"When children are thus indulged, we need not wonder, at an evening's frolic of some young students of William and Mary College, at Williamsburg, in Virginia. The particulars of that abominable transaction found their way into the public newspapers. The first intimation was in the Norfolk Herald, a paper of extensive circulation; and the perpetrators of the outrage were, soon after the publication, *proved* to be students of the college. I shall dismiss this unpleasant subject by adding a copy of the paragraph alluded to.

"Norfolk Herald, April 15, 1803.

"A gentleman of veracity, who has been lately at Williamsburg, informs us, that, on the 1st of April, some youths of that place perpetrated some of the most wicked acts that human imagination could invent. A party of them broke into the church, played on the organ for nearly two hours, and then went to the church-yard, dug up the body of a female that had been buried for many months, took it from the coffin, and placed it on the floor of an empty house, in a situation too shocking to describe! The coffin being found, led to the discovery. It surely could not be any of the students of William and Mary College; for it is impossible, one would imagine, that they would attempt so atrocious and villanous an act under the eyes of their preceptors. Certainly that college must be under better moral government; yet we are told that strong suspicions lurk toward that seminary. It is an old saying, 'Give a dog a bad name, and hang him,' it will therefore behove the governors of that institution, to endeavour, by all means, to discover the offenders, bring them to justice, and rescue the college from the reproach that will otherwise attach. It is the duty of all parents and guardians, that have youths educating there, to probe this matter to the quick; for if the rules and regulations at William and Mary cannot keep its students within the pale of decency, then education will rather be a curse than a blessing to them."

The same author makes the following remarks on the propensity of the Americans for drinking ardent spirits in the early part of the day:—

"I know of no custom more destructive than that which is practised by a numerous set of people in the southern states, called *slingers* and *eleveners*. The European learns with astonishment, that the first cravings of an American, in the morning, is for ardent spirits, mixed with sugar, mint, or some other hot herb; and which are called *slings*. A celebrated physician says, 'No kind of poison kills more than ardent spirits. Sometimes, by destroying the nervous energy, they put an end to life at once; but, in general, their effects are more slow, and in many respects similar to those of opium.'

"Such is the opinion of the faculty, with reference only to those who indulge with the bottle in the evening, or, at any rate, after a hearty dinner; a custom prevalent in Britain. But, if ardent spirits produce such dreadful effects in this case, how much more certain and speedy must they prove to those who swallow slings upon an empty stomach. Englishmen, in some measure, counteract these effects by laying a foundation for the spirits they take to work upon; but the Virginians, Carolinians, and Georgians, suffer it to prey upon their very vitals."

A second-rate consumer of distillations from the sugarcane, the grape, and the juniper-berry, is the *elevener*.—"Sometimes," says Mr. Janson, "I have found both these vile habits in one unfortunate fellow-creature; and to such admonitions are in vain. These eleveners are generally found strolling about the corners of streets, or other public places at eleven o'clock in the forenoon. After the common-place conversation, they adjourn, and take more spirits."

The horrid practice called *gouging* seems peculiar to the United States, and is thus described by the American geographer, Dr. Morse, under the head of North Carolina:—

"When two boxers are wearied out with fighting and bruising each other, they come, as it is called, to close quarters, and each endeavours to twist his fore-fingers in the ear-locks of his antagonist. When these are fast clenched, the thumbs are extended each way to the nose, and the eyes gently turned out of the sockets. The victor, for his expertness, receives shouts of applause from the sportive throng, while his poor eyeless antagonist is laughed at for his misfortune."

"It is in vain," says Mr. Janson, "for later authors to gloss over this subject; to pretend that the custom was once practised in America; or that such was the revenge which once prevailed in the breast of civilized man. It is my avowed purpose to paint 'the manners living as they rise'; and upon this point, with pain am I compelled to declare, that this more than savage custom is daily prac-

tised among the lower classes in the southern states. I shall relate a few recent instances of its existence, and an ocular demonstration of the horrors of its execution."

"Passing, in company with other travellers, through the state of Georgia, our attention was arrested by a gouging-match. We found the combatants, as Morse describes, fast clenched by the hair, and their thumbs endeavouring to force a passage into each other's eyes; while several of the bystanders were betting upon the first eye to be turned out of its socket. For some time the combatants avoided the thumb stroke with dexterity. At length they fell to the ground, and in an instant the uppermost sprung up with his antagonist's eye in his hand! The savage crowd applauded, while, sick with horror, we galloped away from the dreadful scene. The name of the sufferer was John Butler, a Carolinian, who, it seems, had been dared to the combat by a Georgian; and the first eye was for the honour of the state to which they respectively belonged."

It seems, however, that the eye is not the only feature which suffers on these occasions. Like dogs and bears, they use their teeth and feet, with the most savage ferocity, upon each other; as, during Mr. Janson's residence in North Carolina, Mr. Standen, the post-master, and a merchant of Edenton, had a part of his cheek bitten off in an affray with O'Mally, a tavern-keeper in that town.

"A brute, in human form," says our author, "in Bertie county, North Carolina, sharpens his teeth with a file, and boasts of his dependence upon them in fight. This monster will also exult in relating the account of the noses and ears he has bitten off, and the cheeks he has torn. A man of the name of Thomas Penrise, then living in Edenton, in the same state, attempting at cards to cheat some half-drunken sailors, was detected. A scuffle ensued; Penrise knocked out the candle, then gouged out three eyes, bit off an ear, tore a few cheeks, and made good his retreat. Near the same place, a schoolmaster, named Jarvis Lucas, was beset by three men, one Horton, his son, and the son-in-law. These ruffians beat the unfortunate man till his life was despaired of, having bitten, gouged, and kicked him, unmercifully. On the trial of an indictment for this outrageous assault, a Carolina court of justice amerced them in a small fine only."

"Another bestial mode of assault, used by men in North Carolina, is properly called *butting*. This attack is copied from the brute creation, and is executed nearly in the same manner as practised in battle between bulls, rams, and goats. A traveller has endeavoured to confine butting to the negroes; but he must excuse my implicating the white men in this brutal act. That the reader may become a little familiar with these Columbian accomplishments, I can assure him, that disputes, terminated in England by fair blows, are generally there maintained by

the practice of some, and often all, of these dreadful stratagems, should opportunity offer during the combat.

"An American pugilist is equally dexterous with his feet, which are used not only against his antagonist's shins, but are applied, with the utmost violence, against those parts which the contending beasts of the field never assail. Hence loss of eyes, mutilated noses, and indented cheeks, so frequently surprise and shock the traveller. A fellow, named Michie, in my presence, boasted, 'that he could kick any man, six feet high, under the chin, and break his jaws.'

"The lower class," continues Mr. Janson, "in this gouging, biting, kicking, country, are the most abject that, perhaps, ever peopled a Christian land. They live in the woods and deserts, and many of them cultivate no more land than will raise them corn and cabbages, which, with fish, and occasionally a piece of pickled pork or bacon, are their constant food. This land, on which, prior to their settlement, no human step had ever marked a path, required clearing of trees, whose tops almost reached the clouds, before a spot could be found large enough to erect a shelter for the women and children. Their habitations are more wretched than can be conceived; the huts of the poor of Ireland, or even the meanest Indian wigwam, displaying more ingenuity and greater industry. They are constructed of pine-trees, cut in lengths of ten or fifteen feet, and piled up in a square, without any other workmanship than a notch at the end of each log, to keep them in contact. When this barbarous pile is raised between six and seven feet, they split the remainder of their logs to the thickness of two or three inches, and, by laying them over the whole in a sloping direction, form the roof. The chimney is, if possible, worse than Dr. Johnson describes the hole in the roof of a house in Scotland, through which the smoke found a passage. The summer's scorching sun, and the bleak winds of winter, are equally accessible to this miserable dwelling: The interstices between the logs are often left open to the elements, and are large enough to give admission to vermin and reptiles, which abound in this part of the world.

"Amidst these accumulated miseries, the inhabitants of log-houses are extremely tenacious of the rights and liberties of republicanism. They consider themselves on an equal footing with the best educated people of the country, and, upon the principles of equality, they intrude themselves into every company."

The general conduct of the free Americans towards their slaves is too interesting to be passed over in silence, as it affords a remarkable illustration of the national character.

As the state of South Carolina produces abundance of rice, tobacco, cotton, and indigo, most of which articles are exported, it contains more slaves than any other part

of the United States. It is, indeed, the only one in which the shameful traffic is carried on, as the port of Charleston is, perhaps, a greater slave-market than any in the West-Indies.

"The richest planters in the United States," says Mr. Janson, "are to be found in South Carolina, some drawing a yearly revenue from the labour of their slaves to the amount of forty or fifty thousand dollars; and many enjoy an income of from twelve to twenty thousand from the same source. A planter in moderate circumstances is in the receipt of from three to six thousand; while others, so capricious is fortune, drag on a miserable existence, with large families, on the wretched pittance of eighty or one hundred dollars a year.

"The best lands are the tide-swamps, where cotton and rice are grown, and which, in high cultivation, have sold as high as one hundred and seventy dollars per acre; an enormous price, when it is remembered that land, capable of producing corn, may be had, and in good situations too, from five to fifteen dollars; while uncleared land, that is, land in its original state, inhabited by the beasts of the forests alone, is selling at one-third of the last-mentioned price. The value, in short, rises as the land is cleared; while in England we estimate our estates in proportion to the quantity of timber upon them. In general, the tide-swamps command seventy to one hundred, inland swamps twenty to fifty; while such as bear corn, sweet potatoes, &c. fetch from six to forty dollars, and high uncleared land from one to six dollars per acre, in South Carolina.

"The buildings on the plantations are in proportion to the value of the latter, from the cost of thirty thousand dollars to a miserable log-house. The best houses consist, generally, of not more than a ground-floor, with bed-chambers above; and many of them of a ground-floor only; but, in this case, they cover a considerable space. At the south-front it is an invariable rule to attach a piazza, which impedes the extreme heat of the sun from penetrating into the sitting and lodging-rooms; and in the evening it affords an agreeable walk. The kitchens and out-offices are always at the distance of several yards from the principal dwelling. This is done as well to guard against the house-negroes through carelessness setting the houses on fire, for they generally sit over it half the night, as to keep out their noise. Negroes are great and loud talkers; and in this warm climate, having wood for the trouble of fetching it, they often sit up, after their work is done, over a large fire, in the summer, when I could scarcely endure the excessive heat of the night in the open air. The masters here, as in the other southern states, regard their slaves as English farmers do their live-stock. The men are valued, like horses, for their superior properties; the females for their fertility. An infant slave is generally valued at a year's service of the mother; and, as

she is compelled to breeding and maintenance, the mode of enhancing her value.

"The swamps, where the negroes cannot be employed, are the sun's meridian, waist in water, with stagnant pools, support himself here. If he toils all day long in the ground; while in a few days, he is afflicted with savagery of a cruel over the natural brute, the der of a slave is and, if wilfully malicious afore-thought, in fact, the sang looked into.

"When we consider the wretched negroes, the astonishment that regaining that life, unjustly deprived a few months ago, negroes to cut off superintended the offence, and convey honour to him a law with respect a crime. The negro

"An opportunity which gave me negroes in North boat to convey me Pamlico Sound; the appearance of an proposed to make observed led to Blount, of New with the overseer, who proved favorable summer-gusts, was so sudden, as to be handed. From cut to the quarters, communicate with of transporting to a sea-port. I there a gang of

she is compelled to work three-parts of the time she is breeding and nursing, planters are very attentive to this mode of enhancing the value of their estates.

"The swamps and low lands are so unhealthy, that they cannot be cultivated by white persons. Here, however, the negro is compelled to work, uncovered, through the sun's meridian heat, and till evening, often up to his waist in water, for these lands are generally overflowed with stagnant pools, while his pampered master can barely support himself in the shade in such a relaxing atmosphere. If he be employed in the rice-grounds, he must toil all day long in soft mud, ditching and draining the ground; while to a white person such an occupation would, in a few days, prove certain death. Punishments are inflicted with savage ferocity, and frequently at the caprice of a cruel overseer. What else can be expected from the natural brutality of man, in a country where the murder of a slave is only punished by a fine of fifty pounds; and, if wilfully perpetrated, or, as the law terms it, 'with malice afore-thought,' then the fine is only doubled; but, in fact, the sanguinary deed, when committed, is seldom looked into.

"When we contemplate the cruel treatment, which the wretched negroes so often receive, it cannot be matter of astonishment that they should pant for an opportunity of regaining that liberty, of which they have, in general, been unjustly deprived. A white man, a monster in human shape, a few months ago, at Charlestown, compelled one of his negroes to cut off the head of another, while the master *superintended* the horrid deed! He was tried for the offence, and convicted. The judge, in a speech, which did honour to him as a man, lamented the inefficacy of the law with respect to the punishments apportioned to such a crime. The murderer was fined, and then liberated.

"An opportunity once offered," says Mr. Janson, "which gave me full demonstration of the treatment of negroes in North Carolina. I had hired a small sailing-boat to convey me from the island of Mattamuskeet, on Pamlico Sound; the wind proving adverse, with the appearance of an approaching summer-squall, the boatman proposed to make a harbour in a small creek, which he observed led to a new negro-quarter, belonging to Mr. Blount, of Newburn; adding that, as he was acquainted with the overseer, I might there find shelter till the weather proved favourable. This I gladly agreed to, as these summer-gusts, which they call 'white squalls,' are often so sudden, as to upset a vessel before the sails can be handed. From the head of the creek a canal had been cut to the quarter, and from thence it was intended to communicate with Great Alligator River, for the purpose of transporting lumber, with which the country abounds, to a sea-port. For this purpose, Mr. Blount had placed there a gang of about sixty negroes, whose daily work

was in water, often up to the middle, and constantly knee-deep. The overseer was a man of some information, and he gave us a hearty welcome to the log-house, which was a few hundred yards from the huts of the slaves. He said that no human foot had trod upon the spot till his arrival with the negroes, who had penetrated about a mile into the forest with the canal, through the haunts of wild beasts. There was an unusual number of children, in proportion to the working-slaves; and, on my noticing this circumstance, the overseer replied, that but few of them belonged to the gang, being sent thither 'to be raised in safety.' From the situation of the place, there was no chance of their escaping; and, being fed at a very small expence, and suffered to run wild and entirely naked, he observed, that their increased value, when the canal was finished, would nearly defray the expence attending it. An infant slave, when born, is computed to be worth thirty or forty dollars, of course every year increases his value; and a stout 'field-fellow' is worth three or four hundred dollars; a 'field-wench' a fourth part less. He had already been two years in this desolate place, and calculated upon remaining there three more before the canal would be finished.

"The day of our arrival happened to be on Saturday, when the week's allowance is given out. This consisted of salt herrings, of an inferior quality, and a peck of Indian corn in the cob, to each, the grinding of which occupied the remainder of the day. Such was the daily food, without variation, of these wretched people, and even of this the allowance was very scanty. No such luxury as salt pork or beef had they been indulged with for many months; and the overseer observed, with perfect indifference, that he did not expect any fresh supplies for some time after what was brought them should be consumed. A few barrels were at first allowed, by way of reconciling them to the place; and so accustomed were they to drag on this miserable existence, that I observed no repining, each receiving his pittance without a murmur. The overseer, however, took special care of himself. His residence was surrounded with turkeys and fowls, and his cupboard was supplied with excellent bacon. These provisions were set before us, together with a bottle of brandy. During our repast we were attended by a stout negro-boy, entirely naked, whom the overseer had selected to be about his person. The poor fellow's attention was so rivetted on the victuals, that he blundered over his employment in a manner that extorted a threat of punishment from his master, who would not attribute his momentary absence of mind to the cause from which it sprung. As soon as an opportunity offered, after dinner, I cut off, unobserved, a piece of bacon, and gave it to the boy, who snatched at it in an ecstasy, and instantly ran off to the negro-huts. On his return, I questioned him what he had done with

it; when the grateful and affectionate creature replied, that he had given the morsel to his poor mother, who was sick, and could not eat her herrings. Hear this, ye pampered slave-holders! contemplate the virtues of this boy; and, while you teach your own offspring to follow his example, treat his unfortunate race as human beings!

"The day proving boisterous, we remained all night with the overseer. He described, with much apparent satisfaction, the means he employed to keep his gang in subjection, and the different modes of punishment which from time to time he inflicted on them. Some months ago, it appeared, that he missed some of his fowls; and, being convinced they had been stolen by the slaves, he ordered them all into his presence, charged them with the robbery, and ordered them to point out the perpetrator. This not producing the desired effect, he threatened to flog them all, observing, that by so doing he should get hold of the thief without confession; and he actually put his threat into instant execution. The job, he continued, occupied the whole day, as he took his leisure, that it might be complete, and serve as a warning in future. Thus suffered the whole of these innocent miserable people, by way of punishing one, who might have been guilty.

"The first week in the year, in this land of slavery, is a kind of fair for the disposal of negroes, some for life, and others for a limited time, by public auction, the sheriff of the county generally acting as auctioneer. Here is often exhibited a spectacle which would soften the most obdurate heart that had never participated in the horrid traffic. At these times slave-dealers attend from a distant part of the country, making a trade of their fellow-men. Husbands for ever separated from their wives; mothers torn from their children; brothers and sisters exchanging a last embrace, are subjects of mirth to the surrounding crowd of bidders. Often have I witnessed negroes dragged, without regard to age or sex, to the public whipping-post, or tied up to the limb of a tree, at the will of the owner, and flogged without pity or remorse, till the ground beneath was dyed with the blood of the miserable sufferer. These punishments are often inflicted for an unguarded expression of the slave, while groaning under an oppressive task, for neglecting to do homage as his master passes by, and too often to indulge private resentment or caprice. Sometimes they are fastened on a barrel, the hands and feet, nearly meeting round it, are tied together; thus the breech is presented, and in this position they endure their torments. Shocking cruelties of this nature have been practised, even in the more enlightened state of New York.

"An account of some of these barbarities appeared in the New York newspapers, so late as the year 1805. They related the circumstance of a female slave, the prop-

erty of a fellow at Brocklyne, on Long Island, coming to a house in Pearl-street, New York, to beg for food. She was observed to exhibit symptoms of much pain, and to have something concealed under a handkerchief, which she held to the side of her head. On an examination of the circumstance, it was found that, amongst other diabolical modes of punishment and torture, her owner had gratified his brutality by hacking off a piece of one of her ears, and cutting a gash in the other, through which he suspended a large iron padlock. In this situation the unfortunate girl was left, and thus she had crossed the ferry, and wandered through the streets of New York, begging a morsel of bread."

From the contemplation of these wanton and inhuman cruelties, of which innumerable instances are upon record, we shall turn to the relation of a few rigid punishments which the white *freemen* choose to inflict, when for any serious offence they presume to become the *judges* of their slaves.

"In the district of Chowan," observes Mr. Janson, "in North Carolina, a negro man-slave, in the absence of his master and mistress, knocked at their door, and demanded admission. The parents having gone on a visit to their friends a few miles distant, had left their daughter at home; who, having before received improper conversation from the fellow, and fearing to inform her father, apprehensive of the dreadful punishment he would inflict on him for his presumption, refused to open it: the negro persisted, and finally broke it open. After accomplishing his purpose, he fled to the woods; and the object of his brutality, exhausted with resistance, lay helpless till the return of her parents. The distracted father fled to his neighbours, and related the horrid circumstance. The inhabitants quickly mustered, and went in pursuit of the aggressor. After a long search, he was discovered; when the enraged pursuers tied him to a tree, collected wood around him, and immediately consumed his body to ashes."

The following anecdote was related to our author by Doctor Frederic Ramcke, of Edenton:—

"Calling on a wealthy planter, whose family he had long attended as a physician, but whose name, though then repeated, I have now forgotten, he observed, that he had a dangerous negro fellow, who had made some attempts on his white female neighbours, and who had been heard to assert, that he never would cohabit with those of his own colour, if he could, by any means, possess a white woman. The whole of the planter's conversation, while they drank a glass of grog together, turned on this subject, and he concluded by swearing, that he would give him up to the white men, unless he, the doctor, would cure him of this propensity. Speaking in plain terms, he entreated the doctor to perform an

operation which he hesitated;—the doctor treated—and with great demerit, which

"The planter and at the same time already privy to the where the doctor the slave; and the rushed into the room who conceived the ordinary punishment. The doctor, in a and the negro was ment due for his

"The only cou them are in the sam turn to their nativ

operation which would answer his purpose. The doctor hesitated;—the planter offered an hundred dollars—entreated—and was violent. The doctor demanded an indemnity, which was immediately given.

"The planter now ordered the slave into his presence; and at the same time directed his overseer, a white man, already privy to his crimes, to attend. When in the room where the doctor sat, the planter tripped up the heels of the slave; and this being the signal for the overseer, he rushed into the room, and assisted in binding the prisoner, who conceived that he was on the point of receiving an ordinary punishment, which he was conscious of meriting. The doctor, in a few minutes, performed the operation, and the negro was told, that he had received the punishment due for his insults to white women.

"About three months afterwards, as the doctor was going to visit a patient, on the road near the dwelling of the planter, the emasculated slave suddenly appeared before him. We may conclude, that no pleasant sensations pervaded the mind of the operator, for the fellow had on his shoulder a wood-cutter's axe. To turn back, or to risk a meeting, was the question. The doctor checked his horse, to view the physiognomy of the negro, and, finding it tolerably gentle, he boldly enquired after his health, though at a cautious distance. The slave replied, 'Tank ye, massa doctor, you did a me much great good; white or blackee woman I care not for.' This expression, the doctor said, was more acceptable at the moment than the planter's offered fee of a hundred dollars would have proved at any period of his life."

As many erroneous ideas have been formed on the subject of *emigration* to the United States, we conceive we shall perform an important duty by laying the following particulars before our readers:—

"I take up my pen," says Mr. Parkinson, "to write the following pages, free from all unfounded prejudices against America; but at the request of a great number of persons there, who, from different parts of the United Kingdom, and particularly England, have emigrated with the intention of purchasing lands in that country. The great advantages held out by the different authors, and men travelling from America with commissions to sell land, have deluded persons of all denominations, with an idea of becoming land-owners and independent. They have, however, been most lamentably disappointed, particularly the farmers, and all those who have purchased land; for, notwithstanding the low price at which the American lands are sold, the poverty of the soil is such, as to make it not pay for labour; therefore, the greater part have brought themselves and their families to total ruin.

"The only consolation they enjoy is, that all around them are in the same situation; and that, were they to return to their native country in that reduced state, they

would not only be the scoff of their former acquaintance, but feel themselves uncomfortable by not having it in their power to enjoy such ease as they had been brought up to. But the working-men that have emigrated have it not in their power to get back; for, if they have not money to pay their passage, the captains of ships will not bring them from America on the terms on which they are taken, because there is no one ready to pay their passage on this side. To explain this: On their first arrival in America, there are men ready to buy them as slaves for a certain time; and, as these people will want clothing, not having the means to purchase it during their stated time of servitude, they are compelled to get the money of their masters, and that keeps them in the same state the greater part of their life."

As we are aware that some of these assertions may be doubted, we shall quote, in confirmation of them, the following passages from *Priest's Travels*, published, by Johnson, in 1802.

"Philadelphia, September 13, 1796.

"I write this in my way to Boston, where I am going to fulfil my engagement with W——, the particulars of which I informed you of in a former letter. When I arrived at Newcastle, I had the mortification to find upwards of one hundred Irish passengers on board the packet.

"For some time before I left Baltimore, our papers were full of a shocking transaction, which took place on board an Irish passenger ship, containing upwards of three hundred. It is said that, owing to the cruel usage they received from the captain, such as being put on a very scanty allowance of water and provision, a contagious disorder broke out on board, which carried off great numbers; and, to add to their distress, when arrived in the Delaware, they were obliged to perform quarantine, which for some days was equally fatal.

"The disorder was finally got under by the physicians belonging to the Health Office. We had several of the survivors on board, who confirmed all I heard; indeed, their emaciated appearance was a sufficient testimony of what they had suffered. They assured me, the captain sold the ship's water by the pint, and informed me of a number of shocking circumstances, which I will not wound your feelings by relating.

"As the manner of carrying on this *trade* in human flesh is not generally known in England, I send you a few particulars of what is here emphatically called a *white Guinea man*. There are vessels in the trade of Belfast, Londonderry, Amsterdam, Hamburg, &c. whose chief cargoes, on their return to America, are passengers; great numbers of whom, on their arrival, are sold for a term of years, to pay their passage: during their servitude they

are liable to be *re-sold*, at the death or caprice of their masters.

"The laws respecting the *redemptioners*, or people who redeem the emigrants, are very severe: they were formed for the English convicts before the revolution. There are lately Hibernian and German societies, who do all in their power to ameliorate the severity of these laws, and render their countrymen, during their servitude, as comfortable as possible. These societies are in all the large towns south of Connecticut. In New England they are not wanting, as the trade is there prohibited. The difficulty of hiring a tolerable servant induces many to deal in this way. Our friend S. lately bought an Irish girl for three years, and in a few days discovered he was likely to have a greater increase of his family than he bargained for. We had the laugh sadly against him on this occasion: I sincerely believe the Jew regrets his new purchase is not a few shades darker. If he could prove her a woman of colour, and produce a bill of sale, he would make a slave of the child as well as the mother. The emigration from Ireland has been this year very great; I left a large vessel full of passengers from thence at Baltimore: I found three at Newcastle, and there is one in this city. The number of passengers cannot be averaged at less than two hundred and fifty to each vessel, all of whom have arrived within the last six weeks!

"While the yellow fever was raging in this city, in the year 1793, when few vessels would venture nearer than Fort Melling, a German captain, in this trade, arrived in the river, and hearing that such was the fatal nature of the infection, that a sufficient number of nurses could not be procured to attend the sick, for any sum, conceived the philanthropic idea of supplying this deficiency from his redemption-passengers! Actuated by this humane motive, he sailed boldly up the river, and advertised his cargo for sale."

"With regard," says Mr. Parkinson, "to the liberty and equality expected by some who emigrate from these kingdoms to America, they will find that not very pleasant. There is no Englishman who does not think himself above a negro; but, when he comes there, he will have to eat, drink, and sleep, with the negro-slaves. Hence it is that stories are told of the servants in America wanting to eat and drink in the dining-room with their masters. As the master cannot keep three tables, the white servant thinks himself, from the boast of the American liberty and equality, more on an equality with the master than with the negro; and as the negro is under no greater subordination than to acknowledge the man he works for as master; the white man, if he be not a slave, to cause a distinction, will not call him master: therefore, among the white men in America, they are Mr. and Sir; so that, in conversation, you cannot discover which is the master or which

is the man. It is the same with the white women: they are all Madam and Miss. If you call at the door of any man, and ask the servant, if his master is at home, he will say, 'Master! I have no master: do you want Mr. Such-a-one?' that is, the man he serves: and, if you want a man that is a white servant, the master calls him in the same manner.

"Now this sits so uneasy on an English servant, that, by being called Mr. and Sir, he soon becomes the greatest puppy imaginable, and much unpleasant even than the negro. Then, as all men imitate their superiors in pride and consequence, when the negroes meet together, they are all Mr. and Madam among themselves. It is the same with respect to the manner of wearing their hair; almost every one, child or man, has his hair tied. The negro the same; but, as the hair of the negro is short, it is customary to hang lead to it during the week, that it may have length enough to tie on the Sunday."

Mr. Parkinson assures us, that he had *four servants*, in his house at Baltimore, and was not only obliged to clean his own shoes, but his wife and family have risen to milk the cows, while his dependents were in bed. "The idea of liberty and equality," says he, "destroys all rights of the master, and every man does as he likes. Even taking fruit out of your garden or orchard is not looked upon as a theft; nor riding your horse a few miles without leave, if he be only brought back to you again, and particularly if the man that rode him should say he knew you did not want him. It is very unpopular to look upon these things as a crime; and your only way is, to say he is welcome, or have his anger and the whole country about you.

"If a white servant be sent on an errand to a neighbour's house, he will go in with his hat on, and, perhaps, sit down with as much freedom as though he was in his own or his master's house. It is very common, if you step out of your house into the garden, to find a man of any description, black or white, when you come in, to have lighted his pipe, and sitting down in a chair, smoking, without apology, with as much composure as though he were a lodger in the house: and any man that obstructs these liberties is looked upon as a bad subject, an enemy to the rights of man, and an infringer of the rights which the Americans and their fathers have fought for.

"It is not uncommon to take hay or corn out of your fields, for the waggoner's horses or himself to eat; viz. roasting ears of Indian corn. I was in company one evening where a lady was speaking highly of the apples grown in America: she mentioned the captain of a ship to have given them to her. I took the liberty of asking her what they cost? She said, 'O! the captain took them out of an orchard: they cost nothing.' By this method he would take the best; and you, as the proprietor, have

the worst fruit to be taken from you.

"In the difference of these unpleasant men who put in America, are frequently hired by Americans to bring over such as they may buy there is an absolute slavery or punishment for coming to the country, when they take up lands at some future time, or hire-wives, to plead for their money raised from a man who is the proprietor of any money to supply.

