have expected from religious persons, who had renounced the world, and forsaken their native country, for the sake of carrying their religion into the Abyssinian empire; and told him at parting, that since he did not think them worth his acceptance, the next he sent for from them should be much less valuable.

This spirited behaviour of Lobo greatly surprized the king, who suffered him to go away with the presents; but

but being unwilling to lose them, sent one of his officers to fetch them back, with orders to insist upon some addition being made to them. He was glad, however, to take them as they were, Lobo, on his side, insisting upon retrenching them; so that when they were brought again, the greedy monarch received them with visible marks of dissatisfaction and resentment.

The disgust in which he held them on this account was soon evinced, for he not only detained them upon some pretence or other longer at his court than was necessary for getting things ready for their departure, but privately forbid his subjects to sell them any kinds of provisions at any price; so that they must have been obliged either to satiate his avarice by larger presents, or have been in danger of starving, had it not been for father Lobo, who expostulated with him on the impropriety of his conduct, and at the same time threatened him with the emperor's resentment. Notwithstanding this, however, he not only postponed their departure from day to day, but suffered them to be insulted by his subjects, in hopes of finding some pretences for extorting from them farther presents for their dismissal. To avoid this, the only expedient they could find was, to

brIBE one of his favourite ministers with a valuable gift, who soon after obtained their audience of leave, and such supplies of carriages, provisions, &c. as were necessary to proceed on their embassy to the Abyssinian court. But before their departure they were obliged to compliment all the officers of the Dancali court, from the most elevated to the most despicable.

Besides the port of Balyur, there are several other towns in the kingdom of Dancali, particularly Vella, which is a sea-port on the Red-Sea, and very large and well inhabited.

The others of any note are Korkora and Manadeli, in both of which they have some manufactures of cotton and linen, which they sell to the Negroes. This part of the kingdom is watered by the river Hawash, but the soil is in general barren, dry, and sandy, and produces no kind of grain, or any other necessary article of life. The inhabitants are Moors, and consequently very lazy and indigent; and fearful of all Europeans, particularly the Portuguese.

The other territories on the coast of Abex are so trifling as not to admit of any particular notice. We shall therefore pass them over, and proceed to the next chapter.

C H A P. XV.

The Kingdom of NUBIA, or SENNAR.

THIS kingdom receives its name from its capital, which by some is called Nubia, and by others Sennar. It is situated between 13 and 24 deg. of north lat. and between 25 and 38 deg. of east long. It is bounded on the east by the Red Sea, on the west by the kingdom of Gouga, on the north by Egypt, and on the south by Abyssinia, from whence it is separated by the Nile and a long ridge of mountains. It is upwards of 900 miles in length, and about 600 in breadth, and is of an irregular oblong form.

The principal rivers that water this country are the Nile, the Nubia, and the Sira. The Nile overflows here at its usual season, but not so considerably as in Egypt. It receives in its course through this country the Zezer, Maraba, Ambara, and some others of less note, but it is not navigable till it has entered some way into Egypt.

The climate here is exceeding sultry, and the soil in general very sandy and barren. The most fruitful parts are the banks of the Nile and the other rivers, where the inhabitants cultivate great plenty of corn, and some sugar canes; but as the natives have not the art of manufacturing the sugar to a proper perfection, it is of little advantage, few foreigners chusing to purchase it.

Nubia produces several sorts of excellent fruits, and a variety of medicinal plants, roots, drugs, &c. Among the drugs is one of the most poisonous quality, being to quick in its effects, that the tenth part of a grain or seed will kill a man in a quarter of an hour, and a whole grain in an instant. This deadly product, which is a small seed gathered from the tops of an herb not unlike our nettle, is a considerable branch not only of trade, but of the royal revenue; it is sold by the ounce, at an enormous price, and whatever the purchaser gives for it, he must also pay the like sum to the king, and at the same time take a solemn oath not to make use of it within his kingdom.

This country also produces several sorts of medicinal stones, such as the emerald, ivory, and sanders; and in some parts thereof are found great quantities of gold.

The animals which are bred here, are, domesticks, camels, and asses; and the wild, are, also great numbers of lions, tigers, leopards, crocodiles, and serpents. Here are likewise a great variety of reptiles, but the most destructive are the flying

serpents, whose stings are so venomous that they produce immediate death either to man or beast.

The inhabitants of Nubia are in general low in stature, but stout and very courageous. They are quite black, and their faces much disfigured not only by the flatness of their noses, but by the marks of the small-pox, that disease being so prevalent here that they frequently have it twice or three times. The common people wear only a kind of petticoat made of coarse cloth, which is fastened round the waist and reaches to the knees; but the better sort have long robes made of silk or cotton that reaches from the shoulders to their ankles. The ladies of quality have also the same kind of garment, and they adorn their ears, arms and wrists with gold silver, or copper rings, and other trinkets; but they have not any thing on their legs or feet, except a kind of leathern sole fastened to the bottom of the latter with tape or ribbons.

They are greatly addicted to drunkenness, are avaricious, base and designing; and pride themselves not only in cheating strangers, but each other. The principal part of them are Mahometans, but they pay as little regard to religion as to honour and honesty. Those who live in towns or cities employ themselves chiefly in commerce; but such as reside in the villages follow husbandry and sowing, except those who inhabit the more desert parts, and live wholly by plundering their neighbours.

They are very expert riders, for which reason when they are at war they generally fight on horse-back; but as they have the method of poisoning their weapons, the Turks do not care to engage with them. However, they seldom want for opportunities of shewing their military exploits, the Nubian kings being generally at war either with those of Gorham, who inhabit the desert tracts on the south-west, or making incursions into the eastern parts as far as the Red Sea.

Notwithstanding the heat of the climate, and the general barrenness of the country, yet the inhabitants of it are exceeding numerous; inasmuch that it is said one of their kings once assisted the Egyptians on a particular emergency with 100,000 horse.

The king of Nubia is a despotic, independent and powerful prince. His palace consists of a large pile of irregular buildings inclosed with a high brick wall. The

outside of it appears very mean, but the apartments within are spacious and adorned with the most rich and costly furniture.

The king's dress consists of a long robe embroidered with gold and silver, fastened round his waist with a girdle of the finest cotton; and on his head he wears a turban of the same. He never appears in public without a veil over his face, which is made with silk gauze of various colours. Strangers, who are admitted to pay their homage to him, must, on entering the royal apartment, take off their shoes, fall on their knees, and kiss the ground twice. When his own subjects appear before him they do the same, but they must always be without any thing on their legs or feet.

The king is very fond of shooting, and frequently takes excursions with his nobility in pursuit of that diversion. He and his chief nobles attend four days in the week to business of state, at which times also they administer justice in all cases, whether of a civil or criminal nature. This they do with great expedition, especially in the latter case, where, if the person be found guilty, sentence is no sooner passed than executed. For trifling matters they are punished by the bastinado; but in cases of murder and treason, they are put to death, the manner of doing which is, by laying the criminal on his back, and beating him on the breast with a stick till he expires, which, from the severity of the strokes, is generally effected in a very short time.

The language of the Nubians is peculiar to themselves, but bears some kind of affinity to the Arabic: it is not, however, universally spoken throughout the whole kingdom, for in the desolate parts, which are inhabited by a different kind of people, they speak a language that does not border either on the one or the other; so that it is difficult for these, and the inhabitants of the more civilized parts of the country, to understand each other.

The kingdom of Nubia received the gospel from the earliest times, and continued firm to it for several centuries; but for want of good preachers it at length degenerated, and Mahomet's sin took place in its stead: the few who still retain the Christian faith acknowledge the patriarch of Alexandria. There are still extant in several parts of the country, the ruins of their ancient churches; in some of which are the figures of the Virgin Mary, and many other saints, carved in stone.

Having thus premised the general particulars relative to this kingdom, we shall now take notice of its principal cities, which are two in number, namely, Nubia, or Sennar, the capital, and Dungala.

Nubia, or Sennar, is situated in 14 deg. north lat. and 29 deg. east long. It stands on the western bank of the Nile, and is bounded on the south by Abyssinia, and on the west by Gagoa. It is pleasantly situated on an eminence, beneath which is a large plain, covered with a

great variety of odoriferous fruit-trees. It is about five miles in circumference, and so populous that the inhabitants are estimated at 100,000. The houses in general are low, flat, and ill-built; and those in particular without the city are truly wretched, consisting only of poor small huts made of wood and mud. Provisions of all kinds are here very plentiful and cheap, for the sale of which a market is every day held in the center of the city. The inhabitants make fine wheat bread for strangers, but they chuse a coarser sort for their own eating. The inconveniences attending this city arise from the air being very unwholesome on account of the excessive heats, which are also attended with violent rains, that sometimes make it so obnoxious as to produce disorders that prove fatal both to men and beasts.

The inhabitants here carry on a considerable trade in all parts between this city and Dungala, as also from thence down to Cairo, and other parts of Egypt. The commodities they dispose of are, gold, musk, elephants teeth, and fanders; in return for which they receive spices, silks, cottons, and other Indian commodities.

The city of Dungala is situated in 19 deg. 10 min. north lat. and 27 deg. 10 min. east long. It stands on the eastern bank of the Nile, near the confines of Gagoa, and is about 250 miles from Sennar. It is exceeding populous, and is said to contain at least 10,000 houses, but they are all insignificant buildings, being very low, and made only of mud and wood, and covered with straw. The inhabitants, however, are most of them very rich, and carry on a considerable traffick with Cairo, and other parts of Egypt, where they exchange their own commodities, especially fanders and musk, for arms, linen cloth, and other merchandize.

The principal towns in this kingdom are four, namely, Cusa, Guola, Jalac, and Sula; but they are all very trifling, nor do either of them contain any thing that admits of particular notice.

There are many villages, most of which are situated on the banks of the Nile, and other rivers, for the convenience of watering their grounds. These are tolerably pleasant; but the rest, which are in the desert parts, are wretched places, and very poorly inhabited.

To the south of Nubia is the small kingdom of Goham; but we know little of it, only that it is chiefly a desert country, and that the inhabitants of it are generally at war with the Nubians, and other adjoining kingdoms. They are a very rude, ignorant people, go about naked, and chiefly live by plunder. There is not even a single village in the whole kingdom, or any thing that appears like one, except a few wretched huts situated along the White River, which divides this territory from Abyssinia, and falls into the Nile some leagues below the city of Sennar.

C H A P. XVI.

E G Y P T.

WE come now to the description of a country which hath always borne a distinguished rank in history, and was once celebrated above all others for its antiquities, learning, opulence, and fertility. Such, however, is the mutability of all sublunary things, that its present has no resemblance of its former state; and those who read the ancient and modern accounts of Egypt, can scarce believe that they appertain to the same country. Its learning is changed to ignorance, its opulence to poverty, and its fertility to frequent scarcity. Yet Egypt affords ample matter for admiration and pity; the explorer of nature, and admirer of art, may both gratify the most boundless curiosity,

in contemplating the wonderful productions of nature, and the stupendous remains of the most amazing works of art with which this country abounds. At the same time their compassion will be excited by the prejudices that the people have imbibed, and the oppressions beneath which they live. In fine, no country in the universe is more surprising in itself, or has undergone greater revolutions; and, consequently, the description of none can be more gratifying to the general taste, or interesting to every passion incident to the human soul.

Egypt has the Mediterranean Sea on the north, Abyssinia on the south, the deserts of Barca, and unknown parts of Africa, on the west, and the Red Sea on the east.

east. The western extent towards the deserts is indeterminate; geographers, however, place the whole country between the 20th and 32d deg. of north lat. and the 28th and 36th deg. of east long. and consequently make it 600 miles in length, and 250 in breadth.

This country is divided into three parts, viz.

Upper Egypt, or Thebais.
Middle Egypt, or Heptanomis.
Lower Egypt, or Delta.

Each of these districts we shall describe in their respective places; but it is necessary previously to consider, the nature of the country, and its productions.

SECT. I.

Natural History of Egypt.

DURING the summer the air of Egypt is more sultry than some other countries that lie under the same parallel of latitude, which is owing to its situation between two ridges of mountains, and to the sandy soil, which throws back the reflection of the sun's rays. While the sun is in or near the meridian, the weather is astonishingly fervid in the summer, and disagreeably hot even in the winter: yet the nights are extremely cold at all times, which is owing to the great quantity of nitre with which the air is impregnated. Towards the sea-coast the rains continue from November to March; higher up the country they have only a little rain from December to February; but in Upper Egypt they seldom have any at all. The coldest season is in February; the winds which occasion rain are the west and north-west; thunder is often, but earthquakes very rarely known. The fourth wind is extremely hot at all times, but in some particular seasons the heat is so excessive, that the people are obliged to shut themselves up from its intenseness, and to retire to cellars, vaults, &c. to avoid the penetrating rays of the sun. The south-west wind raises such asfouling clouds of sand and dust, as to darken the face of the day, and do great damage by overwhelming whatever it meets with. The refreshing gales which blow from the north-east from the month of May to November, mitigate the heats of the summer, which would be otherwise insupportable. This is called the Etesian wind, and is deemed the happiness of Egypt, as, independent of its reviving qualities, it is thought to occasion the overflowing of the Nile. Lucretius thus mentions it:

" Or that the north winds do his month oppose,
" Then yearly when the Etesia firmly blows;
" Whose long encumb'ring blasts resist his way,
" Put back his streams, enforcing him to stay."

The soil of the flat parts of Egypt are a continued sand, though in many parts the silt of the Nile covers and fertilizes it. Many of the hills are of free-stone, and some contain petrified shells. The coat which the inundation of the Nile leaves upon the sandy foundation, is a composition of muddy earth, full of nitrous and small particles; and this is sometimes so very rich, that sand is obliged to be mixed with it, in order to bring it to a proper temperature. This river, however, neither flows so copiously, or leaves so great a quantity of sediment behind, as it did in ancient times; for its strength and its matter seem to be greatly diminished, and consequently its effects in fertilization must be considerably less than formerly.

* The above is the most rational and probable account we have been able to procure; and though a very recent and learned author differs in some particulars from it, yet both agree in the main points. To evince our impartiality we shall here insert the other account, that the reader may have an opportunity of judging of each. This gentleman says, "Some travellers, who on their voyage from Damietta, or Rosetta, to Cairo, have, from their barge, seen people make furrows in the sand, in which they planted gourd, melon, or cucumber seed, in March, or April, have mistaken those seeds for corn, and have said the soil in Egypt annually produced two crops, and that it was so rich, they were obliged to mix sand with it, in order to diminish the luxuriance. If these travellers had taken the trouble to examine the subject more attentively, they would have found out what kind of seed the people sowed; they would have

We shall now proceed to a description of that so much celebrated river the Nile, which, says an excellent writer, "is the greatest wonder of Egypt, where it seldom rains, but this river, by its regular inundations, supplies that defect, by bringing, as a yearly tribute, the rains of other countries. The ancients placed the Nile in the *Mountains of the Moon*, as they are commonly called, in the 10th deg. of south lat. but we now find that they lie in the 12th deg. of north lat. so that about 4 or 500 leagues, which the ancients gave that river, are cut off. It rises at the foot of a great mountain, in the kingdom of Gojam, in Abyssinia, from two springs, about 30 paces from each other. The river is increased with many rivulets, which run into it, and after passing through Ethiopia in a meandering course, flows at last into Egypt, which it enters almost under the tropic of Cancer, pouring itself down in seven cataracts. Having passed through Upper and Middle Egypt, it is divided into two large arms, a little below Memphis, and those arms afterwards form seven channels, which empty themselves into the Mediterranean by two mouths, viz. Damietta and Rosetta."

Many parts that the inundations of this river will not reach, are nevertheless fertilized by its waters, which are conveyed to them through a variety of artificial canals, cut at an immense expence. During the flood many of the cities and towns, which are erected on rising grounds, and purposely elevated in their construction, appear like islands, being surrounded by the waters of this noble and useful river.

The Nile hath been an object of curiosity, and matter of admiration to the learned of all ages, and has attracted the attention of the travellers of many nations, as well as the people of the countries through which it flows. It begins to rise immediately after Midsummer, comes to its height in August, and falls again in September. Lucan, in his *Pharfalia*, finely describes its course, but pretends that its source is infernal, and had been fought for in vain by Alexander the Great, Sesostris, Cambyses, &c. and many moderns have adopted the ancient erroneous suppositions concerning it.

" From heav'n itself, tho' sevenfold Nilus flows,
" And harvest on an hundred realms bellows."

POPE.

Lucan likewise imputes the rise and fall to the planetary influence; and ascribes the annual inundations to the power of the planet Mercury. The lines which he makes the chief priest Achoreus address to Cæsar upon this occasion are so beautiful, that we cannot avoid inserting them, according to Mr. Rowe's elegant version of that poet.

— " Ev'ry limpid spring, and falling stream,
" Submit to radiant Hermes' reigning beam,
" When in the Crab the humid ruler shines,
" And to the sultry Lion near inclines;
" There fix'd immediate o'er Nile's latent source,
" He strikes the warr'y stores with pond'rous force;
" Nor can the flood bright Maia's son withstand,
" But heaves, like Ocean, at the moon's command;
" His waves ascend, obedient as the seas,
" And reach their destin'd height by just degrees:
" Nor to its bank returns the enormous tide,
" Till Lib'ra's equal scale the days and nights divide.
" Antiquity, unknowing and deceiv'd,
" In dreams of Ethiopian fables believ'd:

discovered that they only make use of sand close to the banks of the Nile, and no farther up the country; because the soil is more clayey, and more hardened by the heat of the sun in this part, so that the grain can by no means vegetate, or pierce through it; that for this reason, till the shoots have acquired more strength, and the earth is softened by repeatedly watering it, they make a bed, consisting of equal parts of sand and pigeons dung, in which the seed can strike root; for without this dung they can expect no fruits. They sow the corn in Egypt in the month of January, after the soil is well soaked by the waters of the Nile; and in Upper Egypt they pluck it up in April, but in Lower Egypt in May. I chuse the phrase *they pluck it up*, instead of *they reap it*, because the people really do the former, in order to make use of the entire straw.

" From hills they taught how melting currents ran,
 " When the first swelling of the flood began.
 " But ah, how vain the thought! No Boreas there
 " In icy bonds constrains the wintry year;
 " And sultry southern winds extend their reign,
 " But scorching suns the swarthy natives flain.
 " Yet more; whatever flood the frost congeals,
 " Melts in the genial spring's return he feels;
 " While Nile's redundant waters never rise,
 " 'Till the hot Dog inflames the summer skies;
 " Nor to his banks his thinning stream confines,
 " 'Till high in heav'n th' autumnal Balance shines:
 " Unlike his watry brethren he presides,
 " And by new laws his liquid empire guides.
 " From dropping seasons no increase he knows;
 " Nor feels the fleecy show'rs of melting snows.
 " His river swells not idly, e'er the land
 " The timely office of his waves demand;
 " But knows his lot, by Providence assign'd,
 " To cool the season, and refresh mankind.
 " Whene'er the Lion sheds his fires around,
 " And Cancer burns Syene's parching ground;
 " Then, at the pray'r of nations, comes the Nile,
 " And kindly tempers up the mould'ring soil.
 " Nor from the plains the cov'ring god retreats,
 " Till the rude fervor of the fits abates;
 " 'Till Phoebus into milder autumn fades,
 " And Meroc projects her length'ning shades.
 " Nor let enquiring sceptics ask the cause;
 " 'Tis Jove's command, and these are Nature's laws."

The prophets Isaiah and Jeremiah call this river Sihor, or Sicho, which has some affinity to the name given to it by the Ethiopians at this day, as they denominate that part of the Nile that runs through their country Sitis; and all these appellations imply the same thing, that is Black River. The Greek word Ægyptios has the same signification, and alludes to the sable colour of the water. The word Nil, or Nilus, however, is derived from the name of a king of Egypt, who did great service to the country, by cutting innumerable canals from the river to several parts which wanted refreshment. The ancients attempted to account for the overflowing of the Nile by various conjectures; but as these were derived rather from imagination than experience, they have generally been found to be erroneous. The moderns, however, have had more success in their enquiries, and have discovered that the inundations of the Nile are owing to the prodigious rains which falling in Ethiopia, rush in torrents from the hills, overflow the country first, and then impetuously descend into Egypt, where they swell the Nile, and cause such salutary effects. The height of the inundation is usually 16 cubits, or 24 feet; for it is to be observed, that the cubit in Egypt, and particularly at Grand Cairo, is but a foot and a half, though in other places it is deemed a foot and nine inches. When it rises to only 12 or 13 cubits, a famine usually ensues; but if it exceeds 16 cubits, the too great overflow does great mischief. Thus extremes are always dreaded; and, says an intelligent writer, "as the riches of Egypt depended on the inundation of the Nile, all the circumstances, and different degrees of its increase, were carefully considered; and the inundation itself, by a long series of regular observations, discovered what kind of harvest the ensuing year was likely to produce. That they might the better judge of the daily increase of the water, and the consequent plenty or scarcity of the ensuing year, the gradual rise of the river was very exactly measured, either by walls sunk, or pillars erected, and divided for that purpose; there was one of the former on the banks of the Nile, in the Upper Egypt, near Syene; and one of the latter was set up in Memphis, on which these different encasements were marked; from whence notice was given to all the rest of Egypt; by which means the inhabitants knew what they might fear or promise themselves from the harvest."

A very ancient column, which served for the same use, is now to be seen in the castle of Old Cairo, said to be erected in the time of the emperor Heraclius, and the present Nilometer, or Mikias, as the Arabs call it, is in the same castle, on the isle of Rhoida. The old Egyptians ascribed the inundation of the Nile to their God Serapis; and the pillar, on which was marked the increase, was religiously preserved in the temple of that idol. The overflowing of the Nile was by them attended with an universal joy throughout all Egypt, as they considered it as the fountain of its happiness; and something of the like custom is observed to this day at Grand Cairo.

Leathern vessels, and the Persian wheel, an hydraulic machine, are sometimes used about Cairo to pour water into the canals; and many ingenious methods have been invented to retain the water upon the ground till sufficient humidity is imbibed, and the soil thoroughly soaked.

The grand signior is not entitled to his annual tribute till the canal is opened at Grand Cairo; and when the bafsa does open it, if the waters are not 16 cubits high, the people refuse the payment of the tribute.

These overflowings of the Nile are said to produce a number of animated beings, which have no names assigned them on account of their equivocal forms. These imaginary insects are thus described by Ovid;

" Thus when the Nile from Pharian fields is fled,
 " And seeks with ebbing tides his ancient bed;
 " The fat manure with heavenly fire is warm'd,
 " And crusted creatures, as in wombs, are form'd:
 " Those, when they turn the glebe, the peasants find
 " Some rude, and yet unfinished in their kind;
 " Short of their limbs, a lame, imperfect birth,
 " One half alive, and one of lifeless earth."

But although such insects never existed, except in the imagination of poets; yet Mr. Pope has, from the fiction of their emerging from slime half formed and half animated, conceived a pretty simile in ridicule of some real beings, of a nature equally contemptible.

" Some have at first for wits, then poets pass'd,
 " Turn'd critics next, and prov'd plain fools at last;
 " Some neither can for wits, nor poets pass,
 " As heavy mules are neither horse nor ass.
 " Those half-learn'd wretches, numerous in our life,
 " Like half-form'd insects on the banks of Nile,
 " Unfinish'd things, one knows not what to call,
 " Their generation's so equivocal."

Some writers have represented the cutting of the bank of the canal, which is to convey the waters of the Nile (when they are risen to a proper height) to Grand Cairo, as a very magnificent ceremony; but later experience, and more authentic information, contradict those exaggerated accounts, and place the whole but in a mean light; for we find that this canal in the country resembles only a ditch badly kept up, for it has not either a lining of stone-work, or a determinate border. Indeed, when it enters the city, it becomes a little more respectable, as it runs along the walls of the houses built upon its edges. However, it has no great depth in the city, any more than in the country, and in the place where the waters of the Nile enter, it may have from 15 to 20 feet in breadth; as soon as the waters of the Nile begin to increase, they close the mouth of the canal, by means of a little mound of earth, which they raise there; and they place a mark to indicate the time of the opening of this canal, and of all the other canals in the kingdom. When this day is come, the bafsa and his beys go, with a grand retinue, to the ceremony of opening the bank. They place themselves under a very indifferent tent, that is on one side of it; and the Copti and the Jews are employed in cutting the bank. Some ill-dressed people, that are in a vile barque, throw nuts, melons, and other like things, into the water that enters, while the bafsa causes some little pieces of money to be thrown in, and a paltry fire-work to be played off, consisting of about 20 rockets. At last, all these rejoicings, so mien boasted of by some travellers, are pretty much like those that one may see at the wedding of a substantial peasant. All that can attract ones curiosity there, is the retinue of the grandees, which has something magnificent in its kind.

The people, on these occasions, do a thousand foolish things, to shew the joy they have, at their expectation of the fertility of their country, and of the plenty of the harvest, from the increase of the Nile. The most lascivious dances are the least part of their joy; and there seldom passes a year, but some one loses his life amidst these tumultuous rejoicings.

It must naturally be conjectured that a country which is sometimes overflowed with water, and consequently subject to humid vapours, at other times purged with intense heat, and very frequently troubled with unwholesome winds, cannot be of an healthy nature. Indeed the accounts which the ancients have transmitted to us concerning the salubrity of the air and pleasantness of the soil of this country are either gross fallacies, and impertinent exaggerations, or else both are totally altered since the time of their writing. The various disorders which afflict the inhabitants are woeful proofs of the pestilential nature of the air, and general unwholesomeness of the place. They have at all times a terrible disease which attacks the eyes of the people. This is so dreadful as scarce to yield to any remedy, and so universal that few or none are exempt from it. Sore-eyes is a general complaint, and blindness so common, that you can hardly meet with a family, but some individuals belonging to it have been deprived of their sight; hence Egypt is often proverbially stiled by the neighbouring nations the *Land of Blindness*. Many have been the reasons assigned as the origin of this dreadful disorder. Some ascribe it to the immense quantities of quick lime used in building, and white washing the houses, the small particles of which peel off through the intense heat, and being carried about by the wind, fly into and stick to the peoples eyes, from whence it is almost impossible to eradicate them; others impute it to the excessive heat of the sun reflected from a salt and sandy soil; and many imagine that it proceeds from both these causes, together with the bad diet, brackish waters, and want of cleanliness; which latter is a national characteristic, and the evils arising from it might be prevented by bathing; but the Egyptians, who are naturally lazy, do not take that pains to wash away the effects of perspiration which they ought to do, and hence the passages of the pores being impeded, the whole mass of blood is infected. This disorder being so general, is in a great measure hereditary, and a complication of other complaints frequently attend it, such as itchy tumours, and all manner of scorbatic and leprous complaints.

From the spring to the summer solstice a dreadful pestilential fever frequently rages; in autumn the thighs and legs of many are beset with a prodigious degree, and filled with carbuncles; the small-pox commits great ravages in the winter; and during the inundations of the Nile, dysenteries, bloody-fluxes, &c. are extremely prevalent. The cooling breezes which blow from April to September, though they tend greatly to mitigate the intense heat, are nevertheless frequently of dangerous consequence, particularly to such as expose themselves to their power, while in a state of perspiration, as rheumatisms are always, and dead-palsies often, the result of such indiscretion.

The plague is common to this, as well as all other Mahometan countries, and the Egyptians are such rigid predeterminarians that they think it impious to attempt to prevent its visits, or stop its progress. Hence its ravages, which happen periodically every fifth year, are dreadful, and in some seasons 500,000 persons have died of it within a few months in the city of Cairo only. Besides the periodical plague, which is certain, it is frequently brought in the intervals from other countries by accident. Many are likewise swept away annually by a distemper called Dem-al-Muyah which resembles the apoplexy in its

* After enumerating the dreadful disorders with which the Egyptians are afflicted, and the general unhealthiness of the climate, a late author draws this inference: "This is sufficient to shew, that if the accounts of the ancients were really true, and not exaggerated, how much it is altered since for the worse; all which are the unavoidable effects of its present arbitrary government."

† The ancients originally wrote upon palm-leaves, afterwards the inside of the bark of certain trees was used, from whence we have the etymology of the word *liber*, or,

symptoms, and is almost as sudden and fatal in its effects; and the dropsy is a very common disorder.

The soil of Egypt is very unequal with respect to fertility; near the Nile, where the water remains upon it for forty days, it produces ten-fold; but farther on it decreases in proportion as the water continues upon it a shorter time, so that in some places it gives but three or four-fold.

To the Egyptians the honour of having invented geometry is attributed, on account of the inundations of the Nile, which some authors have asserted obliged them to re-measure their grounds, in order for every man to ascertain his property; but it appears that this is needless, as the land-marks remain after the decrease of the waters. Nevertheless, an accurate modern traveller informs us that they actually do measure the grounds every year, not for the reason generally supposed, but because the proprietors have annually different farmers or peasants to rent their fields, and each of them farms a greater or lesser piece of ground; it is therefore obvious that it must be measured, more particularly as the rent is not paid in corn but money, at so much per teddan, or acre, the rate being proportioned to the nearness to, or distance from the Nile.

The corn of Egypt would not be sufficient for a quarter of the inhabitants, if wheaten bread was their common food; but the people in general do not eat bread above once a week, their usual food being barley flour mixed with water; and what bread they can get is seldom made of wheat, the general composition being a coarse kind of millet, which the Arabians call dura, and the Greeks karamboch; this millet is always sown on places which can be watered with facility, more particularly on the borders of the Nile: its produce is fifty from one stalk, the stem being about five feet in height.

The soil itself of this country in general is a dark coloured clay mixt with great quantities of salt-petre, so that no trees, and very few plants or shrubs are found in Egypt, and it would be totally sterile were it not for the inundations and artificial methods contrived for watering the land.

The papyrus is a production of Egypt, though it is far from being so plentiful as formerly; the inhabitants having greatly diminished the quantity by digging up the roots for fuel. This reed grew principally on the borders of the Nile, and served the ancients for writing paper. The bark was divided into thin flakes, these were laid flat upon a smooth surface, moistened with the glutinous waters of the Nile, compressed together, and then dried in the sun for use. This kind of paper was invented before the time of Alexander the Great, but that monarch first brought it into general use. The ancient Egyptians set great store by this reed, not only on account of its serving them to write upon, but for its various other uses, for the different parts of it were converted into food for their bellies, cloaths for their backs, boats for their fishing, utensils for cookery, crowns for their gods, and shoes for their priests.

The Egyptian flax was formerly in high esteem, on account of the fine linsens into which it was manufactured, the superior kind of which, called Byflus, was so exceeding dear, that none but the wealthiest people could afford to purchase it. At present there is little of this left, and less known of the manufacturing it.

Barley is usually ripe about the beginning of April, and wheat at the latter end of the same month. The method of sowing it is to throw the grains upon the mud after the inundation, where it is sufficiently mellow; but where the clay is too hard, it must be lightly plowed up. The rice grounds are usually kept under water, and when the rice is ripe, it is threshed by means of a sledge drawn by two oxen, which forces the grain from the straw

book: tables covered with wax became next the fashion, upon which the characters were impressed with an instrument called *Stylus*, whence originates the word *Stylis*, now applied to the deslin: this again gave way to *Papyrus*, from which the word *Paper* is derived, which latter became in universal esteem, as the use of papyrus declined. But it is to be observed, that parchment was used long before paper, and almost as anciently as papyrus, but never so universal as either.

dden and fatal in its common disorder. It is not to be taken with respect to fresh water remains upon it cold; but farther on it continues upon it as it gives but three or

of having invented good the inundations of the Nile obliged them to for every man to ascertain that this is needless, as decrease of the waters. beginning of April, the same month. The grains upon the mud is sufficiently mellow; must be lightly plowed kept under water, and by means of a sledge the grain from the straw

became next the fashion, pressed with an influence the word *Silk*, now gave way to *Papyrus*, which later became papyrus declined. But it was used long before it, but never fo

by running over and crushing it. The Egyptians use barley to feed their cattle, and to make an intoxicating kind of liquor by fermentation, which is the common drink of the lower class of people.

With respect to the animal productions of Egypt, many of the creatures described by the ancients are unknown to the modern inhabitants of the country, particularly the hippopotamus, which is not now to be found in any part of it.

The crocodile is the most celebrated animal production of Egypt, and has given rise to a great variety of romantic stories. The most common length of a crocodile is 18 feet, though some grow to 30, but this seldom happens. The following is the description of one dissected some years since by the Jesuits. It was 18 feet and a half in length, of which the tail was five feet and a half, and the head and neck about two feet and a half; the circumference was four feet nine inches in the thickest part; the four legs had the same parts and conformation as the arms of a man both within and without; the hands (if they are intitled to that appellation) had five fingers, the two last of which had no nails, and were of a conic figure; the hinder legs, including the thigh and paw, were two feet two inches long; the paws, from the joint to the extremity of the longest claws, were above nine inches; they were divided into four toes, of which three were armed with large claws, the longest of which was an inch and a half; these toes were united by a membrane, resembling those of a duck, but thicker. The head was long, with a little rising at the top, but the rest was flat, and especially towards the extremity of the jaws; it was covered by a skin adhering firmly to the skull and to the jaws. The skull was rough, and unequal in several places; and about the middle of the forehead there were two bony crests, about four inches high; the skull, between these two crests, was proof against a musket-ball, for it only rendered the part a little white that it struck against. The eye, in proportion, was very small, and so placed within its orbit that the external part when the lid was closed was only an inch long, and the line running parallel to the opening of the jaws. It was covered with a double lid, one within and one without; that within was folded in the great corner of the eye, and had a motion towards the tail, but being transparent, it covered the eye without hindering the sight. The iris was very large in proportion to the globe of the eye, and was of a yellowish grey colour. Above the eye the ear was placed, which opened from above downwards, as if it were by a kind of spring, by means of a solid, thick, cartilaginous substance. The nose was placed in the middle of the upper jaw, near an inch from its extremity, and was perfectly round and flat, being near two inches in diameter, of a black, soft, spongy substance, not unlike the nose of a dog. The jaws appeared to shut one within another; and the common received opinion, that the animal's under jaw is without motion, is absolutely false; it moves like the lower jaw in all other animals, while the upper is fixed to the skull, and absolutely immovable. The animal had 27 cutting teeth in the upper jaw, and 15 in the lower, with several void spaces between them; they were thick at the bottom, and sharp at the point, being all of different sizes, except 10 large hooked ones, six of which were in the lower jaw, and four in the upper. The mouth was fifteen inches in length, and eight and a half in breadth where broadest; the distance of the two jaws, when opened as wide as they could be, was 15 inches and a half. The colour of the body was of a dark brown on the upper part, and of a whitish citron below, with large spots of both colours. From the shoulders to the extremity of the tail it was covered with large scales of a square form, disposed like parallel girdles, and 52 in number; but those near the tail were thinner than the rest. The animal was covered not only with these, but all over with a coat of armour, which, however, was not proof against a musket ball, contrary to what has been asserted. Those parts of the girdle underneath the belly were of a whitish colour, and were made up of scales of divers shapes, which were not so hard as those on the back. The girdle was large in proportion to the mouth, and a ball of wood, as large as a man's head, readily ran down and was drawn up again. The guts were but short in comparison, being not so long as the animal's body. The

tongue, (which some have erroneously asserted this animal was without) consisting of a thick, spongy, soft flesh, and was strongly connected to the lower jaw. The heart was about the size of a calf's heart, and of a bright red colour, the blood passing as well from the veins to the aorta as into the lungs; there was no bladder, but the kidneys sent the urine to be discharged by the anus. There were 62 joints in the back bone, which, though very closely connected, had sufficient play to enable the animal to bend like a bow to the right and the left; so that what we hear of escaping a crocodile by turning out of the right line, and of its not being able to wheel readily after its prey, seems to be fabulous. It is probable that it can turn with great facility, for the joints of its back are not stiffer than those of other animals which can conveniently turn about.

The crocodile is terrible either on land or in the water, but more particularly so in the latter element. They are often seen basking themselves on sunny banks, where they lay for many hours motionless, and exactly resembling the trunk of a tree. On the approach of any living creature, they dart upon it, run to the water, and immediately plunge to the bottom with their prey. During the floods, they sometimes enter the cottages of the natives, and ferociously seize upon man, woman, or child, cattle, domestic animals, &c. Indeed examples have been known of their taking a man out of a canoe, and diving to the bottom, without its being in the power of those who were in sight to afford him any assistance.

All the parts of the crocodile are remarkably strong, the teeth are exceeding sharp, and above all, the tail is singularly dreadful; with a blow from this, it can overturn a boat, or stun the strongest animal. Many ridiculous and miraculous stories have been told concerning this creature, some have proceeded from travellers taking the most absurd tales upon trust; others have been the manufacture of their inventive faculties in order to impose upon the credulous; but the greatest number perhaps have had their origin from Pliny's description of this animal, which as it is curious, though in many circumstances *romantic*, we shall give for the inspection and entertainment of the reader.

"The crocodile is an animal with four legs, that makes a grievous destruction both in the water, and out upon the land. Of all the creatures that live upon the earth, this alone is without a tongue, and this alone moves the upper-jaw in eating. It hath two ranks of great teeth, and commonly it is longer than 18 cubits. It produceth eggs about the bigness of a goose-egg, that it fits upon them out of the water, and lays them at the place unto which the water is to rise that year, when it is at its highest; as if it had knowledge of this beforehand. It is the only creature that riseth from such a small beginning, to such a prodigious bigness. It is armed with claws to defend itself. Its skin on the back is so extraordinary hard that no weapon, never so sharp, is able to enter it. In the day-time it lies upon the ground, and spends the nights in the waters. When its belly is very full, it sleeps upon the bank with its mouth open; then there comes a little bird, named trochilos, to eat the remains of the devoured prey which sticks between the teeth: with this food it nourisheth itself, and by the picking of the teeth it gives the crocodile a pleasure, which causeth him to fall asleep in this posture. At that time the ichneumon takes notice of the crocodile at a distance, and when it lies its time, it enters into the others mouth, slides down the throat into the belly, and gnaws the entrails; with this the crocodile dies. In the river Nilus are also dolphins which have a very sharp back, with which they kill the crocodiles that pursue them continually. For that purpose these dolphins seem to be afraid of the ravenous beast, which causeth them to hide themselves in the waters under the crocodiles; then, with their sharp backs, they rip open the others belly. This creature is very bold and daring to them that run from it, but timorous and fearful if it be pursued. It is very weak-sighted in the water, but out of the water it is quick. In the winter it spends four months in some cave, without eating. It lives long, and grows continually till it dies."

Tho' the greatest part of this account is erroneous and fabulous, yet it has been generally admired, and believed by many for several succeeding ages. The assertions con-

cerning the tongue and upper jaw are palpable falsities, for it is possessed of the first, and does not move the latter. There is no such bird existing as the trochilos, and dolphins are never found in the Nile.

Crocodiles are not fond of salt water, but love to continue in rivers. They lay their eggs in the sand, having previously dug a hole with their fore paws to deposit them in. Having delivered some of their burden, they cover up the place with great care, and then retire; the next day they return again, uncover the place, lay about the same number of eggs, and then retire till the ensuing day, when they repeat the same for the last time, and then finally close the hole.

As soon as the eggs are vivified by the heat of the sun, which happens at the expiration of 30 days, the young ones begin to break the shell. The mother, by instinct, goes at the same time to assist them by scratching away the sand. The moment they are at liberty, the strongest make towards the water, and the rest mount upon the back of the mother, who carries them safely to it. "But the moment they arrive at the water (says an accurate author) all natural connection ceases, when the female has introduced her young to their natural element, she and the males become among the number of their most formidable enemies, and devour as many of them as they can; and the whole brood feathers into different parts at the bottom, and by far the greatest number are destroyed."

This animal is not only an enemy to its own species, but is at universal enmity with all other living creatures. Man is its professed foe, and kills it to prevent its depredations, as well as to eat it. Indeed its flesh is but indifferent food, though the eggs are deemed great delicacies, and are sought after with avidity, not only by man, but by many beasts, and birds of prey. The vulture is particularly successful in destroying its eggs, which they effect by the following stratagem: they hide themselves among the bushes and shrubs about the banks of those waters where the crocodile inhabits; then watching till she hath deposited her eggs, they go to the place as soon as she retires, scratch away the sand, and feast upon the spoil. At other times, when they have not discovered a crocodile's nest, they are equally destructive to the young fry as they run to the water.

The ichneumon, or rat of Pharaoh, is another terrible enemy to the crocodile species, as it destroys both eggs and young fry with great avidity. On account of this peculiar excellency, as the inhabitants of this country have a just right to esteem it, together with the rest of its perfections, for it is equally destructive to camels, serpents, frogs, rats, mice, and most obnoxious animals and reptiles that it is able to master, the ancient Egyptians deified it, and held it in the utmost veneration. This animal, with respect to shape and colour, resembles a badger; it has a snout like a hog, with which it routs up the earth and sand; the nose is prominent, and the ears short and round. It is of a yellowish colour at all times, except when angry; but if provoked, it bristles up its hairs like a porcupine, and then appears of two colours, which are white and yellow, that run in distinct streaks. The legs are black, the tail long, and the tongue and teeth like those of a cat. It is an amphibious creature, can bear to remain under water much longer than the otter, and is bold, active, and nimble; but that it creeps down the throat of the crocodile, and gnaws its intestines, is entirely fabulous, and was one of the errors of oral information, when conjectures were relied on more than facts, and common report believed without having recourse to experiments.

Antelopes, chamoos, wild oxen, tigers, hyænas, wolves, foxes, wild boars, hares, camels, &c. are common.

The birds of Egypt are the ostrich, flamingo, heron,

* An excellent author says, "It has often been remarked that the social affections are found to be stronger in their descent than their ascent; that the love of parents to their children, for instance, is commonly more ardent than that of children for their parents, though from the state of things, and from the obligations which children owe to their parents, one might reasonably expect it to be otherwise. However, there is a visible good design in this wise destination; we see in it, as in every object we seriously contemplate, the determination of high wisdom. The offspring,

curlew, spoonbill, duck, fowl, eagle, vulture, kite, sparrow-hawk, snipe, lapwing, partridge, &c. The ibis was deified, and held in great veneration by the ancient Egyptians, as well as the Ichneumon, and on the very same account, viz. its being destructive of many obnoxious animals, reptiles, &c. Some travellers affirm, that this bird is no longer to be found, but that its absence or non-existence is amply supplied by the presence of the stork, a bird at once common and useful in Egypt. This creature is of the size of the crane, and greatly resembles it: the colour is white and brown, and the nails of the toes are of a very singular nature, as they resemble the nails of a man much more than the claws of a bird. The stork has no voice, or at least makes no other noise than what is occasioned by its striking the under and upper chaps together very forcibly. There is one peculiar quality in the stork which seems more forcible than in any other living creature, viz. an uncommon degree of filial affection. The singular veneration of this bird for its parent was observed in the earliest ages; hence it was called in Hebrew, chesidah, a word which implies compassion and piety; and in Greek it was termed storge, which signifies, natural affection. From the latter it is probable that the English word stork came to us through the medium of our Saxon ancestors.

This remarkable creature is a bird of passage, and as such is noticed in the Holy Scripture, viz. Jeremiah viii. 7. *Yea the stork in the heaven knoweth her appointed times; and the turtle, and the crane, and the swallow, observe the time of their coming, but my people know not the judgment of the Lord.*

This bird has a long bill, and long red legs, which are peculiarly adapted to the nature of its getting its prey, for as it feeds for serpents, frogs, &c. in wet and marshy places, its long legs serve as stilts; and as it flies away with its food to its nest, its long bill, which is jagged, enables it to secure it. It lays but four eggs, and sits only 30 days. Its filial piety hath been the admiration of all ages, and drawn the attention of the most judicious and learned. One of the seven wise men, when Cræsus asked him which was the most happy animal, replied, the stork, "Because, says he, it performs what is just and right by nature, without any compulsive law." Hence one of our poets says,

"The stork's the emblem of true piety;
"Because, when age hath seiz'd, and made his dan
"Unfit for flight, the grateful young takes
"His mother on his back, provides her food;
"Repaying thus her tender care of him
"Ere he was fit to fly, by bearing her."

The pelican is another bird of which as many stories have been told as of the stork, though with much less truth. It is, however, sufficiently singular to merit particular attention.

The Egyptian pelican, with respect to size and shape, resembles a swan: its colour, however, is not so pure a white, nor is the beak similar, the latter being about a foot in length, and very thick; the colour blue and yellow, and the point sharp. The upper chap is formed like the same part in most other birds, but the lower is unlike any thing appertaining to the rest of the feathered race; it does not consist of one solid piece, but is composed of two long flat pieces, connected by a membrane which extends to the throat, but is flabby and loose, on which account it is capable of containing a vast quantity of any kind of provision. This bird indifferently frequents fresh and salt waters, forests, and groves; the principal things on which it feeds are fishes, and water insects. It builds its nest in the recesses of groves, or bushy places, and then repairs to the sea side, or to rivers, in search of prey; when having fed itself, it fills the

both of the human and the animal race, come into the world feeble and helpless; and if the parental affections were not exceedingly forcible, they must perish in their weak and feeble condition; and the creation would thus be speedily brought to an end. There is not the same reason for the return of affection in the offspring, and therefore we rarely find it in the animal world: soon as the young is able to provide for itself, a mutual forgetfulness generally ensues, and the parent grows as regardless of its offspring, as the offspring of its parent."

fleshy bag at its throat with provisions to carry to its young, who feed from this natural storehouse with uncommon voraciousness; and hence arose the fable, that the pelican feeds its young with its own blood; for, says an ingenious naturalist, "if some person in early time, quite unacquainted with the history of the bird, saw her alight in the midst of a desert, among a brood of ravenous young ones, and feed them from this bag, it would not be unnatural for him to suppose, however strange the thing must be in itself, that it was with her own blood she fed them. Thus arose from a mistake the story of this wonder, which plodding ignorance hath propagated through so many ages, and which moralists and poets have, from the earliest times, drawn into an emblem of paternal affection."

It is observable, that the Nile abounds in many kinds of fish which are common to other places, but that they have in general a very disagreeable bad taste, except between the months of October and February, when some few are tolerable eating.

There are many lakes in Egypt, but the most remarkable are those called *Nedaba*, from whence the natrum, or salt, is taken, and the *Lake without Water*, the latter of which is celebrated for its putrefactions. Different writers have furnished us with very strange and romantic accounts of these lakes, but the most authentic description of them is given by a modern writer, who, a few years ago, travelled through the principal parts of this extensive country. The manner in which he describes them we shall relate in his own words.

"On the 21st of August, says he, I set out from Cairo for Terrané, a place about 42 miles distant, situated on that branch of the Nile which goes to Rosetta. It was my intention to visit the desert, and the convent of St. Macarius, the lake whence the natrum is taken, and the lake without water, in which, according to the accounts of all travellers, I expected to find petrified ships. The governor of Terrané, to whom I delivered a letter from the bey, ordered Arabs to be sent for, who had been at the places whither I wanted to go; many of them offered, and three were chosen to be my companions. We joined a drove of camels that were going to the desert of Scete to be laden with natrum, and set out on the 25th of August, at five o'clock in the evening. On our road we found the ruins of several antient towns. We passed through a long sandy plain, intersected by many torrents. At seven o'clock in the morning we were near a lake from whence they get the natrum in summer. In winter this lake, which is called Scete, unites with another named Nedelea, from whence they take the natrum in that season; and both lakes at that time form only one, which is about 24 miles long, and two broad. The salt had formed a crust over the whole lake Scete, which bore us and our camels. After we had passed over, we left the caravan, and went to a Coptic monastery, where we passed the rest of the day. The monk told me that at half a day's journey from the monastery were petrified ships, and at the same time shewed me a stone, which they pretended was a piece of the mast of a ship. The stone perfectly resembled wood, but it did not appear that it had ever been wood, and much less a piece of a mast.

"The next day, about two o'clock in the morning, I set out in order to see these petrified vessels. After crossing many sandy fields and torrents, with much trouble and fatigue, I at last came to a mountain, from whence my Arabs brought me a stone that had some resemblance of oak wood. This made me dismount from my camel to go and view these pretended petrifications on the spot. I saw many little sharp points projecting from the rocks, which looked much like wood. I beat several of them down with a hatchet, and found one that perfectly represented a joint of the back-bone of some animal. This kind of stone is very heavy, and a little farther they find it of various colours. At last we came to the *Lake without Water*, which is nothing but a number of torrents united into one, and dry all the summer.

"At a distance I saw some small pieces of stone stand out above the sand, and these are looked upon as petrified ships and animals by the people here; at a distance they indeed bear some resemblance to the before-mentioned objects; but when you come near them, they are nothing but pointed rocks buried in the sand, and looking like wood.

It is very difficult to beat off any piece of them. Some pieces of stone are found here scattered about, four or five feet long, and six inches thick, and these are taken for pieces of masts.

"After I had seen these stones, which are a mere *lusus nature*, arising from the mixture of different earths, I returned the same day to the monastery from whence I set out in the morning. The monks told me that the Arabians, who formerly arrived in ships in this lake, or sea without water, had vexed the hermits there very much; and that St. Ephraim, who was then abbot of the monastery, had prayed to the Lord to dry up the sea, which he not only granted, but likewise changed the ships of these Arabians into stone.

"The next day I returned to the lake of Natrum, where I arrived about nine o'clock in the morning. This lake is filled by the rain, which begins to fall in December, and ceases in February. The water leaves the salt behind, with which it is impregnated by coming down the mountains, and through the sandy plains; it then filters through an unctuous clayey ground, and passes through subterraneous channels into several wells, where it becomes drinkable. Besides the natrum, which is taken up from the bottom of the lake with iron crows, in pieces of 12 or 15 pounds weight, there are five other species of salt in it, that are continually replaced by those which the rains carry into the lake. The people put dry plants, old rags, bones, &c. in the place of the salt, from whence many have imagined that by length of time the water in the lake changed these things into salt; but I convinced myself of the contrary, having seen many pieces of cloth, linen and bones, inclosed in the salt, as they had been thrown in the preceding year.

"The natrum belongs to the grand feignior; the basha of Cairo farms it to the richest bey, who generally gives the grand feignior 15,000 hundred weight for it. The inhabitants of five villages belonging to Terrané are employed entirely in taking out the salt, and carrying it away. Ten soldiers, and 20 faithful Arabs guard it, but some of it is stolen now and then, notwithstanding their care. When the thieves are taken, they are carried before the governor, who may order them to be beheaded: but he generally contents himself with confiscating the salt for his own benefit, and fining the thief in two piastres for his own person, and one piastre for every camel load of salt he steals."

"The lake that most claims our attention after the two above mentioned, is called Lake Mandet, which being particularly described by the same writer, we shall also give in his own words: "This lake, says he, is sometimes called Lake Mandet, sometimes Tanis, and sometimes Beheira. It is 66 miles long, and its greatest breadth 24. When the Nile rises it overflows, and forms as it were three great rivers, which empty themselves into the sea: those mouths are called the mouths of Mendes, Tanis, and Pelusium, and they dry up some time after the inundation. This lake, which is the largest in all Egypt, begins close to Damiatra, and ends a little above Palusium. It extends almost east and west, and is separated from the sea by a sandy neck of land only a mile and a half broad. There is a very plentiful fishery, which is farmed for 40,000 piastres annually.

"They have various methods of catching the fish, but the most curious and singular is that with a bird. When the fishermen have set up their long nets, which they draw quite round, they let two tame pelicans swim in the lake, having fastened a thread to their eye-lids, by means of which they can tie up their eyes during the whole fishery. The fishermen are obliged to take this precaution, in order to prevent the birds from eating too many fish. The pelican, having a strong scent, pursues the fish around him, and the people on his sides prevent them from getting away by driving them into the nets.

"The dolphins, which are very numerous in this lake, especially in the Mendesian mouth, pursue the fish, and oblige them to take refuge in little ponds full of reeds: as soon as they are got into these ponds they cannot escape, because the fishermen shut up the entrance into the lake with nets. The fishermen, who reap to great an advantage from those pursuits of the dolphins, almost look upon it as a miracle, and they are ignorant enough to take the dolphins to be some good spirits sent on purpose to do them this service."

S E C T. II.

Divisions, Subdivisions, &c.

EGYPT, as we have already mentioned, is divided into three principal districts, namely, Upper Egypt, Middle Egypt, and Lower Egypt; of all which we shall treat in their proper order, and in regular gradation, from the ancient to the modern state of this country.

1. *Of Upper Egypt, or Thebais; and particularly of its ancient State and remaining Antiquities.*

ACCORDING to Strabo and Ptolemy, this country was divided into these three principal parts, at the time it first began to be peopled. It was called Thebais by the Greeks, from its principal city Thebes; and is the most southerly part of Egypt next to Ethiopia. It was near as large as all the rest, for it included the country on both sides the Nile down to the Heptanomis; its last city being Lycopolis on the west side of the Nile, and Antaeopolis on the east.

This part of Egypt originally contained many large cities, among which were the following, situated on the west side of the Nile, viz.

1. Lycopolis, or the City of Wolves, so called from the inhabitants of it paying an extraordinary respect to that animal.
2. Hycle, about a mile to the west of the Nile.
3. Ptolemais, said by Ptolemy to be the largest of them all. It had a government established after the Greek manner, so that it was probably rebuilt under the Ptolemies, and had its name from them.
4. Abydos, originally famous for having in it the magnificent palace of Menmon. In Strabo's time it was a very small place, and is now a village called el Berbi, or the Temple.
5. Little Diospolis, or the city of Jupiter.
6. Tentyra, whose inhabitants were remarkable for their enmity to crocodiles. They were great worshippers of Isis and Venus; to each of which deities they had a temple, whose ruins are still to be seen.

A modern writer has furnished us with the following description of these antiques. In speaking of them he says, "the remains of the temple of Venus are entirely buried in rubbish, and though one may get in from the top, yet it is impossible to draw or to measure it, on account of the earth and rubbish with which it is filled. On one side of this temple are some Greek letters, which I take to be the remains of some inscription in that language; but they are so defaced, that it is impossible to discover their meaning.

"About 60 yards south-west of this temple, lies that of Isis. The first thing that attracts our notice is a fine portal 69 feet high, 36 broad, and 31 thick. A beautiful cornice surrounds it entirely. Under this portico, and immediately above the door, which is 20 feet high and 10 wide, you see a globe by way of ornament, supported by two fish resembling lampries, which appear in a field azure, like two expanded wings. The portal is covered with hieroglyphics from top to bottom. Through this porch you enter a spacious court filled with broken columns; opposite to the temple, which is in the middle of this court, 12 of them are still standing, and support the remaining part of the ceiling. The front of this temple is 120 feet long, 82 broad, and 70 high; the back measures 166 feet in length, 180 in breadth, and its height is the same with that of the front. The exterior walls are full of Egyptian divinities in a kind of bas-relief, and with hieroglyphics. A very fine cornice surrounds it, and eight lions heads from the gutters on the roof. There are three on each side, and two on the hindmost.

"At first you enter a large hall, 112 feet long, 60 feet high, and 50 feet broad. The ceiling is supported by six rows of columns, four in each row: the first of these columns is 52 feet long, and its circumference 23. The capitals are made in the form of four female heads, whose backs lean against each other. The walls of this hall are ornamented with a prodigious number of figures of animals, Egyptian deities, and hieroglyphics. The ceiling, of which the stones are from eight to 10 feet long, seven broad and two thick, is pointed, and the colours are now as vivid as if they had been but just laid on. From this hall you enter another square one, whose

ceiling rests on six columns, of which three stand on each side. They are of the same form and height as the preceding, but not of the same thickness. This hall measures 42 feet in length, and 41 in breadth. From hence you come into four chambers which have no light but what enters at the door, and through an air-hole in the ceiling. The first of these chambers is 63 feet in length, and 18 in breadth; the rest are 43 in length, and 17 in breadth. The walls of these rooms are painted, and full of hieroglyphic inscriptions.

"Out of the last room you come into a corridor 12 feet long and three broad, that leads to a winding staircase, by which you can mount upon the flat roof. There you likewise find a very dark room 18 feet long, 11 broad, and nine high; it is built above the wall of the great hall, and ornamented with the figures of many Egyptian deities in bas-relief. On the ceiling of this room is the figure of a giant, likewise in relief, with his arms and legs stretched out. The stair-case has not any thing particular, only that five or six of its steps are cut out of a single stone, and which are very easy to mount, being only four inches high."

7. Hermonthis, a city in which Apollo and Jupiter were worshipped, and the capital of a province of that name. It was between three and four miles round, and situated in the middle of a large plain. The ruins of the temple of Apollo are still to be seen; but so imperfect as not to convey any idea of the form or magnificence of that structure. Here are two walls of free-stone, which are nine feet asunder; the height of these walls is 15 feet, and the length 36. On the top of one of them are the remains of a cornice, below which there is a globe, supported by two fish like lampries.

8. Aphroditopolis, that is, the city of Venus.

9. Lotopolis, in which was the temple of Pallas, where both that deity and the fifth Latus were worshipped. The principal part of the temple is still standing, and is described by bishop Pococke, who says, "that the capitals of the pillars are somewhat like the Corinthian; and that within the temple are three stories of hieroglyphics of men about three feet high, and at one end the lowest figures are as big as life, one of which has the head of an ibis."

10. Crocoditopolis, or the City of Crocodiles, so called, according to Strabo, from that animal being the particular object worshipped by the inhabitants.

11. Apollinopolis, where was antiently a magnificent temple, some remains of which are still extant; but the interior parts cannot be entered, they being quite filled up with earth and rubbish. Its front was 118 feet in breadth; the sides 169 feet long, and its height 70 feet. On the ruins of this city is now a small village called Ufus.

12. Elephantine was a city in an island of the same name. The island is about a mile long, and a quarter of a mile broad to the south, ending in a point at the north. There was a temple at Cnuphis on this island, and a nrometer to measure the rise of the Nile. Here are still the remains of a small temple, before which is a statue, sitting with the hands across on the breast, being about eight feet high, with a lituus in each hand.

About 12 miles from Elephantine stood the city of Philus, in an island of the same name, not above half a mile long, and a quarter broad. The island was deemed sacred, from an opinion that Osiris was buried there; and the ruins of a magnificent temple are still to be seen. It was called the Temple of the Hawk, from the inhabitants worshipping that bird, the figure of which is cut among the hieroglyphics in several parts. It was built with free-stone, and situated on the west side of the island. The outer court of the temple was of considerable length, and on each side of it are still remaining a row of pillars, ornamented with a variety of capitals. On the outside of the inner court are large Colossal figures, and within are several beautiful pillars, ornamented with capitals wrought in bas-relief. On each side of the entrance to the east is an obelisk of red granite, and the fourth part of it is terminated by a wall, at which are two obelisks raised on very handsome pedestals.

The country about this island appears very romantic: on the east side it is all rock; on the west the hills are either sandy, or of black rocks. The rocks of Granite cross the Nile, and in three different places, at some distance

distance parts, several large rocks appear to be of it in a peculiar manner. The distance of these rocks from the Nile is about 100 miles.

for in tor h that I distan

distance from one another, divide the stream into three parts, making three falls at each of them. Here are several large cataracts, the most considerable of which appears to be that described by Strabo, who says, "it is a rocky height in the middle of the river; the upper part of it is smooth, so as the water can run on it, but ends in a precipice down which the water falls." Lucian, in his description of this part of the Nile, and of its scattered currents, (which he makes the chief priest Achoreus relate to Cæsar) says,

"Jointly they flow, when Philæ's gates divide
 "Our fertile Egypt from Arabia's^{*} side;
 "Thence, with a peaceful, soft descent, they creep,
 "And fock, insensibly, the distant deep.
 "Who that beholds thee, Nile! thus gently flow,
 "With scarce a wrinkle on thy glassy brow,
 "Can guess thy rage, when rocks resist thy force,
 "And hurl thee headlong in the downward course;
 "When spouting cataracts thy torrent pour,
 "And nations tremble at the deaf'ning roar;
 "When thy proud waves with indignation rise,
 "And dash their foaming fury to the skies?
 "These wonders reedy Abatos † can tell,
 "And the tall cliffs that first declare thy swell;
 "The cliffs, with ignorance of old believ'd,
 "Thy parent veins, and for thy spring receiv'd."

On the east side of the Nile, going down from the island of Philæ, were the following remarkable places:

Syene, built on very high rocks, opposite the fourth end of Elephantine. Its ruins are still to be seen on the heights over Assuan, exactly under the tropic of Cancer. Pliny mentions this place, and particularly the ancient forts here, as being situated in a peninsula; and it is conjectured by modern travellers, that the granite pillars in that neighbourhood are the remains of some ancient temple. Strabo describes an observatory here, built over a famous well, for making astronomical observations. The same historian also gives an account, that there was a garrison here of three Roman cohorts.

South-east of the ruins of Seyne are the granite quarries; all the country, the islands, and some parts of the bed of the Nile, being red granite, which is the stone mentioned by Herodotus. The quarries are not worked in deep, but the stone is hewn out of the sides of the low hills. Pocock says, "they seem to have worked in round the stone with a narrow tool, and when the stones were almost separated, there is reason to think they forced them out of their beds with large wedges, of which there are great signs in the quarries in all parts."

Farther to the south of Seyne was the city of Ombos, now a village called Com-Ombo, where a great heap of ruins are still to be seen of an old temple. On some of the pillars, which are a few feet above the ground, are many beautiful hieroglyphics; but the chief parts of the ruins are so buried in the earth, that it is impossible to form any judgment either of the shape or magnificence of the original building.

Elethya, or the city of Lucina, famous for a temple sacred to that goddess, not the least remains of which are at this time extant.

Cnuphis, so called, says Strabo, from a god of that name worshipped by the inhabitants.

The next we have to mention was the city of Thebes, which, it is said, when in its full prosperity, might vie with the first city in the universe. It was also called Diospolis, or the city of Jupiter, or of the Sun. It had 100 gates, from whence it obtained the additional name of Hecatonpylos, to distinguish it from another Thebes in Bœotia. It was equally large and populous; and, according to historians, could send out at once 200 chariots, and 10,000 fighting men at each of its gates. Though the Greeks and Romans only saw the city in its ruins, yet they have celebrated its grandeur and magnificence. When Homer relates the embassy of Ulysses, Ajax, and Phoenix, to entreat Achilles to return to the

* This excellent poet is here defective in his geography, for instead of Arabia it should be Ethiopia; and his translator has given us his sense literally; though he observes, that Philæ, which is an island in the Nile, and at a good distance from the Red Sea, or Gulph of Arabia, is much ra-

ther to be looked upon as a boundary between Egypt and Ethiopia, than between Egypt and Arabia.

† Abatos is a rock, or little inaccessible island in the Nile, overgrown with reeds and bushes. It lies between Philæ and Elephantine, very near to the cataract mentioned by Strabo.

camp, and be reconciled to Agamemnon, he represents his hero as protesting that nothing should bribe him to such a reconciliation; for he says,
 "Not all proud Thebes unrivall'd walls contain
 "The world's great empress on th' Egyptian plain,
 "(That spreads her conquests o'er a thousand flates,
 "And pours her heroes through an hundred gates,
 "Two hundred horsemen, and two hundred cars,
 "From each wide portal issuing to the wars)
 "Should all these offers for my friendship call,
 "'Tis he that offers, and I scorn them all."

POPE'S HOMER'S ILIAD.

The city of Thebes was not only the most beautiful in all Egypt, but supposed to surpass every other in the whole universe, as well for the splendor of its buildings, as its extent and number of inhabitants. The prince, for many ages, made it their care to beautify and enlarge it; "so which, says Diodorus Siculus, none under the sun was equal in the many magnificent treasures of gold, silver, and ivory; with innumerable colofulles and obelisks of one entire stone. There were four temples admirable in beauty and greatness, the most ancient of which was in circuit 12 stadia, and 45 cubits in height, with a wall of 24 feet broad. The ornaments and offerings within were agreeable to this magnificence, both in value and workmanship. The fabric is yet remaining; but the gold, silver, ivory, and precious stones, were ransacked by the Persians, when Cambyses burnt the temple of Egypt."—Such was the state of this temple at the time of Diodorus.

The ruins of the above temple are still extant, and it is computed to have been about half a mile in circumference. At the first entrance was a court or avenue paved with stone about 100 feet wide, and 3 or 400 feet long. On each side were sphynxes in two rows about 30 feet apart. The inner court of the temple was ornamented on each side with rows of pillars, whose capitals were curiously wrought. Some part of these pillars are still to be seen, but the chief of the building is a mere heap of ruins, and the inside almost closed up with earth and rubbish.

The temple of Jupiter at Carnæk is one of the most perfect we meet with in this part of Egypt, for which reason, and in order that the reader may form a proper judgment of the original construction and magnificence of this structure as well as of Egyptian temples in general, we shall be a little particular in describing it.

This temple had originally eight grand entrances, to three of which were avenues of sphynxes of a considerable length, two of them having sixty statues on each side. To one of these entrances are four grand gateways that lead to the temple; they are about 35 feet deep, 150 long, and about 60 feet high: the first of the gates is of a red granite finely polished, and beautifully adorned with hieroglyphics: it has four compartments without and three within, in each of which are the figures of two women larger than life, and of exquisite workmanship. Farther on each side are colossal figures with hieroglyphics under them, about fifteen feet from the ground. Without the gate is a red granite statue on one side, and on the other a statue composed of a sort of granite and small pebbles. These statues must be exceeding large, for Dr. Pocock, who measured some parts of one of them, says, that he found the hand to be sixteen inches broad, and the head five feet six inches long. The other gates are much of the same nature with this, and are in like manner ornamented with hieroglyphics and colossal figures. To the east of these gates is a large pond, which was probably a reservoir of the Nile water for the use of the temple.

All the entrances have the appearance of extraordinary magnificence; but the most superb and principal one is that to the west, which may be called either a gateway or a front to the great court before the temple. It is 40 feet broad, the bottom part being a solid wall of the same thickness. Within this is a large open court, hav-

ing

ing on each side, at the first entrance, a terrace 80 feet broad. The walk between the two terraces leads to the inner part of the temple, and is adorned on each side with a grand colonade of pillars above 40 feet high and eight feet diameter, with large capital vases like a vase, only worked with some figures in lines. At the farther end of these pillars are two colossal statues of red granite on pedestals four feet wide, and six feet long; but the heads are broke off, and the statues much disfigured.

On each side of the grand entrance into the temple, from the fourth, are two obelisks, having only one column of hieroglyphics, and are upwards of 63 feet high, and six feet square. Farther to the east are two other obelisks, seven feet six inches square, and 73 feet high: they are all of red granite, and the two last have three columns of hieroglyphics all the way down.

The walls and doors of the temple are ornamented with beautiful hieroglyphics and figures of men, in six compartments, above nine feet high and 12 wide, every compartment having the figure of three men in it. On entering the temple, there appears 16 rows of pillars one way, and 18 the other; the two middle rows are 11 feet diameter, but the other eight, with only square stones as capitals. The temple is higher over the two middle rows than in the other parts, having over the space between a sort of windows with twelve lattices of stone in each of them, to convey light into the temple. Both within and without the temple are hieroglyphics and other representations: the outside was beautified in a very grand manner, particularly on the north side, where are still to be seen representations of battles with hories and chariots.

On each side the temple are several apartments, some of which might probably have been used by the priests, and others adapted for the beasts they kept for sacrifice. About 160 feet to the east, is a large building which consists of several small apartments on each side of a spacious colonade, and seems as if adapted for the use of the officers belonging to the temple. To the north of this are ruins of buildings, with a grand gate before them, which seems originally to have led to the temple.

The principal hieroglyphics now to be seen on the gates of this temple are as follow; on one a man offers the deity, in each hand, a vase like a chocolate dish, having on each arm something resembling a folded napkin. In another, one seems to offer himself to two deities, which might probably be the sun and moon. A man offers something like apples to one on a throne; four deities being on thrones above, as on another floor. A bird like a hawk on a pillar somewhat resembling the Corinthian order. A peacock on another. A man standing before four monkeys, which are on two floors; and three trees on a pedestal. These figures are all entire, for being cut in granite, they could not easily be disfigured.

Such is the present situation of the above temple, near which are the remains of several others, whose ruins extend for several miles round. Among these, one of them, from the situation of its fragments, appears to have been round, and near 200 feet in diameter.

About four miles east of Carnack stood another very elegant temple; but the whole of it is totally destroyed, except the grand gate, which is entire, and near it is a sphynx about four feet long.

About a mile to the north of Carnack is a kind of street, on each side of which is a rocky ground about 10 feet high: in these rocks are cut many rooms, and some of them supported with pillars. They are supposed to have served instead of houses in the very earliest times, being contrived as excellent securities from the inclemency of the weather.

At a small distance from these is a rock, and mountainous place called *Briban-el-Meluke*, that is, *the Gate or Court of the Kings*. Here are the sepulchres of the kings of Thebes, in grottos cut out of the rocks, which, in Strabo's time, were 40 in number, and admirably executed. The vale where these grottos are is about 100 yards wide, and there are signs of about 18 of the sepulchres, but only nine can be entered into at this time. The hills on each side are high steep rocks; and the grottos are cut into the rock in a most beautiful manner, in long rooms or galleries under the mountains, which are of a close, white free-stone, that cuts like chalk, and is

as smooth as the finest stucco-work. The galleries are mostly about ten feet wide and high. Four or five of these galleries, one within another, from 30 to 50 feet long, and from 10 to 15 high, generally lead to a spacious room, in which is seen the tomb of the king, with his figure cut in relief on the lid; and in one the picture of the king is painted at full length. Both the sides and ceilings of the rooms are cut with hieroglyphics of birds and beasts, and some of them painted; being as fresh as if they were but just finished, though they must be above 2000 years old. One of the tombs is of one stone of red granite, seven feet nine inches high, 11 feet eight inches long, and above six feet broad. The cover is made to shut into it; and on it is cut the figure of the king in mezzo relievo, with a hieroglyphical inscription, which may be some account of the monarch. This room is adorned with hieroglyphics in different columns, with figures of men, hawks, and bulls. In the furthermost room is a figure in relief, with the arms across on the breast; over it is a globe, and on each side of the apartment is the figure of a man kneeling. In the great room is the statue of a man with a scepter in his hand, and on the ceiling is a like figure painted, with wings hanging down lower than the feet, and covering the whole body. At the entrance, on each side, are the figures of four men larger than life, having on their heads the representations of hawks and other animals; and within a circle, on each of the pilasters, is a man with a head resembling a goat.

Besides those already mentioned, there are many other magnificent remains of Thebes; but the most remarkable are the colossal statues of Memnon: they are made of a particular sort of hard granite, which most resembles the eagle-stone. These statues point to the south-east, and are on pedestals or plinths entirely plain; they are about 30 feet apart: the pedestal of one is 30 feet long and 17 broad, and that of the other 33 feet long and 19 broad. The height of one of these statues, from the bottom of the foot to the top of the knee, is about 19 feet; from the bottom of the foot to the ankle, two feet six inches; to the top of the instep, four feet. On the sides of the legs are two reliefs, and one between the legs of the natural height. The other statue is imperfect, having been broken off at the middle: on the pedestal of this is a Greek epigram; and on the insteps and legs, for about eight feet high, are several inscriptions in Greek and Latin, some of them in honour of Memnon, and others, testimonies of those who heard his sound. Pausanias says, that Cambyzes broke this statue, and that afterwards the upper part, from the middle, was seen lying neglected on the ground: the other part, every day at sun-rising, uttered a sound like the breaking of a string of a harp when it was wound up. This strange circumstance is confirmed by several other ancient historians, particularly Juvenal, who, in one of his satires says,

“Where Memnon's statue magic strings inspire
“With vocal sounds, that emulate the lyre.”

About two miles from Carnack is a small village called *Luxerion*, built on a part of the ancient Thebes, on the east side of the river. Adjoining to this village are the remains of a large and magnificent building, said by Diodorus Siculus to have been the sepulchre of Osymanduas, and that it was a mile and a half in circumference: it consisted of large courts, porticos, shrines, temples, the tomb of Osymanduas, and other buildings; but they are all decayed, and clogged up with dirt and rubbish, that little judgment can be formed of their original construction. The most perfect and conspicuous ornaments that now remain of this structure are two obelisks, which stood near the entrance of the first court, and are said to be the finest in the universe: they are now above the ground 60 feet high, and seven feet square at the bottom. The hieroglyphics are in three columns down every side, cut in with a flat bottom an inch and a half deep. On the top of each is the figure of a person sitting on a throne, with another offering him something on his knees; a *ad* beneath, at proper distances, are the figures of various animals, as also birds, serpents, insects, &c.

Diodorus says, that in the sepulchre where the body of Osymanduas lay, was a circle or crown of gold 36 cubits in length, and one cubit thick, on each of which was cut the rising and setting of all the stars for every

day in the year, with the effects the Egyptian astrologers attributed to them, according to their different dispositions. He likewise says, that this great treasure fell a victim to the depredations committed by Cambyfes and the Persians.

Such are the antiquities now remaining of the ancient city of Thebes, a city celebrated by the first poets and historians in all ages; "That venerable city, (as Dr. Pocock says) whose ruins are older than the foundations of most other cities, and yet such prodigious remains are still to be seen of magnificence and solidity, as may convince those who behold them, that without some extraordinary accidents they must have lasted for ever, which seems to have been the intention of the founder of them."

2. Of Middle Egypt, or Heptanomis; its Antiquities, &c.

THIS division of Egypt received its second name from the seven nomes, or prefectures, into which it was originally divided. It comprehends all the country on each side of the Nile, from Thebes to the point of the Delta, where that river divides itself into three branches by which it enters the sea.

This part of Egypt contained originally many large and noble cities; among which the most distinguished was that called Memphis, situated on the west side of the Nile, a little above the Delta, and about five miles south of Gize, which was opposite to Old Cairo. It was supposed to have been built by Manes, the first king of Egypt; and for many ages was the metropolis of the whole kingdom.

According to some authors, this city was upwards of 18 miles in circumference; and in its neighbourhood were sepulchres of many of the ancient Egyptians, who were to be interred there, as being the place supposed to contain the body of Osiris, one of their kings, whom they afterwards worshipped in the figure of an ox.

The city of Memphis was exceeding large even in the time of Strabo, who calls it the second after Alexandria. But such are the ravages of time, that when Sandys was there, in 1610, little remains of it were to be seen. That writer, in describing it, says thus: "The very ruins were almost ruined; yet some few impressions were left, and divers thrown down, statues of monstrous resemblances; a scarce sufficient testimony to shew to the curious seeker, that there it had been."

This is the part of Egypt that has ever been so famous for containing those distinguished monuments of antiquity the pyramids, which, according to the antients, were situated to the north-west of Memphis. They are now called the Pyramids of Gize, and stand near a ridge of high mountains, on a grade and elevated, in the sandy desert of Libya, about a quarter of a mile from the plains of Egypt.

These pyramids are about 20 in number, three of which are remarkably large, and stand near each other. The others lie scattered, and are models of the greater ones; though some of them are very considerable, particularly one which stands south-west of the rest, about 20 miles farther within the desert. As these pyramids have particularly attracted the attention of travellers for ages past, and as the like of them are not to be met with in any other parts of the universe, we shall here give a particular description of the three largest of them, which will convey to the reader a sufficient idea of the whole.

The largest of these three, according to Herodotus, was built by Cheops, king of Egypt, whom Diodorus calls Chennis. Monsieur de Chazelles, who went purposely to measure it in 1693, gives us the following account of its dimensions: he says, the sides of the square base is 110 fathoms; the fronts are equilateral triangles, and therefore the superficies of the base is 12,100 square fathoms; the perpendicular height 77 fathoms, and the solid contents 313,590 cubical fathoms. Another curious traveller, who took the same pains to satisfy his curiosity as the above gentleman, says, each side of the square base is 660 feet, and its circumference 2640 feet: it has near 500 feet of perpendicular height, and the solid contents the same as mentioned by monsieur de Chazelles.

The ascent to the top of this pyramid is by steps on the outside; the number of which are said to be 212.

These steps are formed in rows, and differ as well in height as breadth; those of the lowermost row are near

three feet high and two broad, which running about the pyramid in a level, form a narrow walk; the second is like the first, but chancing in near three feet; the third is also much the same; and the rest follow in order like so many stairs, rising one above another to the top, which does not end in a point like mathematical pyramids, but in a small flat or square about twelve feet broad.

The best account we have of the entrance and inside of this amazing pile is thus given by Mr. Greaves: "The entrance, says he, into the pyramid, is by a square narrow passage, which opens in the midst of the north side on the 16th step, or ascending 38 feet, on an artificial bank of earth. The stone over it is near 12 feet long and above eight feet wide. This entry goes declining with an angle of 26 degrees, being 36 feet and a half broad, and 92 feet and a half long. The structure of it was the labour of an exquisite hand, as appears by the smoothness and evenness of the work, and close knitting of the joints. On the right hand is a hole of 89 feet long; and a gallery on the left paved with smooth polished marble. Another passage runs in a level 110 feet, and leads to an arched vault or chamber 20 feet long, 17 broad, and 15 high. The second gallery is divided from the first by a wall, and is a very flatly piece of work, not inferior, either in artificial beauty or richness of materials, to the most sumptuous and magnificent buildings: it is 154 feet long, seven broad, and 76 high. The stone of which the gallery is built is a white and polished marble, very regularly cut in large tables; and the joints so close, that they are scarce discernible by a curious eye. It is here to be observed, that those who would view the inside must carry lights with them, for there is no window, or other opening, in this pyramid to admit the light.

"After passing the second gallery, you come to two small ante-chambers lined with a rich speckled kind of Thebaic marble. Beyond is a square hole, over which are five lines cut parallel and perpendicular; besides which no other sculptures or engravings are observed in the whole pyramid. This passage is nine feet long, most exquisitely cut of Thebaic marble, and is a landing-place at the north end of a very sumptuous and well proportioned room. This magnificent and spacious chamber, in which art seems to have contended with nature, stands in the center of the pyramid, equidistant from all the sides, and almost in the midst between the base and the top. The floor, the sides, and the roof, are all made of large tables of the most beautiful marble. From the top of it to the bottom there are about six ranges of stone, all of which are fixed to an equal height, and very gracefully placed round the room in one attitude. The beams that cover this chamber are of a prodigious length, like so many huge beams, lying flat and traversing the room, supporting that infinite mass and weight of the pyramid above. The chamber is 34 feet long, 17 broad, and 19 and a half high. Whatever was originally in this room, at present nothing remains but a tomb of granite marble, of one piece, hollow within, uncovered at the top, and sounding like a bell. The figure of the tomb is like an altar, or two cubes finely fit together, cut smooth and plain, about seven feet long, four broad, and four deep. It formerly had a cover, which has been broke; and it is supposed to have been raised and placed there before the roof of the chamber was closed. This was certainly the monument of the king and founder; but he was not buried in it."

Sandys says, that king Cheops became so poor by building this large pyramid, that he was compelled to prostitute his daughter to raise money; and that she, seeking her particular glory, demanded a stone of each person on whom she bestowed her favours, with which she built a small pyramid near adjoining.

The second pyramid is about 80 yards south of the first, and was built by king Cephrenes, who succeeded Cheops. The architecture of it is much like the former, but it is very inferior in size. It has not any entrance, and is built of white stone, not so large by far as those of the first: the sides do not rise by degrees like that, but are smooth and equal; and the whole fabric seems quite entire, except on the south side. On the north and west sides are two very flatly and celebrated pieces of architecture, about 30 feet deep and 1400 feet long, cut out of the rock in a perpendicular, and squared by the chisel; which

which, it is supposed, were designed as lodgings for the Egyptian priests.

The third pyramid is situated on a rising ground about 200 yards from the second, and is said to have been built by Mycherinus, the son of Cheops, and successor of Cephrenes; it measures about 300 feet on every side, and though less than the other two, is said greatly to exceed them in the beauty of its workmanship.

At a small distance from these pyramids, and about a quarter of a mile from the river, is a monstrous figure called a sphynx, the face of which represents that of a beautiful woman, and the body that of a lion. This extraordinary figure is said to have been the sepulchre of king Amasis, who, according to Gafner, was transformed into a lion. The manner in which that ancient author relates this transformation being rather curious, we shall preserve a copy of it.

“Then first I call'd to mind, what her I fear'd,
 “My dreadful shape, rough mane, and horrid beard.
 “So went I to slip off my lion's case,
 “Began t'untie, unlutten and unlace:
 “Striving to shift, the more myself I hurt;
 “The shape stuck close, like Deianira's shirt;
 “I found then, I no property was in,
 “No monster's fur, but my own monstrous skin.
 “Myself I did next in the mirror view,
 “And from my own reflecting shadow flew;
 “Tho' I had seen all sorts of lions store,
 “Ne'er such a prodigy I saw before:
 “I call'd for help, my voice grown strangely loud,
 “Like thunder rung, broke from a prisoning cloud;
 “Like mouthing tempests, or a water breach,
 “Or battles join'd, ten thousand men in each.”

This sphynx, the supposed sepulchre of king Amasis, is of one entire stone, smooth and polished, and was cut out of the solid rock. Travellers differ with respect to the dimensions of this figure, but the latest and most just appear to be those given by Dr. Pocock, who says, the lower part of the neck, or beginning of the breast is 33 feet wide, and 20 thick to the back; and thence to a large hole in the back 73 feet; and from thence to the tail 30 feet. Besides the abovementioned hole in the back, there is another on the top of the head, by which it is conjectured the priests entered it to deliver their oracles. The Egyptians hieroglyphically represented a harlot by a sphynx, having the amiable face of a woman, and the rapacious strength of a lion. These sphynxes they also erected before the entrances of their temples, intimating, that secrets of philosophy, and sacred mysteries, should be folded in enigmatical expressions, separated from the understanding of the prophane multitude.

As we have already had frequently occasion to mention the Egyptian hieroglyphics, and shall have the like hereafter, it may not be improper here to make a small digression, in order to inform the reader of the rise and nature of those ancient symbols.

After Hermes, and the Egyptian priests who succeeded, had, by long study and speculation, formed a system of theology and natural philosophy, in which God, the supreme cause of all, was the universal soul diffused through the whole creation, they endeavoured to express the divine attributes and operations of the deity, in the works of nature, by the properties and powers of living animals, and other natural productions, as the proper symbols of such amazing causes.

In order to chuse the most proper symbols, and, at the same time, the most expressive of the divine attributes, and of the effects of Divine Providence in every part of the universe, they studied with great application and care, not only the peculiar properties of those animals, birds and fishes, herbs and plants, which Egypt produced, but also the geometrical properties of lines and figures; and by a regular connection of them in various orders, attitudes and compositions, they formed the whole system of their theology and philosophy, which was hidden under hieroglyphic figures and characters, known only to themselves, and to those who were initiated into their mysteries.

In this system their principal hero-gods, Osiris and Isis, theologically represented the Supreme Being, and universal nature; and physically signified the two great celestial luminaries, the sun and moon, by whose in-

fluence all nature was actuated. In like manner the inferior heroes represented the subordinate gods, who were the ministers of the Supreme Spirit; and physically they denoted the inferior mundane elements and powers. Their symbols represented, and comprehended under them, the natural productions of the Deity, and the various beneficial effects of Divine Providence in the works of creation; and also the order and harmony, the powers and mutual influence of the several parts of the universal system.

This is the sum and substance of the Egyptian learning, so famed in ancient times throughout the world. And in this general system the particular history of their hero-gods was contained, and applied to physical causes, and theological science. The hieroglyphic system was composed with great art and sagacity; and was so universally esteemed and admired, that the most learned philosophers of other nations came into Egypt on purpose to be instructed in it, and to learn the philosophy and theology conveyed by these apostolic symbols.

In this hieroglyphic system, the hero-gods not only represented, and were symbols of the supreme God and subordinate deities, but they had each their animal symbol, to represent their peculiar power, energy and administration; and their figures were compounded of one part or other of their symbols, to express more sensibly the natural effects of divine energy attributed to them.

Thus Osiris, when he represented the power and all-seeing providence of the Supreme Being, had a human body with a hawk's head, and a sceptre in his hand, and decorated with the other regalia, or ensigns of royalty. Under the same form also he represented the sun, the great celestial luminary; and, as it were, the soul of the world; his symbol now was a bull, and the scarabeus, or beetle, which expressed the sun's motion, by rolling balls of dung, containing its seed, backwards, or from east to west, his face being towards the east. The symbolical bull was likewise of a particular form and make, to denote the various influences of the sun.

Osiris was also delineated sometimes with a bull's and sometimes with a lion's head, to represent the heat, vigour and influence of the sun, especially in the inundation of the Nile, when the sun was in the celestial sign Leo: and likewise to express the solar influence in all the productions of nature. And it is also observable, that the bull and lion were parts of the Jewish cherub's symbol; and as the one was the head of the wild, and the other of the tame beasts, they represented, in conjunction, the animal creation: while the other two parts, namely, the eagle and human figure, represented the aerial, rational creation.

Isis was termed with many breasts, to represent the earth, the universal mother, and with a cornucopia in her hand, denoting the nutritive and productive powers of nature: her symbol was a cow, part black and part white, to represent the enlightened and dark parts of the moon.

Pan had the horns and feet, and sometimes also the head of a goat, which was his symbol, to shew the generative power of nature, over which he presided. At the same time he symbolically represented universal nature, the cause of all things.

Hermes had a dog's head, which was his symbol, to denote his sagacity, in the invention of arts and sciences; especially in his watchful diligence in the culture of religious rites and sacred knowledge; at the same time he symbolically represented the Divine Providence, was worshipped as the chief counsellor of Saturn and Osiris; he who communicated the will of the gods to men, and by whom their souls were conducted into the other world. He was likewise represented by the ibis, and with the head of this bird, which was, at the same time, his symbol, to signify his conveying literature to the Egyptians, which they believed was done under the form of this bird, and confined to their nation only, as the ibis was not known to live any where but in Egypt.

Ammon represented the deity called Amun, and his symbol was a ram. He was also delineated with a ram's head and horns, to denote the creative power of God, and his beneficial and diffusive influence through the works of nature, making every thing fruitful, to produce and multiply its kind; and cherishing and preserving them by the warmth of the sun, and an internal vital heat and vigour.

The

The universal soul itself was beautifully represented by a winged globe, with a serpent emerging from it. The globe denoted the infinite Divine essence, whose center, to use the expression in the hermetic writings, was every where, and circumference no where. The wings of the hawk represented the divine all-comprehensive intellect; and the serpent denoted the vivifying power of God, by which life and existence are given to all things.

Typhon represented the most powerful demon, or genius, who was continually at war with Osiris and Isis, the most benevolent geniuses of Egypt. His symbol was an hippopotamus, or river horse, a very treacherous and cruel animal.

Orus was a principal deity of the Egyptians, and, according to his hieroglyphic forms and habits, signified sometimes the sun, and sometimes the harmony of the whole mundane system. At the same time, being the offspring of Osiris and Isis, he was always represented young.

In his hieroglyphic figure he was represented with a staff, on the top of which was the head of the upupa, to signify, by the variegated feather of that bird, the beautiful variety of the creation. In one of his hands he held a lituus, to denote the harmony of the system; and a gnomon in the other, to shew the perfect proportion of its parts. Behind him was a triangle inscribed in a circle, to signify that the world was made by the unerring wisdom of God. He had also sometimes a cornucopia in his hand, to denote the fertility and production of the earth.

Harpocrates was described holding one of his fingers on his lips, to denote the mysterious and ineffable nature of God, and that the knowledge of him was to be searched after with profound and silent meditation.

Upon the whole, almost all the Egyptian deities and symbols entered in two, namely, Osiris and Isis, who represented, under various hieroglyphic forms, both the celestial and terrestrial system, together with all the divine attributes, operations, and energy, which created, animated and preserved them.

The Egyptians likewise concealed their moral philosophy under hieroglyphic symbols; but these were not the subjects of the hieroglyphics delineated on obelisks. And as hieroglyphic and symbolical figures were very ancient in Egypt, and first invented, at least formed into a system there, so they were thence carried into other countries, and imitated in all religious mysteries, as well as in political and moral science.

The preceding symbolical figures making the substance of hieroglyphics, and all belonging to Osiris, his family and cotemporaries, they were probably formed into a system soon after the death of those hero-gods, by some who had been instructed in the art of hieroglyphics, by Hermes, the inventor of them. The first he formed himself, and the others were probably added by his learned successors, who had been instructed by him in all his mysterious learning.

This hieroglyphic system was, in its beginning, not so simple and less compounded than afterwards; for it had been improving for several ages before it appeared on the obelisks of the temples. And hence we may infer the time of the first Egyptian hieroglyphic symbols; for, in all probability, they were not older than the time of the famous Hermes, who flourished in the reign, and some time after the death of Osiris.

The hieroglyphic symbols were, in early times, carried into Greece, and gave the first occasion to the fables of the poets, with regard to the metamorphoses of the gods, which they improved from inventions of their own; and from the knowledge of them the Greeks ascribed peculiar arts and inventions to their gods, whose names they first received from Egypt.

Having thus finished our digression, we shall now proceed to describe the remaining antiquities in this part of Egypt.

At Saccora and Dashour, about 10 miles south of Gize, in the Lybian deserts, are many other pyramids, as also the Egyptian catacombs. The pyramids are built from north to south along the brow of a hill, and from the first to the last take up about 12 miles. Sixteen of them are very large, but the others are inconsiderable. One of them is called Mustabait-el-Pharaon; or the seat of

Pharaoh, on which the Arabs say the kings of Egypt promulged their laws; it is 273 feet wide, and 46 in height. Another is 690 feet broad, and 345 high. A third is 600 feet square, and 335 in height. Who were the founders of these pyramids is not known; but they must certainly have been erected upwards of 3000 years.

In the same plain in which these pyramids stand, are the catacombs or ancient sepulchres of the Egyptians. Many of the poor in Egypt are maintained by being employed to dig beneath the barren sands in search of these sepulchres. When their attempt proves successful, they make a small well of about three feet broad, and 16 or 18 feet deep; into which one with a torch in his hand is easily let down by a rope. At the bottom is a four square passage, but so low, that they must stoop to go in. At the end of this they come to the four square vaulted repository, 24 feet every way, in which are tables cut out of the same rock, whereon the bodies are placed in chests or coffins of wood or stone, on which are certain hieroglyphic characters.

The mummies, or bodies themselves, are embalmed with spices and bitumen; but the chests or coffins wherein the mummies lie, and the winding sheets in which they are wrapped, are richly gilt, streaked with various colours, and curiously ornamented with hieroglyphics.

The methods taken by the ancient Egyptians to preserve the bodies of the dead are thus described by Sandys: "In the preparing of them, says he, to keep them from putrefaction, they drew out the brains at the nostrils, and supplied their place with preservative spices; then cutting up the belly with an Ethiopian stone, and extracting the bowels, they cleansed the inside with wine; and stuffing the same with a composition of cassia, myrrh and other odours, closed it again. The poorer sort of people effected the like with bitumen, as also with the juice of cedars, which, by the extreme bitterness, and siccative faculty, not only immediately subdued the cause of interior corruptions, but have preserved them incurrupted above 3000 years."

Among the catacombs is one for particular birds and animals, which is much more magnificent than the others. These creatures were worshipped by the ancient Egyptians, who so highly revered them, that when they happened to find them dead, they embalmed them, wrapped them up with the same care as they did human bodies, and deposited them in earthen vases covered over and stopp'd close with mortar.

The last curiosity we have to mention that was situated near the city of Memphis, was a famous building called the Labyrinth, which is said to have been much more surprizing than their pyramids. It is not quite certain who was the founder of this extraordinary fabric, though it is generally believed to have been built by King Menes, but it is certain that it was erected upwards of 600 years before Christ; and it received its name from being constructed in such a manner that those who entered it could not find the way out again, without the assistance of some experienced guide.

Herodotus says, this structure was built by twelve Egyptian kings, when Egypt was divided into that number of kingdoms, and that it consisted of twelve palaces, regularly disposed, that had a communication with each other. These palaces contained three thousand rooms, half of which, interspersed with terraces, were ranged round the halls, and discovered no outlets; the other half were under-ground, cut out of the rocks, and designed for the sepulchres of the kings. The whole building was covered with stone and adorned with the finest sepulchres. The halls had an equal number of doors, six opening to the north, and six to the south, all encompassed by the same wall; and at the angle where the labyrinth ended, stood a pyramid, which was the sepulchre of one of its founders.

Diodorus Siculus, and several other ancient historians, are of opinion that this structure was absolutely a sepulchre, in which many of the Egyptian kings, particularly those who are supposed to have founded it, were entered; and this opinion appears very likely, as those monarchs prided themselves in being deposited in pyramids and other magnificent structures.

A late celebrated writer has made some very ingenious observations on the folly of the Egyptian monarchs in erecting

erecting such stately edifices to be deposited in after their deaths; as also on the pyramids and manner of interment of the ancient Egyptians. As they are matters of curiosity, it may not be improper to subjoin them, which we shall do in his own words.

"The pyramids, says he, which are here so famous, are the monuments of the kings. The grandees of the kingdom followed their examples, and caused those to be erected which are distinguished by the name of the lesser pyramids, and lie along the side of the river. As for private persons, they were interred in the catacombs, which are very numerous in the sandy plains, situated in the neighbourhood of the southern pyramids. When they were interred in these tombs, they covered the stone which closed up the entrance four or five feet deep with sand, which contributed not a little to the preservation of the bodies by securing them from the injuries of the exterior air. Over and above this precaution, there was no Egyptian but was embalmed after his decease, in a manner more or less costly, according to the abilities of his heirs.

"Superstition was also the cause of all this care about funerals. The priests assured the people, that in a certain period of years an entire revolution would happen, and those whose bodies could be preserved to that time, would have them restored and live in them again. Every one, from that self-love which is inherent to man, being desirous of finding at that time his old case, directed his heirs to take all imaginable care of their bodies. What astonishes me is, that the hump-backed, the lame, the blind, and every other maimed kind of folks, had as strong an inclination as the rest to inhabit a second time so inconvenient and disagreeable a lodging. It is apparent from hence, that these Egyptians did likewise believe, that when the body was once destroyed, there was no getting another. However, it is certain, that all this pains was taken for the cabinets of the curious, and the apothecaries shops of the present times.

"Amongst the bodies of deceased great men, which had been preserved through many ages, and were actually entire in the time of Augustus, historians mention particularly Alexander the Great. They tell us farther, that Augustus being in Egypt, had the curiosity of going to see the tomb of that famous prince, and that he saw therein the body in a shrine of glass substituted in the room of one of gold, which was taken away by Seleucus Cybioticates. How idle it is for sovereigns the most potent and the most dreaded, to dream of respect being paid them after death! Time delivers man from that servile attention which living princes exact; and the tombs of the old Egyptian kings, that of Alexander and other heroes of antiquity, have been violated with as little ceremony as those of private men. They were not so much as spared in times wherein their memories were recent. We adore, in a manner, living princes, and crowds of flatterers continually pursue them with vows for their prosperity: but,

When breathless, they are dust become,
And all the glories of their pride
Are shrunk within the silent tomb,
Tho' for its splendor it be eyed,
Yet they are low and lost indeed,
And hungry worms upon them feed.

There all their swelling tides lose,
Givers of peace and thunderbolts of war;
And as no more they can their bounty use,
There free from flatterers they are.
Nature makes equal in their graves,
Whom fortune made or lords or slaves."

Having thus noticed the most essential particulars relative to the ancient city of Memphis, we shall now take notice of the other cities which ornamented this part of the Egyptian country, namely, Heptanomis, or Middle Egypt. They were as follow:

1. Acanthus, where was a temple of Osiris, and a wood of Thebaic Acantha that produced gums, from which, it is probable, the city might have received its name.

2. Heracleopolis, or the city of Hercules, in an island made by a canal running from the Nile.

3. Niropolis, which stood in the lower part of this island, to the north.

4. Aftinoo, on a branch of the Nile, which ran into the lake Mæris, about 50 miles south-west of Memphis, and 12 miles and a half from the lake. It was first called the city of Crocodiles, because the inhabitants worshipped that animal. Dioleus gives two occasions for the rise of the worship of the crocodile, the principal of which is, that Meneas who is supposed to have built the labyrinth, being pursued by his own dogs to this lake, was carried by a crocodile to the other side, and in gratitude built this city, instituted divine honours to this animal, and set apart the lake for its nourishment. Some ruins of this city are still to be seen near the province now called Fayoum. It is conjectured that this city was about four miles in circumference, and had a canal on every side.

5. Oxyrynchus, so called from a fish of that name worshipped all over Egypt, but principally in this place, where a temple was erected to that deity.

6. Hermopolis, or the temple of Mercury. This city was situated about two miles from the river, and was irregular in its form, being about a mile long, and half a mile broad. Here is still to be seen the grand portico of an ancient temple, consisting of twelve pillars, six in a row, and nine feet diameter. About three miles south-west of these ruins was the ancient castle of Hermopolis, where they took custom for all commodities brought from the city of Thebes.

On the east side of the river here stood the following cities:

7. Antinopolis, where antiently was a town called Bala; but Antinous, who accompanied Hadrian into Egypt, being drowned there, that emperor built this city, and named it Antinopolis, in allusion to the name of his favourite, to whom he instituted games and divine honours. It was about four miles in circumference, and on part of the ground where it stood is now a town called Enshich.

Some remains of this ancient city are still to be seen, particularly a beautiful gate, of which the front is almost entire, and behind it are four pillars, together with 23 many columns and their capitals, the fusts being fluted. Beyond this gate is an avenue with 130 pilasters on each side, but they are all in a very bad condition. At the end of this avenue stands the column of Alexander Severus the Roman emperor; the fust, which is built of five pieces of stone, is 32 feet long, and has a proportionable diameter. The first piece and the capital is ornamented with foliage; the pedestal is square, 12 feet high and five feet broad. On one side of it is a Greek inscription, but the greatest part of it is so defaced as to be entirely unintelligible. Near this pedestal is another, on which also are the remains of a Greek inscription. About 100 yards from this last is a triumphal arch almost entire. The fronts are 48 feet wide, and the sides 24 feet in length. It has three gates, the two outermost of which are seven feet wide and 20 high; and the center one, which is the largest, is 16 feet wide, and 30 feet high. Opposite each of the four sides of this triumphal arch was a colonnade, or range of pillars of red granite, of which nothing remain but some broken pillars. This building was erected in the times when the Romans possessed Egypt, and is doubtless composed of the remains of other more antient ones, which may be conjectured from the number of broken columns that lie on the ground near it.

8. Cynopolis, or the city of Dogs, in which Anubis was worshipped, and dogs were held in great esteem, a certain food being allotted them. It is said the rise of this was owing to Anubis, a companion of Osiris, who wore the dog's skin for armour, as an emblem of his courage; as Macedon, his other companion, wore the skin of a wolf; on which account it is conjectured these animals came to be worshipped. This seems the more probable, when we consider that these deities are represented with human bodies, with the heads of these beasts, which might have originated from their bringing the upper part of the skins over their heads; as Hercules is represented with the skin of a lion, as well as those who wished to be thought like him.

9. Ancutropolis, or the city of anchors; so called from a neighbouring quarry, out of which were cut stone anchors.

10. Aphro-

10. Aphroditopolis, or the city of Venus, the inhabitants of which paid particular adoration to a white cow.

11. Heliopolis, or the city of the Sun, situated on the borders of the Delta, which is the *On* of the scriptures, and is now called Mataria. It was a city of great antiquity, and famous for the worship of the sun. They also worshipped a bull, which was kept here under the name of Mnevis. The small remains of this city are to the north-east of Cairo, and a large mound encompasses the whole, the ancient site being about a mile long and half a mile broad. Here are the remains of a temple, several sphynxes, and an obelisk near 70 feet high. The priests of Heliopolis were the most famous of all Egypt for the study of philology and astronomy, and were the first that computed time by years, each of 365 days. They had here a sort of college, consisting of a great number of rooms. Herodotus came to this place to be instructed in the learning of the Egyptians; and when Strabo was here, he was shewn the apartments of Plato and Eudoxus. Near this city was a famous observatory, which received its name from Eudoxus, who was a great astronomer, and studied that science here for many years. There is great reason to think that the country about Heliopolis is the Land of Goshen, called also Ramefes in scripture; especially as the children of Israel went by Ramefes the first station on their departure from Egypt; this country being near Memphis, where, at that time, it is probable Pharaoh resided.

12. The last city we have to mention in this division of Egypt is that called Cerechua, which was situated on the western side of the Nile; to which may be here added another city, called New Babylon, supposed to have stood on Mount Jehuf, at the south end of Old Cairo, where many ruins are still to be seen. It appears from Diodorus Siculus, that the founders of Babylon were the captives taken by Sesostris, or their descendants; though there was another account, which he does not seem to credit, that it was built by some Babylonians, who came with Semiramis into Egypt. Strabo says, that some captives from Babylon on the Euphrates, having escaped, fled to this hill, made excursions, and plundered the country: but obtaining a pardon, and submitting to the government, they had this place given them to inhabit, and called it Babylon, from their own city.

We must not quit this part of Egypt without taking notice of those beautiful structures the obelisks*, which were here very plentiful, and considered by the Egyptians in no less a respectable light than their pyramids. These obelisks, on account of their beauty as well as height, form at this day the principal antique ornaments of Rome; the Roman power, desiring to equal the Egyptian, having thought it an honour to borrow two of the most distinguished monuments of their kings.

Sesostris erected, in Heliopolis, two obelisks of extreme hard stone, brought from the quarries of Syene, at the extremity of Egypt, which were each 180 feet high, and of one piece of granite. They were cut with a design to acquaint posterity of the extent of his power, and the number of nations he had conquered. When Augustus made Egypt a province of his empire, he caused one of these obelisks to be transported to Rome, and placed in the camp of Marius. He durst not venture upon a second, which was near the palace of Heliopolis, and of a prodigious size, made in the reign of king Ramefes, who, it is said, employed 20,000 men in cutting it. This obelisk must be considered as the most remarkable of all those taken notice of in history, as it is one of the most valuable monuments which now remain of Egyptian antiquity. It was respected even by Cambyses, at the time when that furious prince put all to fire and sword in Egypt, and who spared neither temples, nor those superb monuments, whose ruins are still the admiration of travellers. Cambyses, after having made himself master of Heliopolis, gave up the whole town to the flames; but when he saw the fire approaching to this obelisk, he ordered it immediately to be extinguished. This Cambyses was the son and successor of Cyrus, and conquered Egypt in the year of the world

3479, which was 525 years before Christ. Constantine, more daring than Augustus, undertook to transport this obelisk to Rome; but the death of this prince suspended the execution of his project, which was performed by his son Constantine, who brought it to Rome, and placed it in the Circus, with infinite labour and expence. It was afterwards thrown down, but was re-established by the care of pope Sixtus V. These obelisks are at this time two of the most distinguished structures that ornament the city of Rome.

Besides the above, there were obelisks also in other parts of Egypt, particularly at Arfinoe, Thebes, and Luxurien, from the latter of which places one of them was removed to Constantinople.

These obelisks were, for the most part, cut in the quarries of Upper Egypt; and it is very remarkable that the ancient Egyptians should have had the art and contrivance to dig, even in the very quarry, a canal, through which the waters of the Nile ran in the time of its inundation; from whence they afterwards raised up the columns, obelisks and statues, on rafts proportioned to their weight, to convey them to the different parts of Egypt to which they were destined; and as the country abounded with canals, there were few places but what easily admitted of this convenience.

3. Of the Antiquities of Lower Egypt, or Delta.

THIS last division of Egypt forms a kind of island, and in shape resembles a triangle, or Δ , from whence it received the name of Delta, which is that of the fourth capital letter in the Greek alphabet. It extended from Heptanomis to the Mediterranean sea, and contained not only that part which is encompassed by the arms of the Nile, but also Mareotis and Alexandria, with its dependencies to the west; and Casotis and Augulfanica, with some other territories towards Arabia, to the east.

It begins at the place where the Nile is divided into two large canals, through which it empties itself into the Mediterranean. The eastern mouth is called the Pelusian, and the western the Canopic, from two cities in their neighbourhood, formerly Pelusium and Canopus, called now Damietta and Rosetta; but between these two large branches there are five smaller ones.

Near the lake Mareotis were several considerable places, but there are not any vestiges of them now remaining.

Between the lake and the Canopic branch of the Nile stood the famous city of Alexandria, which received its name from its founder Alexander the Great; after whose death the Ptolemies made it the place of their residence, and the capital of all Egypt.

At a small distance from Alexandria were several other cities, particularly Nicopolis, Eleufis, and Canopus. The latter of these was situated near the sea-side, about 13 miles from Alexandria. It is said to have been built by the Spartans on their return from the Trojan war, and to have taken its name from Canopus, the pilot of Menelaus, who was buried there. In the centre of this city stood the temple of Serapis, besides which, in different parts of it were several obelisks, but there are not the least remains of them now to be seen.

There were several other cities between the sea and the canal that runs from Alexandria to Canopus, as also to the south and west of the last mentioned place. Between the Canopic and Pelusian branches were likewise the cities of Metelis, Naucratis, and Sais, the latter of which was once the metropolis of Lower Egypt, and supposed by some to be the *Sin* of the scriptures. Here was a famous temple dedicated to Minerva, and near it was the asylum of Osiris, where he was supposed to have been buried; for according to the Egyptian mythology, Isis deposited several coffins in different places, that Typhon might not discover his body.

To the north of Sais stood the cities of Cabafa and Brutus; the latter of which was famous for having in it the temples of Latona, Apollo, and Diana.

Besides the before-mentioned, there were many other

* An obelisk is a quadrangular, taper, high spire, raised perpendicularly, and terminating in a point, to serve as an ornament to some open square; and was often covered

with hieroglyphics, or mystical symbols, used by the Egyptians to conceal and disguise their sacred things, and the mysteries of their theology.

cities in this part of the Delta, but we know nothing more than their names as recorded by the antients, there not being the least remains of any one of them now extant.

On the east side of the Delta, where Egypt was bounded by Arabia Petrea and Palestine, stood the following remarkable cities, viz. Bubastus, on the most eastern branch of the Nile, where was a magnificent temple dedicated to Diana, who was called Bubastus by the Egyptians.

Onias, situated higher on the river, and which had its name from a Hebrew priest, who had obtained it of a king of Egypt, and built a temple there in opposition to that of Jerusalem. According to Josephus, Onias was influenced to build this temple by a great faith he had constantly placed in a prophecy of Esaias, who, 600 years before, had foretold that a temple should be built in Egypt, to the honour of the most high God by a Jew.

At a small distance from these cities, stood Mount Casius, where, according to Ptolemy, was a town of the same name. Strabo says it had a magnificent temple dedicated to Jupiter Casius; but it was the most remarkable for containing the sepulchre of Pompey, who was buried on this sandy hill, which runs into the sea, and seems to be the place now called by mariners Tenere. It was near this place that Pompey was treacherously murdered by command of Ptolemy. He was buried by Cordus a Roman soldier; and a superb monument was afterwards erected to his memory, which was repaired and beautified by the emperor Adrian. One of the Roman poets thus exclaims against Egypt on account of the cruel death of Pompey:

“ Oh fatal land! what curse can I bestow
Equal to thee, we to thy mischiefs owe?
“ Well did the wife Cumæan maid, of yore,
Warn our Hesperian chiefs to shun thy shore.
“ Forbid, just heav'n's! your dew to bless the soil;
“ And thou with-hold thy waters fruitful Nile!
“ Let Egypt, like the land of Ethiops, burn;
“ And her fat earth to sandy deserts turn.
“ Have we, with honours, dear Osiris crown'd,
“ And mourn'd him to the tinkling cymbals' sound;
“ Receiv'd her Isis to divine abodes,
“ And rank'd her dogs deform'd with Roman gods;
“ While in despite to Pompey's injur'd shade,
“ Low in her dust his sacred bones are laid.”

The wretched death of Pompey is beautifully represented by Lucan, who in the course of his description of that melancholy event, says thus:

“ But, see! he lies unburied on the sand;
“ Rocks tear him, billows toss him up and down,
“ And Pompey by a headless trunk is known.”

He then makes Cordus, the Roman soldier, secure the trunk, and bury it

“ in a narrow grave:
“ Then with a stone the sacred dust he binds,
“ To guard it from the breaths of scatt'ring winds;
“ And lest some heedless mariner should come,
“ And violate the warriors' humble tomb;
“ Thus with a line the monument he keeps,
“ Beneath this stone the once great Pompey sleeps.”

A little to the east of Mount Casius is the lake Sirbonis, which separates Egypt from Syria. The antient Egyptians called it the place of Typhon's expiration; and the poets feign that Typhon lay under it, for in those times it was supposed to be a place of great security. It was then 25 miles long, but narrow, and enclosed on each side by hills of sand.

There were several cities on the lake Sirbonis, as also on the Red Sea, but there are not any remains of them now to be seen. All therefore, that we have further to say relative to the antient state of Egypt is, that according to Diodorus Siculus, it originally contained 88,000 cities, the chief of which was Thebes. Memphis succeeded to Thebes, and at last Alexandria to Memphis; as Cairo has since done to Alexandria. It is said that when Alexandria was taken by the Saracens, there were in it 4000 palaces, as many baths, 400 squares, and 40,000 Jews that paid tribute.

S E C T. III.

Present State of Egypt; containing a Description of the Cities of Grand Cairo, Alexandria, Rosetta, Damietta, and other remarkable Places.

IN describing the situation of Egypt at present, with respect to its cities and principal places, we shall begin with Grand Cairo, the largest and most opulent city in the whole kingdom.

According to Mr. Mallet, the present city of Grand Cairo owes its foundation to one Giauhir, vizir of the caliph Meezledin, who conquered Egypt: This vizir caused a thick high wall to be built round a plain in which his whole army lay encamped: His master, the caliph, a mortal enemy of twans, as are most of the Arabs, thinking this a more pleasant residence than Alexandria, caused his tents to be set up there; but by degrees some houses were built in that inclosure. In process of time it was full of palaces and public structures, and at last it grew to be a magnificent city, which was insensibly enriched with the ruins of the town of Mafir, which its citizens abandoned in order to come and dwell in this new place. Giauhir, in memory of his conquest, had given this city the name of El Cahera, which is the Arabic word for victorious; and from hence some merchants of Florence and Venice, who were the first Nazarene merchants that were allowed to settle in this city, formed the name El Cairo, to which they added the epithet Grand, to denote the extent and beauty of it.

Grand Cairo may be said to consist of three towns, or cities, namely, Old Cairo, which adjoins to it, Cairo properly so called, and the port of Bulac. Old Cairo is reduced to a very small compass, not being above two miles round; but it is the port for the boats that come from Upper Egypt; and some of the bays have country-houses here, to which they retire at the time of the high Nile. Bulac is the port for boats that come up the river from the different parts of Delta; it is about a mile from New Cairo, and near two miles in circumference.

This capital of Egypt is situated on the eastern shore of the Nile, in 49 deg. east longitude, and 29 deg. 50 min. north latitude. It stands about a mile from the river, and extends eastward near two miles to the mountains, a little above the place where the Nile separates itself into two branches for forming the Delta. It is about eight miles in circumference, exclusive of Bulac or Old Cairo; but it is said to have been much larger when it was the center of trade from the East Indies, though it still continues to be the chief mart and metropolis of the kingdom.

Through the center of the city runs a canal, which comes out of the Nile close to Old Cairo. It has water during three months only, after which time it is a mere dirty ditch. In the watery season it forms seven or eight small ponds in the city and its environs, waters the adjacent fields, and communicates with the Lake of Pilgrims, about nine miles from Cairo.

The streets of Cairo, like most of the Turkish cities, are very narrow; the widest runs the whole length of the city, but it is little better than a long dirty lane. The other streets are so narrow that they frequently make a roof from one house to another over the street, and put a slight covering on it to defend them from the sun: the streets are without pavement, and generally full of dust; but to remove, in some degree, these inconveniencies, they are swept and sprinkled with water every day, especially before the houses of the better sort.

All the houses have flat roofs, and are several stories high; they are built of brick, and the windows which look into the street are secured with iron rails and curtains, in order to prevent the women from being seen. The out-sides of the houses are without any kind of ornament, and the insides are equally plain, having no other embellishments than the necessary furniture for domestic uses, except their saloons, where they receive their friends and acquaintance.

The city is well secured at night, most of the streets having gates at the ends of them, which are always shut up as soon as the day is closed; and to some of the principal ones are guards of janizaries. Some of the smaller streets consist only of shops without any houses; and there are several places for shops like our Exchange, called Bezeftan, which are shut up at night. Shops of the

the same trade are generally together, as well in the Bezestans as the streets.

The mosques in this metropolis are exceeding numerous, being reckoned by most writers to exceed 1100. The principal part of them have minarets, or towers, with each its preacher; but some of them have neither towers nor preachers, being considered only as chapels or oratories. Many of the former are grand and beautiful; but that which exceeds them all, both as to the solidity of its building, and a certain grandeur and magnificence that strikes the beholder in a surprizing manner, is the mosque of sultan Hassan. It is very lofty, of an oblong square figure, crowned with a conical all round, that projects a great way, and is adorned with a particular sort of grotesque carvings of the Turkish manner. The entrance to it is finely inlaid with several sorts of marble, and carved at top; the ascent was by several steps, which are broken down, and the door walled up. This last security was made to keep out the rebels, who often took shelter in the mosque in times of public insurrections; and the place is now so strong, that there is always a garrison of janizaries, who have apartments adjoining to it. Between the mosque and the castle is a spacious and elegant piazza, which is the only one in the whole city.

There is another beautiful mosque at the north-east end of the town called Kubbel-Azab, or the Cupola of the Arabs. It is sixty feet high, with a beautiful dome over it, raised on a base of sixteen sides, in each of which is a window. The room is wainscotted round eight feet high in pannels, with all the most valuable marbles, among which are several fine slabs of red and green porphyry: the borders round the pannels are carved and gilt; and a sort of frieze ranges round, in which are sentences cut in large golden Coptic characters. The walls above this are adorned with Arabic inscriptions, in letters of gold; and the whole cupola is painted and gilt in the finest manner. All over the mosque are hung a great number of glass lamps and ostrich eggs: adjoining to it are several apartments for the priests; and also some grand ones for great people, who sometimes come and reside there. This great edifice is said to have been built by Jaafar, who conquered Egypt for the caliph Moezza.

In the fourth part of the town is another large mosque, said to resemble that of Mecca; and an old building, which appears to have been the quarters of the body of soldiers called Cherkes, to whom it still belongs, and goes by their name. The part of the town where this mosque stands is called Tailoun, from a general of that name, who built a mosque and palace here, but there are not now any remains to be seen of either.

To the east of Tailoun is the castle of Cairo, said to have been built by Saladin. It is situated on a rocky hill, which appears to be separated by art from the east end of the mountain Jebel Mocatham. It has four entrances, two of which are on the north side, one on the east, and the other on the west. The eastern entrance is called the Gate of the Janizaries, and the western one the Gate of the Arabs. The castle is about a mile in circumference, but yet is an irregular building, and the principal part of it in a very ruinous condition. At the west end are the remains of some grand apartments, several of which are covered with domes, and adorned with Mosaic pictures of trees and horses that originally belonged to the antient sultans. This part of the castle is now only used for weaving, embroidering, and preparing hangings and coverings, great quantities of which are annually sent to Mecca. The eastern part of it stands on much higher ground than the rest, from whence there is a delightful prospect of Cairo, the pyramids, and the adjacent countries. About the center of the castle is a large court, on the fourth side of which are the basia's apartments. A small garrison is kept here, and the men are lodged in large towers, which form an inclosure of about five or six hundred paces in circumference. These towers command the basia's apartments; so that whenever he receives an order from the Porte to raise his government, a battery of four or five cannon is quit against it, which would soon beat it down should he offer any resistance. Near the basia's apartments are those of the great divan, wherein are to be seen several leathern shields, each almost an inch thick, with a

javelin sticking in them, wherewith it is said they were pierced by one of the sultans; and kept as monuments of his strength. The officers under the basia have also noble apartments here. Near these apartments is the mint where they coin their gold, and some small pieces called medines, which are made of iron, and washed over with silver.

In this castle is a particular kind of well: it is generally called Joseph's Well, but by the Arabians, the Snail Well, because it descends in a spiral line. It is a square, which within is sixteen feet wide, and twenty-four feet long. The depth is 244 feet, but it has two shafts that are not perpendicularly above one another; the first is 148 feet long; and the other 116. The water is drawn up by means of a double wheel, and a double range of earthen jars. The oxen employed to turn the wheel, go up to the first shaft by a path which is cut in the rock quite round the well from top to bottom. The water of this well can only be drank at the time of the inundation; after which it is brackish like all other wells in the town.

To the south of the castle is a kind of ancient suburb called Caraffa, at the entrance of which are several magnificent tombs covered with domes, and said to be the monuments of some Egyptian kings. The people, in general, have a notion that they are the monuments of the caliphs, the relations of Mahomet, who conquered this country; and such is their veneration for them, that they oblige Christians and Jews to alight from their asses or camels, when they pass this way; to pay them respect.

Adjoining to Caraffa, on an eminence, is the great mosque of El-Imam-Shafei, antiently one of the four great doctors of the law, who is held in great veneration among them, and whose sepulchre is there. It is called La-Salechia, from a title they gave Saladin who built it, together with an hospital and college.

At a small distance from the above is another mosque, situated likewise on a hill, in which the Sheik Duife was buried, which gave name both to the mosque and hill. The inside of the mosque is painted with flowers on a red ground; near it are buried several of the Sheik's children, as also the sons of some basias.

Beyond this mosque, on another hill, is a solid building of stone, three feet wide, built with ten steps, and at top three feet square; on which the Sheik mounts to pray upon any extraordinary occasion; as, at the beginning of a war, or when the Nile does not rise as they expect it should. Under this hill, to the north, are a great number of magnificent tombs covered with cupolas; and several large mosques built over the burial places of great men.

Besides the tombs already mentioned, there are several others about Cairo of the Mahometan doctors or fanatics, which are frequented by numbers of persons who pay extraordinary devotion to them. Among these, the most distinguished is that of the famous doctor Chafai, of whose remains we have the following remarkable story, which shews that the Turkish monks are no less zealous for their saints than the monks of Rome.

A sovereign of Egypt, who was caliph of Babylon, and kept his court there, was desirous to have the body of this famous Chafai carried to all the places where he chose to reside. He wrote to the governor of Egypt to cause it to be taken out of the ground, and to send it to him in a magnificent coffin. The governor was very sorry for this order, because, knowing what a profound veneration all the people had for this pretended saint, he dreaded an insurrection; and in order to avoid the sad consequences which commonly attend popular risings, he communicated the order he had received to the dervises, whom he exhorted to submit to the commands of their prince, and recommended it to them to dispose the populace to consent to the removal of their saint. "I will go to-morrow (said he to them) and perform the caliph's command; do you, therefore, be ready with all necessaries." The Turkish monks resolved to oppose the order of the sovereign, but to do it in such a manner as should not make him their enemy. To effect this with ease, they resolved to cover their fraud with a miracle. They worked all night to finish their project; and after having opened the saint's tomb, they put in combustible matter round the corpse, mixed with some phosphorus, which would take fire as soon as it received air.

After

After they had prepared every thing, they very calmly waited for the governor, who, on pretence of doing more honour to the faint, repaired to his tomb, with a retinue of 10,000 men; though all this apparatus and pomp was only to keep the people from rising in arms. As soon as the governor arrived, the workmen began to open the ground. When they came to the place where the corpse lay, and began to give air to the phosphorus, the combustible matter took fire, and such a hot bright flame burst out of the tomb, that those who dug there were, for some few moments, deprived of their sight. There were the first that cried out, a miracle! The populace did the same; and then the priests proclaimed, that it was not the faint's will to quit the place of his retirement. The imagination of the Egyptians, which is ripe for prodigies, greedily caught at this; and the tomb was instantly covered up again, without presuming to go any farther to work. The governor, like a good politician, and as good a courtier, artfully took advantage of this pretended miracle to satisfy the people, without fighting the order of his matter, to whom he sent an account of the prodigy, which above 10,000 spectators could certify. The caliph, when he heard that the faint was well, and did not care to quit his lodging, consented to let him lie in his old tomb, where he still continues, and where the Mahometan devotees go in crowds to pray.

In Grand Cairo are several bagnios, which are very handsome, and convenient; they are resorted to by great numbers of people, some of whom visit them on a religious account, to purify themselves; while others go to them as places of refreshment and diversion; the latter are chiefly women, who, once or twice a week, spend most of the day in them, and are glad of such a pretence to be released from their confinement. People of the first rank have bagnios in their own houses, to prevent intermixing with those of inferior character.

In Cairo are likewise many kanns, which they call okelas. These are indifferent buildings round a court, and are commonly appropriated to the use of merchants of particular countries for the sale of their respective commodities. There is one for those of Nubia, and the black slaves and goods they bring with them; and another for white slaves from Georgia. They have likewise several kanns at Bulac; in all which strangers are accommodated with a room at a very easy rate.

Grand Cairo is a very populous city, but the inhabitants of it are a mixture of various nations; such as original Egyptians; Arabians; people of Barbary, and other western parts of Africa; and some from Nubia; but the principal part of the inhabitants are descended from the Mamalukes. There are also some Greeks, a few Armenians, and many Jews.

The Europeans settled here are chiefly English and French; with some Italians from Venice and Leghorn.

The Franciscans dependent on the convent at Jerusalem have a large monastery here, and the superior is called the vice-prefect of Egypt; the guardian of Jerusalem having the title of prefect. There is also another convent of Franciscans, whose missionaries are sent from Rome with a superior; he is called the prefect of Egypt, and commands three convents they have in Upper Egypt. These live on a small allowance from Rome, and the benevolence of their disciples: they are under the protection of the English, who are ready to defend all Christians in these countries. Here are likewise two other convents, one of Capuchins and another of Jesuits; both of which are under the protection of the French.

The European merchants here live very agreeably, and are particularly sociable with those of their own nation. They generally dedicate their time in the morning to business, and the remainder of the day to such amusements as the place affords. They frequently ride out to the fields and gardens north of the city, where little danger is to be apprehended: they have a relaxation from business both on the Christian and Jewish sabbath, as the Jews transact a great part of their affairs. When the Nile is high, and little business can be done, they generally spend their time in the houses they have at Old Cairo and Gize; so that they lose no opportunity of possessing every enjoyment their situation and the circumstances of the place can possibly afford them.

Those protestants that die at Cairo are buried in the cemetery belonging to the Greeks, and have the service of the Greek church read over them, unless they have a chaplain of their own to perform that office according to their own liturgy.

The city of Grand Cairo formerly carried on a very considerable traffic; but its commerce has greatly decayed, since the trade with the Indies hath been carried on by way of the Cape of Good Hope. However, from the great convenience of water-carriage, it is still very considerable; for there are few arts in any tolerable perfection higher up, or indeed in any other part of Egypt; so that all the country, up the Nile at least, is supplied with most things from this metropolis.

As there is little credit among the Turks, and as they seldom trust one another to negotiate any business by bills, or risk their money in the hands of any one, this always occasions a great confux of people to the city; so that near a quarter of the souls in it are not fixed inhabitants.

Among the manufactures here, the most considerable is that of making Turkey carpets, and a good trade is carried on by means of the caravans. The caravan that sets out from hence every year consists of between 30 and 40,000 pilgrims, with from 6000 to 9000 camels, besides horses, &c. All these are escorted by 300 of the grand seignior's troops, well mounted and armed, to defend them against the plundering Arabs, who generally lie in wait for them. It is said that the grand seignior allows these pilgrims 600,000 ducats yearly for their maintenance, which is near a fourth of the revenue of Egypt.

Before we leave Grand Cairo, it may not be improper to take notice, that in the villages about it the inhabitants have a method of hatching chickens in ovens, which is also practised in many other parts of Egypt. As this is a matter of a very singular nature, we shall be a little particular in describing the means by which it is effected.

The season for executing this business is from January to April, when the weather is tolerably temperate. The ovens are underground in opposite rows, with a gallery or passage between them; and they are raised one above another, with holes at top, as are likewise in the passages, which they open or stop, as they would have the heat increased or diminished. The fuel that heats them is dung and chopped straw, which make a smothering fire. They continue to heat them gently, eight or ten days together, and then bring the eggs from the lower cells, where they had lain in heaps, and spread them in the upper apartments so as only to cover the floor singly. After this, the business is to turn them every day, and keep a moderate fire in a channel that runs along the mouth of the oven; and, indeed, the art consists chiefly in giving the ovens a proper degree of heat, neither too much nor too little, for in either case the labour would not succeed. Their general rule is, that the eggs be never made hotter than a man can bear them at his eye-lid. Thus they begin to hatch in about three weeks; at which time it is very entertaining to see some of the chickens just putting forth their heads, others half out of the shell, and others quite free. Thunder occasions abundance of eggs to miscarry; and at best many chickens want a claw, or have some defect that is uncommon in the natural way. Mr. Greaves tells us, that the fire in the upper ovens, when the eggs are in the lower, is thus proportioned: The first day the greatest fire, the second less, the third less again, the fourth more than the third, the fifth less, the sixth more than the fifth, the seventh less, the eighth more, the ninth none, the tenth a little in the morning.

The eleventh they close all the holes with flax, &c. making no more fire, for if they should their eggs would break. Thus 7 or 8000 are hatched in a short time. It is to be observed, that the same experiment has been made, with success, in Italy and other parts of Europe; though it must also be observed, at the same time, that the birds thus produced by art, cannot claim an equality, in point of perfection, with those produced by nature.

We shall conclude our description of Grand Cairo with an account of the caravan, or grand pilgrimage, made annually from that city to Mecca.

The desire of gain, joined to the difficulties and dangers of wild Arabs, wild beasts, and other accidents, in such

such long journeys gave the first rise to these caravans; which are no other than an association of a great number of merchants and travellers bound to the same country or place. The antiquity of them, even from the time of the patriarchs, shews the necessity and usefulness of them in those hot and barren climates; nor could any commerce of such lengths and difficulties be carried on, without such associations: but when a certain number of merchants have once joined themselves in this design, fixed the place of rendezvous, the time of their departure, and taken all other necessary precautions and helps for conveniences, safety, and dispatch, experience shews what may be performed by them, what long and barren deserts may be crossed, what difficulties and dangers may be surmounted, and what rich and extensive commerce may be carried on, and with what diffusive benefits they may be managed to and from the remotest countries. For this commerce, divine providence hath amply provided those countries with plenty of camels, a beast exactly fitted for such burdens, and such other fatigues as necessarily attend this painful way of travelling; and so docile and patient, that, with a little care in bringing them up, they are taught to carry burdens of 500lb. weight thro' these sandy and barren deserts, over long ridges of mountains, both hard and craggy, and with a scorching sun over their heads; without that constant refreshment of food, drink, and in some cases even of rest; for want of which, horses, mules, and other beasts of burthen, would expire, in less than a quarter of the time that they continue without it.

Every Mussulman is obliged to make at least once in his life this grand pilgrimage to Mecca, the center of the Mahometan faith. It sets out from Cairo once a year; and is one of the most splendid and numerous cavalcades in all the east. The number of those which compose the caravan seldom amounts to less than 40,000; but it is often much greater, in times of peace and plenty, when the commerce is not obstructed: for these caravans join to their devotions a considerable trade, and return home laden with the richest goods from Persia and India, which come to Gedda by the Red-Sea, and are thence conveyed to Mecca; and this, joined to the richness of the presents carried there, makes it necessary that they should be attended by a sufficient guard. With this view, a draught is always made of all the best troops in Egypt to escort them; at the head of which is the Emir Hadge, or prince of the pilgrims, who hath the power of life and death over the whole caravan. The ceremony of his setting out on this expedition from Cairo is very magnificent; the camels are all ornamented; and the sum total belonging to the Emir Hadge amounts to 3000; but the rest is beyond computation.

Those camels are most magnificently adorned which are made choice of to carry the presents to Mecca, especially that which carries the great pavilion called Mahmel, or covering of Mahomet and Abraham's tomb, which is made in the shape of a pyramid, with a square base, all richly embroidered with gold on a green and red ground; the view of the house of Mecca being embroidered upon it, with a portico around it. He is covered with a rich carpet that comes down to his feet; so that nothing is seen of him but his head, neck, and crupper, which are richly adorned. This camel is said to be bred for that purpose; and after he has performed this office, he is esteemed sacred, and never more put to any use.

Their encampments are so settled, that the caravan must arrive at Mecca in 38 days; and the departure of it is fixed to the 27th day of the moon which follows their Ramadan. It is joined at Beldar, six days journey from Mecca, by the caravan from Damascus; after which they march jointly to Mecca, and are joined in the way by the caravans from other parts, who then proceed together to pay their devotions at mount Arafat, from whence they march on to Mecca, where the Emir Hadge puts up the new grand pavilion. The stay of the caravan is confined to 12 days; in which time a great and rich traffic is carried on between the pilgrims and their followers from all parts; and then the Emir Hadge gives his signal for departure. On their return to Cairo, the greatest festivities are made; and each person is honoured with the title of Hadge, or pilgrim, before his own name.

Of the City of Alexandria.

WE have already taken notice of the original city of this name in our account of the ancient state of Egypt. The present Alexandria, or, as it is called by the Turks, Scanderoon, has two ports: the new one, to which the vessels of Europe resort; and the old one, where those only are admitted that come from Turkey. The former is what Strabo calls the Great Port, lying to the eastward of the Pharos: the other is the port of Fanottus, where was also the Cibotus, which had formerly a communication with the lake Marcotis, that lies behind it to the south. The present city is situated between them, whereas the old city lay farther towards the north and north-east.

The entrance to the new port is defended by two castles of a bad Turkish structure, and which have nothing remarkable but their situation. That which is called the Great Pharillon has in the centre a small tower, the summit of which terminates in a lantern that is every night illuminated. These castles are built on two small islands, one of which is called Pharos, and is about half a mile in extent. The western part of the other island is called the Cape of the Figs, on account of its being famous for producing that fruit in very great perfection.

The walls of the old city which are still remaining, are built of hewn stone, and the arches are admirably executed. They are defended by semicircular towers 20 feet diameter, and about 130 feet apart: at each of them are stairs to ascend to the battlements; and there is a walk round the top of the walls built on arches. These walls, as they now stand, appear to have formerly enclosed all the city except the palace of the kings to the north-east. The inner walls appear to have been erected in latter times, being much stronger and higher than the others, and defended by large high towers.

Within the old walls are a few mosques and three convents. One of the mosques is called the mosque of a thousand and one pillars, where they say was a church dedicated to St. Mark, and the patriarch resided at it, being near the gate, as they report, without which the evangelist was martyred. The other great mosque is that of St. Athanasius, where it is said there was a church of that name. At the church of the Copti convent they shew the patriarchal chair: they also pretend to have the head of St. Mark; and some even say that his body is there. At the Greek convent they shew some things, which, they say, relate to the martyrdom of St. Catherine in this city. The Latins likewise have their convent in the old city, belonging to that of Jerusalem; and there are always some poor Arabs encamped within the walls, which makes it dangerous to be abroad after sun-set, when all the company begin to retire.

At the south-west corner is a large castle, with a few soldiers in it; but no Europeans are admitted there. In the old gates are many fine pieces of granite; and fragments of columns of beautiful marble are seen all over the old city, which bear testimony of its original grandeur and magnificence.

A celebrated writer, in speaking of the ancient city of Alexandria, says, "Instead of those ancient and magnificent structures which travellers may have heard or read of, they must expect to behold little more than their ruins, fragments of stately walls, and tottering towers and castles, whose architecture seems the work of the Saracens. Here they will see the most sumptuous temples converted into plain mosques; some of the finest pieces of architecture artlessly scattered, and employed to patch up an ordinary dwelling; the royal palace become a common prison for slavery; the once numerous and opulent inhabitants dwindled into a small parcel of strangers; and a multitude of miserable wretches, servants and slaves, employed in lading, unloading, and carrying of merchandize."

The same writer says, "The new city of Alexandria may justly be compared to a poor orphan, whose sole inheritance has been the venerable name of its father. The vast extent of the ancient city is contracted in the new, to a small neck of land, between two ports. A place formerly so famous for the extent of its commerce is no longer any thing more than a mere place of em-

barking. It is not a phoenix that revives from its own ashes; being at most a reptile sprung from the dirt, dust and corruption with which the Alcoran has infected the whole country."

Such is the portraiture of the present Alexandria, which is built on the strand to the north, on the ground that seems to have been left by the sea, and makes but a very indifferent appearance. There are but few remains now of those ornaments that decorated the original city. The only ones worthy the attention of the curious are, the famous Corinthian column and two obelisks.

The Corinthian column, which is known by the name of Pompey's Pillar, is situated on an eminence about a mile to the south of the walls, and is supposed to be the greatest and most magnificent column that the Corinthian order has produced.

The generality of people suppose this pillar to have been erected in honour of Pompey, and thereby to have received its name; but others are of a different opinion, and assert, that it was built in honour of Vespasian; which latter appears the most probable, it not being mentioned by Strabo, or any other antient historian. The last opinion is farther confirmed in a letter written by Edward Wortley Montague, Esq. F. R. S. to William Watson, M. D. F. R. S. dated October 10, 1767. As this letter contains many curious observations on the above antient structure, as also the best and most recent description of it that can be met with, we shall here preferre a copy of it, as read before the Royal Society on the 19th of November following. It is as follows:

" Sir,

" I here send you a few lines, which I believe will appear extraordinary, as every traveller that has been at Alexandria has mentioned the famous pillar of oriental granite, which is about a mile without the walls of that city, as erected, according to most writers, either by Pompey, or to the honour of Pompey. As I differ in opinion from them all, and think this famous pillar was erected to the honour of Vespasian, you certainly will expect to hear on what foundation I formed for extraordinary a conjecture, as so new a one may appear to you.

	F. In.	
By my mensuration, the capital of the pillar is	9 7	} British measure.
The shaft — — — — —	66 11	
The base — — — — —	5 9½	
The pedestal — — — — —	10 51	
	— — — — —	
Height from the ground — — — — —	92 0	
Its diameter — — — — —	9 1	

" As soon as I saw this surprizing pillar, I was convinced that if it had been erected in Pompey's time, Strabo, or some of the antients, would have mentioned it: I therefore determined to examine it narrowly. I perceived too that the pedestal was of a bad and weak masonry, composed of small and great stones of different sorts, and absolutely unable to sustain so great a weight; I therefore easily concluded such pedestal not originally belonging to the pillar. I attempted to get out a stone, which I did without trouble, and discovered the pedestal to be hollow. After some time, I mean during the course of many days, I made an opening wide enough to enter it; when within it you will judge how much I was surprized to find this prodigious mass of granite stood, as on a pivot, on a reversed obelisk, as I then believed it was, only five feet square. Curious to know the length of the obelisk, I began to move the earth on one of its sides; but my surprize increased much when I found, after moving a few inches of the soil, that the obelisk was not entire, this pivot being only four feet and one inch thick. It is seated on a rock: the stone is of an extreme hardness, and almost a petrefaction, or rather conglutination, of many different stones, but all vitrefcent. I never met with any stone of this kind any where, except with one small piece on the plain of the Mummies: I broke a piece of it, which lord Bute has; a small piece too of the pillar was sent, that gentlemen may be convinced it is of red granite, and not a composition, as some have imagined.

" This part of the obelisk is covered with hierogly-

phics, which are reversed, a plain proof the pillar was not erected whilst they were held sacred characters.

" Convinced, therefore, that it was not of the antiquity one would suppose it, from being called of Pompey, I visited it several times, to see if it might not be possible to find out something that would give room for a reasonable conjecture, in honour of whom, or at what time, it was erected. From the inscription I could not discover any thing: it is on the west face of the base; but so much injured by time, and I may say too by malice, (for the marks of some instrument appear clearly to have contributed towards defacing it) that one can but imperfectly make out some Greek characters, so imperfectly, indeed, that no one word can be found.

" At length, observing that the cement, or mortar, which closes the final separation of the shaft from the base, was quite destroyed in one part, I was curious to see if any thing was made use of within, to fasten or tie the shaft to the base; I saw there was: being desirous to know if it was lead, and if so, if it was not of that pure, and of which we still meet with some few medals, I endeavoured, with a pretty large hanger, to cut off a small piece of the grapple: there was a great number of lizards that had taken shelter there, and which ran out on my introducing the hanger. I then discovered a dark spot, at the distance of more than a foot, within the circumference of the pillar; which, by striking it with the hanger, I found was something stuck fast to the base: after striking it several times, I detached it from its place, and it proved a medal of Vespasian in fine order. On one side of it was the following inscription:

AVT. KATE. EEBA. OVEEH....

On the reverse,

Victoria gradens; Dextra spiciens, sinist. palmam.

" The reversed hieroglyphics are a proof that this amazing monument was not erected in Pompey's time; and as there is no mention of it in any of the antient writers that I have met with, it seems plain that it was not known before the time of Vespasian. This medal could not by any accident, I think, have been introduced above a foot within the circumference of the shaft; therefore I suppose it was placed there when the pillar was erected, which from thence I conclude to have been done to the honour of that emperor.

" If you think this paper worth it, you will please to communicate it to the Royal Society, and that of the Antiquarians.

" I am, Sir,

" Your most humble servant,

Zante, May 7,
1767.

Ed. W. Montague."

The two obelisks are called *The Needles of Cleopatra*; one of them only is perfect, whose height is about 63 feet; but the other is broke, and part of it lies on the ground.

Among other things that have in some measure escaped the injuries of time in this city, must be considered its great number of cisterns, which are annually filled with the waters of the Nile, by a canal that is called *Cleopatra*, and begins about six miles from Rosetta, from whence it conveys the water to Alexandria. This is the chief water they have fit for use, and when it fails, they are obliged to fetch it from Rosetta. These noble reservoirs were once very numerous, but they are now reduced to six only that are useful; the rest are filled up with earth, as well as the grand pillars that supported them, which were made of brick, and covered over with a composition impenetrable by water.

Near Cleopatra's canal are some catacombs, which consist of several apartments cut in the rock, on each side of an open gallery. On both sides of these apartments are three stories of holes, large enough to contain the bodies. It is conjectured that this is the spot where the suburbs of the old city began, in which were gardens, sepulchres, and places to prepare the bodies for interment. The catacombs extended above a mile to the well, and there are a great number of them by the sea-side. The most remarkable are those towards the farther end of the canal, which may be reckoned among the

the finest that have been discovered; being beautiful rooms cut out of a rock, with niches in many of them large enough to contain the bodies, and adorned on each side with doric pilasters.

The city of Alexandria is computed to contain about 15,000 inhabitants,* who are of different nations, and many of them natives of various parts of the Turkish empire. The reins of government are held by the Turks, who keep a garrison in the city consisting of a small number of Janizaries. The governor who commands them is an Aga, and has his residence in one of the ancient bulwarks; but there is likewise a cadi, who judges in all civil causes. Most of the Turks here are artisans or shop-keepers; but some few of them are merchants, and though they appear mean, are said to be very wealthy.

The greatest part of the inhabitants are the Christian Copti, Greeks and Armenians, who are natives of the country. These maintain themselves much on the same footing as the Turks; and amongst the Greeks and Armenians in particular are some wealthy merchants.

Here are likewise great numbers of Jews, most of whom are foreigners, and natives of Constantinople, Lisbon, or Leghorn, some of them are merchants, and very rich and powerful; but the principal part are poor, and live by selling retail what the rich import by wholesale; by which means the latter preserve a tyrannic authority over the former. He that refuses to obey these imperious lords has no longer any share in trade, and consequently in a short time becomes very miserable. His example induces the rest to submit themselves to all that the rich decide. Their sentences are like those of the judge, to whom the Jews seldom have recourse; since, in all their wants, they are under a kind of necessity of applying themselves to the rich men, and of adhering to what they pronounce.

All Europeans here go under the name of Franks; the chief of those that live in the city are the French and English; the former please themselves with being most respected, and the latter, with having a better trade. The French have about a dozen merchants here, or rather factors to those of Cairo, to whom they have the care of sending the merchandizes landed here. The French consuls live with a distinguished dignity, and the Turks entertain a very high idea of his power. When he goes to Rosetta, he carries a white flag at the mast of his pinnace; and when he goes out of the port, as also when he returns into it, he is saluted by a general discharge of the cannon of the French vessels. He resides, together with the greatest part of his nation, in a large hotel, where he has a church, and a chaplain. He does not traffic himself, and only goes abroad on very particular occasions.

The French trade here is very considerable, as they annually receive several ships, which are chiefly freighted with commodities from Grand Cairo. The vessels they make use of for this intercourse are feluccas, barks and tartanes, which they call caravaniers, because, like the caravans, they go from place to place to take in their loadings.

There are many British vessels arrive at Alexandria every year, but they are not always laden on account of that nation; for the Jews, and even the Turks, often freight them, and thereby carry on a considerable traffic.

The Dutch and Venetians had formerly settlements and consuls at Alexandria; but great bankruptcies, even of the consuls themselves, have entirely ruined that commerce. The Turks, who are not to be amused where their interest is concerned, refuse to admit, any longer, consuls from those two nations, till they have indemnified the losses sustained by their predecessors. Some Ve-

* An English gentleman who was a few years since in Alexandria says in a letter to a friend in England "One time, since the Turks have been master of this city, a coming Mahometan must observing it very thinly inhabited, spread a report, that Mahomet in one of his writings, had left many blessings to the inhabitants of this city, and to those who visit it, and remained a few days, giving alms; by this false report, it got full of inhabitants. The same gentleman says that near the French Man, is a large open place, where the Franks recreate themselves; on the north side of this place is a stand of asses, ranged in rows, and with

netian merchants, however, come hither every year under French protection.

The Swedes, though in alliance with the Porte, go seldom to Alexandria, as they are obliged to pay the duties on their respective commodities to the utmost extent.

The Turkish vessels, that frequent this port, are some fultanas, who go thither yearly to receive, in merchandizes, the carrat, or tax, of the grand seignior. There are also Turkish vessels called saicks and veigues, that are seen daily in the port of Alexandria. The first, as being the largest, go to Damietta and other parts of the Levant; but the latter are ordinarily employed to go to Rosetta; from which places they bring the European merchandizes, and carry thither those of Cairo that are sent in exchange.

The Europeans carry on a very profitable trade here, since, according to their treaties, they always pay so much per cent. less than those who are subjected to the tax of the grand seignior, among whom are comprized the Jews, both foreigners and natives, as well as those nations that have not any consul.

The environs of Alexandria are very low: the only marks by which the sailors can know the coast are, the tower of the Arabians, which lies 36 miles to the westward of the town, and the column of Pompey. This circumstance often occasions ships bound to Alexandria, to go to Cyprus or to Syria, when the weather is foggy. There are neither woods nor pastures for a considerable distance round the town. The land is covered with sand, and some few date-trees grow on it, but the fruit is very indifferent. "It is really a matter of surprize, says a celebrated writer, that this spot should be chosen for so great a capital to be built upon, where it is so difficult of access for ships, and so destitute of wood, water, and all other necessaries of life. But it is much more to be wondered at, that the Ptolemies spent such immense sums to populate this place, and to collect there the greatest abundance of all things that could be had in the world!"

To the south of Alexandria is the lake Marcotis, which is 30 miles long from east to west, and 12 broad. It receives its water out of the Nile at the time of its overflowing, but is dry about four or five months in the year.

At the west end of this lake is the tower of the Arabs, which the natives call the castle Abuzir. It is, indeed, a square castle, 80 feet high, and its fronts are each 250 feet broad. It is built of fine free-stone, and the walls are 14 feet thick. About three quarters of a mile from this castle is another tower, which is square at top and round below; and, six miles from thence, there is another to the westward, on the walls of which are the remains of an Arabic inscription. All these buildings, however, are in a very ruinous condition.

Of the cities of Rosetta, Damietta, &c.

THE city of Rosetta is esteemed one of the most pleasant places in Egypt. It is situated on the west side of the Nile, antiently called Bolbitinum, or the Bolbitic branch. The town is about two miles in length, and consists of two principal streets. The fine country of Delta on the other side of the Nile, with two beautiful islands a little below the town, make the prospect truly delightful. The country, to the north, is improved with pleasant gardens of oranges, lemons, citrons, and almost all sorts of fruits, with the agreeable variety of groves of palm-trees, and small lakes in different parts. When the fields are green with rice, which is much cultivated here, it makes a considerable addition to the beauties of the scene.

each ass a driver. These are lett out to ride, and the driver runs behind his beast, and with a short stick makes him go pretty fast. It is pleasant enough to observe the Christian sailors when they come on shore, and happen to stroll to this place; the drivers in an instant bring their asses in a ring round the sailors, and importune them to ride; the sailors, not understanding them, fall to cursing and swearing at being so hedged in. At length the drivers put the poor tars by force on their beasts, and drive them about half a mile and back again, and then insist on their fare."

About

About two miles north of the towu, on the west side of the river, is a large castle. It is a square building, with round towers at the four corners, having port-holes at the bottom of it, and some pieces of brass cannon. It is built of brick cased with stone, and is said to have been erected above 400 years. A little lower down, on the opposite side of the river, is a platform of guns; to the east of which are salt lakes, where are gathered great quantities of salt.

A little nearer to the sea, from the above castle, is another, whose walls, ordnance and garrison, are but in a poor condition. Somewhat below this second castle the Nile splits into two branches, one turning east, and the other west, and forming what is called a bogaz, or bar in their mouth, which is known by the name of the Canopic. This bar is very dangerous to pass over, especially when the sea is agitated by a northerly wind.

The inhabitants of Rosetta have a large manufactory of striped, and other coarse linen; but their chief employment consists in carrying goods between this place and Cairo. All European merchandizes are brought to this place from Alexandria by sea, and carried from hence in boats to Cairo; in the same manner as those brought from Cairo on the Nile are here put into large boats to be sent to Alexandria. For this purpose the Europeans have their vice-consuls and factors here to transact their business; and letters are brought regularly from Alexandria by land, to be sent by boats to Cairo on the day they set forwards; but letters of greater consequence, that require dispatch, are sent by foot-messengers across the deserts.

Though Rosetta is so near the sea, the water is good, unless when the north wind blows strong, or the Nile is at the lowest, when the water is blackish. It is remarkable, that the river here does not rise above three or four feet; because the banks are low, and the water rising above them, spreads itself all over the adjacent country.

Near this part of the Nile is an island of a triangular form called by the Greeks Latonia, on account of the division of the water here, by which two entrances are made at the mouth of the rivers. It is about a mile in circumference, and there are sandy hillocks from east to west along one middle of it. The island is sandy to the north, but to the south it is a kind of morass.

The arm of the Nile, at Rosetta, is much about the same width as the Thames at Gravesend; but it lessens by degrees, till it becomes so shallow in many places as to be very dangerous, owing to the difficulty of avoiding the flats.

Nearly opposite Rosetta is the city of Damietta, situated on the eastern branch of the Nile, between four and five miles from the mouth of the river. It is a very large place, but the houses in general are indifferently built, and its principal inhabitants are fishermen and janizaries. It is encompassed by walls, except that part that fronts the river, and at the north end of it is a fine large round tower built of hewn stone.

This city is reckoned one of the most beneficial for trade, on account of its important harbour on the Mediterranean. It is supposed to contain about 25,000 inhabitants, exclusive of its suburb on the other side of the Nile. There are here about 400 Greek families, who are the principal merchants and traders in the city. They have a church, a bishop, and the free liberty of their religion, except that of ringing the bell. Besides the Greeks, there are here many other strangers of various nations and religions; but they are greatly restrained in the enjoyment of their national privileges, and are afraid of going into the streets, especially after dark, on account of the insults they are subject to from the Turkish soldiery, who have a natural antipathy to all strangers. They have a particular aversion to Europeans, which seems to be handed down to them by their forefathers, and to be occasioned by the holy war; for this city was the principal scene of action, and the place where Lewis IX. was made prisoner. No persons must appear here in an European dress; and as a Christian is known by his men, strangers dare not go out of the streets they are accustomed to frequent.

The chief trade carried on here is, the export of rice and coffee to all parts of Turkey; and of the former, a contraband trade to Europe, which has been productive of tumults against the Christians. They have also an

import of tobacco and soap, the former from Laticha, and the latter from the coast of Syria.

Near the city of Damietta, and to the south-west of the Lake Marcotis, is the castle of the labyrinth, so called from the famous antient labyrinth, of which we took proper notice in our account of the antient fate of Egypt.

This antient edifice is about 165 feet long, and 80 broad. The portico is a very rustic work, and the principal part of it destroyed, being no where above six feet high; but the front is more ruined than any other part of it. The upper story, in the middle, is fallen down, and is entirely gone almost all the way from this break. As the building now remains, there are 44 tiers of stones, each nine inches deep, and consequently the whole is 33 feet in height.

The whole edifice bears the appearance of some antient palace, or other public structure; but its remains are totally insufficient to convey any idea of its original magnificence.

There are many stones scattered about the plain near this building, especially several round ones with holes in the middle, which seem to have composed the pillars that might be about this edifice, and were probably fastened together by means of these holes.

The next principal place that attracts our attention is, the town of Suez, situated at the north end of the Red Sea, and is thought to be built on the spot where formerly stood the antient city of Arsinoe. It is a considerable sea-port on the isthmus of its name, which joins Asia and Africa, and is advantageously seated on a small peninsula that juts into the utmost verge of the Red Sea, about 63 miles south-west of Cairo. The trade between this town and Cairo is effected by ships belonging to private persons at the last-mentioned place.

To the south of the town is a large sandy bank about two miles long, to the east of which is a road to go out to the shipping; and when there is no wind, they draw the boats along by this bank. About a mile south-west of it are the ships, three miles from the town, the deep water being on the west, where the shore is enclosed by high hills; but on the east side, where the land is low, there are considerable shoals.

The town is small, but the houses, mosques, the quays, magazines, and other public edifices, are made of a most curious sort of stone, consisting of a vast number of shells, so closely united by nature as to be inseparable. The mosques are four in number, all of which are very handsome buildings; and there is also a Greek church. The greater part of the inhabitants are Mahomedans, there being only about 60 Greek families, and a few Copts. They get all the necessities of life, and even pot-herbs, from Cairo; for the country, for about sixty miles round, does not produce any thing. Water is very scarce, inasmuch that they are obliged to fetch it from a place nine miles off, and though blackish, yet they pay for it two-pence per pail.

The town of Suez is governed by a captain, whose business chiefly depends on the ships; and he has under him a caimacan (the ordinary governors of towns) who both together, or separately, govern the affairs of the place. The caimacan generally resides here, and the captain when the ships are in the port. They have a garrison of about 300 men, one half janizaries, and the rest Arabs; and these last are commanded by a sheik, or civil officer of their own, styled sader.

The harbour lies north and south, is not large, and has very little water: when the tide has ebbed out, it is not above five feet deep. As this harbour is only fit for small vessels, the larger ones, which are employed in bringing goods to Jedda and other parts, anchor in another harbour, situated about four miles and a half from the town.

Many of their vessels will carry from 180 to 250 tons. Some of them are bored for 30 guns, but never mount more than two, and these are the best armed; for most of them have only two pedereoes. They direct the ship by means of a pole strongly fastened to the rudder, on the outside, and placed in an inclined situation, not quite horizontally; at the end is fastened a rope, which passes on both sides through blocks fastened to two thick transverse pieces of wood, which are nailed to the two ends of a long and thick beam placed above. being put through the blocks, is hung or fastened on a peg, which stands on that part of the stem where the helm is. On each side three men are placed, who must not leave this rope while the vessel is under sail, and must alter the direction of the helm, when required, by drawing at the rope. These vessels are but ill provided with sailing tackle and trimmings; nor, indeed, do they require them so complete as in most other voyages, for they never fail without a fair wind, and always keep along the shore.

The harbour in which these vessels lie at anchor is from five to eight fathom deep; they are sheltered there from the east wind by the mountains of Ettaga; and when they are forced away by another wind, they run ashore on the neighbouring sandy beach, without sustaining any damage.

The town is very indifferently fortified, having no other defence than twenty-two cannons and three culverins, all of which are in so wretched a condition, that they appear as if entirely useless. At a small distance from the town are to be seen, on an eminence, the ruins of an old castle, supposed to have been formerly built by the French.

Many attempts were made by the Roman emperors and kings of Egypt, to cut a channel thro' the isthmus of Suez, and join the two seas together; but every attempt proved ineffectual. There is still to be seen, about three miles from the town, a deep ditch, which runs across from north to south, and is supposed to be a relic of that vain project.

Of the principal towns and villages situated up the Nile.

THE first we meet with of these is called Gize, and supposed to be situated on a part of the ground where once stood the ancient city of Memphis. It is tolerably large, but the houses are very low mean buildings; and its only ornaments consist of four or five minarets of mosques, with some palm-trees. The inhabitants are chiefly employed in making earthen pots and tiles, but they are so indifferently executed, that they produce but little advantage to them.

About a mile and a half to the south of Old Cairo, is the village of Deir-Etinn, where there is a mosque and a Copti convent. The houses here are almost all built of clay, and covered with reeds. One end of the village is close to the Nile, and the other extends towards the mountains. The greatest ornaments of this village, as well as most of the others, are the palm-trees, which are cultivated in great abundance.

Near the above is the village of Dagjour, remarkable for containing in its neighbourhood many handsome pyramids, as also several spacious mosques.

The next village we come to is Beni-soef, situated on the western shore of the Nile: it is a kind of capital, about 100 miles distant from Cairo, and the place of residence of a bey, who is governor of it. It has many mosques, several of which are very large and elegant structures.

To the north-east of this village is Mount Kobzim, at the foot of which stands the convent of St. Anthony; and at some distance are seen the mountains of Askar, where are the ruins of three monasteries, called Deir Berdet, Deir Bakfte, and Deir Anna. A late celebrated writer, who travelled through most parts of Egypt, and took up his abode some time at the convent of St. Anthony, gives the following particular description of it, as also the monastic life of its inhabitants. After relating his arrival there, he says, "Having rested a little before the convent, I perceived a monk in the window, and I informed him of the reasons that brought me thither. After the superior was acquainted with this, they called to me from a trap door at the top of the convent, and I saw them letting down a rope for me to fasten round my middle. I was by this means drawn up and taken into the monastery, had a cell assigned to me, and was treated like a monk; that is, I received a portion of lentils and had bread every morning and evening during my stay.

"This monastery is a square building, consisting of twenty-eight cells, an ugly dining-hall, a mill, an oven, and a kitchen, besides two very filthy, small and dark churches. Each of them is 30 feet long and 16 broad. There are some bad paintings on the walls, now quite

black from the fumes of incense. One of these churches is consecrated to St. Peter and Paul, and the other to St. Anthony. They are connected by a covered walk, above which there is a little steeple with a bell.

"Between the churches and the kitchen is a square tower, in which they have built a chapel. You go to this tower over a draw-bridge, resting on an adjacent high piece of ground. Here they keep the sacred vessels, their provisions, their books, and all that they hold valuable: this likewise is their refuge when they are attacked by the Arabs. There is a garden close to the cells, which is about 260 yards long and 120 broad. In it they cultivate dates, olives, St. John's bread, peaches, apricots, and vines, besides many kitchen herbs. They likewise make wine, of which the monks drink on the four principal festivals in the year.

"The water of three very clear springs is conducted from the mountains into the gardens, by means of three subterraneous vaults. This water is their common drink, and is also used to water the garden, in which is built a chapel consecrated to the hermit Marcus, containing two altars, one of which is defined for European priests.

"The whole fraternity consists of twenty-five friars, twelve of whom are priests, and the rest lay-brothers. They wear a white woolen shirt, a brown woolen gown, and a fur-coat of black serge with wide sleeves, a black calot which fits very close to the head, a purple coloured worsted cap, surrounded by a blue and white striped turban, a leather girdle, and red or black shoes. They have no stockings, and never uncover their heads.

"Besides the vows of chastity, obedience and poverty, they likewise make that of never eating any flesh meat in the convent, but fasting all the year except Saturdays, Sundays, and Easter. They sing their service standing, and leaning on a stick called Taunt, which is formed like a T. At midnight they go into the church, sleep in their clothes on mats of straw, and before they go to rest, prostrate themselves 150 times on the ground, with extended arms. At each prostration, which they call a penance, they make the sign of a cross. Six of these friars wear the Askim, or angelic dress: it is made of very soft leather and like a pelium; but because this dress obliges those that wear it to make greater austerities, (in particular they must at least make 300 prostrations every evening before they go to bed) the abbot never gives it to any but whom he supposes capable of undergoing such hardships. These monks are very superstitious and ignorant. I know not whether they strictly adhere to the rules of which they promise the observance, on being admitted as members of the order; but so much I know, that most of them waste their time in search of the philosopher's stone, or writing bills which they pretend will cure the sick. They get their provision from the village of Butha on the western shore of the Nile."

Not far from the convent of St. Anthony is that of St. Paul, which the Copti call the Tyger convent, from a supposition that those animals made the tomb of that saint. The principal building is a quadrangle, but much less than that of St. Anthony. The church (of which it is said the cavern where St. Paul did penance makes a part) is 32 feet long and 14 broad, and is very light. The walls are ornamented with paintings, and on that part where the altar is fixed are the remains of a Greek inscription, but so imperfect as not to be intelligible. The garden is planted with many fruit-trees, particularly vines; and the friars plant as many kitchen herbs here as those do belonging to the garden of St. Anthony. About forty yards from the monastery is a rock which supplies it with a large fountain of water. The monks here are 14 in number; among them are five priests, two of whom wear the angelic dress, and the rest are lay-brothers.

On the same side of the Nile with the village of Beni-soef is another called Monfalut. It is a fort of capital, whose mosques give it a beautiful appearance; and it is the see of a Copti bishop. The adjacent country is very fertile, and abounds with a great variety of fruit trees.

The village of Siouth contains several handsome mosques, and is the rendezvous of those who go with the caravan that sets out from hence to Nubia. This village is situated about two miles from the river, in a

very pleasant part of the country; and by the side of it is a large lake which is filled from the Nile by a canal, over which there is a bridge of three high Gothic arches. A califf resides here, who is governor of the province; and there is a bishop, with about 500 Christians. Their church is three miles from the village, among a parcel of hills, in which are cut great numbers of grottes.

Aboutitche is a large village on the same side of the Nile with Siouth, and has some mosques. It is a bishop's see; and is supposed to be the Hypsele of the antients.

Farther up the Nile, on the east side, is the village of Akmin, which is very large, and adorned with several mosques. Here are the remains of two temples, consisting of stones 20 feet long and 10 feet broad; all of which are painted, and full of hieroglyphics. On one stone there is a Greek inscription of four lines, of which the first and last are almost totally, and the others partly defaced. The Copti have a convent here, and there is also an hospital belonging to the Congregatio de Propaganda.

At the foot of a mountain, to the east of this village, is the monastery of St. Senodius. It is built of free-stone, and of an oblong quadrangular; it is 130 feet long, 20 feet broad, and 50 feet high, and has a cornice that goes quite round it. Its greatest sides have two rows of 21 windows each, all closed up; on the other sides there are only nine windows in each row: on the west side were formerly five doors, but they are now all closed up, and the entrance to the monastery is by a little double door on the south side, whose leaves are covered with iron plates. The church is quite decayed, but there are still fourteen columns in it, some of stone and the rest of bricks, covered with gypsum, and which support the ceiling. The choir, which is preserved, contains three altars, but hath not any thing remarkable. Only three monks inhabit this convent, and they have very wretched habitations. There is likewise a deep and wide well in it, whose water rises and falls like the Nile, though the convent is above three miles from the river. However, this rising and falling of the water, which the monks and the Copti look upon as a miracle wrought by Dioscorus whilst he staid in this monastery, arises from a communication with a canal, which gets its water from the Nile, and so provides this well with it. This, and the two monasteries of St. Anthony and St. Paul, are the two cleanliest in Upper Egypt.

The next place we come to is the town of Girge, or Tâhirsche, which is the capital of Upper Egypt, and the residence of the Bey. It is about a quarter of a mile from the river, and tolerably large, being at least two miles in circumference: the houses are in general spacious, and chiefly built of hard brick; and there are several handsome mosques belonging to the Turks. It is also the see of a Copti bishop, and the fathers De Propaganda have an hospital here, where they maintain themselves by their practice of physic, that renders them useful to the Turks. When the Bey of Girge has any thing to communicate to the chief of the Arabs from the Divan at Cairo, he sends them word that they are to come to him. They immediately send one of their number with 2000 horsemen to a certain place destined for those interviews: these troops form a ring round the Bey, who is attended by a train consisting only of twelve persons; and after the interview is over, each returns to his own home.

The village of Gau is situated on the eastern side of the Nile, and was once very large, but a considerable part of it has been washed away by the overflowings of that river. Here are 14 columns preserved standing, and full of hieroglyphical figures. At some distance from the village are many scattered coffins cut in stone, which the travellers make use of as troughs or cisterns to water their horses at; and there is also a colossal statue of rock stone, but it is greatly disfigured. At the foot of the mountain are many quarries, the stones of which are white, and have a fine polish.

About seven miles from Gau, on the same side of the Nile, is the village of Eridy, the residence of a sheik of the same name. This village is famous throughout Egypt on account of a snake, of which the people relate many strange and miraculous stories; and some of them believe it to be the devil, banished into the mountains of Upper Egypt by the angel Raphael. Of this snake, a

celebrated writer has furnished us with the following particulars: "The sheik, says he, keeps this serpent in his possession, as his predecessors have done before him time immemorial. It is two feet long, and about an inch thick; the skin is smooth and reddish: it plays with those who take it in their hands without doing them the least harm, and twines about their arms and legs. It is singular, that it likes women more than men, and when it sees a woman, will creep up to her neck, and get into her bosom. They allow it this liberty, as it is believed to be an angel. In honour of this serpent, they hold an annual festival. The people on this occasion meet here from 60 miles round, and they flock in such numbers, and give so many alms, that above 60 oxen and 200 sheep are killed to give them a meal. They relate many fables of this snake, which is perfectly well taught to do its part. I was told that the sheik could cut it in pieces at night, and he sure to find it whole and found the next morning. From curiosity, I asked him whether it was true that he could do so, and on his answering in the affirmative, I offered him 10 zeechini to perform this miracle before me, but with this condition, that I should keep the pieces of the snake till they united again, and that if this did not happen at the proper time, I should not be obliged to pay him. But he would not agree to it, and his excuse was, that the angel (for thus he called the serpent) would be provoked by such a bargain."

Notwithstanding the absurd notions the people here entertain of this serpent, yet it is remarkable that they can handle these reptiles without receiving the least injury, as is evinced by the following particulars, related by another writer, no less celebrated than the above. In writing an account of his travels while in Egypt, he says, "I am now going to inform you of something which I look upon as very curious; but I assure you the thing is so amazing, that had I not had ocular demonstration of the fact, I would not presume to relate it to you.

One morning as I was looking for something in our warehouses, the floors of which are of sand, I observed in several parts of them the traces of serpents, which gave me some uneasiness, lest at any time I should be hurt by them. I consulted our druggerman about it, who told me to make myself entirely easy, for he knew an Egyptian who could catch me by a charm. I communicated this to Mr. F—— H——, who, like me, wanted faith to believe that any mortal had power to do any such thing. The druggerman sent for the man, and as I suspected he might bring tame serpents with him, and privately let them loose, and then catch them again in our presence; I proposed that the charmer, before he began, should be kept to his buff; this was agreed to be done. We led him into a court-yard where the warehouses stood; but before he went into either of them, he fixed his eyes towards the sky, and muttered something unintelligible to us; this done, he went into one of the warehouses, and with a short and slender stick of a date-tree, he had in his hand, he pointed to the roof, and uttered something with a loud voice, at the same time stamping hard on the ground: as soon as he had done this, he told us there had been serpents there, but were gone. He then went into another warehouse, and after doing the same as he had done in the first, he said, there was a serpent somewhere in the walls; which were of loose stones, very thick and much decayed. Here he repeated his charm; and presently a very large serpent came out of the wall, and stopped; but the charmer, who stood in the middle of the warehouse, uttered some more jargon with very great vehemence, and the serpent came to his feet; he took it up in his hand as unconcerned as though it had been only an eel. In the same manner he caught another among some ruins in the yard. We examined the serpents, and found they had their teeth; for I assure you, Sir, we were so much amazed, that we could hardly believe our eyes. We gave him 30 paras for his trouble, and he went away quite satisfied."

To corroborate the above, we shall subjoin the testimony of the learned Dr. Hasselquist, who, in his travels, speaking of the people of Egypt, says, "They take the most poisonous vipers with their bare hands, play with them, put them in their bosoms, and use a great many more tricks with them, as I have often seen. I have frequently seen them handle vipers that were three or

four feet long, and of the most horrid fort. I enquired and examined whether they had cut out the vipers poisonous teeth; but I have with my own eyes seen they do not: we may therefore conclude that there are to this day psilli (that is, persons who are capable of fascinating or taming serpents) in Egypt; but what art they use is not easily known. Some people are very superstitious, and the generality believe this to be done by some supernatural power, which they obtain from invisible beings. I do not know whether their power is to be ascribed to good or evil; but I am persuaded that those who undertake it use many superflitions." He afterwards says, "he had vipers of four different sorts brought him by a female psilli, who put him, together with the French consul Lironcourt, and all the French nation present, in confinement. They gathered about us to see how she handled the most poisonous and dreadful creatures, alive and brisk, without their doing, or even offering to do her the least harm. When she put them into the bottle where they were to be preserved, she took them with her bare hand, and handled them as our ladies do their laces. She had no difficulty with any but the *viperæ officinales*, which were not fond of their lodging. They found means to creep out before the bottle could be corked. They crept over the hands and bare arms of the woman, without occasioning the least fear in her: she, with great calmness, took the snakes from her body, and put them into the place destined for their grave. She had taken these serpents in the field with the same ease she handled them before us; this we were told by the Arab who brought her to us. Doubtless this woman had some unknown art which enabled her to handle these creatures. It was impossible to get any information from her; for on that subject she would not open her lips. The art of fascinating serpents is a secret amongst the Egyptians. It is worthy the endeavours of all naturalists, and the attention of every traveller, to learn something decisive relative to this affair. How ancient this art is among the Africans may be concluded from the ancient Marii and Psylli, who were from Africa, and daily shewed proofs of it from Rome. It is very remarkable that this should be kept a secret for more than 2000 years, being known only to a few, when we have seen how many other secrets have within that time been revealed. The circumstance relating to the fascination of serpents in Egypt, related to me, were principally, 1. That the art is only known to certain families, who propagate it to their offspring. 2. The person who knows how to fascinate serpents, never meddles with other poisonous animals, such as scorpions, lizards, &c. There are different persons who know how to fascinate these latter animals; and they again never meddle with serpents. 3. Those that fascinate serpents, eat them both raw and boiled, and even make broth of them, which they very commonly use; but in particular they eat such a dish when they go out to catch them. I have even been told, that serpents fried or broiled are frequently ate by the Arabians, both in Egypt and Arabia, though they know not how to fascinate them, but take them either alive or dead. 4. After they have ate their soup, they procure a blessing from their sheik (priest or lawyer) who uses some superstitious ceremonies, and amongst others, spits on them several times, with certain gestures. This matter of getting a blessing from the priest is purely superstitious, and certainly cannot in the least help to fascinate the serpents; but they believe, or at least will endeavour to persuade others, that the power of fascinating serpents depends upon this circumstance."

In the mountains, near the village of Eridy, are 10 or 12 sepulchral caverns. There are also many heaps of ruins, which, according to the report of the Copti, are the remains of the ancient town of Irgy.

Dandera is a small village, but very pleasantly situated, it being encompassed by continued rows of trees, which produce all the various fruits to be met with in Egypt.

Nagadi is a large town, and among other edifices, contains several spacious mosques; and the Copti have a bishop, who constantly resides here.

Carnac is a name given to a vast extent of country to the east of the Nile, where are seen, in various places, some very considerable ruins of buildings that were once spacious and magnificent.

Einy is higher up the river, and is a large place,

adorned with a very handsome mosque. It is the residence of an Arab sheik, and is situated where the ancient Latopolis stood; some remains of which are still to be seen.

Edfu, or Etsou, is the antient Apollinopolis, and is situated on the western side of the Nile. Here is a fine monument of antiquity well preserved, which has been long converted into a citadel, occupied by the Turks.

Elsouan is also situated on the western side of the Nile, and is the ancient Seyne, which was under the tropic of Cancer. It is a poor small town, with a fort of fortrefs, or rather barrack for Janizaries, under their governor, who has the command of the country. In this town, as also in an island adjoining, are quarries of granite, and the remains of some antient buildings. It is at this place where the first cataract of the Nile begins, above which is the island Giefret Ell Heiff, the Philæ of the antients, which is a desert, and quite covered with rocks of granite. The borders of this island are cut in the form of a wall on the rock; and within are abundance of colonades, buildings, and other magnificent antiquities.

At Debonde are the ruins of several grand edifices; as also at Hindau, Sahdach, and Tessa, where Egypt ends, and Nubia begins. From thence up to Derri are many small villages, in some of which are to be seen several ruins of antiquity.

Derri is situated on the eastern shore of the Nile, near the place where the river begins to direct its course towards the west. It is inhabited by a race of people called Barbarins, who are a poor miserable tribe, and live chiefly by plunder. The slope of the shores of the Nile here is in many places covered with lupines and radishes, the seed of which serves for making oil.

The people of Derri have frequent occasion to cross the Nile, in order to go to Elsouan, but as they have not the convenience of canoes, they supply that deficiency by various projects, the most distinguished of which, as described by a modern writer, are as follow: Two men sit upon a truss of straw, while a cow goes before swimming; one of them holds in one hand the tail of the cow, and with the other directs a cord fastened to the horns of the animal. The other man, who is behind, steers with a little oar, by means of which he keeps a balance at the same time. Another way is, to cross the river with camels loaded in this manner: a man swims before, holding the bridle of the first camel in his mouth; the second camel is fastened to the tail of the first, and the third to the tail of the second; another man, sitting on a truss of straw, brings up the rear, and takes care that the second and third camels follow in a row. A third way is this: they put themselves a-straddle upon a great piece of wood, after having placed their cloaths over their heads in form of a turban. They also fasten to it their assagaye or dart; they afterwards make use of their arms as oars, and by this means cross the river without much difficulty, or any danger from the crocodiles.

Having thus given an account of the antient and modern state of Egypt, we shall now proceed to describe its inhabitants, with such other particulars as are necessary to be observed relative to this antient kingdom.

SECT. IV.

Of the Persons, Manners, Customs, Habits &c. of the Egyptians.

EGYPT is inhabited by various people, viz. Arabs, Moors, Copts or Coptis, Turks, Greeks, Jews, Franks, &c. And these so materially differ in their persons, habits, manners and customs, that a peculiar description of each is necessary.

The Turks are tall, well made, finely featured, fair, and dressed after the Asiatic fashion.

The Arabs are a small swarthy people, and reside in tents scattered about the country in a circular form, which they remove as inclination prompts or necessity requires.

The Moors are almost as swarthy as the Arabs, and in every other particular resemble the Moors of the Barbary States.

The Greeks are in every particular like those of the Levant, the Jews in all things resemble those who reside in the other parts of Africa, and the Franks may be characterized

characterized from the different nations from whence they come.

But the Copts or Coptis, who are the real Egyptians, being the descendants of the original inhabitants of the country, are a very ill favoured, bad shaped, slovenly, effeminate, nasty people. They are disagreeable to the beholders in themselves, and receive no manner of addition from their dress, for if the latter is ever so good, they put it on so awkwardly and wear it so clumsily as to appear very ridiculous to other people. But the best dress cannot be long decent with these people, as they frequently use their long sleeves not only to wipe their hands and mouths after meals, but to blow their noses on at other times.

But as evil communication corrupts good manners, we find that the other people already described, when they have a long time resided in this country, insensibly give way to the bad customs of the original natives, and by degrees adopt the disagreeable and obnoxious qualities of the Coptis, for

Example is a living law, whose sway
Men more than all the written laws obey.

This observation is confirmed by a noble writer, who says "Effeminacy and inaction are peculiar to the Egyptians; and though this kingdom is no more than a shadow of what it was heretofore, yet the peoples notions are the same as ever. They are idolizers of feasts, love music, shows and dancing, even to excess; and the modern Egyptians vie with the antients in the state of every thing that may be an agreeable entertainment to the senses. It is almost impossible to be long acquainted with them without catching their humours and manners. The Turks, who are naturally of a serious and phlegmatic temper, by degrees lose somewhat of their gravity. Besides this, such an influence has the climate of this country on the inhabitants, that though the Turks are brave and martial, the children they get here become cowardly, like the other Egyptians, who are, to the last degree, poltroons. Therefore all persons born in Egypt are by the laws themselves excluded from military posts; and though, by a special favour, the children of the Turks have a privilege of being common soldiers, yet this right does not extend beyond the second generation. And all the militia that the Grand Seigneur keeps up in Egypt are recruited by the Turks that are sent from the European and Asiatic provinces. This degeneracy, owing to the air of the country, makes the people of quality glad to mix their blood with that of foreigners; for men as well as animals decline in Egypt, from one generation to another. The horses here, by degrees, lose their speed, the lions their strength and courage, and the very birds are inferior to those of other countries."

Besides the people already mentioned among the inhabitants of Egypt, there are two sorts of a peculiar kind, the first of whom are called the Established Bedouins, and the latter the Wandering Bedouins. The former live in villages, and are to be considered as peasants of the country. The Wandering Bedouins lead the same life as the ancient patriarchs; they live under tents, upon the milk of their cattle, and shift their habitation for the convenience of pasture: they always encamp in places where they can easily come at water; some take up their residence near the mountains, and others retire to places before uninhabited.

A celebrated French writer has given us a very pleasing description of these people, with ingenious reflections on their manner of life and contempt of worldly grandeur; which, as matters of entertainment, we shall lay before our readers.

"The Bedouins, says he, are fonder of their rural life than the courtiers are of the pageantry and bustle of a palace. With them the golden age is still in being; their cattle not only furnish them with the most delicious dishes of meat, but also provide for their other occasions. The wool of their sheep suffices to clothe them, for they make a stuff with it which defends them from the injuries of the air. They look upon those to be madmen, who build immense palaces, and yet think they live in a narrow compass. Do not cares and perplexities, say they, inhabit in those stately buildings? If man has no more content nor satisfaction in those than we have under

our tents, why should we be at the trouble of building them?

"The Bedouins have no need to assemble their general states for preserving their liberty; for they have no disputes, no civil war; they find pasture and water wherever they go, and that is their best treasure, their industry and frugality furnishing them with every thing else. They have no difference about religion, no wrangling doctors and divines; they pass their lives without being disturbed by the rage of opposite parties, always ready to murder one another. These happy people have no tent encompassed with ditches, guarded by soldiers, and set apart for the confinement of prisoners of state: they make it no crime for their brother to differ entirely from themselves; but they have every one the liberty always of praying to the Deity in the Turkish, Arabic, Persian, or even the French language.

"An enemy, were he ever so potent, would not be able, with the assistance of a scrap of paper obtained by the favour of a Bedouin minister, to get an order for a private man to quit his tent, his family, and his flock, and to repair to the confines of Ethiopia, there to stay till further orders. A Bedouin must do not go with a guard of soldiers from one tent to another, to get a subscription to the confession of the Mahometan faith, drawn up in a set form of words, wherein all the virtue of it consists.

"Counsellors, attorneys, solicitors, the several degrees of jurisdiction, subaltern, inferior and sovereign, are unknown to the happy Bedouins. A suit of law between two persons never lasts above twenty-four hours, for the oldest man of the tribe gives his decision of the matter in question on the spot.

"These people are ignorant of edicts and new regulations for the rising or falling the value of money: never does a Bedouin go to bed with an hundred thousand crowns in his pocket, and rise not worth a penny. The most he loses is a sheep, perhaps, which a wolf may run away with in the night. He pays no tax at coming into the world, nor any thing at going out."

Such is the description given of these people by the above writer; from which it appears, that if happiness is in any degree to be possessed by mankind, the Bedouins must be allowed to have a most ample share of it. Their minds are not disturbed by worldly pomp; they are strangers to avarice, and think of no other enjoyments than what result from pure nature.

Some of the Bedouins, however, are not quite so disinterested; for an English traveller who was lately at Alexandria, informs us of an anecdote which was communicated to him by a gentleman of the French factory there.

"This gentleman (says he) told me, that two winters ago, a Bedouin came and shewed him something, which on examination proved to be a piece of ice, a thing not found in an age in this place. Mr. Roboly, pleased with the sight of what he had not seen since he left France, offered the value of a shilling for it; but the Bedouin imagining it to be a precious stone, disdaind his offer, and wrapping it carefully in a rag, went away in quest of a better bidder. He met an acquaintance and opening the rag to shew him what he had found, was surpris'd to find it, and his imaginary jewel, wet; and in order to dry them, he laid them in the sun-shine on a large stone. But how great was his surpris when he saw his jewel grow less and less. He invoked Mahomet, called every Turk that pass'd to look at this miraculous affair, which in a very short time deprived him of his jewel, and left him nothing but the rag."

With respect to the dress of the Egyptians, in common it is a long shirt with wide sleeves; it hangs almost to the ground, and is tied about the middle: over this the vulgar wear a brown woollen shirt, and people of a superior condition, a long cloth coat; and the whole is covered by a blue frock, except upon public occasions, when a white frock is substituted. In the Lower Egypt indeed, instead of the blue frock, a black woollen one is sometimes worn, which, when left open before, is called a terjee. People of rank have these upper garments made of fine cloth, and ornamented with fur. The Coptis and Arabs always wear large sleeves; but the Turks only wear large sleeves upon public occasions; at other times their sleeves are small and close. The people in

general

general wear drawers, but the men do not tuck the shirt or under garment into them, though the women do. Some of the Turks, over their linen drawers, wear another pair made of red cloth, but the latter reaches to the ankles, and beneath them yellow socks are worn.

The Arabs and Egyptians wear red leather slippers, but the Turks and Christians in general use wooden sandals within doors, and shoes or slippers, made after the fashion of their respective countries, when they go abroad.

The dress of the head and feet of this country is the peculiar characteristic of the different people; as all are liable to be fined who transgress the established custom. Pococke says, the head dress is a high stiff cap; with a long piece of muslin wound round it, which is all together called the Turban by Europeans; but inferior people, instead of the turban, wear a red woollen cap that comes close to the head, under which they wear a little white linen skull cap. The shawl wound round the head is the great distinction, and none but the relations of Mahomet are permitted to use green; other people of rank wear white, middling people brown, and the lower ranks of all go without any shawl round their caps. Of the Mameluk dress we have the following account.

The true Mameluk dress is the short garment above-mentioned, put into their great red trousers, which are tied round the leg at each ankle, the foot being left bare; and they wear the sort of shoes used by the Arabs when they ride. In other respects they dress like the Turks; and this is the dress of the slaves, as also of many of the great men, when they are not in a dress of ceremony.

The girdle round the waist is made either of silk, mohair or woollen, and in this a knife in its sheath is usually stuck. The Copts wear a large blue cloth round their necks, with which they cover their heads, as a security either against cold, rain or sun. Some of the Arabs, and native Mahometans, cover themselves in winter with a large brown blanket, and in summer with a blue or white cotton sheet, which they wear as a surlout, putting one corner before over the left shoulder, and then bringing it under the right arm; the left shoulder and body being by these means covered, and the right arm left bare for action.

The dress of the Turkish women here, like the dress of the women in Turkey, differs but little from that of the men, except in being rather shorter, and the under garments made of silk. Their hair is likewise plaited, and their heads bound with an embroidered handkerchief, which encircles a white woollen skull-cap. The common Egyptian women, or Copts, wear a large linen or cotton blue garment, like a surplice, with a kind of bib before their faces, which is joined to the head dress by a tape over the nose, the intermediate space being for them to see through. The superior sort wear a piece of gauze over their faces, and a large black veil to cover their bodies. "The women in some of the villages on the banks of the Nile (says a late traveller) wear a ring in their noses, about the circumference of a half-crown piece, clumsy bracelets of silver, ivory, or iron, round their wrists and ankles, and large heavy ear-rings of metal or great beads. Their whole clothing is no more than a long blue shift, and a veil of the same, with winkle-holes cut in it to see through. They go into the river up to their middle to fill their pitchers, which they carry on their head to their cottages, and sometimes are devoured by crocodiles while they are filling them."

With regard to the bracelets worn for ornaments in Egypt, some are made of gold finely jointed, others of silver or brass wire, and a common sort are manufactured of plain iron.

In the cities of Egypt, most children go entirely naked during the summer, as many in the villages do all the year round, for this reason, that they have no cloaths to wear.

The lower kind of women paint their lips and the tip of the chin blue; the better sort dye their finger nails and their feet yellow, and colour their eye-lid with black lead; but both, with a design to render themselves attractive, take great pains to make their appearance frightfully hideous, at least to strangers.

No women go bare-faced, but such as, for a subsistence, sing, dance, or play upon some instrument about the streets; and common prostitutes, who are heretofore called, and pay a considerable tribute.

We cannot conclude the article of dress better than with an extract from a letter lately written by an English gentleman at Cairo to his friend in London: "As at Grand Cairo (says he) no Frank wears his own country dress, Mr. — and myself have had our hair cut off, thrown aside our European garments, clothed ourselves like Turks, and in order to be quite complete, have been letting our whiskers grow ever since we left Smyrna. I find these garments rather troublesome at present particularly when I go up stairs with any thing in my hands, as I then tread on the bottom of my caftan. The next morning after my metamorphosing, I was obliged to get one to assist in dressing me, but can now do it easily myself. I am at present free from many articles I used before this mutation, as buckles, stockings, garters, sleeve-buttons, ruffles, stocks, cravats, hats, great coats, and walking-sticks."

The Copts in general are grossly ignorant; a few indeed can read, write, and cast accounts; but if any one goes farther in literature, he is deemed a miracle of learning. The Arabs seldom know even how to read, and the native Mahometans very rarely, unless they have been bred up to the law. What is very singular is, that the most intelligent and best educated people in this country are the slaves, who can read and write, are expert in arithmetic, and understand the Arabic, Turkish, and Coptic languages. This proceeds from the laziness of the masters, who being too indolent to attend to business, or inspect their own affairs, generally purchase slaves who have been properly educated, to officiate for them, and superintend their business both at home and abroad.

The Egyptians in general are a treacherous people, ungrateful to their friends, inhuman to their relations, faithless to strangers, and false to their words. If they can cheat you by stratagem they will, if not they attempt it openly; and either accuse you publicly of having committed some crime, or of owing them money; and those who preside in the courts of judicature are so venal, that for a trifling bribe they will give judgment in favour of the accuser, though sensible that the accusation is unjust; of which the following is a remarkable, though not a singular instance:

A worthy French merchant who had long resided in this city, used every day during some years to take a solitary walk. A poor Turk stood to ask alms in the way this gentleman passed, and received daily of him a para, by way of charity. At length the merchant finding his business decrease, determined to quit Alexandria and return to France. As he was here he settled, and remained nine years; at the expiration of which, some genteel offers were made to induce him to settle again in Alexandria. He accepted them, and returned. According to his former custom, he went to take his old walk, in which he saw the Turk mendicant he had so often relieved, and offered him a para, which he refused, and said, "Sir, you are some hundreds in my debt." The gentleman affronted at this insolence walked on, and determined never more to give him any thing. The next day the merchant was ordered to appear before the cadi, when the beggar declared he owed him as many paras, as there were days in nine years, (the time of the merchant's absence.) The cadi desired the mendicant to explain the nature of the debt, which he did as follows; "during this gentleman's first residence in this city, I constantly received a para a day of him, and on this account, looked on myself as his pensioner, and depended on my pension; but he acted very unjustly by me in absencing himself nine years, without first leaving a fund sufficient for the payment thereof; but fate has favoured me in bringing him here again, and I doubt not but I shall have justice done me." The cadi declared that the beggar had a just right to the pension in question, and ordered the merchant to pay him up to that day, which he was obliged to comply with.

The use of laudanum, which was formerly almost general in Egypt, has declined greatly of late years, and is succeeded by the custom of drinking strong waters. When the common people cannot procure the latter, they pound the leaves of green hemp, make a ball of it, and swallow it to make them chearful.

The people in general are great believers in magic, divination and fortune-telling; are fond of talismans, philtres, and charms; and firmly imagine that the eyes

of some particular persons, commonly called evil eyes, have the power of fascinating, and doing great mischief.

The late Dr. Smollet in speaking of Egypt says, "It was from hence that the vagrant race called Gypsies came, and dispersed themselves into every kingdom of Europe and Asia. They were originally called Zinganees, from their captain Zinganeus, who when sultan Selim made a conquest of Egypt about the year 1517 refused to submit to the Turkish yoke, and retired into the deserts, where they lived by rapine and plunder, and frequently came down into the plains of Egypt, committing great outrages in the towns upon the Nile, under the dominion of the Turks. But being at length subdued, and banished Egypt, they agreed to disperse themselves in small parties into every country of the known world, and as they were natives of Egypt, a country where the occult sciences, or black art, as it was called, was supposed to have arrived to great perfection, and which in that credulous age was in great vogue with persons of all religions, and persuasions, they found no difficulty to maintain themselves by pretending to tell fortunes and future events."

An ingenious gentleman who lately belonged to the English factory at Grand Cairo, gives the following entertaining account of the remnants of the Gypsy race, as they are now found in Egypt.

There are still in Egypt a considerable number of people known by the name of Gypsies, some of which I have myself seen. Two of these peregrinators, both females, came to the factory I was at, and inquired whether any of us were desirous to be acquainted with future events that would happen to us. Our cook and chamberlain, who were no less superstitious than many in England, bargained with them for two paras each, and I doubt not, but reaped as much benefit from their prognostications, as the credulous in Britain do from fortune-tellers there. Nothing can be more extravagant than the notions these impostors make those they impose upon believe; always taking care to level their mummery, with the favourite desires of the people of the country. Among many other wonderful events which our cook was to have happen to him, the following were apart. They made him believe, that whatever he should wish for, would certainly come to pass; that he would be blessed with the possession of three beautiful wives, and a numerous train of concubines; that he should be exceeding rich, and after some time become an Adgi. It must here be observed, that the men in Egypt make beauty only (not money, which is never a point considered) the material part of their choice of women, and to be reckoned a pilgrim or saint, which is an Adgi, one of their most ultimate wishes. The effect their extravagant nonsense had on the fellow, is scarce credible; he became proud, imperious, insolent, and totally neglected his business, nor was it possible to continue him longer in our service; he even refused at different times to act so much beneath his new expected dignity, as to labour in his employment: so that it may with propriety be said, he was robbed both of his money and his senses at the same time. The dress of these people differs much from that of the rest of the inhabitants of this country. The women in general go with their faces covered, but the Gypsies leave theirs naked as with us. In their ears they wear long strings of large beads, and at their back is a kind of bag, in which they carry a black cat, which while they are telling people their fortunes, creeps up to their shoulder, and putting its head to their ear, is looked upon as their familiar. Though there are males among this order of people, yet they seldom appear at Cairo, but the cause cannot easily be assigned. The vulgar show great reverence to these wanderers, and believe implicitly every thing they tell them, however extravagant.

By a prophecy which it is said they have amongst them, they believe that Egypt will again be under their dominion; and at the expiration of a certain time, the Turkish empire will be brought to nothing. Mr. Hill has favoured us with this prophecy in English verse, as follows:

"Years over years shall roll,
"Ages o'er ages slide,
Before the world's controul,
Shall check the Crescent's pride."

Banish'd from place to place,
Wide as the oceans roar,
The mighty Gypsy race,
Shall visit every shore.

But when the hundred year
Shall three times doubled be,
Then shall an end appear
To all their slavery.

Then shall the warlike powers
From distant climes return,
Egypt again be ours,
And Turkish turrets burn.

Some of these fortune-tellers are very dextrous at breeding up birds, who are taught to carry little scrolls of paper from their masters to those who come to enquire what luck they shall have; and the good or bad fortune is written therein, the truth of which the people implicitly believe.

The Turks in this country think themselves far superior to all the other Mahometans, and the Mahometans in general fancy that all the Christians are much beneath them. From these absurd degrees of pride, good manners and common civility are seldom preserved among the different orders of people. The mode of salutation, when any of these haughty gentry think proper to salute each other, is by stretching out the right hand, bringing it to the breast, and a little inclining the head; they then kiss the hand, and afterwards put it to the head. But on extraordinary occasions, such as when an inferior visits a superior, the former must kiss the hand, or the hem of the garment of the latter. The word made use of in these salutations is *peace*; but this simple word a Mahometan cannot be prevailed on to make use of to a Christian. With respect to the Arab salutation, it is by joining the hands, and bowing the head several times to the head of him saluted.

At meals, the Turks make use of a low circular or octangular stool instead of a table; under it a coloured cloth is placed on the ground, and over it a kind of table-cloth is spread, large enough to come into the lap of the guests. To people of condition a napkin is given before they eat, and another after they have done, previous to their washing. A copper dish, tinned both within-side and without, is put on the stool, round which bread, pickles, sallads, &c. are placed. Then two or three dishes follow, to which the company either sit cross-legged or kneel. The use of knives and forks is unknown; and the right hand only is employed at meals, with which they tear the meat in a healthy manner; and the matter of the house often throws large pieces to such of the guests as he would pay an extraordinary compliment to. The entertainment consists of two or three courses, and coffee immediately succeeds. The food consists of pilaw, soups, sweet ragouts, stewed dishes, pieces of meat cut small and roasted, and dulma, which is any kind of vegetable stuffed with forced-meat. The inferior servants, who are not slaves, eat what is left; but the slaves have a meal of the coarsest kind of food provided on purpose for them. The Arabs, for their own family, use only a skin by way of table-cloth, which they spread upon the ground; but when they have company, a coarse woollen cloth is substituted, when whole sheep and lambs, boiled or roasted, are set before the guests; and as soon as one company has done, another falls to, till all is consumed.

Dr. Pococke says, "an Arab prince will often dine in the street, before his door, and call to all that pass, even beggars, who sit down to the repast: for the Arabs are great levellers, put every body on a footing with them, and maintain their interest by such generosity and hospitality; but the middling people among them, and the Copts, live poorly. At a Turkish visit, a pipe is immediately brought, and coffee; if it is a visit of ceremony, sweetmeats with the coffee; afterwards a shesbet, and then, according to the dignity of the person, incense and rose-water to perfume, which is a genteel way of dismissing the company. If any one goes to the house or tent of an Arab, bread is immediately made, and they serve four milk, fried eggs, and oil to dip the bread in, a salt cheese like curds, and other similar things."

In Grand Cairo, women are obliged to ride on asses, because the men are asses enough to put confidence in an old prediction, which foretells that a woman on horseback shall some time or other take that city. They are likewise obliged to have short skirts, which would be disgraceful for a man riding on an ass * to make use of. Friday is the day appointed for women to go abroad, when they repair to the sepulchres of their relations to adorn them with houghs and flowers, to hang a lamp over them, and pour water on their graves. The women in riding wear yellow boots without soles, or rather boot legs, and ladies of distinction are attended by many female slaves, who follow them all mounted upon asses.

The bagnios are the places where the women most particularly meet, where they freely chat of the current news, and converse together without the least reserve. We shall here insert, in his own words, an account of the whimsical dreams of an English gentleman who lately resided at Grand Cairo, on his inadvertently entering one of these bagnios while the women were bathing in it.

As there are excellent bagnios in Cairo; I have often been at one near the place where I live. Going there again about six weeks ago, I went in as usual, passing through the entry to the undressing room. I had no sooner got there, but I heard such horrid shrieks and cries, that I was really amazed. In my fright I happened to cast mine eyes on the place where those who came to bathe, undress themselves, and beheld a number of human species entirely naked, with their posteriors turned towards me, who kept screaming on. When I was recovered a little from my fright, I perceived they were females. I immediately took to my heels, the woman servant following me half way out of the passage, endeavouring to strike me with a boom. As soon as I had gained the street, fearing some severe punishment for this accident, I lost no time in getting to the Bazar, where there are always asses to let out. I hired one and ordered the driver to take me to Boulack; when I got there, I bid him drive me half a mile farther up the bank of the Nile. Here I alighted, fat down under a date-tree, and amused myself with smoking tobacco, until the dusk of the evening, and then returned to my place in Cairo, very much cast down for fear of being discovered. The next day, on hearing that inquiry was making after the person, who contrary to the laws of the country, had presumed to go into a bagnio, while women were in it, I was so terrified that a fever ensued, and I lay ill about a fortnight. After my recovery I learnt from our druggeman, that on the days the ladies come to bathe, a large towel is hung over the outward door of the bagnio, as a signal for men not to go in. I acknowledge I saw the towel, but not knowing at that time what it particularly signified, I imagined it was hung out to dry. Besides this signal, a man is placed at the door-way to prevent mistakes; but when I went in, he was gone to a neighbouring house to light his pipe.

People in superior stations do not resort to coffee-houses, but those of the middle rank are very fond of frequenting them. In some of them they have music daily, at stated hours, and in others, a person is regularly employed to recite some entertaining story, which brings a great deal of company together, and highly contributes to their amusement. These coffee-houses are, in general, only so many large sheds, with banks under them, and covered with mats; many of them will contain several hundred persons, who, besides the abovementioned amusement, regale themselves with a pipe of tobacco, and a dish of coffee; the latter is made very strong, but neither sugar nor milk is used with it.

Unless a Christian inhabitant is married, it is not safe for him to suffer any woman whatever to come into his house, and it is for this reason that some of the Frank

* A late traveller says; "No Christian whatever, under the degree of a consul is permitted to ride a horse in Cairo, and a consul seldom does it above once a year, when he goes to pay his respects to the bathaw, and then he throws handfuls of paras among the populace. If a Turk is asked, why a Christian should not ride a horse, he will reply, "because He, you call your Saviour, was contented to ride on an ass."

merchants, settled here, marry Christian women of the country; for then the Turkish ladies may have free access to their houses, and the merchant's wife can be admitted into the harems, by which means she may sell them various commodities.

All persons of the Mahometan persuasion have a particular veneration for fools and madmen, as they think them both inspired, and consequently dearer than saints. The Santos or Santonis, a kind of enthusiasts, are likewise very much admired; of these a late traveller gives an ample and accurate account, which we shall therefore insert.

In this country there is a great number of Saints, Santos, or Santonis; some of them go entirely naked, others with a rag or skin of a beast round their loins for the sake of decency. Some lead a solitary life in holes and caverns, others run begging about the city: these last are very troublesome to every decent person who passes the streets, particularly the Franks, who generally ride, when they have occasion to go to any distant part of the city; for these Santos will lay hold of the ass's neck, and keep with you until you give them something. There is one of these, who begs between Cairo and Boulack, with a brick or stone in his hand; but will accept of nothing except the donor lays it thereon. I have seen one of these fellows run his head several times against a stone wall, for the sake of two or three paras. Those Santos who go entirely naked, are highly esteemed by the people, who say they are undoubtedly in a state of innocence, otherwise they would know they are naked, and would ask for clothes. The Santos who beg on the banks of the Nile, between Rosetta and Cairo, wear their own hair. Most of them have got some favourite passage of the Alcoran by heart, which they repeat in the streets. I have seen many of their tombs, covered with a building in form of a cupola. These mausoleums are erected at the expence of those who most admired the Santo in his life time.

When the followers of a Santo cannot afford to build him a magnificent sepulchre, they will, when carrying him to the grave, suddenly stop, then run backward, as though impelled by some external force; and as soon as they have (or rather pretend to have) recovered themselves, they will feign to try again to get the corpse to the grave, and suddenly run backward as before. After they have repeated this prank several times, they declare to all present, that the holy man will not be buried in the common burial ground, but must be interred in a distinct place, and have a mausoleum erected over him. The populace believe this, and a collection is immediately made to defray the expence of building one. Some days are set apart in memory of some favourite Santos, but it is the common people only who pay any regard to them. Those who are too lazy to work turn Santos, and in many respects behave like lunatics; for the better they act the madman, the greater opinion the people have of their sanctity. Some few of them, I believe, are real lunatics; but the greatest part are certainly more knaves than fools.

In a country so hot as Egypt it must be imagined, that the construction of kitchens, and the modes of cookery, greatly differ from what are found in Europe, particularly towards the northern parts; a gentleman who resided there tells us, "that the places for dressing victuals are detached from the houses. These sheds, or cooking-places, have chimnies, though of a peculiar construction; they are made of a kind of basket-work pargetted in the inside as our chimnies are, and the outside covered with a kind of plaiter. Jacks, for roasting of meat, are not known here, and in a climate so warm as Egypt, the turning of a spit, by a large fire, must be very fatiguing. In pity to our cock, after endeavouring in vain to find a man who could make a Jack, I got a wheel made of wood, and a dog to turn it (such as are seen in and about Bristol.) It is hardly possible to imagine, how

As I was one day riding through a street where almost all the inhabitants get their living by transcribing such parts and sentences of the Alcoran as are particular esteemed by the religious Mahometans, the ass I was riding fell down in the middle of the street, and the scriber at the same time exclaimed "See! see! the beast is not willing to carry an infidel through our holy street."

much the people admired this simple machine, and what elogiums they bestowed on me, who, they imagined, was the inventor of it." The same ingenious gentleman describes the intolerable heat of Cairo, and the consequent customs, in this manner: "Cairo is excessive hot in summer time; the heat is so intolerable, that one has hardly power to set about any thing, and such a multitude of flies, that we are obliged to keep a kind of whisk continually in our hand, otherwise they would, in two minutes, cover our faces like a mask. When we write, we are obliged to have a man stand by us to wipe these insects away. The very beds are so hot, that there is no sleep to be had one night in six, and had we not musketo curtains, there would be no possibility of sleeping at all, because of the gnats. I have often thrown my bed into the corner of the room, and lay on the bare bedstead.

SECTION V.

Language, Arts, Trade, Commerce, Manufactures, &c. of the Egyptians.

THE language antiently spoken in Egypt, at least the most antient that we now know of, was the Coptic: this continued in general use till the conquest of the country by Alexander the Great, who introduced the Greek, which was the most prevailing language for above nine hundred years after; that is, till the Greeks were driven out of it by the Arabs; since which the vulgar Arabic, or Arabick, language, hath been the most universal. The other languages which are still spoken, though not so prevalent as the Arabic, are the Turkish, modern Greek, and Coptic.

The Turks have a genius for traffic, but very little for the liberal or ingenious arts, these being principally in the hands of the Franks, or Christians. In particular, Christians only are silversmiths and jewellers; and these have a pretty brisk trade, on account of the great demand for trinkets and trappings to adorn women and horses: for the Mahometans are not allowed to keep plate in their houses, nor are the men permitted to wear rings, unless they give a tenth part of what they are worth to the poor. Few, however, are found who are so fond of ornament as to purchase the privilege of being fine at the expence of so much benevolence.

The window lattices both to the mosques and houses are very elegant, being curiously manufactured either of iron, brass, or wood. They are made of round bars let into each other, and forming small squares, which are decorated with a variety of ornaments. With respect to the Turks, those who do attempt any inanner of work are much inferior to the Turks of Constantinople.

In many of the villages on the banks of the Nile, the inhabitants are chiefly employed in making sal-ammoniac. This salt is procured from the foot which arises from the burnt dung of animals that feed only on vegetables; but the dung of these animals is only fit to be burnt for that purpose during the four first months of the year, when they feed on fresh spring grass, which in Egypt is a kind of trefoil or clover; for when they feed only on dry meat it will not do. The dung of oxen, buffaloes, sheep, goats, horses, and asses, at the proper time, is as fit as the dung of camels for this purpose. The foot arising from the burnt dung is put into glass vessels, and these vessels into an oven or kiln, which is heated by degrees, and at last with a very strong fire for three successive nights and days; after which the smoke first shews itself, and, in a short time, the salt appears, adhering to the glasses, and by degrees covers the whole opening. The glasses being broken, the salt is taken out in the same state and form in which it is sent to Europe.

The domestic trade of Egypt chiefly consists in supplying the lower parts of Egypt from the upper parts with corn, pulse of all sorts, dates, &c. and supplying the upper parts from the Delta with rice, salt, &c. Cairo is the general mart for all things imported into Egypt, but Indian linens, muslins, callicoes, and China ware, &c. bear a greater price here than in England, being brought the principal part of the way by land.

The exportation of coffee and rice from Egypt to any parts not under the Turkish government is prohibited;

however, great quantities of both are smuggled to a variety of places. Senna, cassia, coloquintida, and a red dye called safranoui, are exported from hence to several European countries. Flax is sent to all parts of Turkey and Leghorn, and cotton is transported in great quantities to Marseilles.

The imports are English, French, and Venetian cloths, silk from Leghorn and Venice, likewise drugs, and dyes which Egypt does not produce; tin from England, lead and marble blocks from Italy, small wares from France and Venice, furs and copper utensils from Constantinople, iron from Salonica, carpets from Asia Minor, wool from Barbary, raw silk from Syria, and coral and amber from various parts.

Besides the above, the things imported from and exported to different places are,

<i>Imports.</i>	<i>Exports.</i>
Agaric	Opium
Arsenic	Indigo
Orpiment	Sugar
Antimony	Cinnamon
Quicksilver	Tamarinds
Vitriol	Saffron
Vermillion	Sal ammoniac, &c.
Cinnabar	
Cochineal	
Brazil wood.	

Of the manufactures of Egypt, the linens are the principal not consumed at home, great quantities of these being sent to Turkey, France, Italy, Algiers, &c. The chief manufactures here are three, viz. linen, woollen, and silk. The silk is worked into large handkerchiefs for womens veils, and other rich handkerchiefs worked with gold; and in Cairo many sattinets and taffetas are made, but both are inferior to those of India. The wool is manufactured into carpets of different colours and sizes, and various garments. And the linen is made from flax which principally grows in the Delta. The threads are drawn from the distaff by letting the spindle hang down, without being spun. The linen, however, when made, is not very fine, which appears to be principally owing to its not being in great request in Egypt, as the better sort of people wear a kind of fine light muslin, which seems better adapted to so hot a climate: the linen, however, is cheap and white; and the chief place for making it is Rosetta.

Pebbles are here finely polished for snuff-boxes, handles for knives, &c. they are done by a wheel, like jewellery work, and are not to be rivalled any where. At Cairo, red leather is made, and a better sort is prepared at Alexandria; yet the latter is far inferior to that which is made in Morocco.

With respect to the trade carried on by the English factory at Grand Cairo, we shall insert an account of it written by a gentleman who resided there many years, and belonged to the factory. In a letter written upon this subject and addressed to a friend, he says, "The goods we have to sell here, are consigned to us by some eminent Turkey merchants in London. The principal articles are, woollens, lead, lead ore, tin, fire arms, cutlery, hard-ware, opticks, bob and chime clocks, also watches, made in a particular manner for the Turkey trade. We sell our goods to some for ready money, and with others, we barter them for some of the following articles, viz. coffee, saffras, gum elemy, gum arabic, gum tragacanth, fagapenum, frankincense, myrrh, aloes, sal-ammoniac, alafaxida, Cocculus Indicus, &c.