"It is precisely the circumstances from manner purchased a particular instance of property, which great distress, by the aid of an American, a free passage voyage, the captain of the passage. The whom I have been ready money for repay those gentlemen. The father pointed in the great captain, proved was, therefore, white as the negroes. This punishment, the gentlemen chose to give to work out the slavery."

"Now I only point out such favourable inducement, which for it cannot be such passage and provision: but the fact is, and, on the other hand, from passengers to these three men, I better characters on the old Dutch into such a situation and the gentlemen

the worst fruit to use yourself: and the whole of the best is taken from you by similar interlopers.

"In the different publications which I have seen, some of these unpleasanties are forgotten. But the fact is, that the men who publish those favourable accounts of America, are frequently emigrants from this country, who are hired by Americans to contract with captains of ships to bring over such as are unable to pay their passage, that they may buy them when they arrive in America; which is an absolute slave-trade, and much worse than the punishment for convicts. The same sort of men in that country, when they are in the greatest distress there, buy or take up lands in the back countries, to pay the money at some future time; and then either come here themselves, or hire what may fairly be termed their counsellors to plead for them; these agents to be paid out of the money raised from the emigrants' pockets, as neither the man who is the pretended land-owner nor his agent have any money to support themselves.

"It is precisely the same with emigrants in similar circumstances from other countries; who are in the same manner purchased and treated as slaves. I will mention a particular instance. A Dutchman, who had lost all his property, which was considerable, and was reduced to great distress, by the war with France, met with the captain of an American ship, who offered him and his two sons a free passage into America; but, at the end of the voyage, the captain offered them all for sale, to pay for the passage. They were bought by Messrs. Ricketts, whom I have before mentioned; who paid the captain ready money for them; and the three emigrants had to repay those gentlemen by labour for a certain number of years. The father, finding himself so wonderfully disappointed in the great expectations held out to him by the captain, proved very obstinate, and would not work; and was, therefore, whipped with a cow-hide, in the same way as the negroes. The old man, nevertheless, in spite of this punishment, still persisting in his obstinacy, the gentlemen chose to give him his liberty, and kept the two boys to work out the sum.

"Now I only blame the captains of ships for holding out such favourable prospects to the emigrants as an inducement, which they know at the same time to be false; for it cannot be supposed that those captains can give them passage and provisions without repayment in some way or other: but the fact is, that they do this by way of profit; and, on the other side the water, they get the same sum as from passengers to this. As to the gentlemen who bought these three men, I can say, from my own knowledge, that better characters cannot exist: the blame, in this case, lay on the old Dutchman, who, when he had brought himself into such a situation, ought with temper to have done his best, and the gentlemen would have treated him with kindness.

"Perhaps, from my observations, it may be here said, that I have been disappointed, and am a prejudiced man. No: I am not. I never had half the condensation shewn me in the same time in England by gentlemen of superior rank to myself as I have had in America; and I solemnly affirm, it was painful to me to leave so respectable acquaintance: but, farming being my sole object, I found the climate and soil there to be of such a nature as to put it out of the power of man to enrich the land without such enormous expence, as (if he had no other means than what the produce of the land would afford) must ruin any one.

"To shew this is true, I will give an example in the speculations of the well-known Messrs. Morris, Nicholson, and Greenleaf. Mr. Morris had so much credit as a banker during the American war, that his notes were current, when those of the United States would not be taken either in their country or abroad. When the war was over, Mr. Morris, not knowing what to do with his money, speculated largely in lands, and took these other two gentlemen as partners. They are broke, have all been in prison, and Mr. Morris must probably die there.

"When I was in America, I was requested, by all the Englishmen whom I knew, to make these facts public at my return. I never met an Englishman in that country, of whatever rank in life he might be, that liked it, but wished himself at home again: but his general acknowledgment was, he had spent his money, and was either unable to get back, or ashamed to return, having so much reduced his circumstances as to be dismayed to see his old friends. And I think it a duty incumbent on me to declare this to my countrymen, that, if they will go, they may go with their eyes open. I have, when in America, discovered my intentions to one American gentleman of rank and fortune, who, perhaps, is one of the best men existing, and one of my most intimate friends. He approved of my design; saying, the delusions carried on were improper; and that the industrious emigrant, finding himself so deceived and disappointed when he arrived in America, is so much disgusted as to brand the whole of the people with being a set of rascals altogether."

The following remarks of Mr. P. on American education are worthy of notice:—

"The education of children is both expensive and difficult to be acquired at any price out of towns and cities. Education and clothing will cost in the proportion of from five to one in England. When I first got to America, in travelling from Baltimore to Annapolis, I called at a tavern to feed my horse. I was ushered into a room where there were several young gentlemen; and they were swearing, and making use of such language as I had never before heard from young men of their appearance. I walked out, and asked who they were. The waiter told me they

were a set of young gentlemen going to college at Annapolis. I went into the room, and sat there while my horse was eating his corn, and I never saw greater confusion: they put into their pockets sugar, preserves, or any other thing they fancied. When the bill was brought in, they used every device to cheat the waiter. I thought they were going on in a way that would make them very complete for the character of the country.

"It is usual for men who have families of children, either to take into their houses teachers, or to subscribe a sum of money towards the building of a house for a teacher, according to the number of children of each person, and his ability. I have been applied to, to join an association of this kind; and the applicant for the office of tutor was generally an outlaw, a man from Ireland, as shabby in his appearance, and equally so in his manners, as you would find a bully in a house of bad fame in England. I have remonstrated with some of the better sort of people on the occasion: they for answer would say, 'What can we do?—these are the only men to be got.' To which I have replied, 'Children are better without instructors, than, from the employment of improper ones, probably, to render abortive every attempt of intellectual improvement.'

"I one day called on a gentleman at Shooter's-hill, near Alexandria; and when I was introduced to him, it was in a place at a distance from the house, in the garden, which he called his office. He was instructing his children. He requested me to dine with him; with which I complied: I spent the afternoon there, and was treated very genteely. He is a sensible well-informed man, and of an extensive property. His mother was an English woman, and a relation of Lord Hawke, in England. He told me he had been so troubled to get his children educated, that at last he had found more satisfaction in doing it himself than pursuing any other method. He told me his eldest son was at Annapolis College; and, when he came home in the holidays, his manners were such, that he was disagreeable to him: and as for the boys he had at home, he had an intention of sending them to England. Now, if a gentleman of such large property, and only one mile distant from the town of Alexandria, finds it so difficult to get his young family instructed, what can a man expect when he is situated some miles from a town, and even hard set to procure them food and clothing? which is the case with thousands in America. And, for want of the infant mind being properly impregnated with a sense of morality, the weeds of vice obstruct the growth of virtue; the youth becomes selfish, and either never knows, or forgets, the duty necessary to the parent; for although the latter pays the child the compliment of education for his own good, it is equally so for the parent's comfort: it excites and promotes those necessary sensibilities of af-

fection, which direct more effectually the duty of a child towards a parent, who naturally enjoys part of the blessing.

"I am persuaded that there are thousands of Americans who, for want of education and attending divine worship, think that man a fool who pays any attention to those duties, believing that cunning is the most necessary qualification for mankind to possess.

"I was invited to dine at a gentleman's house one day, where two of the judges were in company: there was one of them an elderly man, who had a family. When I went into the room, there were many gentlemen sitting round the fire, as it is customary in America to go early to the place where you are to dine, and drink apple-toddy, or spirits and water, before dinner. The conversation turned on some lady, who was very rich, but old and ugly; and the old judge was advising the young one to marry her. The young judge asked whether he would have him marry a woman so much older than himself, and ugly too? 'O!' exclaimed the old judge, 'I should not mind that: I would, after marriage, allow her a separate maintenance, and keep a nice girl.'

"I found afterwards that this old judge, when he was a young man, made a tour to England, and in London got into the company of a celebrated popular leader and his party. I suppose he was desirous of marrying some woman for money at that time. Mr. F—— and his party contrived to introduce to this young American a lady he had in keeping as his mistress, under the idea of her being a rich widow. This amorous hero was so fearful of missing the chance, that, having got the lady in the humour, he married her the next morning. But, as soon as he was sensible of his folly, he deserted her without ceremony, and returned home to his native country. His spouse, however, followed him thither. She still lives with him, and is highly esteemed as a dutiful affectionate wife, and tender mother, having now a very fine young family. Thus their acquaintance relate the story. Therefore it appears that an English kept-mistress makes an American gentleman a good wife. I imagine that the judge is inclined to impress strongly on the minds of his sons the policy of marrying rich women, which occasions such conversation in company; yet it must be particularly improper to come from the mouth of a judge: and, although the Americans deal so much in cunning, it appears they sometimes outwit themselves.

*Account of some Savage Nations.*] The following account of the savage nations who possessed the territory of the United States, is taken from an American publication, entitled, "A Sketch of the Geography of the United States," published at Philadelphia, in 1805.

"Beginning in the north-east, we first meet with the name of the *Tarranteens*, who resided on the River Kennebec, and other rivers in the district of Maine, and the

country east of it. These were called, by the French, Abenakis, and were always hostile to the English, having French missionaries early settled among them.

"The *Aberginians*, who resided round Massachusetts Bay. These were often attacked by the neighbouring Tarrenteens, and as often fled to the English for protection. The *Mohegins*, living between the Thames and Connecticut Rivers, and the higher branches of the former, who were generally friendly to the first settlers.

"The *Pequods*, settled on the sound between New London and Stonington, who were nearly exterminated in the war of 1637, four or five hundred being destroyed in one campaign.

"The *Narragansets*, who dwelt principally round the bay of the same name. This was a numerous tribe, and could furnish two thousand fighting men in 1675. They were the most ingenious savages in the eastern country: they made the neatest wampum, pendants, and bracelets, stone-pipes, and earthenware, which they disposed of to other Indians for furs and peltry; bartering the latter to the white inhabitants, for paints, rum, and baubles.

"The next to the Narragansets were the *Wamponoags*, whose sachem was *Mussasoi*, that gave his name to Massachusetts Bay, and had his principal seats at the towns now called Bristol and Middleburgh. It was Philip, the son of this chieftain, who waged a destructive and obstinate war against the English, in 1675, and at last fell in the contest.

"Besides these, there were many clans of less notoriety, in what are now called the New England States, all of whom are nearly extinct.

"To the southward of the Pequods there was another powerful nation, who were sovereigns of an extensive region, reaching from the Connecticut River to Chesapeake Bay, and as far westward as the Kittatany Mountains, comprehending all that part of New York that lies between the highlands and the ocean, New Jersey, Pennsylvania, and Delaware States. They called themselves *Linellinopes*; by the French they were termed *Les Loups*, and, by the English, *Delawares*. This confederacy comprised numerous subordinate clans, the principal of which were the *Chihocki*, who dwelt on the west side of the River Delaware; the *Wanami*, who ranged from the Raritan, in New Jersey, to the sea-coast; the *Manssies*, on the upper streams of the Delaware, down to the Lehigh; the *Wabingas*, or River Indians, who resided between the Delaware and Hudson, and from the Kittatany to the Raritan; and the *Mohickons*, or Manhattans, who occupied Staten Island, York Island, and part of Long Island, from the highlands to the ocean. These confederate tribes waged war for the greatest part of a century with the Iroquois, or five nations, but were at last subdued, and reduced to the most humiliating terms,

about the year 1682, the time when William Penn landed in Pennsylvania.

"The territory of Maryland was inhabited by the *Susquehannoes*, who were completely destroyed by the five nations; by the *Nanticoeks*, *Conoys*, *Tuteloeks*, and *Manakans*, most of whom united with the Iroquois in the subjugation of the Delawares.

"When the English made their first settlement in Virginia, in the year 1607, this country, from the sea-coast to the mountains, and from the Potowmac to the southern waters of James River, was occupied by forty different tribes of Indians. Of these the *Powhatans*, the *Mannohoes*, and the *Manakans*, were the most potent. The Powhatan confederacy claimed an extent of eight thousand square miles, and contained a population of eight thousand souls. These numerous tribes are nearly lost: of forty nations and upwards, there are hardly forty persons left to witness the effects of European civilization.

"To the south of James River, in Virginia, and in North Carolina, the most noted Indian tribes were the *Chowanoes*, with their allies, the *Nottaways* and *Meherins*, on the east; and the *Corcees*, *Tuscaroras*, and *Cherokees*, on the west. The Tuscaroras were a numerous and powerful nation; but, having engaged in a war with the white inhabitants, about the year 1712, were almost exterminated, a remnant of the tribe being obliged to move to the Ohio, where they afterwards united with the Iroquois, and became the sixth confederate nation.

"The most noted nations among the aborigines of South Carolina were the *Stonoos* and *Westoes*, the *Saramees*, *Apalaches*, *Congaroes*, *Esaws*, and *Yamassees*, on the east and in the centre, who are now either extinct or mingled with other tribes; and the *Catawbas*, *Creeks*, and *Cherokees*, on the west, who still retain their names and a portion of their ancient territories on the frontier of the state."

The various efforts to colonize this ample territory are not undeserving of particular attention. When Sir Walter Raleigh sent a small colony, in 1585, they landed in North Carolina; but the colony returned the following year, and no farther attempt was made, until the commencement of the reign of James I. After this, in 1606, Mr. Percy, brother of the Earl of Northumberland, proceeded with a small colony, and discovered the Powhatan, or James River. On the 26th of April, 1607, Captain Newport discovered the fine bay called Chesapeake, and gave the name of Cape Henry, probably in honour of Henry Prince of Wales, to the southern promontory. In the following year a small colony landed, and commenced a settlement on James River, at the place now called James Town, which proved the first permanent establishment of the English in America. This settlement consisted only of one hundred and four persons. In the same year

a small colony was fixed about nine or ten leagues to the southward of the mouth of Sagadahok River, and Quebec was likewise founded by the French.

In 1609, the celebrated Captain Smith sailed up several of the rivers, and explored some part of the interior country. In 1610, Lord Delawar was appointed governor of the British settlements, and his name was imparted to the commercial bay so called.

In 1614, Captain Smith, in a small boat, coasted from Pennopscot to Cape Code, and also drew a map of the country, under the denomination of New England.

The first town in this division was founded in 1620, and called Plymouth, and, in the following year, Massassoit, one of the most powerful Sagamors, or chiefs of the neighbouring savages, came, with sixty attendants, to visit the new settlement, and entered into an amicable treaty to avoid injuries, to punish offenders, and to restore stolen goods, with promises of mutual assistance in case of war. This treaty was faithfully observed for half a century, and the memory of Massassoit is still held in traditional veneration. In a war with a neighbouring tribe, called Narragansets, who gave their name to an adjacent bay, the English settlers successfully defended their new ally, and nine Sachems declared their attachment to England. In 1624, a bull and three heifers arrived from England, being the first cattle seen in this part of the world.

In the spring of 1630, a grand confederacy was entered into by the Savage tribes, particularly the Narragansets, to extirpate the English colony at Plymouth; but the plot was disclosed by a savage, and the English preparations effectually prevented the design. In 1643, the four colonies of Plymouth, Massachusetts, Connecticut, and New England, entered into a strict alliance, a congress being instituted, consisting of two commissioners from each colony, to be annually chosen, and considered as the representatives of the United Colonies of New England. Morse observes that the powers delegated to the commissioners were nearly the same as those vested in congress by the articles of confederation agreed upon by the United States in 1678; and this union subsisted, with some few

alterations, until the year 1686, when all the charters, except that of Connecticut, were annulled by a commission from James the Second.

The inland discoveries were far from extensive on the part of the English; but the French colonists at Quebec gradually advanced in their knowledge of the interior. Their national character or incensiousness also led the French to form intimate connections with the savage females, while the gravity of the English, probably aided by the puritanical maxims then prevalent among them, preserved their race unmixed.

After an interval of thirty years, Charles II. granted New Jersey to his brother the Duke of York. The Dutch had settled, at an early period, in the country since called New York and New Jersey. These Dutch possessions had always been viewed with a jealous eye by the English colonists, and when the disputes arose with Holland, Charles II. embraced the opportunity of transferring the territory to his brother, the Duke of York. In 1664, Carr was sent with three thousand men to take possession, when most of the inhabitants accepted the oath of allegiance. New Amsterdam was found to be neatly built, the houses being of stone and brick, and covered, in the Dutch taste, with a mixture of red and black tiles. The name of New York was given to the town, and afterwards extended over the country, while Fort Orange received the new appellation of Albany. The boundaries of this region in the Dutch charter were, Maryland on the south, lands belonging to the savages on the west, the French colonies on the north, and New England on the east. A part of it was ceded by the Duke of York to subaltern proprietors, who called it New Jersey. The subsequent settlements of Pennsylvania and South Carolina still further enlarged the bounds of accurate knowledge; but an acquaintance with the real state and natural history of the country was not accomplished till the end of the last and the beginning of the present century.

The *political history* of the United States is blended with that of England; to which the reader is referred for information.

## CHAPTER V.

## SPANISH DOMINIONS IN NORTH-AMERICA.

**T**HE best account of the Spanish dominions in North-America is contained in a work scarcely known in England, and called *El Viagero Universal*, or The Universal Traveller; which occupies the greater part of two volumes, printed at Madrid in 1799. From this source we shall lay before our readers some important intelligence; to which we shall add some valuable extracts from the journey of M. Thierry de Menonville to Oaxaca, in 1777; from the dictionary of Alcedo, published at Madrid, in 1786; and from the papers of M. Humboldt, whose recent travels in America have excited considerable interest throughout Europe.

*Extent and Boundaries.*] In estimating the extent of these large and flourishing possessions, it is necessary to consider the boundaries. That towards the south-east is the eastern boundary of Veragua, the last province of North-America; consisting of a ridge called Sierras de Canatagua. Towards the north, the Spaniards do not readily assent to a boundary, but claim the whole north-west of America, pretending a prior right of discovery to the English, or any other nation: they appoint a governor of New California, by which name they imply all the north-west coast of America. Within land the boundaries of Louisiana, formerly possessed by Spain, ascended to the Turtle Lake, one of the sources of the Mississippi; but since that province has been acquired by the United States, the Spanish possessions terminate on the western coast, where the English claim the port of Sir Francis Drake, and mark the Spanish boundary at Cape Mendocino. The sources of the Rio Bravo, however, may be assumed as a medial boundary, as there are several small Spanish settlements to the north of Santa Fé, in about latitude thirty-nine degrees thirty minutes, while the southern boundary is about latitude seven degrees thirty minutes; hence we have a length of thirty-two degrees, or one thousand nine hundred and twenty geographical miles. The breadth does not correspond to this prodigious length of territory; though in one place, from the Atlantic shore of East Florida to that of California on the Pacific, it amounts to about three-quarters of that length; while the narrowest part of the isthmus, in Veragua, is not above twenty-five British miles: in general, the medial breadth can scarcely be computed at more than four hundred geographical miles.

*Divisions.*] In North-America, the Spanish dominions are

divided into seven grand territories, or domains, generally called kingdoms by the Spanish authors. These are, ascending from the south to the north, 1, Guatemala; 2, Mexico, a name not restricted to the ancient kingdom, but embracing many extensive provinces to the north; 3, New Biscay; 4, New Leon; 5, New Mexico; 6, California; and, 7, Florida.

*Climate.*] The climate of this country is singularly diversified. Humidity predominates in the isthmus, but not so greatly as in the South-American province of Darien, where it rains for nine months of the year upon an average. Violent storms often occur; and sometimes, according to D'Auteroche, the lightning seems to rise from the ground. The maritime districts of Mexico are, however, so hot and unhealthy, as to occasion much perspiration even in January. The inland mountains, on the contrary, are sometimes partly covered with hoar-frost and ice in the dog-days; while in other inland provinces the climate is mild and salutary, with some slight falls of snow in winter: but no artificial warmth is found necessary, and animals remain all the year in the open air. There are heavy rains, generally after mid-day, from April till September; and hail-storms sometimes fall. Earthquakes and volcanos often terrify the inhabitants, and thunder is not unfrequent.

The height of the ground in this part of the world is a wonderful circumstance, and of course has a material effect upon the climate. Humboldt found that the vale of Mexico is about six thousand nine hundred and sixty feet above the level of the sea; and that even the inland plains are generally as high as Mount Vesuvius. These calculations were formerly applied only to mountains; and one of the new improvements of the science is their application to plains and valleys. In the parts to the north of Guadalaxara, where the high chain of Topia runs north from the neighbourhood of that city, for a space of one hundred and fifty leagues, or about six hundred English miles, as far as New Mexico, the rains continue the whole day, from June to September; and in the province of Tabasco the rains are perpetual for nine months of the year. The southern coasts are equally affected, and are subject to great meteorological varieties; but, on the whole, the climate must be regarded as healthy. The aborigines sometimes attain a great age; and grey hairs, baldness, or wrinkles, are unknown till a very late period of life.

*Face of the Country.*] The general appearance of these extensive regions is singular and diversified. When M. Thierry had passed the ridge of Orazava, proceeding towards the south, he found that nature assumed quite a new aspect. The vegetation was surprisingly beautiful. Geraniums, heliotropes, &c. appeared under the yuccas, a kind of aloes, thirty feet in height. The highways were bordered with hedges of the sensitive plant. Superb bigonias, with yellow flowers, from sixty to one hundred feet in height, were also common, while the sides of the hills were covered with a beautiful species of Indian fig-tree, forming a curious ornament to the landscape. From a trunk of fifteen or sixteen feet in height, and five or six in circumference, spring straight branches, which are crowned by a series of others, regularly diverging, so as sometimes to fill a circumference of forty or fifty feet in diameter, and equal height, thus resembling a large chandelier of a sea-green colour. The fruit, when ripe, discloses a crimson pulp; and is said to be wholesome. The pitahiaha, a smaller species of these plants, afford a delicious fruit, which is the common food of the Indians. Extensive ridges of mountains, numerous volcanos, some of them covered with perpetual snow, precipices and cataracts, delicious vales, fertile plains, picturesque lakes and rivers, romantic cities and villages, amidst an union of the trees and vegetables of Europe and America, contribute to diversify the face of this interesting country.

*Soil and Agriculture.*] The soil is, in general, a deep and fertile clay, which requires no manure, except irrigation. Though the population be extremely thin, yet agriculture has of late years made considerable progress. This progress may partly be judged from the state of the tithes, which, in the archbishopric of Mexico, for ten years, from 1769 to 1779, amounted to four millions one hundred and thirty-two thousand six hundred and thirty pesos, or dollars; while for the ten years, from 1779 to 1789, they rose to seven millions eighty-two thousand eight hundred and seventy-nine pesos; the difference being two millions nine hundred and fifty thousand two hundred and forty-nine pesos, or more than half of the former proceeds.

The chief agricultural product is indigo, of which there are annually exported one thousand five hundred arrobas, and about eight thousand quintals of pimento. The cultivation of sugar is considerably increased, and the augmentation of the price in Europe has augmented the trade. Tobacco is a most important branch. Cochineal is rather an article of horticulture, and requires considerable attention: the plant is a peculiar species of cactus, called nopál, and the insect is peculiar to the plant, being very small, and enveloped in a white flim; but, when crushed, the beautiful carmine appears. This plant, which is about eight feet in height, is propagated by branches. The in-

sect is dried before it becomes an article of commerce; and the annual exports are computed, by Estalla, at twenty-three thousand six hundred arrobas. By another computation, the quantity of cochineal exported to Spain is four hundred and sixty thousand pounds, costing in New Spain about twelve shillings a pound, but being worth at Cadiz about thirteen or fourteen shillings. The people employed in this culture are said to amount to between twenty-five and thirty thousand; and the value of the trade to the province of Oaxaca is reckoned at one million pesos.

*Rivers, Lakes, &c.*] The principal river of Spanish North-America is the Rio Bravo, or Del Norte. The course of this river is conjectured to be about one thousand British miles. Alcedo informs us, that it divides the province of Coaguila from that of Texas, which last is in fact a part of the ancient Louisiana. The source is supposed to be in about forty degrees of latitude. In 1779, the governor of New Mexico, D'Ansa, made an expedition against the savages, called Cumanches; and on the 23d of August was at thirty-eight degrees fifty minutes, when the savages informed him that the river rose fifteen leagues to the north-west, in the ridge called Grullas, which belongs to the easterly chain, in the neighbourhood of Santa Fé. The source, according to Antillón, is in a morass, which not only abounds in springs, but is fed by the constant dissolution of snow from adjacent volcanos. Between the Rio Bravo and the Mississippi the chief rivers are the Medina, the Magdalena, or River of Guadalupe, that of Flores, the Arcokisas, and Chicowansh.

Towards the west is a large river, the Colorado, which flows into the Gulf of California. The course of this river may be computed at six hundred British miles. The Rio Colorado, or Red River, is so called because the waters become of that colour, owing to the rains falling upon a soil of red clay: it is a deep and copious stream, capable of considerable navigation. The neighbouring savages, called Cocomaricopas, are dexterous in swimming across, holding in the left hand a piece of wood, which supports their arms or burden, and steering with the right, while the women, supported by a kind of petticoat of basket-work, upon which they place their children, pass in like manner. The course of the Colorado is generally from north-east to south-west, but sometimes west. It is joined from the east by a large river called Gila, which is, however, every where fordable.

The chief lake in Spanish North-America is that of Nicaragua, which is about one hundred and seventy British miles in length, and about half as much in breadth. It is situated in the province of the same name, towards the south of the isthmus, and has a great outlet, the River of St. Juan, to the Gulf of Mexico; while a smaller stream is supposed to flow into the Pacific. If the population

were more numerous, this lake supplied the Atlantic into the Gulf of Mexico, could be desired.

In the province of the lakes, well known ascending towards the north, that deserves attention, are about thirty miles from the coast, about fifteen miles from the coast, drained, so as to form a city, it is probable that the lake is not only containing the city of another Venice, waters, which are three or four other thirty miles from the River Panuco, while another is

#### Mountains.]

Spanish North-America in the neighbourhood of New Mexico, is about three hundred miles; while the height, as to be about one hundred and fifty feet above the sea. It is in most parts of a size and height, as to be about one hundred and fifty feet above the sea. On the summit of the mountain, the temperature of the air is about 50°. It gives rise to the clouds from June to September, of two or three feet high, called the Sierra Nevada. Towards the north, the mountains have not been precisely described. The west of Santa Fé is among its inhabitants, chain with that of the Ridge, of Alzate, America, sending to the Gulf of Mexico, the inferior ridge

On the east, the mountains, forming an intermediate chain, terminating in the Gulf of Mexico, it has been described by Estalla in three parts, forming

were more numerous and industrious, they might make this lake supply the long-wished-for passage from the Atlantic into the Pacific, and in the most direct course that could be desired.

In the province of Yucatan there are many considerable lakes, well known to the cutters of logwood; and, still ascending towards the north, that of Mexico is the first that deserves attention. The lakes of Tezcuco and Chalco are about thirty miles in length, while that of Tezcuco is about fifteen miles in breadth; but as the latter is partly drained, so as to be at the distance of a league from the city, it is probably about twelve miles in breadth. This lake is not only celebrated in history, as originally containing the city of Mexico, rising amidst the waters like another Venice, but is remarkable for the quality of the waters, which are partly salt and partly fresh. There are three or four other smaller lakes, at the distance of about thirty miles from the capital, one of which gives rise to the River Panuco, which falls into the Gulf of Mexico, while another is the source of the River Barnaja.

*Mountains.*] The principal chain of mountains in Spanish North-America is that of Topia, which, commencing in the neighbourhood of Guadalajara, extends north to New Mexico, a distance of more than seven hundred miles; while the breadth of all the ridges is sometimes one hundred and sixty miles. This chain is of such a height, as to be comparable with the Andes of Peru, and abounds with precipices of the most terrific appearance. It is in most parts covered with pines of an extraordinary size and height, and so thick as to exclude the rays of the sun. On the summit, the cold is intense; but the temperature of the sides varies according to their exposure. It gives rise to several rivers, which, during the rains, from June to September, inundate the country to the distance of two or three leagues. The ridge of Topia is also called the Sierra Madre, or mother-chain, and embraces the province of Nayarit, which remained pagan till 1718. Towards the north, the extent of the Sierra Madre has not been precisely determined; but the Moquis, on the west of Santa Fé, and under the same parallel, are classed among its inhabitants, and it is supposed to form one chain with that of Nabajo and the Sierra Azul, or Blue Ridge, of Alzate, and the stony mountains of north-west America, sending off a branch called Gemes, on the west of New Mexico, while on the east of that province is the inferior ridge of Namli.

On the east, there is also a considerable chain, supporting an intermediate table-land, on which are various rivers, terminating in lakes; but not having a general appellation, it has been slightly treated by the Spanish authors. Estalla informs us, that all the extensive territory contained between the Pacific and Atlantic, is divided into three parts, formed by two principal chains of mountains,

running from the south-east to the north-west. On the east of the oriental chain are the provinces of New Leon, Santander, Coaguila, and Texas, besides more southern districts on the Gulf of Mexico; and in the middle division, between the chains, are the provinces of New Biscay, as Tepeguana, Taramara, Topia, and Batopilas, as far as the garrison of the Paso del Norte, which stands in the south of New Mexico; while on the west of the Topian chain are the provinces of Culiacan, Cinaloa, Ostimuri, and Sonora, with Upper and Lower Pimeria, so called from the different elevation of the territory, thus confirming the idea that the western chain terminates in the neighbourhood of Guadalajara. According to this division, the oriental ridge begins in the vicinity of Mexico, farther to the south than that of Topia; and if either of the two chains could be connected with the Andes, it must be the oriental. At the distance of nine or ten leagues from Vera Cruz, M. Thierry says, he found himself in a plain, with the mountains of Alvorado south, Orizava west, and the Sierras Leones north-west, forming a natural barrier of one hundred and fifty leagues; and the eastern ridge seems, by his account, to form a barrier to the vale of Mexico. The other inferior chains are those of Tamalipa, Apanaca, which runs many leagues east and west, and the mountain of Canatagua, which divides Veragua from Panama. They may all be perceived by referring to the map.