When we first settled here, and sold goods to the Mahometans, they would sometimes bring them back, after having kept them a week, complain of defects, when there were none, and insist upon having the money returned; but we were soon after taught in what manner to deal with them. When we sell any thing now to a Mahometan, as soon as the price is agreed on, which we will suppose is 200 Zermaboop chequins, we call in two Mahometans as witnesses, and then take a handful of dirt and put it upon the goods, saying at the same time, we sell you this dirt for 200 Zermaboop chequins.

if he replies, "I buy this dirt, for 200 Zermaboop chequins, the bargain then will be like the laws of the Medes and Persians, which alter not. Perhaps custom only has established this method; but be that as it may, they are never after returned on our hands. When we have gun-arabic, frankincense, myrrh, or Cocculus Indicus, to send to Christendom, we always take care to have it garbelled first; but we, and all other Franks here, are obliged to employ a set of men called Garbellers, and no other, as they pay a certain sum yearly to the Basha for this privilege.

Merchants who consign goods to Cairo, should be very careful to see them well and securely packed or embalmed. We had 30 barrels of tin in rods consigned us by a merchant in London; it came very safe to Alexandria, and was there unshipped and put on board some vessels for this place. In their passage up the Nile, the excessive heat of the sun had such an effect on the barrels, as to cause some of them to fall entirely to pieces, others lost their hoops, and some their heads; which gave the poor thieving sailors who work these vessels, a fine opportunity of making a penny; which when the goods arrived at Boulack, we found they had not neglected; for out of every barrel damaged, they had taken some pounds weight of tin, and sold it at different villages on the banks of the Nile. I would recommend merchants who send tin to Cairo, not to have it put in barrels, but in strong cases made of elm, or oak, to the length of the rods, and have them well nailed up; if this was done, there would scarce be a probability of an ounce being lost; for I never heard of Nile sailors forcing any packages open. Woollens should be embalmed as tight as possible, with a tarpaulin under the outside canvas; for at the mouth of the Nile is a boughas, or mud-bank, on which sometimes the germs run foul; but cloth packed up in the manner I describe, may in case of this accident, be got into another germ without receiving any damage.

Gold and silver stuffs are packed in stout waxed cloth, and then put into a strong case. In and near Cairo, they make oil of the seeds of safflowers, and sell the greaves at 26 paras the kintal of 150 rotolos; these greaves are used by the poor for fuel. In Upper Egypt there are many plantations of sugar-canes; the sugar and molasses made there are sent to a kan near Boulack for sale: the molasses is put into the skins of oxen, heifers, calves, and other animals, which when quite full appear like fo many dead beasts.

Business in general is done by the assistance of brokers, who are mostly Jews, and will buy or sell for their employers, no matter how, so as they get their brokerage. A native of Aleppo, who kept a shop in this city, sold many pikes of woollen cloth to a great Turk for the clothing of his servants, and to be given to the poor; and a few days after, being desired by the Turk to bring in his bill, replied, that through the hurry of business, he had forgot to enter that transaction in his book; he perfectly remembered the rate per pike agreed on, but as to the number of pikes, he was totally at a loss. The Turk desired him to guess as near as he could, and the shop-keeper, seeming suddenly to recollect himself, asked the Turk if he had the listing of the cloth by him; and was answered in the affirmative; then said he, we can soon settle the matter, by measuring that, which must be the same as the length of the cloth. The listing was measured, and the shop-keeper was paid for as many pikes of cloth; but he grossly imposed on the Turk; for it was evident he made him pay twice as much as he ought, as all woollen cloth has two listings. The baseness of this transaction was a few days after explained to the Turk, but the Aleppo knave, had a friend who warned him of his danger, and advised him to decamp, which he immediately did. We pack the drugs, &c. for Christendom, in large square baskets, made of date-tree-wood, which are called coffasses; we line them with coarse blue linen, and cover them with skins of beasts. During the Turkish lent, month, or moon Ramazan, we sell more woollens than at any other time; for then the Turks purchase great quantities for the new clothing of themselves and servants, against the festival of Bairam.

The Weights made Use of in Egypt are as follow, viz.

A grain is the first and least, four of which is a killat.

Sixteen killats is a dram, of which all the Egyptian weights are compounded.

11 drams is a mettigal, by which is weighed gold and silver lace.

144 drams is a rotolo, and is equal to 1 lb. 4 oz. 1 $\frac{1}{2}$ dr.

400 drams is an oke, by which weight shop-keepers sell pepper, sugar, &c.

The Kintals in Egypt are as follow, viz.

One of 36 okes, others of 110, 133, 150, and 155 rotolos.
One pound avoirdupois is equal to 142 $\frac{1}{2}$ dr.
One hundred weight, to — — 40 okes.
One oke, to — — 2 lb. 12 $\frac{1}{2}$ oz.
One hundred okes, to — — 280 lb.

The current Coins in Egypt are,

Burbers, medines, and sequins.
The burber is a copper piece of money about as big as a sixpence, 12 of which make a medine, which is a piece of iron silvered over, and about the size of a silver three-pence.

The sequin is of two sorts; the one, called a funduckee, is of the value of 146 medines; the other, called a zermaboop, is worth 110 medines.

Apers, though not coined in Egypt, are taken here, three going to a medine. Barbary sequins, and Spanish pieces likewise go here. In speaking of great sums, the inhabitants of Egypt always reckon by purses, a purse being 25,000 medines, or 120 pounds sterling.

The Turkish month being lunar, they begin it at the time the moon first appears. The Coptic month is 30 days; and every year they have five intercalary days, and every fourth year six. Their era begins 302 years after Christ, from the martyrdom of the saints in Egypt, in the emperor Dioclesian's reign.

One great caravan that arrives at Cairo, is of those blacks who come from the country near the isle of pheasants, and pass through Fez, Morocco, and Tripoly; being about eight months on their journey, and what they bring is chiefly gold dust. Caravans also come from Tunis and Algiers: besides, there is one of Berberines, from Sennar, who bring the goods of Ethiopia, and of several parts of Africa, as black slaves, gold dust, elephants teeth, gums, ostrich feathers, mulk, ambergris, and ebony.

S E C T. VI.

Political and Military Government of Egypt.

THE government of Egypt is the most considerable one the grand seignior has to bestow. It is vested in a basha, 24 beys, and seven corps of different troops, without the consent of whom the basha cannot act. He begins his viceregency with the month of September, which is the first in the Coptic calendar, and the grand seignior sends his order every year towards that time, by virtue of which he is either confirmed in his post, or dismissed from it. His residence is in the castle of Cairo, and he holds a divan, or privy council, three times a week, viz. Sundays, Tuesdays and Thursdays, at which the beys and the agas, or head of the above-mentioned troops, always assist.

Although the number of beys is fixed at 24, yet it is never complete: the basha, who has a right to appoint them, turns the salary of those who are wanting to his own account. This salary is 500 apers, or about 15 s. sterling per day; and in case they have made some campaigns for the good of the country, it is double that sum. The dignity of bey is purchased, and seldom at a less price than 30 purses.

It is much the same with the militia, or land forces, who are seldom found to exceed half their proper number; only with this difference, that the officers sink the pay of those that are wanting into their own pockets, though not without making some suitable acknowledgement to the basha for winking at the deficiency.

Two of the corps of troops serve on foot, viz. the Janizaries and Azabs. The rest are horsemen, and are called Jumelis, Tufekgis, Sherakfas, Mettefaraccas, and Shaous. The Janizaries are supposed to form a body of 12,000, the Azabs one of 8000, and the horse 20,000; so that the whole number should be 40,000; but for the

reason before observed, they seldom amount to above half the number.

The foot soldiers form the garrison in the castle and city of Cairo; the Meltefarraacs hold the other castles, such as Alexandria, Rosetta, &c. The Junelis, Tuffekgis, and Sherakias, are distributed throughout the kingdom, to serve the beys and governors of provinces; and the Shaous are employed to keep a watchful eye over the chargeable revenues belonging to the grand feignior.

Egypt is divided into a number of provinces, called *Cashtefs*. The governors of them are stiled *Cashtefs*, and those who possess villages, *Meltezens*. All these *Cashtefs* and *Meltezens* are obliged to obey the commands of the *divan* and *basfa* at Cairo. Each *Meltezen*, or owner of a village, must either have sold or given his right to another 40 days before his death. If this has not been done, the whole becomes the property of the grand feignior, in consequence of his right of confiscating all the possessions of his subjects, who at the time of their deaths, are in his service.

The beys are possessed of all the troops and the power, and there is always one amongst them who takes some advantage above the others, and by that means raises their jealousy; but he only keeps in this situation till his enemies have found a stronger party than his own. The government of those who thus elevate themselves above the rest is short, and their end often proves tragical.

Dr. Pococke says, that neither the *basfa*, nor any of the beys seropie taking off their enemies by poison or the dagger, particularly by the former means, of which he relates the following instance: "A *basfa*, says he, knowing that the bey whom he would willingly dispatch was jealous of his designs, ordered his servant, when he came to visit him, to pour his own coffee and that of the bey's out of the same pot. The bey, seeing this, concluded that it could not be poisoned, and drank it off; but the slave, on his given the coffee to the *basfa*, made a false step, as he was ordered, and spilt it on the floor; upon which the bey, too late, perceived the *basfa*'s treachery."

When any intestine wars arise, the *basfa* grows rich, partly because the division among the troops throws some of the power back into his own hands, and partly because a considerable share of the estates of those who are killed in battle, or are afterwards proclaimed enemies of the state, becomes his property. But the most considerable branch of this revenue arises from the pestilence that so frequently rages in Egypt; inasmuch that during the three or four months it commonly lasts, it brings in so great an income, that a single day may produce two or three hundred thousand crowns, by the deaths of those who are possessed of large villages. By the laws of the Ottoman empire, these lands revert to the grand feignior, but a considerable part of them fall to the share of the *basfa*, to which he is entitled by virtue of his commission; and these frequently amount to immense sums, especially as, by the rapid deaths, with which the purchasers are often snatched away, one after another, he is enabled to sell the same estate to three or four different persons in one week; no land purchase being longer than the life of the purchaser.

A late celebrated writer, in speaking of the political constitution of Egypt, says, "Notwithstanding Egypt is subject to the grand feignior, yet we may say it properly belongs to their *Mamalucks*, or slaves, most of whom are Georgians or Circassians. The Turks, who carry on the trade with those slaves, force them to abjure their religion before they bring them into Egypt. All the beys, and especially all the officers of the troops, are renegadoes, and it is rather extraordinary to see a Turk raised to any great military post. They go into the service of the renegadoes, who partly to get rid of the expence of feeding them, obtain for them the pay of a janizary or of a horseman: in one word, all the seven corps of troops consist merely of the life-guards of these renegadoes. There are thays of the janizaries, who have a guard of four hundred men about them, besides those whom they keep in their villages. The renegadoes inherit equal shares of their masters estates with the children; and it has been observed, that the latter being brought up to a voluptuous life, soon spend their inheritance, and are reduced

to such wretched circumstances, as to have recourse to these their own slaves, and beg of them for subsistence, or even to serve them. It may justly be said, that there is no country besides Egypt where such vast changes happen in families."

The revenues of the grand feignior in Egypt consist of three branches, which arise from the lands, the customs and the poll-tax on Christians and Jews. All the villages in Egypt pay a certain yearly rent to the grand feignior, which is fixed; and this is the *hafna* or treasure, that is sent every year to Constantinople. How easy the rent is, may be concluded from the sum which is raised, amounting only to 6000 purses, each of 25,000 medines, or about 120l. sterling; out of this, corn, flour, oil, and the like are sent yearly to Mecca, and 12,000 soldiers are paid, which reduces the treasure to 1,200 purses. After other deductions, for the conveyance of the water of the Nile to their lands, preserving the public canals, repairing the castles, supplying the seraglio, and storing the arsenal, the whole of this treasure carried to Constantinople does not commonly amount to more than 200 purses in specie, or about 24,000l. sterling. The customs are farmed, and the persons that pay the poll-tax are only men, after they arrive at the age of sixteen. It is called the *harach*, and is imposed only on the Christians and Jews.

S E C T. VII.

Of the Civil Government of Egypt.

THE civil as well as political government of this kingdom is first vested in the *basfa*, whose prime minister is called *caia*, and generally holds the *divan*. The *basfa* preserves a dignity not inferior to that of the grand feignior: he always sits behind a lattice at the end of the *divan*, and seldom assists himself, except on very particular occasions, such as reading some order from the *Porte*, or the like. When he goes abroad, he is always attended by one of the great officers, called a *Druggerman* *aga*, who is not only an interpreter, but more especially acts as master of the ceremonies; and, like the grand feignior, he is always escorted by a body of guards.

The *divan* is held three times a week, viz. on Sunday, Tuesday, and Thursday, at the *basfa*'s palace at Cairo. This grand council sits in a spacious and magnificent hall, which hath a noble square or court before it, where the members of it parade with all their retinue, and make such a splendid appearance with their servants and horses, richly dressed and caparisoned, and glittering with gold, silver, and precious stones, that it is said to exceed even the pomp of the grand feignior at Constantinople. According to ancient records, we are informed that sultan Selim, having held his *divan* at Cairo, and in the stately hall of the royal palace of the Egyptian monarchs, forbade the then *basfa* and all his successors to meet any more in that magnificent apartment, lest the sight of so much grandeur and opulence, joined to the noble appearance of the *divan*, should inspire them with a design of shaking off their loyalty to the *Porte*, and of making themselves absolute masters of Egypt: so that this hall, where the *divan* now meets, is quite different from that of the ancient Egyptian kings; nor is there any thing in it worthy of observation, except seven deal planks, each about half an inch thick, and closely fastened together by an arrow, which, it is said, that sultan shot through them. These are kept suspended over the place where the *basfa* sits, as a monument of the extraordinary strength of that monarch.

The different divisions of this country are subdivided into provinces, some of which are under the direction of governors, called *sangacks*; and others under the government of Arab sheiks, or chiefs, all of whom are annually chosen by the *divan* on the 20th of August, which is the first day of the Coptic year. The business of these officers is, to keep the people under their respective jurisdictions in proper order, and to gather in such revenues as belong to the grand feignior.

The city of Grand Cairo is under the guard of the *Janizaries*, as is also the country north of it, and the *Azaba* have the charge of the country round the city. An officer constantly patrols about the city, especially at night, who is called the *Wallas*, and answers to the Turkish officer called *Soubasba*. He takes into custody all persons who behave

behave diſorderly, or cannot give a ſatisſactory account of themſelves; and, if they are not under the protection of the janizaries, frequently inflictſ puniſhment on them at his own diſcretion. Another diſtinguiſhed officer belonging to the city is called metſhib, whoſe buſineſs is to ſee that all weights and meaſures are of their proper ſtandards.

The teſtardar is a great officer, being lord high treaſurer of the tribute paid out of the lands to the grand ſeignior. He is choſen annually by the Porte, but, unleſs in caſes of miſbehaviour, or breach of truſt, he uſually retains his office during life.

The emir hadje, or prince of the pilgrims that go to Mecca, is alſo choſen annually, and generally continues in his office two years, in order to make amends for the great expence he muſt neceſſarily be at the firſt year for his equipage: but if he is a perſon of abilities, and has great intereſt at the Porte, he may be continued longer, though rarely more than ſix years; for if they conduct the caravan ſeven years the grand ſeignior preſents them with a collar of gold. Their perſons are eſteemed ſacred, and if they happen to make any violation on that conduct they ought to preſerve, they are not ſubject to any other puniſhment than being degraded from their office. This officer has command over the eſtates that belong to Mecca. The perquiſtes of his office, excluſive of what he is allowed by the Porte, conſiſt in having a tenth of the effects of all pilgrims who die in their journey; and if he behaves himſelf well during his adminiſtration, it procures him the general eſteem and affection of the whole country.

With reſpect to the adminiſtration of juſtice here, it is much the ſame as in moſt other parts of the grand ſeignior's dominions. A cadilſkier (whoſe office is much like that of lord high chancellor) is ſent annually from Conſtantinople to Grand Cairo, to whom they may appeal from the cadis; and many cauſes of importance in Cairo are immediately brought before him. He has his deputy, called nakih, and his houſe is the place of juſtice. In Cairo there are alſo eight cadis in different parts; and in every ward there is an officer called kabani, who is ſomething like a notary-public; by whom all obligations muſt be drawn that are deemed valid.

A cadi is ſent annually from Conſtantinople to Alexandria, Roſetta, Damietta and Gize; but the cadilſkier ſends them from Cairo to moſt other towns.

The law here is much ſtudied, and is written in the pureſt language, ſuch as is ſpoken at Damafcus. They have a ſaying, that "the law cuts the ſword, but the ſword cannot cut the law;" for the grand ſeignior himſelf cannot inflict any puniſhment on a perſon of that profeſſion, however atrocious his offence.

Many cauſes in Egypt are brought before leading men, who abſolutely decide the matter without having any reference to a magiſtrate; nor is there any appeal to be had from them. One thing is much to be admired here in the adminiſtration of juſtice, which is, that all cauſes are immediately decided, as ſoon as the parties make application to thoſe in whoſe power it is to determine them.

Their puniſhments are proportioned to the offences committed. Thoſe guilty of murder are puniſhed with death; but in trifling matters, they either give them the baſtinadoe, or elſe ſeverely whip them. They are particularly ſevere in the puniſhment of bakers for making their bread deficient, as alſo to butchers for ſelling their meat either ſhort of weight, or ſo ſtale as not to be wholeſome. Of theſe latter puniſhments we have a very particular account, given by a perſon who, a few years ago, travelled through moſt parts of this kingdom: "The puniſhment, ſays he, inflicted on bakers in this country, for making their bread deficient in weight, is, I think, ſevere and cruel; for though I cannot excuſe ſo barbarous an impoſition on the labouring part of the community, yet I would, by all means, limit the puniſhment within the bounds of humanity. When found guilty of the firſt offence, the overſeer of the bakers, who is the examiner and only perſon who tries them, immediately orders the delinquent to be ſeverely baſtinadoed, which is beating them on the ſoles of their feet with a large ſtick; for the ſecond, they are more ſeverely puniſhed in the ſame manner; and for the third, without any other proceſs than the above officer's order, they are ſometimes put into their own oven when hot, where they are ſuffered to periſh, being burnt to death; which puniſhment I ſaw executed.

"The puniſhment of the butchers in this country, who are detected in ſelling meat either ſtale or deficient in weight, is no leſs extraordinary than that of the bakers, though not ſo cruel or ſevere; and as I mean to acquaint you more particularly with facts I have had ocular demonſtrations of, than relations culled from other travellers, ſuch as dancing camels, &c. related by many, and which, after the moſt ſtrict inquiry among the natives, I affirm, I could never hear the leaſt trace of from the old inhabitants of Cairo; ſo you may be aſſured the following is a fact, of which alſo I was an eye-witneſs. A butcher in the neighbourhood where I reſided was detected by the examining officer of being guilty of this crime, and without any other form of trial than the order of the officer, was immediately nailed by one of his ears to the poſt of his own door, his noſe pierced, and one end of a wire about ſix inches long ſaſtened to it; at the other end of which a piece of his ſinking meat was fixed. In this ſituation he was obliged to continue near four hours."

The relations or deſcendants of Mahomet, called in Arabic, ſheriff or noble, and by the Turks emir or prince, have the privilege of being exempt from appearing before any judge but their own chief, who is himſelf a relation of Mahomet, and is called neckhel-ſheraſh. They are ſo much eſteemed, that though any one of the military bodies will puniſh them if guilty of any miſdemeanor, yet they ſill take off their green turban out of reſpect to their character, and then ſubject them to equal puniſhment with others; and the like ceremonies are uſed when they are puniſhed by their own magiſtrate.

Although juſtice is in ſome caſes adminiſtered by the baſſa, his beys, and the military officers, yet they all pay little regard themſelves to the laws of equity. The military officers in particular enrich themſelves by various oppreſſions of the people, eſpecially of the richer ſort, whom they either artfully enliſt, or pretend to have enliſted, under ſome of their bodies; by which they ſeeze them while alive, and ſeize on the beſt part of their effects after they are dead. The baſſa connives at all theſe abuſes, either as being a ſharer in the ſpoils, or out of fear of diſobliging ſuch a powerful body, by diſcountenancing or ſuppreſſing them. The immense riches of the grand ſeignior, ſays a celebrated writer, may be eaſily collected, as he is abſolute lord of all the lands in his dominions; and all the riches center in him, notwithstanding the bad government; for the little officers oppreſs the people, the great officers ſqueeze them; the baſſa, all the people under him; himſelf becomes a prey to the great people of the Porte; and the grand ſeignior at laſt ſeizes the riches of the great officers about him.

Theſe arbitrary proceedings of the military are exerciſed more or leſs all over the kingdom, eſpecially among the Arabian ſheiks, from whom they extort the moſt exorbitant contributions, under the ſpecious name of tribute for protecting them. The janizaries are ſo bent upon this point, that they keep an exact roll of all the various eſtates, trades and occupations in the kingdom; of all the rich and poor; of the different ways by which they have extorted any ſums from them; and are ever conſidering new ones to effect their oppreſſive purpoſe.

The Europeans, and other trading nations, partake of theſe cruel extortions: the janizaries are never at a loſs for a pretence to quarrel with them, ſometimes about their dreſs, at others about their behaviour, as not paying a proper reſpect, or for admitting ſome of their Mahometan women into their quarters by night. Under ſuch pretences, whether real or falſe, they extort money, for there is no other method of avoiding their reſentment than by a quick ſubmiſſion, and ſome anſwerable atonement, as ſpeedy as valuable, according to one of their favourite adages, that "the egg of to-day is preferable to the chicken of to-morrow." But, of all nations, that of the Jews is moſt hated, deſpised and oppreſſed by this tyrannic government; under which they are dwindled to a very inconfiderable number, except at Cairo, and reduced to the loweſt poverty; though they were once very numerous, rich, and entrusted with ſome of the moſt important poſts of the ſtate.

The inhabitants of the upper parts of the kingdom are ſtill more wretched, as they are not only equally oppreſſed by their rapacious governors, but frequently expoſed to the inroads and dreadful ravages of the Arabian ſheiks, who take all opportunities of plundering the poor villagers

by

by way of reprisal for the hardships they suffer from their petty tyrants.

From the tyranny thus exercised by one degree of people over another, the government of Egypt may be said to be at least equally oppressive with that under the direction of the most despotic prince. The rich plunder the poor, and the latter, in defence of themselves, make reprisals wherever they are to be met with. Thus insurrections frequently happen, the consequences of which are not only the loss of property, but of lives; for the poorer sort, when urged by necessity, become desperate, and wreak their vengeance on those that have oppressed them.

“ Tempt not the brave and needy to despair ;
 “ For though your violence should leave them
 bare,
 “ Of gold and silver, swords and darts remain,
 “ And will revenge the wrongs which they sustain :
 “ The plundered still have arms.”

S E C T. VIII.

Of the religion of the Egyptians.

BEfore we describe the present state of religion in Egypt, it may not be improper to give some account of that used by the ancient Egyptians, who were gross idolaters, and worshipped the most fabulous deities.

The Egyptians are said to have been the first who erected idolatrous altars, images and temples, and the first inventors of festivals, ceremonies, and transactions with the gods by the mediation of others, and to have first given names to the twelve gods. They had a great many deities of different ranks and orders. Those who were chiefly honoured were Osiris and Isis, by which it is most probable they originally meant the sun and moon, whose influences governed and preserved the world. The name Osiris in the Egyptian tongue, signified *many-eyed*, an epithet very proper for the sun; and Isis signified *antient*. These two planets are considered by them as the great causes of nutrition and generation, and as it were the sources from whence the other parts of nature, which also they looked upon as gods, and to which they gave distinct names, were derived. These were Jupiter, or Spirit, the *vis vivifica* of living creatures; Vulcan, or Fire; Ceres, or the Earth; Oceanus (by which they meant their Nile) or Moisture; and Neith (Mineiva) or Air. They had also terrestrial and mortal deities, which had, they thought, merited the honours paid them by the benefits they conferred on man in their life-time, several of them having been good kings of Egypt. Some of these bore the same names with the celestial gods, and others had proper names of their own. Such were the Sun, Cronus, or Saturn, Rhea, Jupiter (called by them Ammon) Juno, Vesta, Hermes or Mercury, Orus, Venus, Ian, Arueris, Nephthys, Harpocrates, and others.

Besides these gods, the Egyptians worshipped a great number of beasts; as, the ox, the dog, the wolf, the hawk, the crocodile, the ibis, the cat, &c. Many of these animals were the objects only of the superstition of some particular cities; and whilst the inhabitants of one part worshipped a particular species of them as gods, their neighbours held the same in abomination. This was the source of the continual wars carried on between one city and another; and this was owing to the false policy of one of their kings, who, to deprive them of the opportunity and means of conspiring against the state, endeavoured to amuse them by engaging them in religious contests.

The inhabitants of every city had a peculiar zeal for their gods. “ Among us, says Cicero, it is very common to see temples robbed and statues carried off; but it was never known that any person in Egypt ever abused a crocodile, an ibis, or a cat, for its inhabitants would have suffered the most extreme torments, rather than have been guilty of such sacrilege.” It was death for any person to kill one of these animals intentionally; and even a punishment was decreed against him who should have killed one of them even by accident. Diodorus Siculus relates an incident to which he was eye-witness during his stay in Egypt. “ A Roman, says he, had inadvertently, and without design, killed a cat; the exasperated populace ran to his house; and neither the authority of the king, who immediately detached a body of

his guards, nor the terror of the Roman name, could rescue the unfortunate criminal. And such was the reverence the Egyptians had for these animals, that in an extreme famine, they chose rather to eat one another, than feed upon these imagined deities.”

But of all the animals which the Egyptians held sacred, that most revered was the bull, by which they represented Osiris. There were two of this kind kept, the one at Memphis, called Apis, and the other at Heliopolis, called Mnevis. This last was black, and the honours paid to him were inferior to those due to Apis.

The extravagant worship which the Egyptians paid to the bull at Memphis and Heliopolis, the goat at Mendes, the lion at Leontopolis, and the crocodile at the lake Mæris, almost exceeds belief. They were kept in consecrated enclosures, and well attended by men of high rank, who at a great expence provided victuals for them, which consisted of the greatest dainties, such as the finest flour boiled in milk, cakes of several sorts made with honey, and the flesh of geese boiled or roasted. Those that fed on raw meat were supplied with several sorts of birds. They were washed in hot baths, anointed with the most precious ointments, and perfumed with the most odoriferous scents. They lay on the richest carpets and other costly furniture; and that they might want nothing to make their lives as happy as possible, they had the most beautiful females of their several kinds provided for them, to which they gave title of their concubines, bestowing extravagant attendance and expence upon them.

The crocodile to whom they paid adoration was trained up to be tame and familiar for the purpose; he had his ears adorned with strings of jewels and gold, and his fore-feet were ornamented with golden chains. He was fed with consecrated provisions at the public charge, and when strangers went to see him, which often happened out of curiosity, they also carried presents of cake, dressed meat, and wine, or a drink made with honey, which was offered him by the priests, one opening his mouth, and the other feeding him. When he died, his body was embalmed and buried in a sacred coffin at Arsinoe.

The Egyptians often laid out more money than they were worth in the funerals of these animals. Thus, in the beginning of the reign of Ptolemy the son of Lagus, the bull Apis dying of old age, the funeral pomp, besides the ordinary expences, amounted to upwards of 50,000 French crowns. After the last honours had been paid to the deceased deity, the next care was to provide him a successor and all Egypt was sought through for that purpose. He was known by certain signs that distinguished him from all other animals of that species; upon his forehead was to be a white spot, in form of a crescent; on his back the figure of an eagle, and upon his tongue that of a beetle. As soon as he was found, mourning gave place to joy; and nothing was heard in all parts of Egypt but festivity and rejoicings. The new god was brought to Memphis to take possession of his dignity, and there installed with a great number of ceremonies.

Besides the worship of animals, the Egyptians carried their superstitious folly to such lengths, as even to ascribe a divinity to the pulse and roots of their gardens, for which they are thus reproached by an antient satirical poet.

“ Who has not heard where Egypt's realms are nam'd,
 “ What monster gods her frantic sons have fram'd;
 “ Here Ibis god's with well-grown serpents, there
 “ The crocodile commands religious fear:
 “ Where Memnon's statue magic strings inspire
 “ With vocal sounds that emulate the lyre;
 “ And Thebes, such, Fate, are thy disastrous turns!
 “ Now prostrate o'er her pompous ruins mourn,
 “ A monkey-god, prodigious to be told!
 “ Strikes the beholder's eye with burnish'd gold;
 “ To godship here, blue Triton's scaly herd,
 “ The river progeny is there prefer'd:
 “ Thro' towns, Diana's power neglected lies:
 “ Where to her dogs aspiring temples rise:
 “ And should you seek or onions eat, no time
 “ Would expiate the sacrilegious crime:
 “ Religious notions sure, and blest abodes,
 “ Where ev'ry orchard is o'er-run with gods.”

Such

Such reverence did the Egyptians pay also to cats and dogs, that when one of the former died, all the family shaved their eye-brows; and if one of the latter, their whole body. In case of fire there was great lamentation on account of their cats, which they took greater care, if they could, to preserve, than their houses.

It would be needless to enumerate all the animals worshipped by the antient Egyptians; but at the same time a piece of remissness not to take notice of Herodotus's account of the phoenix, which fable of theirs has given rise to whatever has been since related of that imaginary bird. He tells us, the phoenix was one of the sacred birds, which himself had never seen but in effigy, for he appeared in Egypt but once in 300 years, immediately after the death of his father, as those of Heliopolis affirmed. Their painters represented him with a plumage of crimson and gold, and of the shape and size of an eagle. They pretended he came from Arabia, bringing the body of his father embalmed, which he buried in the temple of the sun. And this they said he performed thus: first, he moulded as much myrrh as he could carry into the shape of an egg; and having tried its weight, hollowed the egg, and put his father into it: he then stopped up the aperture again with myrrh, in such proportion, that the weight of the whole might equal that of the egg before the body was put in, and then carried it to Heliopolis.

The antient Egyptians also offered human sacrifices to their gods. As red oxen were allowed to be sacrificed, because of their resemblance to Typhon, who was said to be red-haired, so men of that complexion were slain in former times at the tomb of Osiris; but few of the Egyptians having red hair, strangers were the usual victims. Men were also in old times sacrificed at Heliopolis to Juno or Lucina. Three a-day were sacrificed at a certain season in the dog-days, being burnt alive, and their ashes scattered abroad. But this barbarous custom was abolished by Amosis, who ordered that so many images of wax should be offered in their stead.

Several reasons have been given for the worship paid to animals by the Egyptians. The first is drawn from the fabulous history. It is pretended that the gods, in a rebellion made against them by men, fled into Egypt, and there concealed themselves under the forms of different animals; and that this gave birth to the worship which was afterwards paid to these animals. The second is taken from the benefits which these several animals procure to mankind: oxen by their labour, sheep by their wool and milk, dogs by their service in hunting and guarding houses, whence the god Anubis was represented with a dog's head. The ibis (a bird very much resembling a stork) was worshipped because he put to flight the winged serpents, with which Egypt would have otherwise been grievously infested, the crocodile was worshipped because he defended Egypt from the incursions of the wild Arabs, by preventing their crossing the Nile, and the ichneumon was adored because he prevented the too great increase of crocodiles, which might have proved destructive to Egypt.

Since the establishment of Christianity, philosophers have asserted other means for the worship which the Egyptians paid to animals; and declared, that it was not offered to the animals themselves, but to the gods of whom they were symbols. Plutarch, in his treatise, where he examines professedly the pretensions of Isis and Osiris, says thus: philosophers honour the image of God wherever they find it, even in inanimate beings, and consequently more in those which have life. We are, therefore, to approve, not the worship of these animals, but those who, by their means, ascend to the deity; they are to be considered as so many mirrors which nature holds forth, and in which the Supreme Being displays himself in a wonderful manner, or as so many instruments which he makes use of to manifest outwardly his incomprehensible wisdom. Should men, therefore, for the embellishment of statues, amass together all the gold and precious stones in the world, the worship must not be referred to the statues; for the deity does not exist in colours artfully disposed, nor in frail matter destitute of sense and motion.

Plutarch says also, in the same treatise, that as the sun and moon, heaven, earth, and the sea, are common to all men, but have different names according to the difference

of nations and languages; in like manner, though there is but one deity, and one providence that governs the universe, and which has several subaltern ministers under it, men give to this deity, which is the same, different names; and pay it different honours, according to the laws and customs of every country.

Having thus premised the religious worship of the antient Egyptians, we shall now take notice of that practiced by the modern ones.

The present established religion in Egypt is that of Mahometanism, which is here exercised in all respects the same as in Turkey, except that they are not quite so strict in observing it in the former as they are in the latter.

Those who have the care of the mosques are called sheiks, which signifies head or chief; but the superiors of the religious government are a mufti, who is the principal, and the doctors of the law; and these are the judges in all causes of a spiritual nature.

The number of sheiks to each mosque is fixed in proportion to its size and revenues. One is superior over the rest, under whom there are hogis, or readers, and those who summon the people to prayers. In small mosques the sheik does all himself: he opens the mosque, calls the people to their devotion, and begins the performance of religious duties at the head of the congregation, who stand in great order, and make all their motions together.

By the most antient and authentic records, it appears that Christianity was first planted in Egypt by St. Mark, who was the first bishop of Alexandria, then the metropolis of the kingdom. The jurisdiction of these prelates were settled by the council of Nice over all the churches of the diocese of Egypt, which included Lybia, Pentapolis, and Egypt properly so called; and afterwards the Ethiopian, or Abyssine churches, became subject to this patriarch.

The first emperor that issued orders to persecute the Christians was Nero, and that persecution extended to Egypt, where many Christians were destroyed. Domitian issued out orders against the Christians, which Nerva revoked. In the time of Severus, a persecution against the Christians went through all the Roman provinces; but it was more cruel at Alexandria than any where else; and many Christians of the first rank in Egypt suffered martyrdom, particularly St. Felicia and St. Perpetua, two female martyrs.

Churches were established in Egypt in the first century; and in the third, more than one half of the Roman empire became Christians. There were many churches in all the cities, which were governed by bishops, priests, and deacons. Of these churches, some were more eminent, and the bishops of them had more authority than others. That of Rome, founded by St. Peter and St. Paul, was the first: those of Alexandria and Antioch held the second and third rank; and that of Jerusalem was respected, because it gave birth to Christianity; but all these churches were linked together in the same communion.

The patriarchs that succeeded St. Mark in the five first centuries were as follow:

The names of the bishops of Alexandria.	The beginning of their pontificate.	The length of their pontificate.

The succession of the patriarchs of Alexandria which followed is not known, and would be of little use in history, as the Barbarians were then in possession of Egypt.

During the persecutions under the Roman emperors, many of the Christians of Egypt retired to Copts, and the places about it, from which it is said they obtained the name of Copts. The Turks still call them by this name. As the Copts practise circumcision, the Christians of other countries, by way of contempt, give them the nick-name of Kufs, or Girdlers, meaning thereby, "that they are Christians only from the girdle upwards," but carry the fear of Judas's below it; for either from a spirit of opposition, or in imitation of their neighbours the Abyssinians, they have adopted that and many other Jewish rites.

The Copti monks, who are dispersed all over the Upper Egypt in poor wretched convents, have also adopted so much of the ascetic life of the old Jewish hermits, that they are looked upon as their spiritual offspring, and particularly imitate them in their long fasts, singing, prayers, and many extravagant severities. Their churches, cells, gardens, utensils, and dress, are as poor and mean as their diet; and, from their ascetic way of life, they contract a morosity of temper, which, joined to their tenaciousness and ignorance, render them totally unfit for any other conversation than that which tends to a monastic life.

The ceremonies of the Copti church are much the same as those of the Greek church: their liturgies are in the ancient Coptic language, which is the Egyptian, though much corrupted, especially by the Greek language, that was introduced among them during the time of the Ptolemies, when they took not only several of their letters, that might be something different in their manner of pronunciation, but likewise adopted many of their words. It is reasonable to suppose that the Arabic language took place of it when the Arabs conquered this country; so that now the Coptic is no more a living language, nor is it understood properly, except by a few of their priests.

The Copti churches are always covered with matting; and when these people go to their devotion, before they enter the church they take off their slippers, and when they come into it, they prostrate themselves and kiss the pavement. The patriarch makes a short discourse to the priests once a year; and the latter read legends from the pulpit on great festivals, but never preach. They keep the Sunday very strictly, and, taking in Wednesdays and Fridays, fast seven months in the year. Their abstinence chiefly consists in not eating eggs, milk, butter, oil, and such things as are at other times commonly used.

It is said, that the chrism, or holy oil, which they call the micron, is consecrated but once in 30 years by the patriarch; and that a whole day is spent in that ceremony, in the course of which they chant the Old and New Testament all over. It is possible this may be done, but the means of effecting it must certainly be by different acts of them taking different parts.

* An excellent writer says, "But if, as has been supposed by some, the Egyptians by years did not mean the

In their ceremony of baptism, they dip the child three times into the water, then confirm it, and give it the sacrament, that is, the wine; the priest dipping the end of his finger in it, and putting it to the child's mouth; which is done after they have administered the sacrament, for they do not keep the consecrated mysteries.

They give absolution as they do in the Greek church, and also anoint all the people present, that the evil spirit may not go into them. The priests are obliged to say an office every day, as long as that of the Roman breviary; only it is every day the same, which they get by rote. The deacons have a shorter form, but the bishops is longer, and the patriarch's still longer. They administer the sacrament on Sundays and holidays, which latter are numerous; and also on Wednesdays and Fridays, and every day in Lent. The priests prepare for it by going into the church the evening before at sun-set, and continuing there till the ceremony is over: they spend the night mostly in singing psalms, and some of the laity shut themselves up with them. They abstain from blood and things strangled; they pray for the dead; but have a notion that the soul goes to heaven in 40 days; and yet they pray for them afterwards.

The Copts in general are very irreverent and careless in their devotions. The night before Sunday and festivals they spend in churches, and the holy day in sauntering about from one place to another. They seem to think that their whole religion consists in repeating their long services, though without the least devotion, and in strictly observing their numerous fasts. They are in general exceeding ignorant, both priests and people; and if we except the convents of St. Paul and St. Anthony, and one at Esne, the rest are inhabited only by one or two priests. The patriarch must be a man that has never been married, and is always taken out of one of the above convents.

The Alexandrian metropolitan is said to have no less than 140 bishoprics in Egypt, Syria, Nubia, and other parts that are subject to his patriarchate; besides the abuna, or bishop of the Abyssinians, who is nominated and consecrated by him. The bishops elect the patriarch, who is confirmed by the principal Copti, because they must advance the money for the firman, or patent, which is afterwards paid out of the patriarchal revenues. He is installed at the east end of the church of St. Macarius in Cairo, where he is elected, and afterwards in the choir of St. Mark in Alexandria. He is generally chosen by the majority of voices; but if the number appear equal, they vote in a more solemn manner, by writing their names, and putting them on the altar.

We must not quit this section, without taking notice of the dervises, who are a very particular sort of people, and may be reckoned of two or three kinds. Those that are in convents are in a manner a religious order, and live retired; though some of these travel with credit, and return to their convents. Some who take on them this character live with their families, and follow their trades; these also appear to be a good kind of people; but there is a third sort that travel about the country and beg, or rather oblige every body to give. They all wear an octagonal badge of white alabaster, with a greenish cast, before on their girdles, and they have a high stiff cap without any kind of ornament. The turcomen wear the same, a little more pointed, but with a white sash about it. There are few of these people in Egypt, except those who live in convents, and these are chiefly situated within a small distance of Cairo.

SECTION IX.

The History of Egypt.

IT is certain that the Egyptians are a very ancient people, though not near so ancient as they would represent themselves, when they give us a catalogue of their princes, some of whom according to their fictitious account reigned several thousand years before the creation.*

It is however evident that this country was very early planted, but the history of its ancient state is so much en-

veloped

periodical revolution of the sun, but only of the moon, their chronology in that case might be confident enough with the Scripture

veloped in obscurity, or disguised by fables, that it cannot in the least be depended on. The first king of Egypt of whom we can speak with any degree of authority was Menes or Mifraim, the son of Ifam, or Cham, who reigned in the year of the world 1816 and 2188 years before Christ. Concerning this prince, Herodotus says that the Egyptian priests informed him that "this Menes was the first king who reigned in the world; and that, before his time, all Egypt, except the country of Thebes, was one moras. That he diverted the course of the Nile, by drying up that part of it, which had passed by the foot of the sandy mountain towards Lybia; and caused the waters to run from a certain angle through the hills by a new channel: after which, he built the city of Memphis, within the ancient bed of the river; caused a lake to be made without the walls from the river; and founded the magnificent temple of Vulcan. Menes instituted the worship of the gods, and the ceremonies of the sacrifices.

Herodotus then tells us that the same priests read to him the names of 330 sovereigns who reigned after Menes, eighteen of whom were Ethiopians, one a woman, and the remainder Egyptians. Diodorus Siculus makes mention of several princes between Menes and Meris, for he says the Menefian family enjoyed the throne to the 52d descent, and that the whole of their reigns included the space of 1400 years. Hence Busris the first was the 53d monarch from Menes, and he was succeeded by eight kings of his line, the last of whom, who was likewise named Busris, was the founder of the city of Thebes, which he made the royal residence.

Osymandyas is supposed to have succeeded the above monarch, though the fact is controverted by some historians. The Bactrians having revolted in the reign of this prince, he raised an army of 400,000 foot, and 20,000 horse, and with this prodigious force reduced them again to obedience. The descendants of Osymandyas reigned after him to the eighth generation; and the last monarch of that line, whose name was Uchoreus, rebuilt and fortified Memphis, to which city he removed the regal seat from Thebes.

Safychis is considered as a great legislator, and the queen Nitocris, who succeeded him, founded the third great pyramid.

After the death of Nitocris comes the race of shepherd kings; for the shepherds, who were Arabians, conquered the greatest part of Lower Egypt, with the city of Memphis its capital. But Upper Egypt still remained unconquered, and Thebes existed a kingdom till the reign of Sesostris. The first of the shepherd kings was named Salatis, and this monarch was succeeded by five others called Beon, Aphaenas, Apophis, Janar and Aflis, whose reigns included the space of 259 years.

Thetmothis, king of Upper Egypt, having raised a prodigious army, drove these shepherd kings and their subjects from Lower Egypt, and obliged them to retire into Palestine. This happened 1825 years before Christ, and in the year of the world 2179, from which time nothing remarkable occurs in the Egyptian history till the year of the world 2276, which was the time when Joseph was brought a slave into Egypt.

The history then becomes uninteresting again, till the year of the world 2427, when Ramafes Miamun, one of the Pharaohs of the sacred writings, reigned over the country, and was particularly oppressive to the Israelites. This prince had a very long reign, and was succeeded on the throne by his son Amenophis, in the year of the world 2494. This Amenophis was the Pharaoh under whose reign the Israelites departed out of Egypt, and who was himself drowned in the Red-Sea.

Moris, or Myris, was the prince that dug the celebrated lake that goes by his name to this day, and erected a noble portico on the north side of Vulcan's temple at Memphis. This monarch was succeeded by the celebrated Sesostris, who began his reign in the year of the world 2513, or 1491 years before Christ.

Sesostris was one of the greatest heroes and conquerors

of antiquity, and his reign is deemed one of the most extraordinary periods of the Egyptian annals. His father formed a design of making him a hero, even from his birth, and laid a plan to bring him up to all the hardihoods of body, fortitude of mind, and military knowledge, requisite to form the character of a great conqueror. His plan was as follows: he ordered all the male children in Egypt, born on the same day with his son, to be brought to court, where they were educated with the young prince, and inured to laborious exercises, in order to qualify themselves for a military life, and at the same time proper care was taken to adorn their minds with all kind of suitable knowledge, so that they were at once formed to command and to execute.

When Sesostris was arrived to a proper age, his father sent him, and those who were educated with him, at the head of a considerable army, against the Arabians, whom they subdued. This was the introductory campaign of the young Sesostris, and his juvenile companions who had been educated with him, in order to give as officers under him, and who were 1200 in number. The king then ordered Sesostris and his army to march against the Lybians, whom they subdued, as they had done the Arabians. On his return from the Lybian expedition, Sesostris mounted the Egyptian throne, his father having died during his absence.

Having a great thirst for glory, and being fond of a military life, Sesostris determined to extend his conquests still farther. But before he entered upon this design, or quitted his kingdom, he wisely provided for its security during his absence, by dividing Egypt into 36 nomes, or provinces, over each of which he placed a trusty governor, in whom he could confide, and made his brother, Armais, supreme regent of the whole. He then levied a vast army, consisting of 600,000 foot, 24,000 horse, and 27,000 armed chariots. With this force he first invaded Ethiopia, rendered it tributary, and obliged its inhabitants to furnish him annually with a stipulated quantity of gold, ebony, ivory, &c. Finding his land forces inadequate to the great plans he designed to execute, he was the first Egyptian king who turned his thoughts to the equipment of a navy. He accordingly, at a vast expence, fitted out two fleets, the one, consisting of 400 ships, was to act in the Arabian seas, and the other, which was of a similar force, was stationed in the Mediterranean. With the first of these fleets he entered the Red-Sea, subdued the coasts, conquered the islands, and then turning back, he proceeded with equal success to India. With his Mediterranean Squadron he conquered Cyprus, the sea-coast of Phoenicia, and several of the Cyclades.

On his return to Egypt, he assembled another numerous army, with which he landed on the continent, and conquered all the countries where he passed. He overran and subdued Asia with an amazing rapidity, entered India, subdued the countries beyond the Ganges, and advanced as far as the ocean. The Scythians, as far as the river Tanais, Armenia, and Cappadocia, were conquered. He left a colony in the ancient kingdom of Colchos, situated to the east of the Black Sea, where the Egyptian customs and manners have been ever since retained. Either the scarcity of provisions in Thrace stopped the progress of his conquests, and prevented his advancing farther in Europe; or his return was hastened by advice he received from the high-priest of Egypt of the revolt of his brother Armais. His empire extended from the Ganges to the Danube; and Herodotus saw in Asia Minor, from one sea to the other, monuments of his victories. It was his custom to let up pillars in every country he conquered, with this inscription: "Sesostris, king of kings, and lord of lords, subdued this country by the power of his sword."

On his return to Egypt with the spoils of the nations he had vanquished, he rewarded his officers and soldiers with the most profuse liberality. The ancient historians say that one circumstance respecting this conqueror is very remarkable, which is, that he never once thought of agriculture, is placed about the same time as in our histories; which could not possibly have been the case, had the world been as old as they suppose; for it cannot be conceived how men could live any time in a regular society without them."

2 like

like other heroes of preserving what he conquered, but contented himself with the glory of having subdued many nations. After having ravaged various countries, and made the world havoc up and down the world for the space of nine years, he seems to have confined himself within the limits of ancient Egypt, as no traces of this new empire are to be found, either under himself in the latter part of his reign, or under his immediate successors.

Sesoftris then expelled his brother Armais from Egypt, on account of his rebellion, when the latter retired into Greece; after which Sesoftris disbanded the Egyptian army, and applied his mind to works the most stupendously magnificent that the imagination can conceive, by which he hoped to immortalize his name, and contribute at once to his own reputation and the public good.*

Sesoftris might be deemed one of the most illustrious heroes of antiquity, had not his pacific virtues been eclipsed by a blind thirst of glory, and the brilliancy of his fame eclipsed by the clouds of vanity which induced him to forget his humanity. He treated the kings and chiefs of the nations he had vanquished with the most unmanly indignities, by ordering them to be chained to his cart, four abreast, instead of hortes. He was at length, however, restrained from this inhuman practice, by a just remark made to him by one of those unfortunate princes, who, in speaking concerning the vicissitudes of fortune, compared the instability of human greatness to the motion of the chariot wheels, by the rotation of which the same part is alternately above and then upon the ground.

After having reigned 33 years, Sesoftris, upon his demise, left the kingdom to his son Pheron, in the year of the world 2547, and 1457 years before Christ. This Pheron, or Sesoftris the second, as he is sometimes called, did not succeed to his father's glories, though he did to his territories. He built two magnificent obelisks in the temple of the sun at Heliopolis, each being 100 cubits in height, and eight in breadth, consisting of one stone only: there is nothing more recorded of his reign, but what is apparently fabulous.

From this period there is a chasm in the Egyptian history, supposed to have been owing to a state of anarchy and confusion, or an inter-regnum; so that we have nothing historically certain upon record, till the time of Proteus, or Cates, who reigned in the year of the world 2800, that is 1204 years before Christ. In the reign of this prince, Paris, the Trojan, was driven by a storm from the Ægean to the Egyptian seas, which compelled him to put into the port of Parichea, situated in the Canopian mouth of the Nile. Thonis, a tributary king, and the governor of that part, seized his person, secured his ships, and sent Paris himself to Proteus at Memphis. The king, understanding that he had stolen Helen, reproached him severely with his perfidious behaviour and breach of hospitality; and then seizing all the riches which he had brought with him from Greece, together with Helen, in order to restore both to the injured Menelaus, he commanded Paris and his attendants to quit his territories in three days, under pain of being treated as enemies. Homer was apprized of these circumstances, but thought proper to sink them in his *Iliad*, as incon-

sistent with his plan, and that he might have an opportunity of rendering his poem much more entertaining by the supposed presence of Helen at Troy. This is manifest from the *Iliad*; for describing the voyages of Paris, he shews, that after he had been drove through divers seas, he arrived at Sidon in Phœnicia:

There garments lay, in various colours wrought,
The work of Sidon's dames; from Sidon brought
By god-like Paris, when he plow'd the seas,
And high-born Helen waded home from Greece.

Iliad, B. VI.

And after having described the nepenthes or mirth-inspiring bowl, prepared by Helen, Homer adds,

These drugs, so friendly to the joys of life,
Bright Helen learn'd from Thone's imperial wife;
Who sway'd the scepter, where prolific Nile
With various simples cloths the fatten'd foil.

Pope's Homer's Odyssey, B. IV. v. 315.

Which verses sufficiently shew, that Homer was not ignorant of the arrival of Paris in Egypt.

Several circumstances related of this king Proteus have given rise to a variety of poetical fables among the ancients. In particular, Eustathius enumerates various opinions concerning Proteus: some understand Proteus allegorically to signify the first matter, which undergoes all changes: others make him an emblem of true friendship, which ought not to be settled till it has been tried in all shapes: and others again make Proteus a picture of a flatterer, who takes up all shapes, and suits himself to all forms, in compliance to the temper of the person whom he courts. Diodorus observes, that the Greeks imagined all these metamorphoses of Proteus to have been borrowed from the practices of the Egyptian kings, who were accustomed to wear the figures of lions, bulls, or dragons, in their diadems, as emblems of royalty; and sometimes that of trees, and such like, not so much for ornament as terror. Others take Proteus to be an enchanter; which kind of men always pretend to know events. This perhaps was the real foundation of the whole story concerning Proteus: the rest is the fiction and embellishment of the poet, who ascribes to his Proteus whatever the credulity of men ascribe to enchanters. Proteus had a magnificent temple erected to him at Memphis, and on his death left the crown to his son Rhempis.

Rhemphus or Rhampinitus is said, by Diodorus Siculus, to have been of an exceeding avaricious temper, and to have amassed so much wealth, as to be able to leave behind him 400,000 talents. Herodotus, however, speaks in milder terms of this monarch; he allows indeed he was fond of riches, but not to fo fond a degree, as he is represented by Diodorus. He tells us that Rhempis built the western portico to the temple of Vulcan, and erected two statues before it, each 25 cubits high, the one being dedicated to summer and the other to winter. He likewise erected a treasury for the purpose of depositing the immense riches he had collected together; and concerning the building of this edifice, Herodotus records the following singular story. The architect employed in this work, placed one of the stones in so

* An ingenious writer says, "His works may be considered as religious, military, and civil. As to the first, he erected an hundred magnificent temples, that is, one in each city, as for many monuments of gratitude to the tutelary gods of all the cities: and he took care to publish in the inscriptions of them, that these mighty works were completed without the assistance of any of his subjects; for he made it his glory to be tender of them, and to employ only captives in these monuments of his conquests. He was particularly studious of adorning the temple of Vulcan at Pelusium, in acknowledgment of the imaginary protection of that god, when his brother had a design of destroying him there. And he erected several statues at the entrance of this temple, in commemoration of his conquest of Ethiopia. His military designs were equally great and useful. To prevent the incursions of the Syrians and Arabians, he fortified the east side of Egypt with a wall, which ran from Pelusium though the desert to Heliopolis, 100 furlongs, or 17 miles and a half. From Memphis, as far as the sea, he cut a great number of canals on both sides the river, for the convenience of trade, and settling an easy correspondence between

such cities as were most distant from each other. Egypt was thereby also made inaccessible to the cavalry of its enemies, which before had harassed it by repeated incursions. Egypt herself, which had been hitherto famous for her horses and chariots, and was admirably well adapted for either, was now no longer the same place in those respects, and put on a new face. And his improvements in civil affairs were of the greatest utility; for he raised a great number of high banks, or moles, in every part of the kingdom, so which new cities were built, as a better security for men and beasts, during the inundations of the Nile. Beldar, according to Herodotus, he divided the lands equally among all the Egyptians, reserving to himself a certain rent; yet if the river diminished the lot of any man, the royal surveyors measured it, and ascertained the loss: from whence, the above author conjectures, geometry had its beginning, and was afterwards introduced among the Grecians; but astronomy, with the use of the gnomon, and the division of the day into twelve parts, they received from the Babylonians.

artful manner, that it might be taken out and put in again by one man only; it being his intention to have some share of the riches of the place. But about the time that the treasure was lodged in it, he was seized with a violent fit of sickness; and finding himself at the point of death, he sent for his two sons, declared to them the whole artifice, and gave them the most exact directions in the management of the business, which he foresaw would never be his fate to accomplish. The father died; and the young men, impatient to take advantage of the discovery, repaired soon after his death, to the treasury; and having, with great ease, removed the stone, carried off with them a considerable sum, repeating, every night, the same theft. Some time after, Rhamphinitus, going in to view his wealth, was surprized to find a visible diminution of his treasure; and the more, as his seal was whole on the door, the only part of the building which he thought could give entrance. The two brothers continued their night expletions, till the king, after two or three further surveys, was perfectly sensible, that, by some means or other, his wealth suffered a successive decrease. He then ordered snares to be laid all round the vessels which held his money. The two brothers failed not to come at night; but one of them, as he approached a vessel full of silver, was immediately taken in the snare. As he found it impossible to make his escape, he called to his brother, who stood without, and earnestly intreated him to come in, and cut off his head, that so he might save his own life, and prevent the discovery of their clandestine theft. The brother, consulting his own safety, and despairing of his, complied with his request; and putting the stone in its place again, took the head away with him. Early next morning, the king, going in to see the event of his project, was so surprized to find a man taken in the snare without a head, that he hastened out in the greatest confusion; from which he no sooner recovered, than he directed that the body should be hung on the outside of the wall, and exposed to public view; charging the guard, appointed to take care of it, to make a narrow inspection into the countenances of the spectators, and in whomsoever they perceived signs of sorrow and mourning, to bring such persons into his presence. The mother of the deceased, hearing that the body was exposed in this manner, distracted with grief, and upbraiding her surviving son, threatened, if he did not procure her his brother's body, and bring it home, to let the king know who had robbed his treasury. The young man did his utmost to bring her to some temper, by reasoning to her the impracticability of her request, but to no purpose. Finding her, therefore, unalterable in her resolution, he gratified her, in the end, by the following subtil invention: loading his asses with skins of wine, he drove them towards the place where the body hung up. Having reached the guard, he privately opened some of the skins; and, striking himself, in token of despair, as soon as the wine began to run out, he counterfeited the trouble and consternation of a person utterly undone: in the mean time, the soldiers upon duty strove to save as much of the liquor as they could for themselves; which he seeing, reviled them with the most bitter reproaches, for the pleasure they took in his misfortune, instead of offering to assist him: but they using him kindly, he pretended to be pacified, and leading his asses out of the way, feigned to be very busy in securing the remainder of his wine; in the mean time, the guards stood round him, and he, pretending to be pleased with their jokes and humour, at last consented to give them a skin of the wine; and they, in return for so great a favour, pressed him to stay, and take part of it with them: he complied, and when the skin was emptied, he gave them another; so that, by excessive drinking, the whole guard was overcome, and fell into a deep sleep: then watching his opportunity, in the dead of the night, he took down the body, laid it across an ass, and, having the right cheek of each of the soldiers, by way of derision, carried it home to his mother. The news of this was matter of new wonder to the king, who, to find out the person that had done it, bestowed him of the following expedient: he ordered his daughter to give her company, in a certain apartment of the palace, to all comers promiscuously; but under this restriction, that she should previously extort from each of them a confession of the most

ingenious action he had ever managed, and the most wicked crime he had ever committed. The daughter punctually complied with her father's instructions; which the young man being apprised of, he resolved to perplex the king a little farther. With this view, he got the arm of a dead body, yet fresh, and, taking it under his cloak, went to the king's daughter: she examined him, in the same form, and to the same purpose, as she had done the rest who had been with her before him; when he frankly confessed, that the most abominable and wicked action of his life was the cutting off his brother's head, when ensnared in the treasury; and the most ingenious thing he had ever done, was the stealing the body from the guard that kept it. She then offered to lay hold of him; but he, holding out the dead arm to her, hastened out, while she grasped it; and, by the favour of the night, made his escape. Rhemphis's rage being now converted into an admiration of the boldness and ingenuity of the man, he caused it to be proclaimed in every city, that if the person, whoever he was, would discover himself, he should not only be pardoned, but rewarded. The young man, confiding in this, went straightway to the palace, and having made himself known, the king gave him his daughter in marriage, accounting him far superior in wisdom to any man then living upon earth.

Seven kings succeeded Rhemphis, but nothing remarkable is recorded of any of them, except Nilus, who ordered a great number of canals to be dug all over the country, and did his utmost endeavours to render the Nile as universally serviceable as possible; whence that river, which had been called hitherto Egyptus, changed its appellation; and from this king, Nilus received the name of Nile.

Cheops followed these seven kings; he was a great tyrant, built the largest of the three great pyramids, (his daughter soon after building a small pyramid near that erected by her father) and reigned 50 years. He was succeeded by his brother

Cephrenes, or Chabrejis. This prince reigned 56 years, was as great a tyrant as the former, and likewise erected a pyramid.

Egypt had been thus afflicted with tyrants for 106 years, when Macherinus, the son of Cephrenes, mounted the throne, and acted quite upon different principles from his father and uncle, being upon the whole a mild and merciful prince.

Astydis succeeded this prince, and erected the eastern portico of the temple of Vulcan, with a magnificence that eclipsed the former porticoes. After his death, Anyfis, who was blind, mounted the throne; and in his reign Sabbaco, king of Ethiopia, invaded Egypt with a powerful army, drove Anyfis to the seas, and seized the kingdom. Sabbaco made great improvements in Egypt, and after having reigned 50 years over that country, evacuated it, when Anyfis returned, and in an extreme old age became repossessed of his kingdom.

On his death, he was succeeded by Sethon, who was both king and a priest of Vulcan. It was in the reign of this prince that Sennacherib, king of Assyria, invaded Egypt, and committed great depredations, till his whole army, according to the sacred writings, was slain by the destroying angel.

Tharaca succeeded Sethon, and reigned 18 years; after whose death the Egyptians divided their whole country into 12 districts, and elected a king to reign over each division. These 12 kings contracted the strongest alliances by mutual intermarriages, and reciprocally covenanted to continue in perpetual amity, without invading the particular territories belonging to each other. This duodecimate, or government of 12 kings, however, lasted only 15 years; for Pflammatichus, who ruled near the sea coast, having grown opulent by commerce, and contracted several alliances with foreign powers, at length became so formidable, that, with the assistance of the Carians and Ionians, he conquered the other 11 kings, and reduced the whole country beneath his sway. Pflammatichus was a great king, and reigned with much wisdom and magnificence; he was, however, guilty of one great political error, which was heaping too many favours not only on the Ionians and Carians, but on the Greeks in general, out of gratitude for the assistance they had given him in subduing the 11 allied kings; which so much irritated his subjects, that 200,000

of them revolted, and made a settlement in Ethiopia, under the protection of the king of that country.

To repair the loss which the country sustained by so great an emigration, Psammaticus applied himself to the encouragement of commerce, and opened his ports to all strangers; and at the same time entered into new, or renewed his old alliances with the Athenians, and other Greek nations. He likewise added a portico to the temple of Vulcan, and built a spacious edifice on the front of it. He reigned 54 years, 29 of which he consumed in the siege of Azotus, in Syria, before he could reduce that great city; this having been the longest siege commemorated in history.

Necus succeeded his father Psammaticus in the year of the world 3388, and 616 years before Christ. This monarch in scripture is called Pharaoh Nechoch. He began a canal of communication between the Nile and the Red Sea, which Darius the Persian afterwards finished. He built a fleet of galleys in the north sea and another in the Arabian gulf at the mouth of the Red Sea; after which he got some of the expertest seamen in the Phœnician service, and sent them out by the Red Sea, through the straits of Babelmandel, to discover the coasts of Africa, where in three years time they sailed round the continent of Africa, passed the straits of Gibraltar, and returned home by the way of the Mediterranean sea. Herodotus says, that this king fought a battle against the Syrians in the plains of Megdolus, where he obtained the victory, and took the great city of Cadytis. Josephus says that Necus made war upon the Mædes and Babylonians, who had dissolved the Assyrian empire, and became so formidable thereupon, as raised the jealousy of all their neighbours; and therefore, to put a stop to their growing greatness, Necus marched with a great army towards the Euphrates, to make war upon them, in the 31st year of Josiah king of Judah. But the scripture expressly says, "Pharaoh Necho king of Egypt went up against the king of Assyria to the river Euphrates; and king Josiah went against him, and he slew him at Megiddo." This Valley of Megiddo in the scripture, is the same as the plains of Magdolus in Herodotus; and the whole is related thus by dean Prideaux: On Necus's taking his way through Judea, Josiah resolved to impede his march, and posted himself in the valley of Megiddo, to stop his passage: whereon Necus sent ambassadors to him, to let him know that he had no design upon him; that the war he was engaged in was against others; and therefore advised him not to meddle with him, lest it should turn to his hurt. But Josiah not hearkening thereto, it came to a battle between them, wherein Josiah was not only overthrown, but also unfortunately received a wound, of which, on his return to Jerusalem, he died.

Necus, animated by this victory, continued his march, and advanced towards the Euphrates, where he defeated the Babylonians, and took Charchemish, a great city in those parts, where he left a good garrison, and after three months returned again towards Egypt: but hearing in his way, that Jehoahaz, the son of Josiah, had taken upon him to be king of Judah without his consent, he sent for him to Riblah in Syria, and on his arrival caused him to be put in chains, and sent him prisoner into Egypt, where he died. Necus, then proceeding on his way, came to Jerusalem, where he made Jehoiaquin, another of the sons of Josiah, king instead of his brother, and put the land to an annual tribute of an hundred talents of silver, and a talent of gold; after which, he returned with great triumph into his own kingdom.

Necus died after a reign of sixteen years, and was succeeded by his son Psammis, who reigned only six years, and left the kingdom to his son Apries.

Apries, in the sacred writings, is called Pharaoh Hophra; he reigned with great prosperity, took Sidon, and reduced all Phœnicia and Palestine; after which he concluded an alliance with Zedekiah, king of Judah (Ezek. xxvii. 15.) declared himself the protector of Israel, and promised to deliver it from the tyranny of Nebuchadnezzar, who soon after destroyed Jerusalem, and carried away Zedekiah captive to Babylon (Jer. xxxvii.). Soon after, the judgments decreed by the prophets of God against Apries began to operate, for that prince having sent an army against the Cyrenians, it was defeated, and the greatest part of the men slain. But the overthrow was not the only misfortune, for the Egyptians con-

ceived, by the imprudent conduct of Apries in the whole affair, that he had intended this army should perish. Fearing therefore that he should devote more of them to destruction, they revolted in great numbers, and put him to defiance. In this dilemma Apries dispatched Amasis, an officer of his court, to appease the insurgents, and bring them back to a sense of their duty. But while Amasis was speaking to them, they put on his head the ensigns of royalty, and declared him their king. Amasis accepted the dignity, and joined the revoltors, which enraged Apries, that he sent Paterbemis, another of his officers, to apprehend Amasis. Paterbemis not being able to effect the business, on his return had his ears and nose cut off by the king's orders. The wrong and indignity offered to a person of his character and worth, so enraged the rest of the Egyptians, that the revolt became almost general: whereupon Apries was forced to fly, and made his escape into the Upper Egypt, where he maintained himself for some years, while Amasis held all the rest. The king of Babylon took advantage of these intestine divisions, and subdued Egypt from Migdol to Syene: that is, from one end of the kingdom to the other. He made a miserable ravage and desolation wherever he came; killed a great number of the inhabitants; and made such dreadful havoc in the country, that the damage could not be repaired in 40 years. (Ezek. xxix.) Nebuchadnezzar having loaded his army with spoils, and conquered the whole kingdom, came to an accommodation with Amasis, whom he left as his viceroy, and returned to Babylon.

Nebuchadnezzar having left Egypt, Apries forsook his hiding place, and hiring an army of Carians, Ionians, &c. marched against Amasis, and gave him battle near the city of Memphis. Being however vanquished and taken prisoner, he was carried to the city of Sais, and there strangled in his own palace; whereby the prophecies of Ezekiel and Jeremiah were fulfilled. (Jeremiah xliii. xlv. xlv.—Ezekiel xxxix. xxx. xxxi.)

Concerning this king Apries, it is observed by Herodotus, that he was of that pride and high conceit of himself, as to vaunt that it was not in the power of God himself to dispossess him of his kingdom. For the first 20 years of his reign he had enjoyed as prosperous a fortune as most of his predecessors; having had many successes against the Cypriots, Zidonians, Philistines, and other nations; but after he took on himself, Caligula-like, to be thought as a God, he fell from his former state, and made this miserable end. After his death, Amasis, without any farther opposition, became possessed of the whole kingdom of Egypt; which happened in the 19th year after the destruction of Jerusalem.

Amasis, who became sole monarch of Egypt in the year of the world 3435, and 565 years before Christ, was a native of Sinph, in the province of Sais; he was a worthy king, and an excellent legislator. Egypt, in his time, was happy in the fecundity of the Nile, and is said to have contained 20,000 populous cities, towns, and villages. To maintain good order in the midst of such a multitude, Amasis made a law, whereby every Egyptian was obliged once a year to inform the governor of the province by what means he maintained himself; the omission of giving such information being punished with death.

Among other public works he built an admirable portico before the temple of Minerva at Sais, and erected a colossus before the temple of Vulcan at Memphis. This colossus lay with its face upwards, was 75 feet in length and had beside it two other smaller statues cut out of the same stone. He likewise built the spacious temple of Isis at Memphis, which was a structure of astonishing magnificence.

In the reign of this king, Cambyses conceived the design of invading Egypt, but when he arrived on the borders of that kingdom, he received information of the death of Amasis, who departed this life, after a happy reign which lasted 44 years, his body was embalmed, and then interred in a sepulchre which he had some years before erected for himself.

Pammenitus the son of Amasis succeeded his father in the year of the world 3479, and 521 years before Christ. This prince had a short and calamitous reign; for Cambyses, still pursuing his design of conquering Egypt, the Persians and Egyptians came to an engagement, when the

the latter were defeated, great numbers slain, and Psammenitus himself taken prisoner. Cambyses treated the captive king in a most ignominious manner; he made his daughter a slave, ordered his son to be executed as a common malefactor, and at length put Psammenitus himself to death.

Having received the submission of all Egypt, Cambyses proceeded to Sais, and with an unmanly degree of resentment, ordered the body of Amasis to be taken out of his sepulchre and burnt; he then slew the god Apis, ordered the Egyptian priests to be severely scourged, and oppressed the people with the most tyrannical cruelty.

Thus were the Egyptians treated with all the insolence of conquest, and reduced to the very lowest degree of submission. Their royal line was extinct, their religion trampled on, their priests persecuted, and themselves despised and oppressed. And thus the kingdom, after having continued in a regal succession above 1600 years, fell a prey to Cambyses, one of the most outrageous, and violent princes that ever reigned.

The succession of the Egyptian kings here ends, and from this period, the history of this nation becomes blended with that of the Persians and Greeks, till the death of Alexander the Great, and after that æra, it is intermixed with the history of other nations. Concerning this great revolution, an ingenious author says, "The Almighty had given by the mouth of his prophets, an astonishing relation of the several circumstances of this mighty event. Thus Ezekiel declared, that during forty years, the Egyptians should be oppressed with every species of calamity, and be reduced to so deplorable a state, that there should be no more a prince of Egypt. The event verified the prophecies, for soon after the expiration of 40 years, Egypt was made a province of the Persian empire, and has been governed ever since by foreigners; for after the ruin of the Persian monarchy, it has been subject, successively, to the Greeks, Romans, Saracens, Mamluks, and last to the Turks, who possess it at this day. See Ezek. xxix. 17—20. xxx. 13. xxxii. Isaiah xix. 4. xx. Jerem. xlvi. 8. 13. xlv. 30. xlv. 11—27.

This period, viz. the year of the world 3280, and before Christ 524, is deemed the second period of the Egyptian history. But with respect to the subsequent actions of Cambyses, and his successors, who reigned over Egypt, as well as Persia, we shall refer the reader to our account of the empire of Persia, page 61 and 62, in which the most remarkable occurrences are recorded; but as only the outlines of the transactions of Alexander the Great's reign are there given, we shall here enter into a more copious detail of that singular and eccentric monarch's transactions.

When Philip king of Macedon had made himself master of Greece, he prepared to revenge the injuries which it had received from the Barbarians during the space of 300 years. With this view, a war against the Persians was resolved on in a general assembly of the Amphictions, and Philip was appointed commander in chief of the forces desired for this expedition; but before he could put this mighty project in execution, he was murdered by Pausanias, in the midst of all the pomp and festivity which he made to celebrate the nuptials of his daughter Cleopatra with Alexander king of Epirus. Philip was succeeded by his son, Alexander the Great, who was then 20 years of age.

The most distinguished passions that appeared in Alexander, even from his tender years, were ambition, and an ardent desire of glory. The terror of his arms soon made all things give way before him in Greece. After punishing several barbarous nations, and also the Thebans, he called the general council of all the states, and free cities of Greece to meet at Corinth, to obtain from them the supreme command against the Persians, as had been granted his father a short time before his death. The deliberations of the assembly were very short, and that prince was unanimously appointed generalissimo against the Persians.

Alexander, in the spring of the following year, collected together his forces, marched with them to Selus, and there passed the Hellespont into Asia. At this time,

* This bank, or causeway, is still remaining, and the same as when first made, being about half a mile in length; by means of which, what was formerly an island, at that

his army amounted to no more than 30,000 foot, and 4500 horse; but with this small army he attempted, and also accomplished, the conquest of the whole Persian empire, and added India to his acquisition.

When Alexander arrived on the banks of the Granicus, a river of Phrygia, he was opposed by the Persian governors with a very considerable army, whom he totally defeated, and, besides great numbers killed, took upwards of 20,000 prisoners. He then took Sardis, the bulwark of the Persian empire next the sea; Ephesus, Miletus, and Halicarnassus, though defended by Memnon, Calene, and Ardion, the capital commanders of Phrygia.

Memnon, soon after his defeat by Alexander, died, and Darius commanded his army in person: it was assembled at Babylon, and amounted to 400,000 foot, and 100,000 horse. Alexander immediately marched to attack Darius, when both armies met and engaged near Issus in Cilicia, where the Persians were defeated, with the loss of 120,000 foot, and 10,000 horse, though the Macedonians lost only 300 foot, and 150 horse. Darius himself escaped; but his queen, his children, and his mother, were taken prisoners; to whom the conqueror acted like a husband, a father, and a son.

Alexander, by this conquest, obtained all the treasures, and other rich stores, which Darius had deposited in Damascus, as a place of security; for not only that city, but most others in Syria, surrendered to him. Instead of pursuing Darius into the plains of Babylon, he directed his march towards Egypt. All Phœnicia submitted to him, except Tyre, which was justly called the Queen of the Sea, that element bringing to it the tribute of all nations. Alexander desired to enter the city, that he might offer a sacrifice to Hercules, its tutelary god; but the Tyrians, who were attached to Darius, refused him admission, upon which Alexander immediately resolved to force them to it by a siege. Tyre was at this time seated in an island on the sea, about half a mile from the continent, and was surrounded with a strong wall. Alexander, to effect his purpose, began to throw up a bank, or causeway, which should reach from the continent to the island. The Tyrians contemptuously asked the workmen, "where Alexander was greater than Neptune, and if they intended to prevail over that god?" This distinguished undertaking, however, was in a short time accomplished; the Tyrians were invested on all sides, and attacked at the same time both by sea and land. After sustaining a siege of seven months, it was taken by Alexander, who sold 30,000 of the inhabitants, and then reduced the city to ashes.

Alexander marched from Tyre to Jerusalem, with a firm resolution of chastising the Jews, because they persisted in maintaining their oath of fidelity to Darius. But he spared the holy city of God, and offered sacrifices to him in the temple, after the manner prescribed to him by the high priest, who shewed him those passages in the prophecy of Daniel, which are spoken of that monarch, and which foretold the destruction of the Persian empire, by a Grecian king. Under the figure of a spotted leopard, with four heads and four wings, the prophet represents Alexander, intermixed with good and bad qualities; rash and impetuous in his resolutions; rapid in his conquests; flying with the swiftness of a bird of prey, rather than marching with the weight of an army, laden with the whole equipage of war; supported by the valour and capacity of his generals, four of whom, after having assisted him in obtaining his empire, divided it among themselves, Dan. vii. 4, 5, 6. Isaiah prophesied the victories of Cyrus, and Daniel those of Alexander, the two most famous conquerors that ever existed; the one founder, the other destroyer, of the powerful Persian monarchy.

From Jerusalem, Alexander took his rout to Gaza, which was the only pass into Egypt, and was defended by Ictis the eunuch, who made a gallant defence for two months; but the place was then taken by assault, and the inhabitants either put to the sword or sold for slaves.

The victorious monarch left a garrison in Gaza, and then turned the whole power of his arms against Egypt. Mazæus commanded for Darius at Memphis, and finding

distance from the shore, was made a peninsula, and so it has continued from that time to the present.

it would be of little use to attempt an opposition against so powerful and triumphant an army, he readily submitted to the conqueror, and gave up 800 talents of gold, with all the royal furniture; whereby Alexander became master of all Egypt.

Alexander, during his stay at Memphis, determined on making a journey to the temple of Jupiter Ammon, * which was situated among the sands and deserts of Lybia, at the distance of 200 miles from Egypt. His motives for making this journey were, according to the religion of those times, vain-glorious and impious. He had read in Homer, and other fabulous authors of antiquity, that most of their heroes were represented as sons of some deity; and aiming to be celebrated an hero like them, he would also be thought the son of a god. Accordingly, having chosen Jupiter Ammon to be his father, he sent messengers before, to consult the priests, to cause him to be declared the son of that god by their oracle, when he should come to consult it.

In his journey to the temple, he took particular notice of a spot of ground opposite to the island of Pharos, which he thought a very convenient place for a new city; and determined to build one there, which should be called Alexandria, in allusion to his own name. He drew the plan of it himself, and marked out the several places where the temples and public squares were to be erected. He employed Dinocrates to build it, and it soon became not only the capital of Egypt, but one of the most flourishing cities in the universe.

As soon as Alexander arrived at the temple, he paid his devotions there, and received from the oracle the declaration he wanted. He then returned to Memphis in great triumph, and from that time, in all his letters, orders and decrees, styled himself, *King Alexander son of Jupiter Ammon*; and occasioned it to be universally propagated, that this god begot him on Olympias his mother, in the shape of a serpent.

He now turned his attention to his new city of Alexandria, whither he went, and took great pains to populate it, by inviting to it the inhabitants of many other places. Among these were great numbers of Jews, to whom he gave very distinguished privileges, not only allowing them the use of their own laws and religion, but also admitting them equally into the same franchises and liberties with the Macedonians themselves. After staying a short time at Alexandria, he left it, and wintered at Memphis, where he settled all his affairs in Egypt. The military command of it he entrusted only with his Macedonians; he divided the country into several districts, under each of which he placed lieutenants independent of each other, not thinking it safe to commit the whole power of that large and populous country into the hands of one man. The civil government he placed wholly in one Doloaspes, an Egyptian; for as he intended that the country should still be governed by its own laws and usages, so he thought a native, who was best acquainted with them, the most likely to see them properly executed.

After Alexander had adjusted these matters, he went to Syria, from whence he marched with his army into Asia, and crossed the Euphrates and Tigris to meet Darius, who had in vain offered terms of peace, and had therefore collected together a much more numerous army than that he had when defeated at Babylon.

Alexander pitched his camp on the banks of the Tigris, a few days after which there happened an eclipse of the moon, which so terrified the Macedonians, that they refused to proceed in their march, crying out, that heaven displayed the marks of its anger; that they were dragged, against the will of the gods, to the utmost extremities of the earth; and that even the moon refused to lend them her usual light. On this Alexander summoned the principal officers into his tent, and commanded the Egyptian soothsayers to declare what they thought of this phenomenon. These were well acquainted with the natural causes of eclipses; but without entering into such enquiries, they replied, that the sun was predominant in Greece, and the moon in Persia; whence, as

often as the moon suffered an eclipse, some great calamity was thereby portended to the latter.

This answer revived the hopes and courage of the soldiers, and Alexander proceeded on his march to attack Darius, who was encamped in a large plain near the city of Arbela, where a battle was to be fought, on which depended the empire of Asia. The Persian army was very superior in numbers to the Macedonian, notwithstanding which the former were totally defeated; and, according to Quintus Curtius, 40,000 Persians were slain.

Darius fled into Armenia and Media, while Alexander took Arbela, Susa, and Persepolis, where he acquired immense treasures. Darius was afterwards murdered by Bessus, who was put to death for it by Alexander. This died Darius, in the 50th year of his age, and sixth of his reign; in whom the Persian empire ended, after it had lasted 206 years, under the government of 12 kings. When Alexander viewed the dead body of Darius, he wept, and paid it such honours, that he ordered it to be magnificently interred. On the death of Darius, all his commanders submitted to the conqueror, by whom they were restored to their former honour and employments.

Alexander was at this time captivated with the charms of an Athenian courtesan, called Thais, at whose instigation he destroyed the city and palace of Persepolis. This she persuaded him to do in revenge for Xerxes having burnt Athens; and thus was destroyed one of the most beautiful palaces in the universe, some remains of which are still to be seen, at a place called Chekel-Minar, near Shiraz in Persia.

Alexander, after having conquered various other countries, at length crossed the river Indus, entered India, and advanced very near the Ganges, which he also intended to pass, had not his army refused to follow him. He therefore contented himself with marching to view the ocean, and went down the Indus to its mouth. In the course of his march to India, he subdued many nations, some of which resisted as long as they were able, while others immediately submitted. His army consisted of 120,000 Greeks and Persians; and his fleet, which he had in the Indus, amounted to 2000 vessels of different kinds and sizes. He conquered Porus; after which he sailed down the Indus as far as the ocean, subduing all the nations in his way on both sides that river.

When he had passed the mouth of the Indus into the Southern-ocean, and had carried his victories to the uttermost boundaries of the earth on that side, he appeared fatigued; and after settling the conquests he had made in India, marched with his army to Babylon, where he relinquished the character of the hero, and substituted in its place that of the debauchee.

Alexander had two wives, the first of whom was Roxana, the daughter of Oxavies, a noble Persian; and the latter, Statira, the eldest daughter of Darius. His chief favourite Hephæstion, married Drypetis, the youngest sister of Statira. Alexander married about an hundred of the Persian ladies to others of his commanders and principal followers; for as these were the daughters of the prime nobility of the Persian empire, he hoped by these marriages to make such an union of the Grecians and Persians, as should render them both as one nation under his empire. These nuptials were celebrated at Susa with great pomp and solemnity for five days together; and all the dowries of these ladies were paid by Alexander, who expended vast sums on these and such other occasions, which were all supplied him from the immense treasure of Darius; of which, it is said, the conquered monarch laid up in his treasury at Ecbatana 100,000 talents, which, according to the lowest computation, amounts to 3500,000 sterling.

When Alexander returned to Babylon, he intended to have made that city the seat of his empire, but the loose he gave to dissipation soon frustrated those intentions. He spent the greatest part of his time in the pleasures and luxuries of the place, especially in drinking, which he carried to such excess as to continue at it sometimes for

* This temple was built in honour of Ham, the son of Noah, who being the first planter of Egypt and Lybia, became the great god of those countries in the idolatrous ages. He was the same whom the Greeks call Jupiter,

whole nights and days together, till at length he drank himself into a fever, of which he died in a few days, in the same manner as his favourite Hephelion had done the year before, while he was at Ecbatana in Media.

Thus ended all the designs of this great and vainglorious prince. Never had any man a greater run of success than he during the twelve years of his reign; in which time he subjected to him all the nations and countries that lay from the Adriatic-sea to the Ganges, at that time the greatest part of the known habitable world.

Alexander was only 32 years and eight months old when he died. He was succeeded by his natural brother, Arrideus, who was declared king in his stead; but, as he was an idiot, the regency of the kingdom was placed in the hands of Perdicas. The government of the provinces was divided among the chief commanders of the army, all of whom went to take possession of their respective districts, leaving Perdicas at Babylon, to take care of Arrideus, and direct for him the main affairs of the whole empire.

The governors of the respective provinces had been but a short time settled in their new stations, before they began to wage war against each other, from the natural consequences of which, several of them were killed, and their districts fell into the hands of their conquerors; so that in the course of a few years, the number of them was reduced to four, namely, Ptolemy, Cassander, Lyfimachus, and Seleucus, who divided the whole empire between them.

Ptolemy had Egypt, Lybia, Arabia, Palestine, and Syria; Cassander had Macedonia and Greece; Lyfimachus had Thrace, and those parts of Asia that lay upon the Hellespont and the Bosphorus; and Seleucus had all the rest.

Thus the prophecies of Daniel were truly fulfilled; which foretold, that the great horn of the Macedonian empire, that is, Alexander, being broke off, there should arise four other horns, signifying four kings of the same nation, who should divide his empire between them. Dan. vii. 6. viii. 8.—22. From this division begins the era of the Lagides, or Ptolemies in Egypt, which continued till the time of Augustus Cæsar.

The era when the empire of Alexander the Great was partitioned out, is termed the third period of the Egyptian history, and this happened in the year of the world 3681 and before Christ 323. The partition of Alexander's empire was however of short duration, except in Egypt, where Ptolemy had first established, and always maintained himself upon the throne without acknowledging any superior, or even competitor. After the battle of Ipsus in Phrygia, wherein Antigonus and his son Demetrius were defeated, and the former lost his life, the empire of Alexander was divided into four kingdoms by a solemn treaty, as had been foretold by the prophet Daniel.

Egypt, from this time to its becoming a province of the Roman empire, had fourteen successive monarchs, including Cleopatra. All these had the common name of Ptolemy, but each of them was likewise distinguished by a peculiar surname, and they had also the appellation of Lagides, from Lagus the father of the first Ptolemy.

The first monarch of the Macedonian race who reigned in Egypt after the death of Alexander the Great, was called Ptolemy Soter. This prince had been one of the chief favourites of Alexander the Great, who reposed the most implicit confidence in him on account of his wisdom, courage, and prudence; in short, he was beloved by the king and revered by the army. On receiving the government of Egypt, he chose Alexandria as the place of his residence, and granted great privileges to those who settled there, by which means that city became exceeding populous and wealthy. The name of Soter or Saviour was given to this Ptolemy by the Rhodians, in consideration of his friendly offices towards them, while their metropolis was besieged by Demetrius, the son of Antigonus. The Rhodians erected statues to Ptolemy, Cassander, and Lyfimachus, who had greatly contributed to the preservation of the place; but to express their gratitude to Ptolemy above the rest, they consecrated to him a grove, and gave him the name of Soter or Saviour. Soon after his establishment in Egypt, Ptolemy confederated with Antigonus, Antipater and Craterus, against Perdicas and Eumenes. However, the troops of Perdicas intinued and

undered him, and then went and joined the army of Antigonus, and Eumenes was defeated by Antigonus in Cappadocia.

It is to be observed, that all this time the body of Alexander the Great lay unburied, as the preparations for the funeral, which was designed to be the most magnificent that had ever been known, consumed two whole years; in the interim, however, the body had been embalmed, in order to preserve it from the effects of heat, and Diodorus Siculus gives the following account of the funeral itself, as well as the preparations for it.

The coffin was of beaten gold, wrought by the hammer as to answer to the proportion of the body, and it was half filled with aromatic drugs, which served as well to delight the sense, as to preserve the body from putrefaction. Over the coffin was a cover of gold; so exactly fitted, as to answer the higher part every way; and over this was thrown a curious purple coat, embroidered with gold; near to which were placed the arms of the deceased, that the whole might represent the acts of his life. Upon the top of the chariot, in which the body was to be conveyed, was raised a triumphal arch of gold, set thick and studded over with precious stones, eight cubits in breadth, and twelve in length. Upon this roof was placed a throne of gold, joined to the whole work, on which were carved the heads of goats; and to these were fastened golden rings, of two hands breadth in the diameter; at which were hung little coronets of various beautiful colours, like so many flowers. Under the top of the arch was a fringe of net-work, where hung large bells, whose sound might be heard at a great distance. On both sides the arch, at the corners, stood an image of victory in gold, bearing a trophy. A peristhylum of gold, like a piazza, supported the arch-work; the chapters of whose pillars were of Ionian workmanship. Within the peristhylum, by a thick net-work of gold, were suspended four tables; and on the first of which was portrayed a chariot curiously wrought, representing Alexander sitting with a royal sceptre in his hand, surrounded by his body-guard, in complete armour; the Macedonians on one side, the Persians with battle-axes on the other; and before them stood the armour-bearers. In the second, were seen elephants completely harnessed, with a band of Indians seated on the fore part of their bodies; and on the hinder, another band of Macedonians, armed as in the day of battle. The third exhibited to the view several squadrons of horse ranged in military array; and the fourth represented ships preparing for a battle. At the entrance into the pavilion were golden lions, that seemed to guard the passage. From the middle of every pillar, an acanthus of gold sprouted up in branches, springing in slender threads to the chapters. Over the arch, about the middle of the roof, a purple carpet was spread in the open air, on which was placed a vast crown of gold, in form of an olive coronet, which, by the reflection of the sun-beams, darted such an amazing brightness and splendor, that it appeared as a flash of lightning at a distance. Under the seats, or bottom of the whole work, ran two axle-trees, about which moved four Persian wheels, whose spokes and naves were overlaid with gold, and the rounds plated with iron. The extremities of the axle-trees were made of gold, representing the heads of lions biting a dart. The chariot had four draught-beams, or poles, to each of which were harnessed four sets of mules, each set consisting of four of those animals; so that this chariot was drawn by sixty-four mules. The strongest and largest of those creatures were chosen on this occasion; and they were adorned with crowns of gold, with collars enriched with precious stones and golden bells.

It may easily be imagined, that, in so long a procession, the motion of a chariot loaded like this would be liable to great inconveniences. Therefore, that the pavilion, with all its appendages, when the chariot moved in any uneven ways, might constantly continue in the same situation, notwithstanding the inequality of the ground, and the shocks that would be frequently unavoidable, a cylinder was raised from the middle of each axle-tree, to support the pavilion; by which expedient the whole machine was preserved steady. And, suitable to so stately a procession, a numerous body of workmen and pioneers attended it, to clear the way from all impediments.

The chariot was followed by the royal guards, all magnificently arrayed in arms. The multitude of spectators at this solemnity is hardly credible: but they were drawn together as well by their veneration for the memory of Alexander, as by the magnificence of this funeral pomp, which had never been equalled in the world.

There was a current prediction, that the place where Alexander should be interred would be rendered the most happy and flourishing part of the whole earth. The governors contended with each other for the disposal of a body that was to be attended with such a glorious prerogative. The affection Perdicas entertained for his country made him desire that the corpse should be conveyed to *Æge* in Macedonia, where the remains of its kings were usually deposited; but Egypt had the preference, and Ptolemy determined to signalize his gratitude to Alexander on this occasion. He accordingly set out, with a numerous guard of his best troops, to meet the procession, and advanced as far as Syria. When he had joined the attendants on the funeral, he prevented them from interring the corpse in the temple of Jupiter Ammon, as they had proposed: therefore it was first deposited in the city of Memphis, and afterwards conveyed from thence to Alexandria. Ptolemy raised a magnificent temple to the memory of this monarch, and rendered him all the honours which were usually paid to demi-gods and heroes by pagan antiquity. Upon which account, says Diodorus, "he was deservedly honoured, not only by men, but by the gods themselves."

Ptolemy, having been thus successful, formed the design of making himself master of Syria, Phœnicia, and Judea. Those provinces lay convenient for him, as well for the defence of Egypt, as for the invading from thence the island of Cyprus, which he had an eye upon. They were granted in the first partition of the empire to Laomedon the Mytlenian, who had possessed them from the death of Alexander, without any interruption or disturbance. Ptolemy at first thought to have bribed them, and offered vast sums for that purpose, but failing in his designs, he dispatched Nicanor with an army into Syria, while he invaded Phœnicia with a fleet. Nicanor defeated Laomedon, took him prisoner, and seized his country. Ptolemy was equally successful in the naval department, by which he obtained the possession of Syria and Phœnicia; but this increase of his power gave umbrage to both Antipater and Antigonus, who grew jealous of his success. As the Jews remained still refractory, Ptolemy marched into Judea, and laid siege to Jerusalem, which he took by assault on a Saturday (the Jews sabbath) as they made no opposition, thinking it a breach of their law, even to defend themselves on that day. Ptolemy returned to Egypt with above 100,000 Jews, whom he carried into captivity; but they at length so far ingratiated themselves into his favour, that he selected 30,000 of them, to garrison his most important places; and he likewise placed colonies of them in Cyrene and Lybia, which countries he had lately subjugated; and from these the Cyrenian Jews are descended.

Antipater about this time died, when Antigonus conceived the idea of re-uniting and making himself master of the whole partitioned empire. To oppose these designs, a league was formed between Ptolemy, Lysimachus, and Cassander.

Antigonus now marched from the East, to dispossess Ptolemy of Syria and Phœnicia, and make himself master of his shipping. Ptolemy, however, withdrew his naval force to Egypt; and Antigonus, being disappointed of his intended seizure of the shipping, proceeded to lay siege to Tyre, which city he reduced in 15 months; and having thus gained this celebrated sea-port, he fitted out a fleet of 500 sail, which rendered him exceeding formidable at sea. Antigonus then marched with one division of his army to oppose Cassander in the Lesser Asia, and ordered his son Demetrius, with another division, to defend Syria and Phœnicia (which he had now seized) against the arms of Ptolemy.

In the interim, Ptolemy reduced the island of Cyprus; and having made a descent upon Upper Syria and Cilicia, he returned to Egypt with great spoils and many captives. At Gaza he defeated the army of Demetrius, and by that means recovered Phœnicia and Syria. But after his departure, Demetrius, being reinforced, again made

himself master of them, and afterwards even conquered the island of Cyprus; all of which he annexed to the dominions of his father; and Antigonus, upon this accession of territory, thought proper to wear a crown, and assumed the title of king, which before he had not done.

Antigonus now determined to invade Egypt by land, while his son Demetrius attacked it by sea; the army and fleet came to Gaza, from whence Demetrius sailed to the Nile: but Antigonus met with great difficulties in passing the desert between Palestine and Egypt. The son could make no descent by sea, nor could the father make any better progress by land; for Ptolemy had well guarded all the mouths of the Nile, and all the passes and avenues on the frontiers. Therefore Antigonus was forced to return back into Syria with disgrace; having lost great numbers of his men by land, and many of his ships at sea, in this unsuccessful expedition.

Ptolemy wrote to Lysimachus, Cassander, and Seleucus, of his success, and renewed the league with them against their common enemy; from which time he became firmly settled in his kingdom, and was never after any more disturbed in it.

Ptolemy II. surnamed Philadelphus, was the son of Ptolemy Soter, by Berenice, and was declared by his father partner in the empire previous to, and successor to the crown after his death. Ptolemy had now governed Egypt 39 years, and was induced, by the assent of Berenice, to declare young Philadelphus his heir. For the king, who at this time was 82 years of age, had several sons by his other wives, and among these Ptolemy Cerannus, or the Thunderer, who was the son of Euridice, and the eldest of the male issue, on which account he deemed the crown his birth-right. The king therefore, in order to prevent the contest which might ensue after his demise between the two brothers, resolved to place the crown on the head of young Philadelphus during his life-time, and reign in partnership with him. This partiality occasioned the eldest son, Cerannus, to depart from court in disgust, and retire to Lysimachus, king of Thrace, who received him cordially in his court.

The celebrated watch tower in the island of Pharos was finished in the first year of the reign of Ptolemy Philadelphus; and Ptolemy Soter, who was himself a learned prince, and a great friend to literature, founded, at Alexandria, a museum, or college, of learned men, much upon the plan of the present Royal Society at London, or Royal Academy of Sciences at Paris. To render this museum respectable, he supplied it with a valuable library of books, which was afterwards gradually augmented by several of his successors, till it contained 700,000 volumes. The method of collecting (besides purchasing) was to seize all the books brought into Egypt by any strangers, to send them to the museum, that they might be transcribed, and then to remit the transcripts to the owners, and keep the originals to enrich the library. The works of Sophocles, Euripides, and *Tichylus*, were borrowed from the Athenians in this manner; when being transcribed, the copies were sent back, and the originals detained; however, as a recompense for the loss of such valuable works, a present of 15 talents, or 1004 pounds sterling, was remitted with the manuscripts. Strabo tells us, that this museum was a large building adjoining to the palace, and standing near the port, that it was surrounded by a portico or piazza, wherein the philosophers met and conversed together: that the members of the society were under the government of a president, whose office was of that consideration and dignity, that during the reigns of the Ptolemies, he was always appointed by those kings, and afterwards by the Roman emperors; and that they had within this building a common-hall, where they ate together, and were plentifully provided for at the common charge. Demetrius the Phalærean seems to have been the first president of this museum. He had been prince of Athens, and governed that state with absolute authority ten years together. As a legislator and philosopher, he was esteemed one of the most eminent men of the time in which he lived; and the emperor Antoninus ranks him with the greatest princes of that age, even with Philip and Alexander the Great. Demetrius was prime minister to Ptolemy Soter; and probably put him upon these projects. For Plutarch tells us, that "Demetrius Phalæreus persuaded Ptolemy to get together

together books which treated of the government of kingdoms and states, and to read them: for in those he would find such good advice, as none of his friends would dare to give him." However, to this museum it was owing, that Alexandria, for a great many ages together, was the greatest school of learning in all those parts of the world, and numbers of the most learned men were bred in it. Among the ornaments of literature who have had their education there, we find the names of Clemens Alexandrinus, Ammonius, Origin, Anatolius, Athanasius, &c.

But to return to Ptolemy Soter; he died in the second year after admitting his son to sit on the throne, and was 84 years old when he departed this life. He was a wife, prudent, just prince, and made Egypt a happy and flourishing kingdom. To his praise it is recorded, that he was easy of access to his subjects, frequently conversed and ate with them at their houses, and thought it no disgrace to borrow their richest plate when he gave any entertainment, because he had but little of his own; and when some represented to him, that the royal dignity seemed to require an air of greater opulence, his answer was, that "the true grandeur of a king consisted in enriching others, not himself."

After the decease of Ptolemy Soter, Ptolemy Philadelphus reigned alone; and to celebrate his accession to the throne, as sole monarch of Egypt, he entertained his subjects with a most splendid spectacle, of which Athenæus hath left us a description, which he transcribed from Callixenus the Rhodian, who compiled a history of Alexandria. It is requisite here to insert the particulars, as they are not only entertaining, but convey a very proper idea of the grandeur and opulence of Egypt; we think likewise, with Mr. Rollin, that as ancient writers speak frequently of sacred pomp, processions, and solemn festivals, in honour of their fabulous deities, it is incumbent on us to give some idea of them for once, by describing one of the most celebrated solemnities that stands on the records of antiquity. This splendid procession continued a whole day, and was conducted through the Circus of Alexandria, being divided into several parts, and forming a variety of separate processions. The fabulous deities had each of them a distinct cavalcade, adorned with the ornaments relative to their history. But Athenæus has only related the particulars of that of Bacchus, by which a judgment may be formed of the magnificence of the rest.

The procession began with a troop of Sileni, followed by a band of satyrs, who were succeeded by the Victories. These last had golden wings, and carried vases nine feet high, streaming with kinked perfumes: their habits were embroidered with the figures of animals, and every part of them glittered with gold. After these came a double altar, covered with a luxuriant foliage of ivy, intermixed with ornaments of gold, and beautified with a golden crown, composed of vine leaves, and adorned with white fillets. Next advanced 120 youths, clothed in purple vests; each of them supporting a golden vase of saffron, incense, and myrrh. They were followed by 40 satyrs, with golden crowns; two persons representing the year, and the geni of the four seasons. Then came Philicus, the poet and priest of Bacchus, attended by comedians, musicians, dancers, and others of that class. Two tripods were carried next, as prizes for the victors at the athletic combats and exercises. An extraordinary large chariot followed these, drawn by 180 men; in which was a figure representing Bacchus, 15 feet in height, and in the attitude of performing libations with a large cup of gold. Before him was a large vessel of gold, formed in the Laconic manner, and containing 15 metretres, or 145 English gallons. This was accompanied with a golden tripod, with a golden vase of odours. Bacchus was seated in a shade of ivy and vine leaves, intermixed with the foliage of fruit trees; and from these hung several crowns, fillets, and thyrsi, with timbrels, ribbands, and a variety of satiric, comic, and tragic masques; and in the same chariot were the priests and priestesses of that deity, with the other ministers, and interpreters of mysteries, dancers of all sorts, and women bearing vases. These were followed by the Bacchantes, who marched with their hair dishevelled, and wore crowns composed some of serpents, others of branches of the yew, vine, or ivy. After these advanced another chariot, drawn by 60 men; in which was the

statue of Nyssa, or Nisa, the supposed nurse of Bacchus. Then came another chariot, drawn by 300 men; on which was a capacious wine-press, full of the produce of the vintage: sixty satyrs trod the grapes, and sung airs to the sound of the flutes: Silenus was the chief of the band, and streams of wine flowed from the chariot throughout the whole procession. Next, followed another chariot, drawn by 600 men; which contained a vessel of 3000 measures, or 27,000 English gallons, and shed a constant effusion of wine. This chariot was followed by 120 crowned satyrs and sileni, carrying pots, flaggons, and large cups, all of gold. Then succeeded a silver vessel, containing 600 metretres, or 5400 gallons, adorned with jewels. Next appeared several large and rich bowls, and other vessels of massy gold and silver. After this rich equipage, marched 1600 youths, habited in white vests, and carrying gold and silver vases. Another troop succeeded, with large and superb drinking vessels, and tables, on one of which was represented the bed of Semelæ. In a chariot, drawn by 500 men, was the representation of a deep-cavern, throuded with ivy and vine-leaves: a fountain of milk, and another of wine, flowed out of the cavern: all the nymphs who surrounded it wore crowns of gold: and Mercury was seen habited in a splendid manner, with a golden caduceus in his hand. The expedition of Bacchus into the Indies was exhibited in another chariot, where the god was represented by a statue, eight feet high, and mounted upon an elephant: he was arrayed in purple, and wore a golden crown, intermixed with twining ivy and vine-leaves: a long thyrsus of gold was in his hand, and his sandals were of the same metal. A tall satyr was seated on the neck of the elephant, with a crown of gold on his head, formed in imitation of pine-branches, and blowing a kind of trumpet made of goat's horn: the trappings of the elephant were of gold, and his neck was adorned with a golden crown shaped like the foliage of ivy. This chariot was followed by 500 young virgins, adorned with purple vests, and golden zones. Next came 120 satyrs, in glittering arms; and these were succeeded by five troops of sileni, and crowned satyrs, mounted on asses, entirely habited with gold and silver. After this troop appeared a long train of chariots; 24 of which were drawn by elephants; 60 by he-goats; 12 by lions; six by oryges, a species of goats; 15 by buffalos; four by wild asses; eight by ostriches; and seven by stags. In these chariots were youths habited like chaitoteers, accompanied by others of a less stature, clothed in mantles embroidered with gold. On each side of these were three chariots drawn by camels, followed by others drawn by mules; in which were tents, with women of various nations, habited like slaves; and the camels carried great loads of odoriferous spices. Then marched a large band of Ethiopians, followed by hunters at the head of 2400 dogs of the Indian, Hyrcanian, and Molossian breed. They were succeeded by 150 men, with several sorts of birds, deer, sheep, and oxen; also a large white bear, 14 leopards, 16 panthers, four lynxes, three bears, a camelopard, and a rhinoceros. Bacchus advanced next, seated in a chariot, and wearing a crown of gold embellished with ivy leaves: he was represented as taking sanctuary at the altar of Rhea, from the persecution of Juno; and Priapus was placed near him, with a golden crown. The statue of Juno was crowned with a golden diadem; and those of Alexander and Ptolemy had crowns of fine gold. The image of Virtue was placed near that of Ptolemy; and also another statue, which represented the city of Corinth. At a little distance was a great vase with golden cups, and a large bowl of gold. This chariot was followed by several women richly arrayed, and wearing crowns of gold. In another chariot was a gold thyrsus, 135 feet long; and a silver lance 80 feet in length. In this part of the procession were a variety of wild beasts and horses, and 24 lions of a prodigious size; also a great number of chariots, in which were the statues of several kings and deities. After these came a chorus of 600 men, among whom were 300 who played on gilded harps, and wore golden crowns. After them were 2000 bulls, all of the same colour, and adorned with golden frontlets, in the middle of which rose a crown of gold. Next advanced the procession of Jupiter, and a great number of other deities; closed by that

that of Alexander, whose statue of massy gold was placed in a chariot drawn by elephants: on one side of this statue stood Victory, and Minerva on the other. The procession was graced with several thrones of gold and ivory, on one of which was a large golden diadem. On the throne of Ptolemy Soter was a golden crown, which weighed 10,000 pieces of gold, and was equal to about 5000*l.* sterling. In this procession were also 300 golden vases, in which perfumes were to be burnt; with fifty gilded altars, encompassed with golden crowns: there were large torches of gold, rich gilded hearths, and magnificent Delphic tripods of gold. After these were several gilded palms, and a gilt caduceus 62 feet long; a gilded thunderbolt 60 feet in length; and a gilded temple 60 feet in circumference. Next were carried 3200 crowns of gold; together with a consecrated crown 120 feet in circumference, and adorned with a profusion of gems: many golden vessels, and other ornaments, embellished with jewels; particularly 20 golden bucklers, and 64 complete suits of golden armour; as also many tables of gold, covered with golden goblets. There were likewise 400 chariots loaded with vessels, and other works of silver; 20 others filled with golden vessels, and 800 more appropriated to the carriage of aromatic spices. The troops which guarded this procession were composed of 57,600 foot, and 23,000 horse, all armed and dressed in a magnificent manner. During the games and public combats, which continued several days, after this pompous solemnity, Ptolemy Soter presented the victors with 20 crowns of gold, and they received 23 from his consort Berenice. It appeared by the registers of the palace, that these last crowns were valued, according to Egyptian estimation, at 334,000*l.* sterling: from whence some judgment may be formed of the immense sums to which all the gold and silver, employed in this splendid ceremonial might amount.