The composition of the mountains of New Spain is but little known; but, according to M. Humboldt, they consist, for the most part, of argillaceous schistus.

*Volcanos.*] The volcanos of New Spain are very numerous. There are twenty-one from that of Soconusco, in the north, to that of Varu, in the south. They are all on the south-western coast, and, after a considerable interval, they again emerge towards the eastern coast, in the vicinity of Mexico. M. Humboldt has stated, that only a small number, and those little elevated, eject lava. He saw, at the volcano of Xorullo, a basaltic cone, which appeared above ground on the 13th September, 1759, and which is now one thousand four hundred and ninety-four feet above the surrounding plain. This volcano is in the province of Mechoacan, at the distance of eight leagues from Pasquaro, the capital, towards the south-west; the volcano of Colima being in the same direction, but at a greater distance. It first appeared on Michaelmas-day, 1759, with singular circumstances. A fertile vale, eight leagues in length and three in breadth, was called Xorullo by the Indians, a word, in their language, signifying Paradise: there was in it an opulent farm, belonging to Don Joseph Pimentel, which produced the best sugar of the whole viceroyalty, when, by the sudden eruption of the volcano, the whole was not only ruined, but the valley assumed a horrid aspect, being blackened with perpetual

since the conquest, and which is twenty-one yards and three-quarters in circumference.

*Animals.*] Among the various animals in this part of America, the most singular are the Mexican or hunch-back dog, and a kind of porcupine. What is called the tiger is a sort of panther, and sometimes grows to a great size. Clavigero says, that the largest quadruped is the dacta or tapir, which is about the size of a mule, and is amphibious. The bison is found in New Mexico; and in California there are said to be wild sheep.

The buffalo of North-America is here common, and valuable for its skin and flesh. In 1783, four or five were embarked at Vera Cruz, and brought to Cadiz. A female calved in Spain; but the climate did not agree with them.

A horse in New Spain commonly costs four dollars; but the horses are far from being well trained. The cavalry is mounted on geldings. Oxen are chiefly used for the plough; but the beef is bad, and left for the poor; while the rich eat mutton and veal. In the southern provinces are armadillos, many varieties of apes, and some beautiful birds and insects; among the latter there is a species of ant, which makes a kind of honey, so abundant as to be an article of commerce. Its form and all its habits are those of the common ant, but it is veined with grey and black. The singularity is, that in the spring the belly swells with honey to the size of a cherry; so that if from a common ant the belly be taken, and the other parts joined to a cherry, there will be a perfect resemblance of the insect. The honey is of the same taste as that of bees.

There are enormous snakes, which are said to attack men and animals by their breath. Fierce snakes are also kept in the fields of maize, where they destroy rats, moles, and insects. Numbers of a kind of wild geese frequent the lakes, and form a great article of consumption in the city. They are often taken, as in China, by Indians, who place calabashes on their heads, and seize the bird by the feet. The fish are few in number and variety.

*Minerals.*] The mineralogy of the Spanish empire in North-America is considered to be the most valuable in the world, as, in a much smaller extent, it produces superior wealth to that of all South-America. Silver forms the chief product; but in some spots gold is also abundant. Alcedo informs us, that during the war with the savages, which ended in 1771, rich mines of gold and silver were discovered in various parts of Sonora, particularly in the plain of Cuicguilla, where there were found lumps of gold, so huge as sometimes to weigh six pounds, at the depth of only two feet. Two thousand persons soon settled in the neighbourhood, and a general commandant of the province was named; it being regarded as one of the richest in the whole viceroyalty, as all the mountains

abound with silver and gold; but the incursions of enemies, the want of labourers, and the difficulty of procuring quicksilver, have concurred, with the abundance of mines near the capital, in causing these of Sonora to be neglected.

Till within the last fifty or sixty years, the richest silver-mines of Spain were those of Zacatecas, about two hundred British miles to the north-west of Mexico; but the minerals appear to have been chiefly smelted at St. Luis de Potosi, which had also rich mines in its neighbourhood, discovered soon after those of Potosi, in South-America, A.D. 1545, whence the name was transferred.

At present, the principal mines are at Guanajuato, considerably nearer the capital, being a distance of only one hundred miles, while it is about one hundred and forty to the east of Guadalajara, and about fifty to the north-west of the city of Queretaro. The mines in the vicinity of Guanajuato produce abundance of gold, silver, and copper, and are carried to a great depth. The chief mines of gold and silver are the Puerta Ovejera, Maru, San Bernabé, Rosario, and Medalla; but there are also live mining stations within the mountains, and in the vales forty-three smelting-houses, which afford employment to great numbers of labourers, who consume annually one hundred thousand loads of maize, eighteen thousand sheep, five thousand oxen, and eighteen thousand loads of meal, there being sixteen villages in the township of Irapuato. The mining operations have much increased within the last fifty years, as appears from the quantity of the coinage; for during thirteen years, from 1766 to 1778, there were coined at Mexico two hundred and three millions eight hundred and eighty-two thousand nine hundred and forty-eight pesos; while, during another thirteen years, from 1779 to 1791, there were coined two hundred and fifty-two millions forty-two thousand four hundred and nineteen pesos; the difference being more than forty-eight millions. Gold and silver are now rarely sent to Spain in bars or ingots, nor are they consumed in plate. Before the freedom of commerce, the coinage never exceeded twenty millions of pesos; and in 1792 and 1793, it annually surpassed twenty-four millions. There are mines of quicksilver in New Spain; but they have not been sufficiently explored.

On the riches of New Spain, the celebrated traveller, Bourgoing, makes the following observations:—

“It might be said to the Spaniards, ‘Far from making efforts to draw from your mines all that they can produce, you ought rather to shut a part. Confine the influx of your metals into the ancient continent to the quantity necessary to replace the insensible waste, what luxury converts into utensils, and what avarice hoards either in Asia or Europe. Follow the example of the Portuguese, who restrict the operations in their diamond-mines, in order

that their value may not be diminished; and that of the Dutch, who burn a part of their spices, that the price may be maintained. The silver of Mexico is to you as diamonds and spices: if you triple the sum, your miners, whose labour might be more usefully exerted on other objects, will have more occupation, but you will not be more rich. You will only pay a triple price for the productions of foreign industry, which will always be necessary in a greater or less degree.'

"To these specious arguments it is answered in Spain, 'We do not perceive any thing terrible in this augmentation of currency. In the first place, the duties present a clear profit to the public treasury; and while the other states of Europe are occupied with increasing their revenues, that they may support great enterprises either in peace or war, by what fatality should it happen that Spain may find causes of decline in what is thought to constitute the prosperity of other states.'

"We may say as much of our manufactures. As long as their operations shall keep pace with the exploration of our mines, our currency will be increased, both by what we employ to pay foreign industry, and with the surplus of what is furnished by Mexico and Peru. Nor do we see any thing dreadful in the prospect. We ask, on the contrary, what are the most flourishing nations? Are they not France and England, those who have by far the most abundant currency? Of what consequence is the source from whence it springs. The combined product of our mines and of our industry will still be useful to Spain, in the hands of great capitalists, who will embellish our cities and country, will furnish funds for public establishments, and will supply the state in critical periods with loans at a lower interest than formerly."

*Natural Curiosities.*] There are here the same common mineral-waters as in other countries. Besides the volcanos, there are many natural curiosities, one of the most remarkable of which is the Ponte de Dios, or Bridge of God, resembling the natural bridge in the territory of the United States.

It is about one hundred miles south-east from Mexico, near the village of Molcaxac, over a deep river called the Aquetoyaque, and is constantly passed as a highway; but it seems uncertain whether the river have worn the passage through a rocky mountain, or the fragment be part of a fallen hill, detached by an earthquake. There are many romantic cataracts, particularly those of the River Barnaja, between the city of Guadalajara and the Lake of Chapala. The floating gardens in the Lake of Mexico were artificial curiosities, the bottom being formed of intertangled willows.

In the province of Vera Paz, which seems to be chiefly calcareous, as it abounds with spots where rivers suddenly sink under ground, there is, between two high ridges, a

cave of great extent, with many detached recesses, abounding with beautiful stalactitic columns and figures, which appear like alabaster. The cold is extreme, and a great noise of water is heard, which, rushing from various parts, forms, at a little distance from the mouth of the cave, a lake of great depth that rolls like a sea, and gives rise to a river, which at a short distance vanishes under ground. There are many subterranean rivers in the province of Yucatan, where, according to Estalla, there is no large visible stream, except that of Lagartos, between the ports of Silan and Cuyo, on the north of this peninsula. This province also abounds with lofty and picturesque cataracts, which are likewise frequent in many parts of New Spain.

*Antiquities.*] The ancient monuments of the Mexicans consist chiefly of a few symbolical paintings, the colours of which are remarkably bright, but the designs rude. Many of their utensils and ornaments have also been preserved, but they are coarse and uncouth. Their edifices were meanly built with turf and stone, and thatched with reeds. The great temple of Mexico was a square mound of earth, only ninety feet wide, partly faced with stone; with a quadrangle of thirty feet at the top, on which was a shrine of the deity, probably of wood. Clavigero, indeed, speaks of this temple in enthusiastic terms; but Estalla, after ridiculing the hunters for Mexican antiquities, says, "There are in Mexico no remains of what our historians have painted: begging pardon of these respectable men, I do not believe one half of what they boast. Those great palaces, gardens, and temples; those immense and populous cities subject to Mexico, and whose kings were tributary to Montezuma; that high and vast wall which divided the Mexican empire from the republic of Tlascalá, and the other wonders related by historians, would have left at least some few ruins in testimony of their existence, even granting that the Spaniards entertained the extravagant wish of destroying all, in order that they might be obliged to construct, with great labour and expence, other edifices far inferior.

"Must we not think in the same manner of the relations concerning the manner and delicacy with which the Mexicans worked gold and other metals? What has become of all those precious toys? They were embarked on board a ship, it is said, and were lost. A wonderful empire, which lost in a small vessel all its precious manufactures of gold! It is certain that not a particle remains of these wonders. Let us suppose in the Spaniards an unnecessary brutality; let us grant to Las Casas that the conquerors, in three or four years, annihilated fifty millions of Indians; shall we also imagine that they destroyed the cities and magnificent edifices, which their own interest and convenience must have led them to preserve? Shall we suppose they did it with a design of not leaving

to the Indians any of their former power? They had no occasion that they had en- the Spaniards, w if there was any those transaction lennity, to displa commemoration

"I am far from Casas, and those to me that, in all not surpass three ple of Tlascala, zuma. But are and other eye-wi with regard to falsehoods for th who only study counts of non-exi Cortez, Diaz, and have been men naturally surpris comparison with and on the conti versant in works from them, were description. For cept the hovels of tribes, without an In New Spain w and more regular ing very populous of great extent, compared it with objects they enco they had previous dazzled with such precious stones, extravagant descen enchanted islands heite, described light, what are the isles, more or less respectable voyag arrived fatigued w which a tempestu of navigation, w almost of the no desert island wou of paradise. But of trees, with f crystalline rivulet

to the Indians any monument which might remind them of their former power? Absurd supposition! The Indians had no occasion for any monument of art to remind them that they had emperors, or that they were conquered by the Spaniards, who thus became their lawful lords; and if there was any necessity not to revive the memory of those transactions, it would be absurd, on an annual solemnity, to display in triumph the standard of Cortez, in commemoration of this famous conquest.

"I am far from believing the absurd calculations of Las Casas, and those who imitate his extravagance. It appears to me that, in all the empire of Mexico, the population did not surpass three or four millions, even including the people of Tlascala, and other towns not subject to Montezuma. But are we then to suppose that Cortez, Diaz, and other eye-witnesses of credit, repeated falsehoods with regard to Mexico? I would reserve the term of falsehoods for those relations of historians or travellers, who only study to divert the reader with marvellous accounts of non-existencies, or idle exaggerations. I believe Cortez, Diaz, and other witnesses of the conquest, to have been men of a very different character, who were naturally surprised at the grandeur of Mexico, from a comparison with what they had hitherto found in the isles, and on the continent of America; and who, never conversant in works of art, and then a long time estranged from them, were surprised at the rudest exertions of this description. For a long time they had seen nothing except the hovels of savages, the rudest furniture, and naked tribes, without any policy or regular form of government. In New Spain were found numerous villages of neater and more regular houses; and the city of Mexico appearing very populous, with a powerful chief, some buildings of great extent, and various objects of art, they fondly compared it with the best cities of Europe. All these objects they encountered in a country, whose inhabitants they had previously held in the meanest estimation; and, dazzled with such unexpected wealth in gold, silver, and precious stones, their inflamed imagination led them to extravagant descriptions. Thus, in modern times, the enchanted islands of Juan Fernandez, of Tinian, of Otaheite, described by voyagers as so many paradises of delight, what are they? Cool judgement would say—little isles, more or less agreeable. But shall we say that these respectable voyagers have told falsehoods? No. They arrived fatigued with the uniform and melancholy spectacle which a tempestuous sea had presented during many months of navigation, wearied beyond expression, sick, deprived almost of the necessaries of life: the moist rocky and desert island would, in their eyes, have assumed the charms of paradise. But happily finding an island covered with verdant trees, with fruits, with salutary plants, diversified with crystalline rivulets, and possessed by humane inhabitants,

eager to relieve their numerous wants, shall it be thought strange that no expressions could equal their feelings in describing these countries; though there were in fact nothing which they themselves would not have despised in other circumstances. From these examples may be seen the real cause of the exaggerations of our historians; and if to this be added the self-interest which induced the Spaniards to magnify the grandeur of their conquests, there is little room to be surprised at their relations."

The chief antiquities of the Mexicans appear to be earthen-ware, in which the Indians of Guadaluara and Mechoacan excel to this day.

*Population.* The population of all the Spanish provinces in North-America has been estimated at not much more than seven millions; of whom the native Indians are supposed to amount to four millions; and the Spaniards and other mixed inhabitants to three millions, of which the Spaniards form about one-third. This calculation is however considered as beyond the actual number, and it is probable that the whole population of Spanish North-America does not exceed six millions. The small-pox is remarkably fatal; and the black vomit, as connected with the yellow fever, acts at intervals with dreadful ravages: notwithstanding the number of priests, monks, and nuns, the population appears on the whole to have greatly increased: in 1612, the inhabitants of Mexico were computed at fifteen thousand; they are now about one hundred and forty thousand.

The population of America, before the European conquest, must have been greatly exaggerated. But this is always the case on the discovery of new countries. The English voyagers to Otaheite supposed the inhabitants to exceed one hundred thousand, when, upon actual enumeration, there were found little more than sixteen thousand. It is probable that, when America was discovered, the whole population, including the West-Indies, did not exceed four millions.

Estalla observes, "that though he has not been able to acquire exact information concerning the population of New Spain, yet, by the most intelligent computations, there are in the intendancy of Mexico, one million two hundred thousand souls, including one hundred and forty thousand for the city. And by the proportion between this province and the others, as well as by the best-founded calculations, it may be supposed that there are, in all the kingdom, three millions and a half of inhabitants." M. Thierry adds, that from Panama to California and Sonora on the one side, and from Carthage to the Mississippi on the other, including a surface of more than two millions of square leagues, the latest enumerations did not present one million of souls, comprising not only all the Spaniards, but the Indians, mingled races, and negroes. This is indeed surprising, as the population of the Spa-

nish dominions in North-America has been understood to be far greater in proportion than of those in the southern part of that continent. But upon the whole there is reason to believe, that neither Estalla nor Thiery are correct, and that the whole population of the Spanish possessions in North-America can in no case exceed three millions."

*Army.*] According to the detailed accounts of Estalla, it appears that the total of the military force in New Spain is as follows:—

Regulars .....	5,982
Militia, &c. ....	31,523
Garrisons, &c. ....	5,686
Total.....	43,191

A great portion of these regular forces consists of cavalry; but the whole are very ill-armed and accoutred; and it may be doubted whether the whole grand viceroyalty of New Spain could send into the field fifteen thousand effective men. This province, however, does not seem to share the domestic discontents which have appeared in some of the others, having been generally favoured by the Spanish monarchs.

*Revenue.*] By the most recent account, the total revenue derived by Spain from America and the Philippines, is two millions seven hundred thousand pounds, of which one half may be deducted for the extravagant charges of the administration. The recent observations of Estalla on the revenues of New Spain are not only little known, but contain much useful information.

"The augmentation," says he, "which has taken place in all the branches of the royal treasury, in this viceroyalty, would appear incredible, were it not proved by authentic documents. For since the visit of Don Joseph de Galvez, afterwards Marquis of Sonora, the sums paid into the royal treasury have been tripled, so as to amount annually to nineteen millions of dollars, and latterly even that sum has been increased. I do not doubt that the expences of administration, salaries, &c. amount to four millions eight hundred thousand dollars, yet there is still an overplus of fourteen millions two hundred thousand dollars; or more than one million eight hundred thousand pounds sterling.

"If all this sum were remitted to the parent-country, the riches of this viceroyalty would redound more to her advantage; but the assignments to the Windward Islands, the Philippines, Louisiana, Florida, and Truxillo, consume three millions four hundred thousand dollars. What is remitted to Spain in money, and copper for the furnishing of artillery; for quicksilver from Castille and Germany; in the produce of vacant bishoprics, and for cards and tobacco, amounts to four millions eight hundred thousand dollars.

"There are some branches of the revenue which attract superior attention, on account of their amount, though they are the most modern in the establishment, and in other respects they may be regarded as of an inferior class. Such are the tributes, the products of the coinage, of quicksilver, gunpowder, cards, duties on goods sold, the beverage called *pnique*, bulls of indulgence, tobacco, lotteries, and letters, all of which are under the management of the minister of state. Other branches are administered in what are called the royal coffers, by their respective superintendants; such as the duties on gold, silver-plate, the assays, tythes, ninth, various ecclesiastical concessions, titles of Castille, vendible offices, compositions and confirmations of lands, cock-fighting, snow and ice, stamps, fines, &c. the product of the mines, copper, lead, tin, alum, and others. Other branches belong to the coffers of Vera Cruz; as customs, freight, convoy-money, &c.

"The branch of tributes is one of the most ancient, as having been established immediately upon the conquest; with this difference, that at first it was rendered in effects, as the Indians paid it in their pagan times; but in 1561 it was ordered to be according to the value of the manufactures and products of the soil. As early as 1569 there were established one hundred and five greater *alcaldias*, or bailiwicks, in which the greater part of the tribute was reduced to money; a practice gradually established throughout the viceroyalty, so that at present the tribute is paid at a fixed proportion of the manufactures and products of the soil. In this, however, there is the inconvenience of inequality: for example, in the district of Guanajuato, only twelve reals are paid yearly, while in that of San Luis Potosi the rate is eighteen reals; because the mines of the former augment in value, while those of the latter decline. The registers of the Indians are made by intendants, or commissaries, who present them to fixed offices for their revision and approbation, and that the exemptions may be notified. On the other hand, the Indians are exempted from the duties on things sold; and in every other respect they have more privileges than the Spaniards.

"The duties on coinage have latterly augmented, and may produce annually to the royal treasury, one million seven hundred thousand pesos. The salaries amount to one hundred thousand, the expences of the mint to three hundred thousand which being deducted, leave a clear sum of one million three hundred thousand pesos. A marc of silver is bought for eight pesos, two maravedis; and is sold to the public at eight pesos four reals; this difference forming the advantage derived by the royal treasury.

"The revenue from salt-works is administered separately, that article being also of great use in the fusion of metals.

"The clear and whole result is one hundred thousand pesos. Gunpowder is of no less utility than salt in the

mines; and such not only to suffice Spanish West-Indiam of two hundred sold at ten reals, but a deduction of mines, for their The duty on card gunpowder, and after deducting five each pack is sold summed are one hundred on articles sold is productive, and three millions four salaries deduct the the expences eight sea-duty, exacted sold there or not, he, while, in the custom-houses of acted, and sometimes

salt in the

mines; and such a quantity is made in the viceroyalty, as not only to suffice for home-consumption, but also for the Spanish West-Indies; producing to the king an annual sum of two hundred thousand pesos. The fine sort is sold at ten reals the pound, the common at eight reals; but a deduction of two reals is made to the proprietors of mines, for their encouragement. The quality is excellent. The duty on cards belongs to the same office as that of gunpowder, and clears annually seventy thousand pesos, after deducting fifty thousand for salaries and expences: each pack is sold at a hard dollar, so that the packs consumed are one hundred and twenty thousand. The duty on articles sold is, after that on tobacco, one of the most productive, and does not fall short of the annual sum of three millions four hundred thousand pesos; of which the salaries deduct three hundred and twenty thousand, and the expences eighty thousand. That which is called the sea-duty, exacted at Vera Cruz, whether the articles be sold there or not, is three per cent. on the supposed value, while, in the interior, it is six per cent. In some custom-houses of the interior only two per cent. is exacted, and sometimes even less.

"The tax on the beverage called *pulque* belongs to the same office as the last; and the use of that liquor is so general, as to amount to four millions of arrobas yearly, at a very low price, three quartillos being sold in the city of Mexico for half a real, and in the country it is still cheaper. Each arroba brought into the capital pays a duty of one real nine and a half granos; in Puebla one real and nine granos; and in other parts of the viceroyalty the Spaniards pay a quarter of the value, and the Indians a sixth. This revenue amounts annually to eight hundred thousand pesos; salaries thirty thousand, expences twenty thousand; clear sum seven hundred and fifty thousand. It may be proper to add, that the *arroba* is about three English gallons.

"The duty on tobacco, though of more modern date, and in the form of a monopoly, is of all others the most useful to the royal treasury. The offices are in the towns of Cordova, Orizava, Zongolica, and Huatusco. It is bought by the king at a medial price of three reals a pound in the leaf, and is sold for ten reals. In order to increase the revenue, there is also a monopoly of segars, the factories being established at Mexico, Puebla, Oaxaca, Orizava, Queretaro, and Guadalaxara, which manufacture varies in quantity according to the demand. The snuff called *rappee* was made in Mexico, but the consumption did not pay the expence. The sale of snuff, which comes entirely from the Havannah, amounts to fifty thousand pesos; that in rolls three hundred and fifty thousand; the *puros* five hundred thousand; and the *segars*, of which the consumption is infinitely greater, five millions four hundred thousand: total sum, six millions three hundred

thousand. In the year 1797, the augmentation of this revenue was eight hundred thousand pesos. Snuff is sold at twenty reals a pound; the *puros* from five to fourteen for half a real, according to size; and at the same price the packets of segars, each containing three dozen and a half. The expences attending on this revenue are about two millions eight hundred thousand; the salaries being seven hundred thousand, general expences two hundred and fifty thousand, purchases seven hundred and fifty thousand, manufacture one million one hundred thousand. The clear revenue is, therefore, three millions five hundred thousand pesos.

"In the capital alone there are more than seven thousand persons employed in making segars: they were formerly a tumultuous class, but are now as peaceable as the other inhabitants, in consequence of the vigilance and firmness of the government.

"Each shop for eatables, or other commodities, pays thirty pesos a year: the gross amount is one hundred and ten thousand pesos; and, after deducting four thousand four hundred, there remains one hundred and five thousand six hundred.

"The revenue from the lottery is one of those which has prospered the most; and, though more subject to variation than any other, may be rated at the clear sum of one hundred thousand pesos.

"Among the taxes gathered at particular offices must also be placed that of the post, which belongs to the minister of state, each courier being supposed to convey the quantity of thirty thousand pesos, more or less. This revenue has also the singularity of liquidating its accounts, not in pesos fuertes, like the others, but in reals of silver. The clear product is supposed to be more than one million four hundred thousand reals.

"Hitherto," says our author, "I have treated of those branches of the revenue which are gathered at particular offices; I have now to mention those under the care of the ministers of the royal coffers.

"The duties on gold and silver, among the most ancient in the vice-royalty, were at first very considerable, but afterwards declined, till, by a royal ordinance of the 1st of March, 1777, the contributions on the gold were reduced to three per cent.; and the double seigniorage was extinguished, the single alone being permitted. This revenue now amounts to two millions of pesos, the expences being only four hundred pesos. Plate, whether gold or silver, presented to be stamped, pays three per cent. besides other duties. To prevent the frauds practised by the artificers, it was determined in the Superior Junta, that they should be furnished from the mint with what gold they might want at one hundred and twenty-eight pesos and thirty-two marcos, the marc of twenty-two carats, (each of four grains;) and that the silver should

be supplied from the state-treasures. The value of this branch amounts to fourteen thousand nine hundred and seventy-seven pesos annually. There are other duties on assays, &c. to the amount of ninety thousand pesos.

"The tithes of the cathedral churches belonged at first entirely to the crown, and the clergy were paid from the royal treasury; but this plan has since been altered. The tithes of Panuco, New Leon, and Arispe, in Sonora, produce sixty thousand pesos. In other provinces ninth is deducted for the use of the king, and valued at one hundred and ninety thousand pesos.

"The extraordinary fondness of the natives for cock-fighting gave rise to a formal establishment in favour of this diversion, which produced a revenue of not less than fifty thousand pesos; and, in order to increase this advantage, a hall or theatre was constructed in the village of San Augustin de las Cuevas, much frequented by the citizens of Mexico during Easter. This building cost six thousand eight hundred and thirty-eight pesos; and in two years and eight months had yielded one thousand seven hundred and forty pesos. There are considerable sums also raised by taxes on trifling articles, such as stamped paper, leather, lead, tin, &c. It is supposed by some able calculators, that after every necessary expence is deducted, the clear revenue must amount to above one million five hundred thousand pounds sterling."

Cities, &c.] MEXICO, the principal city of Spanish America, is celebrated for the singularity of its situation. In a beautiful vale, surrounded with mountains, the lake of Tezcuco is joined on the south to that of Chalco by a strait, on the west side of a tongue of land, the whole circuit of these lakes being about ninety miles. In a small isle, to the north of this junction, and upon the west side of the Lake of Tezcuco, was the old city of Mexico, which was reached by several causeways, raised in the shallow waters; but, on the east, there was no communication, except by canoes. Chimppe D'Auteroche, who visited the city in 1769, informs us, that it is built upon a fen, near the banks of a lake, and crossed by numerous canals, the houses being all built upon piles; from which it would seem that the waters of the lake have diminished, so as to leave a fenney access on the west. This probably happened after 1629, when there was a remarkable inundation, and a wide canal was opened through a mountain to drain the lakes. The site of the city is the same with the ancient one, the viceroy residing on the spot of Montezuma's palace, in a large mansion built by Cortez, and still rented at four thousand ducats from the Marquises del Valle, his descendants. In many places the ground still yields; and some buildings, as well as the cathedral, have sunk six feet. The streets are wide and straight, though very dirty; and the houses, which resemble those in Spain, are tolerably well-built. The chief edifice is the viceroy's pa-

lace, which stands near the cathedral, in a central square. Behind the palace is the mint, in which more than one hundred workmen are employed, as the owners of mines here exchange their bullion for coin. The other chief buildings are the churches, chapels, and convents, which are very numerous, and richly ornamented. The outside of the cathedral is unfinished, as the foundations are suspected not to be safe; but the rail round the high altar is of solid silver; and there is a silver lamp so capacious that three men can get into it; it is also enriched with lions' heads, and other ornaments, in pure gold. The images of the virgin and other saints are either solid silver, or covered with gold and precious stones. Besides the great central square, there are two others, each with a fountain in the middle. "To the north of the town," says D'Auteroche, "near the suburbs, is the Alameda, or public walk. A rivulet runs all round it, and forms a tolerably large square, with a basin and jet d'eau in the middle. Eight walks, each with two rows of trees, terminate at this basin, like a star. This is the only walk in or near to Mexico; all the country about it is swampy ground, and full of canals. A few paces farther, and facing the Alameda, is the Quemadero: this is the place where they burn the Jews, and other unhappy victims of the inquisition. It is an enclosure between four walls, and filled with furnaces, into which are thrown, over the walls, the poor wretches who are condemned to be burnt alive; condemned by judges professing a religion whose first precept is charity. The dresses of the Spanish inhabitants are generally silk, and their hats are adorned with bells of gold and roses of diamonds; for even the slaves have bracelets and necklaces of gold, silver, pearls, and gems."

Mexico is the seat of a very great commerce between Vera Cruz on the east, and Acapulco on the south; and the shops display a profusion of articles in gold, silver, and jewels.

The air of this city is very foul in the narrow parts, and the bodies of dead animals remain long unconsumed. There are many water-courses, covered and open; but they are cleansed only once in two years. The winter is gentle, and it is thought severe when the ice exceeds the thickness of paper. The summer-heats are tempered by the regular showers which fall in the evenings. About noon, during the rainy season, the clouds begin to rise from the lakes, and betwixt two and three o'clock descend in violent showers, of which an European can hardly form an idea, except by comparing the noise and rapidity to a hail-storm. The rain continues two hours, more or less, and is sometimes accompanied with lightning. Water-spouts often occur; but they have never been known to have fallen on the city, but always on the lake. They, however, sometimes destroy small mining establishments; and Estalla asserts, that they have been known even to

level hills. Though just within the tropic of Cancer, the annual cold at Mexico appears, from observations, to exceed the heat. The rainy season prevails from the middle of May to the middle of September; during which, if it failed to rain every evening, the harvest would be lost, and many diseases would ensue.

Mexico contains thirteen hospitals and other charitable establishments; a house of refuge for married women; a Magdalen for abandoned females; a foundling hospital, and a general hospital for the sick poor and mendicants. There are also several houses for female orphans, who are well fed, and receive one hundred dollars a year, and live hundred when they are able to establish themselves. Other girls draw lots at the cathedral, and receive certain perquisites; by which, sometimes, when they wish to marry, they possess from six to eight thousand dollars.

There is a general hospital for the Indians, of which the expenses are defrayed by themselves; but the family of Cortez, the conqueror, maintains another hospital for the Indians, with such excellent assistance, that they are eager to enter. Among several other hospitals, that of San Lazaro receives people afflicted with the leprosy, an ancient malady prevalent in America, where it is chiefly ascribed to the use of cotton-shirts, or other garments of that material, as also to the use of pork, of which there is a great consumption, and that of pimiento-sauce; but the chief cause is the nucleolusness of the people.

The city is abundantly supplied with grain, fruit, and the productions of the garden from the environs, which are very fertile, except on the eastern side of the great lake of Texcoco, where the saline-waters and vapours impede the vegetation. The more populous and crowded parts of the city extend from north to south one Spanish league, and from east to west three-quarters of a league.

The chief gates are that of Guadalupe and those of Los Angeles, Traspasa, Chapultepec, San Anton, and San Lazaro. All the pulque enters by the gate of Guadalupe; and, when a new cargo arrives, the joyous occasion is celebrated with lammers, music, and incredible uproar. In the midst of the great square is a fountain, with a horse of bronze. The palace of the viceroy has a considerable garden, where he sometimes erects a tent, assumes a country dress, and transacts business; but, in general, the viceroys, having no country-houses, pass the warm season at that of the archbishop, in Tacubaya.

The *coliseo*, or theatre, is small, but handsome; the actors generally come from Spain. Smoking is permitted in the theatre, except when the viceroy or his lady is present; the women, who smoke like the men, divert themselves with throwing the ends of segars at the opposite boxes. The spectators are sometimes enthusiastic in favour of certain actresses: not many years ago, in a fit of this kind, while an European actress was repeating a fa-

vourite passage, ounces of gold were thrown upon the stage, to the amount of three thousand dollars, or about seven hundred English guineas; a striking proof of Mexican opulence and extravagance.

The most splendid festivals observed in this city are the procession of Corpus Christi, and the entrance of a new viceroy. On the former are displayed all the luxury and pomp of the capital, particularly in ecclesiastic wealth and ornaments; the latter is a magnificent spectacle. The viceroy proceeds on horseback through the chief streets to the cathedral, where he is received by the archbishop at the head of the chapter. Another solemnity is the 13th of August, the anniversary of the conquest, when the standard of Cortez is hoisted with great parade, and accompanied by the viceroy. A comet from Spain generally arrives once a month: on his arrival all the bells are rung; and on the following day the viceroy and royal audience always celebrate a solemn mass.

VERA CRUZ is described by M. Thierry as situated in a sandy and barren plain, on the shore of the Atlantic, with infectious marshes on the south. It fronts the sea in a semicircle, and is enclosed with a wall, six feet high and three broad, surmounted by a wooden palisade. On the shore are two redoubts, with some cannon to defend the port, which is bad and intricate. The houses are of tolerably good masonry, in stone and lime, with wooden balconies, which have induced some travellers to report that the houses themselves are of wood. The churches abound in decorations of silver, while in the houses the chief luxury consists of porcelain and other Chinese articles. The principal inhabitants are merchants; but European commerce is chiefly conducted at Nalapa. The population is about eight thousand; the inhabitants are generally proud and indolent; but commerce is well understood, and there are seven or eight trading firms, each worth one million of dollars. Opposite Vera Cruz, at the distance of four hundred fathoms, is an islet, on which stands the castle of St. Joduc d'Ulloa, which is fortified with three hundred pieces of cannon. From forty to sixty ships of war, or one hundred merchantmen, might anchor from four to ten fathoms; but the westerly winds often drive vessels on shore. In the rainy season the marshes on the south are haunted by alligators, from seven to eight feet in length. The sea-fowl and other birds are so numerous as sometimes to darken the air; and the mosquitoes are very troublesome. Estalla informs us, that the north winds are so furious, that the ladies are excused from going to mass; and these gales sometimes load the walls with sand. In the rainy season the water regularly falls in the night; while at Mexico it falls in the afternoon.

ACAPULCO is the chief mart of the trade with the Philippine Islands. When a galleon or Chinese ship arrives, the merchants at Mexico hasten to receive their commo-

dities; but at other times the town is little frequented, being in a hot and wet climate, where the south-east winds, in a rainy season, are singularly destructive; hence Acapulco is scarcely inhabited by any Spanish families; but it contains about four hundred families, consisting of Chinese, or people from the Philippines, mulattoes, and negroes. Provisions are scarce; and the city depends on a supply from the Indians. At the distance of a musket-shot stands, on a promontory, the castle of San Diego, with thirty-one pieces of cannon, to defend the haven, which is sufficiently spacious to contain five hundred ships.

PUEBLA DE LOS ANGELES is regarded as the most opulous city after Mexico, the number of inhabitants being not less than sixty thousand. It is in a warm and dry climate, and one of the most beautiful cities in America, the churches being sumptuous, and the streets broad and regular, with large squares and handsome houses. It contains twelve nunneries and several monasteries.

QUERETARO is said to be one of the most opulent cities in the viceroyalty, and the most extensive, next to Mexico; the situation being in a delicious vale, watered by a river, which is divided into numerous channels, and conveyed into two thousand gardens, producing all the fruits and flowers of Europe and America. From three grand squares proceed numerous streets towards the four cardinal points of the compass; and there is a celebrated aqueduct, supported by more than forty arches, of the height of one hundred and five feet. The aqueducts, in general, are beautiful objects of architecture in New Spain. The parochial church is magnificent, and the curacy is considered one of the richest in the viceroyalty. Another church is so sumptuously adorned, that the altar is of massy silver. There are three thousand families of Spaniards, Mestizos, and Mulattoes, and about as many of Otomite Indians; so that the population is computed at forty-seven thousand, among which are many rich and noble families. The manufactures are fine cloths, woollen stuffs, and coarse linens; and the shops are very numerous.

GUADALAJARA is situate on the River Barnaja, or Esquilan, which flows from the Lake of Mechoacan, and runs rapidly to the north-west, there being a great cataract at the distance of four leagues. Here are eight squares, many convents, and two colleges. The streets are unpaved, and the carriages drawn by mshed mules. There are frequent tempests, but it never snows; and when a shower fell, it was so great a phenomenon, that the inhabitants imagined the world to be at an end: the like superstition was shewn at Mexico some years ago, on the appearance of the aurora borealis.

SANTA FE, the capital of New Mexico, is rather a village than a town, but deserves some description, on

account of its singular and remote position, being computed, by the Spanish authors, at the distance of two thousand four hundred British miles to the north of the capital city of Mexico. It was founded in 1682, on the skirts of a high chain of mountains, from which issues a clear river, abounding in excellent trout. The population consists of three hundred Spanish families; the Indians of that district having no desire to live in the town. The surrounding territory is fertile and pleasant, producing wheat, maize, garden-plants, fruits, and particularly grapes, of which esteemed wines are made.

*Manufactures and Commerce.*] In New Spain there are many tanneries, but the leather is far from being equal to the Spanish; and the same may be said of the glass and earthenware. In Guanlalaxara they make earthen jars, of a sweet scent, which are brought even to Spain. In the city of Queretaro, there are various manufactures of cloth, and the soldiers are accustomed to keep their uniforms, as a splendid dress, on their return to the mother-country. The hams of Toluca, twelve leagues south-west from Mexico, are highly esteemed. In Puebla forty-three sorts of woollen-cloths are made, but the dearest is only six reals a yard. There are also pateries and glass-houses, and about twelve hundred looms for veils, mantles, and other articles of fine cotton, some mixed with silk. Most of the other towns have a few looms for the same purposes. The manner of weaving appears to be as simple as in Hindoostan; yet the war having embarrassed the importation of European articles, they are imitated with considerable success, and even blind-lace has been carried to great perfection. The manufacture of plate is carried on to a great extent. Silk is found in the province of Oaxaca.

The commerce of New Spain is of great extent, and has recently undergone considerable improvements, which deserve illustration. Charles III. and his successor exerted themselves so beneficially in favour of the American colonies, that more was done during their reigns than in the whole preceding period. The number of shops has been greatly increased. The imports have also augmented, so that at Vera Cruz alone they amounted, in 1792, to fourteen millions twenty-three thousand eight hundred and eighty-nine dollars. The duties also shew the rise of trade, upon a medium of thirteen years, compared with thirteen preceding the change, the advantage of the former being more than fourteen millions of dollars.

By their successful speculations there are many merchants who can disburse twenty or thirty thousand dollars, without any impediment; and those who can advance smaller sums are very numerous, though formerly there were none of this last class, all being dependent upon the monopolists. Thus an appearance of ease is observed among the middle classes, and even the lower orders.

The greater difficulty many circumstances remained in the cause many can not tal, which former cleared, in 1792, In 1791, a theatre also been erected

The greater diffision of wealth appears, besides, from many circumstances. Formerly many tickets of the lottery remained in the treasury; at present, all are sold, because many can afford to buy. The theatre of the capital, which formerly yielded only four thousand pesos, cleared, in 1792, twelve thousand three hundred and six. In 1791, a theatre was opened at Vera Cruz; and one has also been erected in the city of Queretaro.

The commerce of the viceroyalty may be regarded under five distinct heads; that with China, or the Philippine Islands; that with Peru, the West-Indies, Spain, and the interior of the viceroyalty. The first consists solely in a ship, which arrives annually with five hundred thousand pesos of goods, at prime cost, in the Philippines, but worth at least double that sum in New Spain. The greater part of the cargo consists of silks, printed cottons, or chintzes, wax, porcelain, and other small articles. If delayed by storms or accidents, the cargo is doubled in the following year. This trade had declined, but is now re-established. The company of the Philippines at Cadiz remitted to Vera Cruz, in 1790, 1791, and 1792, goods of those islands to the amount of more than four hundred and fifty thousand pesos, so as to impede the sale of those brought to Acapulco: and this new plan, it is expected, will supplant the ancient, especially in the domain of Guatemala, and the northern coast, separated from Acapulco by a great extent of miserable roads. From this account it will appear, that when Estalla wrote (from whom we have extracted these remarks) a free trade was not established between New Spain and the Philippines, though some writers have asserted that such a regulation had long before taken place.

*Religion and Government.]* The religion of the ancient Mexicans appears to have been chiefly founded on fear, their temples being decorated with the figures of destructive animals; while fasts, penances, voluntary wounds, and tortures, formed the principles of their rites. Human sacrifices were deemed the most acceptable; and every captive taken in war was cruelly tortured and immolated. Thus, instead of a benevolent deity, the worship of the Mexicans may be said to have resembled the principle of some oriental nations. In the Mexican language, *Teotl* was a general term for any divinity; and, in their theory, they believed in a creator, whom they styled *Ipatemoani*, that is, "the by whom we live;" but their supreme deity was an evil spirit, called *Klaccacolotl*, or the *rational evil*, whose delight was to injure and terrify. They believed in the immortality of the soul, and a kind of transmigration; the good being transformed into birds, and the bad into creeping animals. The principal deities were thirteen in number, among whom were the sun and moon; and Tlaloc, the god of water, who was the master of paradise; but Mexitli, the god of war, received the chief

adoration. They had gods of the mountains, of commerce, &c.; and idols rudely formed of clay, wood, or stone, sometimes decorated with gems and gold, were numerous. One was composed of certain seeds, cemented together with human blood. The priests wore a black cotton mantle, like a veil; and there seems to have been orders of monks, the same as among the eastern nations of Asia. The mysteries and voluntary wounds of the priests, their poisonous ointments, and other abominable rites, as related by Clavigero, evince, that the entire system was one of the most execrable that was ever practised on the face of the earth.

The place for the performance of the common sacrifice was the temple, in the upper arch of which stood the altar. The ministers were the priests, the chief of whom, on such occasions, were clothed in a red habit, fringed with cotton. On his head he wore a crown of green and yellow feathers. The other ministers, which were five in number, were dressed in habits of the same make, but embroidered with black; and their bodies were dyed all over with the same colour. These barbarous ministers carried the victim naked to the upper arch of the temple; and, having pointed out to the by-standers the idol to whom the sacrifice was made, extended him upon the altar. Four priests held his legs and arms, and another kept his head firm with a wooden instrument, made in the form of a coiled serpent, and put about his neck. The body of the victim lay arched, the breast and belly being raised up and totally prevented from moving. The chief priest then approached, and, with a cutting-knife made of flint, dexterously opened the breast, and tore out the heart, which, while yet palpitating, he offered to the sun, and afterwards threw it at the feet of the idol: he then took it up and burnt it, and the ashes were preserved as a precious relic. If the idol were of large size, and hollow form, it was customary to introduce the heart of the victim into its mouth, with a golden spoon. It was usual also to anoint the lips of the idol, and the cornices of the door of the temple, with the blood. If the victim were a prisoner of war, they severed the head from the body, to preserve the skull. The body was carried, by the officer or soldier to whom the prisoner had belonged, to his house, to be boiled and served up for the entertainment of his friends. If he were not a prisoner of war, but a slave purchased for sacrifice, the proprietor carried off the body from the altar for the same purpose. They ate only the legs, thighs, and arms, burning the rest, or preserving it as food for wild beasts and birds of prey. Some sects among them, having slain the victim, tore the body in pieces, which they sold at market. Others sacrificed men to their gods, women to their goddesses, and children to the inferior deities. This was the most common mode of sacrifice; but there were others less frequent: such as put-

ting the victims to death by fire, drowning children of both sexes in the lake, or shutting them up in a cavern, and suffering them to perish with hunger.

The principal sacrifice among the ancient Mexicans was that called by the Spaniards the Gladiatorial. This was an honourable death, and reserved exclusively for prisoners distinguished by their valour. The prisoner was placed on a stone in a conspicuous part of the city, armed with a shield and a short sword, and tied by one foot. A Mexican officer, or soldier, better armed, mounted the stone to combat with him. If the prisoner were vanquished, he was carried by a priest, dead or alive, to the altar of the common sacrifices, where his breast was opened, and his heart taken out; while the victor was applauded, and rewarded with some military honour. If the prisoner conquered six different combatants, who successively engaged him, he was set at liberty, and dismissed with honour to his native country.

The present established religion of Spanish America is the Roman Catholic, in all its bigotry and superstition. The clergy are extremely numerous in Mexico; and it has been computed that priests, monks, and nuns, of all orders, make upwards of a fifth of all the white inhabitants, both here and in the other parts of Spanish America. The people are superstitious, ignorant, indolent, wealthy, and licentious: with such materials to work upon, it is not remarkable that the church should enjoy one-fourth of the revenues of the whole kingdom.

The archbishopric of Mexico is extremely opulent, but considered inferior to the bishopric of Puebla de los Angeles. The ecclesiastical courts are numerous; and the holy tribunal of the faith, that is, the Inquisition, is vigilant and severe. The chapter of the cathedral comprehends twenty-six ecclesiastics. While the revenue of the archbishop is computed at one hundred thousand dollars; the dean has upwards of ten thousand; the canons from seven thousand to nine thousand; the minor canons from two thousand to four thousand. The curates are named by the viceroy, from a list of three proposed by the bishop, but the first is always preferred. Several of the curacies are worth many thousand ducats; and one in the archbishopric of Mexico is valued at fourteen thousand ducats a year; while many of the curates in time become prebendaries and bishops. The religious orders at one time held many curacies; but at present they are chiefly bestowed on secular priests.

There are two archbishoprics, those of Mexico and Guatemala, with eight bishoprics, viz. Peblade los Angeles, Oaxaca, Durango, Mechoacan, Antequera, Guadalajara, Yucatan, and Chiapa.

*Government.*] The ancient government of Mexico was an hereditary monarchy, tempered by a kind of election, by which a brother or nephew of the late king was pre-

ferred to his sons. There were several royal councils, and classes of nobility, mostly hereditary. The nobles were styled *pilli* or *tlatoania*; but the Spaniards introduced the general term of *cazique*, which, according to Clavigero, signifies a prince, in the language of Spain. The land did not belong to the monarch, but was alienable by the proprietors. Writing was unknown there, so that they had no code of laws; but some traditions have been preserved on the subject. Their armour and tactics appear to have been extremely rude.

The political system was feudal, there being thirty families which composed the first class in the state, and each of them had many thousand vassals: in the second class there were about three thousand families; the vassals being literally slaves, while the lords had the power of life and death.

The laws were very severe; and numerous crimes were deemed capital.

Each province was subject to a tribute, excepting some nobles, who were obliged to take the field with a certain number of vassals, as was the case during the ancient feudal system in Europe.

The viceroyalty of Mexico is the chief in Spanish America, as it extends over a territory equal to an empire in Europe; but there are several inferior governors, named by the Spanish sovereign. The large domain of Guatemala is ruled by a president, who is also captain-general, or commander of the troops. In New Biscay, some provinces form a separate presidency: but the northern provinces are chiefly held by religious settlements. A lieutenant-governor of the two Californias presides at Monterey. The government of Florida is of no consequence, as the chief power of the viceroy consists in the patronage of all the churches.

The civil government of Mexico is administered by tribunals called Audiences, which bear a resemblance to the old parliaments in France. In these courts the viceroy of the king of Spain presides. His employment is an office of the greatest trust which his catholic majesty has in his disposal, and is perhaps the richest government entrusted to any subject in the world. The greatness of the viceroy's office is diminished by the shortness of its duration; for as jealousy is the leading feature of Spanish politics in whatever regards America, no officer is allowed to retain his power for more than three years; which, no doubt, may have a good effect in securing the authority of the crown of Spain, but is attended with unhappy consequences to the miserable inhabitants, who become a prey to every new governor.

*Customs, Manners, &c.*] The ancient Mexicans are said to have been a ferocious people, and, at the same time, servile and obsequious. Their wars were constant and sanguinary; and their manners in general corresponded

with this barbarous covering themselves with paint, and dancing.

Even in the time of the Spaniards, the Spaniards introduced the general term of *cazique*, which, according to Clavigero, signifies a prince, in the language of Spain. with this barbarous disposition; the principal warriors covering themselves with the skins of the sacrificed victims, and dancing through the streets.

Even in the time of La Prouse, the dress was a loose cloak, and a sash girt round the naked waist; and the under-lip was pierced, to receive an ornament of gold. The year was divided into eighteen months, each of twenty days; and five days were added, which were dedicated to festivity. They cultivated maize and some roots; but their agriculture was rude, and they were strangers to the use of money.

Since the progress of Christianity, however, and the establishment of a foreign yoke, the manners have become more mild. But so much attached are they to games of chance, that they will even pledge their own persons, when they have nothing else to stake, and the Spaniards make use of this infatuation to inveigle recruits for the Philippines. They also sometimes pledge their persons for a debt, and labour in the public works till it be defrayed. As food is cheap, and labour dear, they will, in other cases, gain enough in two days to support them for the week, by which they fall into intoxication and other excesses. They are naturally ingenious, working in wax, ivory, and glass, or making earthenware, with great skill; but as they do not make previous models, nor understand the principles of design, nothing is perfectly finished. When the academy of the Three Noble Arts was established, an Indian presented a skull, which neither by sight, touch, nor weight, could be distinguished from nature, and yet it was wood. Such as have received a little education become honest and decent, and are often made petty magistrates in the villages.

M. Thiery, who made a journey, in 1786, from Vera Cruz to Orizava, and thence to Oaxaca, a distance of about three hundred and fifty British miles, gives some striking sketches of the national manners. He observes that the Indians have a marked aversion to the negroes, whom they regard as scourges in the hands of their masters. Their chief food consists of cakes of maize, called *tordillas*, which, as they are eaten hot, it is a chief duty of the females to prepare. They are often accompanied with *chille*, a kind of sauce, composed of pimento and love-apples, pounded together with salt and water, and which is also used with meat and fish. Their little huts resemble those of woodmen. The universal beverage is pulque, drawn from the magney, or agave Americana, which is to them of infinite use: the leaves, which are three or four feet in length, serving as tiles, while the fibres are used for thread and clothes, the stem as beans, and the young sprouts as asparagus: the juice also supplies them with water, wine, vinegar, balsam, and honey. They make an incision to the heart of the plant, then take off the head, and form a cavity in the trunk, suffi-

cient to hold two or three French pints. The top is then replaced, and during the following day and night the sap transudes from the young leaves into the cavity, is withdrawn the following day, and afterwards until the plant be exhausted, when the buds are planted to secure a new crop.

The rude pyramids, says M. Thiery, sometimes forty feet in height, on a base of twenty, which are frequent in the Mexican dominions, seem to have served as sepulchres of distinguished chiefs. They resemble a kind of rude hovels, raised in St. Domingo, for preserving ice. Baths for the sick, constructed on a very simple plan, are also not uncommon near the fountains. The Indian women are sometimes handsome, and dress in the Spanish fashion of the country; that is, in a shift and petticoat.

The manners and customs of the creoles, or descendants of the original Spaniards, have in many instances become distinct from those of the mother-country; and Estalla has entered into some curious details on this subject. There is a general defect of education, and the manners are not a little corrupted in the populous and opulent city of Mexico, the capital of all America.

As the first colonists were chiefly Andalusians, the Spanish language is spoken with an accent not agreeable to a Castilian; and the men, as well as the women, have a kind of fawning affability, not consistent with Spanish pride. When a Mexican lady receives a visit, she asks a number of questions all at once:—"How do you do?—How is your health?—How were you the other day?" although they may not have seen each other for months. When two gentlemen meet, if the one feel himself inferior, it is—"You are my lord—you are my all;" or even, "you are my great lord:" while the women say—"You are all my desire." But these frivolous failings sink before their ardent loyalty, and extensive generosity. On occasions of epidemic disorders, and other public calamities, their beneficence is excessive; and their charitable establishments would do honour to Europeans.

All the Mexican ladies smoke tobacco, in little segars of paper, which they take from a case of gold or silver, hanging by a chain or riband, while on the other side they wear little pincers, of the same metal. They are continually occupied in this amusement, and as soon as one segar is exhausted another is lighted: they only cease to smoke when they eat or sleep, and even light a segar when they retire to repose. "It may easily be imagined," says our author, "how ridiculous and disagreeable even a pretty woman becomes, with the eternal segar in her mouth; how richly flavoured her breath must be; and how much her health and complexion are vitiated, by this indecent and filthy custom. Girls never smoke in the presence of their fathers; nor are the latter supposed to know that they smoke, though they give them money to

buy segars. This affectation of ignorance is truly diverting: when a mother wants tobacco, she says to her daughter, "Give me the segars which I gave you to keep," knowing that she has given none; but, with dissimulation, pretending to save appearances of respect. The girls, who do not fear their mothers upon much more important occasions, are so circumspect in this business, that, if the mother enter the room, the segar is instantly concealed, because it would be very unpolite to smoke before the *nanita*, for so they call their mothers; while the father is styled *tutita*, a name also given in fondness to any man whom they esteem. The girls address their mothers by *thou*, while the latter call them *sisters*, as expressing greater tenderness; but in fact that they may avoid the appearance of age.

These people are extremely fond of gaming, and affect the most perfect indifference and cheerfulness when they lose. A fellow enters a gaming-house, produces ten or twenty dollars, which had been tied up in a corner of his mantle, lays them on a card, loses them, and, without saying a word, takes a segar from behind his ear, lights it, and walks out, as if nothing had happened. The men easily assume a military air, and learn their exercise with much facility. When a boy has completed his rudiments, it is a day of rejoicing for the school and family. A procession is formed from the seminary, with standard, drums and fifes, to the house of the parents. The masters say that this stimulates application, but they rather wish to profit by the foolish vanity of the relations. When any youth pleases in a ball, by his dancing, music, or voice, all, even the ladies, give him what is called the *gala*; nor can he refuse them without affronting the assembly. The dances of the common people are very licentious; nor are the songs more decent than the movements. In superior houses serious dances are usual; but for the sake of variety they are mingled with those of the country. On the eve and day of All Saints, there are great crowds at the doors of the shop-keepers, both on foot and in carriages, to buy toys and sweetmeats for children, in both of which the Mexicans excel. On other solemn days there are great assemblies in different parts of the city, which are illuminated. At the Indian festival, in the sanctuary of Guadalupe, near Mexico, an immense multitude appears, even from distant provinces, and much disorder ensues.

In this climate nature anticipates her rights, especially in the female-sex, which is much sooner exhausted than in Spain. At the age of thirty, especially if they have borne children, women appear as aged as in Spain at fifty; the teeth falling out, and the face having totally faded. The shocking plan of diet is, no doubt, the principal contributor to this rapid decay. The whole day is employed in eating: in the morning they take chocolate:

at nine they breakfast; take another breakfast at eleven; and soon after noon they dine. After having taken the *siesta*, or day-sleep, they return to their chocolate, which is succeeded by an afternoon's luncheon, more chocolate, and a considerable supper. A remarkable absurdity among them is, that a guest can only acknowledge the goodness of his dinner, or supper, with tears in his eyes. A meal at which no one cried would be regarded as good for nothing: such is the force or quantity of the chillé, or pimento, with which they season every dish.

The laced veils, made in the country, and worn by the ladies, descends to the feet, and usually costs from eighty to one hundred dollars. The *basquina*, or large upper petticoat, also descends very low; and the shoes are neat, and sometimes rich. When at home, or on going out in a carriage, they wear what is called the *rebozo*, or muffler which resembles the shawls used at Madrid. They are particularly ostentatious in the quantity of their diamonds, and the size of their pearls, which they exhibit at balls and festivals. M. Thierry describes the ladies of Vera Cruz as being covered, when abroad, with a long silk-cloak, with only a little opening on the right-side, that they may see their way. At home, they only wear over their shifts a little corset of silk, laced with a cord of gold or silver; while their head-dress is composed of their own hair, fastened at the top with a riband; yet with this simple dress they wear chains of gold around the neck, golden bracelets on their wrists, and beautiful emeralds in their ears. There is little difference between the dress of the men here and those of Spain, though in their houses they display greater wealth in silver images of saints, cornucopias, chandeliers, &c. Only a few years since, the men of the lower class, whether whites or creoles, were all wrapped up in mantles, without any other dress, except drawers and a little hat: this dress served them for street and chamber, and even for bed, which was merely a raised part of the room, covered with a mat, called *petate*. The greater part, which formed two-thirds of the inhabitants, had no other articles whatever. Some regulations, however, have since been made to prevent the indecency of this class, who are forbidden to enter various public places, except in proper clothing.

The Mexicans make frequent use of the bath, which partly atones for the want of linen; and the climate, being dry and warm, renders this custom agreeable and salutary. There are at Mexico a great number of baths, and *temascales*, a kind of steam-baths, used by the ancient natives.

The Indians of *Florida* are robust, and well proportioned. Both sexes go naked, except having a deer-skin round the waist. They stain their skin with the juice of plants, and have long black hair, which they have a method of twisting and binding upon the head, so as to

render it rather becoming. The women, who, in general, have good features, and are well-made, are so active, that they will climb, with amazing swiftness, to the tops of the highest trees, and swim across broad rivers with their children on their backs.

Their economy in the management and distribution of their corn, which is accounted the common stock of the public, is well worthy of notice. The crop, which is calculated to serve only half the year, is collected into granaries appointed for that purpose, and afterwards regularly delivered out to every family, in proportion to the number of persons it contains. The soil is, indeed, capable of affording much more corn than they are able to consume; but they choose to sow no more than will serve them for that term, retiring, for the remainder of the year, into the recesses of the forests, where they build huts of palm-trees, and live upon roots, wild fowl, and fish. They are very fond of the flesh of alligators, which has a strong musky smell. Their meat is dressed in the smoke upon a wooden instrument, resembling a gridiron, and water serves for their common drink.

The people are, in general, satisfied with one wife, but the chiefs are indulged with more, though the children of only one of them succeed to the father's dignity.

In their warlike expeditions they carry with them honey and maize, and sometimes fish, dried in the sun. The chief marches at the head of the army, carries a bow in one hand, and a bow and arrows in the other; his quiver hangs at his back; and the rest follow tumultuously with the same arms. The men make use of bows and arrows with great dexterity. The strings of their bows are made of the sinews of stags; and they point the ends of their arrows with sharp stones, or the teeth of fishes. In their warlike deliberations, if the matter be of great moment, their priests, who are also a kind of physicians, are called in, and their opinions particularly asked. Then the cacique, or chief, carries round a beverage, something like our tea, made by the infusion of the leaves of a certain tree.