Ptolemy Philadelphus now devoted his whole attention to the improvement of the noble Alexandrian library, and spared neither pains or expence to procure the most valuable and curious books from various nations. In particular, he procured a copy of the Old Testament, and had it translated into the Greek language; of which translation we have the following account. Being informed that the Jews had a book which contained the laws of Moses, and the history of that people, he was desirous to have it translated into the Hebrew into the Greek language, that his library might be enriched with so valuable a performance. To accomplish this design, it was necessary for him to address the Jewish high priest, in which he met with great difficulty, because a great number of Jews had been actually reduced to a state of slavery in Egypt, by Ptolemy Soter, during the invasion of Judea in his time; and it was represented to the king, that there would be no probability of obtaining from that people either a copy, or a faithful translation of their law, while he suffered their countrymen to continue in their servitude. Aristæus, Sosibius, and Andreas, three of his principal noblemen, advised Ptolemy to release all the Jew Captives, who amounted to about 120,000; upon which that monarch published an edict for their release, and issued an order, that a certain sum per head should be paid out of the public treasury to their masters, by way of indemnification for the loss of their slaves. The whole expence of redeeming the Jews, of both sexes and all ages, amounted to 297,000*l.* sterling. Ptolemy then wrote a letter to Eleazer, the high priest of the Jews at Jerusalem, to send from thence a true copy of the Hebrew original book of the law of Moses, and with it six out of each of the twelve tribes of Israel, to translate it into Greek.

Aristæus and Andreas were sent with this letter to Jerusalem, and had with them likewise several gifts for the temple, to the value of 495,000*l.* sterling. When they arrived at Jerusalem, they were received with the utmost testimony of joy, and their request was granted with the greatest readiness. In consequence of which, they soon returned to Alexandria with an authentic copy of the Mosaic law, written in letters of gold, and given them by the high priest himself, with six elders of each of the twelve tribes, being in the whole 72 elders, or interpreters, who were authorized to translate the whole from the original Hebrew into the Greek language.

Ptolemy Philadelphus, on the arrival of the 72 elders

at Alexandria, sent for them immediately to court, when he made a trial of their knowledge and abilities, by proposing 72 different and difficult questions to them in their order, that is, one to each; and from the answers which they made, approving of their wisdom, he gave to each of them three talents, or 1350*l.* sterling, amounting in the whole to 97,200*l.* sterling. The elders were then conducted to the isle of Pharos, and lodged in a house provided for their reception, where they were plentifully supplied with all necessary accommodations. They applied themselves immediately to their work, and completed the volume, which is commonly called the Septuagint version, in 72 days. They agreed in the version of each period by common conference together; after which, the whole was read over and approved of in the presence of the king, who gave to each of them three rich garments, two talents in gold, and a cup of gold of a talent weight, with which they returned to Jerusalem.

This version is still extant, and is the same which was in use in the time of our blessed Saviour, as most of the passages quoted by the holy penmen of the New Testament are found verbatim in this version: it is still used in the oriental churches, as it was by those in the primitive ages.

An excellent writer says, "This version, which rendered the scripture of the Old Testament intelligible to a vast number of people, became one of the most considerable fruits of the Grecian conquests, and was evidently comprehended in the design God had in view, when he delivered up all the East to the Greeks, and supported them in those regions, notwithstanding their divisions and jealousies, their wars and frequent revolutions. In this manner God prepared the way for the preaching of the gospel, which was then approaching, and facilitated the union of so many nations, of different languages and manners, into one society, and the same worship and doctrines, by the instrumentality of the sinner, most copious, and correct language that was ever spoken in the world, and which became common to all the countries conquered by Alexander the Great.

It is here necessary to observe, that the most ancient and the best manuscript of the Septuagint version now extant, is the Alexandrian copy, which is in the king's library at St. James's, wrote all in capital letters, without the distinctions of chapters, verses, or words. It was sent as a present to king Charles I. by Cyrillus Lucaris, then patriarch of Constantinople, who had been before patriarch of Alexandria. He also sent an account of the book in a schedule annexed to it, written in Latin with his own hand; signifying, that "This book of the holy scriptures of the Old and New Testament, as we have it by tradition, was written by the hand of Thecla, a noble Egyptian lady, above 1300 years since, a little after the council of Nice."

Ptolemy Philadelphus had married the daughter of Lyfimachus, whose name was Arsinoë, and this princess brought him two sons and a daughter. The eldest of the former afterwards succeeded him, and was known by the name of Euergetes; but their mother, through jealousy, promoted a conspiracy to destroy her husband, who discovered the plot, and confined her in Upper Egypt; and Ptolemy then married another princess of the very same name, but of different qualities.

About this time the Romans began to flourish, and obtain a name among foreign nations, whereupon Ptolemy, desiring to enter into an alliance with them, sent an embassy for that purpose to Rome. The Romans received them with the greatest cordiality, and returned the compliment by sending an embassy to Egypt the ensuing year.

Ptolemy received the Roman ambassadors with the greatest respect, gave them a splendid entertainment, and presented each of them with a crown of gold; which they received because they were unwilling to disoblige him by declining the honour he intended them; but the next morning they placed those crowns on the statues of the king, erected in the public parts of the city. Ptolemy also gave them magnificent presents at their departure, which they deposited in the public treasury on their arrival at Rome. However, the republic would not suffer itself to be exceeded in generosity of sentiments, and ordered that the ambassadors should receive a sum of money equivalent to what they had put into the treasury.

This was a noble contest between glory and generosity. We may observe here three fine examples set before us, in the noble liberality of Ptolemy, the disinterested spirit of the ambassadors, and the grateful equity of the Romans.

Ptolemy reigned about 20 years in a peaceful manner, but then his tranquillity was disturbed by some intestine broils and quarrels he had with his relations; these, however, he soon got over by his vigilance and policy; and then turned all his thoughts to advance the trade of his kingdom by the means of navigation. To this end he drew the merchants, both of the eastern and western parts of the world, by many privileges and immunities, to make Alexandria the center of trade; and that city continued the chief mart of commerce for above 1700 years afterwards (that is, till another passage from the west to those countries was found out by the way of the Cape of Good-Hope, in 1486). But as the road from Coptus to the Red-Sea was through deserts, where no water could be had, nor any conveniences of towns or houses for the lodging of passengers, Ptolemy endeavoured to remedy both these inconveniences, by drawing a ditch from Coptus which carried the water of Nile all along by that road, and built on it several inns at such proper distances as to afford every night lodgings and convenient refreshments both for man and beast, to all that should pass that way. As he thus projected to draw all the trade of the east and west into his kingdom, so he provided a very great fleet to protect it, part of which he kept in the Red-Sea, and part in the Mediterranean. This last was extremely fine, and some of the ships which composed it of a very unusual bigness: for he had in it,

} Oars on a side each.

Total 112 ships.

Besides the above, he had as many more with four and three benches of oars, exclusive of a prodigious number of small vessels. With this formidable fleet he advanced the trade of his country, and kept the maritime nations of Lesser Asia in awe.

The above fleet was certainly very considerable, considering the age in which it was built, and the little knowledge that mankind at that time had of maritime affairs.

Ptolemy, during his whole reign, paid the greatest attention to the improvement of his library; and after his death, left behind him the character of a wise, prudent, magnanimous, and learned prince, by at once endeavouring to promote commerce, and encourage literature in his kingdom, by which he improved the minds, and mended the circumstances of his subjects. The encouragement he gave to the professors of different arts and sciences brought many learned men to his court; among these were seven celebrated poets of that age, who, from their number, were called the Pleiades, or seven stars; these were, Aratus, Theocritus, Callimachus, Lycophron, Apollonius, Nicander, and Philicus. Theocritus wrote an idyllium, and Callimachus an hymn, in praise of Philadelphus, which have reached our time; as also have some of the works of Aratus and Lycophron. In his court likewise flourished Aristarchus, a learned grammarian; Manetho, the famous Egyptian historian, who dedicated his history to him; Conon and Hipparchus, two celebrated mathematicians; Zenodotus of Ephesus, the first who corrected the works of Homer, as Suidas informs us; and Aristophanes, who, according to Vitruvius, read over all the books in the Alexandrian library, in the order they stood. Zonius, the critic, came also to his court, and lived some time at Alexandria. He had written against Homer, whom all besides highly valued and admired: though his eminence this way was remarkable, it could not recommend him to Ptolemy; and for the same reason having drawn on him the aversion of all men, he at length died miserably. As Philadel-

phus had abundance of wit, and his happy genius had been carefully cultivated by great masters, he always retained a peculiar taste for the sciences, but in such a manner as suited the dignity of a prince; for, instead of suffering them to engross his whole attention, he regulated his propensity to those grateful amusements by prudence and moderation. To perpetuate this taste in his dominions, he erected public schools and academies at Alexandria, where they long flourished in great reputation. His intercourse with learned men, and his care to dignify the sciences, may be considered as the source of those measures he pursued to make commerce flourish in his dominions; and in which attempt no prince ever flourished more than himself.

Ptolemy III. surnamed Euergetes, or the benefactor, succeeded his father in the year of the world 3758, and 246 before Christ. In the commencement of his reign, he made preparations to wage war against Antiochus Teos, king of Syria, who had repudiated Berenice, the sister of this Ptolemy. But in the interim, Antiochus was poisoned by his other wife, Laodice; whose son, Seleucus Callinicus, ascended the throne, and began his reign by putting Berenice and her son to death.

Ptolemy determined to revenge the death of his sister, and assembled a considerable body of troops for that purpose. The cities of Asia Minor interested themselves in the quarrel, and dispatched great numbers of forces to join with the king of Egypt. With these reinforcements Ptolemy became very formidable; and having put himself at the head of the confederate army, he soon made himself master of Syria and Cilicia, and having taken Laodice, he put her to death; then passing the Euphrates, he conquered all the country from thence to the Tigris. A domestic sedition, however, interrupted the progress of his arms, and obliged him to return to Egypt with part of his forces. But to secure the countries he had conquered, he left one of his generals, named Antiochus, to guard the provinces which he had taken on the west side of Mount Taurus, and Xantippus was entrusted with the care of those on the east side of it. Having thus provided for the protection of the places he had subjugated, Ptolemy returned to Egypt, carrying with him immense riches, of which he had despoiled the enemy, particularly 40,000 talents of silver, which are equal to 18,000,000 sterling; a great number of gold and silver vessels, 2500 statues, &c. &c. All this happened exactly as it was foretold by the prophet Daniel, (Chap. xi.) who tells us, that after the king's daughter of the south, with her son, should be cut off, and he that strengthened her in those times, that is her father, should be dead, "out of a branch of her roots shall one spring up in his estate," that is Ptolemy Euergetes, who flourishing from the same root with her, as being her brother, stood up in the estate of Ptolemy Philadelphus his father, whom he succeeded in his kingdom; and that he "shall come with an army, and shall enter into the fortresses of the king of the north, and shall deal against them, and shall prevail; and shall also carry captives into Egypt their gods with their princes, and with their precious vessels of silver and of gold, and he shall continue more years than the king of the north: so the king of the south shall come into his kingdom, and return into his own land." The king of the south is the king of Egypt; and the king of the north is the king of Syria; for both are there so called in respect of Judea, which, lying between these two countries, hath Egypt on the south, and Syria on the north. After this the holy prophet proceeds, through the rest of the chapter, to predict all the other most remarkable events that were brought to pass in the transactions of the succeeding times of these two races of kings, till the death of Antiochus Epiphanes, the great persecutor of the Jews.

After the return of Ptolemy to Egypt, Seleucus prepared a great fleet on the coast of Syria, to reduce the revolted cities of Asia. However, his enterprize was ineffectual, as his whole navy was destroyed by a violent tempest. Seleucus and a few of his attendants escaped, but all the rest who composed the fleet were drowned. But, says Justin, this dreadful stroke contributed to the re-establishment of his affairs, for the cities of Asia, which had revolted out of the abhorrence they had of him for the murder of Berenice and her son, on hearing of his great loss, and thinking him sufficiently punished,

changed their hatred into compassion, and declared for him again.

Being thus restored to the best part of his dominions, Seleucus prepared a formidable army against Ptolemy, in order to recover the rest of his territories. But in this attempt he had no better success than in the former, for he was defeated by Ptolemy, who cut off the greatest part of his troops, and he himself, with a few followers only, with great difficulty escaped to Antioch.

The repeated misfortunes of Seleucus, however, seemed to conciliate the affections of his subjects, and their love to him rose in proportion to his distresses. Hence it was that the cities of Smyrna and Magnesia, in Lower Asia, out of the respect which they bore to him, entered into a league to join all their power and strength for the support of his interest and dignity, which they caused to be engraved on a large column of marble; "This very marble, says the learned dean Prideaux, is now standing in the Theatre-yard at Oxford, with the said league engraved on it in Greek capital letters, still very legible. It was brought out of Asia by Thomas earl of Arundel, in the beginning of the reign of king Charles I. and was given, with other marbles, to the university of Oxford, by Henry duke of Norfolk, his grandson, in the reign of king Charles II."

An accommodation at length took place between Ptolemy and Seleucus, and the former then applied himself to the enlarging of his dominions southward; and he extended them a great way down the Red-Sea, making himself master of all the coasts of it both on the Arabian as well as the Ethiopian side.

After having reigned 25 years, he was poisoned by his son, who succeeded him in the year of the world 3783, and 221 years before Christ, and was called Ptolemy IV. or Philopater.

This was a most profligate and vicious prince, and his title of Philopater was given him ironically, for the word itself signifies, lover of his father; but his enmity to his father, and murdering him at last, being notoriously known, he received that appellation by way of derision. Giving way to his diabolical disposition, he soon after murdered his mother Berenice, and his brother Magas, and thus embred his hands in the blood of his whole family.

The weakness and wickedness of this monarch's reign induced Antiochus, the lineal king of Syria, to try to recover his dominions, which had for some time past been annexed to the Egyptian territories. He first reduced Selucia, and afterwards Tyre and Ptolemais.

He began the next campaign in a formidable manner, having spent the winter months in equipping a great fleet, and fitting out a very large army. The fleet he gave the direction of to Diogenetus, and took the command of the army upon himself.

On the other hand, Ptolemy had put his army under the command of Nicolaus, and entrusted his fleet to the care of Perigenes. Nicolaus marched to mount Libanus, where he seized all the passes between that place and the sea. The fleets coasted and the armies marched on both sides; so that their naval as well as land-forces met at the passes which Nicolaus had seized. While Antiochus attacked Nicolaus by land, the fleets began to engage; so that there was a general engagement both by sea and land at the same time. Neither party had the superiority at sea; but Antiochus had the advantage on land, and forced Nicolaus to retire to Sidon, after losing 4000 men. Antiochus could not besiege him there, but marched into Galilee and Gilead, which he reduced to his obedience, and then took up his winter-quarters at Ptolemais.

In the ensuing campaign, both parties again took the field. Ptolemy was himself at the head of his army, which consisted of 70,000 foot, 5000 horse, and 73 elephants, which he led from Pelusium over the deserts that parted Egypt from Palestine, and encamped at Raphia, a town lying between Rhinocorura and Gaza. Antiochus met him there with an army of 62,000 foot, and 102 elephants. The two kings drew out all their forces for a decisive battle, and both rode before the front of their respective armies to animate their troops. Arsinoe, who was sister and wife to Ptolemy, accompanied him in this action, and continued in the army during the heat of the whole battle, exhorting the soldiers to behave valiantly, and exposing herself to all the dangers of the engagement.

During the battle, Antiochus commanding the right wing, routed the opposite wing of the enemy; but pursuing them too far, in the interim the other wing of the enemy having beaten his left wing, fell upon the main body, then left naked, and utterly broke them before he could return to their assistance. This compelled Antiochus to retreat, with the loss of 10,000 men killed, and 4000 taken prisoners; after which he abandoned all his conquests, and retired to Antioch with the remnants of his troops.

In consequence of the above victory, all Coele-Syria and Palestine submitted to Ptolemy, who went to Jerusalem on purpose to visit the temple. "But, says an accurate author, he was not content with viewing this temple only from the outer court, beyond which it was not lawful for any Gentile to pass, but would have pressed into the sanctuary itself, even into the holy of holies, where none but the high-priest was to enter, and that only once a year, on the great day of expiation. The high-priest, priests, levites, and people, in vain opposed this rash and impious resolution. The king entered the inner court; but as he was passing farther to go into the temple itself, he was smitten from God with such a terror and confusion of mind, that he was carried out of the place in a manner half dead. On this he departed from Jerusalem, filled with great wrath against the whole nation of the Jews; and on his return to Alexandria severely put it into execution."

The inhabitants of Alexandria were of three ranks: first, the Macedonians, who were the original founders of the city, and had the first right to it: 2dly, the mercenary soldiers, who came there to serve in the army; and, 3dly, the native Egyptians: but, by the favour of Alexander the Great, and Ptolemy Soter, the Jews were enrolled among the first rank, and had all the privileges of original Macedonians conferred on them. Philopater resolved to deprive them of this right, and to publish a decree, whereby they were degraded from the first rank, and caused them to be enrolled in the third rank, among the common people of Egypt. However, he permitted such of the Jews as would be initiated into the heathen religion, to retain their former privileges. But of the many thousands of the Jewish race, which then dwelt at Alexandria, there were found only 200 who accepted of this condition, and forsook their God, to gain the favour of their king; the rest stood all firm to their religion, and held the apostates in abhorrence, which so much enraged the king, that he took a resolution of destroying all the Jews in his extensive dominions, purposing to begin with those of Egypt, and then to proceed against the inhabitants of Judea. Accordingly he ordered all the Jews in Egypt to be brought in chains to Alexandria. They were brought and shut up in the Hippodrome, a large place without the city, where the people used to assemble to see the horse-races and other shows. The king was determined to expose them there for a spectacle to be destroyed by his elephants, who were brought forth three days successively for that purpose, and on the third day the king was present, when the elephants, to the number of 500, made drunk with wine and frankincense, that they might with the more rage execute what was intended upon those people, were let loose upon them; but, instead of falling upon the Jews, they turned their rage all upon those who came to see the show, and destroyed great numbers of them. Several appearances were seen in the air, which much frightened the king, and all the spectators. All which manifesting the interposal of divine power in the protection of those people, Philopater durst not any longer prosecute his rage against them, but ordered them all again to be set free; and fearing the divine vengeance upon him in their behalf, for the appealing and diverting of it, he restored them to all their privileges, rescinding and revoking all his decrees which he had published against them.

Ptolemy at length concluded a peace with Antiochus, who gave up Coele-Syria and Palestine. If Ptolemy had pursued the victory at Raphia, he might have deprived Antiochus of the whole Syrian empire; and the Egyptians were so much incensed at such a disadvantageous peace, that they broke into a rebellion; Ptolemy, however, suppressed it, and put many of the principal persons concerned to death, and immediately after this occurrence,

rence, the Romans sent ambassadors to renew their ancient friendship and alliance with Egypt, and enter into a treaty of commerce and mutual assistance.

Peace being entirely restored throughout the Egyptian territories, Ptolemy Philopater gave himself wholly up to lust and licentiousness, and suffered himself to be wholly guided by Agathoclea, his concubine, and Agathocles, her brother; drinking, gaming, and libertinism engrossed his whole time, till his excessive debaucheries quite emaciated him, and weakened him so, that he fell a martyr to excess, and died after having reigned 17 years, being then only 37 years of age.

Ptolemy V. surnamed Epiphanes, or the Illustrious, was but five years of age when he acceded to the sovereignty. The death of his father was concealed by Agathoclea and her brother, till they had plundered the palace of many valuable effects; after which they made it publicly known, and then summoned the Macedonians to a general council, when Agathocles, having the young king in his arms, implored their protection for him against the ambition of Theopomus. The Macedonians were so highly incensed at this, that they immediately wrested the young prince from the arms of Agathocles, and placed him on the throne in the public hippodrome, where Agathocles, Agathoclea, and Oenanthe, their mother, were put to death in his presence, as by his order; after which all their creatures were cut off, and the guardianship of the young king was committed to the charge of Salsibus, the son of him who had been the ruling minister of the court during the last three reigns.

Philip, king of Macedon, and Antiochus, king of Syria, thinking to take advantage of the death of Philopater, and the infant state of his successor, entered into a league to divide his dominions between them, in which it was agreed that Philip should have Caria, Lybia, Cyrene and Egypt; and Antiochus all the rest. Accordingly the latter marched into Syria and Palestine, both which places submitted to him without the least opposition.

The Egyptians, finding themselves much distressed by the league made between Philip and Antiochus, against their infant king, and the usurpations which had been made by them on his provinces, sent an embassy to Rome, to pray their protection, offering them the guardianship of their king, and the regency of the kingdom during his minority; and the farther to induce them to accept of their offers, they alleged that the deceased king had recommended both to them at his death.

The Romans, thinking this would extend their fame, accepted the offer, and took upon them the tuition of the young prince. They immediately dispatched three ambassadors to the kings of Syria and Macedon, to let them know that they had taken on them the tuition of the young Egyptian king, and to require them to desist from invading his dominions, otherwise they should be obliged to make war upon them for his protection.

Aristomenes, an old experienced minister of the Egyptian court, was not only appointed guardian over the young king, but also invested with the care of the government, which trust he discharged with great prudence and fidelity. He recruited the army with the best soldiers he could get, and took 6000 stout Ætoliens into pay. He sent one Scopas, an experienced commander, to recover Syria and Palestine; but he was defeated by Antiochus, with the loss of a great number of his men.

Soon after this conquest, Antiochus sent a messenger to Alexandria, with proposals of a marriage between Cleopatra, his daughter, and king Ptolemy, to be consummated as soon as the parties should be of a proper age for it; promising the restoration of the provinces he had conquered, on the day of the nuptials, by way of dowry with the young prince.

The consideration of these proposals was interrupted by means of Scopas, who had been conquered by Antiochus. This general had concerted a scheme for making himself master of Egypt, by murdering the young king; but the plot was discovered by Aristomenes, who put Scopas and all his accomplices to death, and dismissed the Ætoliens from the service.

At the time this conspiracy was fully suppressed, the king was fourteen years of age; and, according to the custom of that country, was declared to be out of his minority; in consequence of which he was enthroned with great pomp, and the government placed solely in his hands.

The Egyptians having accepted the proposals offered by Antiochus, the next year the young king was married to his daughter Cleopatra; on which Antiochus agreed to give up to Ptolemy the provinces of Cœle-Syria, and Palestine. Antiochus was soon after killed in the province of Elimais, where he had plundered the temple of Jupiter Belus.

The following year after Ptolemy's marriage, his wife Cleopatra bore him a son, who reigned after him in Egypt, by the name of Ptolemy Philometor. She had also another son by him, and a daughter called after her own name.

The principal affairs of government had hitherto been under the direction of Aristomenes, who had conducted himself with such propriety as to obtain universal esteem; but the king growing weary of that able and faithful minister, determined to get rid of him, which he accomplished by cruelly ordering him to be put to death. The remainder of his reign was little more than disorder and confusion, and his kingdom was involved in farther troubles than it had been in the time of his father.

The Egyptians, unable to bear longer the grievances under which they had laboured, from the bad administration of the king, attempted to depose him; but he extricated himself out of these troubles by making Polycrates his chief minister, who was a wife and valiant man. The revolters were suppressed, and many of them put to death, among whom were some of the principal nobility.

Ptolemy V. maintained a strict alliance with the Romans during the whole time of his reign; and he also carefully cultivated the friendship of the Achæans. He had proposed to make war upon Sedecus, king of Syria; but he was poisoned by some of his attendants, which put an end to his project and life in the 24th year of his reign, and 20th of his age.

On the death of Ptolemy Epiphanes, his son, Ptolemy VI. called Philometor, succeeded to the sovereignty; but being a child only six years of age, his mother Cleopatra was declared regent, who governed the kingdom with great care and prudence till her death, which happened only one year before the expiration of the king's minority.

The regency, after her death, was invested in Lenæus, a nobleman of the court, and Eulæus, who had the principal care of the young prince. As soon as these two had entered on the administration, they made a demand of Cœle-Syria and Palestine from Antiochus Epiphanes, the son of Antiochus the Great, who had agreed to give up those provinces to Ptolemy V. on his marrying his daughter Cleopatra. Antiochus refused to comply with their demands, which occasioned a war between Egypt and Syria. Cleopatra was mother to one king, and sister to the other, whereby she had prevented any breach being made between them during her life; but the new regents being absolute, friendship subsided, and animosity took place between Antiochus and his nephew Ptolemy Philometor.

The young king having now attained his fourteenth year, was declared to be out of his minority, and great preparations were made at Alexandria for his being enthroned with the usual pomp and solemnity.

Antiochus being informed of this, sent Apollonius, one of the prime nobles of his court, to be present at the ceremony, and to congratulate the young king on the occasion. When the ambassador returned to Antiochus, that prince found that war was intended against him, and therefore he put his frontiers in a proper posture of defence.

Antiochus, not chusing to wait for the enemy, marched to attack them, and was met by the forces of Ptolemy between mount Casius and Pelusium, where a battle ensued, in which Antiochus having got the victory, fortified those borders of his dominions, and then took up his winter quarters at Tyre, which he easily obtained by the governor giving it up without making the least opposition.

In the early part of the following year Antiochus invaded Egypt both by sea and land. He obtained another victory over the Egyptians on their frontiers, took Pelusium; and from thence made his way into the heart of the kingdom. So superior was he in strength wherever he came, that it was in his power to have out them all off to a man; but instead of taking this advantage, he rode about the field in person after the victory, forbidding the soldiers

soldiers to put any of the conquered to death. This clemency so far endeared him to the Egyptians, that on his farther march into the country, they all readily yielded to him. In short, the only place that held out against him was Alexandria, he having made himself master of Memphis, and all the other parts of Egypt.

The young and pusillanimous king voluntarily surrendered himself into the hands of Antiochus, who treated him with great respect; for they eat at the same table, and conversed together as friends. Antiochus pretended for some time to take care of the interest of the young king his nephew, and to manage the affairs of the kingdom as his tutor and his guardian; but when he had made himself master of the country, under this pretence, he seized all to himself, pillaged every place he went to, and greedily enriched himself and his army with the spoils of that country he had pretended to protect.

Antiochus marched from Egypt into Judea; took Jerusalem; slew 40,000 of its inhabitants; and sold the like number for slaves. He sacrilegiously plundered the temple, to the value of 800 talents of gold, or 12,960,000 l. sterling, and returned to Antioch with the spoils of Judea as well as Egypt, which both together amounted to an immense treasure. See Maccabees, chap. v. ver. 21.

The Egyptians, finding their king fallen under the power of Antiochus, and by him deprived, as it were, of the crown, looked on him as altogether lost to them; and therefore, having the younger brother with them, they placed him on the throne, and made him their king in his stead.

When these honours were conferred on the younger brother, he took upon himself the name of Ptolemy Euergetes II. which was soon changed to that of Kakergetes, the former signifying *benevolent*, and the latter *benevolent*. He afterwards obtained the name of Physicon, that is, the *fat gut*, or *great-bellied*, by reason of the great and prominent belly which he acquired by his luxury and gluttony; and by this name he is most commonly mentioned by historians.

Soon after this prince ascended the throne, Antiochus made another expedition into Egypt, under pretence of restoring the deposed king; but in reality to subject the whole kingdom to himself. He conquered the Alexandrians in a sea-fight near Palusium, entered the country with a great army, and marched directly towards Alexandria, to lay siege to that city. The ambassadors who were then at Alexandria, on embassies from several of the Grecian states to the Egyptian court, interposed in vain. Antiochus invaded Alexandria; on which Ptolemy Euergetes, and Cleopatra, his sister, who were then shut up in the town, sent ambassadors to the Romans, to solicit their assistance.

The Roman senate, moved with their remonstrances, and persuaded that it would not be for their interest to suffer Antiochus to attain such an height of power, resolved to send an embassy to Egypt, to put an end to the war. Accordingly three of the most proper persons were appointed for this important negotiation, whose instructions were, that they should first wait upon Antiochus, and afterwards on Ptolemy; that they should order them, in the name of the senate, to suspend all hostilities, and terminate the war; and that, should either of the parties refuse a compliance, the Romans would no longer consider them as their friend and ally.

While this negotiation was concerting, Antiochus, having met with great opposition from the Alexandrians, thought proper to alter his plan, and concluded that it would be most to his interest to keep up an enmity between the two brothers, which would probably so weaken them that he might at length get the master over them both. With this view he withdrew from Alexandria to Memphis, and there seemingly again restored the whole kingdom to Philometor, excepting only Pelusium, which he retained in his own hands; that having this key of Egypt still in his custody, he might thereby again enter the kingdom when matters should be ripe for his design; and having made these dispositions, he returned to Antioch.

From the misfortunes Ptolemy Philometor had met with during these revolutions, he began to be a little roused from his lethargy, and appeared susceptible of the future intentions of Antiochus. Wherefore, as soon as that prince was gone, he invited his brother to an accom-

modation, which was effected by means of their sister Cleopatra; and an agreement was made upon terms that they should reign jointly together. Philometor then returned to Alexandria, and peace was restored to Egypt, much to the satisfaction of the people, especially of the Alexandrians, who had greatly suffered by the war.

When Antiochus heard that the two brothers were reconciled, he fell into a great rage, and determined on future revenge. Accordingly, in the 13th year of the reign of Philometor, he made another invasion upon Egypt, in which he purposed, without owning the interest of either of his nephews, to suppress them both, and make an absolute conquest of the whole kingdom. He subdued all the country as far as Memphis, and marched towards Alexandria; but here he was stopped in his progress, and all his former designs totally frustrated; for, at a place called Leusine, within four miles of the city, he was met by the ambassadors sent from the Roman senate. Among these was Popilius, his old friend and acquaintance, with whom he had contracted an intimate friendship and familiarity while he was at Rome.

As soon as Antiochus saw Popilius, he put forth his hand to embrace him; but the latter refused the compliment, and told him, that the public interest of his country must take place of private friendship; that he must first know, whether he was a friend or an enemy to the Roman state, before he would own him as a friend to himself; and then delivered into his hands the tables, in which were written the decrees of the senate, and required him to give an immediate answer thereto. Antiochus having read the decree, told Popilius he would consult with his friends about it, and speedily give him the answer they should advise. But Popilius insisting on an immediate answer, drew a circle round the king, in the hand, with the staff which he had in his hand, and required him to give his answer before he stirred out of that circle; at which strange and peremptory way of proceeding Antiochus being startled, after a little hesitation yielded to it, and told the ambassador that he would obey the command of the senate; whereon Popilius accepted his embraces, and acted according to his former friendship with him. That which made him so bold as to act with him after this peremptory manner, and the other so tame as to yield thus patiently to it, was the news which they had a little before received of the great victory which the Romans had obtained over Perseus, king of Macedonia.

Antiochus, after this, went back to Syria, and Popilius returned with his colleagues to Alexandria, where they ratified and fully fixed the terms of agreement between the two brothers. The ambassadors then sailed to Cyprus, and caused an entire restoration of that island to be made to the Egyptian kings, to whom it of right belonged. They then returned to Rome, and were followed by ambassadors from the two Ptolemies, to thank the senate for the protection they had received from them.

Antiochus again plundered Jerusalem, and finished an impious life by a miserable death. See II Maccabees, chap. xiii. The two Egyptian kings preserved the agreement ratified between them by the Roman ambassadors but a very short time; for they broke into an open rupture, inasmuch that Physicon drove Philometor from the throne. The latter, in consequence of this, embarked for Italy, and landed at Brundisium, from whence he travelled on foot to Rome, in a sordid habit, and with a mean attendance, to demand from the senate the necessary aid for replacing him on the throne. As soon as the senate were informed of his arrival, they sent for him, and conducted him to a lodging suitable to his royal dignity. A day of audience being appointed, Philometor made known his case to the senate, who immediately decreed his restoration, and sent two ambassadors with him to Alexandria, to see their decree executed; who reconducted him accordingly, and succeeded in negotiating an accommodation between the two brothers. Lybia and the province of Cyrene were assigned to Physicon; Philometor had Egypt and the life of Cyprus. Each was declared independent of the other, and the treaty and agreement were fully confirmed with the usual ceremonies.

Physicon, being dissatisfied with the share allotted him, went to Rome to solicit the senate that he might have Cyprus instead of his brother, which was granted, and

two ambassadors were sent with him to Philometor, to see it executed. The latter refused to submit to this decision, and the Romans declared him their enemy. Philometor afterwards defeated Ptolemy, and took him prisoner at Lapitho in Cyprus, where he pardoned him every thing, and even restored him Lybia and Cyrene, whereby the war between the two brothers was wholly ended, and never after revived.

About this time Antiochus Eupater, king of Syria, was put to death by Demetrius Sotor, the son of Seleucus Philopater, who became king in his stead; but he was defeated and killed by Alexander Balus, who then mounted the throne, and married Cleopatra, the daughter of Philometor. The latter, soon after, suspecting that Alexander had a design upon his life, took his daughter from him, gave her to young Demetrius, the son of Demetrius Sotor, and engaged to re-establish him on the throne of his father.

Soon after this, Philometor defeated Alexander near Antioch, when the latter fled to Zabdiel, an Arabian prince, who cut off his head, and sent it to Ptolemy; but this prince died a few days after, of a wound he had received in the battle. Thus Alexander, king of Syria, and Ptolemy Philometor, king of Egypt, died about the same time, the former after a reign of five years, and the latter after one of thirty-five. Demetrius, who had attained the crown of Syria by this battle, assumed the surname of Nicator, or the Conqueror.

Ptolemy VII. surnamed Ptolemy, or tun-bellied, succeeded his brother in all his dominions; in which he was at first opposed by Cleopatra, the wife of the late king, by whom he had a son; but affairs were accommodated through the mediation of Thermus, the Roman ambassador. It was agreed that Ptolemy should marry Cleopatra, and educate her son, who should be declared heir to the crown after his death.

Ptolemy had no sooner married the queen, and taken full possession of the crown, than he began to shew the natural cruelty of his soul; for before the day of their nuptials was expired, he killed the young prince in his mother's arms. He had affected to assume the name of Euergetes, or the Benefactor; but was now called by the Alexandrians, Kakergetes, or the Malefactor, on account of his wickedness; for he was the most iniquitous and cruel, as also the most vile and despicable of all the Ptolemies that reigned in Egypt.

Cleopatra, his wife, brought him a son, whom he called Memphitis, from his being born at the city of Memphis; but this gave no satisfaction to his people, who universally detested him on account of the barbarous cruelties he was perpetually exercising on his subjects. He murdered and banished not only such as were devoted to his deceased brother Philometor, but also those who had been firmly attached to himself. He empowered his foreign mercenaries to commit murder and rapine upon the oppressed and terrified Alexandrians, who fled into other countries, and left their city in a manner desolate. On this he invited all strangers to come and re-people the place; and as great multitudes flocked there, he not only gave them habitations, but admitted them to all the rights of those who, by his cruelty, had been obliged to desert the place of their nativity.

Among those that fled out of Egypt were many learned men, and other professors of arts and sciences; by which means learning (which had been a long time lost) was revived in Greece, Asia Minor, the Isles, and in all other places where they went.

While the city of Alexandria was receiving new inhabitants, three Roman ambassadors arrived there, who were received in great state by the king. These ambassadors, after taking a full view of Alexandria, and the state of affairs there, sailed up the Nile, to see Memphis and other parts of Egypt; by which they had an opportunity of discovering the number of cities it contained, and the strength of the country. They found that it wanted nothing but a prince of capacity and application to make it a very potent and formidable state. They were therefore pleased that Ptolemy appeared entirely destitute of every qualification necessary for such an under-

* The natural deformity of this prince is particularly mentioned by Ptolemy, who says, that he had a great

head, and a broad face, extremely deformed and shocking, upon a short squat body, with a belly enormously prominent.

taking; and they looked upon him in the most despicable light, more especially as the deformities of his body were equal to those of his soul. After staying a short time at Alexandria, they went over to Cyprus, and from thence proceeded to execute their commission in the other countries to which they were sent.

Ptolemy still persevered in giving a loose to luxury, tyranny, and cruelty. He divorced his wife Cleopatra, and married her daughter, who was called by the same name. He treated the new inhabitants of Alexandria as arbitrarily as he had done the old ones; and thinking it would be his best security to cut off their young men, who were the strength of the place, he caused his mercenaries to surround them in the Gymnasium, as they were at their public exercise, and put them all to death.

This horrid massacre so exasperated the people, that they rose in a general tumult, and set fire to his palace, with an intent to have burnt him in it; but he made his escape to Cyprus, with Cleopatra his young wife, and Memphitis his son. When he arrived there, he was informed that the Alexandrians had put the government of the kingdom into the hands of Cleopatra, his divorced wife, upon which he hired an army of mercenaries, and determined to make war against her.

He had made one of his sons governor of Cyrene, and fearing the Alexandrians would make him king, he sent for him to Cyprus, where he put him to death: by which shocking barbarity the Alexandrians were so much farther enraged, that they pulled down and demolished all his statues, wherever erected in their city.

Ptolemy imagined this was done at the instigation of Cleopatra, his divorced queen; wherefore, to be revenged upon her, he caused Memphitis, a very hopeful and young prince he had by her, to be slain before his face; after which, cutting his body in pieces, he put them all into a box, with his head, thereby to shew to whom they belonged; and sent it, with them inclosed therein, to Alexandria by one of his guards, who was ordered to present it to the queen on the day then approaching, which was to be celebrated as the anniversary of her birth. It was accordingly presented to her on that day, when the joy, which before was universal, was turned into the greatest lamentation, and the horrid scene produced a general detestation against the author of it.

The Alexandrians raised an army under the command of Mariyas, whom Cleopatra had made her general to defend the country against Ptolemy, who got together an army, and sent it against the Alexandrians, under the command of Hegelochus his general, who defeated Mariyas, took him prisoner, and sent him in chains to Ptolemy.

Cleopatra fled to her daughter, who was queen of Syria; and Ptolemy returned to Alexandria, where he re-assumed the government. He married his daughter Tryphæna to Antiochus Gripus, the son of his niece Cleopatra, and placed him on the throne of Syria.

Ptolemy soon after died at Alexandria, in the 67th year of his age, having reigned 29 years from the death of his brother Philometor; but no reign was ever more tyrannical, or abounded with greater acts of cruelty.

He left behind him three sons; Apion, whom he had by a concubine; and Lathyrus and Alexander, whom he had by his niece Cleopatra. The kingdom of Cyrene he bequeathed to Apion; and left Egypt to his widow Cleopatra, in conjunction with one of her sons, whom she should think fit to choose.

Ptolemy VIII. surnamed Lathyrus, had been banished to Cyprus by his father, and even his mother wished to keep him from the crown. But a faction being raised in his favour, he was sent for, and placed on the throne in the year of the world 3887, and 117 years before Christ. Nothing worth recording happened in this monarch's reign, which lasted to years, when his mother contrived to dethrone him, and place his brother Alexander in his room. Ptolemy Lathyrus then retired to Cyprus, where he was suffered to reign unmolested over that island.

Ptolemy IX. or Alexander I. began his reign in the year of the world 3897, and 107 years before Christ.

head, and a broad face, extremely deformed and shocking, upon a short squat body, with a belly enormously prominent.

The first transaction of Lathyrus, after being deposed from the throne of Egypt, was entering Phœnicia with an army of 30,000 men, in order to oppose Alexander Jannæus, the king of the Jews, who had invaded that country with 50,000 men. The two armies engaged at Afophes, near the river Jordan, and Lathyrus obtained a complete victory; but he was soon after obliged to return to Cyprus by his mother Cleopatra, who brought a great army from Egypt into Phœnicia, took Ptolemais, and drove Lathyrus out of that country; as she was apprehensive if he should make himself master of it he would thereby grow strong enough to recover Egypt.

The continual wickedness of the queen-mother was such, that her son Alexander began to be apprehensive that she would either dethrone him, as she had done his brother, or murder him; on which account he took the impious precaution of putting her to death. This parricide occasioned a revolt, and Alexander was driven from the throne by his own subjects. He attempted to recover the crown again, but was killed in an engagement against the revolted, and his brother Ptolemy Lathyrus, being sent for from Cyprus, was reinstated on the throne, and continued to reign over Egypt till his death, which happened 36 years after the death of his father, 11 of which he reigned jointly with his mother in Egypt, 18 in Cyprus, and seven alone in Egypt after his mother's death. He was succeeded by Cleopatra his daughter, and only legitimate child; her proper name was Bernice, for it is to be observed, that as all the males of his family had the common name of Ptolemy, so all the females of it had that of Cleopatra, and besides, had proper names to distinguish them from each other. Thus Selene was called Cleopatra, were two of her sisters; and thus Bernice received that name according to the usage of her family: the observing of this will remove many obscurities and difficulties in the Egyptian history.

It was at this time that Sylla was perpetual dictator at Rome, and sent Alexander to take possession of the crown of Egypt, on the death of his uncle Lathyrus, as his nearest heir male; for he was the son of that Alexander who had put his mother to death, and had attached him to Sylla, who was then the dispenser of law to the world. The Alexandrians had put Cleopatra upon the throne six months before he arrived among them. However, to compromise the matter, and avoid displeasing Sylla, it was determined that Alexander should marry Cleopatra, and reign jointly; but Alexander either disliking the lady, or not liking to have a partner in the government, put her to death 19 days after their marriage, and reigned alone 15 years. This monarch, who was called Ptolemy X. or Alexander II. began his reign about the year of the world 3023, and 81 before Christ. He was at first opposed by the two sons of Selene, the sister of Lathyrus, who went to Rome to solicit the senate in their behalf, but their solicitations were ineffectual. The people at length growing tired of their king, expelled him the kingdom, and called in Ptolemy Auletes, the illegitimate son of Lathyrus. Alexander applied to Pompey for aid, which was out of his power to grant, and the banished king went to Tyre, in hopes of some more fortunate circumstance arising in his favour; he, however, died before any such auspicious event happened.

Ptolemy XI. surnamed Auletes, or the Piper, on account of his priding himself particularly on being skilful in playing on that instrument, began his reign in the year of the world 3039, and 65 years before Christ. He was an exceeding wicked prince; and at the time of commencing his reign, Julius Cæsar was consul of Rome. As he wished to be confirmed in his title to the crown, and to enter into an alliance with the Romans, Cæsar insisted upon his paying six thousand talents for those courtesies. The revenues of Egypt amounted to much more than that sum, yet it was with difficulty the king raised it, and the overtaxing his subjects occasioned great murmurings. Much about the same period a decree was published at Rome by Claudius, for deposing Ptolemy king of Cyprus, the brother of Auletes, seizing his kingdom for the republic, and confiscating all his effects. The Egyptians pressed their king to demand that island as an old appendage of Egypt, which he declined, and they expelled him from his kingdom on that account. Auletes made his escape to Rhodes, where he met with the famous Cato, who was

on his way to Cyprus, to put the decree in execution against that island. Auletes and Cato had an interview, when the former told the latter that he was going to Rome to require assistance of the Romans, in order to re-establish himself in his kingdom; but Cato greatly blamed him for having quarrelled with his people, and thus exposing himself to the disgrace, trouble, and contempt, which he must expect to meet with at Rome. Adding, that if all Egypt was to be sold, the purchase-money would not be sufficient to satisfy the greedy expectations of the principal Romans; therefore he advised him to return to Egypt, and make up all differences with his people. Cato even offered to go with and assist him therein. But Ptolemy went forward to Rome, where he soon found, by full experience, all to be true that Cato had told him. The king was obliged to pay great attendance on the leading-men of the common-wealth, and expend great sums among them to procure them to favour his cause; and after all, when there was no more left to be extorted from him, an oracle was trumped up out of the Sibylline books, whereby it was pretended the Romans were forbidden to give him any help in this case. So that after he had solicited this matter a whole year at Rome, and expended vast sums in it, he was forced to depart from thence without success, and retire to Ephesus, after which the Egyptians placed his daughter Bernice on the throne, and sent an embassy into Syria to Antiochus Asiaticus, who, by his mother Selene, was the next heir male of the family, to invite him to come into Egypt, and there marry Bernice and reign with her: but the ambassadors on their arrival in Syria found him just deceased. However, they made the same proposal to Seleucus his brother, which he readily accepted. He proved a very fordid and base spirited man, which occasioned the Egyptians to give him the nickname of Cabofactes, or the scullion. It was this monarch, who sacrilegiously robbed the sepulchre of Alexander the Great, of the coffin of massy gold, in which his body had been deposited by Ptolemy I. and put it into a coffin of glass. However, the wife of this king, conceiving a great dislike to him, got him to be assassinated, and afterwards married Archilaus, the high priest of Comana in Pontus.

At this time Gabinus was proconsul in Syria, and had passed with a body of troops over the Euphrates, in order to reinstate Mithridates in the kingdom of Media, from which he had been expelled by his brother; but Ptolemy Auletes came to him with letters from Pompey, their common friend and patron, who was declared consul for the ensuing year. By those letters he conjured Gabinus to exert all his power in favour of the proposals that prince should make him with regard to his re-establishment in his kingdom. However dangerous that conduct might be, the authority of Pompey, and the hope of gain, made Gabinus begin to waver. The lively remonstrances of Antony, who sought occasions to signalize himself, and was besides inclined to please Ptolemy, whose intrigues flattered his ambition, fully determined Gabinus. This was the famous Mark Antony, who afterwards, as triumvir, governed one third part of the Roman empire for several years. He accompanied Gabinus into Syria as his general of the horse, and in that service first signalized himself. Being a young man of great courage and a bold spirit, he was the chief promoter of an expedition into Egypt; though it was opposed by most of the other generals; but the opinion of Antony agreed best with the avarice of Gabinus, and carried it against them all. The more dangerous the enterprise, the more right Gabinus thought he had to make Ptolemy pay dear for it, who offered him 10,000 talents; the greatest part to be advanced immediately in ready money, and the rest as soon as he should be reinstated. Gabinus accepted the offer without any hesitation, re-passed the Euphrates, crossed Palestine, and marched directly into Egypt.

On the arrival of the Roman army on the borders of Egypt, Mark Antony was sent with a body of horse to seize the passes, and open the way for the rest of the army to follow. He succeeded in his designs, by securing all the passes, and taking Pelusium, the key of Egypt on that side. Antony having thus opened the way, Gabinus entered Egypt with the whole army, at that season of the year when the Nile was lowest. Archilaus,

the husband of queen Berenice, omitted nothing that could be done to defend the country, and had several conflicts with the invaders; but the Egyptians were of too effeminate a nature to oppose such warlike people as the Romans, neither had they equal skill in military affairs. Hence it was impossible for Archelaus, at the head of such undisciplined forces, to oppose the Roman legionary troops; so that he was not only frequently defeated, but at length slain in one of the engagements. Mark Antony, however, ordered his body to be fought for in the field of battle, and had it afterwards interred in great funeral pomp. After the death of Archelaus, Egypt was soon reduced to obedience, and compelled again to receive Auletes; who was no sooner restored than he put his daughter Berenice to death, for having worn his crown during the time of his exile, and likewise either killed or banished most of the capital men who had been concerned against him, and confiscated their estates in order to raise the money to pay Gabinius for assisting him in obtaining his kingdom.

Having left some Roman troops to be a guard to Auletes, Gabinius returned to Syria.

Being firmly seated on his throne, as he imagined, Auletes filled his dominions with blood and slaughter, the people being kept in fear by the idea of his Roman friends.

Ptolemy Auletes died about four years after his restoration, and 30 after his first coming to the throne, when he was succeeded by his eldest son, Ptolemy, and his eldest daughter, Cleopatra, who, according to his will, were to reign in conjunction. They were both very young, their father therefore had appointed the Roman senate to take care of them till they came to years of maturity. Accordingly, Ptolemy XII. and his Sister Cleopatra, jointly succeeded to the throne of Egypt in the year of the world 3953, and 51 years before Christ.

This was the Cleopatra, who afterwards became so famous, and had a great share in the civil wars of Rome; or rather so infamous for her lascivious amours, especially with Mark Antony the Roman triumvir. Little is known of the beginning of their reign; but we find that the minor king was under the tuition of Pothinus the eunuch, and of Achillas the general of his army, who deprived Cleopatra of her share in the sovereignty, that they might engross the whole power to themselves. Injured in this manner, she went into Syria and Palestine, where she raised a very considerable army, and led it herself into Egypt, to assert her right by force of arms. Ptolemy also assembled his forces, and marched against his sister. Both armies encamped near Pelosium and mount Casius, where they observed the motions of each other, without seeming inclined to come to an engagement. Such were the affairs of Egypt at this period, which was the very time that the unfortunate Pompey fled thither to beg protection against the victorious Julius Cæsar.

It is here necessary to premise, that Pompey had been raised by Sulla, and succeeded to a great part of his power. He by turns flattered the people and senate, in order firmly to establish his interests, but at length attached himself entirely to the latter, and neglected to conciliate the affections of the people any longer. At the same time Cæsar was determined to rival him in power, and turned to the side of the people to effect his purpose. He gained the public favour, by proposing in his consulate a division of lands, and enacting as many popular laws as possible. The conquest of Gaul had greatly heightened the reputation of Cæsar. Pompey and he had previously been united by interest, but ambition and jealousy of each other's power at length occasioned their fatal disunion, and rendered it impossible to settle their differences otherwise than by appealing to the sword. Cæsar, having reduced all Italy and Spain, followed Pompey into Greece, where they at length came to a decisive battle, in the plains of Pharsalia, in Thessaly, in which the army of Pompey was totally routed, and fled to the island of Lesbos, from thence he went to Cyprus, and afterwards proceeded to Egypt, to solicit the protection and assistance of Ptolemy.

Previous to his landing on the Egyptian coast, he dispatched some messengers to Ptolemy, to inform him of his misfortunes, and to require his succour. Ptolemy, being a minor, could return no answer of himself; but

his two ministers, Pothinus, and Achillas, Theodotus the rhetorician, who was the king's preceptor, and some others, consulted together what answer to return. Some were for receiving and relieving him, others for rejecting and refusing him assistance. But Theodotus represented to them in an artful oration, that their safest course was to dispatch him, arguing in this manner to persuade them to acquiesce.

"Should we receive him, Cæsar would be avenged on us for abetting his enemy, or should we reject him and he again recover his power, he then would be revenged on us for this refusal, therefore the only way to secure us from both, is to cut him off. This will make Cæsar our friend, and prevent Pompey from doing us any hurt as an enemy; for, according to the adage, dead men do not bite."

This mode of reasoning conciliated the opinions of the rest, and brought them to adopt the bloody method he had proposed. Achillas, and Septimius a Roman officer, with some others, were pitched upon to put the sanguinary design in execution. They took Pompey on board a small boat, under the pretence that great vessels could not approach the shore without difficulty. The Egyptian troops were drawn up on the sea-side, with their king Ptolemy, at their head, as with a design to honour Pompey; and the latter having tenderly embraced his wife Cornelia, who was in the ship with him, he stepped into the boat, where he was barbarously murdered, in the sight of his wife on one side, and the young king on the other.

The murderers then cut off his head, and threw his body on the sand, where it had no other funeral than what Philip, one of his freedmen, assisted by an old Roman soldier named Cordus, gave it. They raised a wretched funeral pile, and afterwards made a kind of sepulchre over his remains, with the fragments of a wreck which had been driven on shore. A superb funeral monument was, however, afterwards erected to his memory, and, at a subsequent time, it received additional embellishments from the emperor Adrian.

Thus miserably perished Pompey the Great, in the 59th year of his age, concerning whose death Lucan, in his Pharsalia, puts the following lines in the mouth of Pothinus, as additional reasons for the murder of that celebrated person.

"Nor, Pompey! thou thyself shall think it hard,
 "If from thy aid, by fate, we are debar'd.
 "We follow where the gods constrain us lead;
 "We strike at thine, but with'twice Cæsar's head.
 "Our weakness this, this fate's compulsion call;
 "We only yield to him who conquers all.
 "What hopes thy fond mistaking soul betray'd,
 "To put thy trust in Egypt's feeble aid!
 "Our slothful nation, long diffus'd to soil,
 "With pain suffice to till their stony soil;
 "Our idle force due modesty should teach,
 "Nor dare to aim beyond its humble reach.
 "Shall we retire where Rome was forc'd to yield;
 "And make us parties to Pharsalia's field."

The same admirable poet, in another place, thus pathetically exclaims against Ptolemy, on account of his having concurred in this bloody affair.

"Can then Egyptian souls thus proudly dare!
 "Is Rome, ye gods! thus fall'n by civil war!
 "Can he to Nile transfer the Roman guilt,
 "And let such blood by cowards hands be spilt?
 "And thou, inglorious, feeble, headless boy!
 "Dar'st thou thy hand in such a deed employ?
 "Does not thy trembling heart, with horror, dread
 "Jove's thunder, grumbling o'er thy guilty head?
 "Had not his arms with triumphs oft been crown'd,
 "And e'en the vanquish'd world his conquest own'd,
 "Had not the rev'rend senate call'd him head,
 "And Cæsar given fair Julia to his bed,
 "He was a Roman still—That name should be
 "For ever sacred to a king like thee.
 "Ah! fool, thus blindly by thyself undone,
 "Thou seek'st his ruin, who upheld thy throne;
 "He only cou'd thy feeble power maintain,
 "Who gave thee first, o'er Egypt's realm to reign."

And

And again concerning Septimius one of the murderers,

“ Say you, who with the stain of murder, brand
 “ Immortal Brutus’s avenging hand :
 “ What monstrous title yet to speech unknown,
 “ To latest time shall mark Septimius down.”

The same author thus finely describes the manner in which the head of Pompey was carried on the point of a spear to Ptolemy, who ordered it to be embalmed, that he might have the cruel pleasure of keeping and often beholding it.

Caught by the venerable locks which grow
 In hoary ringlets on his gen’rous brow,
 To Egypt’s impious king that head they bear,
 That laurels us’d to bind, and monarchs fear,
 Those facred lips, and that commanding tongue,
 On which the list’ning forum oft has hung ;
 That tongue which could the world with ease restrain,
 And ne’er commanded war, or peace, in vain ;
 That face, in which success came smiling borne,
 And doubled ev’ry joy it brought to Rome ;
 Now pale and wan, is fix’d upon a spear,
 And borne, for public view, aloft in air.
 The tyrant, pleas’d, beheld it ; and decreed
 To keep this pledge of his detested deed.
 His slaves frain drain the ferous parts away,
 And arm the wasting flesh against decay ;
 Then drugs and gums through the void vessels pass,
 And for duration fix the stiff’ning mafs.
 Inglorious boy ! degenerate and base !
 Thou last and worst of the Laguean race !
 Whose feeble throne, ere long, shall be compell’d
 To thy lascivious sister’s reign to yield.

It is easier to imagine than express the distress of Cornelia, who had seen her husband massacred in so cruel and treacherous a manner. She, with her young son Sextus, escaped first to Tyre, and then into Africa. Many of the Roman ships, however, were taken by the Egyptian galleys, and all on board were barbarously put to the sword.

Cæsar hasted to Egypt with all possible expedition, and entered Alexandria with only two legions, and 800 horse, being not in the least apprehensive for his personal safety, because his troops were so few, not exceeding 4000 men in the whole ; as he placed a thorough confidence in their skill and intrepidity ; and in the terror which accompanied the fame of his rapid conquests. Here he first heard of the death of Pompey, and had his head presented to him, which so much affected him that he wept, and ordered it to be buried with the most honourable solemnities.

“ He who, relentless, through Pharfalia rode,
 And on the sonate’s mangled fathers trod ;
 He who, without one pitying sigh, beheld
 The blood and slaughter of that woful field ;
 Thee, murder’d Pompey, could not ruthless see,
 But pay’d the tribute of his grief to thee.
 Oh mystery of fortune and of fate !
 Oh ill conforted piety and hate !”

Rowe’s Lucan.

Pompey’s head was brought to Cæsar by Theodotus, the rhetorician of Chios, the worthy preceptor of such a prince as Ptolemy. He was one of his council, and had been a principal adviser of this barbarous murder. Plutarch, however, informs us, that he was afterwards taken by Brutus in Asia, and, on that account, put to a cruel death.

While Cæsar waited for some more legions from Asia, he passed the time in calling in the remaining part of the debt due to him from Auletes, and in hearing the disputes and interfering in the controversy between Ptolemy and Cleopatra. The unpaid money due from Auletes, Cæsar exacted with great rigour, which Pothinus took care to represent to the people in the very worst colours, in order to prejudice them as much as possible against him. He even plundered the temples of their gold and silver utensils, and made the king and great officers of the court cut out of wooden or earthen vessels, pretending that Cæsar had seized on all those of gold and silver. The Egyptians were still more exasperated at him for presuming to call their king and queen before him, to be judged by

him with respect to the controversy that was between them, he having sent a peremptory order to each to dismiss their respective armies, and leave their causes entirely to his determination.

This was deemed by the people an infringement of the sovereign authority, and not fit for any independent prince to submit to ; Cæsar, however, answered these arguments in this fallacious manner : “ That he did not take upon him to judge as a superior, but as an arbitrator, appointed by the will of Auletes, who had thereby put his children under the tuition of the Roman state, and all the power of the Romans being vested in him, as their dictator, it belonged to him to arbitrate and determine this controversy, as guardian of those children by virtue of that will ; and that he claimed it no otherwise than to execute the will, and settle peace between the king and his sister, according to the purport of it. This explanation having appeased the people, the affair was referred to Cæsar, and advocates appointed to plead for both sides.

In the mean time, Cleopatra hearing that Cæsar was amorously inclined, laid a plot to attach him first to her person, and then to her cause ; for she was a woman of a very lascivious and abandoned character, and did not regard what she sacrificed to her inclination or her interest. She desired permission to come in person to Cæsar, to plead her own cause before him. This was readily granted, and she was privately conveyed into the city by her servant, who carried her on his back, tied up in her bedding, to Cæsar’s apartment in the citadel, where he threw down his burden, untied it, and up started the lady, with the best airs she could put on. Cæsar was pleased with her stratagem, and smitten with her beauty ; which had all the effect on him that she wanted.

Their amour was productive of a son, who was called Cæsarion ; but the intrigues and lewdness of Cleopatra brought great mischiefs afterwards both to the Egyptians and Romans. Hence exclaims the poet,

“ Oh fatal form ! thy native Egypt’s shame !
 “ Thou lewd perdition of the Latin name !
 “ How wert thou doom’d our furies to increase,
 “ And be what Helen was to Troy and Greece !”

On the ensuing day after Cleopatra had been first carried thus to Cæsar, the latter sent for Ptolemy, and told him to receive his sister again upon her own terms ; at which the young king was so inflamed with rage, that he ran into the street like a fury, raged like a lunatic, tore the diadem from his head, threw it down and stamped upon it ; and then bitterly complained to the people, that he was betrayed by a sinister collusion between Cæsar and his sister Cleopatra. This put the whole city presently into great confusion, and the people in vast multitudes flocked to the comfort and assistance of their king. The Romans, however, seized his person ; and Cæsar took care to satisfy the Egyptians, by assuring them that his decision in the cause between the king and his sister should be such as to give universal satisfaction.

Cæsar having summoned the assembly, caused the will of the late king to be read ; and according to that will he decreed that Ptolemy and Cleopatra should jointly reign in Egypt ; and that the other Ptolemy, the younger son, and Arsinoë, the younger daughter of the deceased monarch, should reign in Cyprus.

This decision, as it was certainly truly equitable, gave satisfaction to all, except Pothinus, who well knew that his power would be greatly diminished if Cleopatra, who hated him, had any thing to do in the government. On this account he persuaded Achilles to march with his army from Pelusium to Alexandria, in order to drive Cæsar from it.

Achilles had with him 20,000 good troops, and therefore thought he could overpower Cæsar by numbers ; but the skilful Roman placed his small body of forces so judiciously, that he sustained the assault with great ease and little loss. Achilles not having succeeded in the first attack, made an attempt upon the fort, with an intention to seize the fleet, in order to block up Cæsar by sea ; but here he was again frustrated by Cæsar’s setting fire to the fleet, in order to prevent his design. He at length took possession of the tower of Pharos, and Cæsar fortified himself in the strongest part of the city itself, from whence Arsinoë escaped to Achilles, but Cæsar put Pothinus to death.

But here it is proper to mention, that while the fleet was on fire, some of the ships drove on shore, and communicated their flames to the adjoining houses, and spreading into that quarter of the city called Brachium, it consumed the same, together with the celebrated and noble Alexandrian library, which had been so many years collecting at such an immense expence, and at that time contained above 400,000 volumes; an irretreivable loss to the learned world!

The eunuch Ganymedes put Achilles to death; and succeeded him in the command of the Egyptian army. Photinus, one of the principals in advising the death of Pompey, was, as we have already just mentioned, put to death by the order of Cæsar; and now Achilles, who was one of the principals in executing the murder of that great Roman. a victim to the treachery of Ganymedes. Hence the poet, speaking of the latter, says,

With just remorse repenting fortune paid
This second victim to her Pompey's shade.

Ganymedes, after having taken upon himself the command of the Egyptian army, contrived various stratagems to distress Cæsar during the war; in particular, he found means to spoil all the fresh water in the quarter where the Romans were posted; for there was no other fresh water in Alexandria but that of the Nile, which was kept in vaulted reservoirs, supplied from the river by a canal, which communication he stopped, and turned the sea water into the reservoirs. After being greatly distressed, Cæsar contrived to relieve his troops, by sinking wells so deep that he found springs, and by that means obtained plenty of fresh water.

Cæsar at length being reinforced with more troops and some shipping, defeated Ganymedes in several sallies, and in three naval engagements. But in an attack upon the island of Pharos, and the mole which leads to it, he was repulsed with the loss of 800 men, and was near perishing himself in the rout; for, finding the ship in which he endeavoured to escape ready to sink, he leaped into the sea, and with difficulty escaped to the next ship by swimming. During this escape he carried some valuable papers, which he had then about him, in one hand, and swam with the other, by which he saved them, as well as his own life.

Justice and fate the floating chief convey,
And Rome's glad genius wafts him on his way;
Freedom and laws the Pharian darts withstand,
And save him for avenging Brutus' hand.

At length Cæsar was persuaded to send king Ptolemy to the Egyptian army, in compliance with their desire, and on a promise of peace; but when they had their king at their head, they pressed on the war with greater vigour than before. Mithridates advanced with his army, and defeated a body of Egyptians who defended the banks of the Nile. Ptolemy then advanced with his whole army, to oppose the victors, and Cæsar marched to support them. A decisive battle ensued, in which Cæsar obtained an absolute victory. Ptolemy endeavoured to escape in a boat, which sunk, and he was drowned in the Nile; after which Cæsar returned to Alexandria; when the whole kingdom submitted to the conqueror. Cæsar gave the crown of Egypt to Cleopatra, in conjunction with her youngest brother, who was likewise named Ptolemy, and who was only then eleven years of age. Cæsar continued his amour with Cleopatra till he was obliged to quit Egypt, in order to oppose Pharnaces, whom he engaged, defeated, and drove from the kingdom of Pontus. After this Cæsar returned to Rome, and having previously taken Arsinoe with him, she walked in his triumph in chains of gold; but immediately after this solemnity was over, he let her at liberty.

In the year of the world 3961, and 43 years before Christ, Cleopatra poisoned her young brother Ptolemy, in order to reign alone, from which time she ruled Egypt till her death, as sole sovereign; but in a kind of subserviency to the Roman power. In the interim, Cæsar had been murdered at Rome by a conspiracy, at the head of which were Brutus and Cassius; and immediately after the celebrated triumvirate between Antony, Lepidus, and Octavius Cæsar, was formed, in order to revenge the death of Julius Cæsar. Upon this occasion Cleopatra declared for the triumvirs, and sailed with a numerous

fleet to join Antony and Octavius, who defeated Brutus and Cassius at Philippi; after which Antony came into Asia, to establish the authority of the triumvirate. Cleopatra met him at Tarsus in Cilicia, which proved his destruction: her beauty, wit, and art, enflamed him almost to madness, and extinguished all his military flame. Cleopatra at this time was only 25 years old, and the graces of her person were more powerful than the magnificence of her dress. When she entered the river Cydnus, never was equipage more splendid and magnificent. The whole poop of her ship flamed with gold, the sails were purple, and the oars inlaid with silver. A pavilion of cloth of gold was raised upon the deck, under which appeared the queen, robed like Venus, and surrounded with the most beautiful virgins of her court, of whom some represented the Nereids, and others the Graces. Instead of trumpets, were heard flutes, hautboys, harps, and such other musical instruments, warbling the softest airs, to which the oars kept time, and rendered the harmony more agreeable. Perfumes burnt on the deck, which spread their odours to a great distance on the river, and each side of its banks were covered with multitudes of people, who cried out, that it was Venus coming to make Bacchus a visit for the good of Asia. The description which Mr. Dryden has given in his *All for Love* of Cleopatra's sailing down the river Cydnus, is so extremely beautiful, that we think it necessary to give it a place, that it may accompany the prose account of the same, handed down to us by the ancient historians.

Her galley down the silver Cydnus row'd,
The tackling silk, the itreamers wav'd with gold;
The gentle winds were lodg'd in purple sails;
Her nymphs like Nereids round her couch were plac'd,
Where she, another sea-born Venus, lay.
She lay, and lean'd her cheek upon her hand,
And cast a look so languishingly sweet,
As if, secure of all beholders hearts,
Neglecting she could take them! Boys, like Cupids,
Stood fanning with their painted wings the winds
That play'd about her face; but if the sun'd,
A darting glory seem'd to blaze abroad,
That Men's desiring eyes were never weary'd,
But hung upon the object! To soft flutes
The silver oars kept time; and while they play'd,
The hearing gave new pleasure to the sight;
And both to thought. 'Twas Heav'n, or something
more;

For she so charm'd all hearts, that gazing crowds
Stood panting on the shore, and wanted breath
To give their welcome voice.

Antony and Cleopatra continually revell'd together in every kind of luxurious dissipation; and in one of their entertainments Cleopatra is said to have dissolved a pearl, valued at 50,000, in vinegar, and swallowed it. She had another of equal size, beauty, and value, with which she would have done the same; being, however, persuaded to the contrary, it remained entire, and was taken among her other treasures by Augustus, who carried it from Alexandria to Rome, and dedicated it to Venus.

Mark Antony, after having passed many months in the most scandalous debauchery, returned to Rome, and married Octavia, the sister of Cæsar Augustus, and widow of Marcellus. However, after his marriage he still retained his fondness for Cleopatra, and met her at Lucerne in Phœnicia, from whence they returned together into Egypt, where he indulged his inordinate passion for this lascivious woman to the greatest excess. According to Rollin, he gave her Phœnicia, the lower Syria, and Cyprus, with great parts of Cilicia, Judæa, and Arabia. He also made her a present of the libraries of Pergamus, in which were above 200,000 volumes, and the placed them in a new library, which he built where the former one stood. She had a taste for polite learning and the sciences, and understood several languages. She omitted no kind of arts to keep Antony in her chains; and he entered Alexandria in triumph, dragging at his chariot wheels the king of Armenia, laden with chains of gold, and presented him in that condition to Cleopatra, who was pleased to see a captive king at her feet. At one of their banquets, when Antony was intoxicated with wine, she presumed to ask him to give her the Roman empire, which he was not ashamed to promise her.

This great but wicked woman had two sons by Antony, one of whom was called Alexander, and the other Ptolemy. He heaped a profusion of honours on these young princes, and celebrated the coronation of their mother with great magnificence. She attended him in his progress through Greece, where he repudiated Octavia, and declared war against Octavius, who then declared war against Cleopatra, though actually intended against Antony.

Antony assembled his forces at Samos, and Octavius, or Augustus, got his together at Brundisium. The former had a fleet of 500 large ships, on board of which were 200,000 foot, and 22,000 horse; while the latter had only 250 ships, 80,000 foot, and 12,000 horse. The two fleets met, and engaged near Actium, in the sight of the two armies, which had been landed, and previously drawn up on the opposite shores. The battle was fought with dubious success for some time; till Cleopatra retreated with the whole Egyptian squadron, and Antony, to his great shame, precipitately followed her. This behaviour so much exasperated the officers of the remainder of the fleet, that they immediately submitted to Augustus; and Antony's army soon followed their example.

The fugitives escaped to Alexandria, where Cleopatra put many great persons to death, lest they should betray her: and in order to avoid falling herself into the hands of the enemy, she formed the very extraordinary design to have her ships in the Mediterranean carried into the Red Sea, over an Isthmus of above 70 miles; but in this she was prevented by the Arabians, who burnt all her ships in the Red Sea.

Now Antony found himself deserted by the greater part of those who had been his friends, which so disgusted him with the world, that he for some time secluded himself from mankind, turned misanthrope, and affected to imitate the conduct of Timon, the man-hater. But a life of asperity not suiting his disposition, his affectation soon gave way to the natural bent of his inclination; and he returned to the arms of Cleopatra, with whom he recalled away the remaining part of his life, and endeavoured to extinguish the sense of his misfortunes, by abandoning himself to voluptuousness. In the mean time Cleopatra, who foresaw that she was likely to fall into the hands of her enemies, had some thoughts of eluding the consequences, by putting a period to her own existence. She therefore collected all sorts of poisons, to try which of them would give death with the least pain. She made the experiment of their virtues, strength, and efficacy, upon various condemned criminals, whereby she found that the strongest poisons caused death the soonest, and that those which were gentle brought an easy, but slow death. She tried the bitings of venomous creatures, and caused various kinds of serpents to be applied to different persons. She daily made these experiments, and at length discovered that the asp* was the only one that occasioned neither torture nor convulsions; and which, throwing the person bit into an immediate heaviness and stupefaction, attended with a slight sweating upon the face, and a numbness of all the organs of sense, gently extinguished life.

Augustus proceeded to Pelusium, which immediately opened its gates to him. As soon as this news reached Alexandria, Cleopatra ordered her most precious movables to be carried to a place of security adjoining to the temple of Isis, where she had caused a tomb, and proper repositories to be erected. Augustus hearing this, was fearful that she intended to consume herself and her treasures together, and therefore sent kind and flattering messages to her, to give her hopes of the most generous treatment, while he advanced towards the city by forced marches, and on his arrival encamped near the Hippodrome.

* The asp is of the size of a common snake, only the back is broader, and the neck swells greatly when it is angry. The teeth in general are long; but the two longest are hollow, and contain the venom. The skin is covered with scales, which are of a red cast; and the bite is so fatal, that it kills the person wounded by it within three hours. Lucan thus speaks of it:

- “First of those plagues, the drowsy asp appear’d,
“And then her crest, and swelling neck the rear’d.
“A larger drop of black congealing blood
“Disseign’d her amidst the deadly brood;

2

Antony, in the mean time, prepared to make a vigorous defence. He was successful in a rally, which gave him such spirits, that he determined to engage the adverse party next day, both by sea and land; when, to his great astonishment, the Egyptian fleet revolted to the enemy, and Antony now perceived that Cleopatra had betrayed him. This threw him into such a rage, that he flew to the sepulchral mansion, in order to revenge himself on Cleopatra for her perjury; but she had given orders that Antony should be informed that she had destroyed herself. This intelligence converted his excess of rage to the most violent transports of grief, and determined him to follow her to the grave. With this view he commanded a slave to plunge a dagger into his breast; but instead of obeying him, the slave stabbed himself. This so affected Antony, that he fell upon his own sword; and with very moment an officer came to let him know that Cleopatra was still alive. On hearing her name pronounced, he opened his dying eyes, permitted his wounds to be dressed, and caused himself to be carried to the sepulchre where she had immured herself. Cleopatra would not suffer the gates to be opened, for fear of a surprize; but from a window threw down cords, to which Antony being fastened, Cleopatra and her two women drew him up. When she had drawn him up to her, and had laid him on a bed, she rent her cloaths with grief, and making the most mournful exclamations, cut off his hair, according to the superstition of the pagans, who believed that a relief to those who died a violent death. Antony, for a minute, recovered his senses, expressed his happiness to die in her arms, and then expired.

Augustus entered Alexandria without farther opposition, and Cleopatra, to prevent the disgrace of being carried to Rome to grace his triumphal car, resolved on death; previously, however, she had an interview with Octavius, who permitted her to bury Antony with the utmost magnificence; and she spared no cost in his interment, according to the custom of Egypt. She caused his body to be embalmed with the most exquisite perfumes of the east, and placed it among the tombs of the Egyptian kings.

After visiting the tomb of Antony, and strewing it with flowers, she returned to her chamber, went into a bath, and from thence to table, which was served magnificently. When she rose from table she wrote a letter to Octavius; and having made all quit her chamber except her two women, she shut the door, sat down upon a bed, and asked for a basket of figs, which a peasant had lately brought. She placed it by her, and a moment after lay down, as if she had fallen asleep; but that was the effect of the bite of an asp, which was concealed among the fruit, and had stung her in the arm which she had held to it. The poison immediately tainted her blood, communicated itself to her heart, and she expired without pain. Thus died one of the most beautiful and accomplished, and at the same time one of the most ambitious and wicked princesses that ever lived, in the 39th year of her age, and 22d of her reign, from the death of her father; and in her death ended the reign of the Ptolemies in Egypt.

The death of Cleopatra put an end to the war, and Egypt was reduced to a Roman province. Horace, the celebrated Latin poet, wrote six odes upon this occasion, the most beautiful of which is the 3th of his first book, in which, speaking of the death of Cleopatra, he says:

With fearless hand she dar'd to grasp
The writhings of the wrathful asp;
And suck the poison thro' her veins,
Resolv'd on death, and fiercer from his pains;
Then, scornful to be led the boaf
Of mighty Caesar's naval host,

- “Of all the serpent race are none so fell,
“None with so many deaths such piteous venom swell.
“Chill in themselves, our colder climes they shun,
“And chafe to bask in Africa's warmer sun.”

It was natural for Lucan to imagine the asp to be peculiar to Africa only; but later discoveries evince that it is likewise found in America. The Ibjara of Brasil is supposed to be of the same species, and its venom is equally fatal; but of the latter dangerous serpent we shall give a particular investigation in our description of Brasil.

And, arm'd with more than mortal spleen,
Defrauds a triumph, and expires a queen.

Egypt was now governed by a prefect sent from Rome. Cornelius Gallus, the famous Latin poet, was the first who had this prefecture, and under this form of government Egypt continued a Roman province 670 years, till it was taken by the Saracens.

Augustus now cut off all those whom he thought might revive the civil wars of Rome, among whom was Cæsarion, the son of Cleopatra by Julius Cæsar; however, the children of Cleopatra by Antony were suffered to live, and even treated with clemency, not but he made them adorn his triumph on his return to Rome. The body of Cleopatra was interred with great funeral pomp, and laid in the same tomb with that of her lover Antony. The conquest of Egypt occasioned such an influx of wealth into Rome, that the value of money fell one half, and the prices of provision and merchandize were consequently doubled.

“ Thus mighty states and empires fall and rise,
“ And all things fluctuate beneath the skies;
“ Wealth brings corruption, and corruption vice,
“ Ruin's the game, and follies are the dice.”

Augustus was proclaimed emperor 23 years before the birth of Christ, when he divided the Roman provinces imperial and senatorial, the latter being destitute of troops, while the former were strongly guarded, and Egypt was one of those provinces. Men of distinction, such as had been consuls, or pretors, were made governors of these provinces, with the titles of proconsul and proprietor; but the government of Egypt was committed to a private knight, viz. Cornelius Gallus, the celebrated poet. All these governors held their employments only for a year, and were obliged to quit their provinces, on the arrival of their successors.

Cornelius Gallus acted in his government more like an absolute monarch, than a subordinate magistrate, which obliged Augustus to recall him; after which he spoke with such liberty against the emperor, that he was condemned to perpetual banishment by the senate, which he prevented by falling on his own sword; but the emperor, who was fond of him for his military exploits, as well as his poetical genius, wept when he heard of his death, and ever after paid the greatest respect to his memory.

Ælius Gallus, a Roman knight, succeeded to the government of Egypt, in which time the Ethiopian queen, Candace, invaded that country, she surprized the cities of Syene, Elephantina, and Phylæ, laid waste the countries near them, overthrew the statues of Augustus, and carried the Roman garrisons into captivity. She was, however, at length opposed and defeated by Caius Petronius, who made himself master of Pselcha, the key of Ethiopia on the side of Egypt, and penetrated above 800 miles into the Ethiopian dominions; he then returned to Alexandria with many captives, whom he either sent to Rome, or sold for slaves.

After this, for some years, the world enjoyed a most profound tranquillity; during which JESUS CHRIST, the redeemer of mankind, was born; and 14 years after that period, Augustus died in the 76th year of his age, and 43 years after the battle of Actium.

Tiberius succeeded Augustus as emperor, in whose reign our Saviour was crucified A. D. 33, and Caligula, one of the most wicked of the human race, succeeded Tiberius as emperor A. D. 37, in whose reign the Jews of Alexandria suffered a most severe persecution.

Under several succeeding emperors nothing happened with respect to Egypt, but cruelty, taxation, or neglect; for it was either a persecuted, an oppressed, or a disregarded province.

On the decline of the Roman empire, the caliph Omar, one of the successors of Mahomet, sent an army to invade Egypt, under the command of Amru; who penetrated into the heart of the country, and took Meir, the ancient Memphis, which was treacherously delivered up to him by the Coptic governor: the name of this traitor was Mokawkas, who made a treaty with Amru, which included the whole nation of Copts; a yearly tribute was thereby imposed upon the people, who were allowed the free exercise of their properties, under the immediate protection of the caliph.

The inveteracy of the Copts against their fellow citizens is almost inconceivable; they even encouraged the Arabs to pursue the Greeks from Meir to Alexandria. Amru defeated the Greeks in three engagements, and obliged them to retire within the walls of Alexandria, where they endured a long siege. Amru was taken prisoner in one of the attacks, and brought before the governor: but he escaped by a stratagem, and pressed the siege so close, that it surrendered to the Arabs A. D. 643, after they had besieged it 14 months, and lost before it 23,000 men. Many of the Greeks escaped, and attempted to re-possess themselves of this capital, in which they were defeated with great loss.

Amru informed Omar, that he had found in Alexandria 4000 palaces, 4000 baths, 40,000 Jews that paid tribute, 400 royal circi, or places set apart for public diversions, and 12,000 gardeners, who supplied the city with all kinds of herbs in great plenty; and the Arabian writers inform us, that this metropolis at that time consisted of three cities, viz. Almania, or the port which included the island of Pharos; Alexandria, properly so called, which was situated in much about the same spot as the modern Alexandria now stands, and Nekita, which was probably the old Necropolis, whose ruins are now hardly visible. Amru having taken possession of the place, demolished the walls, and dismantled the city.

The loss of Egypt, which had continued in the hands of the Romans ever since the reign of the emperor Augustus, happened in the 25th year of the reign of the emperor Heraclius, who died soon after. Much about the same time, Omar was assassinated in the mosque at Medina and was succeeded by Othman. The succeeding caliphs of the Saracen race, from Othman to the time that the Egyptians threw off their obedience to the Babylonian caliph, and chose one of their own, were,

A. D. 655. Ali, married to Fatima, the daughter of Mahomet, as well as most of his successors of the same line, placed Egypt under the care of a subordinate magistrate, as governor thereof.

660. Hâsan, the son of Hali by Fatima, who resigned the government within six months.

660. Moawiyah. This was a prince of great parts, and an excellent Arabian poet; and in this reign the Arabs besieged Constantinople the whole summer and spring for several years together; but were received with such vigour and resolution by the emperor, that they thought it advisable to withdraw always in September to Cyrius, and at last abandoned the enterprise. In this long siege, or rather repeated sieges, the Arabs lost incredible numbers of men, and many ships consumed by sea-fire, as it was called, because it burnt under water; being the invention of Callinicus, a native of Heliopolis in Egypt: and about the same time there was a dreadful mortality in Egypt.

680. Yezid succeeded his father Moawiyah.

684. Maowiyah II. succeeded his father Yezid; but he abdicated in only the sixth month of his reign.

684. Abdallah was elected to the caliphate. Then the succession ran as follows:

692. Abdalmalec.

704. Alwalid.

715. Soliman.

718. Omar II.

721. Yezid II.

724. Hesham.

742. Alwalid II.

743. Yezid III. reigned only six months.

743. Ibrahim.

744. Mervan II. This prince was opposed by the partizans of the house of A. Abbas, who began to grow powerful in some of the interior provinces of the empire. After several engagements, being defeated and slain, the caliphate was transferred to the house of Al-Abbas.

749. Abdallah, the first caliph of the house of Al-Abbas, died of the small-pox, and was succeeded by his brother,

753. Abu Jaffar Almanzur.

774. Al-Mohdl.

785. Murfa Al-Hadi.

786. Haroun Al-Bashid.

808. Mahomet III.

813. Abul Abbas Almun Abu Jaafar Abdallah.

833. Al-Motafem.
 841. Haroun Al Wathek Billah.
 846. Al Motawakkal Alallah.
 861. Al Montafcr Billah.
 862. Ahmed Abul Abbas
 866. Mahomet Abu Abdallah.
 868. Mahomet Abu Abdallah Al Motadi.
 869. Ahmed Abul Abbas. In this prince's reign the Egyptians revolted from the caliphs of the Saracens, and founded a caliphate of their own, which was begun by Ahmed Eben Tolun, and hence it is called the dynasty or line of Tolun.

The line of Tolun.

870. Ahmed Eben Tolun.
 883. Hamaria.
 903. Abarun, slain by Mustapha the caliph of Babylon.
 940. Achid Mahomrt.
 943. Abignib.
 970. Mezz Ledin Illachi.
 975. Aziz.
 996. Elhachain.
 1019. Etabar Leazizdin Illatri.
 1035. Malteratzar Billatri.
 1096. Mustale.
 1100. Elamir Bahacan Illatri.
 1135. Elphait Ladin Illatri.
 - - - Eizabar
 - - - Elphaiz
 - - - Etzar Ledin Illatri. In this reign the sultan of Damascus sent a Turkish general, named Syrackoch, with an army into Egypt, who conquered the country, but assumed the regal authority himself. Hence we have another race of monarchs of Egypt, distinguished by the name of

The Turkish line of Caliphs, or kings of Egypt.

1163. Afferedin succeeded Syrackoh.
 1186. Zeli-Heddin. This prince conquered Damascus, Mesopotamia, and Palestine.
 1199. Elazir.
 - - - Eladel.
 1210. Elcharnul.
 1237. Melech Affalach. This prince was slain by his Mameluk guards.
 1242. Elmutan, the son of Melech Affalach, succeeded his father, but was likewise slain by the Mameluks, who became masters of the kingdom in A. D. 1245; and hence we have another race of monarchs in Egypt, called

The race of the Mameluk kings.

1245. Turquimentius.
 1255. Clothes.
 1260. Bandocader.
 1286. Elphis.
 1291. Araphus.
 - - - Melechnefar.
 - - - Melechadel
 - - - Melechaella.

The actions of these kings are very uncertain, the dates of their reign not ascertained, and a chafin is left in the Egyptian history till the reign of

1465. Cathbeyus.
 1498. Mahomet, the son of Cathbeyus, who was deposed.

1499. Campfon Chiarfesius.

- - - Zamballet.

1500. Tonombeius.

1501. Campfon II. This was a worthy prince, and reigned prosperously for the space of 16 years, but at length siding with Ismael, the emperor of Persia, against Selim I. emperor of the Turkes, he drew his kingdom into a war with the latter monarch, in which his armies were defeated and himself slain.

1517. Tonombeius II. succeeded Campfon in his kingdom, but was equally unfortunate; for being vanquished in the first year of his reign, by the emperor Selim, Egypt became a province of the Turkish empire, and continues so to this day; as it is governed by a Turkish basha, who hath his residence at Grand Cairo; therefore its history now becomes blended with that of the Ottomans.

We have been more ample in the history of Egypt than in that of any preceding nation which we have described, and shall conclude it in the words of a late elegant author, which will at once point out the importance of the Egyptian history, and shew our reason for being so copious in it.

"The Egyptians are most worthy of our attention of all the nations of antiquity, and we are particularly interested in their history. From them, by an uninterrupted chain, all the most polite and best constituted nations of Europe have received the first principles of their laws, arts, and sciences. The Egyptians instructed and enlightened the Greeks; who performed the same beneficent office to the Romans; and these lords of the world were not ashamed to borrow from the Greeks the knowledge which they wanted, which they afterwards communicated to the rest of mankind, and of which we are in possession to this day."

C H A P XVIII.

A F R I C A N I S L A N D S.

Of the Islands in the Atlantic Ocean.

I. *The MADEIRA ISLANDS.*

THE Madeira islands are only three in number; namely Madeira, properly so called; the island of Puerto Santa, or Porto Santo; and Isla Deserta, or the Desolate Isle. The whole are situated in the Atlantic Ocean, between 32 and 33 deg. north lat. and 17 and 18 deg. west long. 250 miles north by east from Teneriff, 360 from Cape Cantin, on the coast of Africa, and 300 north of the island of Ferro.

Before we proceed to describe these islands, it is necessary to relate the manner in which they were discovered, first by an English gentleman, and many years after by the Portuguese, as there is something extremely singular

in both these occurrences, but more particularly the first.

In the reign of Edward the third, king of England, a young gentleman named Robert Machin, conceived a violent passion for Ann D'Arice, a beautiful and accomplished lady of a noble family. Machin, with respect to birth and fortune, was inferior to the lady, but his personal qualifications overcame every scruple on that account, and he rewarded his ardor with a reciprocal affection. Her friends, however, did not behold the young gentleman through the medium of passion; they fancied their blood would be contaminated by an alliance with one of a lower rank, and therefore determined to sacrifice the happiness of the young lady, to the hereditary pride of blood, and the mercenary motives of interest.

Fraught

Fraught with these ideas, a warrant was procured from the king, under the sanction of which Machin was apprehended, and kept in close confinement till the object of his affections was married to a nobleman, whose chief merit lay in his honorary title and large possessions.

Immediately after the nuptial ceremony was over, the peer took his beautiful bride with him to a strong and superb castle, which he had in the neighbourhood of Bristol; and then the unfortunate lover was released from his cruel imprisonment.

Machin being at liberty, was acquainted that his mistress had been compelled to give her hand to another. This rendered him almost frantic, and he vowed to revenge the violence done to the lady, and the injury which he himself had sustained.

With this view he imparted his design to some of his friends and companions, who swore to accompany him to Bristol, and assist him in whatever enterprise he undertook. One of his comrades contrived to get himself hired by the nobleman as a servant, and by that means being introduced into the family, he soon found an opportunity to let the lady know the sentiments and intentions of her lover; when the fully entered into all his projects, and promised to comply with whatever he should desire.

To facilitate the design, the lady appeared more cheerful than usual, which lulled asleep every suspicion that her lord might otherwise have entertained; and intreated permission to ride out daily to take the air, for the benefit of her health, which request her consort easily granted. This point being gained, she did not fail to make the most of it, by riding out every morning, accompanied by one servant only, which was her lover's companion; he having been previously pitched upon, by her contrivance, always to attend her.

All things being prepared, the one day rode out as usual, when her attendant conducted her to his friend, who waited at the sea-side to receive her. They all three immediately entered a boat, and soon reached a ship that lay at some distance ready for their reception.

Machin having the object of his wishes on board, immediately, with the assistance of his associates, set sail, intending to proceed to France; but all on board being ignorant of maritime affairs, and the wind blowing a hard gale, they mistook their port, and the next morning, to their astonishment, found themselves driven into the main ocean. In this miserable condition they abandoned themselves to despair, and committed their fates to the mercy of the waves. Without a pilot, almost destitute of provisions, and quite devoid of hope, they were tossed about for the space of thirteen days. At length, when the morning of the fourteenth day began to dawn, they fancied they could descry something very near them that had the appearance of land; and when the sun rose, to their great joy they could distinctly perceive it was such. Their pleasure, however, was somewhat alleviated by the reflection that it was a strange country; for they plainly perceived it was covered with a variety of trees, with whose appearance and natures they were totally unacquainted.

The sloop being got out, some of them landed, in order to make their observations on the country; when, returning soon after to the ship, they spoke in raptures of the place; but at the same time declared they believed it to be uninhabited.

Machin, with his mistress and some of his friends, then landed, leaving the rest to take care of the ship. The country appeared beautifully diversified with hills and dales, shaded with various trees, and watered by many clear meandering streams. Several kinds of wild beasts approached, without offering any violence to them; and the most beautiful birds of different species perched upon their heads, arms, and hands, unapprehensive of danger.

Penetrating farther through the woody recesses, they entered a fine meadow, admirably encircled with a border of laurels, finely enamelled with various flowers, and happily watered with a winding chrysal rivulet. Upon an eminence, in the midst of this meadow, they saw a lofty spreading tree, the beauty of which invited them to repose under its shade, and partake of the shelter it would afford them from the piercing rays of the sun. Beneath this tree they at length determined to make a

temporary residence; and providing themselves with boughs from the neighbouring woods, they built several small huts, or rather arbors. In this place they passed their time very agreeably, and made frequent excursions into the adjacent country, admiring its strange productions and various beauties. Their happiness, however, was of no very long continuance; for, one night a terrible storm arose from the north-east, which blew the ship from her anchor, and drove her to sea. The crew were obliged to submit to the mercy of the elements, when they were driven to the coast of Morocco, and the ship being stranded, all the crew were carried into captivity.

The next morning, when Machin and his companions missed the ship, they concluded she had foundered and gone to the bottom. This new calamity plunged them into the deepest melancholy; and proved in particular so affecting to the lady, that she sunk under it. She had indeed before continually fed her grief by sad prefiges of the enterprise's ending in some fatal catastrophe to all concerned; but the flock of the late disaster struck her dumb; so that she expired in three days afterwards, in the most bitter agonies. Machin was so affected by her death, that he survived her but five days, notwithstanding all that his companions could do to afford him consolation. Previous to his death he begged them to place his body in the same grave with hers, which they had made at the foot of an altar, erected under the beautiful lofty tree before mentioned. They afterwards erected a large wooden cross upon it; and near that an inscription, drawn up by Machin himself, containing a succinct account of the whole adventure; and concluded with a request, that if any Christians should come there to settle, that they would build a church upon that spot, and dedicate it to Jesus Christ.

After the death of Machin, his remaining companions determined to attempt returning to England in the sloop, which had been so well secured near the shore as not to be in the least damaged by the storm which had driven away the ship. But happening to take the same course the others had been forced upon, they, unluckily for them, arrived in like manner upon some part of the coast of Morocco, met with exactly the same fate, were seized in a similar manner, and carried to the same prison. In the place of their confinement, besides their own companions, they met with several other christian slaves; particularly one John de Morales, a Spaniard of Seville. This man was an excellent sailor, and took a peculiar delight in hearing the English captives recount their adventures, by which means he learned, and retained in his memory the situation and peculiar marks of this new discovered country.

In order to connect the above narrative of the first discovery of the Madeiras with what is termed the second discovery, but which, to speak with greater precision, is the completion of the first, it will be necessary to look back a little into the leading incidents which brought about the latter.

John I. king of Portugal, having entered into a war with the Moors, passed over into Africa with a formidable army; and A. D. 1415, laid siege to and took Ceuta. In this expedition he was accompanied by his sons, one of whom, Prince Henry, took great delight in the study of the mathematical sciences, particularly geography and navigation.

Upon this occasion he had a great opportunity of conversing with the Moors and African Jews; and informing himself by their means of the situation of several foreign countries, of their coasts, the seas about them, &c. Hence grew an insatiable thirst for making new conquests; and from this time he determined to devote his attention to the discovery of unknown countries.

In consequence of this resolution, after the reduction of Ceuta, he retired to the Algarves, where, within a league of Cape St. Vincent, he founded a new town, built a fort to defend it, and determined from thence to send out ships upon discoveries. The person he intended to employ upon these occasions, as chief commander, was a gentleman of extraordinary abilities, named Juan Goncalvo Zarco, who became famous, not only for his maritime discoveries, but for being the first person who introduced the use of artillery on board ships. In 1418 he discovered Puerto Santo, one of the Madeiras; and in 1420 he passed the straits, and surveyed a considerable

extent of the coast of Africa. In the interim, a Spanish prince dying, left by his will a large sum of money for the purpose of redeeming Spanish Christians, who were kept as slaves in Morocco. Terms being agreed upon between the emperor of Morocco and the commissioners for the redemption of those captives, a Spanish ship was sent to Morocco to fetch home the redeemed Christians, among whom was the before mentioned John de Morales.

This ship, on its return to Spain, happened to fall in with the Squadron commanded by Juan Gonfálvo Zarco, who was then passing the freights to make observations on the coast of Africa, as we have just noticed.

Spain and Portugal being at that time at war, Juan Gonfálvo Zarco made prize of the Spanish ship; but finding it contained only redeemed captives, he was touched with compassion at the miseries they had already suffered during their slavery, and generously dismissed them, taking out only John de Morales, whom he found to be not only an able sailor, and an expert pilot, but a very intelligent person.

Morales being acquainted with the reason of his detention, and the discoveries that the Portuguese were upon, instead of being grieved, was mightily rejoiced, and offered voluntarily to enter into the service of Prince Henry. He then told Juan Gonfálvo of the island which the English had newly discovered, recounted the story of the two unfortunate lovers, and related every thing which he had heard from Machin's companions, while in slavery.

Juan Gonfálvo was so mightily pleased at this relation, that he tackled about, and returned to the new town which Prince Henry had built, and which was called Terça Nabal. On his arrival he introduced Morales to the prince; when the Spaniard again recounted all he had before told to Juan Gonfálvo. The prince thought this worthy of becoming a national affair, and therefore, communicating the whole to the king his father, and the Portuguese ministry, they determined to pursue this discovery; and for that purpose fitted out a good ship, well manned and provided, and a sloop to go with oars, when occasion required; and the command of the whole was given to Juan Gonfálvo.

On discovering Puerto Santo, a short time before, Juan Gonfálvo had left some Portuguese on that island; and judging by Morales's account of the situation of the island they were in quest of, that it could not be far from Puerto Santo, he determined to sail thither.

On his arrival at that island, the Portuguese, whom he had left behind, informed him they had observed to the North-east a thick impenetrable darkness, which constantly hung upon the sea, and extended itself upward to the heavens. That they never knew it to be diminished; but often heard from thence a strange kind of noise, which they could not account for.

Morales seemed to be convinced that this was the island they were in search of, and Juan Gonfálvo was inclined to adopt his opinion; but all the rest were terrified at the accounts they had heard. It was therefore concluded to remain at Puerto Santo till the change of the moon, to see what effect that would have upon the shade, or whether the noise would cease. But perceiving no alteration of any kind, the panic created among the generality of the adventurers. Morales, however, stood firm to his opinion of that being the land they were looking for; and very sensibly observed, that, according to the accounts he had received from the English, the ground was covered over with lofty stony trees; it was no wonder, therefore, that it should be exceeding damp, and that the humid vapours might exhale from it by the power of the sun, which, spreading themselves to the sky, occasioned the dark cloud they saw; and with respect to the noise, that might be occasioned by certain currents dashing against the rocks on its coast.

Juan Gonfálvo, however, determined to proceed; and setting sail the next day, he at length made land; and the fear of those who had been all along terrified now vanished. The first point they saw they named St. Lawrence's point: doubling this, they found to the southward rising land, where Morales and others were sent in a sloop to reconnoitre the coast; and came to a bay which seemed to answer the description given by the English. Here they landed; and finding the cross and inscription over the grave of the two lovers, they returned to Juan Gonfálvo,

with an account of their success. Juan Gonfálvo immediately landed, and took possession of the place, in the names of John I. king of Portugal, and Prince Henry, his son. Having built an altar near the grave of the lovers, they searched about the island, in order to discover if it contained any cattle; but not finding any, they coasted westward, till they came to a place where four fine rivers ran into the sea, of the waters of which Juan Gonfálvo filled some bottles, to carry as a present to Prince Henry. Proceeding farther, they came to a fine valley, which was intersected by a beautiful river, and after that to a pleasant spot covered with trees, some of which being fallen down, Juan Gonfálvo ordered a cross to be erected of the timber, and called the place *Sancta Cruz*.

They now began to look out for a place proper to fix their residence in while they staid; and at length found a fine track of land, not so woody as the rest of the country, but covered over with fennel, which, in the Portuguese language, is called *Funcho*; from whence the town of *Funchal*, afterwards built on the same spot, took its name.

After having viewed other parts of the island, and daily had occasion for new admiration of the beauties continually discovered, Juan Gonfálvo returned to Portugal, and arrived at Lisbon in the end of August, 1420, without having left a single man in the whole enterprise.

A day of audience being appointed for Juan Gonfálvo to make a report of his voyage, the king gave the name of *Madeira* to the new discovered island, on account of the great quantity of excellent wood found upon it. An order was soon after made for Juan Gonfálvo to return to *Madeira* in the spring ensuing, with the title of captain governor of *Madeira*, to which title the heir of his family at present adds that of count.

Juan Gonfálvo set sail on his second voyage, in May, A. D. 1421, taking with him the greatest part of his family; and arriving at *Madeira*, he cast anchor in the road till then called the English Port; but Juan Gonfálvo, in honour of the first discoverer, then called it *Puerto de Machino*, from which name it was corrupted to *Machico*; which it bears to this day.

Juan Gonfálvo then ordered the large spreading beautiful tree before mentioned, under which Machin and his companions had taken up their residence, to be cut down, and a small church to be erected with the timber; which, agreeable to Machin's request, he dedicated to *Jesus Christ*, and interceded the pavement of the choir with the bones of the two unfortunate lovers.

He then laid the foundation of the town of *Funchal*, which soon grew famous; and his wife *Constanza*, who was with him, dedicated the altar of the new wooden church to *St. Catherine*.

On the death of John I. king of Portugal, his eldest son and successor, *Duarte*, in consideration of the great sums of money expended in peopling this island by prince Henry, his brother, gave him the revenues of it for life. He likewise gave the spiritualities of it to the order of *Christ*, which endowment was afterwards confirmed by *Alonso the Fifteenth*.

The Island of Madeira, properly so called.

MADERA, properly so called, is about 75 miles in length, and 30 in breadth, in the widest places. The first settlers, in order to clear the land, set fire to the woods, the ashes of which occasioned an astonishing fertility, particularly in wines, for several years after; but they gradually decreased, and at present the produce is not above half what it was immediately after the first settlement. The soil, however, is still very rich, though the country in general is mountainous. Fine springs abound in almost every part, besides which there are eight good rivers. This great plenty of water first suggested the hint to prince Henry of sending sugar canes to *Madeira* from *Sicily*, which greatly improved through the increase of heat, and produced more than in their native soil. Vines are here found in abundance; and from the grapes which they produce, a vast quantity of the most delicious wines are made. Indeed the soil is so admirable for the cultivation of vines, that the grapes exceed the leaves in number, and some of the bunches are sixteen or eighteen inches in length. The vintage is about

Earlier,

Easter, and of the wines there are four principal sorts; the one is like champagne in colour and taste; the second kind is stronger, and of a pale white cast; the third, called Malmscy, is exceeding rich and delicious; and the fourth called trinto, equals tint in colour, though it is inferior in taste. The latter wine is not drunk in common; but used to tincture and preserve the others. With respect to the feeding and fermenting the wines, the dealers bruise a certain stone called jets, and having baked the powder, they throw about ten pounds weight of it into each pipe. The Madeira wines have this peculiar excellency, if they happen to be pricked, the heat of the sun will meliorate and recover them, for which purpose it is only requisite to roll the pipe into the sun beams, and open the bung-hole that the rarified air may enter.

It is usual to divide the product of each vineyard equally between the proprietor and the person who gathers and presses the grapes; it however usually happens that the gatherer is poor, and the merchant rich.

The Madeira wines are particularly refreshing in hot climates, and seem, says the author of lord Anson's voyage, particularly adapted to comfort and revive the inhabitants of the torrid zone. Those that are brought directly to England, are not equal in goodness to such as take a West India voyage; in particular if they remain some time in Barbadoes, their flavor is exceedingly heightened.