The funeral of a deceased cacique is celebrated with great solemnity. They place upon his tomb the bowl out of which he was accustomed to drink, and stick great numbers of arrows in the earth around him, bewailing his death, for three days, with fasting and loud lamentations. The generality of them cut off their hair as a singular testimony of their sorrow. Their chieftains also set fire to, and consume, all the household furniture, together with the hut that belonged to the deceased; after which some old women are deputed, who every day, during the space of half a year, at morning, noon, and evening, bewail him with dreadful howlings.

In *Califonia* there are three nations of Indians, who speak three distinct languages, but they are all nearly similar in appearance, being well-formed, robust, vigorous,

and of a healthy countenance. The males, whether children or adults, go almost entirely naked, in all parts of the peninsula; but there is some diversity in the ornaments used by each nation. In the southern parts, they decorate their heads with strings of pearl, braided with their hair, and interwoven with small feathers, the whole forming a very curious ornament. The nation of Loretto generally wear a becoming girdle round their waists, and a curious fillet of net-work on their foreheads; to which some add a sort of neck-cloth, ornamented with tolerable imitations of small round fruits, which bear some resemblance to a rosary. The Cochines of the north usually wear their hair short, and have a kind of diadem, formed of several bands of nacar; to compose which they first detach the mother-of-pearl from the shell, give it a fine polish on both sides, and divide it into small pieces, which are afterwards perforated for the convenience of stringing.

The garments of the women consist of three pieces, two of which form a petticoat, reaching from the girdle to the feet, and the third a short cloak, which covers the body from the shoulders. These pieces, which are made from palm-threads, are not woven, but fastened at the top as in fringes, and hang down in thick skeins and tufts. The Indian women of Cape San Lucas wear their hair long, loose, and spread on their shoulders; but their head-dress, like that of all the other women of California, consists of a piece of net-work, made with great ingenuity. The women of the northern parts wear meaner garments, being covered only from the waist to the knees; and their petticoat, which is made of thin pieces of sedge, cut off at the knots, and fastened together with threads, merely serves to hide their nakedness, without defending them from the inclemency of the weather.

The houses of the Californians make no better appearance than their habits. Those of every *ranchiera*, or village, are merely wretched huts, situated near some water, and when there is a necessity of removing to other places in quest of subsistence, the inhabitants easily shift their station. Wherever they stop, they shelter themselves under the trees, from the scorching heat of the sun by day, and the coldness of the air at night. In severe winters they live in caverns, which they either dig themselves or find in the sides of the mountains; and it is a remarkable fact, that they obstinately refuse to reside in more comfortable dwellings, which have been erected for them by the missionaries.

The Californians admit of a plurality of wives, who provide for the family, and procure a sufficient quantity of fruits from the woods, to keep their husbands in good humour; for, if once they are discarded, no other man will take them. Adultery is accounted a capital crime, except at the festivals and wrestling-matches among the *ranchieras*, when it is the privilege of the victors. Among the Co-

chines of the north, however, scarcely any such exercises are known; and a missionary, speaking of his district, says that, amidst all the freedoms of these Indians, debauchery and illegal amours are very rarely seen.

The manner of negotiating marriages in the nation of Loretto, which inhabits the middle part of California, is to present the bride with a batea or jug; her acceptance of it denotes her consent; and, on her presenting the man with a net for his head, the marriage is confirmed. In the other nations the agreement is concluded at an entertainment, to which the lover invites the whole ranchiera; but, after all this solemnity of contract, the slightest motive sometimes annuls it.

The time of gathering the pitahayas is the vintage of the Californians, and they celebrate it with particular mirth and rejoicings. "The three pitahaya months," says Salva Tierra, "resemble the carnival in some parts of Europe, when the men are, in a great measure, stupefied or mad. At this time, the whole nation give themselves up to feasting, dancings, and buffooneries; in which whole nights are frequently spent. The actors are chosen for their talents of imitation, and, for the most part, acquit themselves tolerably well.

As practice naturally produces perfection, their excellence in dancing is not to be wondered at, it being their principal occupation in time of peace. They dance at their weddings, on any good success in hunting or fishing, at the birth of a child, at a plentiful harvest, at a victory over their enemies, and on every other occasion to which they annex any idea of importance. To these festivities the ranchieras usually invite one another, and likewise send challenges for wrestling, leaping, running, and other trials of strength and agility; to which whole weeks and months are sometimes devoted.

The chief characteristics of the Californians are want of reflection, inconstancy, abhorrence of labour, an inordinate love of pleasure; and, in short, a total want of every thing which renders man inventive, tractable, and useful to himself and society. It is in vain to represent to them any future advantages which will result from their making such and such exertions; the relation of means and ends being beyond the reach of their faculties; nor have they the least idea of pursuing such intentions as will procure some future good, or avert impending evil. Their will is proportionate to their faculties; and all their passions move in a very confined sphere. Equally free from avarice and ambition, they seem to have no care beyond that of procuring food for the present day, and enjoying their most favourite amusements.

The hatred and revenge of these people are excited by the slightest causes; but they are easily appeased, and even without any satisfaction, if they meet with opposition; for, although they appear extremely proud of their courage, it

may be said, with truth, that they have not the least notion of true bravery. The most trivial circumstance is sometimes sufficient to daunt them; and, when once they begin to yield, their fear induces them to stoop to the basest indignities. But, if they happen to gain an advantage, or their enemies become disheartened, they behave in the most haughty and overbearing manner. It is but justice, however, to observe, that the Californians have few of those bad dispositions, for which many of the other American Indians are infamous. No strong liquors are used among them; and it is only on their public festivals that they intoxicate themselves with the smoke of wild tobacco: quarrels are rarely known among them, their malice and rage being reserved for their enemies; and so far are they from harshness or cruelty, that nothing can exceed their gentleness and peaceable disposition.

The Californian priests are frequently called *hechiceros*, or soothsayers; and their supposed commerce with invisible spirits, together with a variety of mystic rites and ceremonies, serves to procure them great authority over their ignorant countrymen. This authority appears most conspicuous at the public feasts; for, although the whole consists of eating, drinking, duncing, talking, and laughing, yet the presence of the priests makes them considered as religious solemnities. The habit worn by the priests on these occasions consists of a large cloak, covering them from head to foot, and entirely composed of human hair: the head is adorned with a plume of hawk's feathers; and in their hands they carry a fan of the same materials. The Southern Ednes, when they cannot procure feathers, adorn their heads with the tails of deer; and the Cochines of the north add two strings of the hoofs of the same beast; one as a chain round the neck, and the other as a girdle.

Having intoxicated themselves with the smoke of wild tobacco, these priests open the entertainment with an oration on their tenets, which they deliver with wild gestures and frightful vociferations, pretending to be inspired by certain spirits, and in their name denouncing whatever their frenzy or interest suggests. But whilst these frantic creatures are haranguing, the others continue feasting and dancing, till they abandon themselves indiscriminately to the gratification of their passions, alike regardless of modesty and decorum.

At these feasts the priests do not omit exercising that authority which they owe to the fears or ignorance of the people; celebrating some as brave and generous, upbraiding others with cowardice and wickedness, and even commanding them to expiate their faults by rigid abstinence, or by clearing the ways along the highest mountains, for the more easy descent of the visiting spirit, when it comes to see them.

These priests are the only physicians among the Cali-

formans; and their great ostentatiousness prove inefficacious; and, if the little finger of the dying man, his death. The rancheria, who, desperate condition covering their face of the scene by

The howling sitters to suck up physician had put to bed with tobacco, infected, and then,

fortunans; and their medicines are always administered with great ostentation and solemnity. When all their prescriptions prove ineffectual, they assemble all the patient's relations; and, if he have a daughter or sister, they cut off the little finger of her right-hand, pretending that the consequent effusion of blood will either relieve the pains of the dying man, or remove from the family all sorrow for his death. Then are introduced all the inhabitants of the rancheria, who, being acquainted with their neighbour's desperate condition, set up a confused howling, occasionally covering their faces; whilst the women increase the horror of the scene by their passionate cries and exclamations.

The howling being ended, the patient requests his visitors to suck and blow him, in the same manner as the physician had previously done. This is by filling a stone-tube with tobacco, applying one end of it to the part affected, and then, with their mouth at the other end, some-

times sucking up the smoke, at others blowing it through the tube with all their force. This office is performed by every person present, as this and the strength of their cries are accounted the strongest proofs of affection. The doctors then thrust their hands into the sick man's mouth, pretending to pluck death forcibly out of his body; and the women give him several smart strokes, in order to rouse him; till, at length, the poor wretch breathes his last, and is taken out to be burnt or buried, as is most convenient. The funeral is performed without any preparation, and with little ceremony, except that of burning or burying with the deceased all his utensils; and so little do they enquire into the reality of a man's death previously to the burning or interment, that the missionaries have sometimes discovered persons on the funeral-pile with evident remains of life, and have snatched them from impending destruction.

## CHAPTER VI.

### NORTH-WEST COAST OF AMERICA.

#### SECTION I.

#### NORTON'S SOUND.

##### *Discovery.*

**CAPTAIN COOK** having, in the month of September, 1778, steered over from the coast of Asia for that of America, saw land, bearing south three-quarters east: and in the course of less than twenty-four hours got sight of the American coast, and soon after came in close with the land, and was abreast of a point lying in the latitude of sixty-four degrees twenty-one minutes north, beyond which the coast takes a more northerly direction. Sailing along the coast, two islands, as he supposed them to be, were seen; and he stood over for one of them; but, on a near approach, he found it to be a peninsula, united to the continent by a low neck of land, on each side of which the coast forms a bay. He plied to the southward, and came to an anchor, the point of the peninsula, which obtained the name of Cape Denbigh, bearing north sixty-eight degrees west, three miles distant.

*Name.*] In honour of Sir Fletcher Norton, Speaker of the House of Commons, and Mr. King's near relation, this inlet was called *Norton's Sound*. It extends to the northward as far as latitude sixty-four degrees fifty-five minutes. The bay lies on the south-east side of it, and is called, by the natives, *Chacktoole*. It is but an indiffer-

ent station, being exposed to the south and south-west winds; nor is there a harbour in all this sound.

The weather being fine, afforded an opportunity of making a great number of lunar observations, the result of which gave one hundred and ninety-seven degrees thirteen minutes east, as the longitude of the anchoring-place on the western side of the sound, while its latitude was sixty-four degrees thirty-one minutes north. With respect to the tides, the night-flood rose two or three feet, and the day-flood was scarcely perceptible.

*Country and Produce.*] A party of men were sent to the peninsula for brooms and spruce. At the same time, half the remainder of the people in each ship had leave to go and pick berries. These returned on board at noon, when the other half went on the same errand. The berries to be got there were wild currant-berries, huckle-berries, partridge-berries, and heath-berries. The captain also went ashore, and walked over part of the peninsula. In several places there was very good grass; hardly a spot was seen on which some vegetable was not growing. The low land which connects this peninsula with the continent is full of narrow creeks, and abounds with ponds of water, some of which were already frozen over. There were many geese and bustards; but so shy, that it was not possible to get within musket-shot of them. Where there was any wood, mosquitoes were in plenty. It appeared

that this peninsula must have been an island in remote times, for there were marks of the sea having flowed over the isthmus; and, even now, it appeared to be kept out by a bank of sand, stones, and wood, thrown up by the waves. By this bank it was evident, that the land was here encroaching upon the sea, and it was easy to trace its gradual formation.

*Report of Survey.]* When Lieutenant King returned from his expedition, he reported, that he proceeded with the boats about three or four leagues farther than the ships had been able to go; that he then landed on the west side; that, from the heights, he could see the two coasts join, and the inlet to terminate in a small river or creek, before which were banks of sand and mud, and every where shallow water. The land too was low and swampy for some distance to the northward, then it swelled into hills, and the complete junction of those, on each side of the inlet was easily traced.

From the elevated spot on which this officer surveyed the sound, he could distinguish many extensive valleys, with rivers running through them, well wooded, and bounded by hills of a gentle ascent and moderate height. One of these rivers to the north-west appeared to be considerable; and, from its direction, he was inclined to think that it disembogued into the sea, at the head of the bay. Some of his people, who penetrated beyond this into the country, found the trees larger the farther they advanced.

*Inhabitants.]* Several people were seen upon the peninsula, and one man came off in a small canoe. Captain Cook gave him a knife and a few beads, with which he seemed well pleased. Having made signs to him to bring something to eat, he immediately left the Europeans, and paddled toward the shore. But meeting another man coming off, who happened to have two dried salmon, he got them from him; and, on returning to the ship, would give them to nobody but the captain. Others of the natives soon came off, and exchanged a few dry fish for such trifles as they could get. They were most desirous of knives, and they had no dislike to tobacco.

"One family of the natives," says Captain Cook, "came near to the place where we were taking off wood. I know not how many there were at first; but I saw only the husband, the wife, and their child, and a fourth person, who bore the human shape, and that was all, for he was the most deformed cripple I had ever seen or heard of. The other man was almost blind. The under-lips of both were bored, and they had in their possession some such glass-beads as I had met with before amongst their neighbours; but iron was their favourite article. For four knives, which we had made out of an old iron hoop, I got from them near four hundred pounds weight of fish, which they had caught on this or the preceding day. Some were trout, and the rest were, in size and taste, somewhat

between a mullet and a herring. I gave the child, who was a girl, a few beads; on which the mother burst into tears, then the father, then the cripple, and, at last, to complete the concert, the girl herself. But this music continued not long. Before night, we had got the ships amply supplied with wood, and had carried on board about twelve tons of water to each."

Captain King has communicated the following account of his interview with the same family.—"When I attended the wooding party, a canoe full of natives approached us; and, beckoning them to land, an elderly man and woman came on shore. I gave the woman a small knife, making her understand that I would give her a much larger one for some fish. She made signs to me to follow her. I had proceeded with them about a mile, when the man, in crossing a stony beach, fell down, and cut his foot very much. This made me stop; upon which the woman pointed to the man's eyes, which, I observed, were covered with a thick white film. He afterwards kept close to his wife, who apprised him of the obstacles in his way. The woman had a little child on her back, covered with the hood of her jacket, and which I took for a bundle, till I heard it cry. At about two miles distant we came to their open skin-boat, which was turned on its side, the convex part towards the wind, and served for their house. I was now made to perform a singular operation on the man's eyes. First, I was directed to hold my breath; afterwards to breathe on the diseased eyes, and next to spit on them. The woman then took both my hands, and pressing them to his stomach, held them there for some time, while she related some calamitous history of her family, pointing sometimes to her husband, sometimes to a frightful cripple belonging to the family, and sometimes to her child. I purchased all the fish they had, consisting of very fine salmon, salmon-trout, and mullet, which were delivered most faithfully to the man I sent for them. The man was about five feet two inches high, and well-made; his colour of a light copper, his hair black and short, and with little beard. He had two holes in his upper-lip, but no ornaments in them. The woman was short and squat, with a plump round face, wore a deer skin jacket, with a large hood, and had on wide boots. The teeth of both were black, and seemed as if they had been filed down level with the gums. The woman was punctured from the lip to the chin."

But to return to Captain Cook's account. "On the 14th a party of men were sent on shore to cut brooms, which we were in want of, and the branches of spruce trees, for brewing beer. Toward noon, every body was taken on board, for the wind freshening had raised such a surf on the beach, that the boats could not continue to land without great difficulty. Some doubts being still entertained whether the coast we were now upon belonged to

an island or the continent, the water put us to a trial, with our ships, under his command. Next day, the wind being from the south-east, we were in the afternoon off in their small boats for such trifles as

"Soon after, a visit. They apparently came out of curiosity. They went to the stern, and gave upon a kind of motions with their hands, nothing savage, and accompanied it.

"Proceeding May, 1778, and thirty minutes were seen to bear west. Being desirous of being tamed by temper this inlet. In the coves, and in the

"To these islands to procure some more than about once in two large return to the ship, not venture alone, looking aloud, and arms; and, in a

an island or the American continent, and the shallowness of the water putting it out of our power to determine this with our ships, I sent Lieutenant King, with two boats under his command, to make such researches as might leave no room for a variety of opinions on the subject. Next day, the ships removed over to the bay, which is on the south-east side of Cape Denbigh, where we anchored in the afternoon. Soon after, a few of the natives came off in their small canoes, and bartered some dried salmon for such tridles as our people had to give them.

"Soon after, nine men, each in his canoe, paid us a visit. They approached the ship with some caution, and evidently came with no other view than to gratify their curiosity. They drew up abreast of each other, under our stern, and gave us a song, while one of their number beat upon a kind of drum, and another made a thousand antic motions with his hands and body. There was, however, nothing savage, either in the song or the gestures that accompanied it.

"Their clothing consisted principally of deer-skins, and they observed the custom of boring their under-lips, and fixing ornaments to them.

"The dwellings of these people are situated close to the beach. They consist simply of a sloping roof, without any side-walls, composed of logs, and covered with grass and earth. The floor is also laid with logs; the entrance is at one end; the fire-place just within it, and a small hole is made near the door to let out the smoke."

## SECTION II.

### PRINCE WILLIAM'S SOUND.

*Discovery, &c.*] We are also indebted to Captain Cook for the discovery of this part of the North-West Coast of America, of which he relates the following particulars in his narrative.

"Proceeding on the North-West Coast of America, in May, 1778, and being in the latitude of fifty-nine degrees thirty minutes north, the east point of a large inlet was seen to bear west-north-west, about three leagues distant. Being desirous of repairing a damage the ship had sustained by tempestuous weather, I was induced to steer for this inlet. In our passage thither were seen two or three coves, and in the middle some rocky islands.

"To these islands Lieutenant Gore was sent, in order to procure some eatable birds. He no sooner approached them than about twenty of the natives made their appearance in two large canoes, on which he thought proper to return to the ships, and they followed him. They would not venture along-side, but kept at some distance, hallooing aloud, and alternately clapping and extending their arms; and, in a short time, began a kind of song. One

man held out a white garment, which we interpreted as a sign of friendship; and another stood up in the canoe, quite naked, for almost a quarter of an hour, with his arms stretched out like a cross, and motionless. The canoes were not constructed of wood; the frame only, being slender laths, was of that substance, the outside consisting of the skins of seals. Though we returned all their signs of friendship, and, by every expressive gesture, tried to encourage them to come along-side, we could not prevail. After receiving some presents, which were thrown to them, they retired towards that part of the shore whence they came, giving us to understand, by signs, that they would visit us again the next morning. Two of them, however, each in a small canoe, waited upon us in the night; probably with a design to pilfer something, thinking we should be all asleep; for they retired as soon as they found themselves discovered.

"The weather, bad as it was, did not hinder three of the natives from paying us a visit. They came off in two canoes, two men in one, and one in the other, being the number each could carry: for they were built and constructed in the same manner with those of the Esquimaux; only, in the one were two holes for two men to sit in, and in the other but one. Each of these men had a stick, about three feet long, with the large feathers of birds tied to it. These they frequently held up to us, with a view, as we supposed, to express their pacific disposition.

"The treatment these men met with induced many more to visit us, between one and two the next morning, in both great and small canoes. Some ventured on board the ship, but not till some of our people had stepped into their boats. Amongst those who came on board was a good-looking middle-aged man, whom we afterwards found to be the chief. He was clothed in a dress made of the sea-otter's skin, and had on his head a cap, ornamented with blue glass-bells, about the size of a large pen. He seemed to set a much higher value upon these than upon our white glass-bells. Any sort of beads, however, appeared to be in high estimation with these people, and they readily gave whatever they had in exchange for them, even their fine sea-otter skins: but here I must observe, that they set no more value upon these than upon other skins, till our people set a higher price upon them; and, even after that, the natives would sooner part with a dress made of these, than with one made of the skins of wild cats or of martens.

"These people were also desirous of iron; but they wanted pieces eight or ten inches long at least, and of the breadth of three or four fingers, for they absolutely rejected small pieces; consequently they got but little from us, iron having by this time become rather a scarce article. The points of some of their spears or lances were of that metal, others were of copper, and a few of bone.

of which the points of their darts and arrows were composed. I could not prevail upon the chief to trust himself below the upper deck, nor did he and his companions remain long on board; but, while we had their company, it was necessary to watch them narrowly, as they soon betrayed a thievish disposition. At length, after being about three or four hours along-side the *Resolution*, they all left her, and went to the *Discovery*, none having been there before except one man, who at this time came from her, and immediately returned in company with the rest. When I observed this, I thought this man had met with something theré, which he knew would please his countrymen better than what they met with at our ship; but in this I was mistaken.

"It was not long before all the Americans left the *Discovery*, and, instead of returning to us, made their way toward our boat, that was employed in sounding the head of the bay. The officer in her, seeing this, returned to the ship, and was followed by all the canoes. The boat's crew had no sooner come on board, leaving in her two of their number, by way of a guard, than some of the Americans stepped into her. Some presented their spears before the two men; others cast loose the rope which fastened her to the ship, and the rest attempted to tow her away. But the instant they saw us preparing to oppose them, they let her go, stepped out of her into their canoes, and made signs for us to lay down our arms, having the appearance of being as perfectly unconcerned as if they had done nothing amiss. This, though rather a more daring attempt, was hardly equal to what they had meditated on board the *Discovery*. The man who came and carried all his countrymen from the *Resolution* to the other ship, had first been on board of her, where, after looking down all the hatchways, and seeing nobody but the officer of the watch and one or two more, he, no doubt, thought they might plunder her with ease, especially as she lay at some distance from us. It was unquestionably with this view that they all repaired to her. Several of them, without any ceremony, went on board, drew their knives, made signs to the officer and people on deck to keep off, and began to look about them for plunder. The first thing they met with was the rudder of one of the boats, which they threw overboard to those of the party who had remained in the canoes. Before they had time to find another object that pleased their fancy, the crew were alarmed, and began to come upon deck, armed with cutlasses. On seeing this, the whole company of plunderers sneaked off into their canoes, with as much deliberation and indifference as they had given up the boat; and they were observed describing to those who had not been on board how much longer the knives of the ship's crew were than their own. It was at this time that my boat was on the sounding duty, which they

must have seen, for they proceeded directly for her, after their disappointment in the *Discovery*. I have not the least doubt, that their visiting us so early in the morning was with a view to plunder, on a supposition that they should find every one asleep.

"The natives, who had left us when the bad weather came on, paid us another visit the next morning. Those who came first were in small canoes; others afterwards arrived in large boats, in one of which were twenty women and one man, besides children. When the weather cleared up, we found ourselves surrounded on every side by land. Our station was on the east side of the sound, in a place which, in the chart, is distinguished by the name of *Snug Corner Bay*; and a very snug place it is. I went, accompanied by some of the officers, to view the head of it; and we found that it was sheltered from all winds, with a depth of water from seven to three fathoms, over a muddy bottom. Soon after we were under sail, the natives, both in great and small canoes, paid us another visit, which gave us an additional opportunity of forming a more perfect idea of their persons, dress, and other particulars, which shall be afterwards described. Our visitors seemed to have no other business but to gratify their curiosity; for they entered into no sort of traffic with us.

"To enable me to form a better judgment, I despatched Mr. Gore, with two armed boats, to examine the northern arm; and the master, with two other boats, to examine another arm, that seemed to take an easterly direction. Late in the evening they both returned. The master reported, that the arm he had been sent to communicated with that from which he had last come; and that one side of it was only formed by a group of islands. Mr. Gore informed me, that he had seen the entrance of an arm, which, he was of opinion, extended a long way to the north-east, and that, probably, by it a passage might be found. On the other hand, Mr. Roberts, one of the mates, whom I had sent with Mr. Gore to sketch out the parts they had examined, was of opinion that they saw the head of this arm. The disagreement of these two opinions, and the circumstance of the flood-tide entering the sound from the south, rendered the existence of a passage this way very doubtful. And as the wind in the morning had become favourable for getting out to sea, I resolved to spend no more time in searching for a passage in a place that promised so little success."

A voyage was undertaken to the north-west coast of America, in the year 1785, and prosecuted to 1788, under the patronage of a commercial company, entitled the *King George's Sound Company*, for carrying on a fur-trade from the western coast of America to China. For this purpose two vessels were fitted out, which were named the *King George* and *Queen Charlotte*; and the command of the former given to Captain Portlock, and that of the

latter to Captain Cook in his narrative of the voyage arrived on the coast their first attention at length accorded to this spot, the favourable native.

latter to Captain Dixon, both having accompanied Captain Cook in his last voyage into the Pacific Ocean. From the narrative of the former, it appears that the ships arrived on the coast of America in July, 1786, and failed in their first attempt to reach Prince William's Sound, but at length accomplished it in April, 1787. Concerning this spot, the following particulars are related in the narrative.

"When the King George was brought to an anchor, in a bay in which, from the report of an officer who had been sent to examine it, the captain was satisfied the ships could ride with safety, she was visited by five canoes, some containing but one man, and others two; but, to the great surprise of the Europeans, they had not so much as the skin of a single animal among them. They had beads of various colours, which they seemed to hold in much estimation. Captain Portlock having enquired if they had any of the sea-otters' skins to dispose of, and being informed that they had sold their whole stock to a trader from Europe, who had just left the sound, entertained but little expectation of carrying on much traffic; however, he determined to make the attempt, and wait for an opportunity of proceeding further up the sound.

"The party that was sent on shore found that the only space they could walk in was along the beach, the rest of the country being entirely covered with snow. Great plenty of wild-fowl were seen, but so shy that they could not be approached. The remains of two Indian huts were seen, and some wood that appeared to have been cut down with edge-tools, and of a different kind from those used by the Indians; from which it was supposed the Russians had been at this spot the preceding autumn, as it was then the general opinion that the people of that nation only made a practice of visiting these seas.

"Having advanced farther up the sound, and moored the ship, the captain observed an Indian advancing in a single canoe: he came along-side, but brought nothing to barter, except a little porpoise-blubber, which he seemed to consider as a dainty. Captain Portlock made him a present, which appearing to gratify him much, he was given to understand the nature of the commodities for which the Europeans wished to traffic; and, as he took his departure seemingly well pleased with his reception, hopes were entertained that he would introduce others for the purpose of commencing a trade.

"In the course of the ensuing day the ship was visited by three natives, in two canoes; but the whole stock they brought to sell consisted of two river-otter skins and two seal-skins, which the captain purchased, and made them a present for their attendance, so that they left the ship very highly satisfied.

"It was observed that the natives were acquainted with the use of fire-arms, and it was conceived they had derived

that information from the Russians; it was also conjectured, from several circumstances, that these visitors were of the party seen in the first harbour the ship had anchored in.

"Two days after, the Queen Charlotte, under the command of Captain Dixon, returned from an excursion to Snug Corner Cove, during which a purchase had been made of about thirty-six sea-otter skins, of different quantities, and a few other furs, part of which were procured near Cape Hinchinbroke, to which place the Queen Charlotte first went, and afterwards proceeded to Snug Corner Cove; as the Indians gave the crew to understand there was a vessel in that neighbourhood, and that another had left it just before the arrival of the former. Captain Dixon was conducted by the Indians to the place, and found the vessel to be the snow Nootka, Captain John Meares, from Bengal. The Nootka had left Bengal in March, 1786, and arrived at Prince William's Sound in October, where Captain Meares had passed the winter. From the inclemency of the climate, there had been a great mortality on board; numbers of the crew had fallen victims to the scurvy, and the remainder were in a very infirm state. Captain Meares, by letter to Captain Portlock, represented his very distressed situation, and entreated such assistance as he could afford; a compliance with which was immediately determined on. Captain Portlock learned from Captain Dixon, that both these vessels had given such high prices in barter for skins, that the value of the cargoes of the King George and Queen Charlotte were greatly reduced. The only commodities held in any estimation were green and red beads, and unwrought iron, in pieces nearly two feet long; but hatchets, saws, adzes, brass-pans, pewter-basins, and tin-kettles, would not be taken in barter, even for fish; so that all that could be depended on, as articles of trade with the natives of this place, were pieces of iron and a few beads. The account sent to Captain Portlock was confirmed by Captain Meares, who came on board the King George, and declared that the survivors in the Nootka were in so languid a state, that he and his chief mate were the only two persons capable of dragging the dead bodies from the ship, over the ice, and burying them in the snow on shore. He also observed, with respect to traffic, that he was in the sound a considerable time before he could procure a single skin, all having been disposed of to vessels that had previously arrived. Captain Meares, on his departure, was supplied with refreshments of various kinds.

"The ships were visited, a few days after, by two large Indian boats, containing about forty men, women, and children, attended by a number of small canoes. All they brought were two very indifferent skins, and a few fish, which were purchased by Captain Portlock, who made the chief, whose name was Shee-na-waa, a liberal

present. He was chief of the most powerful tribe in the sound: his people, however, were notorious thieves, and it was observed that the little boys were furnished with small hooked sticks, for the purpose of picking pockets. The visitors remained about the ship till the evening, when they took their departure, and went out of the harbour. The next day Captain Portlock weighed anchor, hauled further up Prince William's Sound, and proceeded on, till, observing a point in an arm of the cove, that promised good shelter, he sent a boat to examine and sound the place, and following with the ship, and observing that there was an excellent harbour round the point, he stood in, came to anchor, and moored the ship.