The whole island affords vast quantities of figs, cherries, plums, peaches, apricots, walnuts, &c. The English merchants, who are allowed to reside here, have trees planted from England, currants, gooseberries, filberts, &c. which greatly improve in this warm climate, and genial soil.

The Banana tree is here in singular esteem, being reckoned, on account of its deliciousness, the forbidden fruit. To confirm this surmise, they alledge the extent of its leaves, judging them of a size fit to make aprons for Adam and Eve. Oranges, lemons, and citrons, abound here, and of the latter, the natives make a sweetmeat called facket; the particular sugar which they use in candyng them, is deemed an effectual remedy against consumptions, but it is never suffered to be exported, on account of its great scarcity.

The Cedar tree here is very strait, tall, and thick, and has a rich scent. The wood of the nasso tree is of a red ole colour, and besides, there are a variety of other trees, which are common both to Europe and Africa.

The everlasting flower is a great curiosity, for, when plucked it cannot be perceived to fade, it continues to grow like sage, flowers like camomile, and appears always fresh.

The Portuguese have well stocked the island with cattle; there are many hogs, some of which run about wild in the mountains. They have also wild peacocks, partridges, and quails. The first settlers found great quantities of pigeons, but the breed has been greatly reduced.

The principal place in this island is Funchal, or Tunchal, which is now a large and populous city, containing many churches, monasteries, and nunneries. The nuns are under less restraint here than at Lisbon, for they are permitted to converse freely with strangers, and to traffic with them for wares. The inhabitants are a mixture of Portuguese, Negroes, Mulattoes, some English, and a few French, who are upon a level with respect to trade, and intermarry without regarding colour, or country. The port is very dangerous, particularly during the west and south west winds, on which side the road lies open, and there is no anchoring under 40 fathom above a mile from the shore, and that no where but at the west end of the island. The surf too is generally so great on the beach, that the common method of landing, is to swim off the pipe to the launch, so that the only good time for landing, is before the sea breeze comes on.

On a high rock, called the Loo, there is a fort, where small vessels may moor in safety. But, upon the whole, those who trade to Madeira, have but a very uneasy time of it, till they leave that island. Nor is lodging on shore much easier than being on ship board, as you are obliged to lie upon a cott on the floor, pestered with bugs and fleas.

The other towns are Morosico, Santa Cruz, and Machico, the latter taking its name from Machin, the

first discoverer of the island; but these towns are of little note, very thinly inhabited, and contain nothing worthy of observation.

The people here trade among themselves by *barter*. The ordinary food of the poorer people in the time of vintage is little else than bread and rich grapes; were it not for this abstemiousness, the danger of fevers in the hot seasons would be rarely avoided; therefore, even the rich in the hot months are very spare in their diet, and drink but moderately.

The people in general affect great gravity in their deportment, and usually go clad in black; but they cannot part from the spado and dagger, which even servants wear, so that you may see a footman waiting at table with a sword, at least a yard long, and a great basket hilt to it. The houses in general are plain, as the inhabitants put themselves to no great expence, either in erecting or furnishing them. The windows are latticed instead of being glazed, and are secured by wooden shutters at night.

In marriages here, affection is never once thought of; the principal enquiries are into family, descent, and circumstances; the women are prohibited from marrying Englishmen unless they consent to change their religion, and turn Roman catholics.

Murder is very frequent here, on account of the great number of places deemed sanctuaries, and the ease with which a murderer can thereby screen himself from justice. But if the criminal person is taken before he can fly to sanctuary, the punishment is only either banishment, or confinement, both which may be evaded by a pecuniary composition.

The clergy here are exceeding numerous, and generally rich; but none who are descended from Moors, or Jews, are admitted to take orders. The churches are made repositories for the dead; the corpse is curiously dressed and adorned, yet in the interment, store of lime is used in order to consume the body with all imaginable dispatch, which usually happens in a fortnight; so that there is then room for another corpse. The bodies of protestants are not allowed to be buried, but must be thrown into the sea, unless a large sum of money is paid to the clergy, when they are permitted to be interred in consecrated ground.

Porto Santo lies to the north-east of Madeira, under the 32d deg. and 30 min. of north lat. and under the 15th and 30 of long. west from London. It was discovered in the year 1418 by two Portuguese gentlemen (one of whom was Juan Goncalvo) who were sent by the infant Henry, son to John I. king of Portugal, to double Cape Bajador and make farther discoveries. They were surprised with a violent storm, which driving them out into the main ocean, they luckily met with this island, at the time they gave themselves over for lost; and as it proved a safe asylum or retreat to them, they called it Porto Santo, or the Holy Harbour. It was desert at that time, but has been peopled since by the Portuguese, who have continued in the possession of it. This island is but small, and only five leagues in compass, according to Cadamoste, though Sanut affirms it to be larger. It wants harbours, and has only a bay, which is safe enough, except when the wind blows from the south-west. This bay affords a convenient retreat to the ships that come from the Indies, or go to Africa. So that the merchantmen often stop there, which affords a considerable profit to the inhabitants. The island produces wheat and other corn sufficient for the provision of the people. Here are also plenty of oxen and wild boars, and a prodigious number of conies. Here is also dragon's blood, abundance of honey and wax, and the sea abounds with fish. The inhabitants are all Roman catholics, under the spiritual jurisdiction of the bishop of Funchal in Madeira. They would live a very quiet life, were it not for the pirates, who often pay them troublesome visits. In the year 1617 they landed in this island, and carried off 664 prisoners.

On the east side of Madeira, at six leagues distance, is a little island called the Desert, which produces only orchard, and goats.

In the midway, between Madeira and Teneriff, is a little solitary island called the Salvages, which is about a league in compass. It produces neither fruit nor trees. The goats, however, which abound here, find herbage enough

enough to feed upon, which not only supports, but fattens them.

We cannot conclude this article better than by making an extract from captain Cook's curious description of this island, in the account of his late voyage round the world, performed by order of his present majesty.

"There is great reason to suppose that this whole island was at some remote period, thrown up by the explosion of subterranean fire, as every stone whether whole or in fragments that we saw upon it, appeared to have been burnt, and even the sand itself to have been nothing more than ashes.

"The only article of trade in this island is wine, and the manner in which it is made is so simple, that it might have been used by Noah, who is said to have planted the first vineyard after the flood; the grapes are put into a square wooden vessel, the dimensions of which are proportioned to the size of the vineyard to which it belongs. The servants then having taken off their stockings and jackets, get into it, and with their feet and elbows, press out as much of the juice as they can: the stalks are afterwards collected, and being tied with a rope, are put under a square piece of wood, which is pressed down upon them with a lever, with a stone tied to the end of it. The inhabitants have made so little improvement in knowledge, or art, that they have but very lately brought all the fruits of a vineyard to be of one sort by engraving their vines. There seems to be in mind, as there is in matter, a kind of *vis inertia*, which resists the first impulse to change. He who proposes to assist the arti-

ficer, or the husbandman, by a new application of the principles of philosophy, or the powers of mechanism, will find that his having hitherto done without them will be a stronger motive for his continuing to do without them still, than any advantage, however manifest and considerable, for adopting the improvement.

"We saw no wheel carriages of any sort in the place, which perhaps is not more owing to the want of ingenuity to invent them, than to the want of industry to mend the roads, which at present it is impossible that any wheel carriages should pass; the inhabitants have horses and mules, indeed excellently adapted to such ways; but their wine is notwithstanding brought to town from the vineyards where it is made, in vessels of goats skins, which are carried by men upon their heads. The only imitation of a carriage among these people, is a board made somewhat hollow in the middle, to one end of which a pole is tied by a strap of white leather. This wretched sledge approaches about as near to an English cart, as an Indian canoe to a ship's long boat; and even this would probably have never been thought of, if the English had not introduced wine vessels, which are too big to be carried by hand, and which, therefore, are dragged about the town upon these machines. One reason perhaps why art and industry have done so little for Madeira, is nature's having done so much; the soil is very rich, and there is such a difference of climate between the plains and the hills, that there is scarcely a single object of luxury that grows either in Europe or the Indies, that might not be produced here."

C H A P. XIX.

2. The CANARY ISLANDS.

THE Canary Islands, or as they were anciently called the Fortunate Islands, lie in the Atlantic Ocean, near the continent of Africa, and are generally reckoned seven in number, viz.

Grand Canaria
Teneriff
Palma
Ferro
Gomera
Fuerteventura
Lancerotha.

Their longitude is west, from 12 to 21 deg. and their latitude north, from 27 deg. 30 min. to 29. 30 min.

It is to be observed that the above seven are the principal ones, but 7 and Lancerotha are six more, viz.

Graciosa
Rocca
Allegranza
Santa Clara
Inferno, and
Lobos.

But as these are of little or no consequence, and not much better than rocks, they are very seldom taken notice of, either by navigators or geographers.

Before we proceed to a circumstantial detail of these islands, it may be necessary to premise, the most famous and learned geographers agree, that these are the Fortunate Islands described by Ptolemy and Pliny, though the former places them too much southward, namely, under the 16th degree of north latitude, which made some people, who minded only that situation, take them for the islands of Cape Verd. Some say they had their present name from the largest of them, which was called Canaria by the Spaniards, because of the great number of large dogs they found upon it, when they first disco-

vered it. Though Gemara asserts, that when these islands were first discovered, no dogs were found there. And Dr. Harris agrees with Hormius, that they derived their name not from Canibus (dogs,) according to Pliny, but from the Canameans, that is to say, the Phœnicians, who, as Scylax Cariandensis observes, used to sail often from the continent of Africa to Cerne; and some think that Cerne is only a contraction of Canaria.

These islands have been subject to the crown of Spain since the year 1477, when they were discovered by John de Betancourt, a Frenchman in the service of Castile, who subdued Fuerteventura, and Lancerotha, as others after him did the rest from that time to the year 1496. In the days of Ferdinand, king of Castile, and Alfonso V. of Portugal, each of them claiming a right to the other's dominions, and assuming each other's titles, there ensued a bloody war between the Spaniards and the Portuguese, till both sides being spent, a peace was concluded in 1479 at Alcobazas, on the 4th of September, by which they reciprocally renounced their pretensions; and it was therein stipulated, that the Canary Islands should intirely belong to the crown of Castile, and the commerce and navigation of Guinea to that of Portugal, exclusive of the Castilians.

The ancient inhabitants of these islands were called Guanches, and were formerly very numerous: their European conquerors have, however, greatly reduced their numbers by various kinds of cruelties, though remnants of them still remain.

These people, according to the Spanish writers, were rude and uncivilized: polygamy was allowed among them; and they trained up goats to give suck to their children. They had not any notion of private property, thinking that the bounties of nature ought to be enjoyed in common. They made but little use of fire, as they never dressed meat, because they held the slaughter of any living creature in the greatest abomination. Not having

having any iron, they made use of flints to shave with, and in general lived in caverns in the rocks. Each island was divided into a certain number of lordships; in particular, Teneriff was ruled by nine different lords, or petty sovereigns; and these had frequent wars with each other.

The Guanches, like the ancient Britons, painted, or rather stained their bodies with the juice of certain herbs, their favourite colours being red, green, and yellow; and their weapons were lances, darts, and stones. Every lordship had its own mode of worship; thus in Teneriff there were nine different kinds of idolatry; some paying adoration to the sun, some to the moon, and others to particular stars. Upon the accession of any new lord, it was customary for many young persons to offer themselves to die, as sacrifices in honour of him; the manner of which was thus: the new lord held a great feast on the day of his accession, to crown which, all such as were willing to give this cruel proof of their unfeigned affection to him, were attended to a high cliff, which overhung a very deep valley, where, after some preliminary ceremonies, the willing victim threw himself down the precipice, and was dashed to pieces: after which, the lord held himself obliged to reward this sanguinary homage by conferring all manner of favours on the relations of the deceased.

The sieur Durret informs us, that these Guanches were a strong, hardy, robust people, tall and lean, with tawny complexions, and flat noses; of a sprightly disposition, nimble, stout, and warlike. They spoke little, but eat much; their food being principally dried barley, ground and made up into cakes with milk and honey. They climbed up craggy rocks with amazing agility, and defended with equal ease. In fight they threw stones with great exactness and amazing force.

To speak in general terms of the produce of these islands, previous to their being settled by the Europeans, we are told that they were then destitute of wine and wheat, and had scarce any valuable commodity but cheese, goats skins, and tallow. Wheat was sown, and vines planted here since, and both thrive extremely well, only at certain times a pernicious worm called Gorgosho, gets into the wheat, and eats the substance, leaving only the husk in a manner whole.

Since their settlement, they produce corn, cattle, wine, sugar, conserves, pitch which does not melt in the sun, iron, honey, wax, cheese, skins, &c. The water, however, is not good, and the inhabitants endeavour to remove its defects by the use of filtering stones. The harvest is usually in March, to April at farthest, and some of the islands have two every year. Le Maire affirms, that a cherry slip will produce fruit in six weeks after grafting. The oriselle, or Canary seed plant, is the product of these islands; it, however, requires greater care and management here than even in Europe. Beans, pease, papaws, cherries, guavas, pompions, onions, pot herbs, falladings, and all other kinds of garden stuff abound here. The gardens and fields are enameled with a great variety of beautiful flowers; the seas and rivers supply the people with great quantities of fish, and they have deer tolerable plenty. These are the products of the islands in general; but the Spaniards have a saying, which may be thus translated.

Lanceros abound in horses that are fine,
Grand Canaria, Teneriff, and Palma in wine,
Fuerteventura a store of fowls contains,
And the finest fallow deer run on Gomera's plains.

We shall now proceed to describe the islands distinctly, and to take notice of all that is remarkable in each.

GRAND CANARIA.

THIS island is superior to the rest of the Canaries, not on account of its greater fertility, but by reason of its being the seat of justice, and government for them all. There is a governor for this island only, besides whom three auditors, or superior judges, reside here, who act jointly by commission, and hear appeals from the other islands.

Grand Canaria is about 14 leagues in length, nine in breadth, and 34 in circumference. The chief city is called Canaria, or Civitas Palmorum, and hath a noble cathedral, with all the usual dignities. With respect to the

administration of civil affairs, there are several aldermen, who have great authority, and a council house to themselves. The city itself is beautiful, and the inhabitants dress in a very gay manner; the ground is of such a hard sand, that the streets are always clean, and the people in general are healthy, as the air is exceeding temperate considering the situation is nearly tropical.

This town, says Le Maire, is defended by a castle, situated on a hill, but very mean and despicable. It lies a league and half south west from the road, where there is very good anchoring, for the shore near the town is peppered with rocks under water. It is inhabited by above twelve thousand people, and its precincts are near a league in compass, most of the houses being well built, two stories high and flat roofed. The bishop's court, with the inquisitor's tribunal, and the sovereign council, being like the parliament of the seven islands, are held here. But the bishop, governor, and principal people, reside at Teneriff by choice, and only repair to Grand Canaria upon business. There are four convents, viz. Dominicans, Franciscans, Bernardines, and Recollects of Observation. There are also 12 sugar houses, called Inganios, in which a great quantity of sugar is made; but of the growth of sugar, and the method of preparing it, we shall speak more particularly.

A good soil yields nine crops of sugar in 18 years. First they take a cane, which is called the planta, and laying it along in a furrow, cover it with earth, so that by a sluice they can let the water run over it. This plant, in the nature of a root, brings forth sundry canes, which grow two years before they are fit to cut. When ripe they are cut even with the ground, and the tops, with the leaves, called cohala, being chopped off the bodies, are tied into bundles like faggots, and carried to the sugar-house, which is called *au ingenio*. Here they are ground in a mill, and the juice conveyed by a gutter to a great vessel or cauldron, where it is boiled till it comes to a due thickness, and then put into earthen pots of the mould of a sugar-loaf, and placed in the purging-house to purge and whiten, which is done with a certain clay laid on the top. Of the remainder in the cauldron, a second sort, called *el unmas*, is made; and of the purging liquor that drops from the white or clayed sugar, a third sort is made. The refuse of all the purgings is called *terried* of melasses.

When the first crop is thus finished, the canes of which are called *planta*, then the sugar-straws, or withered leaves of the canes, are set on fire, which likewise burn the stumps of the canes close to the ground. With good watering, in two years more a second crop is yielded, which they term *zoca*; the third crop is called *tertia zoca*; the fourth, *quarta zoca*, &c.

The wine of this island is singularly delicious; and the fruits are, melons, pears, apples, oranges, lemons, pomegranates, figs, peaches, hattatoes, or Spanish potatoes. The plantano grows near the sides of brooks, is very strait in the body, and has surprizingly thick leaves, which grow not on the branches, but out of the top of the tree. Every leaf is six feet long, and almost two broad. The fruit grows on the branches, of which each tree hath but three or four. The fruit in shape resembles a cucumber, and when ripe turns black, at which time it is one of the most delicious conserves in the universe. The plantano-tree will bear fruit but once, when it is cut down, and another tree springs from the same root; the cutting down is therefore repeated every season as soon as the fruit is gathered. As this island hath a salubrious air, and is well watered, almost every thing thrives that is planted, such as wild-olives, laurel, poplar, pine, palm, Indian-figs, aloe-shrub, &c. Grand Canaria likewise abounds in oxen, kine, camels, goats, sheep, capons, hens, ducks, pigeons, partridges, &c.

This island, as well as the other Canaries, abounds in those beautiful singing-birds called the Canary-bird, of which a modern naturalist gives the following account: "This bird was originally peculiar to those isles to which it owes its name; the fame that were known to the ancients by the addition of the *Fortunate*. The happy temperature of the air, the spontaneous production of the ground in the varieties of fruits, the sprightly and cheerful disposition of the inhabitants, and the harmony arising from the number of birds found there, procured them the romantic distinction. On the same spot these charming

charming songsters are still to be found; but they are now so plenty among us, that we are under no necessity of crossing the ocean for them. In its native regions, the Canary bird is of a dusky grey colour, and so different from those usually seen in Europe, that doubts have arisen whether it be of the same species. Next to the nightingale, the Canary-bird is considered as the most celebrated songster: it is also reared with less difficulty than any of the soft-bill'd birds, and continues its song throughout the year; consequently, it is rather the most common in our houses."

The original inhabitants of Grand Canaria, are, by the first discoverers, said to have amounted to upwards of 14,000 men capable of bearing arms; exclusive of women, children, aged persons, &c. which must have rendered the island extremely populous. The natives in general were tall of stature, well made, active, cheerful, and of dark complexions. They were warlike and humane, faithful to their promises, fond of difficulties, and fearless of dangers. They frequently climbed up very steep precipices, and by the means of long heavy poles, leaped from rock to rock.

Their dress was a close short coat, reaching only to the knees, and being girded round the middle with a leather belt. The coat itself was made of rushes, which they beat till it became soft, like flax, and then spun and wove it into a garment. Their outward covering was a goat skin cloak: the hairy side of this they wore inward in the winter, and outward in the summer. The caps were made of the skins of goats heads, so contrived, that part of the beard hung down by each ear, and was sometimes tied under the chin.

The cloaths of the ancient inhabitants of Grand Canaria were in general better sewed, and neater than those of the inhabitants of the other islands; being frequently painted, and sometimes adorned with feathers. Some of them went bare-footed, but others wore shoes, made of raw hides, the workmanship of which was tolerably neat.

The external distinction of the noble, or superior rank of Canarians, from those of the vulgar or lower class, was by the cut of their hair or beards. This honorary distinction was not, however, hereditary; but was to be acquired by means of an officer called the *saycag*, whose business was to settle private disputes, and bestow titles. The manner of conferring a title was thus: The person desirous of obtaining it, set his hair and beard grow very long; then going to the *saycag*, he said, "I am the son of such a person; I am arrived at the state of manhood; I can bear the fatigues of war; and for these reasons desire to be enobled." If these interrogatives were answered satisfactorily, the demandant was deemed worthy of being ennobled; and the *saycag* proceeded to cut his hair round and short, accordingly; but on the contrary, if any person present could charge him with having committed any of the alleged crimes, or of having been seen doing any domestic offices, his hair was immediately close shaved, he was for ever forbid entering into the order of nobility, and sent away in disgrace.

Originally the Canarians used only stones, clubs, and sharp pointed poles; but after having been invaded by the Europeans, they learnt of their invaders the art of making shields and swords. In all their wars, however, they preserved humanity and decency; for they never molested women or children; or did the least damage to the temples or sacred places belonging to their enemies. They had, in times of peace, amphitheatres for public combats; when a challenge being given in form, the challenger and challenged both repaired to the grand council of the island, which consisted of twelve principal nobles; here they petitioned for permission to fight, which being granted, they went to the *saycag* to confirm that permission. This being done, and all things prepared, they went to the amphitheatre, where the exhibition was begun by the two combatants mounting on

two large stones at some distance, and pelting each other with smaller stones, which were supplied them for that purpose; the main skill consisting in avoiding being struck by these, by the mere dexterity of body. This lapidation being performed, they engaged with a cudgel in the right hand, and a flint stone in the left, with which they gave each other a hearty drubbing, then retiring for some refreshment, they afterwards returned, and fought again, till the grand council ordered them to desist. These combats were generally fought on public festivals; and the cure, if either of the combatants was wounded, was of a singular nature; for a skilful person, who acted as surgeon, pounded a rush, till it became of the consistency of tow, and then dipping it in goat's tallow, he applied it warm to the place affected. These combats were succeeded by singing and dancing; their dances being quick, sprightly, and agile; and their songs all of a plaintive nature. The houses of the native Canarians were built of stone, but not cemented together; they were, however, fastened with such exactness, that their appearance was not uncouth. The floors were sunk beneath the level of the ground, and the walls were very low. The roofs were formed of wooden beams covered with earth. Beds made of goats skins, mats made of rushes, to sit upon, and baskets formed of palm leaves, were the whole of their furniture.

In the proper season the women gathered flowers, herbs, and shrubs, from which they extracted a variety of colours, and when that season was over, they employed themselves in dyeing, staining, and painting their houses, furniture, and dresses. Their thread was made of nerves, or tendons; the needles of bone; their fish hooks of horn; and their domestic utensils of clay, dried in the sun. The making mats, baskets, thread, needles, fish hooks, pottery, &c. were deemed honourable employments; but the trade of a butcher was looked upon as ignominious, on account of the natural abhorrence the people entertained to killing any animal, that none would converse with a person of that profession, or suffer him to touch any thing belonging to them. Indeed those in any of these islands who eat meat, were looked upon as but little better than cannibals, and the butchers who killed it for them were consequently held in the utmost detestation. The common food of the Canarians was barley meal, milk, butter, &c. They ground their barley with a hand mill, and ploughed their ground with a wooden machine, which, in some measure, resembled a hoc, with a spur at the end of it. When the land was over dry, they had the method of sluicing it by the means of channels, cut in parallel lines, with others intersecting them at right angles. When ripe, the corn was always reaped, threshed, and winnowed by the women. The richer sort of the people resided chiefly in the inland parts of the island, and the poorer class inhabited the sea coast, where they subsisted principally by fishing. They had a peculiar method of catching a small, but exquisite fish, of the pilchard kind, which was this: when they perceived a shoal near the shore, a number of persons swam off, surrounded the fish, and drove them into nets, which were purposely laid for their reception; the prize was then divided between all present with great equity, but pregnant women had always the allowance of two persons; and those who had children, besides their own share, received a share for each child.

They educated their children by the modes of emulation, instead of severity; and parents, when a daughter was to be married, kept her previously thirty days, during which time she was fed with the most nourishing aliments, in order to fatten her; as they deemed it a bad omen for people to marry when lean.

There was an order of nuns among the original Canarians, who were distinguished from the other women by a peculiar sort of long white garments. They had many superstitious traditional notions among them, and the places where they resided were deemed places of refuge for criminals, and had privileges very nearly resembling European sanctuaries. In all crimes but those punishable by death the laws of retaliation were used, and justice, in general, impartially administered. In times of public danger, or when they looked upon themselves to be afflicted by any general calamity, the Canarians went in procession to the rocks and mountains, preceded by the religious women, and carrying with them branches of palm, and vessels filled with milk, which latter they poured

poured upon the rocks, as religious oblations, and then danced in mournful measures, and sung melancholy songs to deprecate the wrath of their supposed divinities. Sometimes they went to the sea shore, and having shouted with great vehemence, they beat the waters with their rods, and performed other ridiculous ceremonies. When any of the Canarians died, if capital people, they were buried in sepulchral caves; if of the vulgar class, in holes in the ground, which were afterwards covered with stones. Some were buried upright, but those who were laid flat had always the head turned towards the North.

The European conquerors of Canaria were informed by the traditions among the natives, that some time previous to their conquest of that place, Canaria was governed by several petty sovereigns, among whom Antidamana, the queen of a most fertile district of the island, was celebrated for her wisdom, equity, and eloquence; so that she became revered by the people of the other districts, and was appealed to as the general arbitrator of their differences. Her great influence, however, gave umbrage to and raised the jealousy of the other sovereigns, who did their utmost endeavours to prejudice the Canarians against her, and represented that it was scandalous for men to submit their reason to the voice and decision of a woman, when they might have their causes decided in proper courts, and tried before competent judges, as their ancestors had always done before them. These insinuations answered the purposes for which they were designed, and the queen found her influence gradually decrease. This piqued her so much, that she determined to give her hand to Gumidaff, a brave warrior and popular officer. The nuptials were no sooner performed than the queen invested her husband with half her power, and made him sole commander of her army. Having put himself at the head of the troops, he successively attacked the other petty sovereigns, conquered them with great rapidity, and brought all their dominions beneath his own sway. He left a son, by Antidamana, who succeeded him as king of the whole island, and this son, at his death, left two sons, between whom he equally divided his dominions. These were on their respective thrones, trying to maintain what their father had left them, and the deposed petty sovereigns were aiming to regain what they had lost, at the time the Spaniards conquered the island; which terminated all their intestine disputes, and united them to lament over one general calamity.

The Island of TENERIFF.

THIS island is situated between the 28th and 29th degrees of north latitude, and between the 16th and 17th degrees of west longitude. It is about 50 miles long, 25 broad, and 150 in circumference. Though it is but the second of the Canary Islands in point of precedence, yet it is the most considerable with respect to its extent, riches, and trade. It was anciently called Nivaria, from the snow that encloses the neck of the pike of Teyda, like a collar; the name of Teneriff being given it by the inhabitants of Palma, in whose language Tencr signifies snow, and ife an hill.

The pike of Teneriff, for which the island is particularly famous, is said to be the highest hill in the universe, and, as Sir Edmund Scory observes, strikes the beholder with amazement, both near and at a distance. "This great mountain," says that writer, "extends its base to Gattachio, from whence it is two days and a half's journey to the top; which top, though it seems as sharp as a sugar-loaf, is yet a flat the breadth of an acre; and in the middle of it there is a gulph, out of which are thrown great stones, with a prodigious noise, flame, and smok. Seven leagues of the way up may be travelled with asses or mules, but the rest must be climbed on foot, and that not without difficulty; every one carrying his own provisions and wine. The ascent of the hill, for ten miles upwards from the foot, is adorned with the goodliest trees in the world, of divers sorts; being well watered with riplings, running from springs, which joining at length, descend in large torrents (especially when swelled by the violent winter rains) into the sea.

In the middle it is intolerably cold, so that the traveller must continue to travel on the south side, and in the day time only. This cold region ends within two leagues of the top, where the heat is no less extreme than at the

bottom. By the same rule, therefore, you must in those regions keep on the north side; and travel only in the night. The best time of the year for the journey is about midsummer, as avoiding the torrens caused by the snows, and if you gain the top by two o'clock in the morning, may abide there some hours; but not after sun rising, a little before which there issues a steam of heat from the east, not unlike the steam of a hot oven. It is remarkable that from the top the sun appears much less a little after it has ascended the horizon than when viewed below; and seems to whirl about upon its center. The sky here is clear and serene; it never rains near the top, nor is there any wind upon it. (The like is said of Olympus.) Though the island is full of sharp ragged rocks, to the number of twenty thousand, yet from hence the whole shews as a plain, laid out in portions by borders of snow, which, however, are nothing else but the white clouds that are many furlongs beneath you. All the upper part is barren and bald, without tree or shrub upon it; out of which, on the south side, there issue streams of brimstone into the neck, or region of snow, which lies intervened, as it were, with brimstone, in several places. The fire from the volcano above mentioned, in the top, breaks out oftentimes in the summer time; and when a stone is thrown down, it resounds like a vessel of hollow brass, struck with the greatest force by a prodigious weight. The Spaniards, by way of mirth, call it the Devil's cauldron, wherein hell's whole provision is boiled; but the natives, or Guanches, seriously think it is hell; and that the souls of such of their ancestors as were wicked went thither to be tormented, while the good and valiant retired into the pleasant valley, where the great city of Saguna now stands, with other towns about it; and indeed there is no place in the world that has a more delicate temperature of air, nor any country which affords a more beautiful prospect than is beheld from the center of this plain, which is fertilized by abundance of waters, falling along the crannies of the rocks, in little streams down the mountains, till several joining, form rivers, which run along the plains into the sea."

So far Sir Edmund Scory, whose account is extremely ingenious and accurate, and differs not from the generality of other accounts, except in one circumstance, in which he tells that there is no wind at the top of Teneriff. There might not perhaps when he was up; but other travellers have felt it.

The height of the pike of Teneriff is about 15 miles; that is the oblique height; for the perpendicular height, according to Varianus, is but 4 miles, and 5 furlongs. Sir Thomas Herbert tells us, it is so high, that the top is seen in clear weather 120 miles off, and that there is plenty of wood at the bottom, snow in the middle, and flames on the top, where there are veins of brimstone burning, which the people call the Devil's Cauldron. It rises from the middle of the island, and has a ledge of hills on each side, which divide it. He adds, that those who ascend it usually ride round for the space of seven leagues, and walk the rest on foot. But the best account of this famous pike is to be seen in the history of the Royal Society of London, published by Dr. Sprat, late bishop of Rochester, from a relation of some considerable merchants and others of credit, who went to the top of it. For our reader's satisfaction we have extracted it as follows:

They set out from Oratavia, a sea-port town on the west side of the island, and passed over several bare mountains and sandy places, till they came to the foot of the pike, where there are many huge stones, which seem to have fallen down from some upper part. After they had ascended about a mile, they were obliged to quit their horses, and though the air was very mild in the day-time, yet it was so cold and strong after sun-set, that they were obliged to keep great fires all night. The black rocks begin a mile above, and lie flat like a pavement. From thence they proceeded to the sugar-loaf, where they began to travel again in a white sand, with shoes, the single soles of which are made a finger broader than the upper leather, to facilitate the passage. When they had climbed to the top of the pike, they found a strong wind, and continual breathing of a hot sulphurous vapour, which made their faces sore, but no such smoking as there was below. The top on which they stood, being not above a yard broad, is the brink of a pit called the Cauldron, which

which they judged to be a musket shot over, and near four yards deep, in shape like a cone, hollow within like a cauldron, and covered all over with small loose stones, mixed with sulphur and sand, which send forth a hot suffocating steam. They descended four or five yards into that pit, but no farther, because of its sliding from their feet, and the difficulty; but some have ventured to the bottom. They observed a clear sort of sulphur upon the stones like salt; and from hence they could see the Grand Canary 14 leagues distant, Palma 18, Gomera 7, and Ferro above 20. As soon as the sun appears, the shadow of this mountain seems to cover not only this and the Great Canary island, but even the sea to the very horizon, where its top seems to turn up, and cast its shadow into the air. Sometimes, especially during the north-west wind, the clouds seem to hang over, or to wrap themselves about the pike, which they call the Cappe, and say it is a certain sign of approaching storms. There are several choice springs on the tops of the other mountains. The sandy way to the foot of the sugar-loaf is steep almost to a perpendicular. There is a cave ten yards deep and fifteen broad, in shape like an oven, or cupola, with a hole at the top, near eight yards over, by which they swung down by a rope that their servants held at the top, till they came to a bank of snow. They were obliged to swing thus, because in the middle of the bottom of this cave, opposite to the overture at the top, there is a round well of water, the surface whereof is about a yard lower than the snow, but as wide as the mouth at top, and about six fathom deep. This is not supposed to be a spring, but only dissolved snow blown in, or water dropping through the rocks. About the sides of this grotto, for some height, there is ice and icicles hanging down to the snow. The whole perpendicular height of this mountain is reckoned four miles and a half. There are no trees, herbs, nor shrubs in all the passages, but pines, and among the whiter sands a bushy plant like broom. On one side there is a sort of carion, which has stems eight feet high, with a trunk near half a foot thick, every stem growing in four squares, and rising from the ground, like tufts of rushes, upon the edges of which grow small red buttons or berries, which contain a poisonous milk, that immediately fetches off the hair from the skin. It is said this plant is spread all over the island.

We cannot conclude our account of this celebrated Pike, without quoting the beautiful lines of Sir Samuel Garth, who, in speaking of this and other mountains, says,

“ From Atlas, far beneath a waste of plains,
 “ Proud Teneriff, his giant brother, reigns;
 “ With breathing fire his pitchy nostrils glow,
 “ As from his sides he shakes the fleecy snow:
 “ Around their hoary prince, from wat’ry beds,
 “ His subject islands raise their verdant heads;
 “ The waves so gently wash each rising hill,
 “ The land seems floating, and the ocean still.”

This island is productive of all the fruits which grow in Grand Canaria, and hath, in common with the other Canary Islands, a shrub called tayhaba, out of which issues a milky juice, which, after standing a little, thickens, and is accounted exceeding good birdlime.

The drage, or dragon-tree, is peculiar to Teneriff; it grows on rocks; and when an incision is made, it yields a juice like blood, which is well known by the name of gum-dragon, and is a common medicine with apothecaries. Targets made of this wood are held in high estimation, because if a sword or dagger is stuck into them, it cannot be easily plucked out, and consequently a great advantage accrues to those who use them.

Teneriff abounds in corn more than other of the Canary islands, and on that account, in times of scarcity, is termed the mother of the rest. Among the rocks grows orchel, a kind of moss, which is of singular use to dyers.

A certain author says, “ There is in Teneriff a small spot of land, about a league in compass, the like to which perhaps cannot be seen in all the world besides; it lies between two towns, one called Laretava, and the other Rialejo. This single league of ground produceth sweet water out of the cliffs, or rocky mountains; corn of all sorts, all kinds of fruits, excellent silk, flax, wax and honey, very good vines in abundance, with great store of

sugar, and plenty of fire-wood.” The best vines in Teneriff grow on the side of a hill called the Ramble, and great quantities of wines are exported to the West-Indies, Europe, &c.

The wines of the island in general are known by the names of Malmsey, Canary, and Verdonia. Beekman insists that the wines which yield the canary were transported hither from the Rhine, in Germany, by the Spaniards, in the reign of the emperor Charles the fifth; where meeting with a happier soil, instead of sharp Rheinish, they produce that sweet delicious wine now so well known all over Europe.

Durret says, besides the dragon-tree, the aloë-plant and pine are natives of Teneriff: the latter yields a certain gum or pitch, which is thus extracted; the wood is cleaved, and laid across a pit, and then the top is set on fire, which forces the pitch to run out below, where there are proper vessels to receive it. The apricot, peach, and pear trees, bear twice annually. The pinguada, lemon, and lignan wood are found here; as are the cotton shrub, and cololquintida. The roses blow at Christmas; the carnations are large and fine, but tulips will not thrive. The rocks abound with samphire, the meadows are covered with clover, and the beach produces a broad-leaved grass. About fourscore ears of wheat spring from one root, the grains of which are as transparent as the purest yellow amber, and in a good season one buhel will produce an hundred fold. The barley and maize are not inferior to the wheat; and indeed fertility seems to be the characteristic of this island.

The quails and partridges are larger than those in England, and extremely handsome. Wood pigeons, turtles and crows, abound in the spring; bees prosper in the rocks and mountains; and silk-worms thrive exceedingly well.

Here are plenty of rabbits, hogs, wild goats, &c. Fishes are found in great quantities, particularly dolphins, sharks, meros, lobsters, muscels, periwinkles, the claeas, which is deemed the best shell fish in the universe, and the cherna, that exceeds in relish any we have in England: here is also another fish which is called an eel, though with little propriety, for it hath seven tails of a span long jointed to one body and one head, which are much about the same length.

The principal place in Teneriff is the city of Laguna, which stands near a lake, about nine miles from the sea; it is called by the Spaniards St. Chiriloval de la Laguna, or St. Christopher of the Lake, and is handsomely built, having two fair parish churches, and a palace for the governor who resides here. It is remarkable that the aldermen of this city pay a certain price to the king to serve their offices of magistrates; but this gives them great power over the inhabitants, who are divided into three classes, viz. gentlemen, merchants, and husbandmen, or as the natives say, idlemen, busymen, and labouringmen. The land on each side of the road, leading to Laguna, is in general rocky, but some spots of corn land are interpered here and there, and terminated by small vineyards on the sides of the mountains. Upon the whole, Laguna presents the beholder with an agreeable prospect, as it stands on the side of a hill, and stretches its skirts on the plain behind; it is large, compact, and populous: the houses, though not uniform, have a pleasant appearance; besides the governor's house, and the two parish churches, here are two nunneries, four convents, an hospital, and some chapels, besides many gentlemen's houses. The convents are those of St. Francis, St. Augustin, St. Dominick, and St. Diego. The churches have pretty high, square steeples, which top the rest of the buildings. The streets are not regular, yet they are mostly spacious, and pretty handsome, and near the middle of the town is a large parade, which has good buildings about it. There is a strong prison on one side of it, near which is a large conduit of good water that supplies all the town. They have many gardens that are set round with orange, lime, and other fruit-trees, in the middle of which are pot-herbs, saladings, flowers, &c. and indeed, if the inhabitants were curious this way, they might have very pleasant gardens: for as the town stands high from the sea, on the brow of a plain that is all open to the east, and has consequently the benefit of the trade-wind, which blows here, and is most commonly fair; so there are seldom wanting at this town

town brisk, cooling, and refreshing breezes all the day.

On the back of the town there is a large plain, three or four leagues in length, and two miles broad, producing a thick kindly sort of grass. On the east side of this plain, near the back of this town, there is a natural lake or pond of fresh water; it is about half a mile in circumference; but being stagnant, it is only used for cattle.

In the winter-time several sorts of wild-fowl resort hither, affording plenty of game to the inhabitants of Laguna. The plain is bounded on the west, the north-west, and the south-west, with high steep hills, as high above this plain, as this is above the sea; and it is from the foot of one of these mountains that the water of the conduit which supplies the town is conveyed over the plain, in troughs of stone raised upon pillars. And, indeed, considering the situation of the town, its large prospect to the east, (for from hence you see the Grand Canary) its gardens, cool arbors, pleasant plains, green fields, the pond and aqueduct, and its refreshing breezes, it is a very delightful dwelling, especially for such as have no business to call them far and often from home; for the island being generally mountainous, steep, and craggy, it is very troublesome travelling up and down in it, unless in the cool of the mornings and evenings. Mules and asses are mostly used by the inhabitants both for carrying and carriage, as fittest for the rocky uneven roads. Beyond the mountains on the south-west side, still farther up, you may see from the town and plains the famous pike of Teneriff, overlooking the rest of the mountains.

Concerning the falcons, or rather strong large hawks, which hover over the lake of Laguna, Sir Edmund Scory says, "I cannot forbear mentioning the haggard falcons that soar every evening about this lake. It is very good diversion to see the Negroes fight them with slings, for they stoop often, and several at a time; and besides are the best mettle hawks in the world, of a larger kind than the Barbary falcon. The viceroy (governor) being one evening to see this sport, on the author's commending their strength and mettle, assured him upon his honour, that a falcon bred in that island, which he had formerly sent to the duke of Lerma, did at one flight (unless he rested on any ships by the way) pass from Andalusia to Teneriff, which is 250 Spanish leagues, and was taken up half dead with the duke's varlets, or bells on."

The next place of any consideration is Santa Cruz, which is a haven lying on the north east side of the island, the best riding place not being above half a mile from the shore, in 40 or 50 fathom, with a black slimy bottom. The shore is generally high land, and in most places steep to the water: and when many ships are there, they are obliged to ride close to each other. Near the watering place are two little forts, which, with some batteries scattered along the coast, command the road. The town is secured by two other forts, which front the sea. The houses are about 200 in number, all strongly built of stone, three stories high, and covered with pantiles. We cannot forbear inserting here the account of the bombardment of Santa Cruz, and the destruction of the Spanish plate fleet, by admiral Blake. Upon the first appearance of Blake's fleet, Don Diego Diaguez, the Spanish admiral, ordered all his small ships to moor close to the shore, covered by the forts and batteries, and then posted six great galleons farther off at anchor, with their broadsides to the sea. Blake having called a council of war, it was unanimously agreed to attack the Spaniards. The English admiral then commanded captain Stayner, in the Speaker frigate, with a squadron to enter the bay, who by eight the next morning, fell upon the Spaniards with great intrepidity. Blake seconded Stayner, and posted some of the greater ships to cannonade the forts, which played incessantly upon them. These drove the Spaniards from their lines and batteries. Blake fought four hours with the galleons, which made a brave resistance, but the English at length obliged the Spaniards to abandon them, though the smallest of these galleons was larger than the biggest of Blake's ships. The English then set fire to the whole Spanish plate fleet, and totally destroyed it, which did the Spaniards incredible damage, as it was immensely rich. Blake's loss amounted only to 48 men killed, and 120 wounded; but the carnage on the side of the Spaniards was terrible indeed. Lord

Clarendon says, that the whole action was so miraculous, that all men who knew the place, wondered that any sober man, with what courage soever endued, would ever have undertaken it; whilst the Spaniards comforted themselves with the belief, that they were devils and not men who had done them so much mischief.

With respect to trade, Oratava, or Larotava is considered as the most convenient port, and here it is that the English consul and merchants principally reside: it is, however, more dangerous here during the westerly winds, than at Santa Cruz during the easterly, and the latter place has likewise the advantage of the best water, so that boats frequently go from Oratava to fetch it. The towns of Garachico and Rialejo have nothing worthy of notice in them, and therefore have not been described by voyagers and travellers.

It is generally allowed that Teneriff is the best peopled of all the Canaries, and some have gone so far as to affirm, that considering its size, it is the best peopled in the ocean. Indeed it is exceeding populous; and the better sort of Spanish inhabitants are exceeding courteous and affable, but the vulgar class, like those of Spain, are exceeding proud and lazy. The men all among them wear a long sword at home and abroad, and will rather starve, or at least take up with pulse and roots, than stop out to fetch any thing better, though there be wild fowl in great plenty. The women wear veils, but many of them contract a method of squinting, by peeping with one eye through a hole made in the front of them.

As what relates to the Guanches, or ancient inhabitants, is extremely interesting, we shall here preserve it for the entertainment of the curious. The origin of the Guanches is not certainly known; they were, and the remainder of them still are barbarous, and without literature, but their language, which still remains among the remnant of them, has great affinity to that of the Moors in Barbary. They had some notion of a deity, and held that there was a supreme power, whom they distinguished by various emphatical names, such as

Achuhurahan - - *The greatest.*

Achuhuchanar - - *The highest.*

Achguayaxeram - - *The maintainer of all.*

When they wanted rain, when too much fell, or in any other calamity, they drove their sheep and goats to a public place appointed for such solemnities. When separating the young ones from their dams, a general bleating was raised, which they imagined would appease the wrath of the heavens, by which means they should obtain what they wanted.

It is evident that they had some idea of the immortality of the soul, by supposing the existence of places for future rewards and punishments. In particular, they supposed the pike of Teneriff to contain hell in its bowels, which they termed Echeya; and to the devil they gave the name of Guayotta.

They had some regularity in civil affairs, as each district had a sovereign, whom they thought it their duty to obey as a supreme magistrate. To him they promised vassalage at a certain age, and confirmed the same promise when they happened to marry. The regal succession was hereditary, and all children were admitted to reign, but illegitimate children were rejected. The kings, however, as well as common people, dwelt in caves, and had not the least conception of civil architecture. One of their kings, named *Acoze*, ruled the whole island singly for many years, but having several children, they conspired against him, deposed him, and then divided his dominions among themselves. Their wars were principally made to steal cattle from each other, particularly spotted goats, which were highly esteemed, and even at this day, the remaining Guanches place a great value upon them.

When a man had a mind to marry, all the preliminary ceremonies were, asking the consent of the girl's parent, and if that was obtained, the marriage was immediately consummated. What was thus so easily done, was as easily undone; for whenever the parties had a mind, they might separate, and marry with others at their pleasure; but under this restriction, that all the children born after the divorce were to be considered as illegitimate; their kings alone, for succession sake, being exempted from this custom.

At the birth of a child, water was poured on it head

by a woman chosen for that purpose, who was taken into the family, and became its adopted mother, nor was it afterwards lawful for any of that race to cohabit with her, or marry her. Such indeed was their sense of modesty in general, that if any man offered the least indecency to a woman, he was assuredly put to death. A degree of delicacy, worthy of imitation in politer nations.

The people in general were of a good stature, well made, and had tolerable complexions: their usual diversions were leaping, running, shooting the dart, throwing stones, dancing, &c. at all which they were extremely expert. Their dress was a short coat made of lamb-skins, without plait, collar, or sleeves, being fastened together with straps of the same leather, or skins. This dress, called the tamarce, was worn equally by men and women; the latter, however, added a callock beneath it. In this garment they lived, in this they died, and in this they were commonly buried.

Wheat being unknown to them, before the conquest of the island by the Spaniards, they sowed barley and beans. The barley being dried by the sun, they ground it with hand mills, then mixing it up with water, milk and butter, used it as their common subsistence, and called it gisfo, or bread. They never eat flesh but upon certain solemnities; when being publicly met together, the king with his own hands, distributed three goats to every 20 of them, with a proportionable quantity of the before mentioned gisfo, or bread. After which the company entertained the king, and each other, with their usual sports, and the day concluded with the utmost festivity.

When sowing time arrived, the king of each district laid out the land in lots to every man; when they turned up the ground with goats horns, and threw the seed into the ground, uttering certain mystical words at the same time, by way of incantation. This was entirely done by the men; but most other laborious works were allotted to the women.

The sepulchral caves of these people were very remarkable. They had an uncommon veneration for the corpses of their ancestors, which were deposited, in caves formed by nature in the rocks; they were preserved in goats skins, bound round by belts of the same, so exactly and uniformly inclosing the body, as to excite admiration, each round being just proportioned to the part; and this method preserved the bodies. The eyes, which are closed, the hair, ears, nose, teeth, lips, and beard, are found entire: they are placed on wooden couches, which the natives had the art of rendering so hard, that they are impenetrable to iron. A particular tribe only had the art of embalming, which was inviolably kept secret from the vulgar. Some of the caves contained two or three hundred bodies. We shall conclude the account of these sepulchres in the words of a learned gentleman, who resided several years on the island: "Being one day hunting, a ferret, having a bell about his neck, ran after a coney into a hole; where the sound of the bell was lost. The owner being afraid he should lose his ferret, in seeking about the rocks and shrubs, found the mouth of a cave, and entering in, was so affrighted, that he cried out. His fright arose from one of these corpses, very tall and large, lying with the head on a great stone, the feet supported with a little wall of stone, the body itself resting on a bed of wood. The man being now a little recovered from his fright, went nearer, and cut off a great piece of the skin that lay on the breast of the body, which was more flexible and pliant than any kid's leather glove, yet not any ways rotten. These bodies are very light, as if made of straw, and in some that were broken might be observed the nerves and tendons, as also the veins and arteries, like strings, very distinctly. By the relation of the most ancient among them, there was a particular tribe who had this art only among themselves, which they kept as a thing sacred, and not to be communicated to the vulgar. The people of this class were likewise priests, and did not marry out of their own tribe; but when the Spaniards conquered the place, most of them were destroyed, and the art nearly perished with them; only the remnants had preserved by tradition the knowledge of a few of the ingredients used in this business, viz. They took butter and fat, kept for the purpose in skins: in this they boiled certain herbs; as a kind of wild lavender,

growing plentifully on the rocks; likewise an herb called Larn, of a very gummy and glutinous nature, found under the tops of mountains; thirdly, a kind of cyclamen, or sow bread; fourthly, wild sage, of which there is plenty here; and some others unknown; rendering it thus a perfect balsam. This being prepared, they first imbowed the corpse, and washing it with a lixivium, made of the bark of pine trees, drying it in the sun in summer, and in a stove in winter. This was repeated very often, after which they began their unction both without and within, drying it as before. This they continued till the balsam had penetrated into the whole habit, and the muscles in all parts appeared through the contracted skin, and the body became exceeding light; after which they sewed them in the goats skins. It is observable that, in the poorer sort, to save charges, they took out the brains behind, and sewed them up in skins, with the hair on; whereas the richer sort were put up in skins so finely and exactly dressed, that they remain extremely pliant and supple to this day. Their ancient people say that they have above twenty caves of their kings and great personages, with their whole families, yet unknown to any but themselves; and which they will never discover." The same gentleman observes, "that the bodies found in Grand Canaria seem not to have been so well embalmed as those in Teneriff, as they are consumed much more, and not so entire in the different parts."

The ISLAND of PALMA.

THIS island is situated about 50 miles to the west of Teneriff, and 200 west of the continent of Africa. It lies in 29 deg. north latitude, and 18 deg. west longitude. It is about 30 miles long, 20 broad, and 70 in circumference.

On the north east part of this island is a high and spacious mountain called La Caldera, or the Cauldron, from having a hollow in it, like that on the pike of Teneriff. The summit of this hill, which is about 6 miles in circumference, is covered with verdure, and some parts of it produce excellent corn. The descent within the Cauldron, which proceeds gradually from the summit, contains a space of about 30 acres; and on the declivity of the inside are several springs that form a stream, which issues out from the extremity of the mountain. The water of this stream is exceeding unwholesome, and of little other use than, by its rapidity, turning two sugar mills that are situated at a small distance from the mountain. The middle of the Cauldron abounds with herbage, besides which there are many trees, particularly the palm, pitch-pine, laurel, lignum-rhodium, and retamas. These last, in most of the other islands, are only shrubs; but in this they grow to large trees, which have a yellow bark: the leaves of these trees are very prejudicial to the goats, as they are apt to breed stones in their bladders, which generally kill them; so that the inhabitants take all the care they can to prevent the goats from getting at them.

Besides the rivulets that spring from the inside of the Cauldron, there are two without; one of which runs east toward the town of Santa Cruz, and the other runs northward to the village of St. Andrews. These are the principal rivulets in the whole island; and the land during the course of them is more fertile than the other parts of it; but the natives supply this defect by building banks, or square reservoirs, which they fill with rain water that rushes down the mountains in the winter season.

Near the sea shore, on the south side of the island, is a medicinal well of hot water; and at a village called Ugaur is a cave, at the extremity whereof is a very curious grotto, whose roof is stuck with large flakes of slate stones, from between which constantly issues a flow of clear and wholesome water.

There are many other mountains in this island, exclusive of that called La Caldera, several of which are very long and lofty, and between them are large vallies, well stocked with various kinds of trees. These mountains occasion a great difference in the climate of this island. In the winter the air is so exceeding sharp up the mountains, that the inhabitants are obliged to keep fires burning both night and day; whereas near the sea side they only have them for cooking, and other occasional purposes. In the months of July, August, and September, the heat near the sea shore is intolerable; while, in the

mountainous,

mountainous parts, the air is quite pleasant and refreshing.

The winds and rain are much the same here as in Canaria, except those that blow from the west; and there are much more frequent, on account of the island laying more to the west and north points.

The natural productions of this island, both with respect to vegetables, poultry, and animals, are also much the same as those of Canaria; except, indeed, among the animals it particularly abounds with rabbits, which, it is said, were first brought to the island by Don Pedro Fernandes de Lago, the second lieutenant general of Teneriff.

This island also produces great quantities of sugar and wines, the former of which is made on the west side of the island, and the latter on the east. Their best vines grow in a soil called the *Brenia*, where it is said they make at least 12,000 casks of wine every year. The wines differ in their quality from those made in the other islands; but they are very rich, and have an excellent flavour. They have likewise great plenty of honey, and most kinds of fruit, the latter of which grow in such abundance, that they export great quantities of them to the other islands.

Palma also produces gum-dragon and pitch, the latter of which the natives extract from the tree called the pitch pine. Pine-apples are likewise very plentiful here; and some of the trees on which they grow are so large, as to be used for the masts of ships.

The principal town in this island is called after its name; and is tolerably large, and well inhabited. The houses are low, but spacious; and in one part of the town is a very handsome church. A considerable trade is carried on here in wines, which are exported to various parts; but particularly to the West Indies.

There is another very neat town in this island, called St. Andrew's, where there are four engines for the making of sugar; but the land hereabouts is very poor, so that the inhabitants are supplied with grain, and other necessary articles, from the island of Teneriff.

The chief port is called Palma; and is situated on the south side of the island. The road is about a quarter of a mile from the shore; and, though it is open to the easterly winds, the ships ride with great safety.

This island has heretofore been greatly subject to earthquakes and volcanos; the effects of which are still to be seen in various parts of it. Nunno de Penna, in his Historical Memoirs, relates, that on the 13th of November, 1677, a little after sun-set, the earth shook for 13 leagues, with a frightful noise that lasted five days, during which it opened in several places, but the greatest gap was upon the mountain of La Caldera, a mile and a half from the sea, from whence proceeded a great fire, which cast up stones and pieces of rock. The like happened in several places thereabout, and in less than a quarter of an hour made 28 gaps about the foot of the mountain, which vomited up abundance of flames and burning stones. He adds, that on the 20th of November following, there was a second eruption of the same mount, from whence came forth stones and fire, with great earthquakes and thunders for several days, so that black cinders were taken up at 7 leagues distance: The adjacent ground was entirely wasted, and the inhabitants forced to quit their habitations.

The last volcano that happened in this island was in the year 1750, when a large body of fire issued from one of the mountains, and took its course with great rapidity to the town of Palma; from whence it spread to the sea, and there discharged itself.

The Island of FERRO.

THIS island is called by the Spaniards Hierro, and by the French L'Isle de Fer. It is the most westerly of all the Canaries; and lies between the 27th and 28th deg. of north latitude, and in 18 deg. west longitude from London. It is about 30 miles long, 15 broad, and 75 in circumference.

According to Barbot, this island was particularly famous on account of the French navigators placing their first meridian in the center of it; as the Dutch did theirs through the pike of Teneriff; but at present most geographers reckon the first meridian from the capital of their

own country; as, the English from London, the French from Paris, &c.

The soil in some parts of this island is very barren, owing to a scarcity of water; but in others it is fertile, and produces all the necessary articles for the support of the inhabitants. There are but three springs in the whole island; so that only rain water can be had in the chief parts of it. The sheep, goats, and hogs that are brought up in those parts distant from the rivulets, feed almost all the year round on the roots of fern and asphodil, and therefore have little occasion for water; as the great moisture that is naturally in those roots supply the want of that element.

Most writers who have described this island give us a very strange account of a large tree, situated in the middle of it, which they say produces such quantities of water from its leaves, as not only to supply the general wants of the island, but also vessels that call here to trade. We cannot, however, consider this relation in any other light than absolutely fabulous; as it does not appear, from all the writers we have consulted, that there was ever any one person that saw it; and therefore imagine the story to have been originally fabricated by some traveller of a very *marvellous* disposition.

There is only one small town in the whole island, and the most distinguished building in it is a parish church. There are many small villages dispersed about it, but there is not any one of them that merits particular notice.

The trade carried on by the inhabitants of this island consists in small cattle, brandy, honey, and orchilla weed.

The Island of GOMERA.

THIS island is situated to the west of Teneriff, in 28 deg. north latitude, and 18 deg. west longitude from London. It is about 30 miles long, 20 broad, and 60 in circumference. It is a very plentiful island, being watered by many rivulets that flow from the mountainous parts, and give fertility to the valleys beneath; and indeed there is hardly any part of the island but water may be had, by digging to the depth of about six feet.

The inhabitants of this island seldom import or export any corn, as they cultivate just a sufficiency only for their own consumption. They have great plenty of all the necessaries of life, particularly cattle, poultry, wine, roots, fruit, and honey. They have deer also in great abundance, and more mules are bred here than in any other of the Canary Islands.

Gomera produces likewise great quantities of sugar, fruits, and wine; but the latter commodity is much inferior to that made in the other islands; and is so poor and weak as not to be fit for exportation. It is therefore chiefly consumed among themselves.

This island has but one small town, which is situated near the sea-shore, and is called after its name. The number of houses is about 150; but they are small, and very mean buildings. Here is a tolerable good church, and a convent of friars; and on one side of the town, next the shore, is a small fort, on the south side of which is an old round tower, and on the north side, a battery of six small cannon.

Opposite the town of Gomera is a very commodious bay, where ships are well secured from all winds, except the south-east; and the bottom of the bay also affords excellent anchorage. To the north of this bay is a good cove, where ships of any burthen may be conveniently placed for cleansing and repairing. The shore opposite to this cove is a high perpendicular cliff, over which there is a narrow path-way that leads to the town; and at a small distance before you enter the town there is a large gate, which is shut every night after dark. The town begins about fifty yards from this gate, and runs in a straight line to the distance of about half a mile.

The Island of FUERTEVENTURA.

THIS island, which belongs to the Lord of Lancelotta, is about twenty-four leagues distant from Grand Canaria. It is about 65 miles in length, and of a very unequal breadth, consisting of two peninsulas, joined by an isthmus of 12 miles over. On the north side there is a haven called Chabras, and another, which is very commodious, towards the west.

Between

Between this island and Lancerota there opens a fine bay, sufficiently big to receive a very large fleet. Towards the north east the coast is very foul, and the breakers exceedingly dangerous.

This island produces wheat, barley, kine, goats, orchel; but neither this nor Lancerota have any wine of their own growth.

In the channel which separates Fuerteventura from Lancerota, there is a little uninhabited island called Lobas, which is between three and four miles in circumference.

La Villa, the principal town, is situated in the center of the island; contains about 100 houses, and has a convent of Franciscans and a church.

The next town is Olivia, which has about 50 tolerable good houses, and a handsome church.

The town of Funche hath more houses than Olivia, and near as many as La Villa; but they are to mean that it only bears the third rank.

Besides these three towns, the island contains many small hamlets, scattered about in different parts.

As the springs are brackish, rain water is caught in pits and cisterns, for domestic uses.

The inhabitants of Fuerteventura formerly had some good horses, of the breed both of Barbary and Spain; but not having far to travel, nor caring for the expence of keeping them, the breed is much degenerated in size, as well as dwindled to a small number. The people indeed prefer asses, as they are more serviceable in the hilly parts, and can be kept at a much cheaper rate.

The great scarcity of wood, shrubs, and bushes, occasions a scarcity of birds and wild fowl. Canary birds are the only ones found in any numbers. Geese and ducks are likewise wanting, from the scarcity of water.

In this, as well as the neighbouring island of Lancerota, are the remains of many volcanos; they are hills with sharp tops, narrow edges, and hollow cavities within, which resemble monstrous chimnies, being black and burnt. No eruptions, one excepted, have been known for many ages; and that one happened about half a century ago, on the fourth west part of Lancerota. It threw out such an inconceivable quantity of fumes, ashes, sulphur, &c. and made such a terrible noise, that most of the inhabitants fled to this island for security. While the volcano continued, a pillar of smoke proceeded from the sea; and when it ceased, a rock arose out of the waves, and rearing its head in a pyramidal form, it still continues in the same position.

The Island of LANCEROTA.

THIS island lies in 28 deg. 40 min. north latitude, and 13 deg. 5 min. west longitude; and is about 32 miles in length, and 22 in breadth. It is about 18 leagues fourth-part of Grand Canaria, and the whole island is parted in the middle by a ridge of rocks, on which feed goats, sheep, and asses. Here are likewise some cattle, camels, and genners. The valleys are dry and sandy, resembling the rye fields in England; but they yield tolerable good barley and wheat: the first harvest being about April, and the second in September. The principal commodities are goats flesh and orchel, and the whole is an estate, or earldom, belonging to the family of Herrera, the head of that family being always lord of Fuerteventura and Lancerota. The people, however, in both islands have the liberty of appeal to the king's judges in Grand Canaria. Boats go from hence weekly to Grand Canaria, Teneriff, and Palma; laden chiefly with dried goats flesh, which is used in the manner of bacon, and is not bad eating.

In 1596, this island was attacked and taken by the English, under the command of Leonidas, earl of Cumberland, of which capture the following are the particulars. The earl having been informed that the Spanish nobleman, who was lord of Lancerota and Fuerteventura, resided in the chief town of Lancerota, which went by the same name as the island, and was possessed of great riches, he dispatched Sir John Berkley, being himself out of order, with about 600 men, to attack the town, which was situated to miles at least from the place where they landed.

The way they went, though in their opinion the nearest, was a very bad road, full of loose stones and sand. When

they arrived at the town they found it almost deserted by the inhabitants, who had carried off almost every thing, except a considerable quantity of wine and cheese. From hence Sir John sent a detachment to the calle, a strong hold upon the summit of a hill, half a mile from the town. It was garrisoned by about 100 Spaniards and natives, who fled at the approach of the English. They found here a dozen brass guns, and many piles of stones, laid up in the most advantageous places. The castle was built of stone, and flanked very strongly and skilfully, both for offence and defence; but with this singular contrivance, that the entrance was raised considerably from the ground, so that if they had drawn in this ladder, twenty men might have maintained it against five hundred. At that time the town itself consisted of about 100 houses, which were only one story, and in general mean. They were thatched with canes and straw, laid upon a few rafters, and a coat of clayey dirt covered the whole, which being hardened by the sun, became proof against the rains. The church was without any windows, and received light only from the door. There was a friary, prettily laid out, with a better supply of water, and a handfomer garden than those belonging to the noble governor's house. The English did not burn or destroy the place, but after ransacking a little, departed. What native inhabitants they saw were strong, active, tall, and amazingly swift of foot. Their arms were pikes and stones, with which they frequently attacked the English in their march; and their custom was, when they perceived the latter going to fire, to fall flat upon their faces, and after hearing the report, to start up, and charge in a feathered and irregular manner.

Lancerota is very high, and may be seen at a great distance, its appearance being black and barren. The principal port, which lies on the south-east side of the island, is called Porte de Naos, and the harbour is tolerably secure for small vessels: indeed it is deemed the best belonging to the Canary Islands, and is much frequented for its conveniency in repairing and cleaning ships. This port is without any town, or indeed houses, except store-houses, magazines, and barracks for soldiers. The castle at the well end of the harbour is of no consequence, as a ship of force might easily batter it down. A channel divides Lancerota from the little island called Graciota, which is uninhabited; and this channel is named the harbour of El Rio. Near this harbour is a salt-work in Lancerota, which turns to a tolerable account.

Rubicon, or Cayas, is the principal town of this island. It is about six miles from Porto de Naos, and is what was formerly called Lancerota. At present it contains about 200 houses, the appearance of which is as mean as when the Earl of Cumberland took it.

The next town, called Harla, is but a despicable place; it contains about 300 inhabitants, and has a tolerable church.

The inhabitants of this island chiefly use rain water, which is caught in pits and cisterns, adapted for that purpose, as they have but few wells or springs. The breed of horses hath dwindled and degenerated in this island, as well as in Fuerteventura; asses are preferred here as they are there, and for the same reasons. The asses indeed in both these islands are used not only for carrying burthens and riding, but for ploughing up the land; so that they are deemed of general utility.

The want of wood here occasions a want of birds, and the deficiency of water a deficiency of ducks, geese, &c. The different appearance of the cattle, at the different seasons of the year, is very singular; for during the verdure of the spring they are plump, fat, and sleek; but in autumn, when the grass and herbage are withered by the heat of the sun, they resemble skeletons, have scarce spirits to work, and their flesh is unfit to eat. Neither Lancerota nor Fuerteventura have any venomous creature, except the black spider; this, however, is sufficient to terrify the people, as its sting is extremely painful, and very dangerous. The seas interlocking and surrounding these islands, afford the inhabitants plenty of fish, particularly cod, much finer than what is caught on the banks of Newfoundland, and a very singular fish called the picudo, or sea-pike, the bite of which is as venomous as that of a viper; yet when dressed, it is pleasant and wholesome food.

General Observations on the modern Inhabitants of the CANARY ISLANDS.

HAVING finished the description of the Canary Islands severally, and taken notice of all that is worthy of observation, with respect to locality, or to their ancient natives, it is now necessary to speak generally of the modern inhabitants, who are a kind of mongrel breed, formed by the intermixture of Spaniards and people of various other nations, with the remnants of the ancient natives. The greatest part of these are small of stature, well made, and have good features. Their complexions are very swarthy, their eyes full of fire, and their countenances exceeding expressive: they are fond of calling themselves Spaniards, and speak the Castilian language; the better sort of people with a good grace, but the vulgar very unintelligibly.

Men of condition in common wear a camblet cloak, of a dark red, or black colour; a linen night-cap, bordered with lace; and a broad slouched hat. When they pay visits, a coat, sword, and white peruke are added; which latter makes a very strange appearance with their dark countenances; and what is still more singular, they keep their great heavy slouched hats upon their heads always in the house; but when they are out of doors, they carry it under the arm.

The peasants wear their own black bushy hair, and tuck some of it behind the right ear; and their principal garment is a white loose coat, made in the manner of a French loose coat, with a friar's cape, and girded round the middle with a sash.

The women wear on their heads a piece of gauze, which falls down the shoulders, is pinned under the chin, and covers the neck and breast. A part of their dress is a broad brimmed slouched hat, but they use this with more propriety than the men; for abroad they wear it upon their heads, and for their faces are shielded from the scorching beams of the sun. Over the shoulders a mantle is thrown, its goodness being in proportion to the condition of the wearer. Jackets are worn instead of stays; but all are very fond of a great number of petticoats. The principal ladies of Grand Canaria and Teneriff dress after the fashions of France and England, and pay visits in chariots; but none walk the streets without being veiled, though some are so careless in the use of their veils, that they take care to let their faces and necks be seen. Some ladies have their hair curiously plaited, and fastened to the crown of the head with a gold comb; their mantles are very rich, and they wear a profusion of jewels; but the clumsiness of dress, and awkwardness of gait, observable in both sexes, render their appearance ridiculous to strangers.

The lower people are afflicted with many noxious disorders, and are naturally very filthy; the gentry, however, affect great delicacy. Both sexes go every morning to hear mass: most go before they take any refreshment. Their breakfast is usually chocolate: they dine at noon, and shut up the doors till three o'clock. People in good circumstances have four courses brought to table; the first is soup, the second roast meat, the third an olio, and the fourth the desert. While drinking, their toasts are much like ours; but they cease drinking as soon as the cloth is removed. After dinner all the company wash their hands in one large utensil, and then go to sleep for about an hour. In winter evenings they regale with chocolate and sweetmeats; but in summer fine spring water is substituted instead of chocolate.

The beds of the people in general are mattresses, spread on mats, and placed upon the floor. The sheets, pillows, quilt, &c. are fringed or pinked; but no curtains are used, as they deem them the harbours for fleas and bugs. The women sit upon cushions, on a raised part of the floor, either when they receive, or when they pay visits. The children are instructed in convents, and usually make a rapid progress; for it must be confessed, that the people have a quick genius, particularly for poetry. The common amusements are singing, dancing, playing on the guitar, cards, wrestling, quoits, throwing at ball through a ring at a distance, &c. They take an airing on horseback, but travel with asses.

Each of the Canary Islands, as well as each town and family, hath its peculiar titular saint; and the festivals of these saints are kept with great solemnity. The people in general hold the employments of a butcher, taylor, miller and porter, in the utmost contempt; and the officers

of justice have a right to seize upon a person of any of these employments, when a criminal is put to death, and make him perform the office of executioner. For their hatred to these four employments, they give the following reasons:

A { Butcher } is Barbarous
 { Taylor } is Effeminate
 { Miller } is A Thief
 { Porter } is A human beast of burthen.

In the principal of these islands, the gentry, though proud, are polite; the lower people, though poor, are mannerly; and even beggars ask charity with a good grace; and if refused, never behave with impertinence.

Private pilfering is very common here; but highway and street robberies are seldom or ever known. The only consequence of robbery, however, is a sound drubbing, or a short imprisonment. Duels are never heard of, but private murders are common; which evinces that the people have more malice than courage. The inhabitants of the Canary Islands in general are temperate: or at least if they are otherwise, it is in private only; for nothing can be a greater stain there than to be seen drunk, and a man who can be proved a drunkard is not admitted to take his oath in any court of judicature. Hence those who are fond of liquor intoxicate themselves in their chambers, and then lie down, in order to sleep themselves sober.

If a man falls in love with a young woman, and her parents refuse to consent to their union, she has liberty to complain to the curate of the parish, who takes her away, and places her in a convent; where she must remain till they consent to her marriage.

What we have hitherto said concerning the modern inhabitants of the Canary Islands, must be confined to the people of Grand Canaria, Teneriff, Palma, Ferro, and Gomera, only; as the natives of Puerteventura and Lanzarote differ in several particulars; for they are tall, strong, robust, and of a very dark complexion; and the other Canarians deem them rude and unpolished with respect to themselves; they speak a barbarous kind of the Castilian, and dress like mean Spanish peasants. Their houses are built of stone and lime, covered with paniles for the better sort of people; but only thatched for the meaner; and the floors are paved with flag stones. Their diet is as mean as their habitations: they hate improvements, because they deem them innovations; and have so little curiosity, that none will visit Spain, if they can help it; and very few of the Canary Islands, unless obliged so to do by business.

The principal manufactures of all these islands are silk hose, and silk garters, knit; quilts, taffettes, blankets, coarse cloths, &c. In the large towns men are weavers and taylors; but in the villages women only; and the exportation of raw silk is prohibited, in order to encourage the manufactories.

The commerce of the Canaries may be considered under five heads, viz.

The { Domestic trade with each other, and from Island to Island.
 { Trade to Europe.
 { Spanish West Indies.
 { English Colonies in America.
 { Coast of Barbary.

The center of trade here is Teneriff, where the English and Dutch have consuls. The principal commerce is carried on in foreign bottoms, particularly English; and the most capital traders are Irish Roman catholics, and their descendants settled here.

The various imports are:

From Great Britain { Woollen goods, hardware, hats, red herrings, pilchards, wheat, &c.
 From Ireland { Butter, Candles, pickled Pork, pickled herrings, &c.
 From Holland and { Gunpowder, cordage, coarse flax, &c.
 and Hamburg { Bar Iron.
 From the British { Dried cod, rice, beef, pork, hams, American Colonies { bees wax, deal boards, staves, wheat, flour, maize, &c.
 From Barcelona, Seville, Majorca, Italy and Cadiz { Silks, Velvets, Oils, Cordage, &c.

In return for these they export their various commodities and manufactures to the several countries from which they receive their imports.

C H A P. XX.

3. Cape de Verd ISLANDS.

THESE islands are so called from a cape of the same name, situated directly opposite to them, in 14 deg. 10 min. north lat. and 16 deg. 30 min. west long. They were discovered by the Portuguese, in the year 1462, to whom they have ever since belonged, and a viceroy, appointed by his Portuguese majesty, constantly resides in the island of St. Jago. The cape took its name from the perpetual verdure with which it is covered, and the islands received theirs from the cape. The Portuguese give them the name of las Ilhas de Verdes, either from the verdure of the cape, or else from an herb called fargosso, which is green, and floats on the water all round them.

These islands cover the sea, from the 20th to the 24th degree, so thick, that they seem to be floating islands, intended to obstruct the passage of ships, it not being easy, without a strong gale, to pass through them. The Dutch call them the Salt Islands, from many of them producing large quantities of that commodity.

The chief of these islands are eleven in number,

namely,	
May, or Mayo.	St. John, or San Juan.
San Jago, or St. James's.	St. Nicholas.
Sal, or Salt.	St. Vincent.
Bona Vista, or Good Sight	St. Anthony.
St. Philip's, otherwise call-	St. Lucia.
ed Fuego, or the Isle of	
Fire.	

The climate of these islands is exceeding hot, and in some of them unwholesome. The soil differs with the climate: for though several of them are very stony and barren, yet the principal part are fertile, and produce various sorts of grain and fruits, particularly rice, maize, or Indian wheat, bananas, lemons, citrons, oranges, pomegranates, cocoa-nuts, figs and melons. They have also calavanes, a sort of pulse like French beans, and great quantities of pumpkins, which form the common food of the inhabitants.

Besides the fruits already mentioned, these islands produce two others of a remarkable nature, viz. the custard apple and the papah. The former of these is as large as a pomegranate, and much of the same colour. The outside husk, shell or rind, is in substance and thickness between the shell of a pomegranate, and the peel of a sweet orange, softer than the former, yet more brittle than the latter. The coat, or rind is also remarkable for being covered with small regular knobs or risings; and the inside of the fruit is full of a white soft pulp, which in its form, colour and taste, greatly resembles a custard, from whence it received its name, which was probably first given it by the Europeans. It has in the middle a few small black stones, but no core, for the whole of it is entire pulp. The tree that bears this fruit is about the size of a quince-tree, and has long slender branches that spread a considerable way from the trunk. The fruit grows at the extremity of these branches, upon a stalk about nine or ten inches long. It is to be observed that only some of these branches bear fruit, for though these trees are large, yet in general each tree does not produce above 20 or 30 apples.

The papah is a fruit about the size of a musk-melon, and resembles it in shape and colour, both within and without; only in the middle, instead of flat kernels, which the melons have, these have a quantity of small blackish seeds, about the size of pepper-corns, the taste of which is much the same as that spice. The fruit itself, when ripe, is sweet, soft, and luscious; but while green, it is hard and unpalatable, though even then, if boiled, it will supply the place of turnips, and is in general greatly admired. The tree on which this fruit

grows, is about 10 or 12 feet high; the trunk is thickest at the bottom, from whence it gradually decreases to the top, where it is very thin and taper. It has not any small branches, but only large leaves that grow immediately on the stalks from the body. The leaves are of a roundish form, and jagged about the edges, having their stalks or stumps larger or smaller, as they grow nearer to, or farther from the top. They begin to spring out of the body of the tree at about six or seven feet high from the ground, the trunk being below that entirely bare, and the leaves grow thicker all the way from thence to the top, where they are very close and broad. The fruit grows only among the leaves, and are most plentiful where the leaves are thickest; so that towards the top of the tree the papahs spring forth from it in clusters. However, it is to be observed that where they grow so thick, they are but small, being no bigger than ordinary turnips, whereas those that grow lower down the trunk, where the leaves are not so thick, grow to the size above described.

The Cape de Verd Islands also abound with several sorts of poultry, particularly curlews, Guinea hens, and flamingos, the latter of which are exceeding numerous. The flamingo is a large bird, much like a heron in shape, but bigger and of a reddish colour. They go in flocks, but are so shy that it is very difficult to catch them. They build their nests in shallow ponds, where there is much mud, which they scrape together, making little hillocks like small islands, that appear about a foot and a half above the surface of the water. They make the foundations of these hillocks broad, bringing them up taper to the top, where they leave a small hollow pit to lay their eggs in. They never lay more than two eggs, and seldom less. The young ones cannot fly till they are almost full grown; but they run with prodigious swiftness. Their flesh is lean and of a dingy colour, but it neither tastes fishy, or any way unpleasant. Their tongues are broad and long, having a large lump of fat at the root, which is delicious in its taste, and so greatly admired that a dish of them will produce a very considerable sum of money.

They have also several other sorts of fowls, as pigeons and turtle-doves; miniotas, a sort of land fowl as big as crows, of a grey colour, and the flesh well tasted; crusas, another sort of grey-coloured fowl, almost as large as the former; these are only seen in the night, and their flesh is said to be exceeding salutary to people in a decline, by whom only they are used. Here are likewise great plenty of partridges, quails, and other small birds; as also prodigious quantities of rabbits.

They have many wild animals in these islands, particularly lions, tygers, and camels, the latter of which are remarkably large. There are also great numbers of monkeys, baboons, and civit cats, and most of the islands abound with various reptiles. The tame animals are, horses, asses, sheep, mules, cows, goats and hogs; and here the European ships, bound for the East Indies, usually stop to take in fresh water and provisions, with which they are supplied in great abundance.

The sea is plentifully stocked with fish of various sorts, particularly dolphins, bonettas, mullets, snappers, silver fish, &c. And there is such plenty of turtle here, that several foreign ships come yearly to catch them. In the wet season the turtles go ashore to lay their eggs in the sand, which they leave to be hatched by the heat of the sun. The inhabitants go out in the night, and catch the turtles by turning them on their backs with poles; for they are so large that they cannot do it with their hands. The flesh of the turtles, well cured, is as great a supply to the American plantations, as cod-fish is to Europe.

There are many European families in these islands, all of whom profess the Roman Catholic religion. The natives are all negroes, and much like their African neighbours, from whom it is supposed they are descended; though being subject to the Portuguese, they have their religion and language. Both men and women are stout, lily, and well limbed; and they are in general of a civil and quiet disposition. Their dress (particularly those of the island of St. John) is very trifling, consisting only of a piece of cotton cloth wound round the waist. The women sometimes throw it over the head, and the men across the shoulders. Neither sex wear shoes or stockings, except on certain festivals. The men are particularly fond of wearing breeches, if they can get them; and are very happy, be they ever so ragged, so that they have but a waistband and a flap before.

Having thus taken notice of the general matters relative to these islands, we shall now describe the respective particulars belonging to each, beginning with

The Island of MAY, or MAYO.

THIS island is situated in 15 deg. north latitude, and 22 deg. west longitude from London. It is about seven leagues in circumference, of a roundish form, and has several small rocky points that shoot out from it into the sea. On the island are two hills of a considerable height, one of which is flat at the top; but the other terminates with a point, and is very dangerous to ascend. The rest of the island is for the most part level, and a tolerable height from the sea. The soil is in general very dry and barren, owing to the want of water. There is but one small spring in the whole island, which is situated about the center of it, and from whence proceeds a stream of water that runs through a valley between the hills.

From the natural barrenness of the soil there are but few trees here, and those chiefly within the island. Near the sea are some shrubs, which produce a sort of silk cotton; the shrubs are about four feet high, and the cotton grows in pods as large as an apple, but of a long shape, which, when ripe, open at one end, parting leisurely into four quarters. This cotton is of very little value, and is therefore used only for the stuffing of pillows, or other purposes equally trifling. Near the shore are also some bushes of the right cotton shrub, but the greatest quantity of them are planted in the middle of the island, and are carefully attended to by the inhabitants, cotton cloth being their chief manufacture.

On the west side of the island is a bay, and a sand bank that runs two or three miles along the shore, within which there is a large salina, or salt pond, encompassed by the sand bank and the hills beyond it. The whole salt-pond is about two miles in length, and half a mile wide; but the greater part of it is generally dry. The north end, which is always supplied with water, produces salt from November till May, those months being the dry season of the year. The waters that yield this salt work out of the sea through a hole in the sand bank, and the quantity that flows into it is in proportion to the height of the tides; in the common course it is very gentle, but when the spring tides arise, it is supplied in abundance. If there is any fall in the pond, when the flush of water comes in, it soon dissolves; but in two or three days after it begins to congeal, and so continues till a fresh supply of water comes in again from the sea.

The English carry on a considerable trade here for salt, and the armed ships destined to secure the African commerce, afford the vessels thus engaged their protection. The inhabitants of the island are principally employed in this business during the season; they rake it together, and wheel it out of the pond in barrows, from whence they convey it to the sea side on the backs of asses, those animals being here in great abundance. The pond is not above half a mile from the landing-place, so that they go backwards and forwards many times in the day; but they generally restrain themselves to a certain number.

The chief fruits that grow in this island are figs and water-melons: there are also plenty of calavanes and pumpkins, which are the ordinary food of the inhabitants. They have likewise several sorts of fowl, particularly flamingos, curlews, and Guinea-hens; and their chief cattle are, cows, goats and hogs.

The inhabitants live in three small towns, the principal of which is called Pimote, and contains two

churches, with as many priests: the second is called St. John, and has one church, and the third, which has a church also, is called Lagoa. The houses are very mean, small and low: they are built with the fig-tree (that being the only one, fit for the purpose, that grows on the island) and the rafters are made with a sort of wild cane.

The negro governor of this island has his patent from the Portuguese governor of St. Jago; his situation is tolerably advantageous, as every commander that sails salt here, is obliged to compliment him with a present. He spends most of his time with the English in the salting season, which is his harvest; and indeed all the islanders are at that time fully employed. These people have not any vessels of their own, nor do any Portuguese ships come hither, so that the English are the chief on whom they depend for trade; and though they are subjects of Portugal, yet they have a particular esteem for the English nation. Alms are also here a great commodity of trade, they being so plentiful, that several European ships come annually to freight with them, which they carry to Barbadoes, and other plantations.

SAN JAGO, or ST. JAMES'S ISLAND.

THIS island is situated about four leagues to the westward of Mayo, between the 15th and 16th degree of north latitude, and in the 23d of west longitude. It is very mountainous, and has a great deal of barren land in it; notwithstanding which it is the most fruitful and best inhabited of all the Cape de Verd Islands.

The capital town of this island is called after its name, and is situated in 15 degrees north latitude. It stands against the sides of two mountains, between which there is a deep valley 200 yards wide, that runs within a quarter of a mile of the sea. In that part of the valley next the sea is a straggling street, with houses on each side, and a rivulet of water in the bottom, which empties itself into a fine small cove or sandy bay, where the sea is generally very fresh, so that ships ride there with great safety. Near the landing-place from this bay is a small fort, where a garrison is constantly kept, and near it is a battery mounted with a few small cannon. The town contains about 300 houses, all built of rough stone; and it has one small church and a convent.

The inhabitants of this town are in general very poor, having but little trade. Their chief manufacture is striped cotton cloth, which the Portuguese ships purchase of them in their way to Brazil, in return for which they supply them with several European commodities.

On the east side of the island is a tolerable large town, called Praya, where there is a good port; which, especially in peaceable times, is seldom without ships. At this port most of the European ships, bound to the East Indies, touch, to take in water and provisions, but they seldom stop on their return to Europe. When the European ships are here, the country people bring down their commodities to sell to the seamen and passengers; these generally consist of bullocks, hogs, goats, fowls, eggs, plantanes, and cocoa-nuts, which they exchange for shirts, drawers, handkerchiefs, hats, waistcoats, breeches, and any kind of linen. The town of Praya is but small, and does not contain any remarkable building except a fort, situated on the top of a hill, which commands the harbour.

The natives of this town and St. Jago are, in general, black, or, at least, of a mixed colour, except some few of the better sort that reside in the latter, among whom are the governor, the bishop, and some of the padres or priests. The people about Praya are naturally of a thievish disposition, so that strangers, who deal with them, must be very careful, for, if they see an opportunity, they will steal their goods and run away. Those of St. Jago town, living under the governor's eye, are more orderly, though generally very poor, having but little trade.

The Island of SAL, or SALT.

THIS island received its name from the great quantity of salt naturally produced here from sea-water. It is the windermost of all the Cape de Verd Islands, and lies in 17 degrees north latitude, and five deg. 18 min. west longitude, from the Cape. It is mostly low land, having only five hills, and stretches, from north to south,

fourth, about eight or nine leagues, but its breadth does not exceed one league and a half.

This island is exceeding barren, and almost uninhabited, there being only a few people that live in wretched huts near the sea side, whose business is to gather the salt for those ships that occasionally call here for that article. It was formerly well stocked with goats, cows, and asses, but now there are only a few of the former, which is the principal food of its miserable inhabitants.

Capt. Roberts, who landed in this island, relates the following story, which, he says, he was told by one of the blacks that then resided here. "About the year 1705, says he, not long before I went ashore, the island was entirely deserted for want of rain, by all its inhabitants, except one old man that resolved to die on it, which he did the same year. The drought had been so extreme for some time, that most of the cows and goats died for want of sustenance; but, rain falling, they increased apace, till, about three years afterwards, they were again reduced by an odd accident. A French ship coming to fish for turtle, by stress of weather, or some other means, left behind her 30 blacks, which she had brought from St. Antonio to carry on the fishing. These people, finding nothing else, fed mostly on wild goats, till they had destroyed them all but two, one male, and the other female; these were then on the island, and kept generally upon one mountain. A short time after, an English ship (bound for the island of St. Mayo) perceiving the smoke of several fires, sent their boat on shore, and, thinking they might be some ship's company wrecked on the island, put in there; when they understood the situation of the people, they commiserated their case, took them all in, and set them on their own island."

The island of Sal does not at this time produce any kind of vegetable, except a few small shrubby bushes that grow by the sea side; neither has it any kind of animals, except goats, which are so poor as to be almost useless.

On the fourth west side of the island is a small port, near which there is a trifling island, with a sand bank, in a kind of bay; and a little farther to the southward is a safe road for ships.

On the shore of this island are found great quantities of turtle, some of which are exceeding large; there is also abundance of land crabs, and the sea abounds with various kinds of fish.

BOVA VISTA, or GOOD SIGHT.

THIS island is situated in 16 deg. 10 min. north latitude, and 5 deg. 14 min. west lon. from the Cape; and is so called on account of its being the first that the Portuguese discovered of these islands. Its length is not certainly known, but it is supposed to be about 60 miles in circumference. On the north coast of this island is a ledge of white rocks, and the eastern coast is bounded by sandy downs; but, within land, the country is in general very mountainous. On the fourth west side of it is a good road and harbour, where ships may anchor in five to 16 fathom water, on a sandy bottom.

This island produces great quantities of indigo, and more cotton than all the Cape de Verd Islands besides; yet it is a difficult matter to get a supply of it: for the men are so indolent, that they will not gather the cotton till a ship is arrived to purchase it; nor will the women spin it till absolute necessity obliges them.

The natives of this island are particularly fond of the English, whom they greatly endeavour to imitate; and the men generally dress after the European fashion. When they have an opportunity they buy cloaths of the English; and these they greatly prefer to their own, though made as near as possible after the same fashion.

St. PHILIP, otherwise called FUEGO, or the ISLE of FIRE.

THIS island is situated in 15 deg. 29 min. north latitude, and 6 deg. 54 min. west from the Cape. It received its second name from a very large mountain, which frequently emits great quantities of fire and sulphur. It is the highest of all the Cape de Verd Islands, and, at a distance, appears like one continued mountain. On the west side of it there is a road for shipping, near a small caille situated at the foot of a mountain; but the harbour is not safe on account of the violent breaking of the

waves. The wind blows very strong round this island, and the shore being on a flant, the water is very deep; so that no ground is to be found with the lines, except just next the caille.

This island is very deficient of water, there not being a single running-brook throughout it; notwithstanding which it is tolerably fertile, and produces great quantities of pompions, water-melons, seshoons and maize, but no bananas or plantanes, and scarce any fruit-trees, except wild figs: in some of their gardens, however, they have guava trees, oranges, lemons and limes. They have likewise some good vineyards; but they make no more wine than what will just serve for their own consumption.

The principal inhabitants of this island are negroes, there not being above one white to an hundred blacks. They are all Roman catholics, though some of them intermix with that religion many pagan superstitions. They make cotton cloths for their own use, and breed great numbers of mules, which they sell to other nations.

When the Portuguese first came to people this island, they brought with them negro-slaves, and a flock of cows, horses, asses and hogs; but the king himself furnished the place with goats, which ran wild in the mountains. There are many of the latter animals here at this time, and the profits of their skins is referred to the crown of Portugal. The person who has the management of this revenue is called captain of the mountains, nor dare any person kill one of them without his licence.

The ISLAND of St. JOHN, or SAN JUAN.

THE island of St. John is situated in 15 deg. 25 min. north lat. and seven deg. two min. west lon. from Cape de Verd. The land of this island is exceeding high, the hills rising pyramidally one above the other. It abounds in pompions, water-melons, potatoes, bananas, maize, seshoons, cows, horses, asses, hogs, &c. Hunting, or killing of goats are privileges belonging peculiarly to the governor only, and none are permitted to keep hunting-dogs except the governor, and the caudadors, who are licensed by the governor; these precautions having been taken in order to preserve the breed. When the governor is disposed to make a hunt, all the hunters and hunting-dogs are assembled; and, after the chase, being again met together, the governor parts some of the venison among them as he pleases, sending home the rest in order to distribute it among the old, infirm, and necessitous.

The island of St. John abounds with saltpetre more than any other of the Cape de Verd Islands: it grows in caves, covering the inside like a thick hoar frost, and in some places like icicles. Captain Roberts tells us, it is his opinion that this abounds with copper, and perhaps with finer metals, for which he gives his reasons; he observes, that there are several acid fountains, of a vitriolic quality, which he tried by putting a clean knife into them; and, in about half a minute, it would be all covered with copper, nearly of a gold colour, very thick, and, when dry, it might be scraped off in scales or powder. Some of these waters had a much stronger power than others, and their acidity diminished in proportion to their distance from the fountain-head. Many are found of a dark blue, black and reddish colour, some of which exceed iron in weight, and nearly equal lead in gravity.

The seas about St. John abound with fish, and the principal employment amongst the natives is fishing; hence they miss no opportunities of wrecks, or, when ships touch there, to procure all the bits of iron they can. Most of the fish here have remarkable large sharp teeth; and the baits used are generally crabs and insects.

The salt here is made by the heat of the sun, which, shining on the water in the holes of the rocks, is thereby tunned, and sometimes lies two feet thick.

The natives usually go and get a quantity of salt early in the morning, fish the greatest part of the day, dry, split, and salt their fish in the evenings, and, having heaped them up, let them lie in the salt all night. On the ensuing morning they spread them out to dry in the sun, and then they are fit to use whenever wanted. The baleas, a sort of whale or grampus, is very common near this island; and some affirm, that ambergris is the

form of this creature. A great quantity of ambergris was formerly found about this island, but it is less plentiful at present. Captain Roberts says, that some years before he was there, Juan Carneira, a Portuguese, who was banished from Lisbon for some crime, having procured a little sloop or shallop, traded among these islands; meeting, at length, with a piece of ambergris of an uncommon bigness, he not only procured his liberty, and leave to return before the term of his exile was expired, but had sufficient left, after defraying all charges, to put himself into an eligible way of living; and a rock near to which he found the ambergris is, to this day, called by his name.

The natives do not amount to above 200 souls, they are quite black, and the most innocent and harmless, as well as ignorant and superstitious of any of the inhabitants of the Cape de Verd islands. They are humble, charitable, humane and hospitable; pay a particular respect to their equals, reverence their elders, dutiful to their parents, and submissive to their superiors.

The Island of St. Nicholas.

THE island of St. Nicholas is about 45 miles distant from the island of Salt, the north west point being in 17 deg. 10 min. north lat. and west lon. from Cape de Verd, six deg. 52 min. It is the largest of all the Cape de Verd islands, St. Jago excepted. The land is high, and rises like a sugar-loaf, but the summit of the most elevated part is flat. The coast of this island is entirely clear from rocks and shoals. The bay of Paraghisi is very safe, but the other roads are insecure till the trade-winds are settled. There is a valley in this island which has a fine spring of water in it, and many persons employ themselves in supplying different parts with that useful fluid, with which they load asses, and carry it a considerable way at a cheap rate. Water may likewise be obtained by digging a well in almost any part of the island.

The chief town, or indeed the only place worthy of that name, is the town of St. Nicholas, which is close built and populous; but all the houses, and even the church, are covered with thatch. The celebrated pirate, Captain Avery, having once received some offence from the inhabitants, burnt this town; but it was afterwards built again, much in the same manner, and to the same extent.

The inhabitants of St. Nicholas are nearly black, with frizzled hair; they speak the Portuguese language tolerably well, but are thievish and blood-thirsty. The women here are more ingenious, and better housewives, than in any other of the Cape de Verd islands. Most families have horses, hogs and poultry, and many of the people of St. Nicholas understand the art of boat-building, in which the inhabitants of the other islands are deficient. They likewise make good cloths, and even cloaths, being tolerable taylor, manufacture cotton quilts, knit cotton stockings, tan leather, and make good shoes.

St. Nicholas abounds in oranges, lemons, plantains, bananas, pumpions, milk, water-melons, sugar-canes, vines, gum-dragons, fishoons, maize, &c. The people are strong Roman catholics, but their dispositions are forabolinate, that their priests have enough to do to rule them.

The Island of St. Vincent.

St. Vincent is about 43 leagues distant from the isle of Salt, to the west, inclining a little northwards, and two leagues to the west of St. Lucia, under the 18th degree of north latitude. It is five leagues in length. On the

north-west side of it there is a bay, a league and a half broad at the entrance, surrounded with high mountains, and stretching to the middle of the island. This bay is sheltered from the westerly and north-westerly winds by the high mountains of the isle of St. Vincent. So that this is the safest harbour of any in all these islands. And yet it is of difficult access, because of the furious winds that blow with the utmost impetuosity from the mountains along the coast. There are several other small bays on the south side of the island, where ships may anchor, and thither the Portuguese generally go to load hides. There is also in a valley fresh water, which is sent to spout out of the ground where one digs a little. The south-east side of this island is a sandy shore, but there is not a drop of water on the hills, no, even in the deep valleys.

The Island of St. Anthony.

St. Anthony is the most northward of all the Cape de Verd islands, and lies under the 18th degree of north lat. seven miles from St. Vincent, with a channel between them, which runs from south-west to north east. Here are, in this island, two high mountains, one of which is nearly as high as the Pike of Teneriff, and seems always enveloped in clouds. The inhabitants are about 500 in number, and, on the north-west side of the island, there is a little village consisting of about twenty houses or cottages, and inhabited by near fifty families of negroes and white people, who are all wretchedly poor, and speak the Portuguese language. On the north side there is a road for shipping, and a collection of water in a plain lying between high mountains, the water running from all sides in the rainy season; but, in the dry season, the people are greatly distressed for water. The principal people here are a governor, a captain, a priest, and a school-master, who all take much upon themselves, so that the people have a jingling saying, which implies, that

The governor makes us all beggars,

The priest advises and prays,

The captain swears and swaggers,

The school-master flogs and flays,

But the governor's staff, and the beads of the priest,

The school-master's rod, and the captain's sword,

Assist but their masters on us to feast,

For we are the slaves that must add to their hoard.

The Island of St. Lucia.

St. Lucia lies in lat. 17, 18, north; it is high land, full of hills, and is about eight or nine leagues long. On the south-east end of it are two small isles, very near each other. On the east-south-east side is the harbour, where the shore is of white sand; here lies a small island, round which there is a very good bottom for anchoring; and there is a very good road over-against the island of St. Vincent, where ships may anchor in 20 fathoms water.

The Island of Brava.

BRAVA, or the savage, or desert island, is about four leagues to the south-west of Fuego; there are two or three small islands to the north of it. On the west side of it there is a very commodious road for such ships as want to get water. The best harbour lies on the south-east side of the island, where ships may anchor next to the shore in 15 fathoms water. There is an hermitage and a hamlet just above the harbour.

C H A P. XXI.

The Island of G O R E E.

NEAR the continent of Africa, in 14 deg. 30 min. north lat. and 17 deg. 20 west long. lies the island of Goree, the only European settlement between the rivers Gambia and Senegal. Being but a small distance from the shore, it forms an excellent road for shipping, and is surrounded by rocks, every where inaccessible, except at a little creek, 120 fathoms broad, and 60 fathoms long, inclosed between two points of sand, one of which is pretty high, and called the Point of the Burying Ground; the other is lower, and before it lies a sand bank, over which the sea beats with great fury. All round this island there is good anchoring, and particularly in the before-mentioned creek, between which and the land, ships may ride in perfect security from the most dangerous seas. This island was yielded to the Dutch in the year 1617, by the king of Cape Verd, and they built a strong fort upon the north-west part of it. But that fort not being sufficient to prevent an enemy's landing in the creek, they erected another to secure the warehouses. It was taken by the English in 1663, and retaken by the Dutch soon after. The latter, however, did not keep it long; for the French conquered it in 1677: after which they, thought proper to rebuild them, and to maintain the island as a place of consequence. It was, however, taken from them in the late war, together with Fort Senegal; of both which captures we shall give a circumstantial account, since they are so intimately blended together as not to be related singly, without obscuring the whole.

A scheme being formed by Mr. Cumming, a sensible quaker, for attacking the French settlements on the coast of Africa, the ministry determined to carry it into execution.

Mr. Cumming, as a private merchant, had made a voyage to Portenderick, an adjoining part of the coast, and contracted a personal acquaintance with Amir, the Moorish king of Legibelli, whom he found extremely well disposed towards the subjects of Great Britain, preferring them, on every occasion to all other European nations; which had exasperated the French against him, that he declared he should never be easy till they were extirpated from the place. Just at that time he had declared war against them, and used often to wish that the king of Great Britain would send out an armament to reduce Fort Lewis and Goree, which the French had erected to defend their factories on that coast, with some ships of force to protect the traders; promising, in such a case, to join his Britannic Majesty's forces, and indulge his subjects with an exclusive commerce. At his return to England, Mr. Cumming informed the government of the great advantages which would accrue to the nation from such an attempt. It was, however, taken very little notice of at that time; but at length all difficulties being overcome, a small squadron was equipped for this expedition, under the command of captain Marth, having on board a body of marines, commanded by major Mason, with a detachment of artillery, ten pieces of cannon, eight mortars, and a considerable quantity of warlike stores and ammunition. Captain Walker was appointed engineer, and Mr. Cumming was concerned as a principal director and promoter of the expedition. In the beginning of March 1758, this little armament sailed, and in their passage touched at the island of Teneriff; and while the ships were taking in the wine and water, Mr. Cumming proceeded in the Swan sloop to Portenderick, charged with a letter of credence to his old friend, the king of that country. But on his arrival he had the mortification to find this prince engaged in a new war with a neighbouring nation, and at that time heading his army at a very considerable distance from his capital. One of the chiefs, however, dispatched a messenger to the king, with advice of Mr. Cumming's arrival and design; declaring at the same time, that he would use the utmost

expedition in assembling three hundred warriors to join the English troops, adding, that he was persuaded the king would send a detachment from his army to reinforce them.

Captain Marth, with the rest of the armament, had by this time arrived at Portenderick, and without waiting for the Indian forces, which were not yet ready, they sailed again on the twenty-second of April, and the next day, at four in the afternoon, discovered the French flag flying upon Fort Louis. Captain Marth having taken a large Dutch ship, richly laden with guns, which lay without the bar, came to an anchor in Senegal road, at the mouth of the river, where he perceived the enemy had posted several armed sloops to defend the passage of the bar, which is extremely dangerous. The captain, however, immediately prepared for landing. All the boats of the fleet were employed to carry the stores into the small craft, notwithstanding the enemy's vessels kept firing on them. As soon as every thing was ready, and the channel discovered, the ships weighed anchor; and at that instant the wind, which generally blows down the river, veering about, captain Miller, in the London-bus, seized the opportunity, and passing the bar with a full sail, cast anchor on the inside, where he lay all night exposed to the whole fire of the enemy. Next morning he was joined by the other small vessels, upon which a regular engagement ensued, and was warmly supported on both sides. At last the bullets and one of the small vessels running a-ground immediately bulged, and were filled with water. This misfortune obliged the troops they contained to take to their boats, and with great difficulty they reached the shore, where they formed in a body, and were soon after joined by their companions from the other vessels; so that the whole now amounted to three hundred and ninety marines, besides the detachment of artillery. Expecting to be attacked by the natives who lined the shore at some distance, as it resolved to oppose the descent, they threw up an intrenchment, and began to disembark the stores, great part of which lay under water. While they were thus employed, the negroes came down in great numbers, and submitted to them; and on the following day, they were reinforced by three hundred and fifty seamen, who passed the bar in sloops, with their ensigns and colours flying.

Their intention was to make an immediate attack on Fort Louis, but this design was prevented by the arrival of two French deputies at the intrenchment, with proposals from the governor for a capitulation. A short time being passed in deliberations, it was agreed, That all the white people belonging to the French company at Senegal should be safely conducted to France in an English vessel, without being deprived of their private effects: that all the merchandise and unaccounted treasure should be delivered up to the victors: that all the forts, store-houses, vessels, arms, provisions, and every article belonging to the company in that river, should be put into the hands of the English immediately after the capitulation should be signed: that the free natives living at Fort Louis should remain in quiet possession of their effects, and in the free exercise of their religion; and that all negroes, mulattoes, and others, who could prove themselves free, should be at their option either to remain in the place, or remove to any other part of the country.

The captains Campbell and Walker were immediately sent up the river with a flag of truce, to see the articles signed and executed. Having rowed towards a battery on the point of the island, they lay upon their oars near an hour, beating the chamade; but not the least notice was taken of their approach. Being at a loss to account for this strange conduct, they returned to their intrenchment, where they learned that the negroes on the island were in arms, and blocked up the French in Fort Louis, resolving

to defend the place to the last extremity, unless they were included in the capitulation. The governor signified this circumstance, in a letter to the English commander, telling him at the same time, that unless the French director-general should be allowed to remain with the natives, as a surety for the performance of that article of the capitulation in which they were concerned, they would suffer themselves to be cut in pieces rather than submit.

This request being readily granted, the English forces began their march for Fort Louis, accompanied by a number of long-boats, in which the artillery and stores had been embarked. On seeing them advance, the French immediately struck their flag, and major Mason took possession of the castle, where he found ninety two pieces of cannon, with a very considerable quantity of treasure and merchandize. The corporation and burghers of the town of Senegal readily submitted, and swore allegiance to the king of Great Britain: the neighbouring princes, attended by numerous retinues, visited the commander, and concluded treaties with the English nation; and the king of Portenderick, or Legebelli, sent an ambassador from his camp to major Mason, with compliments of congratulation, and assurances of friendship.