"As the articles the people on board the ship had to barter were not held in great estimation, the captain sent off two boats, to trade with the natives up the sound, if any opportunity should offer; but they met with very little success; indeed, most of the sea-otter skins, procured since the arrival of the ships, were green, and recently taken from the animal, so that the purchasers were under the necessity of stretching and dressing them themselves.

"The boats which had been sent out a second time, for the purpose of traffic, having unfortunately got into a large flat bay, and the tide ebbing before they could extricate themselves from the shoals, they were left dry for near two miles round. Shee-na-waa and his tribe, consisting of near two hundred men, observed their situation, and approached them, armed with spears and knives. The people in the boats were at first intimidated, but their fears rather subsided, when they found that plunder was the sole aim of the Indians. Though they were desirous of evading their designs, they were cautious of irritating the Indians, conscious that opposition to the measures of their numerous opponents would expose them to a most violent resentment; so that the plundering party obtained an excellent booty, consisting of most of the trading articles, two muskets, two pistols, and some of the people's clothes, and what the old chief, Shee-na-waa, accounted a most invaluable prize, was an officer's quadrant, with an ephemeris, and the necessary tables. It is to be observed, that the Europeans were permitted to purchase some skins, the plundering tribe affecting a desire to traffic, to disguise their intention of committing depredations.

"After this transaction, some natives came along-side the ship; they consisted of about twenty-five in number, men, women, and children. The chief was a man of placid countenance, rather of a low stature, with a venerable beard, and seemed to have attained his sixtieth year. He was disabled on one side, and seemed to have undergone a paralytic stroke. He presented the captain with an excellent otter-skin, but had only a few salmon to dispose of, which were purchased, and afterwards the

chief, and those who seemed to be of most consequence, were gratified with donations, and trifles were distributed amongst the women and children. The whole of this party were mild and courteous, and went on shore highly gratified with their reception."

Captain Portlock observed that these Indians dwelt in temporary huts, composed of a few sticks and a little bark. Their principal food is fish; but their most delicious fare is a kind of rock-weed, covered with the spawn of some fish. What is extraordinary, they eat, according to Captain Portlock's account, hemlock-root, which, though poisonous to an European, by constant practice, is nutritious to these Indians.

The captain, after repeated trials and experience, during a course of near three months, finding that no traffic worthy of prosecution could be carried on with the natives of this sound, determined to put to sea, and accordingly, on the 25th of July, he departed from the harbour, which obtained the name of Port Etches, and stood out of the sound, to pursue his progress on this coast.

Captain Vancouver, who, in the year 1790, undertook a voyage, by his majesty's command, in the *Discovery* sloop of war, attended by the armed tender, *Chatham*, in order, as a principal object, to examine and survey the north-west coast of America, with a view to ascertain the existence of any navigable communication between the North Pacific and North Atlantic Oceans, visited the coast of America three different times. The last time he touched at Prince William's Sound, concerning which the following interesting particulars are communicated in his narrative.

"When the ships came to anchor within the south point of Montagu Island, in May, 1794, they were visited by four of the natives, one of whom appeared to know that the people belonging to the ship came from England, as he often mentioned the words English, Portlock, and Nootka. From the first two words the inference was obvious, and the latter seemed to refer to the name of the vessel in which Mr. Meares came into the sound, and passed the winter. The natives did not bring any articles for barter, nor would they venture on board, though they did not refuse the presents that were offered, but returned thanks in the Russian language, and intimated that there were some people of that country, who lived up the sound. As it was the design of Captain Vancouver to examine the western shore of the inlet, he despatched two boat-parties for that purpose, under the command of two experienced officers.

"Soon after their departure, as the natives did not seem inclined to visit the vessels, the captain attended them on shore, and found a party, consisting of eight Indians and a Russian. The Indians came on board, and many attempts were made to induce the Russian to come at the

same time; but from his shy and reserved manner, for his personal conveyance to him, that such an impression, and confidence as to admit.

"Having delivered the Indians entrusted, the Indians as a present from the messenger, though he was prevailed upon and enjoined the known to be more accordingly gratified with the most excellent he was prevailed upon immediate opposition Indians, in the He was joined the ships together.

"The Russian to visit the ship, geography and as well as to the he soon conceived vigators in the of ing a Russian ocean. The Russian wishes, as he has recently sent from procure from the he set out for the him.

"Stress of winter sent out for the to an island adjacent were landed they clamoured of "four Indians appeared, an amicable the Europeans, ly intercourse with Europeans remaining the store was attended with disappeared none of their abrupt axe, for which they were appointed.

"In the morning the party proceeded in the course of

same time; but all proved ineffectual, and as it appeared, from his shy and reserved behaviour, that he was alarmed for his personal safety, some necessary refreshments were conveyed to him by the Indians, from an expectation that such an instance of hospitality would banish his apprehensions, and inspire him with such a degree of confidence as to admit the Europeans to an interview.

"Having delivered the articles with which they had been entrusted, the Indians returned, and brought some birds, as a present from the Russian, who, from the account of the messenger, still entertained apprehensions of danger, though he readily accepted whatever was sent him, and enjoined the Indians to solicit such articles as were known to be most agreeable to him. With these he was accordingly gratified, and the presents were accompanied with the most explicit declarations of sincerity. At length he was prevailed on to come on board, when he took immediate opportunity of testifying the fidelity of the Indians, in the discharge of the trust committed to them. He was joined by two other Russians, and they visited the ships together.

"The Russian who had been so frequently importuned to visit the ship, appeared to be much better versed in geography and sea-charts than either of his companions, as well as to be a man of more general information, as he soon conceived the import of the business of the navigators in the distant parts, as well as their desire of seeing a Russian chart of the modern discoveries in this ocean. The Russian assured them he could gratify their wishes, as he had a chart at Port Etches, which had been recently sent from Kamtschatka, which he undertook to procure from thence, and, having taken some refreshment, he set out for that purpose, leaving his companions behind him.

"Stress of weather having obliged one of the parties, sent out for the purpose of surveying the coast, to retire to an island adjacent to Snug Corner Cove, as soon as they were landed they were accosted from the woods by an exclamation of "*lawlee!*" a word signifying friendship; and four Indians appeared, indicating, by their words and gestures, an amicable inclination, which being returned by the Europeans, accompanied by some donations, a friendly intercourse was established between the parties. The Europeans remained in this place during the night, expecting the storm would subside; but it increased, and was attended with torrents of rain. But the Indians had disappeared unnoticed, and it was found that the cause of their abrupt departure was their having purloined an axe, for which the negligence of those of the crew who were appointed to the watch was severely censured.

"In the morning, the storm in some degree subsiding, the party proceeded on the business of their survey, and, in the course of their progress, were conducted to an

island by two Russians, and, on their landing, received, by eight others, with the utmost cordiality. Their abode on this island seemed to be merely transient, their only shelter being under a large skin-boat, resting with one of its gunwales on the ground, while the other was propped up by sticks, of a height sufficient to admit their creeping under it. Thus did these ten Russians live in the proximity of a large village, inhabited by not less than two hundred Indians, which would have rendered it dangerous for the surveying party to have taken up their night's abode so near, were it not for the confidence of the Russians in the friendly disposition of the natives, which was justified in the event; for two large canoes, containing about twenty persons in each, arrived just as the party were retiring to rest; and one of these Indians, who had the appearance of a chief, delivered to the Russians ten skins, nine of which were beaver, and one a sea-otter skin.

"The officer of the surveying party having received directions from Captain Vancouver to visit the north-west point of Port Etches, if circumstances would admit, in order to obtain some general information from the Russians resident there, accordingly proceeded towards that quarter. Here they experienced every instance of hospitality from a Mr. Colomenee, who was intrusted with the management of an extensive commercial establishment. The Russian residence was defended by a galliot, of about seventy tons burthen, hauled on shore, placed erect, and forming nearly one side of the square, within which their houses were built, the whole of which it overlooked, and commanded the circumjacent country to a considerable distance."

The natives of Prince William's Sound are not above the common height, though many of them are under it. They are strong-chested, and the most disproportioned part of their body is their heads, which are very large, with thick short necks, and large, broad, or spreading, faces, which, upon the whole, are flat. Their eyes, though not small, scarcely bear a proportion to the size of their faces, and their noses have full round points, hooked or turned up at the tip. Their teeth are broad, white, equal in size, and even. Their hair is black, thick, and straight, and their beards, in general, thin.

There is a considerable variety in their features, but few can be said to be handsome. Their countenances commonly indicate a considerable share of vivacity, good-nature, and frankness; and yet some of them have an air of sullenness and reserve. Some of the women have agreeable faces; and many are easily distinguishable from the men by their features, which are more delicate. The complexion of some of the women, and of the children, is white, but without any mixture of red; and some of the men, who were seen by the Europeans naked, had rather a brownish or swarthy hue.

With respect to their disposition, they are, in general, friendly, and remarkably affectionate to their women and children. It must be admitted that they are addicted to thieving, which seems common to Indians in general. Captain Portlock observes, that during the intercourse of his people with them, they were less addicted to this practice, in consequence of their being severely reprimanded; and he expresses an opinion, that, if good examples were set before them, they would become industrious in hunting, and procuring the sea-otter and other skins for sale to the settlers.

The dress which is worn indiscriminately by men, women, and children, consists of a kind of close frock, or rather robe, reaching generally to the ankles, though sometimes only to the knees. At the upper part is a hole, just sufficient to admit the head, with sleeves that descend to the wrist. These frocks are made of the skins of different animals, the most common of which are those of the sea-otter, grey fox, racoon, and pine-martin, with many of seal; and, in general, they are worn with the hairy side outward. Some also have these frocks made of the skins of fowls, with only the down remaining on them, which they glaze on other substances; and one or two woollen-garments were seen. At the seams, where the different skins are sewed together, they are commonly ornamented with tassels or fringes of narrow thongs, cut out of the same skins. A few have a kind of cape, or collar, and some a hood, but the other is the most common form, and seems to be their whole dress in good weather. When it rains, they put over this another frock, ingeniously made from the intestines of whales, or some other large animal, prepared so skilfully, as almost to resemble our gold-beaters' leaf. It is made to draw tight round the neck; its sleeves reach as low as the wrist, round which they are tied with a string, and its skirts, when they are in their canoes, are drawn over the rim of the hole in which they sit, so that no water can enter. At the same time, it keeps the men intirely dry upward; for no water can penetrate through it, any more than through a bladder. It must, however, be kept continually moist, otherwise it is apt to crack.

They do not usually cover their legs or feet, but scarcely any are without mittens for the hands, made of the skins of bears' paws. Those who wear any thing on their heads, have high conical caps, made of straw, and sometimes of wood, resembling a seal's head.

The men commonly wear their hair cut short round the neck and forehead: but the women allow it to grow to a considerable length, and most of them tie a small lock of it on the crown. Both sexes have the ears perforated with several holes, about the outer and lower part of the edge, in which they hang little bunches of beads, of a tubulose shelly substance. The septum of the nose is

also perforated, through which they frequently thrust the quill-feathers of small birds, or little ornaments, strung on a stiff string or cord, three or four inches long, which give them a truly grotesque appearance. But the most unsightly fashion, adopted by some of both sexes, is their having the under-lip cut quite through, in the direction of the mouth, a little below the swelling part. This incision, which is made even in the sucking children, is often above two inches long, and, either by its natural retraction when the wound is fresh, or by the repetition of some artificial management, assumes the true shape of lips, and becomes so large as to admit the tongue through. In this artificial mouth they stick a flat narrow ornament, made chiefly out of a solid shell or bone, cut into little narrow pieces, like small teeth, almost down to the base or thickest part, which has a small projecting bit at each end, that supports it when put into the divided lip, the cut part then appearing outward. Others have the lower lip only perforated into separate holes, and then the ornament consists of as many distinct shelly studs, whose points are pushed through these holes, and their heads appear within the lip, as another row of teeth immediately under their own.

These are their native ornaments: but many beads of European manufacture were found among them, chiefly of a pale blue colour, which they hang in their ears, about their caps, or join to their lip-ornaments, which have a small hole drilled in each point to which they are fastened, and others to them, till they hang sometimes as low as the point of the chin. They also wear bracelets of the shelly beads, or others of a cylindrical shape, made of a substance like amber, with such also as are used in their ears and noses.

The men frequently paint their faces of a bright red, and sometimes of a blue or leaden colour, but not in any regular figure; and the women, in some measure, endeavour to imitate them, by staining the chin with black, that comes to a point in each cheek.

Their habitations are ill-made and inconvenient; they are, in general, from four to six feet high, about ten feet long, and about eight feet broad, built with thick plank, and the crevices filled up with dry moss. The method they use in making plank is to split the trees with wooden or stone wedges.

Their articles of food are fish and animals of all kinds. They also eat the vegetables which their country affords, and the inner bark of the pine-tree, which is an excellent antidote to the scurvy, which prevails in this country very much.

Their beverage is most probably water; for in their boats they were seen to bring snow in the wooden vessels, which they swallowed by mouthfuls. Perhaps it could be carried with less trouble, in these open vessels, than water

PRINCE WILLIAM. Their method of eating is very different from ours, for they always to adhere to their victuals, and eat the raw fat of the animal, and into mouthfuls, which they are said of their people to be very clean and healthy. The wooden vessels, in which they were kept in excess, were neat, and from

Their canoes are open, and the other observes that in one and one man, besides and compared the description of what is Greenland, and in manner, with no head and stern, some resemblance is of slender pieces seals, or of other compose the outer canoes of these people and of the same manner, and Esquimaux material. Some of in proportion to the and the head or front of a violin.

Their weapons are the same that are the same that defensive armour mail, made of the which makes it to admit an arrow or body, and may not stays.

Of domestic use wood; and others, sides are made of boxes, though the bottoms fixed in smaller, and of a bling a large oval shallow, made from These last are some little square bags, frocks, neatly ornamented with interwoven with sinews, and bound ingeniously plaited so closely wrought

themselves. Their method of eating seems decent and cleanly, for they always took care to separate any dirt that might adhere to their victuals: and though they sometimes did eat the raw fat of some sea-animal, they cut it carefully into mouthfuls, with their small knives. The same might be said of their persons, which, to appearance, were always clean and decent, without grease or dirt; and the wooden vessels, in which their victuals are probably put, were kept in excellent order, as well as their boats, which were neat, and free from lumber.

Their canoes are of two sorts, the one being large and open, and the other small and covered. Captain Cook observes that in one of the large boats were twenty women and one man, besides children. He attentively examined and compared the construction of this with Crantz's description of what he calls the great or women's boat, in Greenland, and found that they were built in the same manner, with no other difference than in the form of the head and stern, particularly of the first, which bears some resemblance to the head of a whale: the framing is of slender pieces of wood, over which the skins of seals, or of other larger sea-animals, are stretched, to compose the outside. It appeared, also, that the small canoes of these people are made nearly of the same form and of the same materials with those used by the Greenlanders and Esquimaux; at least the difference is not material. Some of these carry two men. They are broader in proportion to their length than those of the Esquimaux; and the head or forepart curves somewhat like the head of a violin.

Their weapons and instruments for fishing and hunting are the same that are made use of by the Esquimaux. For defensive armour they have a kind of jacket, or coat of mail, made of thin laths, bound together with sinews, which makes it quite flexible, though so close as not to admit an arrow or dart; it only covers the trunk of the body, and may not be improperly compared to a woman's stays.

Of domestic utensils they have oval shallow dishes, of wood; and others, of a cylindrical shape, much deeper; the sides are made of one piece, bent round, like our chip-boxes, though thick, neatly fastened with thongs, and the bottoms fixed in with small wooden pegs: others are smaller, and of a more elegant shape, somewhat resembling a large oval butter-boat, without a handle, but more shallow, made from a piece of wood or horny substance. These last are sometimes neatly carved. They have many little square bags, made of the same gut with their outer stocks, neatly ornamented with very minute red feathers interwoven with it, in which are contained some very fine sinews, and bundles of small cord, made from them, most ingeniously plaited: they have also chequered baskets, so closely wrought as to hold water; wooden models of

their canoes; little images, four or five inches long, either of wood or stuffed, which are covered with a bit of fur, and ornamented with pieces of small quill-feathers, in imitation of their shelly heads, with hair fixed on their heads. Whether these might be mere toys for children, or held in veneration, as representing their deceased friends, and applied to some superstitious purpose, could not be determined. They have instruments made of two or three hoops, or concentric pieces of wood, with a cross-bar fixed in the middle, to hold them by; to these are fixed a great number of dried barnacle-shells, with threads, which serve as a rattle, and make a loud noise when they shake them.

They have iron knives, some of which are straight, others a little curved, and some very small ones, fixed in long handles, with the blades bent upward; they have knives of another sort, which are sometimes near two feet long, shaped almost like a dagger, with a ridge in the middle. These they wear in sheaths of skins, hung by a thong round their neck, under their robe; and they are, probably, only used as weapons, the other knives being apparently applied to other purposes. Every thing they have, however, is as well and ingeniously made as if they were furnished with the most complete tool-chest; and their sewing, plaiting of sinews, and the small work on their little bags, may be put in competition with the most delicate manufactures found in any part of the known world: in short, considering the otherwise uncultivated and rude state in which these people are, their northern situation, amidst a country perpetually covered with snow, and the wretched materials they have to work with, it appears that their invention and dexterity, in all manual works, is, at least, equal to that of any other nation.

### SECTION III.

#### PORT DES FRANCAIS.

*Discovery, &c.]* This port was discovered by that eminent French circumnavigator, M. de la Perouse, on his arrival at the north-west coast of America, in June, 1786, of which he gives the following account in his narrative.

"Being in the latitude of fifty-eight degrees thirty-six minutes north, we discovered a falling-in of the coast, which appeared to be a very fine bay. I stood towards it, and, at the distance of a league, sent two officers to reconnoitre it; and, from the report they made on their return, I resolved to shape my course towards the passage, and, having entered it, came to an anchor.

"This port had never been discovered by any other navigator: it is situated in latitude fifty-eight degrees thirty seven minutes north, thirty-three leagues to the north-west of that of Los Remedios, the extreme boundary of Spa-

ish navigators, about two hundred and twenty-four leagues from Nootka, and a hundred from Prince William's, Sound. The calmness of the interior of this bay was very delightful to us, who were under the absolute necessity of making an almost entire change in our stowage, for the purpose of getting out six guns that were in the hold, without which it would have been imprudent to navigate the Chinese seas, so frequently infested by pirates. I gave this place the name of Port des Français.

"To form a conception of this bay, let us suppose a basin of water, of a depth in the middle that could not be fathomed, bordered by peaked mountains, of an excessive height, covered with snow, without a blade of grass upon this immense collection of rocks, condemned by nature to perpetual sterility. I never saw a breath of air ruffle the surface of this water: it is never troubled but by the fall of enormous pieces of ice, which continually detach themselves from five different glaciers, and which, in falling, make a noise that resounds far in the mountains. The air is in this place so very calm, and the silence so profound, that the mere voice of a man may be heard half a league off, as well as the noise of some sea-birds, which lay their eggs in the cavities of these rocks. It was at the extremity of this bay that we were in hopes of finding channels by which we might penetrate into the interior of America.

"We soon perceived Indians, who made signs of friendship to us, by hanging up in the air white cloaks and different skins. Several canoes of these Indians were fishing in the bay, where the water was as smooth as in a basin, whilst the jetty was seen covered with foam by the breakers; but the water was very smooth beyond the passage, which was an additional proof to us that there was a considerable depth. During our forced stay at the entrance of the bay, we had been continually surrounded by the canoes of the Indians. In exchange for our iron, they offered us fish, skins of otters and other animals, as well as different little articles of their dress: they had, to our great surprise, the appearance of being well accustomed to traffic, and made a bargain, in favour of themselves, with as much ability as the most experienced purchasers of Europe. There was none of our articles of commerce for which they expressed so ardent a desire as iron; they accepted also some beads, but it served rather to finish a bargain than to form the basis of an exchange. We prevailed upon them in the end to receive plates and pewter-pots; but these articles had only a transient success, and iron prevailed over all. This metal was by no means unknown to them; they had each of them a dagger of it hung from their neck: the form of this instrument resembled that of the *creese* of the natives of Hindoostan; but they bore not any resemblance in the handle, which was no more than a lengthening of the blade,

rounded, and without an edge. This weapon was enclosed in a case of tanned leather, and it appeared to be the most valuable article in their possession. Observing us to examine these daggers with great attention, they made signs to us, that they never used them but against bears and other beasts of the forests. Some of them were also made of copper, but they did not appear to prefer them to others, as that metal is common enough among them.

"Soon after our arrival, we were visited by one of the principal villagers. Before he came on board, he seemed to address a prayer to the sun; he afterwards made us a long speech, which was terminated by some very agreeable songs: the Indians of his canoe accompanied him by repeating the same air in chorus. After this ceremony, they almost all of them came on board, and during the space of an hour danced to the sound of their own voices. I made the chief several presents, which rendered him so troublesome, that he every day passed five or six hours on board, and I was obliged to renew them very frequently, or else he went away discontented, and muttering threats, which, however, were not very dangerous. On the day of our arrival at the second anchorage, we established the observatory upon an island, which was only a musket-shot from the ship; here we formed a settlement for the time of our stay in this port. As soon as we had established ourselves upon the island, almost all the Indians of the bay repaired thither. The report of our arrival had spread itself to the adjacent parts: we saw the arrival of several canoes, filled with a very considerable quantity of otterskins, which these Indians bartered for hatchets, knives, and bar-iron. They gave us their salmon for pieces of old hoops; but they afterwards became more knowing, and we could not procure this fish, except for nails and other small pieces of iron.

"As all the Indian villages were on the continent, we flattered ourselves with being in a state of security upon our island, but we were soon convinced of the contrary. We had already experienced that the Indians were great thieves, but we did not suppose them to be possessed of an activity and obstinacy capable of carrying into execution the longest and most difficult projects. We were soon taught to know them better. They passed every night in watching the most favourable opportunity to rob us; but we kept a good guard on board our ships, and they seldom deceived our vigilance. I had, besides, established the Spartan law; the person robbed was punished; and, if we did not applaud the robber, we at least reclaimed nothing, in order to avoid any quarrel, that might be attended with melancholy consequences. I do not dissemble that this extreme lenity rendered them insolent; I had, however, endeavoured to convince them of the superiority of our arms; a cannon, with ball, had been discharged in their presence, for the purpose of letting them see that

they could be resisted with ball, had, in the Indians, penetrated which they had, by signs, that it besides, our most over their heads. inspiring us with vinced, by their d'ne exhaustible; th settlement I had there in the night versed a very thin the day, and gl stirring a leaf, th carry off some address to intro guard of the ob ornamented with officers, who, b under their bols twelve soldiers, officers. they could be reached at a distance, and a musket, loaded with ball, had, in the presence of a great number of these Indians, penetrated through several doubles of a cuirass which they had sold to us, after having made us understand, by signs, that it was impenetrable to arrows and daggers; besides, our most expert marksmen killed the birds flying over their heads. I am very certain they never thought of inspiring us with sentiments of fear; but I have been convinced, by their conduct, they imagined our patience to be inexhaustible; they soon compelled me to take away the settlement I had made upon the island: they disembarked there in the night from the side of the coast; they traversed a very thick wood, which was totally impervious to the day, and gliding upon their bellies, almost without stirring a leaf, they contrived, in spite of our sentinels, to carry off some of our effects; in a word, they had the address to introduce themselves into the tent where the guard of the observatory slept; they took away a musket ornamented with silver, as well as the clothes of the two officers, who, by way of precaution, had placed them under their holster; they were unperceived by a guard of twelve soldiers, and they never once awakened the two officers. This last theft would have given us but little disquiet, but for the loss of the original memorandum-book, in which was written all our astronomical observations since we had arrived in Port des Français.

"The chief before mentioned paid us another visit on board, better attended, and much better dressed, than before. After many songs and dances, he made a proposal to sell me the island on which we had placed our observatory, reserving, no doubt, to himself and the other Indians, the right of robbing us. It was somewhat more than doubtful whether this chief had a property in any land; the government of this people is such, that the country might belong to the whole society: however, as many Indians were witnesses to this bargain, I had an undoubted right to conclude that they gave their sanction to it, and I accepted the chief's offer; convinced, at the same time, that the contract for this purchase might be set aside by many tribunals, if the nation should ever contest it with us; for we had no proof that the chief was the real proprietor, and the witnesses his representatives. Be that as it may, I gave him several ells of red cloth, hatchets, knives, bar-iron, and nails; I also made presents to all his suite. The bargain being thus concluded, I sent to take possession of the island with the customary formalities. I ordered them to bury a bottle at the foot of a rock, which contained an inscription adapted to this taking possession, and I laid near it one of the bronze-medals which had been struck in France before our departure.

"The principal work which had been the peculiar object of our stopping here was finished; our guns were mounted, our stowage completed, and we had taken in a

great quantity of wood and water. No port in the universe could furnish more conveniences for expediting this labour, which is frequently so difficult in other countries. Cascades, falling from the top of the mountains, poured the clearest water into the casks as they lay in the long boat; drift-wood in great abundance is scattered along the shore of a smooth sea. The survey was finished, as well as the measurement of a base taken, which had enabled many of our officers to measure trigonometrically the height of the mountains. We had only to regret the loss of the memorandum-book of observations; and this misfortune was nearly done away by the different notes, which had been found again.

"But a misfortune of the most lamentable kind, which no human prudence could foresee, at this period awaited us. It is with the most lively grief that I am about to trace the story of a disaster, which was a thousand times more afflicting than disease and all the other events incident to long voyages. I yield to the imperious duty I have imposed on myself of writing this narrative; and I am not ashamed or afraid to make known that my sorrows since this event have been a hundred times accompanied by my tears; that time has not had power to assuage my grief; every instant, every object recalls to my mind the loss we sustained, in circumstances where we thought we had so little cause to dread such an event.

"As it was proposed that the soundings should be laid down in the draught of Monsieur de Monneron, engineer in chief, and Monsieur Bernizet, geographical engineer, by the sea-officers, the pinnacle of the *Astrolabe*, under the orders of M. de Marchainville, an officer of that ship, was ordered for the next day, and I prepared that belonging to my ship, as well as the barge, the command of which I gave to M. Boutin, an officer of the *Boussole*. M. d'Escures, my first lieutenant, chevalier of St. Lewis, commanded the pinnacle of the *Boussole*, and was the commanding officer of this little expedition. As his zeal had sometimes appeared to me to be rather too warm, I thought it my duty to give him his instructions in writing. The details I made of the prudence which I expected from him appeared to him so minute, that he asked me if I thought he was a child, adding, that he had commanded ships before that time. I amicably explained to him the motive of my orders: I told him, that M. de Langle, commander of the *Astrolabe*, and I had sounded the passage of the bay two days before, and that I perceived that the commanding officer in the second boat had passed too near the point, upon which he had even touched: I added, that young officers, during a siege, deemed it a feather in their cap to mount the parapet of the trenches; and that the same spirit made them, when in boats, brave the dangers of rocks and breakers; but that this unreflecting boldness might be attended with the most melancholy con-

sequences in a voyage like ours, where these kind of dangers were every moment presenting themselves before us. After this conversation, I gave M. d'Escures the following instructions in writing, which I read to M. Boutin: they will explain, better than any other exposition, the mission of M. d'Escures, and the precautions which I took.

"Previous to making known to M. d'Escures the object of his mission, I apprise him, that he is expressly forbidden to expose the boats to any danger, and to approach the passage, if the sea break there. He is to set off at six o'clock in the morning, with two other boats, commanded by Messrs. de Marchainville and Boutin, and sound the bay from the passage as far as the little creek which is to the west of the two paps. He is to lay down the soundings upon the draught which I have put into his hands, or to sketch one from which they may be taken. Even if there is no broken water in this channel, but only a swell, as this work is not very pressing, he is to postpone sounding till another day; and he will constantly keep in view that all things of this kind which are done with difficulty are always done ill. It seems probable, that the most convenient moment for approaching the channel will be at slack water, about half-past eight o'clock; if circumstances are then favourable, he will endeavour to measure the breadth of it with a log-line, and he is to place the three boats in a parallel line, sounding across it, or from east to west. He is afterwards to sound from north to south; but there is little likelihood of his being able to take these latter soundings during the same tide, because the current will have acquired too great strength.

"In waiting for slack water, or supposing the sea should be rough, M. d'Escures will take the soundings of the interior of the bay, particularly the creek which is behind the paps, where I think it is likely there may be a very good anchorage: he is also to endeavour to lay down upon the draught the extent of the two bottoms of rock and sand, in order that the good ground may be well and easily known. I think that, when the channel from the south of the island is open from the point of the paps, there is a certainty of a good sandy bottom. M. d'Escures is to ascertain whether my opinion be well founded; but I again repeat, that I entreat him not to deviate from the most consummate prudence.

"After these instructions could I be supposed to have any thing to fear? They were given to a man of thirty-three years of age, who had before commanded men-of-war. What a combination of motives for security!