Having left an English garrison at Fort Louis, and placed a sufficient number of armed boats to secure the passage of the bar, the large ships failed to make an attempt on the island of Goree, which lies at the distance of thirty leagues from Senegal. This expedition, however, for want of a sufficient force, miscarried. But the ministry being sensible that the English settlements on the coast of Africa could never be secure while the French kept possession of this island, they fitted out a squadron, the command of which was given to commodore Keppel, consisting of four ships of the line, several frigates, two bomb-ketches, and some transports, having on board seven hundred regular troops, commanded by colonel Worge. On the eleventh of November this armament sailed from Cork in Ireland, and, after a dangerous passage, they arrived at Goree the latter end of December; when the commodore immediately made a disposition for attacking the island. The flat bottomed boats for landing the troops being hoisted out, and ranged along side of the different transports, Mr. Keppel stationed his ships on the west side of the island. A shell being fired from one of the bomb-ketches, which was the signal for the engagement to begin, the great ships poured in their broadsides without intermission, and their fire was returned with

equal vivacity from all the batteries of the island. At length the cannonading from the ships became so severe and terrible that the French soldiers fled from their quarters, in spite of all the efforts of the governor, who endeavoured to keep them to their duty; which obliged him to strike his colours, and to surrender at discretion; upon which the commodore sent a detachment of marines on shore, who disarmed the garrison, and hoisted the British flag on the island of St. Michael. Two trading vessels, which happened to be at anchor in the road, likewise fell into the hands of the English, with stores, money, and merchandize, to the value of twenty thousand pounds. This important conquest cost the victors only one hundred men killed and wounded. Commodore Keppel having left a garrison at Goree, and reinforced that of Senegal, returned with his squadron to England.

Goree at present, however, belongs to the French, as it was afterwards ceded to them by the treaty of peace in 1763. Though of so much importance to the African trade, Goree is only a small island, extending about three quarters of a mile in length. It is of a triangular form, without wood, and has no water but what the inhabitants catch in cisterns, reservoirs, &c.

Great quantities of gum are brought to this place and Senegal, by the Moors and Arabs, and from hence sent to Europe, and other parts of the world. They bring it on camels, bullocks, horses, &c.

The gum is measured in a cubical vessel, called by the Moors *Quantor*, and every quintal pays a certain duty. Proper commissaries put it into sacks, and then allow it to be carried to the Company's settlements.

The natives of this place and Senegal are in general Mahometans, and they practise circumcision with great rigour. The operation is performed at the age of 15, that the youth may have sufficient strength to undergo it and be tolerably well instructed in the principles of his faith. The ceremony is never performed in hot weather; the last quarter of the moon is always chosen, through a notion that the operation is then less painful, and the wound cured with more ease. It is done in a beautiful meadow, surrounded by gardens, upon a few boards elevated a little from the ground. The victims are led thither by their parents, succeeding each other according to their ranks, when the priest performs the operation. After which the youth retires smiling, or at least affecting to smile.

C H A P. XXII.

Of the Island of Bussi; the Island of Bisseur, or Bissao; the Bissagoe Islands, &c.

N E A R the south-east of the mouth of the river St. Domingos, or Kasaba, on the coast of Negroland, lies the island of Bussi, or Boissi. It is about 35 leagues in circumference, covered with trees, and well watered with several rivulets. The inhabitants are papels, but treacherous, wicked, and great robbers, so that it is very dangerous to trade with them; notwithstanding some ships venture in order to procure oxen, and palm-nuts, which are the only articles they will sell. In the island are two good secure harbours, the one to the north, called Old Port, and the other to the south, called New Port.

The island of Bisseur, or Bissao, is situated in the same gulph, and is separated from Bussi by a canal about a mile broad. This island is near 40 leagues in circuit, and the ground imperceptibly rises to the middle of the island, where are the tops of several hills gradually sinking beneath each other, and forming many intermediate valleys, in which the waters gather and form rivu-

lets that run into the sea. The country is fruitful, well cultivated, and abounds with trees, particularly fine large orange trees, which the Portuguese and Negroes, whose habitations are intermixed, take care to plant about their houses. Mangoes are found in great plenty, especially about the sea shore. The only town here is that of the Portuguese, the houses of which surround the parochial church, and the convent of St. Francis, but it has been considerably increased in inhabitants by means of the factory, which the French have settled near it. Besides this, there is no cluster of houses, or even huts, in the whole island, which even merits the name of a village; notwithstanding which the island is divided into nine provinces, eight of which are governed by officers, appointed by the sovereign, and each of these takes the title of king, that they may together give that of emperor to their common master. The ninth province this petty emperor reserves to himself as a kind of patrimony.

The inhabitants of this island are likewise called papels,

pels, but have a language and customs peculiar to themselves. Their chief idol is a little figure they call Shinah, but it is no easy matter to know what he performs. Besides this idol, each individual takes for a god whatever the imagination may suggest. Consecrated trees are either deemed deities, or the dwellings of deities; and to these they sacrifice bullocks, dogs, and cats, which they take particular care to fatten, and wash clean, before they kill; after having killed them, they spill part of their blood round the foot of the tree, and sprinkle the branches of it with the rest. The victim is then cut to pieces, and if a bullock, the emperor, officers and people take each a part, and carry it home in order to eat it, leaving their supposed god only the horns, which are hung up upon the tree, and there remain till they happen to drop down, or rot to pieces.

At the death of the emperor, the best beloved of his wives, and most useful of his slaves, are killed and buried near the place where the emperor's corpse is to be interred, that they may go with him, to serve and divert him in the other world.

The body of the emperor is put into a kind of coffin made of reeds, and very neatly wove. Then four of the strongest lords carry it with great solemnity to the burial place, where being arrived, a very whimsical ceremony succeeds; for the nobles amuse themselves, for a considerable time, by tossing his majesty's coffin, body and all, up into the air, and catching it again, without letting it fall to the ground. When they are pretty well tired of this sport, one of the great lords extends himself on the ground, at full length, and the rest once more throw up the coffin, body and all, but do not, as before, attempt to catch it, when the royal corpse falls on the prostrate lord, and almost beats the breath out of his body. After having been thus overwhelmed with the royal weight, he is immediately acknowledged emperor. It appears by this ceremony that the kingdom is elective, though one of the royal family, either the son, brother, or nephew of the deceased, must be chosen; and you may be sure the pretenders to the crown do not fail to bribe with presents those bearers of the royal bier, who may properly enough be styled electors.

The Portuguese have a fort upon this island. It is a pretty large square surrounded with walls, having three small bastions; the fourth was never begun; the fort has neither ditch, covered-way, or palisadoe. The curtains are so low, and in so bad a condition, that one may easily get over them, and enter the fort. There are 20 great guns, as many muskets, besides those of the garrison, which ought to be 20 Negroes, paid by the king of Portugal.

The island of Boulam lies at the mouth of Rio Grande, or the Great River, which by means of this island divides

itself into two branches. Boulam is between eight and ten leagues long from east to west, about five in breadth from north to south, and between 25 and 30 in circumference. It is surrounded with woods, beyond which the country is very fine, well cultivated by the Negroes of the Bisagoes Islands, who come thither to sow millet, rice, and other grain, and return home after they have reaped their harvest. The ground rises almost imperceptibly for two leagues from the sea-shore, to the foot of some hills, which serve as a base to higher mountains, which stand in the center of the island. Yet these mountains are neither steep nor craggy, being covered with fine and lofty trees. Through the many vallies between these hills and mountains, run several considerable rivulets, which the Negroes assert to run constantly, even in the dry season of the year.

The mouth of Rio Grande, or the Great River, to the south-east of the isle of Boulam, is about two leagues broad, and having run some leagues from east to west, it makes a great elbow, or winding, and turns to the north-east, till a little higher it is divided into two arms by the island Bisagoes. Both sides of this river are very well peopled, and covered with lofty trees of several sorts, which the Portuguese cut to build harks. There is one particular tree, which they call michery: it is easily worked, and never infested with worms. It is full of an oily moisture, excessively bitter, which probably keeps the worms from it. Trials have been made of that wood in several parts of Europe, Africa, and America, and it has always been found of equal goodness. These trees never grow very tall, few of them being above 22 feet high: but then they are very thick.

The Negroes here are tall, strong, and healthy, though they live only upon shell and other fish, palm-oil, and palm-nuts, chusing rather to sell to the Europeans the millet, rice, and other produce of the earth which they reap, than to keep them for their own use.

The island of Formosa is the most easterly of all these islands, but is now desert. La Gallina, (or Hen-Island, thus called, from the great numbers of hens the Portuguese found there) and Canabac, are very populous and fruitful, and have plenty of good water. Calicut is the most considerable of these islands, being about six leagues long, and two broad: its soil is very good, and produces millet, rice, and all kinds of pulse, besides orange and palm-trees, and many others. This island, with those of Carache, Canabac, and La Gallina, are the only ones where the Europeans may trade with some security. They trade, however, sometimes at the other islands, but they must be extremely cautious; and yet after all their precaution, they will be robbed and murdered, if they venture to go ashore.

C H A P. XXIII.

The Island of St. HELENA.

THE island of St. Helena is situated in the midst of the Atlantic Ocean, in the 16th deg. of south lat. and six deg. 35 min. west long. it is 840 miles from the coast of Benguela, 1020 from Guinea, and 1800 from the continent of South America.

There cannot be a more pleasing, or animated, and at the same time just description of this island, than what is given by the ingenious captain Thompson, in his sailor's letter, which we shall therefore transcribe: "After a passage (says he) of 85 days, 21 of which were so dead a calm, that the very sea grew putrid, we arrived at this little particle of earth, placed in the midst of an immense ocean, and so very removed from any thing terrestrial, that it surprises me it is not washed away and dissolved in such a body of water. The basis is so very small, and

the rock so perpendicular, that with our deepest line and plummet, we can find no ground but in one place round this island, and there the bank is so small and steep, as not to admit of more than 12 sail of ships. It is distinguished to you by a single black dot on the general map, and it is hardly more on the sea, which makes it so difficult to find. The Dutch, who are not quite such alert navigators as the English, call it butter island; they say the sun melts it, and though there may be some humour in the thought, yet it is a small apology for their want of vigilance. One would imagine that the God of nature intended this spot for the recreation of seamen in their long passages through the southern seas, and as a guide to some small place, gave a peculiar pigeon to inhabit it and direct the voyager. This bird rambles 100 miles to the

the windward, and nearly on an east and west line in the latitude of the island, a small as pleasing to us, as that to Noah with the olive branch, being a certain indication we had not passed in idle; but what is still more extraordinary, these birds are never seen to the leeward. The falling into this port is romantic beyond description, the rocks being so lofty, and your eyes passing to near them, that they make a perfect canopy between you and the heavens. A vessel from the summit of these hills, appears no bigger than her boat, or buoy, and her men, like those of Lear, gathering samphire on the rocks of Dover. Saint Helena is situated in the serene climate I ever breathed in, and delightfully temperate. Not subject either to hurricanes, or earthquakes, for one concussion would throw it down like a nine-pin, and the water dissolve it like a lump of sugar. The surface is a good mould, and would produce all kinds of grain, was it not infested by mice and rats, which devour it as soon as sown. The inhabitants therefore are obliged to eat yams, instead of bread, some part of the year, their meal and corn being brought annually in the store ships from England. Every family has two houses, their town habitation being in St. James's Valley, where they instantly repair, on the arrival of a ship, to regale the sea gentry with the produce of their farms. Every house, like Bath, is let out into lodgings, and exorbitantly dear; for as valetudinarians make one market, the arrival of a feurvy fleet makes the other. Their profits are great when you consider they raise all their own flock, enjoy it with their lodgers, and make them likewise pay most extravagantly dear for it, which we tars do with profuse-ness; for the short time we stay the mind is in a perfect enchantment, the power of Circe over the companions of Ulysses is not to be compared with our situation, nor her magic spells with the intoxicating delights of St. Helena. Every thing appears like a scene of enchantment to an eye so long confined to sky and water, a body corrupted with salt food, and the jet beauties of India exchanged for the fairest goddesses. It is such a scene of rapture, that had that child of fancy Shakspeare beheld it after such a voyage as ours, his description and imagery would, if possible, have surpassed every thing he has given us, for I may truly say with him,

"The object and the pleasure of mine eye
"Is only Helena."

This island is said to have been first discovered and settled by the Portuguese on the festival of the empress Helena, mother of the emperor Constantine, for which reason the Portuguese gave it her name, which it still bears. But it being afterwards deserted by them, it lay waste, till the Dutch, finding it convenient to relieve their East-India ships, settled it again. But they afterwards relinquished it for a more convenient place, which is the Cape of Good Hope. Then the English East-India company settled their servants there, and began to fortify it; but they being yet weak, the Dutch, about the year 1672, came hither, retook it, and kept it in their possession. This news being reported in England, captain Monday was sent to take it again; who by the advice and conduct of one that had formerly lived there, landed a party of armed men in the night in a small cove, unknown to the Dutch then in garrison, and climbing the rocks got up into the island, and so came in the morning to the hills hanging over the fort, which stands by the sea in a small valley. From thence firing into the fort they soon made them surrender. This island has continued ever since in the hands of the English East-India company, and has been greatly strengthened both with men and guns, so that at this day it is secure enough from the invasion of any enemy. For the common landing-place is a small bay, like a half-moon, scarce 500 paces wide between the two points. Close by the sea-side are good guns planted at equal distances lying along from one end of the bay to the other; besides a small fort a little farther in from the sea, near the middle of the bay—all which makes the bay so strong, that it is impossible to force it. The small cove, where captain Monday landed his men, when he took the island from the Dutch, is scarce fit for a boat to land at, and yet that is now also fortified.

There is a small English town within the great bay, standing in a little valley, between two high steep mountains. There may be about twenty or thirty small houses, whose walls are built with tough stones. The inside

furniture is very mean. The governor has a pretty tolerable handsome house by the fort, where he commonly lives, having a few soldiers to attend him, and to guard the fort. But the houses in the town if not empty, have only when ships arrive: for the owners of these houses have all plantations farther in the island, where they constantly employ them selves. But when ships arrive they all flock to the town, where they live all the time that ships lie here; for then is their fair or market, to buy such necessaries as they want, and to sell off the product of their plantations.

Their plantations afford potatoes, yams, and some plantane and bananas. Their flocks consist chiefly of hogs, bullocks, cocks and hens, ducks, geese and turkeys, of which they have great plenty, and sell them at their own prices to the sailors, taking in exchange shirts, drawers, or any light clothes, pieces of calico, silks, or muslins; arrack, sugar, and lime-juice is also much esteemed and coveted by them.

Mr. Ovington formerly carried over to this island several French refugees with him, who were kindly entertained by the Company, and some advanced to considerable posts. He could see this island twenty-five leagues at sea; and tells us, that the serenity and temperateness of the air gives the islanders as fair and fresh a complexion as those in England have.

The Company's affairs here are managed by a governor, deputy governor, and store-house keeper, who have standing salaries allowed by the Company, besides a public table well furnished, to which all commanders, masters of ships, and eminent passengers are welcome. The natives sometimes call the result of their consultations severe impositions; and though relief may perhaps be had from the Company in England, yet Mr. Ovington observes, that the unavoidable delays in returning a redress at that distance does sometimes put the addressees under a hardship; and thinks, that were not the situation of this island very serviceable to our East-India ships homeward bound, the constant trouble and expence would induce the Company to abandon the island, for though it is furnished with the conveniences of life, yet it has no commodities of any profit to merchants.

Mr. Lockyer makes this island 20 miles in circumference, and observes, that in Chapel-valley was James's fort, of 10 small guns, which he was told was demolished afterwards, and a much larger erected in its stead. There was also a platform of 20 guns, and three at the landing place. Banks's platform had six guns; Roze's platform seventeen, and in Lemon-valley, where the Dutch formerly landed, was a platform of six more, all which had received considerable additions since. There is no landing to the windward, and 17 m. creek and bays are secured as above, besides alarm-guns on the hill. All things are dear to strangers, except choice roots and limes. They had, in Mr. Lockyer's time, 1500 head of black cattle, with plenty of hogs, goats, turkeys, and all sort of poultry. Their chief gain is kidney-beans from 8 to 12 shillings a bushel: A small ox is sold for six pounds, and turkeys for a dollar a-piece. The common people subsist chiefly on potatoes, yams, plantanes, pulse and fish; and if they can get flesh once a week, they reckon it good living. The Company allows the soldiers salt meat, but how often our author does not say. Both they and the mechanics may earn a great deal of money by their labour. Their common drink is plain water, or mussy, which is but one remove from it.

The masters of the plantations keep a great many blacks who, upon severe treatment, hide themselves for a quarter of a year together, keeping among the rocks by day, and roving at night for provisions; but they are generally discovered and taken. The island produces here and there a drug like Benzoin, and great plenty of wild tobacco on the hills, which the slaves use to smoke for want of the right sort. The inhabitants are supplied with necessaries twice a month out of the Company's store, at six months credit. The chief commodities for sale here are cherry brandy, malt and cyder, spirits, beer, Madeira and Canary wines, and Spanish brandy, which may be taken in at those islands; Batavia arrack, sugar, raisin-candy, tea, fans, china, lacquered ware, silks, China ribbons, coarse striped gingham, ordinary muslin, coarse chints, blue and brown long-clothes, salamopores, and all sorts of coarse calicoes.

C H A P. XXIV.

Of the Islands of Ascension and St. Matthew.

THE Island of Ascension lies nearly in the midway between Africa and America; that is, it is almost equi-distant from Loango in Africa, and Pernambuco in Brazil, lying in the same parallel, in 7 deg. south lat. and 13 deg. 10 min. west long. from London.

This island was discovered in the year 1588, by Julian d'Acugna, on his return from the East Indies, who called it Ascension, because he first perceived it on Ascension-day. It is about twelve miles long, not above three broad, and nearly twenty-five miles in circumference. The whole island is quite mountainous, and almost barren; yet it is generally used by our homeward bound East India ships, as a place of refreshment. Great quantities of ashes and cinders are found upon the soil, which induces some to imagine that a volcano must have been here formerly. The harbour, however, is exceedingly convenient, and some few places are fit for tillage. When the ships touch here, their crews sometimes live upon turtle for a fortnight, and deem it not only pleasant but salutary food. The goats that run here wild are very lean, and indifferent eating, and the birds, of which there are various kinds, are so extremely bad tasted, that none of the sailors can use them as food.

On this island there is a place which seamen term the post-office, and where they leave letters. The method is to put them into bottles, which they closely cork, when the people of the next ship that comes take out the letters, and leave others in their room.

Neither the Portuguese, or any other nation, have thought proper to take, plant, or cultivate this island; it is, however, very convenient for East India ships to call at, when they happen to overhoot or miss of St. Helena. Just before the ships leave this place, after having feasted sufficiently upon turtle, the sailors take a large parcel of those amphibious animals on board, in order to gratify the luxurious appetites of the English epicures; for luxury now supercedes all other thoughts, and by preying first upon the body individual, at length threatens the ruin of the body politic.

- “ There in her den lay pompous luxury,
 “ Stretch'd out at length, no vice could boast such high
 “ And general victories as she had won,
 “ Of which proud trophies there at large were shewn;
 “ Besides small states and kingdoms ruined,
 “ Those mighty monarchies that had o'erspread
 “ The spacious earth, and stretch'd their conquering
 arms
 “ From pole to pole, by her ensnaring charms
 “ Were quite consum'd—There lay imperial Rome,
 “ That vanquish'd all the world, by her o'ercome.
 “ Fetter'd was th' old Assyrian lion there,
 “ The Grecian leopard, and the Persian bear;
 “ With others numberless, lamenting by
 “ Examples of the power of luxury.”

May's Henry II.

And here it may not be improper to describe the turtle, which, from an article of luxury, is now become an article of commerce.

Turtles are usually distinguished by sailors into four kinds: the trunk-turtle, the loggerhead, the hawk's-bill, and the green turtle.

The trunk-turtle is generally larger than the rest, and its back is higher and round; but the flesh is rather rank.

The loggerhead has obtained his title from the size of his head, which is much larger in proportion than that of the other kinds; but the flesh, like that of the former, being rather rank, is very seldom eaten.

The hawk's-bill turtle has a long and small mouth, resembling the bill of a hawk. The flesh is but indifferent; but the shell serves for many valuable purposes, such as making snuff boxes, various trinkets, &c.

The green turtle is the most celebrated and most valuable of the turtle kind. The delicacy of the flesh, and its nutritive qualities, have rendered it highly esteemed. It refreshes and feeds the sailor, and forms a principal part in the banquet of the epicure.

Dampier appears to have been the first who informed us of the distinctions among these animals, and that while the rest might be valuable for other purposes, the green turtle alone was prized for the delicacy of its flesh. Conveniences are made in ships to bring these over alive, which cannot, however, be always effected; for though they scarce require any provisions in the voyage, yet the working of the ship occasions them to be beat against the sides of the boat that contains them, by which they become battered and lean, so that in order to eat this animal in perfection, instead of bringing the turtle to the epicure, the epicure ought to be transported to the turtle.

The colour of the shell of this animal is rather greener than that of others of this kind; whence it has the name of the green turtle. Those which are about two hundred weight are the most common size, though they are sometimes found to exceed five hundred.

The turtle seldom comes from the sea but to deposit its eggs, or to sport in fresh water. In about twenty-five days after laying, the eggs are hatched by the heat of the sun, and the young turtles, about the size of quails, are seen burbling from the sand, as if earth-born, and running directly to the sea, with instinct only for their guide. But it sometimes happens that the surges of the sea beat them back upon the shore, and they become a prey to the innumerable quantities of birds which at that time haunt the coast.

In order to catch the turtles upon this island, the sailors go on shore in the night-time, when they find great numbers on the strand, who, from their natural slowness, cannot get away; these they turn upon their backs, and leave till morning, when they can take them at pleasure; for when a turtle is once turned upon its back, it cannot get upon its feet again without assistance.

The Island of St. Matthew,

THUS called by the Portuguese, because they discovered it on that Saint's day, lies to the north of St. Helena, and to the north-east of Ascension, under the second degree of south latitude. It is desert, though there is a fine rivulet of fresh water that runs through it. Garcia de Loaisa, a gentleman of Biscay in Spain, who commanded the fleet which the emperor Charles V. caused to be fitted out at the Groyne, to go and conquer the Molucca Islands, having landed at the island of St. Matthew, found it uncultivated, but full of large orange-trees. He found also some poultry there, and on the barks of trees there were inscriptions in the Portuguese tongue; which proved that some of that nation had been there before. Dapper says, they continued several years on that island.

C H A P. XXV.

Of the Islands of Annabon, St. Thomas, Prince's Island, and Fernando Po.

THE island of Annabon was discovered on New Year's day, and on that account was named Annabon by the Portuguese, as that expression signifies the good, or the new year. It lies to the east of St. Matthew in 2 deg. south lat. and 5 deg. 10 min. east long. being near 210 miles from the coast of Loango, and is near 30 miles in circumference. Here are two high mountains, which being continually covered with clouds, occasion frequent rains. Here are several fertile valleys, which produce plenty of bananas, potatoes, oranges, pine-apples, tamarinds, and cocoa nuts; besides which the island abounds with lemons, citrons, nuts, figs, Turkish corn, and millet. Here are also oxen, cows, hogs, goats, fowls, pigeons, with plenty of fish. The island likewise produces great quantities of cotton. The governor is a Portuguese, who has very few white people with him; all the other inhabitants are blacks, who are nevertheless very submissive to the governor, and zealously attached to the Roman Catholic religion. On the south-east of the island there are two rocks, one of which is very low, and almost even with the surface of the sea, the other is much higher and very large. On these rocks are a multitude of birds, so tame that they suffer themselves to be taken with the hand. The water is so deep between these two rocks, that ships may easily pass between them. On the same side of the island there is a very good watering-place, the water running down from the mountains into a valley full of orange and other fruit-trees; but it is a difficult matter to come at that water, because of the violent breakings of the sea; and the negroes have made an entrenchment of stone there, from which they can very much incommodate those who go thither for water. The road for shipping is on the north-east side of the island, where one may anchor in 7, 10, 13, or 16 fathoms water, on a sandy ground, close to the land, over-against the village where the abovementioned entrenchment is. When the inhabitants cannot prevent a descent, they leave their houses, which are only of timber and sand, and retire into the mountains. They are very well armed. The revenue of this island consists chiefly in cotton. The negroes gather it, and after they have cleaned it, they send it into Portugal. Here are also some civet-cats in the mountains, which yet afford but little profit. The

inhabitants are poorly clothed. The women go bare-headed, and have also the upper part of their body naked, wearing only a piece of linen wrapped round them, which reaches from the pit of the stomach to just below the knee.

St. Thomas, or St. Thomas's Island, is directly under the equinoctial line, and about 240 miles north-west from the city of Loango. The air here is so exceedingly hot, that Europeans soon die, though negroes will live to near an hundred years of age. Being an equatorial situation, the days and nights are consequently always equal. The only rainy months are March and September, when the sun passes vertically over the island; but at other times they have nocturnal dews, which refresh and fertilize the soil. It produces less sugar than it formerly did; but is extremely fruitful in wheat, wine, millet, rye, barley, melons, cucumbers, figs, ginger, red parsnips, cabbages, French turnips, lettuces, radishes, sage, beat, parley, &c. Olive, peach, and almond-trees thrive well in timber; but excessive heat and moisture prevent the bearing of fruit. Partridges, quails, ouzels, parrots, &c. abound here; so doth the sea with excellent fish, and large whales. A mountain in the island's center hath its top covered with a cloud, which moistens the trees, and greatly nourishes them. The higher the sun ascends above the horizon the more moisture does the cloud afford. The Portuguese built a town called Pavoasin, with a harbour towards the Continent. This town is exceeding pleasant, and the inhabitants barter sugar for wine, cheese, leather, and cloaths.

Prince's Island is nearly under the equator, the lat. being only 1 deg. 30 min. It is woody and mountainous, abounding in fruit, rice, Indian corn, sugar, herbs, roots, &c. It contains also cattle, hogs, and goats; but the vast quantities of asses are both troublesome and dangerous, as they wantonly destroy many of the fruits of the earth, and will attack, and tear to pieces, a man, if they find him single and unarmed.

About thirty miles to the westward of the continent is the island of Fernando Po, in 4 deg. north lat. It is near 30 miles long, and 20 broad. The produce and inhabitants do not differ from those of Prince's Island, and it likewise belongs to the Portuguese government.

C H A P. XXVI.

Islands in the INDIAN OCEAN.

THE ISLAND of BOURBON.

THIS island, which lies in 21 deg. south lat. and 54 deg. east lon. is 370 miles east of Madagascar, and 120 miles south-west of the island of Mauritius. It is of an oval form, about 40 miles long from east to west, 30 broad from north to south, and above 120 in circumference. It was first discovered in the year 1545, by a Portuguese, of the house of Mascarinhas, who gave it the name of Mascarin, in honor of his family, and stocked it with hogs and goats; but thought proper afterwards to abandon it. In the year 1613, captain Castleton, an English naval officer, touched here in a ship named the Pearl; and from the journal of his voyage, written by John Tatton, master, we shall make the following extract. "In twenty-one degrees south

latitude, they saw an island west-south-west, and south-west by west, five leagues distant, being very high land. At six o'clock at night they anchored on the eastern side of it, a mile from shore, in ten fathoms, fine black sand, which you meet with from forty fathoms, to four fathoms close to land. The boat being sent ashore, found infinite numbers of great land-tortoises, as big as a man might well carry, which were very good meat. The north-east point of this island is very high and steep; and a little to the south-east of the point is low land, where runs a fine water, like a river, and though a boat cannot go in, yet it is a very good place to water in. At some distance from the shore, the island appears like a forest, whence the author (John Tatton) called it England's forest; but the others named it Pearl Island, from the ship.

" This

" This island was uninhabited, but abounded with land-fowl, both small and large doves, great parrots, and the like, and a huge bird, the bigness of a turkey, very fat, and so short wing'd that it could not fly: The birds of this kind were all white, and in a manner tame, as are all the other fowls, because they have not been feared with shot. The sailors knocked them down with sticks and stones; ten men might take fowls enough to serve forty for a day. Some of the company, walking up into the island, found a river, and a pond well stocked with mullards and wild geese, besides an infinite number of great eels, as good as any in the world. If struck with a pike, or any other thing, they would run not above two or three yards off, and then lie still again, so that they might be easily taken. The author observing they were bigger than any he had ever seen, weighed one, and found its quantity twenty-five pounds. They were also the sweetest fish, in his opinion, that can be eaten; whence he concluded, it was as good a place as the world could afford for refreshing, neither was there any danger about the island, but the shore itself."

This island, however, never retained the names of England's forest, or Pearl Island, mentioned here to have been given it, but continued to be called by the name of Mascarin till the year 1654, when Monsieur De Flacourt took possession of it in the name of the king of France, and gave it the name of Bourbon, which it still retains in compliment to the royal family upon the French throne. He left there a few of his people and slaves, who not liking their situation, were afterwards brought away by an English ship. The French, however, again formed a settlement there in 1674, and have now three considerable towns on the island, viz. St. Paul, St. Denis and St. Sufanna, but the governor usually resides at St. Denis.

According to the latest accounts of this island, it abounds in all kinds of refreshments, and the air is particularly excellent. The French East-India ships touch here to take in water and provisions, for the roads are good for shipping, but there is no harbour in the whole island. Here is plenty of wood and water, and the face of the country is beautifully diversified with hills and dales, pastures and woods, and watered by excellent springs and rivulets. In one of the mountains there is a small volcano, which discharges fire, and fills the neighbourhood with a bituminous matter; and the flames are perceived, in the night time, at the distance of twenty-five leagues.

Some of the trees here are fit for building vessels. The ile of Bourbon likewise produces the shrub that bears coffee, the tamarisk, the cocoa-tree, the tree from whence benzoin distills, the cotton, aloe and ebony tree. The black ebony here is less esteem'd than the yellow; and the wild coffee, which is very plentiful, is exceeding good. Many of the trees and plants produce odoriferous gums; and here are plenty of oranges, lemons, tobacco, palms, white-pepper, &c. The island likewise abounds with black cattle, hogs, goats, and boars, the flesh of which is admirable, on account of their feeding on tortoises; many kinds of fowls, pigeons, turtle-doves, parrots, &c. The surrounding seas, and intersecting rivers, rivulets, &c. supply the inhabitants with abundance of fish; and, on the shore, are found great quantities of ambergris, corals, and beautiful shells. Here are no crocodiles, snakes, musketoos, or any of those vermin, or other venomous creatures, which are so troublesome in most other parts of the torrid zone.

A French writer, in speaking of this island, says, " The best animal found here, whether for taste or wholesomeness, is the land-tortoise, and the most agreeable fruit is the anana; this tortoise is of the same figure with those in Europe, but of a very different size. They say it lives a prodigious time, that several ages are required to bring it to its full growth, and that it can live several months without food. They have kept some young ones in the island, which, at the end of twenty years, encreased in bulk only a few inches.

" As for the anana, it is a fruit of an oblong figure, and of the bigness of a melon; it is covered with short leaves, disposed very much in the same manner as the divisions of a pine-apple, and it is crowned with a tuft of leaves something longer; it grows on a plant resembling an artichok, and has the taste of several fruits, but more especially a quince.

" The bat of this island is very singular, and one might call it the flying fox, since it very much resembles this animal in size, hair, head, ears, and even teeth. The female hath two teats, and, under each wing, a bag to carry her young in. The length of the wings is about four feet from one extremity to the other. The flesh is so good to eat, that they go a hunting for them with the same eagerness that we go a shooting partridges.

" But though this island is so agreeable, it does not come near to the beauty of the coasts of Java and Sumatra plains, which are covered with orange, cocoa, and other fruit-trees, with a number of rivulets that water them, hills adorned with delightful groves, forests for ever green, villages and towns shining with all the rural graces, concur to render those coasts the most charming in the world."

Vines have been successfully planted here of late years, and now considerable quantities of different wines are annually produced; but the greatest inconveniences here arise from the terrible hurricanes and storms, which are not only exceeding violent, but very frequent; hence shipwrecks are common, and the most horrid desolations become familiar to the eye, so that the following animated description is but too often realized on the coasts of this island.

The sea grows white, and rolling waves from far,
Like heralds, first denounce the wat'ry war;
Then, the captain soon began to cry,
Strike the topsails, let the main-sheet fly,
And furl your sails;—the winds repel the found,
And, in the speaker's mouth, the speech is drown'd;
Yet, of their own accord, as danger taught,
Each in his way—obscurely they wrought:
Some flow the oars, or stop the leaky sides,
Another, bolder yet, the yards betrides,
And folds the sails, a fourth with labour laves
Th' intruding seas, and waves ejects on waves.
In this confusion, while their works they ply,
The winds augment the winter of the sky,
And wage intestine wars, the full'ring seas
Are toss'd and mingled as their tyrants please;
The captain wou'd command, but in despair
Of safety, stands; amaz'd with stupid care,
Nor what to bid, or what forbid, he knows,
Th' ungovern'd tempest to such fury grows,
Vain is his force, and vainer is his skill,
With such a concourse comes the flood of ill.
The cries of men are mix'd with rattling shrouds,
Seas dash on seas, and clouds encounter clouds;
At once, from east to west, from pole to pole,
The sarky light'nings flash, the roaring thunders roll;
Now waves on waves, ascending, hide the skies,
And in the fires above the water fries.
When yellow sands are sifted from below,
The glut'ring billows give a golden show;
And when the fouler bottom spews the black,
The Stygian dye the tainted waters take;
Then frothy-white appear the flattened seas,
And change their colour, changing their disease,
Like various fits the beaten vessel find,
And now sublime the rides upon the winds,
As from a lofty summit looks from high,
And from the clouds beholds the netter sky;
Now from the depth of hell they lift their light,
And, at a distance, see superior light;
The lashing billows make a loud report,
And beat her sides as batt'ring-raas a fort.
Thus seas impell'd by winds, with added power,
Assault the sides, and o'er the hatches tow'r;
The planks, their piteous coverings wash'd away,
Now yield, and now a yawning breach display;
The roaring waters, with a hostile ride,
Rush through the ruins of her gaping side;
Mean time, in sheets of rain, the sky descends,
And ocean swell'd with waters upwards tends;
One rising falling one, and the heavens and sea
Meet at their confines in the middle way;
The sails are drunk with showers, and drop with rain;
Sweet waters mingle with the briny main,
No star appears to lend his friendly light,
Darkness and tempest make a double night;
But flashing fires disclose the deep by turns,
And while the lightnings blaze, the water burns.

An univerfal cry refounds aloud,
The failors run in heaps, an artlefs crowd;
Art fails, and courage falls; no fuccour near,
As many waves, as many deaths appear.
One weeps, and yet delpairs of late relief,
One cannot weep, his fears congeal his grief;
But ftupid, with dry eyes expects his fate.
One with loud shrieks laments his loft eftate,
And calls thofe happy whom their fun'ral's wait.
This wretch with prayers and vows the Lord implores,
And even the skies he cannot fee adores.
That other on his friends his thoughts beftows,
His careful father, and his faithful fpoufe.
The cov'tous worldling, in his anxious mind,
Thinks only on the wealth he leaves behind.
Tof'd by the fea's, pref'd with the pond'rous blow;
Down finks the fhip within th' abyfs below;
Down with the vefel fink into the main
The many, never more to rife again.

A French officer, who very recently vifited both this ifland and the Ifle of France, or Mauritius, tells the following ftory concerning one of the pirates who ufed to infift this ifland. "The viceroy," fays he, "of Goa, came one day to anchor in the road of St. Denis, and was to dine with the governor. He had fcarcely fet his foot on fhore, before a pirate fhip of fifty guns anchored along fide his vefel, and took her. The captain landed forthwith, and demanded to dine at the governor's. He feated himfelf at table between him and the Portugefe viceroy, to the latter of whom he declared that he was his prifoner. Wine and good cheer having put the feamen in good humour, Monf. Desforges, the governor, afked him at how much he rated the viceroy's ranfom! "I muft have," faid the pirate, "a thoufand piaftres." "That's too little," faid Monf. Desforges, "for a brave fellow, like you, to receive for a great Lord like him: afk enough, or afk nothing." "Well, well then, I afk nothing," replied the generous corfair, "let him be free." The viceroy infantly re-embarked and fet fail, happy at having efaped on fuch good terms. The pirate afterwards fetled on the ifland, and was hanged, a confiderable time after an annety had been publifhed in favour of his com-

panions, and in which he had failed to get himfelf included. This injuftice was the work of a canceller, or judge, who was defirous of appropriating the fpoils of the pirate to his own ufe. It is not long fince the laft of thefe pirates, whofe name was Adam, died, aged 104 years."

The fame writer has alfo given us the following defcription of the original inhabitants of this ifland, with obfervations on the prefent ftate of them. "The manners," fays he, "of the firft inhabitants of Bourbon were very fimple; the greater number of the houfes were not made to fhut: a lock was a curiofity. Some people even put their money in a tortoise-fhell over their door. They drefled in blue cloth, went bare-footed, and lived upon rice and coffee: they imported but little from Europe; content to live without luxury, fo they lived without want. They joined to this moderation the virtues that ever attend it; good faith in commerce, and generofity in their proceedings. As foen as a ft ranger appeared, the inhabitants came to him, and, as a ft ranger, offered him their houfes.

"The laft war in the Indies has made a change in their manners. The volunteers of Bourbon diftinguifhed themfelves in it by this bravery; but the ftuffs of Asia, and the military diftinctions of France, thereby got footing in the ifland. The children, richer than their parents, require to be treated with more confideration. They have now no enjoyment of an unnoticed good fortune, but feek in Europe pleafures and honours, in exchange for domeftic happinefs and the quiet of a country life. The attention of the fathers being chiefly fixed upon their fons, they fend them to France, from whence they feldom return. Hence it is, that in this ifland there are more than five hundred marriageable girls, who are likely to die without husbands."

The whites who inhabit this ifland are eftimated at 5000, and the blacks at 6000. Their principal traffic is with France, to which place they export the various commodities of the country.

The chief town in this ifland is called St. Denis, and is the refidence of the governor and council. It is a fmall place, and does not contain any thing remarkable, except a redoubt, built of ftone, and a drawbridge.

C H A P. XXIV.

The Ifland of Mauritius, otherwife called the Ifle of France.

THE Ifland of Mauritius, or Maurice, is fituated in 18 deg. 30 min. fouth latitude, and 56 deg. eaft long. It was called Mauritius, in honour of Maurice, prince of Orange, who was ftadtholder at the time the Dutch took poffeffion of it, A. D. 1598.

Mauritius is between three and four hundred miles eaft of Madagafcar, and is about an hundred and fifty in circumference. The form is oval, and from the many high mountains torrents of water rufh down with great impetuofity, and form various rapid rivers and rivulets, which are foul near where they fall, particularly in the rainy feafon; but grow clearer as they turn farther from the mountains, and are as transparent as cryftal before they difembogue themfelves into the fea.

Thus the pure limpid ftream, when foul with ftains,
Of rufhing torrents, and defcending rains,
Works itfelf clear, and as it runs rehnes,
Till by degrees the floating mirror fhines;
Reflects each flower that on its border grows,
And a new heaven in its fair bosom fhows.

This ifland contains two ports, the principal of which is to the fouth-eaft, where the Dutch fettlement formerly was, the remains of the buildings belonging to which are ftill to be feen. This port may be entered with eafe be-

fore the wind; but it is mighty difficult to get out of it, as the gales generally blow to the fouth-eaft. The other port, named Port Louis, is fituated to the North-weft, and is fmallier than the former; but the town belonging to it is deemed the capital of the ifland, though it is fituated in the moft difagreeable part of it. This town, denominated the Camp, is built at the bottom of the port, and towards the opening of a valley. The valley itfelf is formed by a chain of mountains, whofe fummits are rocky, without trees or bufhes; but covered with a dungy herb, which makes the country appear black like a colliery.

The town itfelf, called the Camp, is built with tolerable regularity, the houfes are of wood, and only one ftory high; they ftand feparate from each other, and are all furrounded with pallifades; the ftreets, however, are not paved or planted with trees, nor are there any fortifications except towards the fea, where the place is defended by the fort called Port Blanc, and a battery on the little ifland of Torrelliers.

The Ifle of France is watered by above fixty rivulets, fome of which deferve the name of rivers, but others do not contain any water in the dry feafon. The whole, however, as we have already mentioned, have their fources principally in the mountains. A gentleman,

who was lately on this island, says, "Every thing here differs from what is seen in Europe, even the herbage of the country. To begin with the soil: It is almost every where of a reddish colour, and mixed with veins of iron, which are frequently found near the surface, in the form of grain, the size of a pea. In the drier parts, especially near the town, the ground is very hard. It resembles pipe-clay; and, to make trenches in it, I have seen them cut it with axes, as they do lead. As soon as it rains, it becomes soft and sticky, notwithstanding which, they have not yet been able to make it into bricks." There is no real sand in the soil, but the ground is every where rocky, except where artificial means have been used to make it otherwise. The rocky substances, in general, are of an iron grey colour, contain a great deal of iron ore, and vitrify in the fire.

Of the vegetable productions, both natural and exotic, of the Island of Mauritius, or Isle of France.

THE herbs natural to this island are a turf, which grows in beds near the sea shore; it is very thick and elastic; its leaf is very small, and so sharp pointed as to prick people's cloaths. The cattle will not touch this herb, but love to browse upon a kind of dogs grass, which grows in many parts, and puts out little hard branches from the joints. The best herb, however, is one that grows on the windward side of the island. It has largish blades, or rather leaves, and is green and tender all the year.

Here is likewise a shrub that yields a kind of fruit whose husk might be turned to singular advantage. A prickly aparagus; a mallow with small leaves; a thistle with yellow flowers, which yield seed that are poisonous; a kind of sweet-scented lilly; a bad-scented gilliflower, sweet-basil, which is of a healing quality.

The plants called raquettes, which bear yellow flowers, are used, on account of their sharp prickles, in making hedges. The velantier is a plant whose odour is quite agreeable at a distance; less so, as you approach it, and perfectly nauseous when you come quite near it; and here is a kind of bramble that bears a nut, the kernel of which is bitter, but efficacious in many disorders.

Balm thrubs and a bastard kind of potatoe are common; as is panner grass, which latter serves for physic and cloathing, for it is used medicinally, and likewise to make thread. There are likewise many other shrubs, which have not as yet particular names assigned them, but go under the general denomination of liames or rattens; these twine round the trees in a most anasing manner, and secure them from the violence of the hurricanes; of the bark of these, strong cords are made, which are tougher and more serviceable than those made of bark. Here is a very pretty shrub called bois de demoiselle, or lady-wood, others that resemble the box tree, and some that bear a great affinity to the cork tree. The napou tree is as penetrable to a knife as a turnip, but it is of a poisonous nature. The bastard cinnamon tree is large; its timber resembles that of the walnut tree, and its wood is much valued by cabinet makers. The iron wood, and stinking wood trees are common, as are likewise the sandal wood tree, the vacoa or small palm, the latanier or larger palm, the mangrove, which grows in the sand of the sea, and a very large kind of fern.

As the ebony of this island is the finest in the world, we shall here speak more generally of it. The real, or black ebony tree, grows very high and thick, has a bark of a dark colour, and the leaves, which resemble those of myrtle, are of a deep green tinge. The ebony trees, after being cut down, are buried under the ground for some time, which, it is said, improves the jetty black. The wood being very fine and beautiful, is used in various Mosaic inlaid works, and toys; the qualities are, being hard, heavy, possessing an admirable black, and bearing a high polish. However, ebony is not quite so much in request as formerly, on account of the Europeans having discovered so many methods of giving other hard woods a beautiful black colour, and an elegant polish.

As many vegetable productions, which were brought here by order of government, transplanted by private persons, or imported by the desire of some of the settled inhabitants, have greatly increased, it is proper to speak

of them particularly, and this may be done under four classes, viz.

1. The plants which being once sown, afterwards grow wild by re-sowing themselves and so become naturalized.

2. Articles of cultivation.

3. The produce of the kitchen garden.

4. The produce of the flower garden.

Among the wild plants, or those of the first class, are a kind of indigo, purslain, water-crelles dandelion, wormwood, mullen; the bullrush, which is green for about five months in the year; white grass, which was introduced first of all for forage, but none of the cattle will eat it, and its increase is now so great, that it is become one of the plagues of husbandry; the brette, a species of the morell, with a prickly leaf, but pleasant of taste, and of a purgative nature; the brette is of two sorts, the species already mentioned is only used as a medicine, the other is served up to table in the manner of spinach.

Among the plants which are the objects of cultivation, the cassave root was transplanted hither from America, and grows in great plenty; it is of infinite service in subsisting the Negroes, who are allowed three pounds of it daily; maize or Turkish corn, and mamoe, are common, as are wheat, rice, millet, fatague, a fine kind of grass brought from Madagafcar, and tobacco; but the latter is but very indifferent. Experiments have been made, but without any success, to propagate faint-soin, trefoil, hemp, flax and hops. It is to be observed, however, that vegetables in general degenerate here, and that those who wish to have them tolerably good, are obliged to be supplied with fresh seed from the Cape of Good Hope, or Europe.

Here are in the kitchen gardens pease, French beans, artichocks, pun skins, melons, water melons, cucumbers, gourds, pepper, pine apples, pomegranates, strawberries, spinach, garden-crelles, ferrel, cherville, parsley, fennel, cellery, leeks, lettuce, endive, colliflowers, cabbage, burnet, garraon purslain, sage, aparagus, carrots, parsnips, turnips, saffras, radishes, beet roots, European potatoes very small, Indian potatoes very large, saffron, ginger, pistachio-nuts, chives, leek, and onions.

The productions of the flower-gardens here are only the tuberose, larkfoot, large daisy of China, and pinks, of a small species, from Europe. Attempts have been made to transplant other flowers hither, but they have never yet succeeded. The African exotics are the flowering shrub, or *Bell Immortelle*, or *Immortal Beauty* of the Cape; a reed which bears a group of leaves, white in the inside, and violet coloured without; a kind of tulip, bearing but two leaves, which always adhere to the ground. These flowers are all without smell, and even those transplanted from Europe lose their fine fragrance when cultivated here.

Aloes flourish here, as do rose-trees, jessamines, myrtles, a flower called the shoemaker-flower, the poincillade, a kind of bramble, jalop-flowers, the vine of Madagafcar, which is only a rattan, with which cranes are made, but it bears a yellow flower. The mongris, which has some resemblance both to the jessamine, and the orange-tree. The franchipanier is an inferior kind of jessamine, and the Indian lilac.

The cotton-tree, sugar-cane, and coffee-tree, succeed tolerably well; and here are found some oak, pine, fir, cherry, apricots, medlar, apple, pear, olive, fig, and mulberry-trees, but they are, in general, much degenerated with respect to size; and the fruit-trees only blossom, but scarce ever bear any fruit. The peach-tree, however, produces fruit, and the vines transplanted hither, bear grapes, but a kind of white louse is very destructive to both. The poleché is a tree that affords a pleasant shade; the bambou is useful in various domestic matters. The banana is very common, and the blacks are exceeding fond of its fruit. They are treated with it in great plenty every new-year's day; and they usually count their years of sorrow and servitude by the number of banana seals they have regaled at. The gonyava tree is a kind of medlar, the jamroe tree resembles a rose tree, but bears a small fruit of a sweetish but insipid taste. The badamier yields a kind of almond; the avoc at serves as a sweetmeat, the jaca tree furnishes a large fruit, which is rather agreeable to the taste.

The

The tamarind tree here has a beautiful head, its leaves are spread during the day, but closed at night, like most other leguminous plants. Its pod contains a mucilage, which makes excellent lemonade. Orange and citron trees abound, but the fruits of each are but indifferently tasted. The cocoa-trees, however, produce nuts, which are very delicious. Date, palm, fago, &c. are found here, but in no great perfection.

Upon the whole, the climate of this island is rather too cold for the vegetable productions of Asia, and too hot for those of Europe properly to succeed in. Therefore the exotics of Africa are best calculated for transplanting hither.

Of the animals of the Island of Mauritius, as well natural to the place, as those imported from other countries.

THE only quadrupeds natural to this island are monkeys and rats. The monkeys are of a middling size, of a reddish colour, and have long tails. They frequently go in droves, and pillage the houses. When they are on the scout, they will fix themselves on the tops of trees, and the points of rocks; and if any of them see any danger near, they cry out to alarm the rest, when they all immediately decamp.

The rats have ever been so numerous in this island, that it is said the Dutch abandoned it on that account. They are much the same as those of Europe, from whence it is supposed they were originally brought. They make great destruction to the corn and fruits, particularly the former, inasmuch that a whole field of maize has been known to have been destroyed by them in a single night. In short, the havoc these animals make here, is almost incredible.

Among the birds here is one called corbigaux, which is reckoned the best game on the island; but they are very difficult to catch.

Parrots are very plentiful, but none very handsome. There is also a species of the paroquets; they are about the size of sparrows, and have green bodies, with grey heads.

Here is a bird called by the natives Pailencus, and by the English, the tropic bird. There are two sort of them, one of which is all white, and the other variegated, having the body white, the beak black, and the tail and claws red. They build their nests in the woods, but are generally found near the sea; and are so little intimidated, that they are very easily caught.

The woods abound with black-birds, which are a kind of game particularly admired by the natives. There are also two sorts of pigeons, one of which is called the Dutch pigeon, and is exceeding good; but the other, though pleasant in its taste, is of so bad a quality, that those who eat of them are thrown into strong convulsions.

Near the sea side are found great numbers of Toulou-roux; these are a kind of amphibious crab that make burroughs under-ground, like moles; they run very fast, and, when attacked, will snap their claws by way of defence.

But the most extraordinary creature here, is that called Bernard l'Hermitte: it is a kind of lobster, whose hinder part is not provided with a shell: but it instinctively lodges itself in empty shells which it finds on the shore. They run together in great numbers, each with its house after it, which it abandons for a larger one as it advances in growth.

There are great numbers of insects in this island, the most destructive among which are the grass-hoppers. Ants are also exceeding numerous, and very troublesome in the houses, as it is a difficult matter to secure the provisions from being destroyed by them.

Here are likewise wasps, spiders, various kinds of flies, centipedes, and lizards. Moths, or small butterflies, so infect the houses after dark, that they are obliged to put their candles into glass cylinders. These flies draw into the houses a very beautiful lizard: it is about five inches long, and has bright and sparkling eyes; it climbs along the walls, and lives upon flies and other insects: they are not in the least mischievous; but, on the contrary, so tame, that if sugar is thrown on the ground, they will immediately come and take it.

The greatest enemy to the insects is the spider, some of which have bellies as big as a nut, with large paws, covered

with hair. Their webs are so strong, that even small birds are sometimes caught in them. They are of particular use in destroying the wasps and centipedes.

There is an insect here called formicaleo, which is particularly destructive to the ants; and another named canerelas, of which there are three sorts: the most common are about the size of a cock-chaffer, of a reddish brown: another sort of them is flat, and of a grey colour. The houses are greatly pestered with them, especially in wet weather; and they are very destructive to furniture and books.

A late celebrated writer, in speaking of the insects of this island, says: "The temperature of this climate is so favourable to the propagation of insects, that in a short time the fruits would be eaten up by them, and the island itself become uninhabitable, but most of the fruits of these meridional countries are clothed with a thick rind, and afterwards with a skin, a very hard shell, and an aromatic bark, like the orange or citron; inasmuch that the flies can introduce their eggs into very few of them only. Many of these noxious animals are at perpetual war with each other. The formicaleos lay snares for the ant; the green fly pierces the canerelas; the lizard hunts the butterfly; the spiders spread nets for every insect that flies; and the hurricane, which rages once a year, annihilates at once a great part both of the prey and of the devourers."

Having thus particularized the animals natural to this island, we shall now take notice of those brought into it from other countries.

Among those of the quadruped kind, which may be called domestic, are horses, oxen, sheep, and hogs. The horses are very small, and so dear, that a common one cannot be purchased for less than an hundred pistoles. There is one sort of oxen here, of the Madagascar breed; but they are not so good as those from Europe, nor will the cows of that breed give half the quantity of milk. The sheep are large and fat, but they are apt to lose their wool. The pork is at least equal in quality to that of Europe; but it will not receive the salt, on account of the peculiar acidity of that article.

In the woods are great numbers of wild goats, wild hogs, hares, and flags. The latter are particularly numerous, and of infinite service to the natives, their flesh being exceeding good, especially from the beginning of April to the end of August.

They have various kinds of poultry; but the most common are ducks and fowls, the former of which were brought from Manilla, and the latter from Europe. They have also a small species of fowl from China, whose flesh is exceeding delicate.

The wild fowl are pintadoes, Chinese pheasants, pigeons, and three sorts of partridges: these birds always roost on the tops of trees, to secure themselves from being destroyed by the rats.

Among the small birds is a very beautiful one, called the Titmouse, which has a number of white spots on the wings. There is also another brought from Bengal, called the cardinal, whose head, neck, and belly, at a particular part of the year, is of a lively red, and the rest of the plumage is of a party-coloured grey.

The most propagating bird in this island is that called the Martin, which, in size, colour, and aptitude to talk, greatly resembles the English starling. It will perch upon, and peck at bealls, without fear; but its chief prey is the grass-hopper, which it pursues with an unwearied perseverance. They always fly in pairs, and constantly assemble at sun-set in very considerable flocks. Their flesh is very indifferently eating, notwithstanding which the shooting of them is prohibited.

There are two sorts of birds here, brought from the Cape, one of which is called the gardener's friend. It is of a brown colour, about the size of a large sparrow, and lives upon worms, snails, and small serpents, which it not only eats when pressed by hunger, but makes an ample store of, by sticking them on the prickles of the hedges. The other Cape bird is much like the English sky-lark, and is the only inhabitant of this island that is heard to sing. They were first brought here as curiosities, but some of them escaped to the woods, where they bred so fast, that they are now exceeding numerous.

In the ponds and lakes are two sorts of fish, one of which is the Chinese gold-fish: these thrive equally

equally well as in their own climate; but as they increase in bulk, they lose their beauty. The other is called Gourami, and was imported from Batavia. It is a fresh-water fish, about the size of a salmon; but the taste of it is far superior, and it is reckoned the best fish in India.

Several attempts have been made to bring frogs here, that they might eat the eggs which the mosquitoes lay on the standing-water; but from the difference of climate, or some other cause not known, every attempt has hitherto proved unsuccessful.

We shall now mention an animal of a very singular nature, which Mr. Buffon calls the great Madagascar bat, yet as it is common not only to the island of Madagascar, but to the islands of Bourbon and Mauritius, and particularly predominates in the latter, we think proper here to describe it. But it is necessary to premise, that the bats seen in Great Britain are insolent and minute, incapable, from their size, of injuring mankind, and not sufficiently numerous to incommode them; but here there is a larger race of bats that are truly formidable: a single one is a dangerous enemy; but when they unite in flocks, they become really dreadful. Des Marchais says, that if the inhabitants of the African coast were to eat animals of the bat kind, as they do in the East-Indies, they would never want a supply of provisions. They are so numerous, that when they fly they obscure the setting sun: early in the morning they are seen sticking upon the tops of trees, and clinging together in great heaps. The Europeans often amuse themselves in shooting them, and the negroes are expert in killing them; they, however, regard the bat with horror, and would not eat it if they were starving.

This animal is about a foot long, from the tip of the nose to the insertion of the tail; and its extent, from the tip of one wing to that of the other, is about four feet. It has large canine teeth; that is to say, four cutting teeth above, and four below. The nose is black and sharp, the ears large and naked, and the talons crooked, strong, and compressed sideways; but it is without a tail. These animals differ in colour, some being of a bright red, others of a brown, and others of a dark dusky colour. It resembles the common bat in its internal conformation, in the form of its wings, and the manner of its flying. When these creatures repose, they stick themselves upon the tops of the tallest trees, and hang with their heads downwards; but at other times they frequently settle upon animals, and even upon man himself. They devour indiscriminately fruits, flesh, and insects; and are, in particular, so extremely fond of the juice of the palm-tree, that they will intoxicate themselves with it till they drop to the ground. At night they may be heard in the forests, at the distance of more than two miles, with a most horrible din; but they usually retire at the approach of day. Nothing is safe from the depredations of these noxious creatures: they destroy fowls, and domestic animals, if they are not properly secured, and frequently fallen upon the inhabitants themselves, attacking them in the face, and inflicting very terrible wounds. It is very probable, as M. Buffon observes, that the ancients took their idea of harpies from these fierce and voracious creatures, as they both seem to concur in many parts of the description, being equally cruel, deformed, greedy, and uncleanly.

Monsters more fierce offended Heav'n ne'er sent,
From hell's abyss, for human punishment;
With panches foul, with ordure still unclean,
With claws for hands, and looks forever lean.
_____ with hideous cry,
And clatt'ring wings, the hungry harpies fly.

The Indians eat these animals, and say the flesh is very good, especially at particular times of the year, when they have more fat than usual; and even some of the French here, and in the Isle of Bourbon, have brought themselves to use them, in order to give a relish to their bouillous; but the negroes hold them in the utmost abhorrence, and will not touch them upon any account. Persons have been attacked by these creatures, and have sometimes passed from a sound sleep into eternity; for the bat is so dexterous a bleeder, as to insinuate its sharp-pointed tongue into a vein unperceived, and to suck the blood till it is satiated, at the same time fanning with its wings, and agitating the air, which, in these

hot regions, lulls the sufferer into a still sounder sleep. It is therefore dangerous to repose in the open air, or to leave open any entrance to these noxious animals.

Of the marine natural Productions of the Island of Mauritius, or Isle of France.

WHALES are frequently seen to the windward of the island; but they are not so large as those in the northern seas. There is no established whale fishery here, yet the negroes are not unacquainted with the method of harpooning them. Sea cows are sometimes caught, and their flesh, in some measure, resembles beef in taste. The veuille is a blackish fish, and has some similarity to the coal-fish in taste and make.

Many of the fish near this island are of a poisonous quality, in particular the white ones, with a large belly and great head, such as the captain and carangue; and of the rest it is to be observed, that the smaller the fish the greater the danger. The most esteemed fish for eating here is a kind of turbot, called the water-pullet, the fat of which is green, and exceeding delicious. The hog-fish has a head like a pike, and upon its back are seven points, as large as its body, the pricks of which are very venomous: a membrane, streaked with brown stripes, and resembling the wing of a bat, unites them.

The perouet-fish is so called from its exact resemblance to the bird of that name; for it is green, hath a yellow head, and a kind of white crooked beak. The fishes of this species likewise go together in numbers, like the birds called perouets.

The eels are of the conger kind, furnish but bad food, and are very dangerous to those that attempt to bathe in the creeks where they are found; as they are in general eight feet long; to the full as thick as a man's leg; exceeding voracious; and capable of killing any person they attack.

Here are great numbers of lobsters, cray-fish and crabs; the two former are of a fine blue colour, marbled with black, and the latter is principally grey. One species hath the eyes in two long tubes, like telescopes, which, when not in use, are deposited in grooves along the side of the shell.

Among the shell-fish, here is one of a very singular nature; for the usual order seems to be reversed: the animal is on the outside of the shell, the whole appearing as a shapeless mass, soft and membranous, in the middle of which is a single bone, or shell, smooth and arched.

The tulier, an enormous fish of the oyster kind, is common here: the shell is supposed to be the largest which the sea produces.

With respect to other marine productions, Mauritius, or the Isle of France, is surrounded by madreperes, a kind of vegetation of bones formed like a plant or shrub. They are so exceedingly numerous, that many of the rocks seem formed of them only. Among the madreperes that adorn and diversify the sea shores are, some exactly resembling cauliflowers, others cabbages, wheat-stalks, trees, &c. Many are of the coral kind, and exhibit a prodigious variety of colours, but these are, in general, so brittle, that it is not worth while to send them to Europe. Star-wort is sometimes seen, and ambergris was formerly plentiful, but very little of it is found at present.

Of the inhabitants of Mauritius, white, black, &c. Their customs, manners, &c.

THIS island, when first discovered, was uninhabited. The first French people who established themselves here were a few husbandmen from the island of Bourbon. These people were simple in their manners, industrious in their callings, and hospitable in their behaviour. When the importance of the island was known, from its situation, in the course from Europe to the East-Indies, many persons came to settle here, particularly several who were sent by the French East-India company. These, by their tyrannical and avaricious behaviour, soon became exceedingly obnoxious to the people in general; commerce employed their thoughts, but they had not the least idea of humanity; they fancied they came so far to get money, not to do good; and, instead of clearing the lands for the purposes of agriculture, they cleared them to erect dwelling-houses and warehouses, which they might sell at an exorbitant price to new settlers.

It is true, complaints were made of their arbitrary proceedings; but the aggressors were too great to be punished, and the complainants too little to obtain redress.

Many seafaring people afterwards settled here, who hoped to gain great advantages from the intermediate commerce between Europe and India; but these neither mended the manners, nor the morals of the rest of the inhabitants.

Soon after, the French East-India company sent a military force hither, commanded by officers whose families were very good, but whose pockets were very low. These, having more pride than money, did not choose to keep company with the merchants or clerks, because they were sordid; with the planters, because they were mean; nor with the sailors, because they were brutish; so they kept company with each other, and remained as poor in the Isle of France, as they had been in Old France.

Some of the king's troops then touched here, and several of them became settlers; but these entertained a sovereign contempt for the company's troops, and the rest of the inhabitants; and this dislike was cordially retained by the other parties holding them in the highest disdain.

The next settlers were some missionaries of the order of St. Lazarus; when all the endeavours of these were to reign uncontrouled over the minds of the inhabitants, as the company's principal servants did over their lives and properties.

A succession of scheming merchants followed; who introduced monopolies, and all the chicanery of trade; and at length, to complete this heterogeneous group, the late war occasioned the scum of Europe and Asia to emigrate to the Isle of France; bankrupts, ruined libertines, thieves, prostitutes, and wretches of every denomination, driven by their crimes from the former, or by the bad success of the French arms from the latter, sought refuge here. "On the arrival of this kit of men (says an admirable writer) the complaints, both general and particular, of the inhabitants, were augmented; every character was traduced with an Asiatic ingenuity, hitherto unknown to the calumniators of our climate. No woman was now looked upon as chaste; nor any man as honest; all confidence and esteem were at an end. Thus by vilifying all mankind, they thought to reduce all mankind to their own level."

At length, in the year 1765, the French East India company yielded up to the king a colony which had cost them so much trouble and expence; when the ministry took this opportunity to send several of their minions, sycophants, and creatures, for whom they could not provide in Old France, to the Isle of France, that the latter might there provide for themselves, and the former get rid of their importunities. These added to the number, and increased the vices of the inhabitants; and now discord reigned over the whole island, and extirpated that love of society, which might have been expected to prevail among persons residing in an island formed of little more than a number of rocks blended together, in a remote corner of the world; secluded from the rest of mankind, and surrounded by an immensity of tempestuous seas.

The people in general here are greedy of gain, yet, grasp what they will, they are never satisfied; an hundred and fifty per cent. appears too trifling an advantage to content them, for avarice hath a most insatiate appetite. The desire of accumulating riches continually encreases the population of the island; but was you to hear the discontented voice of the people, you would conceive that it must, in a very short time, become again uninhabited; for every man declares he will go away the ensuing year; and some of them have made this declaration for 20 or 30 years successively, yet they seem fixed to the spot, and remain still to make the same declaration for years to come.

A gentleman, who resided a considerable time upon the island, says, "probity and honour are of no esteem; the cunning man is here the *man of wit*; it is, however, in my opinion, a character only worthy of foxes; it is certainly not a property natural to the human species, and a wretched society must that be, where it is looked upon as an estimable quality. On the other hand, mistrustful and wary people are much disliked; this may appear a contradiction, but the reason is, that there is less to be got from persons used to be on their guard, who

may detect and expose those who would impose upon them. Their insatiability, with respect to the feelings which constitute the happiness of a generous mind, is extreme. They have no taste for arts of literature; every sentiment of humanity is here depraved, nay, I may say extinct. I was once at the funeral of a considerable merchant, but saw no signs of affliction. His brother-in-law remarked, indeed, that they had not dug the grave so deep as it should have been. This indifference extends to all that are about them; the streets and courts are neither paved, nor planted with trees. The houses are meer cabbins of wood, which may be easily removed from one place to another upon rollers; the windows have neither glass nor curtains; and the houses have but little furniture, and that little but very shabby. There is a sort of an exchange, where people meet at noon and in the evening; here they make their bargains, and rail at, and talk scandal of their neighbours."

In proportion to the number of people, few here are married; the rich pretend they do not chuse to marry till they return to Europe; the poor plead their poverty as an excuse; but the real reason is the facility of access to the negro girls. The people, in general, are immoderately fond of dancing; and the women, in the plantations, seldom or never come to town but at Easter, to con.acts, or when a ball is announced.

The usual mode of travelling, particularly for women and children, is in palanquins, carried by slaves; for the badness of the roads, and unevenness of the streets, will not admit of the use of wheel carriages. The women are pale, but well made, and in general handsome. They have great vivacity; and, if properly educated, would be agreeable companions; but few of them can read; yet, ignorant as they are, they are much less depraved than the men; being of a domestic turn, sober, careful, and neat in the extreme. Their most usual dress is muslin, trimmed with rose-coloured taffaty. They are extravagantly fond of their children; yet being ignorant themselves, they bring them up in utter ignorance; and what is worse, the children imbibe with their milk the vices of the negro women, who are their nurses, and generally suckle them.

The black inhabitants of the island are either Indians or negroes.

The Indians are Malabars, or Malayans, who come from Pondicherry, in order to articulate themselves as servants for a certain term of years. These occupy a suburb called the Camp of the Blacks; in general they work at trades, are sober and thrifty, but lascivious. They are clad in long muslin gowns; wear a turban on their heads; have gold rings in their ears, and silver bracelets on their wrists. Some few who do not like work engage themselves to serve the principal and richest people as running footmen. These being equipped with a handsome cane, and a poignard at the girdle, affect great state, and deliver the most trivial messages with such an appearance of profound gravity, as to appear truly farcical.

The negroes or slaves are brought from Madagascar, where the greatest price for a stout slave does not exceed seven pounds ten shillings sterling. These are neither so black nor so badly featured as the natives of Guinea; but resemble the Europeans in features, and in complexion incline to a copper colour. They are in general active, ingenious, grateful for favours, and faithful when well used; and have a quicker sense of an insult done to any one they love, than of any personal injury to themselves. After having been purchased at Madagascar, they are landed, with only a rag round their loins, at the Isle of France, where being sold, it frequently happens that husbands, wives, brothers, sisters, friends, lovers, &c. are cruelly torn asunder, and bidding each other a long farewell, are driven in the greatest anguish to the respective plantations for which they are bought. Some upon these occasions have been known to turn frantic, and do mischief, which is imputed to the horrors they conceive at the apprehensions of the dreadful fate to which they imagine they are doomed; for it is a prevailing notion with some tribes of the Madagascar negroes, that the white people intend eating their flesh, making red wine of their blood, and gunpowder of their bones; nor are these strange ideas to be wondered at, considering the innumerable barbarities of the whites, which have given the blacks occasion to suggest them.

In the plantations, every day as soon as the dawn begins to peep, a signal of three smacks of a horse-whip calls these unhappy wretches to work, when they toil through the day almost naked, broil in the meridian sun's excess of heat, and experience the extremities of hunger and thirst, for their food is only maize, manioc root, or cassava root, and those but scantily allowed them; and though water may be had for nothing, yet their tyrannical task-masters will hardly allow them time to refresh themselves therewith. The most trivial offence is punished by a most dreadful flagellation, after which an iron collar, with three sharp spikes, is put round the unhappy offenders neck, and he is again sent in that condition to pursue his labour. Yet after this inhuman treatment the poor wretch, on his return home in the evening, though perhaps ready to faint with the fatigues of the day, and the anguish of mind and body, is not permitted to retire to rest till he has repeated a prayer for the prosperity of his worthy master, and has returned him the most respectful thanks for his wonderful goodness! a refinement upon cruelty, which certainly must double the anguish of the stripes originally given, and could be exacted by none but minds infernally bent. This dreadful treatment extends to each sex indiscriminately, the females having no more mercy shewn them than the men.

Some years since the French government, for the relief of these miserable wretches, instituted a code of laws, called the *Code Noire*, or *Black Laws*; and these statutes enact that they shall receive no more than 30 lashes for any offence whatever, that they shall have meat once a week, a new shirt annually, and not be obliged to labour on Sundays. These regulations, however, have not as yet had any effect, for the brutal planters have hitherto disregarded the laws of the mother country, and followed only the dictates of their own inhumanity.

When a stranger seems struck with horror at these fights, the inhabitants coolly tell him, "you don't know the blacks, sir—they are such gluttons that they will steal victuals whenever they have an opportunity—are so idle that they have not their masters business at heart. And the women are so inattentive to their families, that they would sooner procure an abortion than bring children into the world." These are their curious arguments in excuse for their excess of barbarity, when it must appear obvious to every thinking mind, that if they steal food, it is because they are almost famished, if they do not their masters business, it is because treated too cruelly to think kindly of them; and if the women are not fond of bringing children into the world, it is because they would not have their offspring treated with the inhumanity they themselves continually experience.

Love is the only passion which keeps the Negroes from absolute despair, this cheers their drooping spirits, and invigorates them to go through their daily labour. For the object of their passion they despise dangers and laugh at difficulties. When a Negroe is in love, he will in the evening forget the fatigues of the day, and with ala-

city go many miles and run many hazards to converse but a few minutes with his beloved mistress.

When overwhelmed by despair, a Negroe will sometimes attempt to get back to Madagascar in any little boat he can steal, and run the hazard of being drowned, rather than continue in slavery. If this expedient fails, he flies to the woods, where he secretes himself in the most obscure recesses, from whence he sometimes makes excursions, at once to gratify his revenge, and obtain plunder.

Troops are frequently sent to ferret the absconded slaves from their lurking places, and sometimes the principal people form parties of pleasure, as they please it, to hunt them; when a negroe is put up, like a beast, and hunted down, or shot, like any wild animal; then his head is cut off, and carried away in triumph, the unexampled trophy of the most atrocious cruelty.

When one of these negroes is taken, without being hunted, his sentence for the first offence is to be severely flogged, and to lose an ear; for the second, to be still more severely whipped and ham-strung; but the third offence is punished with death, which is executed by hanging, or breaking on the wheel. Some of these negroes have been baptized, but that hath given no encouragement to others to become Christians; for those who are baptized are no better used than those who are not; as the planters think more of their own interest than of the religious sentiments of their slaves.

With respect to commerce, the inhabitants of this island receive

The most of their household utensils	} from	China. India. Madagascar The Cape of Good Hope Spain
Their apparel		
Their slaves		
Many of the articles of provender which they consume		
Their money		

And we might add, their laws and government from France; their follies from various nations, both white and black; and their vices, at the head of which stand inhumanity and avarice, from the arch-enemy of mankind, the devil himself.

The greatest clog to trade here is paper currency, which is payable in France, six months after its arrival there, at a loss sometimes of fifty per cent.

We have been rather ample in our account of Mauritius, or the Isle of France, as, in all other systems of, or treaties on Geography hitherto published, a description of it hath been either totally omitted, or so slightly given as scarce to merit attention. Yet this island is at present, and has been for some years past (notwithstanding the depravity of the inhabitants, and inconvenience of the climate) of the utmost political consequence. Hence the late, ed Dr. Campbell, whose ingenious writings gave his present Majesty the first idea of prosecuting discoveries in the remotest regions of the world, and prompted him to set on foot the late voyages to the South Seas, and to the North Pole, says: "The Isle of France is at present one of the finest, as it was always one of the most important and improveable, spots upon the globe."

C H A P. XXV.

Island of MADAGASCAR.

THIS island, which is one of the largest in the universe, is differently named by different people, viz.

The	{	Natives	} call it	Madagascar.
		English		St. Lawrence.
		Portuguese		L'Isle Dauphine, or
		French		the Dauphin's Island.
		Persians, Arabians, Nubians, &c.		Serendib.

It lies between the 12, 30, and 25 deg. 10 min. of south latitude, and between the 44th and 51st of longitude east from London; so that its greatest length from north to south is about 800 miles; but its greatest breadth is not above 220 miles. It lies north-north-east, and south-south-west. Its southermost point, which leans towards the Cape of Good Hope, is the broadest; and the northern point, which inclines towards the eastern ocean, is much narrower. At a distance from the sea are very high and steep mountains; but it abounds nevertheless with spacious plains, extraordinary good pastures,

rivers and lakes, well stocked with fish; agreeable springs, the water of which is, perhaps, the best in the world; and large forests always green, where lemon and pomegranate-trees, agreeably mixed with odoriferous flowering trees, perfume the air with the most delightful scent.

This island is intersected, and its coasts divided by rivers which have their source in the inland parts, and discharge themselves into the sea. The bays and gulphs are innumerable, and in general abound in good roads and harbours, so that the island might be rendered of great consequence. The French always claim the honour of having first discovered the maritime countries between the bay of Antongil and the bay of St. Augustine, although the Portuguese, in all their voyages to East India, have constantly, since the year 1506, anchored in this island, and improved their discoveries; and the Dutch have followed the example of the Portuguese; and it must be allowed that the French have penetrated farther into the country than either.

This island is divided into 28 provinces, or counties, which form to many distinct people and governments, viz.

| Ranoumene | |
| Ranoumaninthy | |
| Sahaurinha | |
| Soumaudo | |
| Manatengh | } These all run through, and water the province of Machicore |
| Manfatre | |

All these provinces are pretty large; Machicore, the

largest of all, is about 70 leagues long, and 40 broad: But the most populous are Vohits-Anghombe and Eringdrane. These several nations are perpetually at war against one another; ancient quarrels are the pretences of these wars, but the true cause of them is the desire of plundering each others goods and cattle. Every one of these provinces is governed by a petty tyrant, who usurps the sovereign power, either by main force, or by artifice. The sons succeed the fathers, and thus the same family keeps the inhabitants of the province in perpetual subjection.

We shall now speak of these provinces respectively; as many things must be locally related, which cannot come into the general description of this large island.

1. The province of Anossi, or Carcauss, or, as some writers have called it, Androbizalar, extends from the province of Manatengha to the river Mandrerei. Crocodiles swarm in all the rivers of this province, and indeed they are to be found in all the rivers of the island. A lake is found at the head of the principal river, called Franchete. The name of this lake is Ambone; it is half a league over, and has sufficient depth for any ship, if the mouth was constantly open, which might very easily be effected. The cape which runs out from the river Franchere is by the French called Cape St. Roman, but the natives name it Kanevate. When the Cape is passed, the coast forms a fine bay in the shape of a cross, as the land projects into the middle of it, and forms a peninsula, called Tholangare. Fort Dauphin lies to the north of this peninsula, and Port Dauphin over against it; and hence the French call this bay Dauphin Bay. The entrance is rocky and dangerous; but within it is a secure harbour for either shipping or boats. A small island, called by the French St. Clare, lies near and forms another convenient harbour. This province includes several other less considerable peninsulas, and smaller islands on the coast. The country, upon the whole, is beautiful, and abounds in fruit-trees; and is fertile in pastures for cattle. It is surrounded by mountains, finely diversified with hills and plains; and with proper culture might be made to produce not only all the necessaries, but even all the luxuries of life.

This province, besides villages and hamlets, contains eight towns, viz.

- | | |
|------------|-------------|
| Franchere | Maromamou |
| Imanhal | Imours |
| Cocombes | Marofontons |
| Andravaule | Fananghe |
| Ambonetana | |

Several leagues from Fort Dauphin the Portuguese had formerly a fort, on the summit of a high rock, and several inclosures that furnished them with all sorts of provisions; but they were at length all massacred by the neighbouring natives.

In this province the mountains are covered with trees and shrubs, and the French have often dug here, in expectation of finding gold; they have, however, been always disappointed. In the rivers indeed, they sometimes found stones, and yellow clay, intermixed with black and white spangles, the latter shining like silver; these they carefully pounded and washed; but the separated matter proved much too light. Some writers, nevertheless, report that the Portuguese, by digging here, formerly found gold, and that the places where they dug had been filled up by the natives, after they had driven those invaders out of their country.

The inhabitants of this province are of two kinds, viz. whites and negroes.

The whites are descended from some Arabs, who settled here upwards of two centuries since; and the negroes are the original inhabitants of the country. The whites are divided into three classes or degrees, viz.

- Rohandrians
- Anacandrians
- Andzath

And the Negroes are divided into four classes, or degrees, viz.

- Voadziri
- Lohavohits
- Antsaa
- Andeves

The Rohandrian whites are the nobles, and from among them the chiefs and kings are chosen.

The Anacandrians are of the blood of the Rohandrians, but it is by a degenerate mode, or in other words they are the illegitimate offspring, or the descendants of the illegitimate offspring of the kings, princes, and nobles of the Rohandrian race. Both these classes enjoy the privilege of killing cattle, which is considered as a mighty great honour in Madagascar.

The Andzati is the lowest class of the whites, being the illegitimate descendants of the Anacandrians. The people of this class are in general fishermen, and they are not permitted to kill any living creature except the fish they catch, and chickens.

All these people, though distinguished by the name of whites, are in fact rather of a copper colour, and their hair hangs down in ringlets.

With respect to the Negroes, those of the first, or Voadziri class are the most powerful and rich, are masters of several villages, and descend from the original lords of the country, though they are at present, and have been for a considerable time, subordinate to the whites. They are permitted to kill cattle if no white happens to be in the village, but if a white is near at hand, they must not aspire to such honour.

The Lohavohits, or second class, are chiefs, but still they are inferior to the Voadziri; as the Voadziri are lords of districts, and the Lohavohits only of single villages. These are likewise permitted to kill beasts for their own use, when they are absent from any white.

The people of the Antioa, or third class, are the legitimate offspring of the Lohavohits; and the Andeves, or the people of the fourth class, are considered in a despicable and mean light, the term itself, by which they are denominated, implying *left men*, and as such they may be considered, since they are either slaves made by the fortune of war, or the children of slaves. In times of famine, or scarcity, if the masters of the Andeves cannot, or will not support them, the latter have the privilege of changing masters, and giving themselves to be the slaves of others; but freedom is a thing they never can obtain, till death releases them from their tyrants. Others may vary their circumstances by industry, and gain an accession of wealth by fortunate contingencies, but the unhappy Andeves have no alternative, nor any hope beyond the idea of slavery; to the others

- “ Good unexpected, evil unforeseen,
- “ Appears by turns as fortune shifts the scene;
- “ Some raised aloft, come tumbling down again,
- “ While others fall, rebound, and rise again.

But the wretched Andeves are invariably fixed in the most unhappy situation that human nature is capable of experiencing, viz. perpetual captivity; and are without the least pleasing gleam of hope of ever hiding any alteration in their circumstances.

2. The province of Manatengha is well watered, fruitful, and agreeable, but nothing remarkable is mentioned concerning it.

3. The valley of Amboule is finely watered by a variety of springs, which it receives from the mountains of Encelida, Hela, and Manghaze. In the midst of this pleasant valley stands the large town of Amboule, which is populous in itself, and the circumjacent territories abound in cattle, plants and fruits, particularly white yams, and the herb scumbe, whose compressed seed produces the oil menachil; and the cattle are here remarkably fat and fine. This province produces iron; and near the town of Amboule is a hot fountain of mineral water, which is deemed exceeding efficacious in the gut. The people of this district are principally employed in manufacturing weapons and domestic utensils, with iron and steel. With respect to their dispositions, they are licentious and dishonest, so that this district, or province, is deemed the retreat of the roguish and lazy, who escape from other provinces, and run thither in order to herd with such whose characters resemble their own.

This province is subject to a Rabetau, or great lord, who is exceeding rich, particularly in cattle, and rules in a very arbitrary manner. Subordinate to this Rabetau is another, who rules over a little district called Izame. This district contains only about 800 persons, the men of which are deemed the best soldiers in the island.

4. The province of Vohitsbang extends from the river

Manatengha, to the river Mananghare, and stretches up the country to the river Itomampo.

The sea coast of this province is mountainous, and covered with thickets, and the plain parts are fertile and abound in honey, sugar canes, yams, rice, and other grains, cattle and iron mines.

The inhabitants of this part are black, with thick long curled hair, extremely quarrelsome, vindictive, cruel, treacherous, and revengeful. They are great thieves, and pay no little regard to humanity in their robberies, that they frequently steal the wives, children, and servants of their nearest relations, and sell them for slaves. They have conceived an implacable hatred to the white natives, as they are possessed with the notion, that the latter have the power to bewitch them, and what belongs to them, and to send diseases and death among them and their cattle.

Their garments are made of the bark of a tree called frautraltraou, and those brought from Matatan are made of another bark called avo. They travel into the provinces of Anossi and Ampatre, and their arms are a heavy dart, and a wooden shield covered with the hide of an ox.

5. The province of Itomampo is only about three leagues in length, narrow in proportion, situated in a valley surrounded by high mountains, and the best steel in the island is prepared here.

6. The province of Icondre is likewise very small and mountainous. Its boundaries on the north-east are high hills, which divide it from the country of Itomampo. On the south are the countries of Vatemahon and Machicore; the other boundaries are hills and woods adjoining to various provinces.

7. The province of Vatemahon, which adjoins to that of Icondre, is uninhabited at present, the whole race of its inhabitants having been extirpated and destroyed by the wars.

8. The province of Anachimouffi is said to be four days journey in extent, and is principally bounded by mountains or rivers. This province is extremely populous, finely watered, and exceedingly fertile in cattle, yams, rice, and every other necessary of life. The title of the prince of this province is decan or dian panohaha, whose subjects formerly became very rich and powerful, by the assistance of the French in the wars carried on by them against the neighbouring provinces.

9. The province of Eringdrane is a fine flat country, of great extent, and divided into two districts, viz. greater and lesser, which separation is by the river Mangharac.

10. The province of Vohits Anphombe is divided from that of Eringdrane by the river Manantara, which river has its source in Eringdrane.

We are told, that these two provinces are uncommonly fertile, and so exceedingly populous, that Eringdrane can send into the field 30,000, and Vohits Anphombe 100,000 fighting men. In both these provinces, the towns and houses surpass, in beauty, those of any other. Iron, steel, and all the necessaries of life abound here. Cloaths are made of the rind of banana trees, and these garments are very near as fine as silk, and, by the natives, are preferred to it, though they can likewise make silk. The people of these two fertile provinces are, however, very great enemies to each other.

11. The province of Manacrongia is situated on the sea coast, the inland parts being bounded either by rivers or mountains. The river Mananghare, which waters this province, is formed by the conflux of these rivers, viz. the Itomampo, the longainon and Mangharac, besides many small rivulets that run down from the mountains, and, which all uniting, lose their respective names, and take that of Mananghare. This river afterwards separates, and disembogues itself into the sea, by seven mouths, none of which are navigable, on account of the rocks in them, nor is the river itself, though a very wide one.

12. The province of Matatan is situated near a river that bears the same name, which hath its source in the adjacent mountains, and discharges itself into the sea by two mouths, which are seven leagues distant from each other, and form a large and delightful island.

This province is flat, abounds with sugar-canes, honey, yams, and cattle, and is watered by many rivers, which

which contain great quantities of fish. Sugar-canes grow in such plenty, that many ships might be loaded yearly could the natives be brought to make sugar, and were they furnished with necessary implements. Polygamy is allowed to the chiefs of this country, and their wives, who are generally about 20 in number, live in separate apartments in an inclosed place, surrounded by palisades, like a large town; and whoever presumes to enter it is punishable with death.

13. The province of Antavarce is watered by many streams, some of which have their source in the Red Mountains, which bound it to the north-west.

14. The province of Ghallenboulou surrounds a bay of the same name, which is very extensive, with a good road for boats behind the rocks, but extremely dangerous. The village of Ratimafou lies upon the coast of this province, but the Europeans know it by the name of St. Matthew.

15. The province of Tanetavi, situated on a bay of the same name, is well watered, and tolerably fertile.

16. The province of Sahaveh is likewise situated upon a gulph of the same name; this gulph is of great depth, the bottom is sandy and good, but the bay is unsafe on account of the excessive high winds.

17. The province of Voulovlou is near Cape Long-Point, and being well watered, is exceeding fertile. In this province is a fine harbour, between some high rocks which project a considerable way into the sea.

18. The province of Andououche is a maritime province, containing many gulphs, bays, harbours, &c. particularly the bay of Antongil, formerly called Mangahabe by the inhabitants of the country. It is situated lengthways to the north, and is about 18 miles wide. At the end of the bay stands an island extremely high above water; it is about six miles in circuit, covered with the most delightful verdure, and abounding in all kinds of grain, plants, fruits, bananas, honey, fowls, &c. Besides this island, there are some rocks, and three or four other small islands in the middle of the bay from the entrance on the north east side; some of these are town with rice, and the others covered with wood.

19. Bordering on the before-mentioned bay, is the province of Mangahabe, which contains many populous villages. On the north side of the river stands a large town called, by the Portuguese, St. Angelo. Upon advancing deep in the bay, upon the left hand, stands another called Spakenburg, built by the Dutch, in 1595, in their first voyage to the East-Indies, containing, in the inclosure, about 200 houses. The coast here is covered with forests of high trees, for several miles in length, and the interior part of the country is full of bamboo, or a kind of thick cane called bambu vocilau. The soil itself is good and fat, and, from the frequent showers of rain, properly mellowed. The meadows are rich in pasture, though the inhabitants are never rich in cattle, the greatest flock, of the most wealthy, not amounting to above twenty head. The mountains are peculiarly fruitful; and the towns, in this part, are erected with great regularity and solidity. They even exhibit some signs of taste in the choice of situation, as they are either built on pleasant eminences, or by the sides of rivers. They are strongly fortified round, and have only two gates, or entrances, one for the usual, or ordinary goings in and out, and the other towards the woods, to facilitate their retreat to those places of refuge and safety, when surprized by their enemies, or when too weak to resist. The people in general here are fairer than the whites of Matatan, their hair is long, and hanging down; they are free, liberal, hospitable to strangers, and are not addicted to murder or theft. They are fond of singing and dancing; love is the only subject of their songs, but their dances have rather an innocuous tendency.

20. The province of Adeimon is small, and so inconsiderable, that it is scarce mentioned by geographers, or voyagers.

21. The province of Mandrerei is partly watered by the river of the same name, and partly by other streams. This river which, near its source, divides the provinces of Anossi and Ampatre, runs, like a torrent, with great rapidity; it rises in the same mountain with that of Iomampo, and runs a great way to the south-west, re-

ceiving several other rivers and streams in its course, till it discharges itself into the southern ocean.

22. The province of Ampatre lies along the sea-coast, is 60 miles in length, and between 30 and 40 in breadth, from the sea to Machioure. In this province there is a great scarcity of water, which is to be had only from a few marshes, here and there, as here is no river. It is supposed that Mr. Drury, who was many years a slave in Madagascar, alludes to this country which he calls Anterdroe (the name used by the natives) in mentioning the great scarcity of water. "This employment (says he) of attending the cattle, was agreeable to me, except in excessive hot weather, when it was a great fatigue to drive them several miles to water, at least every other day; but, in the colder season, we had no occasion to observe that practice, for the dew falls so plentifully in the night, that we find it sufficient to drive them into the grafs about break of day; and even the inhabitants of this part of the country of Anterdroe, who have no water near them, go into the fields, in a morning, with two wooden platters and a tub, and, in less than an hour, will collect about eight or ten gallons of dew water, which is very good, while fresh, but will turn four in a day or two, and grow disagreeable to the taste."

23. The province of Caramboule is but a small quarter, being not above twenty miles in length, and ten in breadth. The sea bounds it to the south, and towards the west there is a gulph, which is denominated the Bay of Caramboule; and this bay or gulph runs greatly from the west towards the east, and thereby divides this province from that of Ampatre. The country of Caramboule is in general dry and barren, notwithstanding which there are some good pastures, and many herds of cattle. They have cotton and some silk, which is made into apparel by the inhabitants; and, besides the tame, great quantities of wild cattle.

24. The province of Mahafalle is situated more to the north-west, on the sea side, and extends as far as the salt river, called by the Portuguese, Sacalite. This river flows from the country of Houlouve, and turns into a gulph, an accustomed anchoring-place of the Portuguese, but never frequented by the French.

25. The province of Houlouve begins at the mouth of the river Sacalite, and extends above two days journey up the country.

26. The province of Sivah extends about twelve miles along the coast.

27. The province of Ivronheue, or the country of the bay of St. Augustine, is the next, and situated near the river longhelaha.

The river longhelaha, besides many rivulets, receives the waters of three small rivers, Orandumainthi, Otig-helamaassy and Satamaie.

28. The province of Machioure is of great extent, and of equal length with the river longhelaha. It is upwards of 200 miles from east-north-east to west-south-west, the same from east to west, and about 150 from north to south, that is from the river longhelaha, to the provinces of Ampatre and Mahafalle.

This country was, some time since, laid waste and ruined by war, the inhabitants being concealed in woods, though fear of their enemies, and subsisting upon roots only, or the flesh of wild cattle. Previous to that time, several of the before-mentioned provinces were under the sovereignty of one lord, called Dian or Deean Balacalen, or lord of an hundred thousand parks; in the life time of this prince, these countries enjoyed a profound peace, and flourished in excess of riches and pleasure, but, upon his death, a war broke out between his sons, which was carried on with so much fury and animosity, that it ended in their mutual ruin.

NATURAL HISTORY OF MADAGASCAR.

THIS island being in general well watered, its soil is very fruitful, and produces an abundance of all the necessaries of life. It has several sorts of grain, particularly rice and barley, the latter of which is called by the natives apembe; it grows exceeding high, and is ripe in the month of June.

There are also several kinds of pulse, with a great variety of plants. Among the former are a kind of small beans, called by the natives voangkemb; they are very pleasant to the taste, whether ripe or otherwise; but

they are unwholesome, being hard of digestion: they are generally sown in June, and grow to perfection in three months.

The voumifourous are small peas, about the size of lentils; they are cultivated with little trouble, and are sown at the same time with the voungkemb's beans.

The vouandron is a kind of bean produced also with great ease: the fruit lies under-ground in pods, with only one bean in each; and the leaves greatly resemble trefoil.

The vevates is much like the caper-tree, and blossoms in the same manner: each pod contains only one small pea of the size of a lentil; the plant is very fruitful, and grows to the height of a cherry-tree.

Here are likewise great plenty of leeks, purslane, lettuce, carrots, cabbage, turnips, anise, mullard and hawthorns.

This island also abounds with a great variety of fruits, particularly bananas, ananas, and water-melons. The latter are of two kinds, one with black, and the other with red seeds: the fruit is exceeding wholesome, and gives considerable relief to the inhabitants during the hot season. They have likewise such melons as in Europe, and punkins, whose first seeds were imported from France.

Besides these, there are many other kinds of fruits, as also various sorts of trees, peculiar to this island; among which we shall select the following:

The voarot is the fruit of a large tree, whose leaves resemble those of the olive, which, added to the height and extent of the boughs and branche, exhibit a very pleasing appearance; the fruit is about the size of a cherry, with a thick shell like a nut: it has a very bitter taste, and is of three sorts or colours, white, red, and black, but the two former are the most common.

The voaverone is a fruit of a violet colour, not larger than a red currant, and has a very pleasant taste. White nallberries grow also here; but they are exceeding sour; and the leaves have but a slight resemblance of those in Europe.

The voatfourte is a small solid fruit, about the size and shape of a nutmeg: they taste much like the walnut, and are exceeding good, either boiled or roasted.

Voanane is a fruit about six inches long, consisting of four parts: it tastes like a stony pear, and is a sovereign remedy in laxative disorders.

Entafale is the fruit of a large tree, which grows very stout and high: the leaves are few, and resemble those of the nut-tree; the fruit is long, and divided into different little cells, thinner than the skin that covers them: it grows on the trunk of the tree, from the bottom to the top, and is only fastened by a thin stalk, which is very curious and uncommon: the fruit is of a yellowish colour, very juicy, and of an agreeable taste.

Fons, or Jouroo, is a plant that grows like a plume of feathers, with leaves six feet long, and two broad. The fruit is called voatfonsi, and is inclosed in a hard rind or bark.

The tree called Anghiive is of two sorts, the great and lesser; the fruit of the former is about the size of a hen's egg, and the latter that of a walnut; they are both of a reddish colour, and have a delicious taste: a decoction of this tree cures the heat of urine, and the gravel.

Varacoco is a plant that twines about great trees, and bears a violet-coloured fruit as large as peaches, of an admirable taste, extremely sweet, but viscous, with four kernels in the middle; the wood of this plant is used for the making of hoops; and through the bark of it oozes a red gum, thick and resinous, which dissolves, by candle, like gum lachi, and has much the same smell.

The fruit called the vouanoune, or Indian fig-tree, has the taste and shape of European figs. If an incision is made in the trunk of this tree, there proceeds from it a liquid of the colour of milk, and of a very sweet taste; and the bark of the tree is used for the making of cordage.

Voanatin is the fruit of a large tree that grows by the sea side; its meat, though clammy and viscous, is nourishing; and is eat by the natives with milk or salt: the wood is very solid, exceeding clean and smooth, and not subject to rot, or be worm-eaten.

Vontaca is a fruit about the size of a quince; its root is as hard as a gourd, and full of flat seeds: the meat,

when ripe, has an exquisite flavour and taste, and gives the most fragrant smell; but, if not perfectly ripe, it is very prejudicial to the stomach.

Vootarte grows upon small trees with broad leaves; the fruit is about the size of an egg, and full of juice, like the cocoa-nut; the peel, dried, has an aromatic taste; and the natives make ropes, mats, and baskets of the leaves.

Achith is a kind of plant that grows much like a vine; the leaves, which are always green, are round, pointed at the end, and dented like ivy: the fruit is about the size of a grape, and is ripe in the months of December and January.

Antontoui is a small plant like flax, and of a bitter, styptic taste. It is of a corrotive quality; and, in times of scarcity, is eat by the natives to support and preserve strength. Some of them chew this plant to blacken the teeth, lips and gums, which they consider as ornamental to their persons.

Lengoa is the fruit of a creeping plant, about the size of a silberd, thick-shelled, and tastes like the large green plum; the skin, pounded, gives a black dye, and is made use of by the natives for that purpose.

Zanale is a tart creeping herb, in great esteem among the natives for the same purpose as the lengoa; as also for the cure of ulcerated gums.

Veva is a small shrub, whose leaves resemble those of the almond-tree: they are of a dark green above, white and hairy underneath, and have an attractive quality.

Hamavale is a tree with six leaves on each branch, placed opposite each other. The leaves have an odiferous scent, and when steeped in wine or brandy make an excellent cordial.

Endrach odrach is a very large tree, the wood of which is yellow, odourous, heavy, and so hard that it will not perish, though placed under-ground for a considerable number of years; from this last quality it received its name, which in the language of the natives, signifies lasting for ever.

Timandam is a tree that bears but few leaves; they are useful, however, in many cases, particularly in curing the plague and other contagious distempers.

Ferocite is a slender shrub, which produces small round cabbages, that are excellent in their taste.

The moulatate tree is covered with a green bark, hard and very prickly: it produces a fruit resembling silberds, and the wood is used for making handles to darts.

Siny Manghit, or odoriferous, is a very slender tree; and to called from the agreeable smell of its leaves and bark, the former being ferntid like white and yellow sanders, and the latter that of cloves, producing also a sweet scented resin.

Lakene is a tree whose stock is upright and hollow, and the leaves are fixed round in a spiral line like a screw.

The Pooraha produces a green odiferous balsum, and is a sovereign remedy for all sorts of wounds and bruises.

Saldits is a fine woody plant, and produces red flowers resembling leathers. The seed of this plant excites vomiting, and the root of the same stops it.

The pendie tree shoots leaves higher than an oak, and bears ten or twelve white flowers of an excellent odour.

Apocapoue is a tree whose leaves and flowers are like those of purple-lantel: the fruit is about the size of an almond, and is a strong poison; an oil, however, is extracted from the kernels, which is useful for anointing the head.

The vou'ou tree is a kind of the Indian cane, and grows plentifully in most of the provinces, particularly in that of Ghal'embon'ou. Many of these trees are very lofty, and from the extremity of their branches appear exceeding beautiful. Every three years they bear a fruit about the size of a bean, from whence might be made a flour not inferior to that from European wheat. This tree is useful to these islands as the cocoa-tree is to the Indians: it supplies them with materials for household furniture, and for various other articles: they make their wherries with it, and use it for the roofs and floors of houses.

Anpoufoutehi, is a very light wood; it is of a white colour, soft and easy to be worked. The staves of this

wood,

wood, when steeped in water, are good for several disorders, and the bark of it makes an excellent cordage.

Anaze is a large tree, and grows like a pyramid; the fruit is full of white pith, has hard kernels like the pine-apple, and in taste much resembles tartar.

The tranthaa tree is very thick and lofty, and produces a reddish liquor; the leaves are like fern, and the wood is hard and beautifully veined.

Latacanghomelabe is a creeping plant with a white blossom, which smells much like our jessamin.

Rhomba is an herb that grows high, and shoots forth large leaves: it smells like cloves and cinnamon, and is a species of balsam.

The longue is a plant that bears a flower resembling jessamin; the root of it is bitter, and is not only an infallible cure for the heart-burn, but is also an antidote against poison. There are two sorts of this plant, one which flowers white, and the other purple flowers; but those which bear the white are the most efficacious.

Anramatico is a large plant with long shoots at the end of the leaves, which have a hollow flower. This plant bears a particular, and most curious kind of fruit: it is shaped like a vase and cover, and is of two kinds, red and yellow; the natives, who believe that rain would immediately follow the gathering of this fruit, refrain from it upon their journeys; but Europeans have found by experience that relations to be romantic, and without foundation. The flowers are full of water, and some of them will contain near a gallon.

Donout is an herb bearing yellow flowers, and very thick leaves: when burnt green it has the smell of melilot, and the ashes make excellent lye.

Fimpi is a tree about the size of the olive; the bark is of an ash-grey, smells like musk, and in taste resembles pepper, though much sharper. The bark of this tree is dried in the sun like cinnamon, and whether burnt or not has a most agreeable smell; the wood is white and hard, and has also a strong scent; the leaves have the same smell as those of the aloe, and are apt to promote freezing.

Eneafatahe is a wood of a greenish colour, and full of veins: it smells like a rose, and when ground and applied to the stomach will immediately cure the heart-burn.

Vintag is a tree whose wood is never worm-eaten. It is used by the natives for building canoes, and produces a gum or resin, which is particularly good in healing wounds.

The vehat is a small shrub, the bark of the roots of which is useful in dying; if boiled with silk or woollen on a slow fire, it impregnates the stuff with a red colour, and by adding a little lemon-juice it will give it a fine yellow.

Besides these trees and plants, which are peculiar to Madagascar, there are many that resemble, or are the same with the European plants. Grapes grow to perfection in a part of the island called the Delta of Allifalab, but the inhabitants, being ignorant of their quality, are afraid to eat them.

Hemp grows here in great abundance, the stalk, leaves, and seed of which are much the same as that cultivated in Europe. The natives take particular care in the management of this plant: they chew the dry leaves in lieu of tobacco, which produces a milder effect, as they stupefy and cause sleep. Many of them use it to banish chagrin and melancholy. The stalk of the Madagascar hemp is looked upon as fit for cordage or linen, and is never used in the same manner as in Europe.

They have also great plenty of sugar canes, but the inhabitants reap little benefit from them, owing to their want of knowledge in making sugar. White pepper, ginger and saffron grow likewise in many parts of this island.

They have here several sorts of honey, called, in the language of the country, tencle. The first is made from bees, and the second from green flies called fish. They have two other sorts made from ants, one sort is from winged ants, and is gathered from hollow trees; the other from ants of a larger size without wings, who make their honey in vaultages, or great heaps of earth pointed at the top, and pierced round with holes. All these sorts of honey are exceeding sweet; but there is yet another sort esteemed poisonous, being made by bees

who suck the flowers of a particular tree that produces a sharp poison. This tree is found in several of the provinces, and is called by the natives caracara.

The inhabitants make three sorts of wines, the first and most common of which is made of honey. The second sort is made of sugar canes; the method of doing which is as follows: the canes are boiled in water till it is reduced to two thirds, after which they put it into large gourds; and in three days the wine is so strong and penetrating, that in a night's time it will eat through an egg-shell. The third sort is made with the fruit of banana, boiled four or five hours, which makes a fourth wine, somewhat in taste like cyder.

This island also produces a great variety of gums, many of which are very fragrant, and particularly efficacious in healing wounds and ulcers. One of the most distinguished among these gums is that called cacamahaca, of which there are two sorts, the one oozing from the tree spontaneously, and the other by making incisions. It is not unlike our poplar-tree, only larger and taller; its leaves are small and green, its fruit red, about the size of a walnut, exceeding resinous, and containing a stone like our peaches. The gum is good to digest tumours; and being applied in form of a plaister to the temples, and nape of the neck, it allays pains in the head, repels defluxions of rheum, and abates inflammations of the eyes. It is also good against the tooth-ach, and in arthritic pains it is used externally with great success.

The animals of Madagascar are various, and most of them peculiar only to this island. Here are three sorts of cattle, one kind horned, another with round heads without horns, and a third, whose horns are loose, and fastened only to the skin of the head. All these animals have exertions between their shoulders, somewhat like that of camels: these exertions are very fat and fleshy, and some of them so large as to weigh from 60 to 80 pounds. The natives melt down the fat, which they use instead of butter, and deem it equally agreeable in its taste.

In most of the provinces, but particularly in that of Machicore, are great numbers of buffaloes: the natives believe that they were originally domestic animals, and became wild by the long continuance of civil wars.

Here are great numbers of goats and kids; the female generally kids three times a year, and brings four at each time. Sheep are also very plentiful, and the flesh exceeding fine and juicy. Among the sheep there is one sort that have flat tails, which are so large as to weigh from 20 to 30 pounds.

The woods are inhabited by a great number of wild boars, who greatly damage and destroy the rice. These animals have two horns near the nose like great prickles, and their skin is so hard as to be almost impenetrable.

In most of the provinces, are found various kinds of monkeys and baboons: some of them are large and white, have black spots on the ribs and head, with long snouts, and are of so fierce a nature, as never to be tamed. Others have grey hair and flat noses, and are easily tamed. Those called varis are the most common; they are grey, have long snouts, and large bushy tails like foxes. There is another white sort called fisea, with good teeth, white tails, and two spots like teeth on the ribs; they are of a middling size, and will stand upright and frong on their hind legs. In the provinces of Ampatre and Matafalle is another white kind, with tails chequered white and black, that run through the woods in troops of 40 or 50 together. There is also another grey kind, with eyes sparkling like fire, and short hair, who die soon after being taken, owing to their natural wildness.

Among the animals peculiar to this island, there is one that greatly resembles a porcupine, whose flesh, though insipid and flabby, is greatly admired by the natives. It is called, in the language of the country, roudouck; but Drury calls it the ground hog, and gives the following description of it. "It is, first, of the size of a cat, with snout, eyes and ears, like an English hog; it has bristles on the back, but no tail; the feet are like those of rabbits, and it feeds upon beetles and young snails: it is very prolific, bringing about 20 in a litter, and suckling them all. It hides itself in the ground in a surprising manner; digs first two feet directly down, then two or three obliquely, afterwards works upwards

assant

assant till within half a foot of the surface, where it makes a proportionate lodging for the body, and lies five or six months without sustenance; at the expiration of which term it is as fat as when it went in. It is an excellent food, and no pains are spared to take them."

Voffe is an animal like a badger, and the flesh of it is greatly admired by the natives.

Varelle is a beast of prey, of the bigness of a fox, with a large and long tail, and has hair like a wolf.

Vintifi are a kind of grey squirrels, which keep in the holes of trees, and are naturally so wild, that there is not any possibility of taming them.

Voudioe is a small animal like a weasel, of a dark red colour; it feeds on honey, and discharges a scent much resembling musk.

Civet cats are very numerous, and their flesh is much admired by the natives.

Tretretete is an animal about the size of a heifer two years old; it has a round head, human countenance, with the fore and hinder parts of a baboon, and breeds chiefly in a desert part of the island, near the lake of Lipomani. The natives are frightened when they see it; and the animal, in return, takes to its heels on the appearance of a man.

The antamba is an animal about the size of a large dog; but in colour greatly resembles a leopard. It preys on man and beast, but keeps to the mountains, and is seldom seen.

Manganzahoe is a large beast that brays like an ass, and is thought by some to be the wild ass. These are the fewest seldom seen, as they always keep on the mountains.

The brebis is an animal with one horn in the middle of the forehead. It is about the size of a goat, and is extremely wild.

Here are neither elephants, tigers, lions, nor horses; but they have great numbers of dogs, which are in general small, with long snouts, short ears, and hair like foxes.

This island produces also several kinds of river and other birds, known, in the language of the country, by the general name of Vourou; but they are much less than those of Europe, the eggs of the hens not being larger than those of pigeons. Here are many pheasants, which are the same as those in England; but there is a particular sort that have violet feathers and a red beak. Here are likewise small paroquets, and some of a dark red, but these last are very scarce: small green finches that whistle, and imitate the songs of other birds; wild turkeys; black, white, and grey eagles, with fine plumage; wild flocks, with crests on their heads; common teal, and a particular sort, with red legs and claws, called halives; pelicans; black and white herons; water-wag-tails, &c.

Samba is a bird whose feathers are as red as fire.

Vourouchontfi are white birds that follow the cattle, and feed upon the flies and beetles found on them; they are generally very lean, and to ill tasted as not to be of any use to the inhabitants.

Voula is a river bird, with a long and white beak; it is about the size of a pelican, and its flesh is tolerable good eating.

Talva is also a river bird, about the size of a hen, with violet plumage, and red beak and feet.

Horetac is a bird with a red crest on the head; and has black feathers, and feet like a teal.

Takia is a bird whose wings, feet, and beak are black: it is about the size of a black-bird, and has but one simple note, from which it received its name; for it is continually calling Takia, in the same manner as the cuckoo is so called in England, from its note being expressive of that sound.

The island of Madagascar produces also a great variety of insects and reptiles, among which are the following:

The famosantaton, or breast-leaper, is an extraordinary, but dangerous insect. It is about the size of a small lizard, and fixes itself, as if glued, to the barks of trees, with its mouth always open, ready to catch spiders, flies, and other insects. They are called breast-leapers, from their leaping on the breasts of those who approach the tree where they are; and so fast do they stick, that it is impossible to get them off without cutting away that part of the flesh on which they are fixed.

Mandouts is a kind of serpent that feeds on bats and small birds: it is about the length and thickness of a man's arm, and not venomous, though deemed so by the generality of the natives.

There are many other serpents, such as the menore, fave, mare, triondibale, renutric, and anacondé. The last is very dangerous, though in substance not thicker than a quill. It slips into the body at particular times, gnaws the intestines, and occasions the most excruciating pain; and, if not extracted in a short time, which is seldom the case, infallibly produces death.

The tringalaka huravou, or water scorpion, resides constantly in marshes and still waters; destroys cats; attacks dogs; and sucks their blood, when killed.

The vancho, or scorpion-spider, has a large, round, and black belly; and is extremely dangerous. Its bite occasions an instantaneous swooning, which sometimes lasts two days, attended with a remarkable coldness and shivering. The method of cure is by placing the person by the fire, and administering the same things as are used to expel poison.

Anocalife is a creeping animal that breeds between the barks of rotten and worm-eaten trees. It is about six inches long, of a flat form, and has many legs like a caterpillar, with a hard skin. Its bite is exceeding venomous, and causes the like disorder as that produced from the vancho; and if the same remedies are not applied, the consequence will be the loss of life.

There are great numbers of moth-worms, earwigs, bugs, and other troublesome insects. The acolalan is a small insect, not so offensive in smell, but like a bug; when full grown it is about the size of a man's little finger, at which time it becomes winged and flies away. The young ones remain in the houses, and are very destructive to the furniture, as also to cloth and most kinds of apparel.

The vombaré is a butterfly variegated with different colours, among which are those of gold and silver. Others are known by the name of facandre: these proceed from beetles, and keep to the bark of a particular small shrub, on which they deposit honey, not inferior to that produced from bees.

Here are many sorts of snails, some of which have their particular appellations, but they are in general called cacacora. Caterpillars also abound here, and are of several kinds, but the whole of them are distinguished by the name of singoulou voulon.

Here areche is a beetle that gives light, and shines in the woods and houses in the night with a surprising luller.

Worms of various kinds are also found in this island; but the most distinguished are the silk-worms, which are quadruped. Some of them, called landeve, produce one prickly cocoon; others, called landetiraha, make small cuds enclosed in a large one, frequently containing 500 young. The third kind, called landeanacau, spin their silk on the tree anacau that grows by the sea side; the cuds hang in strings, separated from each other, and the silk is the finest, strongest, and best of all. The fourth sort, called Landevontagata, make their silk on the tree vontonfir, which is also very fine, but not so substantial as the former.

Here are a great number of ants; but they are all exceeding harmless, except one sort called ficourourous, which are particularly destructive to the rice.

Land-tortoises are also very plentiful, and are of two sorts, one of which is called hilitoca, and the other fanou.

The mines in this island abound with iron and steel, which the natives have the art of purifying and forging with much less difficulty and labour than the Europeans. According to Mr. Drury, in the inland mountainous parts, silver is found, and a white metal, which much resembles British tin.

The gold here is of two sorts, viz. a pale soft sort which is of little value, and a finer sort, which is tolerably good. It must be observed, however, that we speak only of the gold natural to the country, for great quantities of other gold are to be found here, which have been introduced at different times by various European nations, by the pirates, who formerly harboured here, and by the eventual means of shipwrecks.

Besides these treasures, the rivers and brooks are rich

in various precious stones, viz. emeralds, sapphires, crystals, topazes, granates, amethysts, eagle-stones, hyacinths, jaspers, blood stones, touchstones, and cornelians.

The waters here run under ground in a very particular manner, and afterwards re-appear, impregnated with the juices which they draw with them, and in this manner receiving the different tastes and qualities inherent in the metals and places through which they flow. In the valley of Amboula is a fountain of hot water, esteemed a sovereign remedy against all disorders proceeding from cold in the nervous parts, and the same water taken inwardly cures asthma, and all disorders of the lungs, removes obstructions in the loins, and expels the gravel.

Of the Inhabitants of Madagascar; their Customs, Manners, &c.

This island, though reckoned to be eight hundred leagues in compass, is not populous to contain above sixteen hundred thousand souls. All the inhabitants are black, except those of a little province beyond the Maratanes, and most of the great men who are descended from the Arabs, and still preserve something of their complexion, though they become black insensibly, by their intermarriages with the original inhabitants. The Arabs, who seized upon this island in the beginning of the sixteenth century, established commanders in all the provinces of the island, and fixed the chief seat of their government beyond the Maratanes, which is the reason why their descendants, who are styled Lavalles, are still fair, or at least called so; for they are not half so fair as the blackest gipsy.

They are tall, nimble, and have a proud gait. They sometimes affect a frowning countenance; and they know how to conceal a grand design, or the strongest passion, with as much artifice as the most crafty knave among the nations that are the most famous for their political dissimulation. Wild people are found in some parts of this island, who let their hair and beards grow, go almost naked, inhabit thick and unrequited woods, avoid meeting their fellow natives, live upon wild cattle, fruits, roots, &c. meys, locusts, &c.

According to the accounts given by the French of this island, the inhabitants are some of the most deceitful, flattering, and false people in the universe; particularly those of the coast of Mangabe, to the end of the island, southward. Though the people of the inland parts of the same province are much less cruel and treacherous; speak little; are better observers of their promises; and follow other customs and laws. Drury, indeed, seems to excuse the others, in some measure, from the imputations thrown upon them by many writers, but more particularly the French; for he says: "whether their little acquaintance with the Europeans gives them a dread of them, I cannot say; but I am sensible they imagine that white men are extremely addicted to fighting, and not fond-hearted as themselves. This received notion may be a great motive to their destroying them on very trivial provocations; for they are always jealous that the white men have some evil designs upon them; so that they are ever on their guard, dreading the audacity and superiority which the Europeans have over them in point of war." Again, in speaking of the treatment which the natives received from the French, he says: "They made them all slaves, inverted the whole order of their government, and most of them being illiterate peasants, who took upon them to rule, they showed no regard either to morality, civility, or indeed common decency; made no distinction of person; commanded all orders; and treated every black as if he was a brute, and so much inferior to themselves, as not to have the least right or title, in their opinion, to the common privileges of human creatures: so that to kill one of them was no more than to kill a dog, or any noxious animal whatsoever. I do not make this as a reflection on the French only, though, if credit was to be given to half what the natives say, they were guilty of the most scandalous and execrable actions. Our own countrymen (too much addicted to their follies and vices) are not exempt from the just censure of this scandal upon white men; for the conduct of our British states, and others too, who are not willing to be thought inhuman, has been barbarous to the last degree."

The Madagascariens having but a very slender knowledge of commerce, and knowing but little of arts or sciences, apply themselves principally to agriculture, the breeding of cattle, or hunting of game. Their country, was it not so greatly neglected, might be rendered extremely opulent: from the number of silk-worms, with proper management, silk might be made a staple commodity; but the views of the people extend only to the absolute necessities of life, such as common provisions, mean habitations, and a trifle of wearing apparel; for of luxury they have very little idea, and superfluities they affect to despise. With respect to trades, therefore, our catalogue will be rather confined. All may be said to be architects, according to the custom of the country, because every individual is capable of erecting a hut for himself. Some work tolerably well in gold and silver. The smiths are extremely expert in working of iron or steel. They reduce the ore, as brought from the mines, into powder, upon burning coals; place it between four stones, which are clayed round for the purpose, and by continual blowing underneath, with bellows made in the shape of water-pumps, the ore runs in less than an hour; the metal is afterwards extracted, and by means of heat is formed into bars of about four pounds weight. A few are expert in polishing metals, making earthen ware, spinning, weaving, rope making; and many are tolerable firemen.

The articles made by the smiths in general are:

Implements of iron and steel	Nippers
Fishing hooks	Gridirons
Hatchets	Forks
Hammers	Clavins
Shovels	Darts
Razors	Butchers knives, &c.

The goldsmiths make ear-rings, bracelets, necklaces, and other ornaments.

Here are some carpenters and turners, who make wooden chells, and plates, or platters; wooden and horn spoons; and other household goods.

The Rohandrians and Anacandrians are remarkable for the wood-work of their houses; their chief tools, however, are only a plane, a wedge, and a rule. The fishermen use draw-nets, well-baskets, hooks, and harpoons; and exchange the fish to the inland inhabitants for rice, yams, roots, cotton, and other necessities: some, however, they dry, to serve as occasion requires.

The rope-makers make cordage of all sizes and lengths. The small ropes for netting and baskets are made from the bark of different trees.

In spinning, women alone are employed, and they make various sorts of stuffs from flax, and they likewise make threads from the barks of trees.

In Madagascar agriculture is practiced with less trouble than in Europe, because the manner is more simple. No plough is employed in the tillage of land: an ax for felling the limbs of trees, a bill for lopping off the branches, and an implement called saugali, for grabbing the roots and weeds, are their sole instruments. The arms and branches of trees, when dry, by being burnt to ashes, greatly enrich the ground; and this soil is afterwards proper for the production of yams, rice, &c. when properly wetted by rain or other water. In some few places rice is planted grain by grain, and cut in the same manner; but in the greater part of the island the ground is prepared by the trampling of oxen, which breaks and kills the weeds, and these rotting, manure the soil; when the rice is sowed, which grows with great ease, and in a short time becomes extremely fine. The fields for rice are marshes, or marshy land, called horraes, and every horrae, or field of rice, is the property of a particular chief, which occasions great differences from their pretensions of right to the best and most fertile soils. The poor negroes plant and cultivate yams on the sides of mountains, and are obliged continually to hunt the wild boars, and other wild animals, in order to preserve their plants from destruction.

The people are much addicted to singing and dancing, in particular, the women are very fond of singing, and compose verses extempore, which, though not the best poetry in the world, shews an aptitude of genius, and ready turn of wit, that is really surprising. Their songs are either panegyrics on the remarkable actions of their ancestors and heroes, or of an amorous turn, or of a satirical nature. Their musical instruments are three in number, viz.

The valiham, which is strung with cords.

The vanle, which is made of bamboos.

The herrafovou, which is played upon with a bow.

The performers on the latter instrument are the most esteemed.

The riches of the inhabitants consist in cattle, which the men look after; and in fields of rice and roots, which the women sow. Gold and silver serve only for ornaments. They make pawns, and carpets of cotton of divers colours; and as they have no looms, but only sticks laid on the ground, which they raise by turns to make the wool, they cannot work very fast.

Here are cities, towns, and villages; noblemen, and slaves. The cities contain at least a thousand houses, or rather huts, and are surrounded with ditches six feet deep, and as many broad, with palisades within on the banks of the ditch. The donac (thus they call the lord's house) is built with boards, raised about six feet above ground, and covered with leaves. The other habitations are so low, that one cannot enter them without stooping. The towns are encompassed only with flakes dove into the ground; and the villages have neither flakes nor ditches. Four negroes take up a hut on their shoulders, and carry it where they please. When a lord visits another, the person visited lends to the other one of his wives, whom the visitor likes best.

With respect to the household furniture, it consists only of rush mats, which are either of a yellow or a red colour, and are neatly made and strung. The floors on which they lie are covered with these mats without bed, bolster, quilt, or any sort of covering, and the pillow is only a log of wood. This description is general, and answers to the furniture of all the houses, those of the Rohandrians excepted, for these people make use of pillow-biers stuffed with cotton seed. Their cloaths, sambers, girdels or saravohits, cotton, effects, and all ornaments are kept in baskets; and oils for the body and hair in earthen pitchers. Their kitchen furniture consists of earthen pots called villangues, lousies, safes, monangees, and sines, wooden dishes and spoons, dried gourds or calabashes to hold water, knives, gridirons, mortars to pound rice, troughs, and winnowing fans, with large vessels for honey wine. The leaves of rates twelve feet long and four broad, are used instead of napkins, and smaller portions serve as plates: these are spread upon mats on the ground, for neither tables nor chairs are used.

With respect to the dress of these people, the negroes go naked, excepting their middles, which they cover with a linen called lambar; and some of the women use saravohits, or drawers, with an azean, or long robe without sleeves, hanging down to the ankles, and a piece of linen before, sewed at both ends like an apron. The white men and women (we do not mean European whites, but such as are so denominated in this island) go without any covering on their head or feet, except the inhabitants of Manghabé, as the men in that province wear a square cap, and the women a hood, pointed at top, and hanging down upon the shoulders. The dresses are of different colours and names, some of red silk called foatimihli, others of cotton called varo; these are of a variety of colours, curiously interwoven with fine cotton in white stripes, and are far from being despicable workmanship, or inelegant in appearance. Others are made from the barks of trees; either from that of the sautafronou, try, mouffa, avo, courava, or threads of banana. The cotton-cloths made by the whites, or zaceramini, in the province of Anestti, are the finest and best, much sought after by the inhabitants of Vohitbang, and others, who buy up great quantities; but the most esteemed are the cottons, with silk borders about a foot deep, the ground white, with black stripes, and black and red silk lace. The chiefs only, and Rohandrians, wear this upon great formalities, and are preferred for the funerals of the chiefs, whose bodies are wrapped up therein. The garments for slaves are made of the bark of trees; which is first beat to a hemp, then boiled twice in strong lye, afterwards washed, and twisted upon spindles in different sizes, and worked up for apparel: the cloth resembles European linen, is strong, and more lasting than cotton. Those made of the bark of try are extremely fine and soft, but not durable; as are those of atfouche,

in the province of Matatan, from the bark of the tree avo; of which also paper is made in the provinces of Ghallenboulou, Manghabé, and round the bay of Antongli; the bark or thin skin of small leaves shooting from the middle of the tree mouffa, which, in other places, produces only large leaves, twelve or fifteen feet in length, supplies them with wearing-apparel. The fruit of this tree is like a pine-apple. The stuffs made from banana, chiefly in the province of Eringdran, are fine, light, and equal in beauty to the silken manufacture, and are wove in the same manner. Their ornaments, called frauch, are different kinds of chains worn round the necks, arms, and legs; ear-rings, bracelets, rings, and other toys, with necklaces of different names; talantes, faraves, and endachs, consisting of three or four, and even twelve rows of pearls, corals, beads of gold, glass of all colours, rock-crystal, agats, cornelian and sardonian stones. These ornaments of gold are only worn by the Zaceramini, who are the chiefs of the island, and the Voazdri and Lohavohits among the negroes.

Polygamy is practised throughout the island, and the people in general are exceeding incontinent, which may be owing to the extremes that aduate either sex; the men having too much freedom, and the women being under too much restraint; yet these opposite causes produce similar effects, for here, since

“Man the lawless libertine may rove,

“Free and unquell'd thro' the wilds of love,

he takes all the licentious liberties which such an unbounded licence permits; and the women thinking that

“Constraint in all things makes the pleasure less,

“But sweet's the love that comes with willingness,

allow themselves such freedom in private, in order to compensate for what they suffer by the severity of the public laws, and tyranny of their husbands, that very few can claim that inestimable jewel, chastity.

The negroes here have no other marriage ceremony than agreeing to cohabit together; but the whites have a peculiar ceremony in being joined, or married to the head wife, but their other wives they take with as little form as the negroes do theirs.

The ceremonials practised at funerals are as follow. The relations wash and cleanse the body of the defunct, and then adorn it with the most costly ornaments which the defunct wore when living. It is then wrapped up in a mat in order to be carried in that manner to the grave. The head of a woman's corpse is usually embellished with a kind of cap. But the heads and beards of men of rank, when defunct, are clean shaved. Previous to the time of burial, the corpse lies in state for some days, during which space a light is continually burnt at its feet; and all the relations, friends, and slaves frequently surround the corpse, and make the most dismal lamentations. Having tired themselves with bewailing, the women fall a dancing, and the men have recourse to warlike exercises. At length they all surround the body again, call the dead by his name, very gravely expostulate with him for dying, and pathetically demand whether he had not every thing that could satisfy him in this life, such as beautiful and faithful wives, dutiful children, loving friends, industrious slaves, a sufficiency of gold, silver, iron, cattle &c. It may not be improper to observe, that this burlesque method of howling over, and interrogating the dead, is not peculiar to the Madagascariens, as many other nations have the same custom, and even in Europe some persons retain these absurd ceremonials at this present time.

On the day of interment the corpse is carried to the burying-place, which is named Amououaque, in a coffin made of hollow trunks of trees, which are curiously closed together; and there it is deposited six feet deep, under a strong hut, in which are laid plates, dishes, apparel, rice, tobacco, &c. that the dead may want no necessary accommodation. The defunct being then properly provided for, the hut is entirely closed up by placing a large stone before the only entrance. Then, on the outside, beasts are sacrificed; and the company having regaled themselves, some fragments of meat are left, which they suppose will be equally distributed between

the deceased and the demons. Fifteen days after, imagining that the provisions are exhausted, the relations and friends send more, lest the dead body, or the demons who guard it, should be famished; and these presents are always accompanied with the kindest messages, and most respectful compliments to the deceased.

The heads of all the beasts which are sacrificed, are fixed upon long poles, and placed round the sepulchral hut in the manner of trophies. Sacrifices of beasts are likewise made by, or in favour of the children descended from the deceased, or those nearly related to him, when the juvenile band invoke the spirit of the departed person in a kind of hymn, which implies,

Spirit, that art flown away,
Listen to our artless lay;
Teach us, spirit, to do well;
Teach us, spirit, to excel;
Stoop, oh spirit! and be kind,
Teaching those you left behind;
Listen to our artless lay,
Spirit that art flown away.

If a person of distinction dies at a distance from home, his body is burned upon the spot, but his head, having been previously cut off, is carried home and interred in a proper sepulchre, with the usual funeral rites. But persons slain in war, who have been hastily buried in or near the field of battle, are, in times of peace, again dug up, and re-buried in the usual form, provided the space from the time of interment is not so considerable as to admit of an almost total putrefaction.

The Madagascariens hold the memory of their ancestors in the utmost esteem and veneration. Their greatest and most solemn oaths being to swear by the souls of their predecessors, or the virtues of their parents.

When any person is sick, the nearest relations apply to the ombiasse, or priest, who goes by night to the amon-zouque, or sepulchre of the father; or, if the father is still living, to that of the grandfather of the afflicted person. Then making a hole in the monument, he places a kind of cap upon the aperture, and begins his incantations with several grimaces, invoking the spirit of the deceased to take pity of the person disordered, and restore his helpless progeny to health and vigour. The aperture being closed, the ombiasse takes away the cap, returns to the house where the sick person lays, and places it upon his head. If the patient recovers, the ombiasse receives great applause, and is loaded with presents; but if he dies, the ombiasse, very gravely, imputes it to the evil demons, or to fate; for the Madagascariens are great predestinarians; but never to any fault in himself, or deficiency in his incantations. The very same method is pursued in cases of insanity, the ombiasse applies to the sepulchres of the deceased, to demand understanding for their offspring, and that their senses may be restored. If the patient recovers his senses, the priest is rewarded; if the former remains mad, no disgrace ensues to the latter.

The common diet of these islanders is cow's milk, rice and roots. They roast sometimes large pieces of beef, with the hide on. They drink water and honey-wine. But they have neither bread, nor grape-wine. The honey-wine is a composition of three parts of water to one of honey, which they boil together, and kim, after it is reduced to three fourths. They afterwards put it to work in large pots of black earth, made in this island. This wine has a very pleasant tartish taste, but is too luscious. The wine made of sugar-canes is still more unwholesome.

Of all the barbarous customs and execrable superstitions of these people, the custom of exposing their children to a certain and cruel, though indeterminate kind of death, of strangling them in the birth, or sacrificing them to demons, are perhaps the most atrocious, and may be the true political reason why this large island is so thin of inhabitants, in proportion to its great extent, and amazing fertility. These execrable cruelties are owing to the ombiasse, who exercise a most uncontrolled power over the minds of the people; the latter being under an obligation of exposing their new-born children in desert places, to famish, or be devoured by wild beasts; to strangle them in their birth, or to sacrifice them to their demons, according to the prediction or command of the ombiasse, who pretends to contemplate the aspect of the planets at

the time of their birth, pronounces arbitrarily whether they are fortunate or inauspicious, and decrees the child to life or death accordingly. These detestable murders are the more frequent, as besides the ombiasse having the fate of new-born infants at their disposal, at all times, those who are born on what the people deem unlucky days, are sure to be put to death; and, unhappily, above half the days in the year come under that denomination. The inauspicious, or unfortunate portions of the year are,

The entire months of } April, or Safard.
March, or Ramahara.

The last week of every month in the year.

Every eighth day, whether it falls in auspicious or in inauspicious months or weeks. Every eighth day being called Assarantor, and every last week in each month, Alacossi.

Every Wednesday and Friday throughout the year are deemed unlucky. And even particular hours are supposed to be influenced by the vitings, or unlucky planets.

Sometimes, however, the force of nature overcomes the power of superstition; and the prejudice of custom yields to the dictates of parental affection.

Custom, which wisdom often over-rules,
And serves, instead of reason, to the foals;
Custom, which all the world to slavery brings,
The dull excuse for doing silly things.

The ombiasse are not insensible to the power of bribery; and what will not a parent, who truly feels; give to save his inoffensive offspring.

Fathers alone a father's heart can know
What secret tides of still enjoyment flow.

This wealth, the grand fountain of vice, and stimulator of crimes, may, properly applied, be rendered the means of charity, and friend of humanity. Nothing in the creation is intrinsically vicious; it is only the improper application of things which render them pernicious.

Hence, says an accurate author, in speaking of these execrable customs: "powerful nature breaks the chains with which she is fettered by pagan education, and exhibits the compassionate and tender impressions of her own potent Creator, in the frequent opposition given to these sanguinary precepts, by preventing the cruel destruction of innocent babes, in the preservation of the life which their parents had been instruments of giving, and in reversing the sentences of the cruel and avaritious ombiasse. Slaves are often employed to suckle and bring up the children born in unfortunate times. Sacrifices, denominated falls, of beasts and cocks have been immolated, whilst they were confined in places pointed out by pagan superstition, to take off the malignity of the predominant star, which would necessarily take effect, were these customary and superstitious practices neglected."

The same language is spoke throughout the island, but differently pronounced in different provinces, long and short, of great affinity with the oriental, chiefly Arabic, and agreeable to the Greek in the manner of speaking, in the order and conjunction of the nouns and verbs active, and extremely copious. The characters in use amongst the ombiasse are the Arabic, in number twenty-four, written from the right to the left, though the pronunciation of some differs from the Arabic. These characters were introduced about three centuries ago by the Arabs sent by the calif of Mecca, who landed at Matatan, intermarried with the women of the country, and taught the Arabic language, with the Koran, to those who embraced the doctrine; and which some of them continue to this day.

To convince the reader of the number of soft and liquid tones with which the Madagascari language abounds, we shall select a few of their common words, with the signification in English.

Valu	Alive
Melangore	To agree
Tumborts	An anchor
Malike	Anger
Lchulu	Any body
Munoungo	Ascend
Voorha	Aligator
Omebayloyhe	Hule
Betu	Brains

Haner	Beef
Munday	Boil
Metonu	Broil
Onebayyovva	Cow
Onebey	Cattle
Morte	Dead
Lumbbook	Dust
Tanna	The earth
Sofee	The ear
Moffu	The eye
Tule	An egg
Varlarvo	A mouse
Oroong	The nose
Arratto	A net
Overnarmo	Potatoes
Lomoty	A plumb
Plato	A pistol
Ponndey	Powder
Knidoc	A pirate
Hulu	People
Color	Years

The four cardinal points of the wind.

Teenonghet	East
Audjeffer	West
Avatruchs	North
Ateemo	South

Numbers.

Efer	One
Roaa	Two
Talu	Three
Efutchs	Four
Decnie	Five
Fammung	Six
Fecto	Seven
Varlo	Eight
Sever	Nine
Folo	Ten

Days of the week.

Alhaida	Sunday
Alletenne	Monday
Talortor	Tuesday
Allerrerbeer	Wednesday
Commehee	Thursday
Immor	Friday
Sarhueche	Saturday

All the inhabitants of Madagascar, the negroes of Malchicore and the inhabitants of the mountains excepted, are tolerably expert at casting up small sums. Like the Arabians and Europeans they reckon from one to ten, and after ten add the number one, as far as twenty.

With respect to their weights and measures, they use none higher than a drachm: for as they weigh no articles whatever, gold and silver excepted, drachm weights are deemed sufficient, all other commodities being sold by way of barter or exchange. The names of these small weights are

Nanqui	Half a grain
Sacare	A grain
Nangue	Six grains
Vari	Half a drachm
Sompi	A drachm

The measures here are

The Vouie	contains	Half a pound of rice &c.
Mouca		Six pounds of ditto
Zatou		A hundred voulus, or fifty pounds ditto

There are measures of capacity: the measure of length is only a reff, or a measure of about two yards in length, which is used in measuring cordage, stuffs, &c. the land not being estimated by admeasurement, but by the quantity of grain which is required to sow it.

Madagascar paper is made with fewer instruments and engines than the European. The bark of the tree Avo is boiled two days in good lye, made of the ashes of the same tree, till it becomes soft and supple, then washed in clear water, beat to a proper consistency, and poured afterwards on mats made of exquisitely fine reeds, twisted and regularly joined together, in order to be drained and become paper. After this it is placed on a leaf of balsam, oiled with manachil, to dry in the sun; each dried leaf is afterwards dipped in a decoction of rice, to prevent it from remaining spongy; then being dried once more, it

becomes smooth, even, and fit for use. Their ink is extracted, by way of decoction, from the wood called aradranto, which is likewise made use of by the principal people for building. The extract being mixed with verdigris, becomes exceeding black. The pens are made of bamboo, and are cut to the same size, fashioned after a similar manner, and rendered almost as transparent as European quills.

The trade of this island is rather of a domestic than foreign nature, as the natives have very confined ideas, and imperfect notions of foreign traffic. Among themselves they barter commodity for commodity, as no such thing as currency is established throughout the whole island. Even if they obtain any gold or silver coins from the Europeans, who sometimes touch here, they immediately melt them down, in order to convert them into ear-rings, bracelets, &c. The domestic trade is of this nature: the people of the cotton provinces take care to cultivate that article, and then carry it to the provinces which abound in cattle, rice, &c. Having trucked or bartered commodities, the wants of each are supplied; for those who have plenty of provisions are by their means supplied with cloathing, and those who can easily procure apparel in their own country are furnished with provisions, in which their own provinces might be deficient. Thus the exchange of the produce of one province for that of another is the whole of their domestic, or inland trade.

With respect to the foreign trade, or rather traffic, which some of the Madagascarians carry on with the European ships, that sometimes touch here, it consists of exchanging

Fresh provisions	} for {	Yellow wares
Sapphires		Hard wares and small wares of all sorts
Rubies		Looking glasses
Emeralds		Beads
Cornelians and other precious stones found in the country, &c.		Fire arms
		Coral of any size or colour, pierced through for stringing, &c.

Hence the riches of these people consist in the wares and commodities which they thus procure; in the bills, hatchets, knives, lances, iron and steel spades, lammers, &c. which they make; in the slaves they take in war, or steal in times of peace; in the cattle which they breed; and in the lands which they cultivate.

We are told that the celebrated French governor, Flacourt esteemed this island of great importance for advancing and establishing commerce towards Ethiopia, the Red Sea, golph of Arabia, and other Indian countries; that great advantage might be made from the convenience of wood for building ships, which might be carried on, and exchanged for other commodities in the preceding countries.

Most of the princes, or sovereigns of the different territories in this island, are related to each other, and so are their great lords and inferior subjects, by continual intermarriages; yet they are perpetually quarrelling with, and waging war against each other; private family disputes often occasion open ruptures, and the resentment of an individual will induce some thousands to commit hostilities. These domestic wars are pursued with more rancour and hatred than a war with a foreign enemy would be; for when relations or friends differ, they entertain a greater implacability against each other than strangers, when they happen to be at enmity. His sentiment is finely illustrated in the following lines, by William Whitehead, Esq; poet laureat, in his ode for the new year, performed before his majesty, Jan. 1, 1778.

When rival nations, great in arms,
Great in power, in glory great,
Fill the world with war's alarms,
And breathe a temporary hate,
The hostile forms but rage awhile,
And the trid' contest ends;
But ah! how hard to reconcile
The foes who once were friends.

Each hasty word, each look unkind,
Each distant hint that seems to mean
A something lurking in the mind,
Which almost longs to lurk unseen.

Each shadow of a foe offends
Th' enbitter'd shades who once were friends.

That power alone, who fram'd the soul,
And had the springs of passion play,
Can all their jarring strings controul,
And form on discord, concord's way.
'Tis he alone whose breath of love,
Did o'er the world of waters move,
Whose touch the mountains bends,
Whose word from darkness call'd forth light,
'Tis he alone can reunite
The foes who once were friends.

In war, their engagements are seldom regular, they chiefly depend on surprize and ambuscade, and sacrifice courage to stratagem. When the prospect of advantage offers, they usually assemble privately, act with the utmost caution and privacy, gain the enemy's frontiers by forced marches in the night, and attack them suddenly and unexpectedly; if success attends their arms, they commit the most cruel ravages, if they meet with an unpromising repulse, they retreat with the utmost precipitation. But good or bad success are equally fatal to the country; if they are fortunate, they destroy all before them as they advance; if unfortunate, they lay the country waste as they retreat. Thus famine frequently reigns in a country, calculated by nature to afford the utmost plenty, and many are starved in the midst of a luxuriant soil, by means of the intestine broils which reign among the people.

Sometimes the prince of a territory gives notice to the lords, who are his subjects, to assemble their forces separately, and to march by different routs to a certain place of rendezvous, in order to meet suddenly upon, and attack the towns of their neighbours, which they surround, and advance to with the most dreadful shouts; and if successful, they massacre all they meet with in them, sparing neither sex nor age. After this sanguinary heat is over, if they meet with any other of the adverse party, or overtake any fugitives, they make slaves of them; but usually put to death those who are allied to the chiefs, fearing if they should survive they will at some future time become formidable.

Their political management of war is this; they depute spies to observe the condition, number and situation of the enemy, if on a march, or encamped, or to reconnoitre their towns, and take notice of the importance of their fortifications, if they should mean to maintain them and stand a siege. If threatened to be attacked by others, they change their place of residence, drive their women and cattle into the most private recesses, or places which are difficult of access, and consequently may be easily defended. Thus their passions prompt them to plunder each other, and their perpetual dangers insensibly give them policy; but during these ravages, all parties think themselves right; the prince imagines it his duty to prevent any neighbours from becoming too powerful for his own people, and fancies it incumbent on himself to crush such aspirers; the people deem it their duty to obey their prince, who has their good at heart; all see through the medium of their passions, and fancy the means just if the motive or proposed end is so. It is self-love and reason at strife, and the improper use of either, occasions all their miscarriages.

- “ Two principles in human nature reign;
- “ Self-love, to urge, and reason, to restrain;
- “ Nor this a good, nor that a bad we call,
- “ Each works its end, to move or govern all:
- “ And to their proper operation still,
- “ Ascribe all good; to their improper, ill.
- “ Self-love, the spring of motion, acts the soul;
- “ Reason's comparing balance rules the whole.
- “ Man, but for that, no action could attend,
- “ And, but for this, were active to no end:
- “ Fix'd like a plant on his peculiar spot,
- “ To draw nutrition, propagate, and rot;
- “ Or, meteor-like, flame lawless thro' the void,
- “ Destroying others, by himself destroy'd.
- “ Modes of self-love, the passions we may call:
- “ 'Tis real good, or seeming, moves them all;
- “ But since not ev'ry good we can divide,
- “ And reason bids us for our own provide;

- “ Passions though selfish if their means be fair,
- “ Lill under reason, and deserve her care;
- “ Those, that imparted, count a nobler aim,
- “ Exalt their kind, and take false virtue's name.

POPE.

Sometimes parties of only 40 or 50 are sent to plunder and destroy the lesser villages and hamlets, and these light detachments are called *tanvoave*. If opportunity serves, the towns are reduced to ashes; but if they are under any apprehension that the flames will exasperate the neighbouring inhabitants, who might immediately pursue them, or cut off their retreat, they satisfy themselves with only plundering the towns without burning them. Their kind of expeditions are named *tanichamantli*, or secret war, and the marauders, who engage in them, are always provided with what they deem charms, which are small bullets written in Arabic characters, these they imagine will procure them success, and bring the greatest misfortunes on their enemies, by taking away their strength, and depriving them of their courage to defend themselves; they likewise imagine that they afflict their foes with innumerable disorders, and occasion the most fatal distempers to attack them. Both parties are equally superstitious in respect to these charms, and as one side must succeed, their reputation is continually kept up; for the unsuccessful party never conceives that his charms are inefficacious, but imagines that some faults in the preparation, or the violation of some ceremonies have rendered them unpropitious.

With respect to warlike weapons, they are different in different parts of the island. Some make use of a dart, which is named *renelats*, with an iron point long and thick, and carry besides 15 lesser darts, that are named *litonaches*. Others use an ample shield, and a large dart called *caubahi*, but the generality use lances as well as darts, and the great men carry fire arms; for to carry a lance only, is the badge of a person of common, or vulgar rank; but to bear a gun upon the shoulder betokens gentility, and shews that the bearer ranks as a nobleman or gentleman.

The Madagascarians have little notion of discipline in their wars; they generally charge in separate bodies of 100 each; their charges are irregularly made, as each individual tries to do his best, but at the same time keeps continually shouting, hawling, capering and jumping about, in order at once to intimidate the enemy, and to prevent any aim from being taken at himself. So that an attack thus made, appears to be rather the assault of a promiscuous mob, than the well conducted attack of disciplined troops. When an enemy falls, he is immediately pierced through with darts, by as many as can get near him, and his throat is afterwards cut from ear to ear.

We are told from good authority, that during the time of war, the women keep up continual dancing (alternately) by day and night, never sleep or eat in their town houses, and however addicted to idleness, upon no account whatever suffer the company of another man, whilst their husbands are exposed to danger, persuaded that they (the husbands) would be killed or wounded, by infidelity in their absence, and believe them to be animated by their continual dancing, and their strength and courage encreas'd; wherefore they keep up their dancing during the war, by the most superstitious observance of the customs and ceremonies.

When one prince finds himself too weak to oppose another by force of arms, he has recourse to negotiation, and sends ambassadors, laden with presents, to sue for peace, appoint a time and place for a conference, and settle all the preliminaries of an accommodation. If the presents are received, and the proposals approved, other presents are sent in return, and every thing is settled for the intended meeting, the place appointed being always on the banks of a river. When the day arrives, both princes, or chiefs, repair to the river at the head of their respective armies. Each then kills a bull in the sight of the armies, and then they present to each other respectively a piece of the liver on the end of a spear, which both are obliged to eat a piece of, and then they mutually wish with the most solemn imprecations,

That the liver may burst them.
That God may withdraw his hand from amongst them.

That they may be destroyed by their enemies.
 That their race may end in themselves.
 If they any longer think of carrying on the war.
 If they carry off the cattle, or destroy the subjects of each other.

If they have any design of sending witchcrafts or poisons into the enemy's country, &c.

The Madagascariens have some notion of astronomy, and divide the year, like us, into twelve months, viz.

Vatrevate,	}	or	March,
Safard,			April,
Atsifi or à Soutri,			May,
Valafira,			June,
Fofia,			July,
Maca,			August,
Habia,			September,
Sacamallich,			October,
Sacave,			November,
Voulambitrou,			December,
Afaranghitis,			January,
Afarabe,			February.

The first day of the year begins with the new moon in March: they have no certain and regular account of time and seasons, but compute the years by the days of the weeks, beginning the year of circumcision on Friday. They have likewise observed the motions of the heavens, the revolutions of the planets, and the signs of the zodiac, which, in the manner of the Europeans, they likewise divide into twelve signs, viz.

In the spring,			
Almiza,	}	or	Libra,
Alicarobo,			Scorpion,
Alacoli,			Sagittarius.
In summer,			
Alizadi,	}	or	Capricorn,
Adalou,			Aquarius,
Alohotti,			Pices.
In autumn,			
Alahemali,	}	or	Aries,
Azorou,			Taurus,
Alizozo,			Gemini.
In winter,			
Afarata,	}	or	Cancer,
Alafade,			Leo,
Atamboulo,			Virgo.

Thus are they correct by casual observations only; and accurate, without the knowledge or use of instruments; which evince, that the heavens are an universal book that is open to all nations; may be read in every climate; and be serviceable, even to the most savage and ignorant. So just is that beautiful ode of Mr. Addison's on the glories of the heavens.

I.

The spacious firmament on high,
 With all the blue aethereal sky,
 And spangled heav'ns, a shining frame!
 Their great original proclaim.
 Th' unwearied sun, from day to day,
 Does his Creator's power display;
 And publishes to every land,
 The work of an Almighty hand.

II.

Soon as the evening shades prevail,
 The moon takes up the wondrous tale;
 And nightly, to the list'ning earth,
 Repeats the story of her birth;
 Whilst all the stars that round her burn,
 And all the planets, in their turn,
 Confirm the tidings as they roll;
 And spread the truth from pole to pole.

III.

What though, in solemn silence, all
 Move round the dark terrestrial ball;
 What though nor real voice nor sound
 Amid their radiant orbs be found!
 In reason's ear they all rejoice,
 And utter forth a glorious voice;
 Forever singing as they thine,
 The Hand that made us is divine.

The perpetual enmity in which the Madagascariens seem to live with each other, arises either from jealousy or theft; but while the former occasions many private animosities, the latter usually terminates in war. Princes, and nobles themselves, make no manner of conscience of stealing their neighbour's cattle privately; and their neighbours return them the compliment whenever an opportunity presents. In this manner it sometimes only prompts to retaliation; but, at other times, it occasions open hostilities to commence.

During some part of Mr. Drury's captivity in the island of Madagascar, he was a slave to a chief of great consequence, who was, however, very fond of stealing his neighbour's cattle privately. As the mistress of Mr. Drury, when he first went with his master upon one of these expeditions, is rather whimsical, we shall quote it for the entertainment of the reader. "My master (says he) attended by several of his slaves, took me with him, one evening, into the woods. I observed great preparations made for killing and dressing a bullock, or some such thing; but there being none to kill, and it being then dark, I perceived that they walked with great circumspection, talked softly, and testified all the symptoms of some secret design: upon this the tears stood in my eyes, imagining that they intended to cut me up, and make a meal of me; but my fright was soon over when I saw two slaves hauling a long a bullock by a rope fastened to his horns, and my master striking his lance into his throat in order to dispatch him. They immediately cut up his carcase, and dressed the entrails after their own manner. The booty was equally divided, and I observed that each man took care to hide his portion in some private place, from whence he might convey it away by night. As soon as our business was over, we parted, some one way, and some another, for fear of being taken notice of. I now plainly perceived, that we were all this time plundering of our neighbours."

After the men return from war, or from a grand hunting-match of wild cattle, when they enter their town or village, the wives and slaves of the chiefs come creeping from their respective huts, and lick their feet in a most respectful manner; and when this ceremony is performed, the wives and slaves of the other great men, and even the wives of slaves themselves, all act in a similar manner to testify their homage and submission to their respective husbands; but when they return from their thieving-matches, or stealing their neighbour's tame cattle, not the least notice is taken of their having been absent.

As the hunting of wild cattle is one of the principal diversions of these people, we shall give some account of the nature of it in the words of Mr. Drury, as his relation is both more authentic, and more curious than any other. "It was now night (says he) and they were going a beef-hunting: when they set out on purpose to kill the best beasts, they always make choice of the darkest nights. They permitted me, on my request, to accompany them, but first ordered me to wash myself, as they themselves did, that we might not smell either of fish or sweat. I would have taken two lances, according to custom, but they obliged me to leave one behind me, lest two together might rattle in my hand. These cattle feed only in the night, and if all these precautions were not taken they could never be surprized, for they are always on their guard, snoring with their noses, and listening after their pursuers. We can hear them roar and blow a great way off; by which we know where they are, and we are forced always to go round, till they are directly to the windward of us, for otherwise they would soon scent us. As soon as we had got the wind and cattle right a head, and were within hearing, we walked with all the circumspection imaginable, cropping the top of the grass with our hands, as close as possible, to mimic, as well as we could, the noise a cow makes when she bites it. The moment they heard us, they were all hush, not one of them bellowed or grazed, but seemed to listen with the utmost attention; which, when we perceived, we all stood still likewise without a whisper, whilst three or four, who understood the nature of it best, continued cropping the grass. When the cattle had listened till, as we imagined, they took us for some of their own species, they returned to their grazing, and we walked, with caution, nearer, still mimicking them as we moved softly along. Decan Murnanzack (one

(one of the chiefs) ordered me to keep behind, lest they should discern my white skin, and be startled; he also gave me his lambs to cover myself with, which was a large piece of black silk, so that if I had been near them they could have seen nothing but my face, the grass being above knee deep.

"At length we got amongst them, so that one of our men, as he told me, with some grass in his hand, and under the cover of a bush, took hold of the dug of a cow, and, finding that she gave no milk, he concluded she was not lean; for which reason he struck his lance instantly into her belly, and drew it out again, making no other motion. The cow, thus wounded, will give a spring perhaps, and make a noise, as if another had run her horns against her; but this is so common amongst them, that the herd is not any ways disturbed by it; so that our people struck three or four after this manner, and left them with an intention to come the next morning and trace them by their blood; for it is very dangerous to keep too near them in the night. As soon as they find themselves sorely wounded, they run from their companions, and will attack the first man they see. They are generally found actually dead, or fallen down in some wood, or shelter of bushes, as if they industriously endeavoured to conceal themselves.

"A day or two after this beef-hunting, we had an accidental diversion of another kind; our dogs had got the scent of some wild hogs that were got into a thicket, and were very busy in running round it, but could find no entrance for a considerable time. At length, however, they found the path which the swine had made, and attempted to enter the wood by it; the passage was defended by a large boar, who fought the dogs with great fury, and wounded one of them in a very desperate manner; now what with the dogs on the one hand, and the swine on the other, there was such a yelping, grunting, and howling, that the woods rang with their noise, and one would have imagined, all the hogs in the island had met there by consent, in order to revenge their quarrel upon us. We laid down our burdens, and some of us went up to them armed with pikes and lances; Decan Muzauzack shot the boar that wounded his dog, whereupon another, in an instant, defended the entrance, and fought so resolutely, that neither the dogs nor we ourselves could come near the cattle that were within, till we had made a passage behind them with our hatchets and lances; and then fired upon some of the most resolute who turned upon us: the rest, perceiving themselves attacked behind, fought their way through the dogs, and ran away with the dogs after; when words cannot describe the noise there was, especially after a number of them were wounded."

The religion of the inhabitants of Madagascar.

THE inhabitants of Madagascar have no particular places of religious worship; nor do they offer up prayers, unless their occasional incantations may be so called. Their first principle of religion, however, is to believe in one SUPREME GOD, who created the heavens and the earth, all animated beings, and an innumerable host of angels, in seven days. Yet, after having this just idea of the deity, they have not any notion that it is necessary to worship him, or pay him divine honours, acknowledging, that it is sufficient to acknowledge his power, for that he is too sublimely great to take notice of them; and too immensely good to be angry with them. They likewise believe in a demon, or devil, who they say is infinitely inferior to the Supreme Deity in power; but, at the same time, he has power sufficient to do them a great deal of mischief, and to torment them cruelly; him, therefore, they worship, to deprecate his wrath, and incline him to spare them. Hence we may draw two inferences from what hath been furnished, viz.

1. That they deem God the author of all good, and the devil the author of all evil.

2. That their religion is founded on fear, not gratitude; and that their notions of piety are formed on reluctant, not a willing adoration.

To the devil they give the name of Taivady, and have a proverbial distich, describing his character, which may be thus translated:

Into the world Taivady sends,
Or of himself, or by his friends,

Misfortunes, quarrels, and disease,
All that can ruin, or can seize.
'Tis he assists to steal our cattle;
Or gives us ill success in battle.

On account of those mischievous qualities, they try to appease him by sacrifices, to win his friendship by incantations, and do all in their power to put him into as good a humour as possible.

They likewise invoke a third power, whom they call Dian, or Decan Manang, that is, lord of riches in general, and sovereign of gold in particular; so that this fabulous deity answers to the Pluto of the Greeks. Out of veneration, therefore, to Decan Manang, when any of them obtain a piece of gold, they lift it above their heads, and kiss it with the most profound respect; and some even go so far as to fancy, that a remission of their sins may be obtained by drinking water in which gold earrings, bracelets, &c. have been dipped.

The angels, or immediate servants of God, they believe are infinite in number, and great in power. Some of these, they imagine, are continually employed in the movement of the heavens, and act as governors subordinate to God in the management of the wandering and fixed stars, comets, rain, wind, and indeed all the phenomena of nature. Others, they fancy, are employed as attendants on, and guardian angels of mankind; and many, they suppose, have the superintendance of all manner of enterprises, whether civil or military.

In the whole, they imagine, there are seven kinds or orders of spirits, including both good and evil, viz.

1. The superior angels, or immediate servants of God, (which are those already mentioned) are the first class, being called Malaringhea.

2. Those of the second order are called Concoulanpon; and these are of an inferior nature with respect to the others; because they are supposed to be corporeal; yet, while they think proper, they remain invisible to mankind; becoming only visible to those whom they intend to favour. Their frequent solitary places, are of both sexes, marry, get children, live long, but are mortal; and, after death, are rewarded and punished according to the merit and measure of their actions. Thus, even the most ignorant and savage people, in many parts of the universe, have a tolerable idea concerning future discrimination for former actions.

Religion prompts us to a future state,

The last appeal from fortune and from fate,

Where God's all-righteous ways shall be declared;

The bad meet punishment, the good reward.

During life, however, they are supposed to be favoured with some other privileges, besides those already mentioned, superior to what are granted to mankind; such as being exempted from the power of poison, dilemppers, accidents, &c.

3. The spirits of the third class are, the apparitions of parents, friends, &c. or of those whom they love, and who love them.

4. The spirits of the fourth class are, the apparitions of their enemies, or of those whom they have had reason to fear; and, consequently, these spirits are deemed of a malignant nature.

5. The spirits of the fifth class, which are called Anagats, answer to what we term phantoms; and are, even by the Madagascarians themselves, deemed rather imaginary, than real; for they seem to think them only the illusions of the fancy.

6. The spirits of the sixth class, called Socara, are demons or evil spirits, whose business it is to enter into, possess, and torment people of all ages and conditions.

7. The spirits of the seventh class are called Bilis; by which word is meant, the devil and all his fiends. These are supposed to be as numerous as the first class, though not so powerful; nevertheless, as their privilege of doing mischief is extensive, their propensity to evil is greatly dreaded by the people in general.

Independent of the above, the generally received religious notions of these people are:

That God having created heaven, earth, and all things animate and inanimate, then formed Adam out of clay, and placed him in Paradise, which they supposed was either in the sun or the moon; but which planet they do

not pretend to say, with any degree of precision; however, this Paradise, they affirm, was refreshed by four rivers, that respectively flowed with wine, oil, milk, and honey; and abounded with a profusion of the most delicious fruits: yet Adam was prohibited from either eating or drinking of these delicacies, his constitution being such as to need no manner of refreshment.

This is their notion of the creation, in which truth and falsehood are blended together; but the sacred beauties of the first are visible through the erroneous blemishes of the latter; and the whole evinces the extravagancy of corrupted nature, when delitute of revelation, the only guide to be depended on.

Their idea of the fall, which appears to the full as extraordinary, is this: That the devil, by cunning and craft, finding Adam in Paradise, asked him, why he drank not and ate not of the wine, milk, oil, honey, and fruits, which here abounded, and were so exceedingly delicious: to which Adam replied, that he durst not, because he had been prohibited from so doing by God himself, and besides he had no manner of necessity for nourishment to support life. The devil, being determined to ruin him, if possible, appeared to be satisfied with this answer, and departed; but soon after returning, he deceived Adam by the most fallacious discourse, pretending that he had obtained permission from God for Adam to eat or drink whatever he pleased. Adam being thus deluded, ate and drank, and entered into the corruption of nature; on which account God banished him from Paradise, and sent him into a far country. Here an imposthume grew in the calf of his leg, which burst in a few months, and produced a female child. Adam being very much perplexed on this account, applied to the angel Gabriel, to know, by his means, what he was to do in the affair? When the angel Gabriel told him, it was the will of God that he should bring her up, and marry her at a certain age; which he did, and called her Rahouna, or Eve.

Rahouna was subsequently delivered of two sons, Cain and Abel, who (says their tradition) afterwards destroyed each other, being stimulated thereto by the instigation of the devil, after this, had many children, who, as they increased in numbers and years, encreased likewise in wickedness. The greatest part of these God thought proper to destroy, on account of their vices; but first commanded Noah to build a ship, and retire to it with his wife, children, relations, domestics, &c. and with a male and female of every other species of animated beings. These having entered the ship, the deluge succeeded, and drowned the rest of the people, the cattle, &c. &c. the waters covering the whole earth, four mountains excepted, viz.

Zabalicaaf	} in the	{	North
Zabalicaoure			South
Zabalirof			West
Zabalibazani			East

When the flood had subsided, Noah, with all belonging to him, quitted the ship, and fixed their residence at Jerusalem: from hence they removed to Mecca; and here, according to tradition, Noah received four kinds of writings, which he was to transmit to posterity, and which contained the law of God, viz.

1. Alifuran, or Al-Koran, was intended for Noah.
2. Socralli, intended for Moses.
3. Zomboura, intended for David.
4. Alindzi, intended for Christ, whom they call Bahilla.

These traditions and religious principles having been introduced by the Mahometan Arabs, who were the progenitors of those people called the Madagascarian Whites, there is no wonder that they should have made such a selection of Christian, Jewish, and Mahometan tenets, and have interlarded them with absurdities of their own; nor can we be surpris'd that they should have attempted to make the Mahometan the primitive religion, since, where chronology is unknown, any error which dates alone can rectify may go down.

In a great measure they are right in their notions concerning Christ, as they allow that he was sent by God; that he was not begotten of man; that he was born of a virgin; that he was God and man; that he was a great prophet; and that he was crucified by the Jews; but then

they add, that God, not thinking proper that he should die, substituted a malefactor in his place, who died instead of him. The latter circumstance might originate from the scriptural account of the malefactor who was crucified at the same time as Christ.

The priests, or ombiaffes, are of two orders, viz.

The ombiaffes omponeants, and

The ombiaffes omptinquill.

The first order is usually composed of white Madagascarians, who practise physic, teach the Arabic language, compose the zidiff, or Arabic words, written on small billets, which are used as charms; act as schoolmasters, conjurors, wizards, priests, &c.

The second order are black ombiaffes; and these, by pretending to geomancy, or the art of divination, upon all occasions, live with great reputation among the people, and accumulate considerable profits to themselves.

There is another class of inferior ombiaffes, which are placed upon the footing of quacks, as not being deemed to regular in their profession as the two former orders. These, however, visit the sick, not to administer medicines, but to predict the event of the disorder; their predictions usually being favourable or unfavourable, as they are well or ill paid.

The Madagascarians have received from the Jews and Mahometans, by means of the Arabs, who come to settle there, the custom of circumcision, the ceremony of which is performed every third year; at which time they build a hall raised upon wooden pillars, and encompassed with a pallisado of stakes. The great lord of the province kills a bull, and having spilt the blood of it, mixed with honey-wine, round the building, he opens the pallisado, and plants at that opening a banana-tree with leaves and fruit, on which he hangs a girle, tainted with the blood of the bull: after which that place is looked upon as sacred; no person approaches it but with the utmost respect, and none enter it. The fathers of the children who are to be circumcised, fast during the first eight days of the moon of March; and the last day they walk abroad two and two, carrying the children on their shoulders, wrapped up in Paans. The young men who are not married follow them, and holding their sabres in their hands, they make threatening motions with them, as though they were going to attack an enemy. After they have walked three times round the donac (the lord's house) they stop before the door, and dividing themselves into two troops, they exercise themselves a long while in feigned attacks, till being tired at last, they are obliged to sit down on mats prepared for them. The next day a priest or Marabout runs like a madman into all the cottages, in order to drive away the evil spirit out of the bodies of these children; he threatens him, and at length makes the people believe, that he has forced him to come into the body of a chicken, which is tied up in a basket, and crushing it to death, he tells them: the children are delivered of that evil spirit. The fathers and mothers present themselves afterwards before the great lord, with as many oxen and as many black chickens as there are children to be circumcised, and the lord appoints the day on which the ceremony is to be performed. That day being come, the lord, sitting at the entry of the hall, receives, on a table covered with paans or carpets, the offerings of the mothers; then he enters into the hall, and sits down in the middle of it, and the fathers holding their children on a very smooth stone, the lord cuts off the prepuce, which done, the father immediately cuts the throat of his chicken, makes the blood of it drop on the wound, and gives the child back to the mother; who dipping cotton into the blood of the ox that has been killed, and into that of the chicken also, ties it about the wound.

Drury gives us the following account of the method of thanksgiving after a successful war. "The inhabitants," says he, "have in all their houses a small portable utensil, which is devoted to religious uses, and is a kind of household altar, which they call the Owley. It is made of a peculiar wood, in small pieces, neatly joined, and making almost the form of a half moon, with the horns downwards, between which are placed two alligators teeth. This is adorned with various kinds of beads, and such a fish fastened to it behind, as a man ties about his waist when he goes to war. However, I observed that they brought two forks from the woods, and fixed them in the ground, on which was laid a beam,

flender at each end, and about six feet long, with two or three pegs in it, and upon this they hang the owley. Behind it was a long pole, to which a bullock was fastened with a cord. They had a pan full of live coals, upon which they threw an aromatic gum, and planted it under the owley. Then they took a small quantity of hair from the tail, chin, and eye-brows of the ox, and put them on the owley. Then my matter used some particular gestures with a large knife in his hand, and made a formal incantation, in which the people joined. In the next place they threw the ox on the ground, with his legs tied fast together, and my matter cut his throat." Thus the ceremony ended, and this is deemed an obligation for having obtained a victory over an enemy. Thus these people, like many ancient nations,

Do recompense with death their creatures toil,
Then call the blest above to share the spoil,
The fairest victim must the powers appease,
So fatal 'tis sometimes too much to please.
He hears the murderous prayer the priest prefers,
But understands not 'tis his doom he hears;
— And views perhaps the knife,
Uplifted, to deprive him of his life;
Then broken up alive, his entrails fees,
Torn out, for priests to inspect the gods decrees.
Dryden's Ovid.

Political and civil Government of Madagascar.

THE accounts given of the political state of this island differ very much from each other, which is not owing to any want of authenticity in the several authors, but to the revolutions which have so frequently happened; so that different writers, treating of the political state of Madagascar, at various periods, must of course vary from each other exceedingly. Hence Vincentius Albus, and Gasper de San Bernardino, have informed us that this island was divided into six distinct kingdoms, whose sovereignties were at continual variance with each other; and Marcus Paulo, the Venetian, tells us, that in his time it was governed by only four sovereigns. By later accounts, however, it is certain that every province hath its particular sovereign, or lord, who is called dean, or deacon; and this sovereign lord appoints a touloubi, or governor, over every village in his territories.

The civil government here is not dependent on edicts or public instruments; nor is there such a thing as written law in the whole island. A kind of natural law, arising from the common occurrences of life, founded on the feelings of human nature, resulting from reason, and handed down by tradition from father to son, is the sole guide of these people.

These traditional, or oral laws, are of three kinds:

1. *Mandindili*, or the law of the prince.
2. *Masimpofo*, or the law of individuals.
3. *Masimame*, or the general law, or custom of the country.

The first of these laws, or the law of the prince, respects his peculiar prerogatives, and shews how far his will should be limited, and how far his power extended.

The second of these laws, or the law of individuals, is of a domestic nature, and respects each individual, his manner of living, his deportment according to his circumstances, his behaviour to persons of his own family, or to his immediate neighbours.

The third kind of these laws is the universal law of the country, or what may be called the common law. It regards all occurrences, offences, and complaints, which are of a public and material nature, or which, in any measure, affect the welfare of the community.

Of these laws we shall give a few examples.

Of the first kind,

To lie with one of the sovereign's wives is death by the law of the prince, or the prerogative law.

Of the second kind,

If a man is caught robbing his neighbour of an ox or a cow, he is obliged to restore it untended.

If a man borrows an ox or a cow of his neighbour, and does not return it in a year's time, six calves are looked upon as an equivalent for the ox; and if he neglects payment at that time, those calves are supposed to be three steers, and three heifers; and their increase, which, by

a fair computation, arises by their growth and production, is the man's right of whom the beast was borrowed. And if it go on for ten years, or any longer term, it is computed what three bulls and three cows might produce in that time, and all that produce is due to the creditor.

Of the third kind,

If a man has criminal conversation with the wife of another man, who is his superior, he forfeits thirty head of cattle, besides beads and shovels in abundance; but if the men are of equal degree, then the fine is only twenty head of cattle.

If any one maliciously assaults another, and breaks a leg or an arm, he is fined fifteen head of cattle, as a forfeiture to the party injured.

If any one breaks the head of another, and the aggrieved party has not returned the blow, he receives three beavers by way of damage.

If any one steals another's hive of honey, and is caught, the fine is three iron shovels; for it is to be observed, that iron shovels, hoes, &c. are a kind of small money with these people; for here is no trade, but by barter, or the exchange of one commodity for another, therefore they are very exact in proportioning the value of different articles.

If one man's cattle break into another's plantation, the owner, for every beast found there, must give an iron shovel.

If two men quarrel, and one happens to curse the other's father or mother, whether they be living or dead, and his antagonist has so much command of himself as to refrain from cursing the other's father or mother, he recovers two beavers, as a compensation.

If any one is found guilty of stealing Guinea corn, cavaunes, potatoes, or the like, out of any of the plantations, he forfeits a cow and calf to the owner, or more, if the damage done is supposed to require a greater forfeit.

REVOLUTIONS.

THE ancient history of this country cannot be known, as the people are without public records, or the chronological knowledge of events. All that is known is from oral tradition; but the transactions thus handed down are too futile and vague, and too much interwoven with fiction, to merit notice. We are told, indeed, that the province of Anossi, which has been better known to the Europeans than any other part of the island, was, previous to the arrival of the French, governed by a sovereign, who was not only honoured as a king, but almost revered as a god. His name was Andian Ramach, and on his demise the crown devolved to Andian Manarive, who was a Christian, having been educated at Goa, and baptized by the Jesuits. He, however, soon turned to the paganism of his ancestors, and was afterwards killed by a musket ball, when the French attacked the town of France.

Captain Rivault, in the year 1642, obtained permission from cardinal Richieu, for nine years, exclusive of all others, to send ships and forces to Madagascar, and the neighbouring islands, in order to establish a colony, plantation, and commerce. And this gentleman erected a society for this purpose, under the name of a French East India Company, and the grant was drawn out, with the addition of ten years more privilege; or, in other words, extended to the year 1661. In the interim, that is, immediately subsequent to the making out of the grant, A. D. 1642, the first ship was sent under the command of captain Coquet, who was going to load ebony at Madagascar, on the account of himself and some private merchants; but had orders to take with him two governors, whose names were Pronis and Fouquebourg, and twelve other Frenchmen; these being commanded to land and remain there, till the arrival of a ship from France, which was to sail in November.

Coquet got to Madagascar in September, having in his way anchored at the island of Bourbon, which he took possession of, in the name of the king of France; touching afterwards at the Isle of St. Mary, he did the same; and arriving at the bay of Antongil, in Madagascar, he acted in a similar manner. Pronis and Fouquebourg were at length landed in the port of St. Lucia, in the province of Manghalae.

The expected ship from France arrived on the first of April, in the ensuing year. It was named the St. Lawrence, and was under the command of captain Giles Refimont,

Refinot. This officer brought seventy men with him, to reinforce Pronis. The inhabitants, jealous that the French would obtain too firm a footing in their country, meditated an opposition; but their intentions were prevented, or at least delayed, by the prudent conduct and timely presents of Pronis. Upon this success, Pronis sent twelve men, to penetrate into the province of Matatan, six of whom were cut off by the natives, and the rest compelled to retreat; and soon after, captain Refinot's son and six sailors were murdered in the province of Vohitbang. This opposition was owing to the secret intrigues of the leading men in Anossi, who, from their maritime situation, did not dare to offend the French themselves; but stirred up the people of other provinces, to oppose and murder them upon all occasions.

In 1644, Pronis thought proper to remove from St. Lucia to the bay of Tholagare, where he began to fortify himself; and having reduced almost the whole province of Anossi by force of arms, he built Fort Dauphin, in 25 deg. 6 min. south lat. the situation being excellent, the harbour commodious and fine sheltered, and the entrance very convenient for shipping of any burthen. Behind the fort he erected several other buildings, with large enclosures, which produced various sorts of fruits, kitchen herbs, &c.

In the year 1650, the fort took fire by some unforeseen accident, and was totally destroyed; soon after, however, it was rebuilt, and strongly garrisoned, the French being always at variance, and frequently at war with the natives.

In the year 1651, the celebrated French governor, Flacourt, at the head of 80 Frenchmen, and a great number of armed negroes, ravaged the country, to a considerable distance from the fort, carrying off great quantities of cattle, and destroying all the houses and huts in his way. This occasioned the natives to conceive an extraordinary aversion to the French; and what added to their dislike was, that whenever any prisoners fell into the hands of the French, they looked upon them all in an equal light, and sold them indiscriminately to the then Dutch governor of the island of Mauritius, not making any distinction between deans or lords, freemen or slaves; or showing any greater respect to their ladies, when captives, than to women of a lower rank. The French at length finding that the idea of conquering Madagascar was chimerical, and that the danger and expence of maintaining a colony, and keeping up a fortress here, were not recompensed by the profits accruing from the settlement, thought proper at once to abandon the island, and all projects relative to it.

The traditional accounts given by the natives, of the attempts made by the French to settle on and subdue Madagascar, being exceedingly curious, we shall extract them from Drury's narrative of his captivity upon this island.

"This part of the country (saith he) to which the French have given the name of Port Dauphin is called in the Madagascar language, Antenosa. There came hither upwards of a century ago, two French ships, on what account I cannot learn, however, they came to an anchor close under land, in a very good harbour. The captain observing that there were plenty of cattle, and all provisions, as a very good soil, determined that one of them should stay here and establish a settlement. Hereupon they cast lots who should continue on the island, and the person on whom the lot fell was captain Melmerico.

This captain Melmerico landed with two hundred white men, well armed, and provided with store of ammunition, and other necessaries for the building of a fort, which they immediately began. No sooner had the natives observed their intention, but they used their utmost art and industry to prevent them: this created a war, in which the French were the victors, who took at several times a great number of prisoners: in this war, the king of Antenosa, and his brother were killed; and amongst many other children that were made captives, the king's son was one. When the French had suppressed the natives, and completed their fort, the ships set sail for France, and carried this young prince, and several others of distinction with them.

In about a year after this expedition, the natives began to be better reconciled to the French; notwithstanding they were secretly disgusted at the indignity offered to

their young prince, and could by no means relish the government, and direction of foreigners: however, the French, by their artful, and cunning deportment and insinuations, gained so much friendship amongst them, that they married, and lived up and down in several towns, at some distance from each other; and not above five or six in a place. They occasionally assisted the natives in their wars against a king, that resides to the north-ward, whom they defeated, took a great number of slaves, and many cattle. In this manner they lived for some years with great tranquillity, neglecting their fort, and extending themselves all over the whole country of Antenosa: but at last, as their families grew numerous, the natives grew jealous; and recollecting how inhumanly they had treated their prince, and perceiving them thus scattered, and dispersed; they thought this a favourable opportunity to free themselves from a foreign yoke. Hereupon they formed a conspiracy to cut off all the white men in one day; and the Wednesday following it was put in execution, not leaving a white man alive in Antenosa.

Soon after a French ship came there as usual: the maorintiers, or slaves, who retained a respect for the French, got a canoe, and went off to them; and informed them that their country-men were all massacred. The captain was startled, and deeply concerned at this melancholy news, but could not revenge their cause, being glad to steer another course, without making the least attempt to go on shore.

Having now no body to interrupt them, they put their government into its original form, and made choice of one for their king, who was the nearest related to the former; there being no other son but him whom the French took captive. Under this new king's direction they lived peaceably and quietly for several years, no French ship ever presuming to come near them; but now and then an English ship paid them a visit; and they traded in a very fair and honest manner with the officers on board.

Some years afterwards a French ship, homeward bound from India, happened to be in great distress for want of water and provisions, and could not compass the cape. Port Dauphin lay very commodious for the captain, but he knew that the natives were their implacable enemies, neither was he ignorant of the real occasion; and therefore resolved to make use of the following stratagem. Under a pretence of being sent ambassador from the French king, he went on shore in great pomp, and with proper attendants. The ship lay at anchor as near the shore as possible, in order to be within reach of their guns, in case any acts of hostility should be shown them. The natives who came down to them, asked if they were English, or French: they replied, the latter; but they were sent by express orders from the French king with some valuable presents, and were inclined to make a treaty of peace. The king they had last chosen, whom I mentioned before, died about a month before their arrival, and no new one was then elected in his stead; but the old queen (mother of the young prince, whom they had clandestinely conveyed away some years before;) being then alive, gave directions that the ambassador should be conducted to her house. His men carried a great many things of no great value amongst them; but such, however, as they knew would be highly agreeable in this country. These were formally presented in the name of the French king, and the queen testified her satisfaction in the reception of them, by entertaining the captain in the most elegant manner she could devise. This day passed in compliments, mutual presents, and such other ceremonies, as were consistent with their ideas of public grandeur; the next day she sent for the captain, and informed him, that she expected his men, as well as himself, should take the oaths according to the custom of her country.

The captain having readily agreed to her proposition, the ceremony was performed after the following manner: the holy oxley, of which we have already given some account, was brought out, and hung upon a piece of wood laid cross-wise on two forks, all which were cut down on this solemn occasion; as was also a long pole, to which a bullock was fastened: this was provided by the queen, and when killed, they took part of the tail, and some of the hair of the nose and eye brows, and put them

them on some live coals that were under the owley; they then took some of the blood, which they sprinkled upon it, and upon the beam whereon it hung; the liver also was roasted, and a piece placed on it; two other pieces were put on two lances, which were stuck in the ground betwixt the queen and the ambassador; the queen swore hrril to this, or the like effect.

I swear by the great God above, by the four gods of the four quarters of the world, by the spirits of my fore-fathers, and before this holy owley; that neither I, nor any of my off-spring, nor any of my people, who assist at this solemnity, or their issue, shall, or will wittingly, or willingly, kill any Frenchman, unless he proves the first aggressor; and if we, or any of us, mean any other than the plain, and honest truth by this protestation, may this liver, which I now eat be converted into poison, and destroy me on the spot.

Having repeated this form of words, she took the piece of liver off the lance, and eat it; and when she had done, the sham ambassador did the same.

The captain, or quondam ambassador, stayed on shore about three, or four days after this solemn contract, and sent on board what provision his people wanted. A firm friendship being now established between them, they strove who should outvie the other in the acts of courtesy and complaisance. The captain invited the queen to go on board his vessel, and the very readily went with several of the chief of her people; who were treated by the captain with great magnificence, and to her intire satisfaction. She returned on shore in the ship's boat, and stood looking about her for some time after she was landed. The Frenchmen, not regarding the presence of the black queen, stripped, and swam about to wash, and cool themselves; the queen, observing the whiteness of their skins, indulged her curiosity in looking on them; at last, perceiving one man, whose skin was much darker than the rest of his companions, as he came towards the shore, and was going to put on his cloaths, she espied a particular mole under his left breast; she went to him immediately, and looking more wisely on it, would not permit him to put on his shirt; but claimed him as her son, who had been carried away when a child many years before; and had not patience to contain herself, but ran to him (crying for joy that she had found her son) threw her arms about his neck, and almost kissed him with kisses. This surprized all the people, as well blacks as whites, till having recovered herself a little, she turned to them, and told them, this was her son; and shewed them the private mark. They who had known the young prince, drew near, viewed the mole, and acquiesced with her, that it must be he, and no other. The Frenchman could not tell what to make of this odd discovery, nor what might be the fatal consequences that might possibly attend it.

The captain, therefore, taking the man aside, advised him to give as artful answers as he could to what questions they should ask him, for their safety's sake. Now there were several blacks who spoke French, and by their means the Frenchmen as soon understood the queen as they did. She desired they would ask him, if he knew the country he was born in? He answered, he could remember nothing of it, for he was carried from his native place when a child. She asked him if he knew her? He said, he could not pretend to say absolutely that he did; but he thought she bore a great resemblance to somebody he was much used to when young.

This confirmed them more and more in their opinion; as to his being white skinned, they thought that might easily be from his wearing cloaths, during the time he was absent from home; his hair was as black as theirs, so that it was concluded it must be their prince. The old queen was transported with joy at finding her son, and the natives were for chusing him their king directly, he being the next heir. They asked what was his name? He told them, he never remembered that he was called by any other name than that of Samuel; but they gave him what they thought was his original name, compounded with Tuley, which denoted his return, or arrival; so they called him Dean Tuley-Naro, (dean, it may be observed, is an universal title of honour, and signifies Lord,) and he was also further saluted immediately with the title of Panazker, that is, King of Antenosat.

The captain and other Frenchmen were surpris'd to

find the man play his part so dexterously; not perceiving at first that he was in earnest, and was as fond of being their king, as they were of electing him; though it was in so heathenish a place. He had here twelve thousand fighting men immediately under his command; and a fine, spacious, and plentiful country, to live in at his pleasure. The ship's crew failed away, and left him behind them; but as often as the French had occasion for what this island afforded, they made it a constant practice to put into Port Dauphine, and traffic with him.

About three years before we were castaway, says Drury, a French ship happening to be there, some of the men got drunk on shore; and in a quarrel with some of the natives, told them that king Samuel was not their lawful prince; but that he was still resident in France. This might have proved of very fatal consequence to him, but he took such care to prevent it as no one could justly blame him for; he sent for the man who made this public declaration, and ordered him to be shot to death; he commanded likewise his companions to depart forthwith, and assured them that if ever they, or any of their countrymen presumed to come within his territories again, they should feel the weight of his resentment.

Besides Port Dauphine, the Europeans often frequented the bay of Antongil, which is situated in the 16th deg. of south lat. and extends above 40 miles to the northward, being near thirty miles broad at its entrance. It contains a small island, which is fertile in provisions, has plenty of fresh water, and a good harbour for shipping. The Dutch had formerly a factory here, which is now abandoned, as thofe left to take care of it were almost sure to fall victims to the bloody dispositions of the natives, or the inclemency of the climate.

St. Augustine's Bay is situated just under the tropic of Capricorn, in 23 deg. 30 min. south lat. being on the western coast of Madagascar; and was formerly much resorted to by Europeans.

Mr. Salmon says, "it was once expected that the pirates would have made a settlement in this island, and usurped the dominion of it, having six or seven sail of ships, with which they used to infect the Indian seas, and carry their prizes into a place of security, on the north-east part of Madagascar, where they possessed themselves of a harbour of difficult access, and defended from storms by the little island of St. Mary, which lies before it in 17 deg. south lat.

"The court of England, about the year 1700, sent a squadron of four men of war, commanded by commodore Warren, to drive the pirates from thence; but he, finding it impossible to come at them, published a proclamation, in pursuance of his instructions, offering a pardon to all that would come in (except Avery, their leader) but not a man came over to him. The commodore afterwards proceeded to Fort St. George, in the East Indies. This gentleman used his utmost endeavours to meet with the pirates in the sea of India, but to no purpose; and having left one or two of his ships on the shoals near Malacca, returned with the rest to England. However, his expedition had this good effect, that the pirates durst not stir from Madagascar; and finding they were so narrowly watched, they agreed to divide what they had got, and disperse themselves. Two of them were afterwards taken by the Dutch at Malacca, and being sent to Fort St. George, were brought over to England in the Howland, being the same ship the author, Mr. Salmon, came home in, A. D. 1701. What became of Avery himself," continues Mr. Salmon, "I could never learn; but it is probable he is dead, or remains concealed in the island of Madagascar."

Later accounts, however, assert, that Avery dissipated his immense wealth, returned to England incog. lived many years privately and poorly, and at length died in great indigence and misery, at Biddford in Devonshire, concluding thus a life of wickedness in a death of calamity; for as

Heaven for ever waits on virtuous deeds,
And though a late a sure reward succeeds;

so

Justice unnumber'd insults will endure,
Her punishments are always slow, but sure;
She strikes the strongest blow when fancy's dead,
Her hands are adamant, her feet are lead.

Debauchee.
Suo

About the year 1740 another English pirate, named Plantain, settled here, and attempted to profit by the divisions among the petty princes of the island, sometimes taking the part of one chief, and sometimes of another; by which conduct he made himself considerable among the natives, till each individual of his crew affecting the state of nobility, and growing too proud to be commanded, the captain found himself entirely deserted; when, venturing to sea in an open boat, with only one associate, he landed on the coast of Malabar, in India, and entered into the service of the celebrated piratical prince, Angria, whose fleet was destroyed during the late war, by admiral Watson: a particular account of which we have given in chap. x. sect. 10, page 158, of this work.

Some islands being situated in the gulphs belonging to, or near the coasts of Madagascar, may, with propriety, be included under this head; being, from their locality, usually considered as appendages to it, at least when considered geographically.

The first of these is the island of St. Mary; or, as the natives and the Madagascariens call it, Nossi Ibrahim, or the Isle of Abraham, which lies in 17 deg. south lat. about two leagues from the shore of Madagascar, and opposite to the mouth of the river Mananghare. It is about 50 miles in length, from north to south, and almost ten from east to west. It is surrounded by rocks, over which canoes may pass when the sea is high; but at low tide they are scarcely covered with a foot of water, which renders the coast in general dangerous, and only accessible for shipping at particular places. Various beautiful shells, and great quantities of white coral, abound about this island. The whole is intersected and watered by many rivers, rivulets, and running springs, which give fertility to the soil, and beauty to the scene; enriched on every side by plantations of rice, yams, millet, fruit, vegetables, &c. Sugar-canes grow spontaneously, and the tobacco-plant comes to very great perfection. The air is extremely moist; for there is hardly a day in the year but it rains some time within the twenty-four hours, and it often rains a week together, without intermission. The cattle are fat and good: ambergris is found about the eastern shore, and the island abounds with various gums, particularly that excellent one called taca-nahaca. Since the French were settled on the island of St. Mary, it became much more populous than before; nor dare the neighbouring Madagascariens now set a foot on the island, though they formerly used to carry fire and sword amongst the poor natives, and were a great scourge to them. At present there are ten or twelve villages, and near a thousand inhabitants, who employ themselves chiefly in cultivating rice, yams, peas, beans, &c. They are likewise very fond of a fish called hourils, which they catch either by nets or hooks, and eat or sell them, as their necessities require. Their religion is paganisin, intermixed with some particles of Judaisin; and they keep on good terms with Christians, though none of them have been known to become proselytes.

To the south of the island of St. Mary is a small island, separated by a narrow channel, not above three fathom over, so fertile, rich, and abundant, that the inhabitants of St. Mary send their cattle hither to fatten, and lay out large plantations of rice, corn, roots, and fruits, notwithstanding which they have not thought proper to plant any colony in it. This is probably the same island which Le Court places in the bottom of the bay of Antongil, which he highly praises for its beauty and fertility, as well as for the safety of its harbour, which was once much frequented by the Dutch, in their early voyages to the East Indies.

The island of Diego Rodriguez is situated in 19 deg. 15 min. south lat. about 22 leagues to the eastward of Madagascar; and is uninhabited.

In the 16th deg. south lat. are situated the islands called by the Portuguese Ihas, Primitias, and other islands called Angoras, which are four in number; but these islands contain nothing worth particularizing, or that is worthy of attention.

Here we may likewise mention several small islands called Utiques, placed by Le Croix opposite to Cape St. Sebastian, on the coast of Salsola, and under the lat. of 24 deg. nine min. from the continent; yet these we have reason to believe to be the little cluster of islands which

stand off St. Sebastian, on the north west end of Madagascar, east of the Comoro Islands; they produce rice, millet, and great abundance of cattle; there is also ambergris found on the sea-coast, which the people collect and export to different parts of the continent; but the most valuable commodities of these islands is a pearl fishery, which might turn to good account, if the natives understood their virtue, and did not spoil their colour and transparency, by boiling the oysters in which they are found.

The inhabitants are negroes, and resemble those of Madagascar, both in persons and dress; if the bit of rag, or lambs, tied round their middle, merits that denomination. Their religion is paganisin, with some faint gleams of Judaisin, and they are exceedingly superstitious, being extremely fond of attending to predictions, though their lives are usually rendered unhappy thereby, as, indeed, how can it be otherwise; for if we believe that some certain good is destined to attend us, we groan under the present burden, and are anxiously miserable for its arrival; while, on the contrary, if we fancy that some evil will assuredly befall us, we feel it poignantly in expectation, and are truly unhappy, in the excruciating idea of what may chance to happen. Then how impious must they be who attempt to pry into futurity, and to search for that which heaven hath so wisely concealed. And how kind is Providence, to hide from us so cautiously what, if known, could only render us the slaves of either hope or fear.

Heaven from all creatures hides the book of fate,
All but the page prescrib'd their present state;
From brutes what men, from men what spirits know,
Or who could suffer being here below;
'Tis Lambs thy riot dooms to bleed to day,
Had he thy reason would he skip and play?
Pleas'd to the last, he crops the flow'ry food,
And licks the hand just rais'd to shed his blood.
Oh, blindness to the future, kindly given,
That each may fill the circle mark'd by heav'n;
Who sees with equal eyes, as God of all,
A Hero perish, or a sparrow fall;
Atoms or systems into ruin hurl'd;
And now a bubble burst, and now a world.
Hope humbly then, with trembling pinions soar,
Wait the great teacher Death, and God adore;
What future bliss he gives not thee to know,
But gives that hope to be thy blessing now,
Hope springs eternal in the human breast;
Man never is, but always to be blest.
The soul uneasy, and confin'd from home,
Rests and expatiates in a life to come. POPE.

To the east of Madagascar, from the fifth, to the 40th degree of latitude, are a number of small islands; but as they are all uninhabited, so a description of them cannot be expected.

The island of Diego Garcia lies under the latitude of eight, and longitude 90 east. Near two degrees south of this land three small islands, called Brandons; and directly south of them, about three degrees, stands the island of Rodrigue, or Roderigo, between the continent and Madagascar, not very far distant from the Comoro Islands. Under the 29th deg. of south latitude stands the island of Romaricres, about three deg. east and south-east of Mauritius; a little beyond which is the island of John of Lisbon, in the same longitude with the Isle of Bourbon, and in latitude 26 deg. south.

In latitude 32, and longitude 76, lies an island discovered by the Dutch, who never gave any name to it. To the south of this, between latitude 37 and 38, are two other islands, one of which is called Amsterdani, and the other St. Paul; but neither of them contain any thing that merits the attention of a traveller.

Besides the above, to the north of the Cape of Good Hope, are three small islands, called by the Dutch, Roben Eiland, Dallen Eiland, and Frans Eiland. The first of these is also called Rabbit Island, from the prodigious numbers of those animals that burrow about the shore. It is very small, being not more than two leagues in circumference. The second is called also Deer Island, from its being inhabited by considerable numbers of those animals. It is imagined that these animals were brought hither by Spitzbergen, in the year 1601. The English and

and Dutch afterwards brought hither some sheep, which have also greatly increased, though not any way in proportion to the deer, which are so numerous as to cover the principal part of the island. The sheep here grow to an amazing bulk; and their tails are so large, as to weigh from 30 to 40 pounds.

It is astonishing how these animals procure a subsistence; or what could induce the people to bring them here, as the island, which is sandy, produces nothing but a few flowers and briars: it must, therefore, have had a very unpromising appearance for the breeding or fattening of cattle, though the event has answered the expectations of those who were induced to try the experiment. What still increases our astonishment is, that it wants fresh water; which circumstance alone, it might have been imagined, would have destroyed the

whole project. Hence we may admire the works of Providence; and say with David, in his pastoral hymn,

The Lord my pasture shall prepare,
And feed me with a shepherd's care:
His presence shall my want supply,
And guard me with a watchful eye;
My noon-day walks he shall attend,
And all my mid-night hours defend.

Tho' in a bare and rugged way,
Thro' devious lonely wilds I stray,
Thy bounty shall my pains beguile:
The barren wilderness shall smile,
With sudden greens and herbage crown'd,
And streams shall murmur all around.

C H A P. XXIX.

ISLANDS near the Coast of ZANGUEBAR.

THERE are many islands near this coast, but the generality of them are very small and uninhabited. We shall, therefore, only take notice of the most considerable, which we shall describe in proper order, according to their respective situations, beginning with

The Island of MOZAMBIQUE.

THIS island is situated in a gulph, in the 15th degree of south latitude, and about two miles from the coast. Before the island, and next to the shore, are two smaller ones, which seem as if they had been formerly joined with the main land. One of these is called St. George's, and the other St. James's; but they are both small, and without any inhabitants.

The island of Mozambique is very small, being not above a mile and a half long, and three quarters of a mile broad. The land is smooth and even, and the greatest part of it covered with white sand. The air is very sultry and unwholesome; and they have no other fresh water than what arises from a small spring situated about the center of the island. Though the soil here is very dry and sandy, yet the inhabitants have gardens, in which, from the assistance of water brought from the above spring, they cultivate oranges, lemons, ananas, and fig-trees.

Notwithstanding the general barrenness of the island, here are great numbers of black, and small cattle, particularly sheep, whose rumps are of an enormous size. They have likewise some hogs, and a kind of fowl, whose feathers and flesh are black: when these are boiled, the water is of the colour of ink, but the flesh of the bird is very delicate and wholesome.

The natives of this island are short of stature, very black, and have curled hair like the wool of a sheep. They are naturally cruel, deceitful, and enemies to strangers; but as they are very fearful, and great cowards, the Portuguese, who are masters of the island, keep them under tolerable subjection. The men wear only a small piece of cloth wound round the waist; but the women have a kind of petticoat of coarse cotton cloth, which reaches from the middle to the ankles. They wear round their necks, strings of coral, beads of various colours; in their ears they have brass rings; and on their arms, bracelets made of brass or tin. Some of them are Christians, others Mahometans; and the rest idolaters.

The island of Mozambique belongs entirely to the Portuguese, who built a town in it, which is called also by the same name. This town is of infinite advantage to them, as their ships not only stop and refresh here in

their way to the East Indies, but it also secures their trade with the neighbouring nations, particularly those of Sofala and Monomotapa, from whence they take great quantities of gold. This town also keeps in awe the kings and nations of the adjacent coast, most of whom are either subjects or allies to the Portuguese. The houses in this town are tolerably well built; and they have a convent and an hospital for the sick, both of which are large and handsome buildings. Here is likewise a fort, which is much larger than any the Portuguese have on the whole coast of Zanguebar. It is a square building; and at each corner there is a bastion planted with several pieces of ordnance, which secures both the town and the harbour. It is surrounded with a triple rampart, and a very broad and deep ditch.

The continent, opposite this island, is also called Mozambique; under which name the reader will find it described in our account of the coast of Zanguebar.

The Island of MOMBAZA.

THIS island is situated in four deg. five min. south latitude: it lies in a gulph, and is about 30 miles in circumference. It has a large town situated on a rock, and defended by a strong castle. The houses are built after the Italian manner; and the castle is the usual residence of a Mahometan prince. The Portuguese were once masters of this island, but they were routed from it by the Arabs about the middle of the last century.

This island is watered by a river of the same name, which springs from the mountains of Monocrogi, runs from east to west, and then discharges itself into the sea.

The port of Mombaza is very safe and commodious; and is greatly resorted to by the merchants of the coast of Zanguebar, and other places, for the convenience of trade.

The QUERIMBA ISLANDS.

THESE islands are seated along the coast, from Cape del Gada, in 10 deg. to the 12th deg. of south latitude; and extend two degrees, or 120 miles, from north to south. The most remarkable, and largest of them, which gives name to the rest, is Querimba, where the Portuguese have a small fort. This island, which is the most populous of them all, contains about 25 houses, not contiguous together, but feathered up and down, like so many farm-houses. In the middle of the island is a church, where mass is said by a Dominican priest sent hither by the archbishop of Goa.

The other islands that go under the denomination of Querimba are, Ibo, or Oibo, Matomo, Macooloo, and Malinda;

Mahinda; but they are all too insignificant to merit any particular notice, except the first, which is under the direction of a Portuguese governor, who has a large house several stories high, with an extensive garden behind it; and the whole is enclosed with a lofty and strong wall. This island and Querimba have good harbours for shipping, which is not the case with any of the rest, the channels between them being, at low water, not more than three feet deep.

The Querimba islands are all well watered with springs, and are therefore exceeding fertile, producing plenty of dates, oranges, citrons, grapes, pot-herbs, &c. They abound also in good pastures, where are fed great herds of large and small cattle. Most of them have likewise great plenty of game; and the sea about them produces a variety of excellent fish. The inhabitants receive wheat, rice, and dried sweet-meats, from Ormus.

These islands were formerly inhabited by Arabs, as appears from the ruins of several houses, which were built with stone, bricks, and mortar. The Portuguese, when they first came here, not only destroyed the houses, under pretence of their being inhabited by Mahometans, but they even carried their cruelty so far as to murder all the people, without sparing either age or sex. It was owing to this cruelty, that these islands continued many years uninhabited; till, at length, some Portuguese from Mombaza, Mozambique, and other parts, came and settled on them. At first, each family took possession of an island, where they built a house, provided themselves with fire-arms, and bought slaves not only to till the ground, but also to defend their persons. They are now inhabited by Portuguese and Blacks; and they are under the protection of the governor of Mozambique, who sends them annually a judge, to decide all differences that may happen amongst them.

To the south of Querimba is a cluster of small islands uninhabited. These islands were called by the Portuguese, The Islands of the Whipped or Lashed, because the first time they went to examine them, having a pilot, whom they had taken at Mozambique, who found that the perfidious wretch endeavoured to entangle them among those islands in order to shipwreck their fleet; in

consequence of which, they punished his treachery, by severely whipping him with cords; and from thence the islands received their name.

The Island of MONFIA

LIES in nine deg. 30 min. south latitude. It is very fertile in rice and millet, and has a great variety of fruit-trees, as also prodigious numbers of sugar-canes. It contains only a few villages, though it is at least an hundred miles in circumference.

The Island of ZANJABAR, or ZANZIBAR.

THIS island is situated in seven deg. 55 min. south latitude; and is about eight leagues distant from the continent. It is a very fertile island; and, in particular, produces plenty of rice, millet, and sugar-canes. It has many forests, in which grow very tall lemon-trees, whose blossoms perfume the air for a considerable distance. It abounds with springs of excellent water; and must heretofore have been very rich, since a Portuguese, named Ravaeo, during two months that he continued on the spot, took from these islanders, twenty vessels laden with several sorts of merchandize. When the Portuguese first began to appear in these parts, the king of this island promised to pay yearly, to his Portuguese majesty, a certain quantity of gold, besides thirty sheep, which a Portuguese captain was annually sent to receive. The chief part of the people that now inhabit this island are Mahometans.

There are only two other small islands to mention on the coast of Zanzubar. The first of these is called Lamo, and is situated between the first and second deg. of south latitude. Here is a small town, which is the residence of the king; and near it is a good harbour for shipping. The king of this island was murdered by the Portuguese in the year 1589.

The other island, which is called Pate, is situated to the north of Lamo, in the 2d degree of south latitude. It has a small town about the center of it; but it does not contain any building that merits particular notice. The inhabitants are all Blacks; and the chief part of them profess the Mahometan religion.

C H A P. XXX.

The COMORO ISLANDS.

THESE islands, which are situated to the north of Madagascar, are five in number, the largest of which gives name to the whole; though the other four have names peculiar to themselves, namely, Mohilla, Angazaja, Johanna, and Mayotta.

Though Comoro is the most considerable of these islands, in point of size, yet, in all other respects, it is the most insignificant; for it has not any safe road for ships; and the natives are so barbarous and uncivilized, that no Europeans have ventured to stop here for a considerable time past. The natives of this island are jealous of strangers in general, and have a peculiar aversion to Europeans; the reason of which originated from the cruelties exercised on them by the Portuguese when they first visited these seas; for they not only robbed them of their property, and committed the most dreadful outrages, but also made them captives, and frequently divided them of every earthly enjoyment, by forcing them on board their ships, and then selling them for slaves. It is therefore little to be wondered at, that the descendants of these unhappy people should look with detestation on those who had proved themselves strangers to every humane sensation.

The island of Mohilla is no less insignificant than that of Comoro; and very seldom visited, not only from the dislike the inhabitants have to strangers, but also from

there not being any place convenient for the reception of ships.

All these islands, however, are exceeding fertile, and abound with cattle, sheep, hogs, and fowls of various sorts; they also produce sweet and sour oranges, great and small citrons, cocoa-nuts, bananas, honey, betel, sugar-canes, rice and ginger.

The island of Angazaja is inhabited by Moors, who trade with various parts of the continent, and most of the islands to the eastward, in cattle, fruits, and the other commodities of the island, exchanging them for callicoes and other cotton cloths. The bread used in this island is made of the kernel of the cocoa-nut, boiled or broiled, and spread over with honey: their drink is palm-wine, a juice extracted from the sugar-cane, and suffered to ferment, or the milk of the cocoa-nut. They never let their women be seen by strangers, without permission from one of the chiefs, or an order to see them, which the stranger brings with him. Many of them write and read Arabic with great facility; and some of them understand the Portuguese, which they learn by means of the intercourse with Mozambique, whither they trade in vessels of 40 tons burthen. The houses are built of stone and lime, made of calcined oyster-shells, with which the walls and roof are plastered in a very elegant manner, and the roofs and windows covered with palm-leaves, which

which receive equally as a defence against rain and the scorching heat of the sun. This island is under the government of ten lords, the constitution being a pure aristocracy.

The island of Mohilla is under the direction of a sultan, whose children participate in his authority, whether male or female, and govern in quality of viceroys in different parts of the island. All, however, bear the title of sultans, though they are, in some respects, subordinate to the authority of the father: each has his guards, his crown, scepter, and all the ensigns and pageantry of majesty, together with a brilliant court, and numerous household. The sultan never goes abroad without being attended by twenty of the principal persons in the island; upon which occasion, his dress is a long robe of striped calico, hanging from his shoulders to his heels, with a turban on his head. The people in general wear loose calico gowns, and are continually wearing areka, or betel, in the manner of the East Indians, to whom, in their customs, they have a near affinity.

The island of Johanna is the most frequented, and best known to Europeans, of all the Comoro islands; for here they touch for refreshments in their passage to Bombay, and the Malabar coasts of India.

This island lies in 12 deg. 20 min. fourth latitude. It is 30 miles long, 15 broad, and about 90 in circumference. Though some parts of it are exceeding mountainous, yet it is, in general, a very beautiful and fertile spot. The soil is naturally very good; and, from its being well watered by rivers, produces abundance of the chief necessaries of life.

In order to display the beauties of this island, as well as to take the advantage of introducing a proper description of its natural productions, we shall relate the account of an excursion taken by Mr. Grose and another gentleman, the second day after they landed on this island; which account is as follows: "As we set out pretty early in the morning, says he, we made a shift to penetrate about five miles into the country before the sun began to be any-ways troublesome; and this was no small stretch, considering the mountainous way we had to go. We had fowling-pieces with us, and the view of excellent sport in shooting, could we have reached the places where we might perceive the game lay; but we could not conquer the ascent of the hills, though we endeavoured to scramble up them on our hands and knees. We were obliged therefore to rest satisfied with what small birds presented themselves in the valleys and hills that were passable. We made our breakfast on pine-apples, and the milk of cocoa-nuts, which served to quench our thirst. About noon, coming to a beautiful piece of water, we seated ourselves in the shade by the banks of it, to make a second meal, as well as to enjoy the tinkling of several little springs and natural cascades that fell from the rocks, and, according to their distance, seemed to found a gradation of notes, so as to form a kind of agreeable soothing water-music.

"The orange and lime-trees, which stand in great numbers about that spot of ground, bending under the weight of their fruit, diffused a most fragrant odour. There were also pine-apples which grew wild, of eleven and thirteen inches in circumference, of a much richer flavour than those afterwards met with in India. Our guides too made us distinguish a number of goyava, and especially plumb-trees, the size of whose fruit is about that of a damascene, and leaves a pleasing relish on the palate for some minutes after it is eaten. All these growing prominently, and without the least arrangement or order, combined with the falls of water, and the stupendous height of the surrounding hills, covered with trees and verdure, and, in their various breaks and projections, exhibiting the boldest strokes of nature, altogether composed what might, without exaggeration, be called a terrestrial paradise, compared to which the finest gardens in Europe, with their statues, artificial cascades, compartments, and all the refinements of human invention, would appear poor indeed! Here it was impossible for art to add any thing, but what would rather spoil than adorn the scenery.

"It was not then without regret that we quitted so charming a spot, after having feasted our eyes with the beauties of it; to which it may be mentioned, as no inconsiderable addition, that there was no fear of wild beasts or of venomous creatures mixed with our pleasure,

the island being so happy as to produce none. We returned then to our tent, well paid for the slight amusement we had undergone in this little excursion."

This island produces several other kinds of fruits, besides those mentioned in the foregoing account, among which is a very remarkable sort of sweet oranges; they are about the size of limes, are exceeding juicy, and have a much more delicious flavour than those produced in Portugal.

The chief cattle of this island are oxen, sheep, and hogs. The oxen are in general of a middling size, and, like those in the East Indies, are remarkable for having a large fleshy excrescence between their neck and back. Their flesh is exceeding sweet, and the excrescence, when kept for some time in pickle, is like marrow, and is generally preferred either to tongue or udder.

In the woody parts of this island, are great numbers of monkeys of various kinds and sizes; but there are not any wild beasts of prey, nor are they infested with any venomous animals. Besides the monkeys, the woods are inhabited by two other kinds of animals, which bear some kind of resemblance to that species; one of them is called mongooz, and the other maucauco, of the latter of which there are two sorts.

The mongooz is about the size of a small cat, and has a head shaped like a fox, with black eyes, and orange coloured circles round the pupil. The hair about the eyes is black, and hangs downwards in a point towards the nose, which is also black; but there is a space between the eyes and nose, entirely white, which is continued to the sides of the face as far as the ears. The upper part of the head, neck, back, tail and limbs, is of a dark brown ash colour, and the hair is somewhat woolly. The under side of the body is white, and the paws are like human hands, with flat nails, except a sharp pointed claw on the second toe of the hinder feet. The tail is long, and the hair thick and soft. Its actions are like those of a monkey. It feeds on fruits, herbs, and almost every thing else, not excepting even live fish. There are several sorts of these animals, which differ only in colour; and they are all very harmless and inoffensive.

The maucauco is an animal about the size of an ordinary cat, but the body and limbs are of a more slender make, and the tail is at least double the length of the body. It has a long snout, and the head greatly resembles that of a fox. The iris of the eyes is of a bright hazel, and the face and ears are white; but the nose is black, and each eye is surrounded with a broad black circle. About the nose, and on the sides of the head and eye-brows, there are long stiff hairs, like the whiskers of a cat. The crown and back part of the head are covered with dark ash-coloured hair, longer than that on the face; but the back and sides are of a reddish ash-colour, and not so dark as the head. The outsoles of the legs are of a light ash, but not red as on the back. The upper sides of the paws are whitish, and the bare skin within side is black. The fore paws, or hands, are like those of men, and have a distinct thumb, and flat nails. The hinder paws are remarkable for having the thumb, or great toe, very broad. The insides of the paws are covered with black hair; and the hair on the whole body is very soft and delicate to the touch, standing almost upright like velvet. It has two small nipples high on the breast, and placed as in the monkey-kind. The tail is long, covered with fur, and marked alternately with broad rings of black and white. When it sleeps it brings its nose to its belly, draws its paws close in a sitting posture, and brings its tail over its head. When it plays, it uses a sort of galloping, with its tail raised over its back.

The black maucauco is much about the same size as the other, and, like that, is also a very sociable, gentle, harmless creature; though it has all the cunning and whimsical tricks of the monkey kind. The head is shaped like that of a fox, having a sharp snout; and the eyes are of an orange colour, with black pupils. The ears are rounded at the tips, and much hid by the hair that grows on their borders. The same long hair is continued on the sides of the head and face, above and below the ears, which makes it have the appearance of a shaggy ruff round the face. It has six scooping teeth in the fore

part of the lower jaw; but there are not any to answer them on the upper side, there being only a cavity to receive those from above. It has four dog teeth, two above and two below, and the backward teeth are very rough and jagged. The fur on the body and limbs is long, thick and soft, and stands almost upright on the skin. The hands are shaped like those of men, with flat nails, and the feet are like those of monkeys, except the great toe, which is much larger, and on the next to it is a sharp claw. The hinder legs are longer than the fore legs, and the tail is longer than the whole body, and nearly of an equal thickness from one end to the other. All the fur, with the naked part of the nose, and inside of the paws, are of a deep black. It feeds upon vegetables, and when made familiar, will eat cakes, and bread and butter. It eats sitting upright, holding its food in its fore paws, or hands.