"Our boats set off, as I had ordered, at six o'clock in the morning: it was as much a party of pleasure as of utility and instruction; they might hunt and breakfast under the trees. I joined with M. d'Escures, M. Pierrevert and M. de Montarnal, young officers, the latter the only relation that I had in the sea-service, and to whom I was at-

tached with as tender an affection as if he had been my son. No young officer had ever given rise to more promising hopes, and M. de Pierrevert had already acquired what I shortly expected from the other. Seven of the best soldiers of the detachment formed the armament of the long-boat, in which the head pilot of my ship embarked to take soundings. M. Boutin had for second in his small boat M. Mouton, lieutenant of the Boussole. I knew that the boat of the Astrolabe was commanded by M. de Marchainville; but I was not informed whether there were any other officers on board.

"At ten o'clock in the morning I saw our jolly-boat coming back. In some surprise, because I did not expect her so soon, I asked M. Boutin, before he came on board the frigate, if any thing new had occurred: the first thing which struck me, as a cause of fear, was an attack from the Indians. The countenance of M. Boutin was by no means calculated to remove my doubts: in his face was painted the most lively sorrow. He soon informed me of the dreadful wreck he had just witnessed, and from which he had himself escaped only by the firmness of his disposition, which had discovered to him all the resources that remained in such extremity of danger. Drawn away by following his commander into the middle of the breakers, which set into the channel, whilst the tide ran out of it at the rate of three or four leagues an hour, he imagined he could lay his boat's stern to the sea, and driving in this manner it would prevent her from filling, so that she might nevertheless be drifted out to sea by the tide. He soon saw breakers ahead of his boat, and found himself in the main sea. More taken up with the safety of his comrades than with his own, he rowed along the edge of the breakers, in hopes of saving some of them; he even pushed into them again, but was repelled by the tide; at length he got upon the shoulders of M. Monton, in order to see to a greater distance: vain hope! all, alas, had been swallowed up, and M. Boutin returned at the time of slack water. The sea having become very calm, this officer entertained some hopes for the pinnacle of the Astrolabe. He had only seen ours perish. M. de Marchainville was at the time a full quarter of a league from the place of danger, that is to say, in water as perfectly calm as the best enclosed port; but this young officer, impelled by a generosity which undoubtedly was imprudent, since in these circumstances all assistance was impossible, having too high a courage, and too elevated a soul, to make these reflections when his friends were in so imminent a danger, flew to their assistance, threw himself into the breakers, and perished like his commanding officer, a victim to his generosity and formal disobedience of orders.

"M. de Langle soon came on board my ship, equally oppressed with grief as myself, and with tears in his eyes,

informed me that  
than I imagined.

informed me that the misfortune was still infinitely greater than I imagined. Since our departure from France, he had made it an invariable rule never to send the two brothers, Messrs. la Bourde Marchainville and la Borde Bouterwilliers, on the same expedition, and he had yielded in this single instance to the desire which they had expressed to walk and hunt together; for it was almost under this point of view that both of us had considered this excursion of our boats, which we thought as little exposed to danger as they would have been in Brest Road, when the weather was remarkably fine.

"At the same moment we had a visit from the Indians in their canoes, to announce to us this melancholy event: these rude unpolished men expressed to us, by signs, that they had seen our two boats perish, and that there was no possibility of affording them assistance; we loaded them with presents, and endeavoured to make them understand, that he who should have saved a single man would have been entitled to all our riches.

"Nothing could be better calculated to move their humanity; they hastened to the sea-shore, and spread themselves over the two coasts of the bay. I had already despatched my long-boat, commanded by M. de Clouard, second captain of the Bousole, to the eastward, where if any one, contrary to all probability, had escaped death, it was likely he would land. M. de Langle went upon the western shore, in order to leave no part unvisited, and I remained on board, charged with the protection of the two ships, with the necessary compliment of men to preclude all fear from the Indians, against whom prudence required that we should be constantly on our guard. Messrs. de Langle and Clouard were attended by all the officers, and many other persons: they went three leagues along the beach, upon which, however, not the smallest wreck came ashore. I, nevertheless, still entertained a small degree of hope; the mind with difficulty acquiesces in so sudden a transition from a pleasant situation to that of so rooted a sorrow; but this illusion was destroyed by the return of our boats, and I was thereby plunged into a state of such acute distress, as no language is adequate to describe, but in the most imperfect manner.

"Nothing more now remained to be done but to quit, as speedily as possible, a country where we had experienced so melancholy a disaster; but there were still some days due to the families of our unfortunate friends: too precipitate a departure might occasion doubts and uneasiness in Europe; it might not occur to people there, that the current extended no farther than a league without the channel; that the boats, and those wrecked in them, could be driven to no greater distance; and that the fury of the sea in that place dissipated every hope of their return. If, contrary to any probability, any of them had been able to return, as this could only happen in the vic-

nity of the bay, I formed the resolution of waiting some days longer; but I quitted the anchorage of the island, and took that of the bed of sand, which is at the entrance upon the west coast. It took me five days to effect this passage, though no more than a league, during which time we were exposed to a squall of wind, which would have put us in very great danger, had we not been anchored in a good muddy bottom. It was fortunate we did not drag our anchors, for we were less than a cable's length from the shore. The wind being contrary, detained us longer than I intended to stay, and we did not sail till the 30th of July, eighteen days after the event, the description of which has given me so much pain, and the remembrance of which will perpetually make me unhappy. Before our departure we erected upon the island in the middle of the bay, to which I gave the name of *Cenotaph Island*, a monument to the memory of our unfortunate companions. The following inscription was composed by M. de Lemon, a scientific man, who buried it in a bottle at the foot of the monument:—

"At the entrance of this harbour perished twenty brave seamen.

"Reader, whoever thou art, join thy tears to ours."

*Description of the Harbour.*] "In the harbour," says M. de la Perouse, "to which I gave the name of Port des Français, the sea rises seven feet and a half at full and change of the moon. The sea-breezes, or, perhaps, other causes, act so powerfully upon the current of the channel, that I have seen the flood come in there like the most rapid river; and, in other circumstances, though at the same periods of the moon, it may be stemmed by a boat. I have in my different excursions found the high-water mark to be fifteen feet above the surface of the sea.

"These tides are probably incident to the bad season. When the winds blow with violence from the southward, the channel must be impracticable, and at all times the currents render the entrance difficult; the going out of it also requires a combination of circumstances, which may retard the departure of a vessel many weeks; there is no getting under way but at the top of high water; the breeze from the west to the north-west does not often rise till towards eleven o'clock, which does not permit the taking advantage of the morning-tide; finally, the easterly winds, which are contrary, appear to me to be more frequent than those from the west, and the vast height of the surrounding mountains never permits the land-breezes, or those from the north, to penetrate into the road. As this port possesses great advantages, I thought it a duty incumbent on me to make its inconveniences also known. It seems to me, that this anchorage is not convenient for those ships which are sent out at a venture for trafficking in skins: such ships ought to anchor in a great many bays,

and always make the shortest stay possible in any of them, because the Indians have always disposed of their whole stock in the first week, and all lost time is prejudicial to the interests of the owners: but a nation which should form the project of establishing factories, similar to those of the English in Hudson's Bay, could not make choice of a place more proper for such a settlement. A simple battery of four heavy cannon, placed upon the point of the continent, would be fully adequate to the defence of so narrow an entrance, which is also made so difficult by the currents. This battery could not be turned or taken by land, because the sea always breaks with such violence upon the coast, that to disembark is impossible. The fort, the magazines, and all the settlements for commerce, should be raised upon Cenotaph Island, the circumference of which is nearly a league; it is capable of being cultivated, and there is plenty of wood and water. The ships, not having their cargo to seek, but being certain of having it collected to a single point, would not be exposed to any delay; some buoys, placed for the internal navigation of the bay, would make it extremely safe and easy; it would form pilots, who, better versed than we are in the set and strength of the current at particular times of tide, could ensure the entrance and departure of the ships. Finally, our traffic for otter-skins has been so very considerable, that I may fairly presume, there could not in any part of America be a greater quantity of them collected."

*Climate.*] The climate of this coast seemed to be infinitely milder than that of Hudson's Bay, in the same degree of latitude. Some of the pines measured six feet in diameter, and one hundred and forty feet in height; those of the same species at Prince of Wales's Fort and Fort York are of a dimension scarcely sufficient for studding-sail booms.

*Vegetable, Animal, and Mineral, Productions.*] Vegetation is very vigorous during three or four months of the year. The Europeans found great abundance of celery, round-leaved sorrel, lupines, the wild pea, yarrow, and endive. Every day and every meal the copper of the ship's company was filled with them. They ate them in soups, ragouts, and salads, and these herbs did not a little contribute to keep them in a good state of health. There was seen among these pot-herbs almost all those of the meadows and mountains of France; the angelica, the butter-cup, the violet, and many species of grass proper for fodder.

The woods abound in gooseberries, raspberries, and strawberries, clusters of elder-trees, the dwarf-willow, different species of briar, the gum-poplar tree, the willow, the horn-beam, and superb pines, fit for the masts of the largest ships. Not any of the vegetable productions of this country are unknown in Europe. M. de Martinière,

in his different excursions, met with only three plants which he thought new.

The rivers are filled with trout and salmon, and in the bay are stettans, ling, the single thornback, and some plaice. Muscles are scattered in profusion upon that part of the shore which is uncovered at low water, and the rocks are clothed with small limpets. M. de Lamanon took from a place elevated more than two hundred toises above the level of the sea, petrefactions well preserved, and of the largest dimensions, of the shell known by conchologists under the name of the *royal cloak*, or *St. James's shell*.

In the woods the hunters met with bears, martins, and squirrels; and the Indians sold them skins of the brown and black bear, of the Canadian lynx, ermine, marten, little grey squirrel, beaver, Canadian marmot or monax, and the red fox. M. de Lamanon also took alive a water and a musk rat.

There is no great variety of birds, but the individuals are pretty numerous. The thickets abound with sparrows, nightingales, blackbirds, and yellow-hammers. Here are also the white-headed eagle, a large species of raven, king-fishers, blue jays, and some humming-birds. The swallow or martin, and the black oyster-catcher, build their nests in the clefts of the rocks on the sea-shore.

From among the minerals, the French naturalists collected ochre, coppery pyrites, garnets, brittle but very large and perfectly crystallized, schorle in crystal, granite, schist, hornstone, very pure quartz, mica, plumbago, and coals; some of these substances prove that the mountains contain copper and iron ores.

*Inhabitants, Customs, Manners, &c.*] The inhabitants of this place have rather a low forehead, but more open than that of the South-Americans. Their eyes are black; and very animated, their eye-brows full, their noses well-formed, except being widened a little at the extremity, their lips thin, their mouths moderately large, their teeth fine and very even, their chin and ears very regular. The colour of their skin is very brown, owing to their being exposed continually to the air; but their children, at the time of birth, are white. The beards of the men are less than that of Europeans, but, nevertheless, sufficient to take away all possibility of doubt of their existence. "The belief," says our author, "that the American Indians have no beards, is an error which has been too slightly adopted: I have seen the native Indians of New England, Canada, Acadia, and Hudson's Bay; and I have found amongst the different nations several individuals with beards, which led me to think that the others were in the habit of pulling them out by the roots."

"The frame of their body is feeble; the weakest of our sailors would overcome in wrestling the strongest of the Indians. I have seen some of them, whose swelled legs seemed symptomatic of the scurvy, but their gums were

in a very good state, arriving to any great degree who seemed to have no privilege, and without any different labours of

in a very good state: I have my doubts, however, of their arriving to any great age, and I perceived only one woman who seemed to have reached sixty; she did not enjoy any privilege, and was, like the others, subjected to the different labours of her sex."

The men pierce the cartilage of the ears and nose, to which they hang different small ornaments. They make scars on their arms and breast, with a very keen-edged instrument, which they sharpen by passing over their teeth, as over a stone; their teeth are filed close to the gums, and for this operation they use a sand-stone, rounded in the shape of a tongue. They use ochre, soot, and plumbago, mixed up with train-oil, to paint the face and the rest of the body, in a frightful manner. In their full-dress, their hair is flowing at full-length, powdered, and plaited with the down of sea-birds: this is their greatest luxury, and is, perhaps, reserved only to the chiefs of a family: their shoulders are covered with a simple skin; the rest of the body is absolutely naked, except the head, which is generally covered with a little straw-hat, very skilfully plaited; but they sometimes place on their heads two horned bonnets of eagles' feathers, and even whole heads of bears, in which they fix a wooden skull-cap. These several head-dresses are extremely various; but their principal object is to render themselves frightful, perhaps for the purpose of keeping their enemies in awe.

Some of the Indians had entire shirts of otters' skins, and the common dress of a great chief was a shirt of a tanned skin of the elk, bordered with a fringe of deers' hoofs and beaks of birds, which, when they dance, imitates the noise of a kind of bell. This same dress is very well known among the savages of Canada, and other nations who inhabit the eastern parts of America.

The women have a strange custom of wearing in the lower-lip an elliptical piece of wood, lightly grooved on its circumference and both its sides, and which is commonly half an inch thick, two in diameter, and three in length. This singular ornament, besides being a great deformity, is the cause of a very troublesome, as well as disgusting, involuntary flow of saliva. This appendage is peculiar to the women; and female children are made to undergo the preparatory operations from the time of their birth.

The arts are somewhat advanced among these people, and in this respect civilization has made considerable progress; but that which softens their natural ferocity, and polishes their manners, is yet in its infancy; and the mode of life they pursue excluding all kind of subordination, they are continually agitated by fear or revenge; and are continually attacking each other. Exposed in the winter to perish for want, because the chase cannot be successful, they live during the summer in the greatest abundance, as they can catch in less than an hour a sufficient quantity of fish for the support of a family; they remain idle dur-

ing the rest of the day, or devote it to gaming, to which they are much addicted.

"Indians in their canoes," says M. de la Perouse, "were continually round our frigates; they passed two or three hours there before they began to exchange a few fishes, or two or three otter-skins; they seized all occasions to rob us; they tore off the iron which was easy to be carried away, and, above all, they examined carefully how they might deceive our vigilance during the night. I caused the principal persons amongst them to come on board my frigate, and loaded them with presents; yet these very men whom I so particularly distinguished, did not disdain the theft of an old pair of breeches, or a nail. When they assumed a mild and pleasant appearance, I was convinced they had stolen something, although I frequently pretended not to perceive it.

"I had expressly recommended the caressing of their children, and giving them little presents. The parents were insensible to this mark of benevolence, which I thought incident to all countries; the only reflection it gave rise to in their breasts was, to ask to accompany their children when I made them come on board; and I several times, for my instruction, had the pleasure of seeing the father take advantage of the moment in which we seemed most engaged with his child, to take up and hide under his garment any thing that lay within his reach.

"Sometimes, immediately after loading them with presents, I pretended to have a desire for certain little articles of trifling value, which belonged to these Indians; but this was a trial of their generosity which I always made in vain.

"We never went on shore but well armed and in force. They were very much afraid of our firelocks, and eight or ten Europeans in a body might keep a whole village in awe. The surgeon-majors of our two frigates having been so imprudent as to go a hunting by themselves, were attacked by the Indians, who endeavoured to force their muskets from them, but in this they were unsuccessful: thus two men, without any other assistance, made so good a defence as to oblige them to retire. The same event was experienced by M. de Lesseps, a young Russian interpreter, to whose assistance one of our boat's crews very fortunately arrived.

"I gave the name of *village* to three or four wooden sheds, of twenty-five feet in length, and fifteen in breadth, covered only to windward with planks, or bark of trees; in the middle was a fire, over which were hung some flat fish and salmon, drying in the smoke. Eighteen or twenty persons were lodged in each of these sheds; on one side the women and children, and the men on the other. It seemed to me that every cabin formed a small colony, independent of its neighbour; each of them had its canoe, and a kind of chief; it took away its planks and fish, de-

parted and proceeded out of the bay, without the rest of the village seeming to be at all concerned. I think I may venture to assert, that this port is inhabited only in the favourable season, and that the Indians never pass a winter in it. I did not see a single cabin sheltered from the rain; and although there had never been collected together so many as three hundred Indians in the bay, we were visited by seven or eight hundred others.

"The canoes were continually entering and going out of the bay, and each of them brought and carried away their house and furniture, which consisted of a great many small boxes, in which were enclosed their most valuable effects. These boxes are placed at the entrance of their cabins, which exhale a stench, worse than that of the den of any animal in the world. They never remove themselves more than a few steps for the performance of any necessary occasion, in which they seek neither for shade nor privacy; and when this happens during a meal, they take their place again, from which they never were at a greater distance than five or six feet.

"By our stay at the entrance of the bay, we procured infinitely more knowledge of the manners and customs of these Indians, than we could possibly have obtained at the other anchorage. Our ships lay at anchor near their villages. We every day made them visits, and every day we had cause of complaint against them; though our conduct towards them had never varied, and we had never ceased giving them proofs of our mildness and benevolence.

"Like us, they fish by staking the rivers, or with a line. In the latter method they are very ingenious: they fasten to every line a large seal's bladder, and then throw it into the water; from every canoe a dozen or fifteen lines may be cast: when the fish is hooked, it sets the bladder in motion, and the canoe hastens after it; two men may thus watch a dozen or fifteen lines without the trouble of holding them in their hands.

"They know how to forge iron, to fashion copper, to spin the hair of different animals, and, by the help of a needle, to fabricate with this yarn a tissue equal to our tapestry; they intermix in this tissue narrow strips of otter's skin, which give their cloaks the semblance of the finest silk shag. In no part of the world can hats and baskets of reeds be plaited with more skill; they figure upon them very agreeable designs; they also engrave very tolerably figures of men and animals in wood and stone; they inlay boxes with mother-of-pearl, the form of which is very elegant; and they make ornaments of a serpentine form, to which they give the polish of marble.

"Their weapons of attack and defence are the dagger, a lance, made of wood hardened by fire, or with iron, according to the wealth of the owner; and a bow and arrows, which are generally tipped at the point with cop-

per; but these bows have nothing particular in them, and are not near so strong as those of many other nations.

"I found amongst their trinkets pieces of yellow amber, but I am ignorant whether it be a production of their country, or whether, like the iron, they have received it from the old continent by their indirect communication with the Russians.

"I have spoken of the passion of these Indians for play; and the custom to which they deliver themselves up with the greatest avidity is a game of chance. They have thirty wooden pieces, each having different marks, like our dice; of these they hide seven; each of them plays in his turn, and he whose guess comes nearest to the number marked upon the seven pieces, is the winner of the stake agreed upon, which is generally a piece of iron or a hatchet. This gaming renders them serious and melancholy: I have, however, frequently heard them sing; and when the chief came to pay me a visit, he commonly paddled round the ship singing, his arms extended in the form of a cross, in token of friendship; he then came on board, and played a pantomime, which was expressive either of combats, surprises, or death."

Our travellers met with a morai, which proved that these Indians were in the habit of burning their dead, and preserving the head. Each of these monuments consists of four tolerably strong stakes, which support a little wooden chamber, in which repose the ashes deposited in coffins. In one of them the Europeans opened the coffins, untied the packet of skins which enveloped the head, and, after having satisfied their curiosity, they scrupulously replaced every thing; and added to it a great many presents of different kinds of iron instruments and beads. The Indians, who were witnesses of this visit, discovered a little uneasiness, but they did not fail to take away the presents.

#### SECTION IV.

#### FOX ISLANDS.

*Situation, Discovery, &c.*] These islands, which have obtained their general appellation from their abounding in foxes of various colours, are situate in about forty-two degrees of north latitude, and one hundred and fifty degrees of west longitude. They are called separately by a variety of names, among which the principal are Atchu, Amlak, Atak, Unmak, Alasku, Oonella, Acootan, and Oonalashka.

In September, 1758, two vessels were fitted out by some Russian merchants to sail to the north-west coast of America, in quest of sea-otters. One of these, called the St. Vlodimir, sailed the 28th of that month, under the command of Dmetri Paikof, carrying on board a collector of tribute, named Shaffyrin, and a crew of forty-

five men. In a place where they were appointed, they were by the contrary winds prevented from the objects they directed to, and were known under the name of Islands.

On the 1st of October, they were called, by the name of Goreloi, or Burakoi, steep and craggy. At Amlak, where they were appointed, they were divided themselves into two parties, Drusinin, and Shaffyrin led the first on board with them.

All the islands were bones stuck through the gristle of their noses, marked with black, and passed under their arms, and their darts.

At first the Indians were invited; but, in a short time, a boy, of about fifteen years of age, named Hermolai, and who might be able to cover a hut, as many boys. He behaved, and he was digging roots. He sociate with the Indians, had given of them, without the least

In the spring, one man on the islands returned. Shaffyrin, who had eleven men, by the first of the natives immediately set on foot, succeeded in his mission, were so considerable, very critical. The islands were allay, by Betshevin, and joined in part, Amlak, the other

The consort put to sea on the

five men. In a short time they reached Beering's Island, where they wintered. In July, 1759, they steered towards the south, in order to discover land; but being disappointed, they bore away for the Aleutian Isles. Contrary winds preventing them from effecting this purpose, they directed their course for the distant islands, now known under the name of Lyssie Ostrova, or the Fox Islands.

On the 1st of September they reached the first of these, called, by the natives, Atak or Atchn, and, by the Russians, Goreloi, or Burnt Island; but as they found the coasts very steep and craggy, they made for an adjoining island, named Amlak, where they determined to winter. To accomplish the purposes of their voyage with more expedition, they divided themselves into three parties. At the head of one was Drusinin, who went over to the small island of Sitkin; Shaffyrin led the second to Atak; and Polevoi remained on board with the rest of the crew.

All the islands were well peopled. The men had bones stuck through their ears, under their lips, and in the gristle of their noses. The faces of the women were marked with blackish streaks, made by a needle and thread passed under the skin. They had no iron among them; and their darts were pointed with bone and flint.

At first the Russians imagined that Amlak was uninhabited; but, in one of their hunting parties, they met with a boy, of about eight years of age, whom they named Hermolai, and taught him the Russian tongue, that he might be able to act as an interpreter. Soon after, they discovered a hut, in which were two women, four men, and as many boys. These people they conciliated by a mild behaviour, and employed them in hunting, fishing, and digging roots. By degrees, others were induced to associate with them, from the character their countrymen had given of the strangers; and they passed the winter without the least interruption.

In the spring, the hunting parties returned, who had lost one man on the island of Atak; in June, 1760, the same parties returned to their former stations; and shortly after, Shaffyrin, who headed one of them, was cut off, with eleven men, by the inhabitants of Atak. Drusinin received the first intelligence of this massacre from some of the natives of Sitkin, where he then resided; and immediately set out to join his companions on board. He succeeded in regaining the vessel; but their numbers were so considerably reduced, that their situation was very critical. At this period, however, their apprehensions were allayed by the arrival of a vessel, commanded by Betshevin, at the island of Atak. Both crews now joined in partnership. The one of them wintered at Amlak, the other continued at Atak.

The consort vessel was named the Gabriel. She had put to sea on the 31st of July, 1760, and was well manned;

carrying, besides, some passengers, and agents for the merchant at whose risk she was fitted out. The Gabriel, having reached the Aleutian Isles, stood from thence to make new discoveries among the more remote islands, which lie in a chain to the extent of fifteen degrees of longitude. On the 25th of September they reached Burnt Island, as has been previously mentioned, and joined crews with the St. Vladimir, which was in momentary dread of being attacked by the natives.

During the ensuing winter they obtained a valuable collection of furs and sea-horse teeth. In the following June, the two crews being distributed on board the consort vessels, the Vladimir remained at Amlak, with an intention of proceeding to Kamtschatka, while the Gabriel put to sea in quest of new discoveries.

After touching at Umnak, to take in wood and water, they sailed to the remote island of Alaksu, where, having secured the ship, they built huts, and made other preparations for wintering. They found this island populous; and at first the natives behaved in a friendly manner, and even delivered up nine of their children as hostages to the Russians, to obviate all suspicion of treachery; but, in a short time, the irregular behaviour of the crew alienated their affections, and provoked them to hostilities. In January, 1762, two of the principal persons on board, with a party of twenty men, proceeding along the shore, offered some violence to the young females; in resentment of which their countrymen fell upon the aggressors, and the two leaders were killed, and three wounded. Not long after, the watch of the crew was suddenly attacked, when several of the Russians lost their lives, and their huts were reduced to ashes. The following May, two other Russians were killed, as they were going to bathe in the warm-springs on the island, not far from the harbour; on which seven of the innocent hostages were put to death. The same month, a general attack was commenced on the Russians; but, having gained time to prepare their fire-arms, the natives were repulsed with loss. The adventurers, however, finding themselves in continual danger, weighed anchor, and sailed for Umnak, where they seized some of the inhabitants, with their wives and children, to serve as their guides in the discovery of other islands. Stormy weather setting in, they were driven out to sea, to the westward, with such violence, that all their sails were carried away. At length they struck against land, which was found to be in the district of Stobolskoi Ostrog. Six men were immediately despatched to land, in order to collect some supplies, while the crew endeavoured to ply the ship to the windward. When the boat returned, the men were with great difficulty drawn aboard, and the ship was driven with impetuosity along the coast of Kamtschatka, and ran into the bay of Kalatzoff, where the cargo was landed.

During this voyage, the captain and his crew had behaved so inhumanly towards the islanders, that they were brought to trial for their crimes, and the preceding circumstances, with many aggravations, came out in evidence against them. It appears also they had carried away above twenty women and girls, whom they used with great brutality. On their first approach to the coast, fourteen of these unfortunate females were sent on shore to dig roots and gather berries for their oppressors. Of these, two eloped, and a third was killed; when the rest, in a fit of despair, threw themselves into the sea, and were drowned. The natives of the islands they had visited are described as being tall, and strong built. They make their clothes of the skins of birds; and thrust bones through their under-lips, by way of ornament. Their dwellings are under ground; and they have several apertures on the sides, by which they make their escape, while the principal entrance is beset by an enemy.

The island of Oonella is about 10 miles in circumference; Airotan is considerably larger, and has in it some high mountains covered with snow.

A voyage to Oonalashka was undertaken by a Russian of the name of Drusin. The ship was manned by thirty-four Russians and three Kamtschadales; and the distresses they encountered have hardly been exceeded in any nautical enterprise on record. They sailed from Okotsk on the 6th of September, 1762, and on the 11th of October arrived at the harbour of St. Peter and Paul, where they wintered. In June, 1763, they again put to sea, and, after a prosperous navigation, reached the Aleutian Isles, and anchored before Atak, where they took up seven shipwrecked Russians.

About the middle of July they proceeded to some of the more distant islands, and having laid in a supply of water, they continued their voyage. In the beginning of September they reached Umnak, where they cast anchor. Here a large party landed, and, after passing over to the eastern extremity of the island, they returned in safety to the vessel. During this excursion they found several traces of their countrymen.

On the 22d, Drusin continued his voyage to the northern point of Oonalashka, and, having laid up the vessel in a secure harbour, they took the landing ashore, and began to construct a hut. Three companies were now despatched on a hunting expedition; one, consisting of eleven men, under the guidance of Peter Tsekalef; a second, of the same number, under the command of Michael Kudyakof; and a third, of nine men, under Yephim Kaskitsyn. Of the two last no circumstantial account has ever been received, as not one of them ever returned to Kamtschatka.

Kaskitsyn remained near the harbour, while the other two parties proceeded to the northern part of the island.

Kudyakof stopped at a village called Kalaktak, and Tsekalef went on to Inalok, about thirty versts farther. Having found a dwelling with about seventy inhabitants there, whom he apparently conciliated by kindness, he built a hut for himself and his companions, and kept a constant watch.

On the 4th of December, six of the party being despatched to look after the pit-falls for their game, there only remained five persons, viz. Tsekalef, Korelin, Bragin, Shaffyrin, and Kokovin, to guard the hut. The islanders, seeing them weakened by this separation, took the opportunity of displaying the first proofs of their hostile intentions. As Tsekalef and Shaffyrin were on a visit among them, they suddenly, and without provocation, struck Tsekalef on the head with a club, and afterwards stabbed him with knives. They next fell on his companion, who defended himself with a hatchet with so much resolution, that he effected a retreat to the hut.

Bragin and Korelin, who were in the hut, had immediate recourse to their fire-arms; but Kokovin, being at a small distance, was surrounded by the savages, and desperately wounded, before Korelin could come to his assistance. At last, however, his companion brought him off, though half dead. In a short time the natives surrounded the hut, which, being furnished with musket-holes, stood a siege for four days without intermission. The fire-arms prevented the savages from storming it; but the Russians, on the other hand, found it impossible to move from their retreat on the most urgent occasions. At length, Shaffyrin and Kokovin being a little recovered from their wounds, they all sallied out with their guns and lances, when three of the assailants were killed on the spot, and several wounded, and the rest were put to flight. During the siege, the caps and arms of the six Russians who had been sent to the pit-falls were displayed by the savages in triumph, as a proof that these unfortunate men had fallen victims to their resentment.