In the woods are also great numbers of squirrels, which are generally very large and shy, but they are neither well shaped, or agreeable in colour.

They have several kinds of poultry in this island, particularly fowls and ducks; and there is also a great variety of game, but the inhabitants are so inexperienced both in the use of nets and guns, that very few of them are caught.

The sea here abounds with several sorts of excellent fish, which the natives are very expert in catching, particularly thornbacks, mullets, and a flat fish greatly resembling turbot. But the most remarkable species is the parrot-fish, so called from its mouth, which is hooked like the bill of a parrot. It is about a foot long, and the colour is greenish, variegated near the head with yellow. The fins are blew, as are also the eyes, which are very brightly, and have a yellow iris: the scales are very large, and there are two rows of strong teeth in the mouth, with which it breaks open mussels, and oysters. The flesh of this fish is very firm, and well tasted.

The natives of this island are in general tall, strong, and well proportioned; but the women are not so well made as the men. They have all long black hair, piercing eyes, lips somewhat inclining to be thick, and are in general of a colour between olive and black.

The poorer sort live in huts made of reeds tied together, and plastered over with a mixture of clay and cow-dung; and the roofs are thatched with a kind of matting made of cocoa leaves. The better sort have their houses made of stone and mud.

Their principal food consists of vegetables and milk, which they have here in great plenty, and perfection. Instead of oil and vinegar for their sallads, they use a kind of liquid, somewhat like our treacle, which they extract from the cocoa-nut.

The quality are distinguished by the nails of their fingers and toes, which they suffer to grow to an immoderate length; and they paint them with the alkenna, a yellowish red, furnished them by a particular shrub that grows in the marshy parts of the island. They usually carry large knives stuck in a sash they wear round their waists, some of which have silver, or agate handles; but the generality are made of wood, carved.

The common people have no other clothing, than a piece of coarse cloth wound round the waist, with a skull cap made of any kind of stuff. Those of a superior rank have a kind of wide-sleeved shirt, which hangs down over a pair of large drawers, and a waistcoat made thick or light, according to the season of the year; and the very distinguished of all wear turbans on their heads.

The women wear a short jacket and petticoat, with a kind of loose gown; and when they go abroad, have a veil over their faces. They take great pains in ornamenting their arms, legs, and ears, in the latter of which they have such a quantity of trinkets made of metal, that the lobes of them are so dilated by the weight as almost to touch the shoulders. Their arms and wrists are decorated with a number of bracelets, made of glass, iron, copper, pewter, or silver, according to their respective ranks or circumstances.

They suffer their children from their birth, both males and females, to go stark naked till they are seven or eight years of age; a custom they have in common with the orientals, who are not so much governed in it by the heat of the climate, or necessity, as by physical

reasons. They imagine that infants are constitutionally more apt to be hurt by heat than cold; and that the free access of the air to all parts of their bodies, is even nutritious, and more favourable to their principles of growth, than if they were sweltered up with swathing clothes, which, they think, rob them of a hardness conducive to their health. By these means, the children are preserved from complaints, to which others are subject, from their cloaths being so binding as to occasion them to cry, and frequently to such a degree, as to terminate, through their straining, into ruptures. This conduct, with respect to their children, appears to be very consistent, and to have the wished-for effect; for instead of meeting with a deformed person, it is very rare to see one who is not admirably proportioned. The Johannians judiciously endeavour to acquire health, which above all enjoyments in this life, is certainly the most desirable acquisition. In their eyes health

— Seems a cherub, moft divinely bright,
More soft than air, more gay than morning light.
And with propriety may they thus exclaim,
Hail, blooming goddess! thou propitious pow'r,
Whose blessings mortals next to life implore;
With so much lustre your bright looks endear,
That cottages are courts, when those appear;
Mankind, as you vouchsafe to smile or frown,
Find ease in chains, or anguish in a crown.

The Johannians are, in general, a plain, simple, well meaning, inoffensive people; hospitable beyond their wealth, void of pride, and strictly honest in all their dealings. Mr. Grose, in speaking of these people, says, "Their manners still retain a great deal of the simplicity of uncultivated nature. The mildness of the climate renders them indolent, and prone to venery. They often make use of the liberty, granted them by their laws, of divorcing their wives, upon slight pretences, for the sake of novelty; though they have generally two or three of them, and are confined to no number of concubines they can maintain. They are forward enough to beg any thing they like; but very far from being thievesly inclined. They treat the English, in particular, very cordially and fraternally; not purely from a principle of interest and convenience, which however has doubtless some influence, but from gratitude, for the effectual assistance they formerly received from them in their wars with the Mohillians. Being moreover assured, by a frequent intercourse, that they have no design of invading their country or liberty, of which they retain a strong jealousy against other European nations, and of the Portuguese especially; to whose usurpation of the sea coast on the continent, they are no strangers; against which they chiefly, and with great reason, rely on the inaccessibility of their mountains, of which nature has formed for them an impenetrable barrier, and defence of the interior country.

"Their language, says the same writer, is a corrupt Arabic, mixed with the Zangubar tongue, of the opposite part of the continent, from whence it is probable the Comoro Islands were originally peopled. But the white sort of them, who are generally of the best rank, or at least the most esteemed among them, partly derive their colour from the Arab mixture, and partly from their communication with the Europeans, which was formerly much more common than at present. They have adopted the jealousy of the Arabs, together with their manners and religion; though theirs is as yet no more than a gross Mahometanism, adulterated with the remains of their ancient superstitions, especially among the lower sort."

They hate and dread the devil so much, that they frequently burn him in effigy, intimating by that, their detestation of this enemy to the human species. They also have a strong abhorrence of that spot where any one happens to die, looking upon the ground either to be unlucky, or dividing departed spirits, the universal foible of the vulgar; or, as others suppose, believing the place to be polluted by the dead carcase. They therefore quit the place for some time, but afterwards return to the house, and live in the chambers where their friends died, with the same unconcern as other people. In general, the religion and manners of all the inhabitants of these islands, have a strong affinity: they vary in particular

particular modes, but the fundamentals are nearly the same in all.

In this island are 73 villages, besides the town of Johanna, the residence of the chief or king; and the number of inhabitants is estimated at 30,000. The town of Johanna contains about 200 houses, most of which are inhabited by the principal men of the country. These are built of stone, but they are all very low, except the king's palace, which is both lofty and spacious. The people here suffer strangers to come familiarly into their first apartment, but reserve all the others for the use of their families.

The title of king is justly given to the chief of this island, he having all the essentials of royalty, with an unlimited power over his subjects, both in spirituals and temporals.

Mr. Grose, who was a considerable time here, and to whom we are greatly obliged for many particulars relative to this island, has furnished us with a very curious account of the means by which the sovereignty of it was first acquired, which for the entertainment of the reader, we shall give in his own words.

"The grandfather, says he, of the present king, was an Arab, or Moorish trader to Mozambique, where, on a quarrel with a Portuguese sirdago, or gentleman, with whom he was dealing for slaves on that coast, he had the fortune to kill his adversary, and was thereon obliged instantly to fly, and put to sea in the first boat he could seize on the shore, when the first land he made was Johanna, where he took refuge. Here meeting with an hospitable reception, he remained some years in obscurity, until an Arab trunk being driven in there by stress of weather, he made himself known to his countrymen, for whom he procured all the relief the place afforded.

"In the mean time he had so perfectly acquainted himself with the language and manners of the inhabitants, and was so captivated with the fertility and pleasantness of the country, that he not only relinquished every thought of returning to his own, but laid a scheme to obtain for himself the sovereignty of this; in which he was greatly countenanced and assisted by the Arabs, his countrymen, who came into his views, from the advantage they expected to receive from his success.

"He proceeded not on a plan of violence but of insinuation, in making himself necessary to the natives, whom he instructed in the use of arms, before unknown to them, especially the assagaye, or lance, which those of any consideration among them now handle with dexterity. This then, with other methods of war which he taught them, entirely new to these simple people, proving of singular service to them, against the inhabitants of the neighbouring islands, especially of Mohilla, with whom they had constant bickerings, sometimes invading, and sometimes invaded, acquired him such a consideration and authority, that he soon availed himself thereof, and procured himself to be elected their chief or king, and invested with a despotic power. Yet this was not obtained but by degrees, and by great art; themselves too being divided among one another. As soon, however, as he had carried his point, he made them repent of their credulity and confidence; for not only strengthening himself by calling in some of his countrymen, with their families, but choosing for his guards the most bold and determined of the natives, he was soon in a condition to establish an arbitrary government. Such as endeavoured to oppose him in his pretensions and innovations he forced from their families, and sold for slaves to the Arabs, who, on this alteration, increased their resort there for trade, which they still continue. In short, he succeeded to entirely, as to overcome all opposition, and to bequeath the peaceable sovereignty to his son, who was about 43 years of age when his father died, and who had no farther trouble or contestation with his subjects, until he also dying a few years ago, left two sons, of whom the eldest is at present (1756) king of the island."

The king resides, for the most part, about nine miles, according to their computation, up in the country, seldom coming down to what they call their lower town, on the sea side, but when the European ships are lying there, at which times he is accompanied by a very numerous retinue. He seldom misses going on board the vessels, where the captains regale him in the best manner

they are able, after the European fashion, and compliment him both on his arrival and departure, with a discharge of five guns. This is a ceremony he is exceeding fond of, not only from the satisfaction he receives from the civility of the captains, but from its making him appear of greater importance, and consequently more respected by his subjects.

Every captain is obliged to obtain a licence from the king before he can trade with the natives; but this licence is easily acquired, nothing more being wanting than to compliment his majesty with a few trifling articles of European manufacture.

"As soon as a ship anchors in the road," says Mr. Grose, "it is immediately surrounded with a number of canoes, hurrying on board with refreshments of all sorts of the produce of the island; and it is humorous enough to observe the confusion and strife among the rowers, who shall get first to their market the ship. They are sometimes overet when the sea is any thing high, but without any danger to their persons, being excellent swimmers, and lose only their little cargoes of green trade. These canoes are most of them balanced on each side with out-leaguers, composed of two poles each, with one across, to prevent their oversetting. They use paddles instead of oars, and make no distinction of head or stern. Their larger boats, called pangays, are raised some feet from the sides, with reeds and branches of trees, well bound together with a small cord, and afterwards made water-proof with a kind of bitumen, or resinous substance. The mast, for few have more than one, carries a sail or two, which is made either of cocoa leaves, or sloop grass matted together; and in these boats they will venture out to sea for trips of three or four weeks, and sometimes longer.

"It was common, some years ago, for the natives, who came off with refreshments to the ships, such as fresh cocoa nuts, plantains, fowls, goats, &c. to deal entirely by way of barter, for handkerchiefs, rags, glass bottles, bits of iron, and in short all sorts of trumpery, without any respect to money. They are now, however, well acquainted with the value of gold and silver, and are not altogether so fond of baubles as they used to be; for if we want to purchase cattle, fowls, or cowries, they desire to be paid either in specie, fire-arms, or gunpowder. They have likewise fallen upon a method of soliciting those who come there, particularly all passengers, to contribute a dollar or two towards improving their navigation, which they carry on with the African continent; and by way of persuasive example, produce several lists of persons who have subscribed to that purpose; so that they sometimes collect thirty or forty dollars a ship, from those who touch here: and when the captains leave the place, they generally make it a point for them to sign, and leave with them a certificate of good usage."

Thus the most savage inhabitants of the world daily improve in cunning and artifice, though we must not from thence infer that they grow wiser, a common but misapplied epithet for peoples growing more knavish than formerly, which induces some who are fond of false prudence to conclude that they are consequently less foolish; but where integrity does not go hand in hand with improvement, we refine away happiness, and sacrifice every social virtue to chicanery and artifice. In the pure simplicity of nature the productions of the earth are as free as the air we breathe, and every one partakes as he pleases of the bounties of Providence. At length the people improve till they get an idea of private property, and that immediately puts them upon the expedient of valuing one commodity by another, and making use of barter to supply each others necessities. Again, successive improvements evince that barter is attended with many inconveniences, as it is almost impossible, where the truck is various, properly to estimate one commodity by the casual value of another: hence the necessity of coinage appears, in which commodities of all kinds and values may be easily paid for, an equivalent readily given, and commercial intercourse carried on with the greatest facility. But if a people, who thus refine in the course of their improvement, lose their probity, and become fraudulent, exchange their natural benevolence for the avarice of trade, and sacrifice their integrity to commercial artifices, their refinement is a misfortune, and their improvements contribute to their unhappiness; for the poor shepherd, blessed with purity of conscience, is sensible of

more essential bliss than the rich and great, whose minds are monitors against them for their deviation from the line of rectitude.

If those who live in shepherd's bower
Prest not the rich and idly bed,
The new-mown hay, and breathing flower,
A softer couch beneath them spread.

If those who sit at shepherds' board
Snooze not their talk by wanton art,
They take what nature's gifts afford,
And take it with a cheerful heart.

If those who drain the shepherd's bowl
No high or sparkling wines can boast,
With wholesome cups they cheer the soul,
And crown them with the village toast.

If those who join in shepherds' sport,
Gay, dancing on the daisied ground,
Have not the splendor of the court,
Yet love adorns the merry round.

The only particular account of Mayotta, which we can depend upon, is that given by the French commander, commodore Beaulieu, in the narrative of his expedition to the East Indies, in which he tells us, Mayotta is rather low, but abounds with provisions and fruit; that it is cool, moist, covered with verdure, and inhabited all along the sea shore. "The tide (says he) carried us wellward along the coast to a point where we came in sight of a ship, upon which I sent out our long-boat with ten musqueteers, who brought me word that it was a vessel of 40 tons, bound from Mecca, and that the captain taking us for Dutch ships, had run all the goods on shore. The captain of this vessel shewed me two letters, one from an English commander called Martin, and another from captain Banner, to inform their countrymen, that they had taken in several refreshments at that place, especially fruit: that they had found no water, and that linen cloth and paper were proper commodities for that place; adding, that care ought to be taken, not to disoblige the inhabitants, who, though they appeared friendly, were able to do them a great deal of mischief. The road being surrounded with rocks, the Arabian master advised me not to attempt landing

without fetching a pilot from the shore, and accordingly I sent my boat along with him, and in the afternoon he returned with two of the inhabitants, who, before sunset, brought our ship safe to an anchor. I then sent the Arabian master back to his own ship with full assurances of the innocence of our designs, and the friendly disposition of the French, together with a letter to the same purpose, addressed in Spanish, to the king of the island.

"Afterwards the king sent some of his chief favourites to assure us of his friendship, and readiness to supply us with whatever the country afforded. Upon this, I sent him a present of a silver hilted dagger, a couple of very handsome knives, a ream of paper, and a looking-glass, which he received with pleasure; and, in return, sent me a young kid and some fruit. At the same time desired the Arabian captain, who was then on shore, to buy me some provisions, promising to find such commodities as were proper to be given in exchange. Upon this, the captain sent me word, that the inhabitants of the island were of such a particular humour, that they would not conclude a bargain of the value of half a rial in a day's time; and would not buy a yard of cloth, without calling all their relations and neighbours to fix the price they should give for it. I was also informed, that a Portuguese carraek, having been cast away upon that island, about three years before, the inhabitants were so overstocked with rials, that they set no value upon them.

"The next day, having observed a couple of ships belonging to that country, I had the captains brought on board, when they informed me, that they came from the Island of Mayotta; that they were laden with rice and dried fish, and were bound for Mombaze. The next day they supplied me with as much rice, peas, and hung beef, as would serve us for four months; of which I was very glad, as I could buy nothing of the inhabitants without an infinite loss of time. Besides, I began to suspect their honesty; for the day before, when we were founding, in order to come to an anchor, some of them made a signal for us to come over a place where we observed a long ridge of rocks; whence, I presumed, that the advantage they had made by the shipwreck of the Portuguese carraek, had tempted them to wish us the same fate. Finding, likewise, that the water was brackish, we sailed away, and left the place."

C H A P. XXXI.

The Island of ZOCOTORA or SOCOTORA.

THE Island of Socotora was first discovered by one Ferdinand Pereira, a Portuguese, about the year 1506. It is situated about 75 miles to the north-east of Cape Guardafay, in 12 deg. 10 min. north latitude: it is bounded, on the north-east, by the kingdom of Melinda; and, on the south, by the continent of Arabia, from whence it is distant about 50 miles. It is of very considerable extent, being not less than 80 miles in length, 60 in breadth, and 150 in circumference. There are several good ports on the shore, beside which there are two excellent bays, where the shipping ride with the greatest safety.

The ground in the bays is sand, and in some places stony; but not so as to injure the cables. The tides here are contrary to those of India; for when the moon appeareth on the horizon, it is high tide, which thence begins to ebb; and by the time it cometh to the meridian, it begins to flow again in the same order as it sets at Goa; and being set, it is then full sea.

The climate of this island is exceeding sultry, owing to the short continuance of rains, which seldom last more than two or three weeks in the season. This defect, however, is happily remedied by heavy dews, occasioned

by the lofty mountains, whose tops are generally covered with snow, so high as to condense the clouds, and afterwards dissolve them in a kind of heavy mist or fog, which thorough waters the earth. In some parts of the island are rivers, which rise from springs, and are never affected even by the driest seasons, but other parts of it are totally destitute of water, except in the rainy season.

This island is exceeding populous; and the inhabitants are under the government of a prince, or sultan, who was once subject to the charrifs of Arabia, but is now tributary to the Porte.

The whole country abounds in cattle and fruit, with which, and some other commodities, the natives trade to Goa, where they are better received than the Arabs, who are not permitted to enter that town without passports.

The other productions of the island are, also, frankincense, dragon's-blood, rice, dates, ambergris, and coral.

As the two last articles have not yet been particularly noticed, we shall here take the opportunity of describing them.

Ambergris is, in general, of an ash colour, or grey, and

and is a fat solid substance, like suet, but light. It is variegated like marble, and is sometimes speckled with white; it springs from the bowels of the earth, is condensed in the sea, and is found floating on the water, though sometimes it is met with on the sea shore, where it has been thrown by the waves. It is sometimes black as well as grey; but the grey is accounted the best. There is little room to doubt that this is a sort of bitumen, which proceeds from the earth near the bottom of the sea; for it sometimes contains stones, shells, the bones of animals, and the bills and claws of birds, as well as honey-combs, from which the honey has not been all lost. Hence it appears, that this bitumen must have been first in a liquid state: it has sometimes been found in lumps of 200 pounds weight.

Ambergris will readily melt in the fire into a sort of gold-coloured resin, which will kindle and burn when held to a candle. It will not dissolve entirely in spirits of wine, but leaves a black pitchy matter behind it. The solution, after some time, will leave a white cloudy sediment, which will coagulate by little and little, and grow thick, especially by the coporation of the finer parts of the spirits of wine. When this is dry, it becomes a shining sort of earth, not much unlike spermaceti. It consists of oily greasy particles, which are very fine and volatile, with others that are thicker, saline and bituminous. Ambergris is of great use among perfumers; and is recommended by physicians for raising languishing spirits, and increasing their motion; whence it is given for disorders of the brain and heart, as well as in fainting fits. The dose, in substance, is a pill of the size of a small pea, or from one grain to eight, in a poached egg or wine.

There are various kinds of coral, some of which resemble small trees without leaves; others are in the form of a net, sometimes with large meshes, and sometimes with small. The inside of the branches seems to be of the nature of horn; for it has the same smell when put into the fire; but the bark is of a stony nature, and contains a great deal of salt. Coral, properly so called, is of a stony nature, and is placed in the animal kingdom, because it produces sea insects. Some of these are red, and others white, and others of various colours; however, the red, of the colour of vermilion, is best, and is by some said to be of the male kind, and that which is palish of the female. The white coral is the next in value, and then black; but those of the other colours will not allow to be corals, though they are found in the same places. It is always covered with bark, and is stony, solid, and very hard, even in the water; though the branches are a little flexible, but soon grow hard in the air. The bark of coral is a mixture of tartar and a fluid of a gluey nature; and though it is a little rough, it takes a very fine polish. Some take the black coral to be a sea plant of a different nature.

Red coral is not so much esteemed in Europe as it is in Asia, and particularly in Arabia. It is used for making several sorts of toys, such as spoons, heads of canes, knife-handles, sword-hilts, and beads; and, when set in silver, is served as a play-thing for children, and is designed to rub their gums therewith, that they may breed their teeth more easily.

On the young branches of coral there are found small eminences, pierced in the form of flars, and full of a milky fluid when they are just taken out of the water. Many learned men have thought sea plants to be nothing but petrifications, consisting of plates of salt, and layers of tartar, placed one upon another; and as coral always grows with its head downwards, in caverns of rocks in the sea, the situation has caused them to suspect that they were nothing else but petrifications, like those found on the roofs of certain caves in the rocks. But since the discovery of the flowers of coral, and some other marine productions, it is not at all doubted but they have a regular organization; and if their seeds have not been perceived, it is because their smallness renders them imperceptible.

But some have thought that the generation of these plants is not owing to these seeds; because, as they always hang with their heads downwards, they would fall off to the bottoms of the caverns, and not place themselves on the top; but this difficulty may be removed, by supposing they are lighter than the sea wa-

ter, and that the milk which surrounds them is of a thick nature, that it may help to assist them in floating. Hence indeed it may happen, that many of them may rise to the top of the water, and there perish; but then likewise others may ascend to the top of the caverns, and there fix themselves, and then they will grow like coral, from which they proceed. Hence we may conclude, from the regularity of these productions, the organization of their parts, the great numbers of small pores in their bark to receive the bitumen, and other sea juices, the eminences regularly hollowed in the form of flars, which serves for the caels of flowers in the same shape, the vessels full of a milky fluid which is found between the bark and the body of the plant, to make it grow thicker by little and little, and the perpetual uniformity of the same circumstances. From all these particulars we have reason to believe, that the bottom of the sea is covered with plants, with characteristics different from ours.

The red coral is only chiefly for medicinal uses, and many authors have ascribed great virtues thereto, which are in a great measure imaginary; however, it cannot be denied that it is a good absorbent, and therefore is proper to restrain the organism of the blood, and to blunt the acrimony of the bile and other humours, in various sorts of fluxes, as well as for the gripes in children. Its dose is from a scruple to a dram.

The inhabitants of Goa, who purchase these articles, export them from thence to many parts of the Indies, and to most of the kingdoms of Europe; whence arises great profits to the traders, and advantages to the inhabitants, who are luxuriously supplied with all the necessaries of life, in exchange for their commodities. Formerly they had a more immediate intercourse with Europe, by means of the East India ships, which frequently stopped here, when disappointed of their passage, either by being too early or too late for the monsoons; but now the stated periods of those winds are so well ascertained, that this port is almost entirely neglected.

Besides the natives of Socotora, there are here great numbers of Arabs; the latter of whom call the former by the name of Beduins, or stupid brutes. These last are divided into two sorts, namely, the natives of the coast, who intermarry with the Arabs, and are called half-Beduins; and those of the interior parts, who rigorously adhere to their own customs, and reckon it a heinous crime to mingle blood with foreigners. The last are the true Beduins, or original inhabitants of the country. They are much finer than the Indians, and are in general tall and very proportionably made; but in their dispositions they are deceitful, insolent, and great cowards, satisfying themselves to be enslaved, in a manner, by a handful of Arabs, and attending to nothing besides husbandry and pasture, both which are chiefly carried on by the women. Their food consists of milk, butter, rice, dates, and the flesh of such cattle; and their common drink is water.

The other inhabitants of this island seem to make use of all the benefits of their situation, but at the same time they want the personal advantages of the Beduins; for they are of a low stature, disagreeable complexion, lean habit, and have hideous features; but they are very hardy, and are prodigious strong and active. They feed on fish, flesh, milk, butter, and vegetables: their common dish is a composition of all these boiled together, with which they eat bread, rice, or dates.

The dress of the people of this island differs according to the several parts of it. The native Beduins go almost naked, having nothing more than a small piece of cloth fastened round the waist, and a cap made of goats skin. The women go bareheaded, and have a flout gown, or cloak, with a fluit made of goats hair. But the most general dress of these islanders consists of a long cloak, which reaches from the waist to the ankles, it hangs down in a train behind, and is not unbecoming, though extremely incommodious, on account of the heat of the climate: when they are at work, they gather it up and fasten it round the waist with a girdle.

The Socoterans are entirely ignorant of arts, inasmuch, that was it not for the Arabs, they would be destitute of almost every convenience of life. If possible, they are still more ignorant of the liberal arts; and so little

little desirous are they even to acquire the knowledge of reading and writing, that they think they have sufficient learning if they are able to reckon their cattle by making notches on a piece of wood. Their chief ingenuity is displayed in the canboline manufacture, which is a beautiful stuff, made with the hair of goats and other animals.

These people have several very strange and uncommon customs. They practice polygamy, and divorce their wives at pleasure, either for a certain time, or for ever. They may even be the father of children, without being obliged to maintain either them or the mother, provided the latter, during her pregnancy, consents that the father shall give away the child, when it sees the light. On these occasions the father kindles a fire before the door of his hut or cave, and then makes proclamation that he will give away the infant of which his wife is on the point of being delivered. After this he fixes upon some particular person for its adopted father, to whom the infant is carried immediately after its birth. Here it meets with all that tenderness, kindness, and those caresses which are denied it by the unnatural father, is given to a nurse, and ordered to be fed with goats milk. These children are called *The sons or daughters of smook*; and it frequently happens that a good natured man, who is himself incapable of getting one, shall have the honour of rearing a dozen children, upon whom he bestows all the affection of a real parent. This is certainly one of the most extraordinary, and unnatural customs to be met with in history, as it does not seem to be founded either on the principle of religion, policy, or inclination, but upon mere caprice only; for it is common with a father, who exposes his own, to adopt the children of others, and requite, by his kindness to the latter, the good offices due to the former.

These people have also another custom, which is no less strange and singular than the above. They generally bury their sick before they have breathed their last, making no distinction between a dying and a dead person. They esteem it a duty to put the patient as soon as possible out of pain; and make this their request to their friends, when they are on the sick bed, which, in all acute disorders, may be called the death bed. When the father of a family finds himself thus circumstanced, and apprehends that his dissolution is near, he assembles his children around him, whether natural or adopted, his parents, wives, servants, and all his acquaintances, whom he strongly exhorts to a compliance with the following articles of his last will: never to admit any alteration in the doctrine, or customs of their ancestors; never to intermarry with foreigners; never to permit an affront done to them or their predecessors, or a beast (not from either of them, to go unpunished; and, lastly, never to suffer a friend to lie in pain, when they can relieve him by death. Such are the extraordinary requests of the dying man: after which he makes the signal to have the last of them performed upon himself, and expires.

This last duty is frequently performed by means of a white liquor of a strong poisonous quality, which oozes from a tree peculiar to this island. Hence it is, that legal murders are more common here than in any country in the world; for, besides the inhuman custom last mentioned, the other requests of dying men produce numberless quarrels, and entail family feuds and bloodshed upon their posterity for generations, by taking revenge of the injuries done to their ancestors.

How different are these customs from those adopted by the Turks, who even found hospitals for superannuated and decayed horses, and gratefully repay, when old age hath disabled them, the services they have received from those useful animals while in their prime and vigour; considering benevolently and philosophically that *The noble universe is one system of society.*

Look round our world; behold the chain of love
 Combining all below and all above.
 See plastic nature working to its end,
 The single atoms each to other tend,
 Attract, attracted to, the next in place,
 Form'd and impell'd its neighbour to embrace.
 See matter next, with various life endu'd,
 Press to one center still, the gen'ral good.

See dying vegetables life sustain,
 See life dissolving vegetate again:
 All forms that perish, other forms supply,
 (By turns we catch the vital breath, and die)
 Like bubbles on the sea of matter born,
 They rise, they break, and to that sea return.
 Nothing is foreign; parts relate the whole;
 One all-extending, all-preserving soul
 Connects each being, greatest with the least;
 Made beast in aid of man, and man of beast;
 All served, all serving: nothing stands alone;
 The chain holds on, and where it ends, unknown.

In Socotora justice is administered by the chief magistrates, who are next in rank to the sultan: they are called *hodamos*, and sit at certain times to judge and determine in all causes political and ecclesiastical, civil, or criminal. They hold their office only for a year, during which they preserve the most distinguished power and dignity. There is no appeal from this tribunal, nor can the successors reverse any decree passed before his coming into office.

In criminal cases, the punishment for murder is death, which is done either by cutting off the offender's head, or impaling him alive. In cases of theft, if the robber escapes with his booty, and takes sanctuary in a temple, he is protected; but if he is caught by the person robbed before he reaches the temple, he is then delivered up to justice, and the punishment for the crime is the loss of his right hand. Other trifling matters are punished by fines, one half of which goes to the sultan, and the other half is equally divided among the magistrates.

With respect to the religion of the Socotrans; the Arabs amongst them are Mahometans, but all the rest are pagans, and practise the most superstitious maxims. They adhere strictly to circumcision, and are so nice in preserving this rite, that they cut off the fingers of those whose parents have neglected to perform the operation upon them, or have themselves refused it.

They keep lent, or at least fasts equivalent to it, which they begin to observe at the new moon in March, abstaining, for the space of sixty days, from milk, butter, flesh, and fish; and living wholly upon dates, rice, honey, and vegetables; procuring the honey from Arabia in exchange for aloes and frankincense. They have altars and crosses; but, as they are entirely ignorant of every tenet of the Christian church, nothing certain can be deduced from ceremonies and usages handed down by tradition, of which they can give no manner of account, or for which they cannot produce a single reason. That they are gross idolaters is sufficiently evident from their worshipping the moon, which they esteem as the creative principle of all things; a notion extremely inconsistent with atheism, much more with Christianity, and the doctrines of redemption.

At times of great drought they assemble in a solemn manner, and offer up their petitions to the moon. They make a public sacrifice to her towards the beginning of lent, and offer up numbers of goats in honour of her. They enter into their temples whenever the moon rises or sets, and practise several other religious ceremonies, which prove them to be the zealous votaries of this inconstant deity, and totally ignorant of the principles of the Christian religion.

La Croix says, "At the rising and setting of the moon, or more probably at the new and full moon, they make solemn processions round their temples, or *moquamos*, as also round their buying-places, striking against each other two pieces of odorous wood, about a yard long, which each man holds in his hands. This ceremony they perform three times in the day, and as often at night; after which, putting a large cauldron, suspended by three chains, over a great fire, they dip into it splinters of wood, with which they light their altars and the porch of the temple. They then put up their prayers to the moon, that the will enlighten them with her countenance, shed upon them her benign influence; and never permit foreigners to intermix with them. They make also an annual procession round the temples, preceded by a cross; and the whole ceremony ends upon the priest's clapping his hands together, as a signal that the moon is tired with their worship. Others say, that the signal consists in cutting off the fingers of the person

who holds the cross; in recompence for which, he has given him a flick, with certain marks, prohibiting all persons, of whatever degree or condition, to molest or hurt him ever after; on the contrary, they are to aid and assist him with all their power, in whatever manner he may require their help; and to respect and honour him as a martyr to religion, under the penalty of corporal punishment, and the loss of an arm."

These particulars, relative to the religion of the Socotorans, are confirmed by Sir Thomas Roe, who, during his stay on this island, took great pains to preserve, in his journal, a minute account of the manners and customs of the natives. This writer says, that he found the inhabitants of Socotora to consist of four different sorts of men, viz. of Arabs, whom the king of Caxem had lent to keep the island in subjection to him; of slaves to the prince, who are employed in preparing aloes, and other offices of drudgery; of Beduins, the primitive inhabitants of the island, who were banished to the mountains till they submitted to the yoke, and agreed to breed up their children in the Mahometan religion; and, lastly, of savages, with long hair, who live naked in the woods, and refuse all society.

To add to the particulars already mentioned of this island and its inhabitants, it may not be improper to preserve the short account of it given by Mandelsoe, who was an accurate observer, and very particular in describing the manners and customs of the people. "They live, says this writer, chiefly upon fish, roots, and fruit. They have no wild-fowl, and great scarcity of tame; yet they are not destitute of cows, camels, asses, and sheep, with goats, whose hair upon the thighs is curled in the manner in which satyrs are painted. Their arms are swords with large hilts, without a guard; poniards, with long blades, which they constantly wear stuck in their girdles; and fire-arms, which they manage with some dexterity, but cannot keep in order, or free from rust; so that, in a few weeks, they are rendered useless. They are remarkably expert in the use of bucklers, which they wield in such a manner as to protect every part of the body, and are wounded only when their shoulders are pierced, or cut down by blows. Though they live in an island, and trade with the continent, they are ignorant of navigation, and have no other vessels than flat-bottomed fishing-boats, with which, however, they weather great storms. The torrents that tumble down from the mountains, like rivers, either in rainy weather, or when the snow on the tops of the mountains is melted by the sun, sufficiently supplies all foreign shipping with water. Though they are Mahometans, yet they worship the sun and moon; Christians or infidels, their religion is a strange mixture of truth and infidelity. But one would imagine, that idolatry and paganism prevail, from the solemn processions and sacrifices made to their luminaries.

"The Socotorans use their women, who are chiefly Arabian, with great tenderness; but are so jealous, that they never permit them to be seen by a stranger. As they are crafty and deceitful themselves, so they are suspicious of the same insincerity in others; they adulterate their commodities, and expect that those they deal with have done the same. The island affords some indifferent oranges, tobacco, citrons, and cocoa-nuts; but they seldom come to maturity, on account of the stony, dry, and sandy soil. Their chief commodity is aloes, and they have also dragon's-blood, and keep great numbers of civet-cats; so that this commodity may be purchased at Socotora for three or four crowns per ounce, which flows how plentiful it is; but, unhappily, there is no method of being secured from fraud, for they find means to adulterate even the civet."

"The natural craft and subtlety of the Socotorans is beyond conception. Indeed, the deep penetration, and cunning of these, as well as most other Arabs who inhabit the islands in and near the Red Sea, and the adjacent parts of the continent, are such as to have given rise to many curious stories concerning them; one of these, a celebrated living author hath availed himself of in a recent performance; and as it displays better than words can otherwise describe, the profound sagacity, as well as perfidy of these people, and gives at once an idea of some of their local customs and the stile they use, we

shall introduce it for the gratification of the reader's curiosity.

"Zadig determined to pass his time, for the future, in the study of nature; who he happens, and he, then the philosopher who pretends, with unobscured, that spacious book which the Supreme Being has laid open at before his eyes? The truth he discovers there, one of infinite service to him. He thereby cultivates and improves his mind. He lives in peace and tranquillity all his days, and is not afraid of any person.

"Wrapped up in these contemplations, he retired to a little country-house on the banks of a river; there he never spent his time in calculating how many inches of water run through the arch of a bridge in a second of time; or in enquiring if a cube line of rain falls more in the month of June, than in that of the rain. He formed no projects for making silk gloves and stockings out of spiders webs, nor of China ware out of broken glass bottles; but he pry'd into the nature and properties of animals and plants; and soon, by his strict and repeated enquiries, he was capable of discerning a thousand variations in visible objects, that others, less curious, imagined were all alike.

"One day, as he was taking a solitary walk by the side of a thicket, he espied one of the queen's eunuchs, with several of his attendants, coming towards him, hunting about in deep concern, both here and there, like persons almost in despair, and seeking with impatience for something lost of the utmost importance.

"Young man," said the queen's chief eunuch, "have not you seen, pray, her majesty's dog?" Zadig very coolly replied, "You mean her bitch, I presume?" "You say very right," said the eunuch, "it is a spaniel, black and white." "A spaniel," said Zadig, "She has had puppies too, lately." "Indeed, she has," said the eunuch, "but she has long ones." "By your leave," said Zadig, "you must, doubtless, have seen her," said the eunuch, "almost out of her mind." "Indeed I have not," replied Zadig, "neither do I know, but by you, that the queen ever had such a favourite bitch."

"Just in this critical juncture, so various are the turns of fortune's wheel! the best palfrey in all the king's stables had broke loose from the groom, and got upon the open plains. The head huntsman, with all his inferior officers, were in pursuit after him, with as much concern as the eunuch about the bitch. The head huntsman addressed himself to Zadig, and asked him whether he had not seen the king's palfrey run by him. "No horse," replied Zadig, "ever galloped so smoothly; he is about five feet high, his hoofs are very small, his tail is about three feet, six inches long; the studs of his bit are of pure gold, about twenty-three carats, and his shoes are of silver, about eleven penny-worth each." "What eunuch did he touch, pray, Sir?" "Whereabout is he?" said the huntsman. "I never set eyes on him," said Zadig, "nor I, neither do I ever hear, before now, that his majesty had seen a palfrey."

"The head huntsman, as well as the head eunuch, upon his answering their enquiries in very exact, not doubting in the least, but that Zadig had clandestinely conveyed both the bitch and the horse away, recurred him, and carried him before the grand dilerham, who condemned him to the knout, and to be confined for life in some remote and lonely territory.

"No sooner had the sentence been pronounced, but the horse and bitch were both found. The judges were in some perplexity in this odd affair; and yet thought it absolutely necessary, as the man was innocent, to recall their decree. However, they laid a fine upon him of four hundred ounces of gold, for his false declaration of his not having seen what doubtless he did; and the fine was ordered to be deposited in court accordingly. On the payment whereof, he was permitted to bring his cause on to a hearing before the grand dilerham.

"On the day appointed for the purpose, he opened the cause himself, in terms to this, or the like effect:

"Ye bright stars of justice, ye profound abyss of universal knowledge, ye mirrors of equity, who have in you the solidity of lead, the hardness of steel, the lustre of the diamond, and the resemblance of the purest gold,

since ye have condescended so far as to admit of my address to this august assembly, I here, in the most solemn manner swear to you, by Orasimades, that I never saw the queen's illustrious bitch, nor the noble palfrey of the king. I will be ingenuous, however, and declare the truth, and nothing but the truth: As I was walking by the thickets side, where I met with her majesty's most venerable chief eunuch, and the king's most illustrious chief huntsman, I perceived upon the sand the footsteps of an animal, and I easily inferred that it must be a little one. The several small, though long ridges of land between the footholds of the creature, gave me just grounds to imagine it was a bitch, whose teats hung down, and for that reason I concluded she had but lately pupped. As I observed likewise some other traces, in some degree different, which seemed to have grazed all the way upon the surface of the sand, on the side of the forest, I knew well enough the must have had long ears. And forasmuch as I perceived, with some degree of curiosity, that the sand was every where less hollowed by one foot in particular, than by the other three, I conceived that the bitch of our most august queen, was somewhat lamish, if I may presume to say so.

"As to the palfrey of the king, give me leave to inform you, that as I was walking down the lane by the thickest hedge, I took particular notice of the prints made upon the sand by a horse's shoe, and found that their distances were in exact proportion; from which observation I concluded the palfrey galloped well. In the next place the dust of some trees in a narrow lane, which was but seven feet broad, was here and there swept off, both on the right hand and on the left, about three feet six inches from the middle of the road, for which reason I pronounced the tail of the palfrey to be three feet and a half long, with which he had whisked off the dust on both sides as he ran along. Again I perceived under the trees, which formed a kind of bower of five feet high, some leaves that had lately fallen to the ground, and I was sensible the horse must have shook them off, from whence I conjectured he was five feet high. As to the bits of his bridle, I knew they must be of gold, and of the value I mentioned, for he had rubbed the studs upon a certain stone, which I knew to be a touchstone, by an experiment that I had made of it.

"To conclude, by the prints which his shoes had left on some dirt stones of another nature, I conceived his shoes were silver, and of eleven penny weights sineness, as I before mentioned.

"The whole bench of judges stood astonished at the profundity of Zadig's nice discernment. The news was soon carried to the king and queen. Zadig was not only the whole subject of the court's conversation, but his name was mentioned with the utmost veneration in the king's cabinet, and his privy council; and notwithstanding several of their magi declared he ought to be burnt for a sorcerer, yet the king thought proper that the fine he had deposited in court should be peremptorily restored. The clerk of the court, the scribes, and other petty officers, waited on him in their proper habits, in order to refine the four hundred ounces of gold, pursuant to the king's express order, modestly reserving only 93 ounces, part thereof to defray the fees of the court, and the domestics swarmed about him likewise in hopes of some small consideration."

Zadig, upon the winding up of the whole, was fully convinced that it was very dangerous to be over-wise, and was determined to set a watch before the door of his lips for the future.

An opportunity soon offered for the trial of his re-

solution, a prisoner of state had just made his escape, and passed under the window of Zadig's house. Zadig was examined thereupon, but was absolutely dumb. However, as it was plainly proved upon him, that he did look out of the window at the same time, he was sentenced to pay 500 ounces of gold for that misdemeanor, and moreover was obliged to thank the court for their indulgence.

The real Arabian story, from which the above was principally taken, and fabricated by the author of Zadig, is as follows:

"Three Arabs, brethren of a noble family, who were travelling together for the sake of improving their minds, were met by accident by a camel driver, who asked them if they had not seen a camel, which had strayed from him in the night. Was not the camel blind of an eye, said the eldest? Yes, said the man. It had a tooth out before, said the second; it is very true, replied the man. Was it not a little lame, added the third: why really it was, returned the driver.

"The camel driver took it for granted that they had seen it, and therefore besought them to tell him which way it went; follow us, friend, said they; and the man did so.

"He had not gone far before he happened to spy that the camel was laden with corn; it had, added the Arabians, a vessel of oil on one side, and a vessel of honey on the other. It had so, said the man, and therefore let me conjure you to tell me where you met it. Met, it replied the eldest of the brothers, why we never saw your camel at all.

"The men, losing all patience at this, began to load them with reproaches; and as they were passing through a village, raised the people upon them, and caused them to be apprehended. The judge of the village, not being able to determine the cause, sent them to the prince of the country, who perceiving by their behaviour that they were persons of distinction, set them at liberty, lodged them in his palace, and treated them with all the respect imaginable. After some days were over, he took an opportunity to entreat them to clear the mystery, by explaining to him how they could possibly hit upon so many circumstances without ever having seen the camel.

"The young men smiled at the impotency of the prince, and, after having returned him abundance of thanks for the civilities they had received, the eldest of them spoke thus:

"We are not either deceivers, or necromancers, we never saw the man's camel, nor did we use any other instruments of divination, than our senses, and our reason. I for my part judged it was blind, because I observed the grass eaten on one side of the road, and not on the other."

"I, said the second, guessed it had lost a tooth before, because where the grass was cropped closest, there were constantly a little tuft left behind."

"And I, added the third, conceived it was lame, because the prints of three feet were distinct in the ground, whereas the impression of the fourth was blurred, whence I concluded that the beast dragged it, and did not set it to the ground."

"All this I apprehend, said the prince, but how in the name of fortune could you discover that oil and honey made part of its loading?"

"Why, returned the Arabians, we guessed this, because on one side of the road we saw little troops of ants foraging the grass, and because on the other we saw the flies assembled here and there in groups, inasmuch that few or none were on the wing."

C H A P. XXXII.

The Streights of Babelmandel, the Red Sea, the Island of Babelmandel, &c. &c.

TH E name of Babelmandel, given to the freights which join the Indian Ocean to the Red Sea, is a corruption of the words *babal mandul*, which latter imply the *gate of sweeping*, an epithet bestowed on these freights by the ancient Arabs, on account of the danger that attended the navigation of them, which was conceived to be so great, that when any of their relations passed them, they put on mourning, as persons whom they had given over for lost. Yet dangerous as such voyages might be deemed, many, allured by the hope of gain, engaged in them.

So much can avarice the foul betray,
And e'en the very thoughts of death outweigh;
In dear-bought gold the fordid mind can see,
Pleasures unknown to peaceful poverty.

According to De Castro, the Arabian gulph, or Red Sea, which includes the freights of Babelmandel, begins on that part of the ocean, bounded on the side of Africa, by Cape Guardafay, of Old Anomata, and on the side of Asia, by Cape Tartak. From these capes the shores run westward as far as Aden and Zeyla, and from thence proceed, narrowing with descent coasts, and not much winding till they meet in the mouth of the Arabic gulph with two promontories.

The promontory on the Arabian side was called *Possidium* anciently, but the name of that on the European side is lost. The intermediate freight was called by the Arabians and Indians *Alhaho*, which signifies the gates or mouths, as it is not above six leagues wide, and is interspersed with little islands, as scarce to admit of shipping to pass through its narrow channels. These small islands are full of bays, ports, nooks, creeks, &c. the ebbing and flowing of the waters into and from which greatly impede the navigation in those parts.

On the side of Arabia the cape appears to those coming from the sea to be an island, at a considerable distance from the main land; but not far from the cape is the island of Robon, or rather Roboon, which name, in the Arabic language, signifies a pilot; and this appellation was given to the island, because several pilots, who understood the navigation of these freights, resided here. This island is very flat, and not two miles in compass. The water from here to the promontory is so shallow, that it may be easily forded when the tide is low. About a league farther is another island, somewhat bigger than Robon's island, yet unrequented, although it hath a very good haven.

By means of so many islands it must be naturally supposed that many channels are made; the principal of which may be safely passed in the night, steering north-west by west, or south-east by east, there being eleven fathom deep quite through, and neither flat shoals, or any other obstruction.

The other channels are not quite so big as the above, but may be as easily navigated; and the Arabians are either more skillful in maritime affairs, or less fearful than they formerly were when they named these freights, as at present they do not appear to be afraid of navigating them. Thus boldness, like vice, increases from familiarity, and our fears, like our virtues, yield to the frequent sight of what we dreaded.

"Vice is a monster of so frightful mien
As to be hated, needs but to be seen;
Yet, seen too oft familiar with her face,
We first endure, then pity, then embrace.

The Island of BABELMANDEL.

The island of Babelmandel, or the Port of Affliction, was formerly called the Island of Diodorus.

It is situated towards the entrance into the Red Sea, adjoining to one side of the freights of Babelmandel, and lying under 12 deg. 50 min. north lat. It stands in the very middle of the freights, about four miles from the Arabian, and the same distance from the Abyssinian coast, directly opposite to Cape Zeila. Hence it forms two fine channels, one on each side of it, and from its situation might, if properly fortified, command both. It is affirmed by ancient historians, that the kings of Egypt formerly fortified these channels by laying booms, or chains across both, from the island to the continent on each side. This island is about five miles in circumference; and important on no other account than its admirable situation, as it produces neither grain, roots, fruits, or herbage. Formerly, however, it occasioned bloody wars between the Abyssinians, and the Arabs of the kingdom of Adal, falling into their hands alternately, till the Portuguese took it and demolished its fortifications. The Mahometans now being masters of both coasts, it is sunk into its natural nothingness, and is almost deserted, having only a few poor inhabitants, for whom it still supplies a subsistence. Yet these people, though poor, find the most perfect happiness in their situation; they possess what they deem a competence, and find the utmost felicity in what sense might hardly call penury.

"O happiness! our being's end and rim!
"Good, pleasurable, safe, content, what's thy name?
"That something which will prosper till 't is made flight,
"For which we bear to live, nor fear to die,
"Which still to near us, yet beyond us lies,
"O'erlook'd, seem'doubtless, by the fool and wife.
"Plant of celestial seed, if dropp'd below,
"Say in what mortal soil thou deign'st to grow?
"E'er opening to some courts propitious shrine,
"Or deep with d'inead, in the flaming mine?
"T'would with the wreaths, Parnassian laurels yield,
"Or reap'd in iron harrows of the field?
"Where grows? where grows it not? If vain our toil,
"We ought to blame the culture, not the soil:
"Fix'd to no spot, is happiness sincere,
"Tis no where to be found, or e'er try where;
"Some place the bliss in action, some in ease,
"Those call it pleasure, and contentment these;
"Some sunk to beasts, find pleasure end in pain;
"Some swelled to Gods, confess e'en virtue vain;
"Or indolent, to each extreme they fall,
"To trust in e'er'y thing, or doubt of all.
"Who thus define it, by thy roots or less
"Than this, that happiness is happiness?
"Take nature's path, and mad opinion's leave;
"All states can teach it, and all birds conceive;
"Obvious her goods, in no extreme they dwell;
"There needs but thinking right, and meaning well.
"Know, all the good that individuals find,
"Or God and nature meant to mere mankind,
"Reason's whole pleasure, all the joys of sense,
"Lie in three words, health, peace, and competence.
"But health consists with temperance alone,
"And peace, oh virtue! peace is all thy own.
"The goods of fortune, good or bad may gain;
"But these less taste them, as they worse obtain.

As the best account of the other islands in the freights of Babelmandel, the navigation of those freights, and

of the Red Sea, with the entrance into the latter, &c. &c. is found in the voyage of the Portuguese admiral Don Stefano de Gama, from Goa to Suez, the journal of which was written by the famous Don Juan de Castro, then one of the commanders in his fleet, and afterwards governor and viceroy of India, we shall extract as much from that famous voyage, as is necessary to elucidate this part of our work.

In passing the freights, De Castro made an observation at noon, and found the mouth of them to be in 12 degrees, fifteen minutes, north latitude; two hours after midnight the Portuguese set sail from the mouth of the freights. In the morning they saw both coasts, being nearer the Abesim, between which and the first island, they sailed north-west by west, the wind blowing hard at east till noon. This coast was quite new to the Portuguese; their distance from land was about four leagues. An hour after sun rise they saw a range of islands, most of them very low, which extended north-west and south-east; as the coast did, along which they lay, for about 60 leagues. In this channel of Abesim they sailed with a fair wind, having islands all the way on both sides.

Here there is no sailing by night, or without the wind in the poop; for if it happens to change, it is impossible to tack about, or come to anchor, till the ship arrives at the first islands, which are nine little ones; after having passed these, the sea becomes more open and free; but, towards the shore, there are several islands and rocks, which render the navigation dangerous if a vessel keeps too near the coast; and it is the opinion of De Castro, that none should attempt the navigation of the freights of Babchandel, or the Red Sea, without a pilot belonging to the country. A little farther are seven small islands, called the Seven Sisters, between which and the shore are some very dangerous rocks; after having passed these, they arrived at the Island of Sorbo, and anchored in a harbour of the same name, in nine fathom and a half water.

De Castro found the island of Sorbo to be in 15 degrees, seven minutes, north lat: It is near twenty miles in circumference, and belongs to a great Archipelago of islands, about four leagues from the Abyssinian coast, and twenty-four from of Masna. The Portuguese roved about this island, and perceived it was low, and full of trees, but the trees were all short, or of the shrub kind; the plains were verdant, and they discovered the tracks of men and beasts in several places, though they did not happen to meet with either, a camel excepted, on which account they called it Camel Island. After all their researches, they did not find any water, except in one well digged in a stone, and made, according to their conjecture, principally for the reception of rain.

Having left Sorbo, they sailed among many islands, most of which were very low, and almost even with the sea. In their passage, they kept about a league to the right of them; and in the evening saw also to the right, about four leagues distant, a very long range of islands, extending near five leagues in length, north-west and south-east, as near as could be judged. The coasts here stretched north-west by west, and south-east by east; and the depth of water was continually twenty-five fathom, in an oozy bottom.

They afterwards entered the channel between the point of Dahlak and Shamo; the island of Shamo being the first they made of five very flat islands, which are situated between the said point, and the main land. It is two leagues in compass, and contains a few springs and wells. Near this there are several other small islands, the names of which are unknown, and the places themselves so insignificant as not to merit any description.

THE ISLAND OF DAHLAK.

THIS island is situated near the coast of Habash or Abex, being about twenty leagues eastward from the continent; and about the same distance south of Masna.

Dahlak is the largest, and most considerable island on this coast, being near 60 miles in circumference. The air is temperate and salubrious; the land well watered, and verdant; and the people numerous and robust.

Great numbers of camels, oxen, goats, &c. feed in the pastures; the sea and rivers yield plenty of fish; and the inhabitants are profusely supplied from the continent with honey, corn, &c.

The wealth of the place arises chiefly from pearl-fishing, at which many of the natives are very dexterous; and the pearls found here are some of the finest in the universe. And here it may not be amiss to describe this beautiful substance, which, though not properly so, is ranked as a gem.

Pearl is a hard white shining body, usually roundish, found in a staccous fish resembling an oyster.

Pearls, though esteemed of the number of gems, and though they have been highly valued in all ages, proceed only from a distemper in the creatures that produce them, being analogous to the bezoars, and other stony concretions in several animals of other kinds. And what the ancients imagined to be a drop of dew, concentered into a pearl in the body of the pearl-fish (which they supposed rose from the bottom to the surface of the water to receive it) is nothing more than the matter destined to form and enlarge the shell, bursting from the vessels designed to carry it to the parts of the shell it should have formed, and by that means producing these little concretions.

Besides pearls, this island produces many emeralds. The emerald is the most beautiful of all the class of coloured gems, when perfect. It is sometimes found in the roundish or pebble form; sometimes in the columnar, or crystalline form; the pebble-emeralds are, however, the most valued. These are found loose in the earth of mountains, and in the beds of rivers they are in their natural state, bright and transparent, though, as glossy than the columnar ones.

Emeralds have the green colour in all its different shades, from very dark, to extremely pale; and are sometimes entirely colourless; though the English jewelers then call it white sapphire.

Those inhabitants of Dahlak who do not concern themselves in fishing are, in general, notorious pirates, and plunder all the ships that come in their way. They behave with asperity to all, but particularly to the Turks, when any of them are so unfortunate as to fall into their hands; and when they get home, they take a peculiar pleasure in boasting of their piratical exploits to their wives, children, and relations; when

—The fond wife, in tears of transport drown'd,
Hugs her rough lord, and weeps o'er every wound;
Hangs on the lips that decks of blood relate,
And smiles, or trembles at his various fate;
His little lill'ning progeny turn pale,
And beg again to hear the dreadful tale.

The king of Dahlak is sovereign of this, and many other islands; and his subjects consist chiefly of Abyssinian Christians, or Christians of the Abyssinian church. Indeed some few Mahometans, of the sect of Ilihi, reside in his dominions; but these are much oppressed by the king, and cordially hated by their Christian fellow-subjects. The people of Dahlak, who appear to be of the Ethiopic race, are black, and ill-favoured; but strong, robust, bold, daring, and loyal to their sovereign. They are extremely sagacious and crafty, fond of repeating and hearing entertaining tales, very pleasant companions, and admirably skilled in story-telling; so that they seem by nature, to practise the precepts, and avoid the errors mentioned in the artificial rules of Mr. Stillingfleet, viz.

A story shou'd, to please, at least seem true,
Be a-propos, well told, concise, and new;
And whensoever it deviates from these rules,
The wife will sleep, and leave applause to fools.
But others, more intolerable yet,
The waggeries they've said or heard repeat;
Heavy by memory made, and what's the worst,
At second-hand, as often as at first.
And can ev'n patience bear, without disdain,
The maiming register of sense once slain,
While the dull features, big with archness, strive
In vain, the fore'd half smile to keep alive.

The clothing of the Dahlakians is a large piece of silk, or cotton (according to the respective ranks of the wearers) tied round the middle, and hanging down to the feet; but from the middle, upwards, both sexes go naked. The language they speak is Arabic, intermixed with Ethiopian words; and their deportment is courteously itself to each other, but they are very unkind and cruel to strangers.

The

The goat's hair here is very fine and long, so that it is manufactured into tolerable camblers. The soil, in general, of this island, is red; and though it does not produce much timber, yet it yields abundance of herbs. Here is a small insect resembling a bee, which feeds on a kind of gum, that distills from a tree which hath some similitude to a cherry-tree; and from this insect it is said, that gum lac, used in varnishing, making sealing-wax, &c. is extracted.

The capital city, which goes by the same name as the island itself, is situated on a point of land to the westward of it; but it is of no great consideration, as the king resides, the greatest part of the year, at the little island of Masua, of which we shall proceed to give some account.

The Island of MASUA.

MASUA is only half a mile in length, and somewhat less in breadth. It is very flat, and lies very near the main land; that is on the north-west side. It has a good harbour, secure in all weathers, the depth of the water being about eight or nine fathom, and the ground oozy. The entrance of this port is on the north-east side, towards the middle of the channel, for from the east-north-east point of the island, there runs a shoal towards another point; so that ships must take care to keep the middle of the channel, which is very strait, and consequently dangerous; and runs north-east and south-west.

The people here resemble those of Dahlak in customs, manners, vices, &c. and have likewise similar virtues. The men are also of two classes, those who follow traffic, or the pearl fishery, and those who live by piracy; yet both classes are looked upon in a light equally favourable, as piracy is not here deemed criminal, or even dishonourable. Whatever profits accrue from either trading or thieving are, by the men in general, appropriated to the purposes of gallantry, and the facilitating their amours; for the people here are great votaries of Venus, and Cupid seems to reign with unbounded power; the men being as expert in intriguing, and the women as skillful in the arts of coquetry, as if they had been educated in much politer nations. As the people of Masua are exceeding warm in their passions, both from their manner of living, and the natural heat of the climate; their sanguine constitutions, and the heat of their imaginations, often precipitate them into very rash actions; and their amours frequently have a fatal conclusion.

Oh mighty love, from thy unbounded pow'r,
How shall the human bosom rest secure!
How shall our thought avoid the various snare;
Or wisdom to our caution'd hearts declare
The different shapes thou pleasest to employ
When bent to hurt, and certain to destroy
The haughty nymph, in open beauty dress'd,
To-day encounters our unguarded breast;
She looks with majesty, and moves with state,
Unbent her soul, and in misfortune great,
She scorns the world, and dares the rage of fate,
Here whilst we take stern manhood for our guide,
And guard our conduct with becoming pride,
Cham'd with the courage in her action shown,
We praise her mind, the image of our own.
She that can please is certain to persuade;
To-day belov'd, to-morrow is obey'd.
We think we see thro' reason's optics right,
Nor find how beauty's rays elude our sight:
Struck with her eye, whilst we applaud her mind:
And when we speak her great, we with her kind.
To-morrow, cruel pow'r, thou art the fair,
With flowing frow, and dishevel'd hair;
Sad her complaint, and humble is her tale,
Her sighs explaining where her accents fail,
Here gen'rous fortitude warms the honest breast,
We raise the sad, and succour the distressed:
And whilst our wish prepares the kind relief,
Whilst pity mitigates her rising grief,
We sicken soon from her contritious care,
Grieve for her sorrows, groan for her despair;
And against love too late those bosoms arm,
Which tears can soften, and which love can warm.
Against this nearest, cruellest of foes,
What shall wit meditate, or force oppose?

47

Whence, feeble nature, shall we summon aid,
If by our pity and our fear betray'd?
External remedy shall we hope to find,
When the close fiend has gain'd our trench'rous mind,
Insulting there does reason's pow'r deride;
And, blind himself, conducts the dazl'd guide?

PRIOR'S SOLOMON.

Masua, with all the opposite coast, was formerly subject to the emperor of Abyssinia; but, within the last century, it was seized by the king of Dahlak, who resides chiefly here for the conveniency of carrying on a trade with the continent; from whence he receives abundance of gold and ivory.

The air is exceeding hot and unhealthy, during the months of May and June, for want of wind; so that the king and principal inhabitants retire to Dahlak during those months.

Very near this island, to the south and south-west, lie two other islands; the largest is next the land; the other, lying towards the south-west, is very round. Between these islands and Masua are many shoals; but through the midst of them runs a channel, where gallees and row vessels may pass at full sea.

The people of Masua value themselves much on account of the queen of Sheba; saying, that she crossed from the continent thither, and took shipping in their port, in order to visit king Solomon, to whom she carried immense riches, and afterwards returned to her own country.

The Island of MARATE.

BETWEEN this island and Masua are some clusters of small inconsiderable islands, whose names are not known, and whose importance is so little, that they have not been thought worth describing by any navigator, traveller, or geographer.

Marate itself is a low barren island, of a roundish shape, about three leagues from the continent, and 66 from Masua; but, in compass, it does not exceed five miles.

On the south-west side, facing the coast, there is a very good haven, secure from all winds, especially the eastern, made by two very long points, which extend north by west, and south by east, inclosing a spacious harbour, narrow at the mouth, where there lies a long, very flat island, with some sand-banks and shoals; so that no sea can get in. This port hath two entrances, both very near the points. The channel, on the east side, lies north by west. The depth is three fathoms, in the shallowest place, and increases advancing in the port; where, near the shore, it is four or five fathoms, and the bottom is rather muddy.

The people who inhabit this island differ in nothing with respect to customs, manners, &c. from those who reside in Masua, Dahlak, &c. And therefore need not a particular description.

The Island of SWAKEN, SUAQUEN, or SUACHEM.

THIS island is situated in 19 deg. 45 min. north lat. and 37 deg. 30 east lon. and the port is deemed one of the best in the Red Sea. The entrance is by a narrow strait, which leads to a lake; in the midst of which is an island, and a town that covers every part of the island.

This town was once very important, and extremely opulent; as we are informed by de Caſtio, in his account of De Gama's voyage, for at the time he was there, which was about the year 1540, he says

"Swaken, at present, is one of the richest cities in the east, standing near the coast of Abyssinia. It equals, if not exceeds, the most eminent places in goodness and security of the port, facility in lading, and unlading of ships, traffic with remote countries, strength and advantageous situation of the town, &c.

"The harbour is sheltered, by nature, from all winds; and the waters so smooth and still, that the tides are scarce perceptible. It is capable of containing 200 large ships, besides an infinite number of galleys. The road is from five, to twelve fathoms water, and hath a mud bottom, which is seen in all places not exceeding seven fathom water. The ships come up close to the shore, quite round the city; and may be laden, by laying a plank from them to the merchants warehouses."

6 T With

With respect to commerce, De Castro says, he knew no city, Lisbon excepted, which could compare to it, for at that time it traded to both the peninsulas of India, the Arabian and Persian gulphs, Grand Cairo, Constantinople, Alexandria, Ethiopia, &c.

For strength the city seemed naturally well secured by the many shoals, islands, rocks, sand-banks, and intricate channels, that lie from 16 leagues about it, which renders the approach by sea very dangerous, and terrible to navigators; yet the inhabitants had not taken the less care to defend it by art. "This city, says De Castro, thus situated, in the midst of a circular nook, stands in a flat island, almost perfectly round and level with the water, about a mile in compass. In this space there is not a foot of ground but what is taken up with houses; so that all the island is a city, and all the city an island."

Such was the importance, and opulence of Swaken, between two and three centuries ago, at which period it was under the dominion of a Casrian prince. Subsequent to that time, it has fallen into the hands of the Turks, and like most other places, which those haughty, tyrannical, and idle people, have become possessed of, hath ever since dwindled away to little or nothing, lost its commerce and consequence, grown poor and less populous, and at present is of very trifling consideration. Such are the effects of indolent examples, and arbitrary government.

On the north-west side of this island lie three others, two of which are very small, but the third, next the channel, is about as large as the city. Between this island, and the coast on the north side, runs a great and long channel, where a numerous fleet may ride with safety in seven fathom water.

The houses now remaining in Swaken, and the other little islands, are all erected with stone and mortar, and built much in the European manner; the decayed city of Swaken is the seat of a Turkish governor, who acts subordinate to the basha of Grand Cairo, and the modern inhabitants are principally Turks or Arabs.

The best buildings in Swaken are the baths; and the most pleasing amusement which both the Turks and Arabs take, is that of bathing. Indeed, the sultry situation of the place seems to require frequent ablutions, both for health and pleasure; and Mahomet appears to have entertained the same opinion of the Turkish dominions in general, by his having made purification, by frequent washings and bathings, a fundamental point of the Mahometan religion, and a duty diurnally incumbent on every one of its professors.

That his followers might be more punctual in these ablutions, Mahomet is said to have declared, that the practice of religion is founded on cleanliness, which is the one half of the faith, and the key of prayer; without which it will not be heard by God. And that these expressions might be the better understood, one of the commentators reckons four degrees of purification; the first of which is the cleansing of the body from all pollution, filth, and excrement; the second, the cleansing of the members of the body from all wickedness and unjust actions; the third, the cleansing of the heart from all blamable inclinations, and odious vices; and the fourth, the purging a man's secret thoughts from all affections, which may divert his attention from God; adding, that the body is but as the outward shell, in respect to the heart, which is as the kernel. And for this reason that some commentator highly complains of those who are superstitiously solicitous in exterior purifications, avoiding those persons as unclean, who are not so scrupulously nice as themselves, and at the same time have their minds lying waste, and over-run with pride, ignorance, and hypocrisy.

Left so necessary a preparation to their devotion should be omitted, either where water cannot be had, or when it may be of prejudice to a person's health, they are allowed, in such cases, to use fine sand, or dust, in lieu of water, and then they perform this duty by clapping their open hands on the sand, and passing them over the parts in the same manner as if they were dipped in water.

But in these ablutions, the men never bathe with the women; and there is so much modesty observed, that any one would be reproved who should see any thing

through inadvertency; and if he did it by design, he would be bastinadoed. There are some baths which are for the use of the men in the morning, and for the women in the afternoon. Others are frequented one day in the week by one sex, and the next by the other. People are served very well in these baths for three or four aspers. The first entrance is into a fine hall, in the middle of which the principal fountain appears. All round the hall is a small bench, about three feet high, covered with a mat. The men sit upon it to smooke, and pull off their clothes, which are folded up in a towel. The air in this first hall is so hot, that nothing can be borne upon the body, but an apron about the waist, to cover before and behind. In this condition a man passes into a small hall which is still warmer, and from thence into a larger, where the heat is more sensible. All these halls are generally closed above with small domes, which let in light at the top, through a round glass, like those our gardeners put over their melons. In the last hall there are marble basins with two cocks, one of hot water and the other of cold, which every one mixes according to his own fancy, and pours upon his body with little buckets of brass belonging to the place. The pavement of this chamber is heated by furnaces beneath, and every one walks there as long as he thinks proper. When a man desires to be scoured, a servant of the bath causes him at once to lie along upon his back, and setting his knees upon his belly, presses and squeezes him violently, and makes every bone crack. They handle after the same manner the joints of the back and the shoulder-blades. If he would be shaved, he shaves him, or gives him a razor to shave himself. When the person enters the great hall, another servant presses his flesh all over with his hands so dextrously, that having kneaded him, if we may say so, without doing any harm, he forces out a surprizing quantity of sweat. The little chamber-bags they make use of here, are instead of the frigitels of the ancients, and are much more convenient. To clean the skin the better, they pour a great deal of hot water upon the body; and also use perfumed soap. They wipe the skin with linen very clean, dry, and warm; and the ceremony concludes with the feet, which the same man washes very carefully, when you return to the hall. In this hall they smooke, drink coffee, and have collations; for after this exercise, a man finds himself very hungry. By cleansing the glands, the bath certainly facilitates perspiration, and consequently the circulation of the juices, which supply the blood. A man perceives himself very light, when he has been well purified, but he must be accustomed to this bath from his youth, for otherwise the breast is very much affected by these warm rooms. The women are very happy when they are permitted to go to the public baths; but most of them, especially such whose husbands are rich enough to build them baths at home, have not this liberty. In the public baths they entertain one another without any constraint, and pass their time more agreeably than in their own apartments. The men who have any complaisance for their wives, do not refuse them these innocent diversions; for too much constraint makes them sometimes seek reasons for a divorce.

The Island of BARBORA.

This island lies in 10 deg. 45 min. north lat. and 47 deg. two min. east long, and has its appellation from a town of the same name on the neighbouring continent.

The inhabitants of Barbora are negroes; and the common people wear cotton garments, which go round their waists, and hang down to their feet, the rest of the body being bare; but those of a superior quality have the addition of a long cotton gown, which covers them all over, their faces excepted.

These people are great breeders of cattle, for which the soil of the island affords excellent pasture; and very industrious traders, as they carry on a considerable traffic,

by exchanging	{ Cattle Gold Frankincense Ivory Pepper, &c.	for	{ Cloths Amber Necklaces Glass beads Raisins, Dates &c.
---------------	--	-----	---

The commodities they exchange away, are either the produce

produce of their own island; or what they procure from the neighbouring continent; for their labour in looking after cattle, as many of them officiate in the capacity of shepherds and graziers to the people of the kingdom of Adel on the opposite continent. Those who here tend the herds and flocks are some of the happiest and most inoffensive people in the universe: indeed their felicity hath been to most the admiration and envy of others, that many capital men from Adel, and the adjacent kingdoms, and several rich Arabian merchants, have thought proper to retire hither from the adulation of courts, the dangers of war, the hazards of commercial voyages, and the painful bustle of trade, in order to taste, in rural retirement, those delicious pleasures, which they could not obtain in the pursuit of fame and riches.

But blest is he, who, exercis'd in cares,
To private leisure public virtue bears;
Who tranquil ends the race he nobly runs,
And decks repose with trophies labour won:
Him honour follows to the secret shade,
And crowns propitious his declining head:
In his retreats their harps the muses string,
For him in lays unbought spontaneous sing.
Friendship and truth on all his moments wait,
Pleas'd with retirement better than with state;
And round the bowyer where humbly great he lies
Fair olives bloom, or verdant laurels rise.

The commodities they receive by commercial means, are brought to them by Turkish, Moorish, Arabian, Egyptian, &c. merchants. Their traffic, however, is much decayed since the Europeans have formed such powerful commercial connections in the East Indies, as the merchants above alluded to naturally repair to the best mart, and seek the most profitable mode of vending their commodities.

Where gold allures the heart and charms the eye,
Molt men towards its bright effulgence fly;
Forfake old friends, new riches to acquire,
And in the arms of avarice expire.

The inhabitants of this island are admired by all who have traded in those seas, for their universal philanthropy, and are peculiar for their singular benevolence to each other, and their very humane treatment to domestic, and other animals. We wish that such virtues were more general, and that those who esteem themselves polite people, and boast of a more refined education, would copy the shining parts of all characters, however differing from them in political religious sentiments, or remote with respect to the locality of situation. These ideas naturally turn our thoughts on the wanton cruelty, and inhumanity, often unnecessarily exercised towards the brute creation, by Europeans, and too frequently extended even to our own species; and such reflections, induce us to transfer some excellent observations of the Rev. Dr. Primatt, as at the same time that these observations display those cruelties in their proper colours, with respect to ourselves, they apply with great propriety to some distinctions, too frequently made with respect to the generality of the inhabitants of that part of the globe, which we have now under consideration.

"I presume, says he, there is no man of feeling, that has any idea of justice, but would confess upon the principles of reason and common sense, that if he were to be put to unnecessary and unmerited pain by another man, his antagonist would do him an act of injustice; and from a sense of the injustice in his own case, now that he is the sufferer, he most naturally infer, that if he were to put another man of feeling to the same unnecessary and unmerited pain which he now suffers, the injustice in himself to the other should be exactly the same as the injustice in his tormentor to him. Therefore the man of feeling and justice will not put another man to unmerited pain, because he will not do that to another which he is unwilling should be done to himself. Nor will he take any advantage of his own superiority of strength, or of the accidents of fortune, to abuse them to the oppression of his inferior; because he knows that in the article of feeling all men are equal; and that the differences of strength or station are as much the gifts and appointments of God, as the differences of understanding, colour, or stature. Superiority of rank or station may

give ability to communicate happiness, (and seems to be intended;) but it can give no right to inflict unnecessary, or unmerited pain. A wise man would impeach his own wisdom, and be unworthy of the blessing of a good understanding, if he were to infer from thence that he had a right to despise, or make game of a fool, or put him to any degree of pain. The folly of the fool ought rather to excite his compassion, and demands the wise man's care and attention to one that cannot take care of himself.

"It has pleased God, the Father of all men, to create some men with white skins, and others with black skins; but as there is neither merit nor demerit in complexion, the white man (notwithstanding the barbarity of custom and prejudice) can have no right, by virtue of his colour, to enslave and tyrannize over a black man; nor has a fair man any right to despise, abuse, or insult a brown man. Nor do I believe that a tall man, by virtue of his stature, has any legal right to trample a dwarf under his foot. For, whether a man is wise or foolish, white or black, fair or brown, tall or short, and I might add, rich or poor, (for it is no more a man's choice to be poor, than it is to be a fool, or a dwarf, or black, or tawney,) such he is by God's appointment; and extractedly considered, is neither a subject for pride, nor an object of contempt. Now if amongst men the differences of their powers of the mind, and of their complexion, stature, and accidents of fortune, do not give to any one man a right to abuse or insult any other man on account of these differences; for the same reason, a man can have no natural right to abuse and torment a beast, merely because a beast has not the mental powers of a man. For such as the man is, he is but as God made him; and the very same is true of the beast. Neither of them can lay claim to any intrinsic merit, for being such as they are; for before they were created, it was impossible that either of them could deserve; and at their creation, their shapes, perfections, or defects, were invariably fixed, and their bounds set which they cannot pass. And being such, neither more nor less than God made them, there is no more demerit in a beast's being a beast, than there is merit in a man's being a man; that is, there is neither merit nor demerit in either of them.

"A brute is an animal no less sensible of pain than a man. He has similar nerves and organs of sensation; and his cries and groans, in case of violent impressions upon his body, though he cannot utter his complaints by speech or human voice, are as strong indications to us of his sensibility of pain, as the cries and groans of a human being, whose language we do not understand. Now as pain is what we are all averse to, our own sensibility of pain should teach us to commiserate it in others, to alleviate it if possible, but never wantonly, or unmeritedly to inflict it. As the difference amongst men in the above particulars are no bars to their feelings, so neither does the difference of the shape of a brute from that of a man, exempt the brute from feeling, at least, we have no ground to suppose it. But shape or figure is as much the appointment of God as complexion or stature. And if the difference of complexion or stature does not convey to one man a right to despise and abuse another man, the difference of shape between a man and a brute, cannot give to a man any right to abuse and torment a brute. For he that made man and man to differ in complexion, or stature, made man and brute to differ in shape and figure. And in this case likewise there is neither merit nor demerit; every creature, whether man or brute, bearing that shape which the supreme wisdom judged most expedient to answer the end for which the creature was ordained.

"With regard to the modification of the mass of matter of which an animal is formed, it is accidental as to the creature itself; I mean, it was not in the power or will of the creature to choose, whether it should sustain the shape of a brute or a man; and yet, whether it be of one shape, or of the other, the matter of which the creature is composed would be equally susceptible of feeling. It is solely owing to the good pleasure of God that we are created men; or animals in the shape of men. For he that "formed man of the dust of the ground, and "breathed into his nostrils the breath of life" that he might "become a living soul," and, endued him with the sense of feeling, could, if he had so pleased, by the

same

same plastic power, have cast the very same dust into the mould of a beast; which, being animated by the life-giving breath of its maker, would have become a "living soul" in that form; and, in that form, would have been as susceptible of pain, as in the form of a man. And if, in brutal shape, we had been endued with the same degree of reason and reflection which we now enjoy; and other beings, in human shape, should take upon them to torment, abuse, and barbarously ill-treat us, because we were not made in their shape, the injustice and cruelty of their behaviour to us would be self-evident: and we should naturally infer, that, whether we walk upon two legs or four; whether our heads are prone or erect; whether we are naked or covered with hair; whether we have horns or no horns, long ears or round ears; or, whether we bray like an ass, speak like a man, whistle like a bird, or are mute as a fish, nature never intended these distinctions as foundations for right of tyranny and oppression. But perhaps it will be said, it is absurd to make such an inference from a mere supposition that a man might have been a brute, and a brute might have been a man; for, the supposition itself is chimerical, and has no foundation in nature; and all arguments should be drawn from facts, and not from fancy of what might be, or might not be. To this I reply in few words, and in general; that all cases and arguments, deduced from the impotent and benevolent precept of "doing to others as we would be done unto," necessarily require such kind of suppositions; that is, they suppose the case to be otherwise than it really is. For instance, "a rich man is not a poor man;" yet, the duty plainly arising from the precept is this—The man who is now rich ought to behave to the man who is now poor, in such a manner as the rich man, "if he were poor," would be willing that the poor man, "if he were rich," should behave towards him. Here is a case which, in fact, does not exist between these two men; for the rich man is not a poor man, nor is the poor man a rich man; yet the supposition is necessary to enforce and illustrate the precept, and the reasonableness of it is allowed. And if the supposition is reasonable in one case, it is reasonable, at least not contrary to reason, in all cases to which this general precept can extend, and in which the duty enjoined by it can, and ought to be performed. Therefore, though it be true, that "a man is not a horse;" yet, as a horse is a subject within the extent of the precept, that is, he is capable of receiving benefit by it, the duty enjoined in it extends to the man, and amounts to this—Do you that are a man to treat your horse, as you would be willing to be treated by your master, in case that you were a horse. I see no absurdity, nor false reasoning in this precept; nor any ill-consequence that would arise from it, however it may be grieved by the barbarity of custom.

"In the case of human cruelty (that is, the cruelty of men unto men) the oppressed man has a tongue that can plead his own cause, and a finger to point out the aggressor: all men that hear of it inuader with horror; and, by applying the case to themselves, pronounce it cruelty with the common voice of humanity; and unanimously join in demanding the punishment of the offender, and brand him with infamy. But in the case of brutal cruelty, the dumb beast can neither utter his complaints to his own kind, nor describe the author of his wrong; nor, if he could, have they it in their power to redress and avenge him.

"In the case of human cruelty, there are courts and laws of justice in every civilized society, to which the injured man may make his appeal; the affair is canvassed, and punishment inflicted in proportion to the offence. But, alas! with shame to man, and sorrow for brutes, I ask the question, What laws are now in force? or what court of judicature does now exist, in which the suffering brute may bring his action against the wanton cruelty of barbarous man? The laws of Triptolemus are long since buried in oblivion; for Triptolemus was but a heathen. No friend, no advocate, not one is to be found among the "hulls nor calves" (Psalm lxxviii. 35.) of the people, to prefer an indictment on behalf of the brute. The priest stalks by on one side, and the Levite on the other side; the Samaritan stands still, sheds a tear, but can no more; for there is none to help; and the poor wretched, and unbenefitted creature is left to moan in un-

regarded sorrow, and to sink under the weight of his burden.

"But suppose the law promulged, and the court erected. The judge is seated, the jury sworn, the indictment read, the cause debated, and a verdict found for the plaintiff. Yet what cost or damage? What recompence for loss sustained? In actions of humanity, with or without law, satisfaction may be made. In various ways you can make amends to a man for the injuries you have done him. You know his wants, and you may relieve him. You may give him cloaths, or food, or money. You may raise him to a higher station, and make him happier than before you afflicted him. You may entertain him, keep him company, or supply him with every comfort, convenience, and amusement of life, which he is capable of enjoying. And thus may you make some atonement for the injury which you have done unto a man: and by thy assiduity and future tenderness, thou mayest, perhaps, obtain his pardon, and palliate thine own offence. But what is all this to the injured brute? If by thy passion or malice, or sportive cruelty, thou hast broken his limbs, or deprived him of his eye-sight, how wilt thou make him amends? Thou canst do nothing to amuse him. He wants not thy money nor thy cloaths. Thy conversation can do him no good. Thou has obstructed his means of getting subsistence; and thou wilt hardly take upon thyself the pains and trouble of procuring it for him (which yet by the rule of justice thou art bound to do) Thou hast marred his little temporary happiness, which was his all to him. Thou hast maimed, or blinded him for ever; and hast done him an irreparable injury."

BEFORE we conclude our account of Africa, we shall mention a few supplementary circumstances relative, in the first place, to what hath been the opinions of the learned concerning the causes of a difference of complexions in mankind; as this seems necessary here, since the greatest part of the inhabitants of this quarter of the globe are Blacks.—And, secondly, respecting slavery, to prove that it is absolutely inconsistent with, and even contrary to sound policy, humanity, reason and justice; with some hints to those who are not to be moved by such arguments; for the better treatment of slaves, during their passage from Africa to America, and on the plantations. . . . latter, greatly to the advantage of their owners as well as themselves.

With respect to the deep black, which tinges the complexions of Negroes, a learned author says, "The cause of this singularity has been the subject of much inquiry, which hath given rise to a variety of systems. Some have absurdly supposed that the Negroes, being the descendants of Cain, have had this mark of infamy stamped upon them, as a punishment for the fratricide of their ancestor. If it were so, it must be allowed that his posterity have made a severe atonement for his crime; and that the descendants of the pacific Abel have thoroughly avenged the blood of their innocent father.

"But, waving the discussion of such ridiculous fancies, let us enquire, whether it is possible that the Negroes should derive their colour from the climate they inhabit? Some philosophers, and eminent naturalists, are of this opinion. There are no Negroes, say they, but in the hottest countries. Their colour becomes darker the nearer they approach to the equator. It becomes lighter, or more bright, at the extremities of the torrid zone. The whole human species, in general, contract whiteness from the snow, and grow tanned in the sun. Various shades may be observed from white to black, and from black to white, marked out, as it were, by the parallel degrees which cut the earth from the equator to the poles. If the zones, imagined by the inventors of the sphere, were represented by real lands, one might perceive the jetty colour of the natives insensibly decrease to the right and left as far as the two tropics; from thence the brown colour of the inhabitants grows paler and brighter to the polar circles, by shades of white, becoming more and more brilliant. But it is somewhat remarkable, that nature, which hath lavished the brightness of the most beautiful colours on the skin and plumage of animals, and on vegetables and metals, should, properly

properly speaking, have left men without colour; since black and white are nothing but the beginning and absence of all colours.

“Whatever be the original and radical cause of that variety of complexion in the human species, it is agreed, that this complexion is owing to a gelatinous substance, that is lodged between the cuticle and the skin. This substance is blackish in negroes, brown in olive-coloured or swarthy people, white in Europeans, and diversified with reddish spots in those who have extremely light or red hair.

“Anatomy hath discovered, that in negroes, the substance of the brain is blackish, that the pineal gland is entirely black, and their blood is of a much deeper red than that of white people. Their skin is always hotter, and their pulse quicker. The reason of their hair being curled is, because, having to penetrate through a network of a more dense and tenacious substance, it becomes twisted, and cannot be lengthened out. The sweat of the negro diffuses a strong and disagreeable odour, because it is impregnated with that thick and rancid grease which hath been long lodged, and slowly oozes out between the cuticle and the skin. This substance is so palpable, that one may distinguish in it, with a microscope, a sediment formed in little blackish globules. Hence the perspiration of a negro, when it is copious, tinges the linen cloth which wipes it off.

“The colour of the negroes is falsely supposed to be owing to the climate, since in Africa, under the same parallels, the eastern coast has no negroes, and even produces white people; and that in America the heat of the sun and nature of the soil have never produced any negroes. Though it should be allowed, that the western coast of Africa is the hottest region of the whole globe, the only inference to be deduced from this would be, that there are climates proper only to certain species, or certain species adapted to particular climates; but not that the difference of climates could change the same species from white to black. White people never become black in Africa; nor negroes white in America. An union, indeed, between the sexes of these two, produces a species, who partake equally of the colours, features, and complexion of both. If man was originally white, it must be supposed, that having been created nearer to the frigid than to the torrid zone, he peopled the earth successively from the poles to the equator: while, on the contrary, the fertility of the globe between the tropics, is a presumption that it has been peopled from the equator to the poles.

“The climate inhabited by the negroes exhibits no palpable variations, but such as may be occasioned by sands or morasses. The almost insupportable heat of their days is succeeded by very cool and refreshing nights, with this difference only, that they are less so in the rainy seasons than in the time of drought. The dews, less profuse under a cloudy sky, than under a serene horizon, is undoubtedly the cause of this singularity.”

With regard to the African slaves, we are told in a recent publication, that “in America it is generally believed and asserted, that the Africans are equally incapable of reason and of virtue. The following well-authenticated fact will enable us to judge of this opinion.

An English ship that traded in Guinea in 1752, was obliged to leave the surgeon behind, whose bad state of health did not permit him to continue at sea. Murray, for that was his name, was there endeavouring to recover his health, when a Dutch vessel drew near the coast, put the blacks in irons whom curiosity had brought to the shore, and instantly sailed off with their booty.

Those who interested themselves for these unhappy people, incensed at so base a treachery, instantly ran to Cudjoe, (a black, at whose house Murray lodged) who stopped them at his door, and asked them what they were in search of. “The white man who is with you,” replied they, “who should be put to death, because his brethren have carried off ours.” “The Europeans,” answered the generous host, “who have carried off our countrymen, are barbarians; kill them whenever you can find them. But he who lodges with me is a good man, he is my friend; my house is his fortress; I am his soldier, and I will defend him. Before you can get at him, you shall pass over my body. O my friends, what just man

would ever enter my doors, if I had suffered my habitation to be stained with the blood of an innocent man?”

This discourse appeased the rage of the blacks: they retired ashamed of the design that had brought them there; and some days after acknowledged to Murray himself, how happy they were that they had not committed a crime, which would have occasioned them perpetual remorse.

This event renders it probable, that the first impressions which the Africans receive in the new world, determine them either to good or bad actions. Repeated experience confirms the truth of this observation: those who fall to the share of a humane master, willingly espouse his interests. They insensibly adopt the spirit and manners of the place where they are fixed. This attachment is sometimes exalted even into heroism. A Portuguese slave who had fled into the woods, having learnt that his old master had been taken up for an assassination, came into the court of justice, and acknowledged himself guilty of the fact; let himself be put in prison in lieu of the master; brought false, though judicial proof, of his pretended crime, and suffered death in lieu of the guilty person. Actions of a less heroic nature, though not uncommon, have touched the hearts of some colonists. Several would readily say as Sir William Goethe, governor of Virginia did, when he was blamed for returning the salutation of a black: “I should be very sorry that a slave should be more polite than myself.”

We will not here farther set ourselves as to enlarge the ignominious list of those writers who devote their abilities to justify by policy what morality condemns. In an age where so many errors are boldly laid open, it would be unpardonable to conceal any truth that is interesting to humanity. If whatever we have hitherto advanced hath seemingly tended only to alleviate the burden of slavery, the reason is, that it was first necessary to give some comfort to those unhappy beings, whom we cannot set free; and convince their oppressors that they are cruel to the prejudice of their real interests. But, in the mean time, until some considerable revolution shall make the evidence of this great truth felt, it may not be improper to pursue this subject further. We shall then first prove, that there is no reason of state that can authorize slavery. We shall not be afraid to cite to the tribunal of reason and justice those governments which tolerate this cruelty, or which even are not ashamed to make it the basis of their power.

Montesquieu could not prevail upon himself to treat the question concerning slavery in a serious light. In reality it is degrading reason to employ it, I will not say in defending, but even in refuting an abuse so repugnant to it. Whoever justifies so odious a system deserves the utmost contempt from a philosopher, and from the negro a stab with his dagger.

If you touch me, said Clarissa to Lovelace, that moment I kill myself; and I would say to him, who attempted to deprive me of my liberty, if you approach me, I will stab you. In this case, I should reason better than Clarissa; because defending my liberty, or, which is the same thing, my life, is my primary duty; to regard that of another, is only a secondary consideration; and if all other circumstances were the same, the death of a criminal is more conformable to justice than that of an innocent person.

Will it be said, that he who wants to make me a slave does me no injury, but that he only makes use of his rights? Where are those rights? Who hath stamped upon them so sacred a character as to silence mine? From nature I hold the right of self-defence; nature, therefore, has not given to another the right of attacking me. If thou thinkst thyself authorized to oppress me, because thou art stronger and more ingenious than I am; do not complain if my vigorous arm shall plunge a dagger into thy breast; do not complain, when in thy tortured entrails thou shalt feel the pangs of death conveyed by poison into thy food: I am stronger and more ingenious than thou; I am a victim, therefore, in thy turn; and expiate the crime of having been an oppressor.

He who supports the system of slavery is the enemy of the whole human race. He divides it into two societies of legal assassins; the oppressors and the oppressed. It is the same thing as proclaiming to the world, if you

would preferre your life, instantly take away mine, for I want to have yours.

But the right of slavery, you say, extends only to the right of labour, and the privation of liberty, not of life. What! does not the master, who disposes of my strength at his pleasure, likewise dispose of my life, which depends on the voluntary and proper use of my faculties? What is existence to him, who has not the disposal of it? I cannot kill my slave; but I can make him bleed under the whip of an executioner; I can overwhelm him with sorrows, drudgery, and want; I can injure him every way, and secretly undermine the principles and springs of his life; I can smother by slow punishments, the wretched infant which a negroe woman carries in her womb. Thus the law protects the slave against a violent death, only to leave to my cruelty the right of making him die by degrees.

Let us proceed a step further: the right of slavery is that of perpetrating all sorts of crimes: those crimes which destroy personal safety; for the slave may be sacrificed to the caprice of his master: those crimes which make modesty shudder.—My blood rises at these horrid images. I detest, I abhor the human species, made up only of victims and executioners; and if it is never to become better, may it be annihilated!

Further, that I may disclose without reserve my sentiments on this subject. Cartouche, the highwayman, sitting at the foot of a tree in a deep forest, calculating the profits and losses of his robberies, the rewards and pay of his associates, and adjusting with them the ideas of proportion and distributive justice; this Cartouche is not a very different character from that of the merchant, who, reclined on his counter, with his pen in his hand, settles the number of attacks which he can order to be made on the coasts of Guinea; who deliberately examines how many firelocks each negro will cost him, in order to support the war which is to furnish him with slaves; how many iron fetters to confine him on board; how many whips to make him work: how much each drop of blood will be worth to him with which each negro will water his plantation: if the black woman will contribute more to his estate by labour of her hands, or by those of bearing children?—What think you of this parallel? The highwayman attacks you, and takes your money; the trader carries off even your person. The one invades the rights of society; the other, those of nature. This certainly is the truth; and if there existed a religion which authorized, which tolerated, even by its silence, such enormities; if, moreover, occupied by idle or factious questions, it did not eternally denounce vengeance against the authors or instruments of this tyranny; if it made it criminal for a slave to break his bonds; if it did not expel the unjust judge who condemns the fugitive to death; if such a religion existed, its ministers ought to be massacred under the ruins of their altars.

But these negroes, say they, are a race of men born for slavery; their dispositions are narrow, treacherous, and wicked; they themselves allow the superiority of our understandings, and acknowledge almost the justice of authority.

The minds of the negroes are contracted; because slavery destroys all the springs of the soul. They are wicked; but not sufficiently so with you. They are treacherous, because they are under no obligation to speak truth to their tyrants. They acknowledge the superiority of our understandings; because we have abused their ignorance: they allow the justice of our authority; because we have abused their weakness. I might as well say, that the Indians are a species of men born to be crushed to death; because there are fanatics among them, who throw themselves under the wheels of their idol's car before the temple of Jaguernat.

But these negroes, it is further urged, were born slaves. Barbarians, will you persuade me, that a man can be the property of a sovereign, a son the property of a father, a wife the property of a husband, a domestic the property of a master, a negro the property of a planter?

But these slaves have sold themselves. Could a man ever by compact, or by an oath, permit another to use and abuse him? If he assented to this compact, or confirmed it by an oath, it was in a transport of igno-

rance or folly; and he is released from it, the moment that he either knows himself, or his reason returns.

But they had been taken in war. What does this signify to you? Suffer the conqueror to make what ill use he pleases of his own victory. Why do you make yourselves his accomplices?

But they were criminals condemned in their country to slavery. Who was it that condemned them? Do you not know, that in a despotic state there is no criminal but the tyrant.

The subject of an absolute prince is the same as the slave in a state repugnant to nature. Every thing that contributes to keep a man in such a state, is an attempt against his person. Every power which fixes him to the tyranny of one man, is the power of his enemies; and all those who are about him are the authors or abettors of this violence. His mother who taught him the first lessons of obedience; his neighbour, who set him the example of it; his superiors, who compelled him into this state; and his equals, who led him into it by their opinion: all these are the ministers and instruments of tyranny. The tyrant can do nothing of himself; he is only the first mover of those efforts which all his subjects exert to their own mutual oppression. He keeps them in a state of perpetual war, which renders robberies, treasons, assassinations lawful. Thus, like the blood which flows in his veins, all crimes originate from his heart, and return thither as to their primary source. Caligula used to say, that if the whole human race had but one head, he should have taken pleasure in cutting it off. Socrates would have said, that if all crimes were heaped upon one head, that should be the one which ought to be struck off.

Let us, therefore, endeavour to make the light of reason, and the sentiments of nature, take place of the blind ferocity of our ancestors. Let us break the bonds of so many victims to our mercenary principles, should we even be obliged to discard a commerce which is founded only on injustice, and whose object is luxury.

But even this is not necessary. There is no occasion to give up those conveniences which custom hath so much endeared to us. We may draw them from our colonies, without peopling them with slaves. These productions may be cultivated by the hands of freemen, and then be reaped without remorse.

The islands are filled with blacks, whose fetters have been broken. They successively clear the small plantations that have been given them, or which they have acquired by their industry. Such of these unhappy men, as should recover their independence, would live in quiet upon the same manual labours, that would be then free and advantageous to them. The vassals of Denmark, who have lately been made free, have not abandoned their ploughs.

Though all the nations concerned in the African trade are equally interested in preserving the slaves in their passage, they do not all attend to it with the same care. They all feed them with beans, mixed with a small quantity of rice; but they differ in other respects in their manner of treating them. The English, Dutch, and Danes keep the men constantly in irons, and frequently hand-cuff the women: the small number of hands they have on board their ships obliges them to this severity. The French, who have great numbers, allow them more liberty; three or four days after their departure they take off all their fetters. All these nations, especially the English, are too negligent with regard to the intercourse between the sailors with the women slaves. This irregularity occasions the death of three-fourths of those whom the Guinea voyage destroys every year. None, but the Portuguese, during their passage, are secured against revolts and other calamities. This advantage is a consequence of the care they take to man their vessels only with the negroes, to whom they have given their freedom. The slaves, encouraged by the conversation and condition of their countrymen, form a tolerably favourable idea of the destiny that awaits them. The quietness of their behaviour induces the Portuguese to grant the two sexes the happiness of living together: an indulgence, which, if allowed in other vessels, would be productive of the greatest inconveniences.

All the negroes, as well male as female, who come from Guinea, or are born in the islands, have the yaws

once in their lives: it is a disease they must necessarily pass through; but there is no influence of any of them being attacked with it a second time, after having been radically cured. The Europeans seldom or never catch this disorder, notwithstanding the frequent and daily connection which they have with the negro women. These women suckle the children of the white people, but do not give them the yaws. How is it possible to reconcile these facts, which are incontrovertible, with the system which physicians seem to have adopted with regard to the nature of the yaws? Can it not be allowed, that the semen, the blood, and skin of the negroes, are susceptible of a virus peculiar to their species? The cause of this disorder, perhaps, is owing to that which occasions their colour: one difference is naturally productive of another; and there is no being or equality that exists absolutely detached from others in nature.

But whatever this disorder may be, it is evident from the most accurate and undeniable calculations, that there dies every year in America, the seventh part of the blacks that are imported thither from Guinea. Fourteen hundred thousand unhappy beings, who are now in the European colonies in the new world, are the unfortunate remains of nine millions of slaves that have been conveyed thither. This dreadful destruction cannot be the effect of the climate, which is nearly the same as that of Africa, much less of the disorders, to which, in the opinion of all observers, but few fall a sacrifice. It must originate from the manner in which these slaves are governed: and might not an error of this nature be corrected?

The first step necessary in this reformation would be to attend minutely to the natural and moral state of man. Those who go to purchase blacks on the coasts of savage nations; those who convey them to America, and especially those who direct their labours, often think themselves obliged, from their situation, and frequently too for the sake of their own safety, to oppress these wretched men. The soul of these managers of slaves, lost to all sense of compassion, is ignorant of every motive to enforce obedience, but those of fear or severity, and these they exercise with all the harshness of a temporary authority. If the proprietors of plantations would cease to regard the care of their slaves as an occupation below them, and consider it as an office to which it is their duty to attend, they would soon discard these errors that arise from a spirit of cruelty. The history of all mankind would shew them, that in order to render slavery useful, it is at least necessary to make it easy; that force does not prevent the rebellion of the mind; that it is the master's interest that the slave should be attached to life, and that nothing is to be expected from him the moment that he no longer fears to die.

This principle of enlightened reason, derived from the sentiments of humanity, would contribute to the reformation of several abuses. Men would acknowledge the necessity of lodging, cloathing, and giving proper food to beings condemned to the most painful bondage that ever has existed since the infamous origin of slavery. They would be sensible, that it is naturally impossible that those who reap no advantage from their own labours, can have the same understanding, the same œconomy, the same activity, the same strength, as the man who enjoys the produce of his industry. That political moderation would gradually take place, which consists in lessening of labour, alleviating punishment, and rendering to man part of his rights, in order to reap with greater certainty the benefit of those duties that are imposed upon him. The preservation of a great number of slaves, whom disorders, occasioned by vexation or regret, deprive the colonies of, would be the natural consequence of so wise a regulation. Far from aggravating the yoke that oppresses them, every kind of attention should be given to make it easy, and to dissipate even the idea of it, by favouring a natural taste that seems peculiar to the negroes.

Their organs are extremely sensible of the powers of music. Their ear is so true, that in their dances, the time of a song makes them spring up an hundred at once, striking the earth at the same instant. Enchanted, as it were, with the voice of a singer, or the tone of a stringed instrument, a vibration of the air is the spirit that ac-

tuates all the bodies of these men: a sound agitates, transports, and throws them into extasies. In their common labours, the motion of their arms or of their feet, is always in cadence. At all their employments they sing, and seem always as if they were dancing. Music animates their courage, and rouses them from their indolence. The marks of this extreme sensibility to harmony are visible in all the muscles of their bodies, which are always naked. Poets and musicians by nature, they make the words subservient to the music, by a licence they arbitrarily assume of lengthening or shortening them, in order to accommodate them to an air that pleases them. Whenever any object or incident strikes a negro, he instantly makes it the subject of a song. In all ages this has been the origin of poetry. Three or four words, which are alternately repeated by the singer and the general chorus, sometimes constitute the whole poem. Five or six bars of music compose the whole length of the song. A circumstance that appears singular is, that the same air, though merely a continual repetition of the same tones, takes entire possession of them, makes them work or dance for several hours: neither they, nor even the white men, are disgusted with that tedious uniformity which these repetitions might naturally occasion. This particular attachment is owing to the warmth and expression which they introduce into their songs. Their airs are generally double time. None of them tend to inspire them with pride. Those intended to excite tenderness, promote rather a kind of languor. Even those which are most lively carry in them a certain expression of melancholy. This is the highest entertainment to minds of great sensibility.

So strong an inclination for music might become a powerful motive of action under the direction of skillful hands. Festivals, games and rewards might on this account be established among them. These amusements, conducted with judgment, would prevent that stupidity so common among slaves, ease their labours, and preserve them from that constant melancholy which consumes them, and shortens their days. After having provided for the preservation of the blacks exported from Africa, the welfare of those who are born in the islands themselves would then be considered.

The negroes are not averse to the propagation of their species even in the chains of slavery. But it is the cruelty of their masters which effectually prevents them from complying with this great end of nature. Such hard labour is required from negro women, both before and after their pregnancy, that their children are either abortive, or live but a short time after delivery. Mothers, rendered debilitate by the punishments which the weakness of their condition occasions them, snatch sometimes their children from the cradle, in order to strangle them in their arms, and sacrifice them with a fury mingled with a spirit of revenge and compassion, that they may not become the property of their cruel masters. This barbarity, the horror of which must be wholly imputed to the Europeans, will, perhaps, convince them of their error. Their sensibility will be roused, and engage them to pay a greater attention to their true interests. They will find that by committing such outrages against humanity, they injure themselves; and if they do not become the benefactors of their slaves, they will at least cease to be their executioners.

They will, perhaps, resolve to set free those mothers who shall have brought up a considerable number of children to the age of six years. The allurements of liberty are the most powerful that can influence the human heart. The negro women, animated by the hope of so great a blessing, to which all would aspire, and few would be able to obtain, would make neglect and infamy be succeeded by a virtuous emulation to bring up children, whose number and preservation would secure to them freedom and tranquillity.

It is now time to emerge from regions of ignorance and barbarity, to the more enlightened realms of Europe; from nations tainted with the most horrid and cruel superstitions, to kingdoms where the gospel light prevents errors, checks criminal offences, meliorates each propensity to evil, and humanizes the rational soul; in fine, from savage countries, where despotism reigns triumphant, and tyranny shows its most ghastly features, to polished states; where,

if despotism dares appear, it is obliged to put on a placid countenance; and arbitrary power is under such limitations, as to be compelled to wear the most kindly smiles.

We shall, however, close this article, and our account of that quarter of the globe called Africa, with the following poetical lines, which are supposed to have been addressed by an African negro, (condemned to be burnt for attempting to regain his freedom after having been sold as a slave into one of the European settlements) to his wife, while he was fastened to the stake and ready for execution.

'Tis past:—Ah! calm thy cares to rest!
Firm and unmov'd am I:—
In freedom's cause I bar'd my breast,—
In freedom's cause I die.

Ah stop! thou dost me fatal wrong:—
Nature will yet rebel;
For I have lov'd thee very long,
And lov'd thee very well.

To native skies and peaceful bow'rs,
I soon shall wing my way;
Where joys shall lead the evening hours,
Unless too long thy stay.

O speed, fair sun! thy course divine;
My Ahala remove:—
Where thy bright beams shall ever shine,
And I for ever love!

On those blest shores—a slave no more!
In peaceful ease I'll stray:
Or route to chase the mountain boar,
As unconfin'd as day;

No Christian tyrant there is known
To mark his steps with blood,
Nor fable mis'try's piercing moan
Refounds thro' every wood!

Yet have I heard the melting tongue,
Have seen the falling tear;
Known the good heart by pity wrung,
Ah! that such hearts are rare!

Now, Christian, glut thy ravish'd eyes,
—I reach the joyful hour;
Now bid the scorching flames arise,
And these poor limbs devour!

But know, pale tyrant, 'tis not thine
Eternal war to wage;
The death thou giv'st shall but combine
To mock thy baill'd rage.

O death, how welcome to th' oppress'd!
'Thy kind embrace I crave;
'Thou bring'st to misery's bosom rest,
And FREEDOM TO THE SLAVE!

END OF THE FIRST VOLUME.