On the retreat of the natives, the Russians dragged the baidar into the sea, and rowed out of the bay without molestation. They soon after landed at a small habitation; and, finding it unoccupied, they drew their vessel ashore, and, armed with guns and lances, they traversed the mountains where they had left Kudyakof's party. As they approached Kalaktak, the village where these men had been stationed, they fired from the heights, but no signal being returned, they drew the melancholy conclusion that this party had been massacred. Immediately on the report of the fire-arms, numerous bodies of the islanders made their appearance, and closely pursued the Russians, who escaped their fury only by the favour of the night. Having reached a rock on the sea-shore, where they were sheltered, and could act on the defensive, they made such good use of their fire-arms, that the assailants

thought it prudent than the miserable proceeding towards them. They ran the whole break of day, when, having espied the shore. Alarmed with precipitation several islanders in vessel.

During that day but, when night towards the have view were the fragments of their hopes, and scattered over the mountains they found to the mountains.

Darkness co where they pass covering the isl array, they occ themselves for a part remaining sult with a voll sian fire-arms continued the w

thought it prudent to retire. No sooner were they gone, than the miserable fugitives seized the opportunity of proceeding towards the spot where their vessel lay at anchor. They ran the whole night, without intermission; and at break of day, when they were about three versts from the haven, they espied a locker of the vessel lying on the shore. Alarmed by this unexpected event, they retreated with precipitation to the mountains, where they descended several islanders in their canoes, but no signs of their own vessel.

During that day they kept themselves closely concealed; but, when night set in, they descended with anxious fear towards the haven, and the first objects that met their view were the fragments of the vessel on which they placed all their hopes, and mangled carcases of their companions scattered over the beach. Having collected what provisions they found left by the savages, they again returned to the mountains.

The subsequent day they scooped out a cavity, in which they might shelter themselves, and covered it with a piece of a sail. In the evening they paid another visit to the beach, where they found the image of a saint, and a prayer-book; but all the tackle and lading had been carried off, excepting the sacks for provision, which being made of leather, the savages had ript them up, probably in search of iron, and had left them, with the provision, as useless. The Russians gladly collected these supplies, and dragged them to their mountainous retreat, where they lived in the greatest misery from the 9th of December until the 2d of February following.

To fill up their melancholy hours with some labour that might tend to give them the pleasure of anticipation at least, they constructed a little baidar, which they covered with the leather of the sacks. When completed, they drew it by night to the sea, and, instantly embarking, they rowed along the northern coast of Oonalashka, in order to reach a vessel belonging to Trapesnikof, under the command of Korovin, which, they had reason to apprehend, lay somewhere in that direction. By keeping at some distance from the shore, they had the good fortune to pass three habitations unperceived. Next day, however, they were seen by five islanders in a baidar, who, immediately on deservying them, made towards Makusiuk, before which place the fugitives must necessarily pass.

Darkness coming on, the Russians landed on a rock, where they passed the night, and early next morning discovering the islanders advancing towards them in hostile array, they occupied an advantageous post, and prepared themselves for defence. Part of the savages landing, and part remaining in their baidars, they commenced the assault with a volley of darts; and notwithstanding the Russian fire-arms did considerable execution, the skirmish continued the whole day, at the close of which the enemy

retired, and the fugitives sheltered themselves and their canoe in an adjoining cavern. The attack was again renewed; but the assailants were at length compelled to retire.

In this place the Russians remained posted three days, secure from their enemies; but the sea, rising at a spring-tide, threatened to overflow them, on which they sallied out towards a neighbouring cavern, which they gained without sustaining any loss.

In this new asylum they were confined five weeks, watching by turns, and never venturing more than twenty yards from the entrance. They allayed their thirst with snow-water and the ooings of the rock; and, to appease the calls of hunger, they had a few shell-fish, which they collected on the beach. Driven, at last, by extreme want to the necessity of attempting something, they one night returned to draw their baidar out to sea, and happily escaped unperceived. They continued rowing by night, and concealing themselves by day, by which means they escaped observation, till they fell in with Trapesnikof's vessel, to their unbounded joy, on the 30th of March, 1764.

But, though their calamities were lightened by the enlarged society of their countrymen, they were by no means at an end. Korovin, under whose command they had now put themselves, had suffered scarcely fewer disasters than they had done. He had been repeatedly attacked by the savages, and sustained serious losses, nor was he now in a state of quiet. However, his crew being now reinforced, by the arrival of Korelin and his three companions, to the number of eighteen persons, he put to sea towards the end of April, carrying with him eleven hostages. Contrary winds soon overtook them, and, after combating their fury for some days, they were stranded in a bay of the island of Umnak. The ammunition and sails, together with some skins for the construction of baidars, were with difficulty saved. During the landing, one man was drowned; and in the general confusion eight of the hostages effected their escape.

Under the present distressing circumstances, they secured themselves between their baidar and some empty barrels, spreading the sails over head, in the form of a tent. Two were appointed to watch, while the rest, being worn out with fatigue, laid themselves down to repose. Before day-break, however, they were alarmed by the approach of about one hundred savages, who, at the distance of twenty yards, threw their darts with such force, that many of them pierced through the baidar and the skins, and others fell from above, through the sails. By this discharge the two men on the watch and the three remaining hostages were killed on the spot; and all the Russians were wounded.

So effectually had the latter been surprised, that they had not been able to have recourse to their fire-arms. They

we had seen in Prince William's Sound and the Great River, but he was free from paint. He did not seem to understand any of the words commonly used by the people of the Sound, when repeated to him.

"We left this place, and steered to the westward, till we got sight of the continent, the nearest part of which was about four leagues distant. The land to the south-west proved to be islands. We then steered to the northward, and proceeded till we had land in every direction. That to the south extended to the south-west in a ridge of mountains; but our sight at first could not determine whether it composed one or more islands; we afterwards found it to be only one island, and that called, in the account of the Russian discoverers, by the name of *Oonalashka*. Before we were through the channel that leads to the harbour, as the wind failed, we were obliged to anchor, and wait, till a light breeze springing up, we weighed and stood in for it. This harbour is called, by the natives, *Sanganoodha*, and is situated on the north side of Oonalashka, in the latitude of fifty-three degrees fifty-five minutes north. It runs in, south by west, about four miles, and is about a mile broad at the entrance, narrowing towards the head, where its breadth is not above a quarter of a mile, and where ships can be landlocked, in seven, six, and four, fathoms water.

*Intercourse with the Natives and Russian Traders.]*

"Soon after we came to anchor in this harbour, I received, by the hands of an Oonalashka man, named Derramoushk, a very singular present, considering the place. It was a rye-loaf, or rather a pie made in the form of a loaf, for it enclosed some salmon, highly seasoned with pepper. It was natural to suppose that this present was from some Russians now in our neighbourhood; and, therefore, we sent, by the same hand, to these unknown friends, a few bottles of rum, wine, and porter, which we thought would be as acceptable as any thing we had besides; and we soon knew that in this we had not been mistaken. I also sent along with Derramoushk a corporal of the marines, an intelligent man, in order to gain some farther information, with orders, that, if he met with any Russians, he should endeavour to make them understand that we were English, the friends and allies of their nation. The corporal returned with three Russian seamen, or furriers; who, with some others, resided about two miles to the westward of the harbour, where they had a dwelling-house, some store-houses, and a sloop of about thirty tons burthen. One of these men was either master or mate of this vessel; another of them wrote a very good hand, and understood figures; and they were all three well-behaved intelligent men, and very ready to give me all the information I could desire. But, for want of an interpreter, we had some difficulty to understand each other. They seemed to have a thorough knowledge

of the attempts that had been made by their countrymen to navigate the Frozen Ocean, and of the discoveries which had been made from Kamtschatka, by Bering, Tschirikoff, and Spangenberg. One of these men said that he had been with Beering in his American voyage; but must then have been very young, for he had not, at the distance of thirty-seven years, the appearance of being aged. Never was there greater respect paid to the memory of any distinguished person, than by these men to that of Beering. The trade in which they are engaged is very beneficial; and its being undertaken and extended to the eastward of Kamtschatka, was the immediate consequence of the second voyage of that able navigator, whose misfortunes proved to be the source of much private advantage to individuals, and of public utility to the Russian nation; and yet, if his distresses had not accidentally carried him to die in the island which bears his name, and from whence the miserable remnant of his ship's crew brought back sufficient specimens of its valuable furs, probably the Russians never would have undertaken any future voyages, which could lead them to make discoveries in this sea, toward the coast of America. Indeed, after his time, government seems to have paid less attention to this; and we owe what discoveries have been since made principally to the enterprising spirit of private traders, encouraged, however, by the superintending care of the court of Petersburg. The three Russians having remained with me all night, visited Captain Clarke next morning, and then left us, very well satisfied with the reception they had met with, promising to return in a few days, and to bring with them a chart of the islands lying between Oonalashka and Kamtschatka.

"While I was at a village at a small distance from Sanganoodha, a Russian landed there, who, I found, was the principal person amongst his countrymen in this and the neighbouring islands. His name was Erasin Gregorioff Sim Ismyloff. He appeared to be a sensible intelligent man; and I felt no small mortification in not being able to converse with him, unless by signs, assisted by figures and other characters; which, however, were a very great help.

"I found that he was very well acquainted with the geography of these parts, and with all the discoveries that had been made in them by the Russians. On seeing the modern maps, he at once pointed out their errors. Both Ismyloff and the others affirmed, that they knew nothing of the continent of America to the northward; and that neither Lieutenant Synd, nor any other Russian, had ever seen it of late. They call it by the same name which Stæhlin gives to his great island; that is, *Alaschka*. Stachtan Nitada, as it is called in the modern maps, is a name quite unknown to these people, natives of the islands as well as Russians; but both of them know it by the name

of America. From what we could gather from Ismyloff and his countrymen, the Russians have made several attempts to get a footing upon that part of this continent that lies contiguous to Oonalashka and the adjoining islands, but have always been repulsed by the natives, whom they describe as a very treacherous people. They mentioned two or three captains, or chief men, who had been murdered by them, and some of the Russians shewed us wounds, which, they said, they had received there.

"Some other information, which we got from Ismyloff, is worth recording. He told us that, in the year 1773, an expedition had been made into the Frozen Sea in sledges, over the ice, to three large islands that lie opposite to the mouth of the River Kovyma. A few days after, Ismyloff returned, and brought with him the charts before mentioned, which he allowed me to copy, and the contents of which furnish matter for the following observations. There were two of them, both manuscripts, and bearing every mark of authenticity. The first comprehended the *Penshinskian Sea*, the coast of Tartary, as low as the latitude of forty-one degrees, the Kurile Islands, and the peninsula of Kamtschatka. The second chart was to me the most interesting, for it comprehended all the discoveries made by the Russians to the eastward of Kamtschatka, towards America. The latitude of the coast discovered by Beer- ing and these two navigators, especially the part of it discovered by Tcherikoff, differs considerably from the account published by Muller and from his chart.

*Object of the Russian Settlement.* "There are Russians settled upon all the principal islands between Oonalashka and Kamtschatka, for the sole purpose of collecting furs. Their great object is the sea-beaver, or otter. I never heard them enquire after any other animal, though those whose skins are of inferior value are also made part of their cargoes. I never thought to ask how long they have had a settlement at Oonalashka, and the neighbouring isles; but, to judge from the great subjection the natives are under, this cannot be of a very late date. All these furriers are relieved, from time to time, by others. Those we met with arrived here, from Okotsk, in 1776, and were to return in 1781, so that their stay at the island would be four years at least.

*Inhabitants, Customs, Manners, &c.* "The native inhabitants are rather low of stature, but plump and well shaped, with rather short necks, swarthy chubby faces, black eyes, small beards, and long straight black hair, which the men wear loose behind, and cut before, but the women tie it up in a bunch.

"To all appearance, they are the most peaceable inoffensive people I ever met with; and, as to honesty, they might serve as a pattern to the most civilized nation upon earth. But, from what I saw of their neighbours, with whom the Russians have no connexion, I doubt whether

this was their original disposition; and rather think that it has been the consequence of their present state of subjection. Indeed, if some of our officers did not misunderstand the Russians, they had been obliged to make some severe examples, before they could bring the islanders into any order. If there were severities inflicted at first, the best apology for them is, that they have produced the happiest consequences; and, at present, the greatest harmony subsists between the Russians and the natives. The natives have their own chiefs in each island, and seem to enjoy liberty and property unmolested; but whether or not they are tributaries to the Russians we could never find out.

"As to their dress, both sexes wear the same in fashion; the only difference is in the materials. The women's frocks are made of seal-skin, and those of the men of the skins of birds; both reaching below the knee. This is the whole dress of the women; but, over the frock, the men wear another, made of gut, which resists water, and has a hood to it, which draws over the head. Some of them wear boots, and all of them have a kind of oval snouted cap, made of wood, with a rim to admit the head. These caps are dyed with green and other colours, and round the upper part of the rim are stuck the long bristles of some sea-animal, on which are strung glass-beads, and on the front is a small image or two, made of bone.

"They make use of no paint, but the women puncture their faces slightly; and both men and women bore the under-lip, to which they fix pieces of bone. But it is as uncommon, at Oonalashka, to see a man with this ornament, as to see a woman without it. Some fix beads to the upper-lip, under the nostrils, and all of them hang ornaments in their ears.

"Their food consists of fish, sea-animals, birds, roots, and berries, and even of sea-weed. They dry large quantities of fish in summer, which they lay up in small huts for winter-use; and, probably, they preserve roots and berries for the same time of scarcity. They eat almost every thing raw. Boiling and broiling were the only methods of cookery that I saw them make use of, and the first was probably learnt from the Russians. Some have got little brass-kettles, and those who have not, make one of a flat stone, with sides of clay, not unlike a standing pie. I was once present when the chief of Oonalashka made his dinner of the raw head of a large halibut, just caught. Before any was given to the chief, two of his servants ate the gills, without any other dressing beside squeezing out the slime. This done, one of them cut off the head of the fish, took it to the sea, and washed it; then came with it, and sat down by the chief, first pulling up some grass, upon a part of which the head was laid, and the rest was strewed before the chief. He then cut

large pieces off the cheeks, and laid these within the reach of the great man, who swallowed them with as much satisfaction as we should do raw oysters. When he had done, the remains of the head were cut in pieces, and given to the attendants, who tore off the meat with their teeth, and gnawed the bones like so many dogs.

"As these people use no paint, they are not so dirty in their persons as the savages who thus besmear themselves, but they are full as filthy in their houses. Their method of building is as follows:—They dig in the ground an oblong square pit, the length of which seldom exceeds fifty feet, and the breadth twenty, but in general the dimensions are smaller. Over this excavation they form the roof, of wood which the sea throws ashore. This roof is covered first with grass, and then with earth, so that the outward appearance is like a dunghill. In the middle of the roof, towards each end, is left a square opening, by which the light is admitted; one of these openings being for this purpose only, and the other being also used to go in and out by, with the help of a ladder, or rather a post, with steps cut in it. In some houses there is another entrance below, but this is not common. Round the sides and ends of the huts the families (for several are lodged together) have their separate apartments, where they sleep, and sit at work, not upon benches, but in a kind of a concave trench, which is dug all round the inside of the house, and covered with mats, so that this part is kept tolerably decent. But the middle of the house, which is common to all the families, is far otherwise; for, although it be covered with dry grass, it is a receptacle for dirt of every kind.

"Their household-furniture consists of bowls, spoons, buckets, piggins or cans, matted baskets, and, perhaps, a Russian kettle or pot. All these utensils are very neatly made, and well formed; and yet we saw no other tools among them but the knife and the hatchet, that is, a small flat piece of iron, made like an adze, by fitting it into a crooked wooden handle. These were the only instruments we met with there, made of iron; for, although the Russians live amongst them, we found much less of this metal in their possession than we had met with in the possession of other tribes on the American continent, who had never seen, nor perhaps had any intercourse with, the Russians. Probably, a few beads, a little tobacco and snuff, might purchase all they have to spare. There are few, if any of them, that do not both smoke and chew tobacco, and take snuff; a luxury that bids fair to keep them always poor.

"They did not seem to wish for more iron, or to want any other instruments, except sewing-needles, their own being made of bone. With these they not only sew their canoes

and make their clothes, but also execute very curious embroidery. Instead of thread they use the fibres of sinews, which they split to the thickness which each sort of work requires. All sewing is performed by the women.—They are the taylor, shoe-makers, and boat-builders, or boat-coverers; for the men, most probably, construct the frame of wood over which the skins are sewed. They make mats and baskets of grass, that are both beautiful and strong. Indeed there is a neatness and perfection in most of their work, that shews they neither want ingenuity nor perseverance.

"I saw not a fire-place in any one of their houses. They are heated, as well as lighted, by lamps, which are simple, and yet answer the purpose very well. They are made of a flat stone, hollowed on one side like a plate, and about the same size, or rather larger. In the hollow part they put the oil, mixed with a little dry grass, which serves the purpose of a wick. Both men and women frequently warm their bodies over one of these lamps, by placing it between their legs, under their garments; and sitting thus over it for a few minutes.

"They produce fire both by collision and by attrition; the former, by striking two stones against each other, on one of which a good deal of brimstone is first rubbed. The latter method is with two pieces of wood, one of which is a stick, of about eighteen inches in length, and the other a flat piece. The pointed end of the stick they press upon the other, whirling it nimbly round, as a drill, and thus producing fire in a few minutes.

"Their fishing and hunting implements lie ready upon their canoes, under straps fixed for the purpose. They are all made, in great perfection, of wood and bone, and differ very little from those used by the Greenlanders. These people are very expert in striking fish, both in the sea and in rivers. They also make use of hooks and lines, nets and weirs. The hooks are composed of bone, and the lines of sinews.

"The natives of Oonalashka bury their dead on the summits of hills, and raise a little hillock over the grave. In a walk into the country, one of the natives, who attended me, pointed out several of these receptacles of the dead. There was one of them, by the side of the road leading from the harbour to the village, over which was raised a heap of stones. It was observed that every one who passed it added one to it. I saw in the country several stone hillocks, that seemed to have been raised by art. Many of them were apparently of great antiquity. What their notions are of the Deity, and of a future state, I know not. I am equally unacquainted with their diversions, nothing having been seen that could give us an insight into either."

## SECTION V.

## NOOTKA, OR KING GEORGE'S, SOUND.

*Discovery, Situation, &c.*] Captain Cook, on his departure from the Sandwich Islands, in the month of February, 1778, prosecuted his voyage, in order to accomplish his main object of making discoveries in the northern hemisphere, among which was that he called King George's Sound, in honour of our august sovereign, but he afterwards found that it was called Nootka by the natives. The entrance is situated in the east corner of Hope Bay, in forty-nine degrees thirty-three minutes north latitude, and in two hundred and thirty-three degrees twelve minutes east longitude. The east coast of that bay, all the way from Breakers Point to the entrance of the Sound, is covered by a chain of sunken rocks, that seem to extend some distance from the shore; and near the Sound are some islands and rocks above water.

The harbours and anchoring-places within its circuit are numerous. The cove is covered from the sea, but has little else to recommend it, being exposed to the south-east winds, which blow with great violence.

*Climate.*] The climate is considerably milder than that on the east coast of America, under the same parallel of latitude. When Captain Cook was here, the mercury in the thermometer never, even in the night, fell lower than forty-two degrees, and very often, in the day, it rose to sixty degrees. No such thing as frost was perceived in any of the low ground; on the contrary, vegetation had made a considerable progress.

*Vegetables.*] The trees which chiefly compose the woods are the Canadian pine, the white cypress, and the wild pine, with two or three other sorts of pine less common. The trees in general grow with great vigour, and are all of a large size. There is but little variety of other vegetable productions. About the rocks, and on the verge of the woods, grow strawberry-plants, some raspberry, currant, and gooseberry, bushes, with a few small black alder-trees. There are likewise a species of sow-thistle; goose-grass; some crow's foot, which has a very fine crimson flower; and two sorts of anthericum, one with a large orange flower, and the other with a blue one. There are also wild rose-bushes; a great quantity of young leeks, with triangular leaves; a small sort of grass; and some water-cresses, which grow about the sides of the rills; besides great abundance of andromeda. Within the woods, besides two sorts of underwood-shrubs, are mosses and ferns. Of the first of these there are seven or eight different sorts; of the last, not above three or four; and the species of both are mostly such as are common to Europe and America.

*Animals.*] As the ships under the command of Captain Cook lay in a cove on an island, no other animals were

seen alive in the woods than two or three raccoons, martens, and squirrels. Besides these, some of the people, who one day landed on the continent, near the south-east side of the entrance of the sound, observed the prints of a bear's feet, near the shore. All the account, therefore, that could be given of the quadrupeds, is taken from the skins which the natives brought to sell; and these were often so mutilated with respect to the distinguishing parts, such as the heads, paws, and tails, that it was impossible even to guess at the animals to which they belonged; though others were so perfect, or at least so well known, that they left no room to doubt about them. Of these, the most common were bears, deer, foxes, and wolves. The bear-skins were very numerous, and in general of a shining black colour. The deer-skins were scarcer, and they seem to belong to that sort called the fallow-deer by the historians of Carolina; though Mr. Pennant thinks it a different species from ours, and distinguishes it by the name of Virginian deer. The foxes are in great plenty, and of several varieties; some of their skins being quite yellow, with a black tip to the tail; others of a deep or reddish yellow, intermixed with black; and a third sort, of a whitish grey or ash colour, also intermixed with black. The ermine is found at this place, but is rare and small; the raccoons and squirrels are of the common sort; but the latter are rather smaller than the European, and has a deeper rusty colour running along the back.

There are two quadrupeds which Captain Cook's people could not distinguish with sufficient certainty. Of the first of these they saw none of the skins, but what were dressed or tanned like leather. The natives wear them on some occasions; and, from the size, as well as thickness, they were generally concluded to belong to the elk, though some of them might belong to the buffalo. The other animal, which seems by no means rare, was supposed to be a species of the wild cat, or lynx. The length of the skins, without the head, was about two feet two inches. They are covered with a very fine wool or fur, of a light brown or whitish yellow colour, intermixed with long hairs, which, on the back, where they are shortest, are blackish; on the sides, where they are longer, of a silver white; and on the belly, where they are longest, of the colour of the wool; but the whitish, or silver hairs, are often so predominant, that the whole animal acquires a cast of that kind. The tail is only three inches long, and has a black tip.

The marine animals off the coast are whales, porpoises, and seals. The sea-otter is fully described in different books, taken from the accounts of the Russian adventurers, in their expeditions eastward from Kamtschatka. Captain Cook's people for some time entertained doubts whether the numerous skins which the natives brought really belonged to this animal; as their only reason for being

at that opinion was the softness of the fur; but when a whole otter was chased from some rocks, rather young, with glossy black ears, and with white, gave the throat, and breast a brown colour, with the whole length of each jaw; two minute, and placed ones. In these those found by the outer toes of There seemed, skins than is met with sea-otters. The at the different, had brown hair, beneath; but they came into their considerable quantities of flour and state they attained their full colour, and assume have then a greater any long hairs. older, were of seen that had even

Birds in general different species, few are so shy, harassed by the elements. Those ravens; a blue Canadian, or number of brown, though they seen into the Sound the trees. There less than a through spots on the wings and a yellowish and much more the upper part, head; the belly a black spot on wings and tail above, with a the mouth, a third and fourth the size of a large

of that opinion was founded on the size, colour, and fineness of the fur; till a short time before their departure, when a whole one, that had been just killed, was purchased from some strangers who came to barter. It was rather young, weighing only twenty-five pounds; of a glossy black colour; but many of the hairs being tipped with white, gave it a greyish cast at first sight. The face, throat, and breast, were of a yellowish white, or very light brown colour, which, in many of the skins, extended the whole length of the belly. It had six cutting-teeth in each jaw; two of those of the lower jaw being very minute, and placed without, at the base of the two middle ones. In these circumstances, it seems to disagree with those found by the Russians, and also in not having the outer toes of the hind-feet skirted with a membrane. There seemed, also, a greater variety in the colour of the skins than is mentioned by the describers of the Russian sea-otters. These changes of colour certainly take place at the different gradations of life. The very young ones had brown hair, which was coarse, with very little fur underneath; but those of the size of the entire animal, which came into their possession, and just described, had a considerable quantity of that substance; and both in that colour and state the sea-otters seem to remain, till they have attained their full growth: after that, they lose the black colour, and assume a deep brown or sooty colour; but have then a greater quantity of very fine fur, and scarcely any long hairs. Others, which were suspected to be still older, were of a chestnut-brown, and a few skins were seen that had even acquired a perfectly yellow colour.

Birds in general here are not only rare as to the different species, but very scarce as to numbers; and few are so shy, that, in all probability, they are continually harassed by the natives, who use their feathers as ornaments. Those which frequent the woods are crows and ravens; a blueish jay or magpie; common wrens; the Canadian, or migrating, thrush; and a considerable number of brown eagles, with white heads and tails; which, though they seem principally to frequent the coast, come into the Sound in bad weather, and sometimes perch upon the trees. There are four species of wood-peckers: one less than a thrush, of a black colour above, with white spots on the wings, a crimson head, neck, and breast, and a yellowish olive-coloured belly; the second is a larger, and much more elegant, bird, of a dusky brown colour on the upper part, richly varied with black, except about the head; the belly of a reddish cast, with round black spots; a black spot on the breast; and the under-side of the wings and tail of a plain scarlet colour, though blackish above, with a crimson streak running from the angle of the mouth, a little down the neck on each side. The third and fourth are a small bird of the finch kind, about the size of a linnet, of a dark dusky colour, whitish be-

low, with a black head and neck, and white bill; and a sand-piper, of the size of a small pigeon, of a dusky brown colour, and white below, except the throat and breast, with a broad white band across the wings. There are also humming-birds, which yet seem to differ from the numerous sorts of this delicate animal already known. The birds which frequent the waters and shores are gulls; shags, wild ducks, divers, swans, and plovers.

Fish are more plentiful than birds, though the variety is not great: the principal sorts are the common herring, but scarcely exceeding seven inches in length; a smaller sort, which is the same with the anchovy or sardinia, though rather larger; a white or silver-coloured bream, and another of a gold-brown colour, with many other longitudinal blue stripes. The herrings and sardinias come in large shoals, and only at stated seasons, as is common with that sort of fish. The bream, of both sorts, may be reckoned the next to these in quantity; and the full-grown ones weigh at least a pound. The other fish, which are all scarce, are a small brown kind of sculpin, such as is found on the coast of Norway; another of a brownish red cast; the frost-fish; and a large one, somewhat resembling the bull-head, with a tough skin, destitute of scales. There is a small brownish cod, spotted with white, and a red fish of the same size, besides another differing little from the hake. There are also considerable numbers of the fish called the *chimara*, or little sea-wolves, by some; which are a kin to, and about the size of, the *pezegallo*, or elephant-fish. Sharks sometimes frequent the Sound, as the natives were seen to have some of their teeth in their possession. The other marine animals are a small cruciated *medusa*, or blubber; star-fish, which differ somewhat from the common ones; two small sorts of crabs; and two others; one of them of a thick, tough, gelatinous consistence; and the other a sort of membranaceous tube or pipe, both which are probably taken from the rocks. There is also a very large cuttle-fish.

The only reptiles here are brown snakes, two feet long, with whitish stripes on the back and sides; they are entirely harmless; and brownish water-lizards, with a tail exactly like that of an eel, which frequent the small standing pools about the rocks.

The insect-tribe is very numerous. There are four or five different sorts of butterflies, none of which are uncommon; many humble-bees, some large moths, two or three sorts of flies, a few beetles, and some mosquitos.

[Minerals.] As to the mineral substances in this country, though Captain Cook's people found both iron and copper here, they had little reason to suppose that either of them belonged to the place: neither were the ores of any metal seen by them, except a coarse, red, earthy, or ochreous substance, used by the natives in painting themselves, which probably might contain a little iron; with a

white and a black pigment, used for the same purpose: but they did not procure specimens of them, and, therefore, could not possibly determine what were their component parts.

Besides the stone or rock that constitutes the mountains and shores, which sometimes contains pieces of very coarse quartz, the same navigators found amongst the natives articles made of a hard black granite, though not remarkably compact or fine grained; a greyish whet-stone, the common oil-stone of carpenters, in coarser and finer pieces, and some black pieces, which were little inferior to the hone-stone. Here were also observed some Muscovy talc, and some pieces of rock-crystal, tolerably transparent.

*Inhabitants, Customs, Manners, &c.*] The natives are, in general, under the common stature, but not slender in proportion, being commonly full or plump, though many of the old people are rather lean. The visage of most of them is round and full, with high prominent cheeks; and above these the face is frequently much depressed, or seems fallen in between the temples; the nose also flattening at its base, with pretty wide nostrils, and a rounded point: the forehead rather low; the eyes small and black; the mouth round, with large thick lips; the teeth tolerably equal and well set, but not remarkably white. They have either no beards, which is most commonly the case, or a small thin one upon the point of the chin; which does not arise from any natural defect of hair on that part, but from plucking it out more or less; for some of them, and particularly the old men, have not only considerable beards all over the chin, but mustachios, both on the upper lip and toward the lower jaw, descending obliquely. Their eye-brows are scanty and narrow; but the hair of the head is in great abundance, very coarse and strong; and, without a single exception, black and straight. The neck is short; the arms and body are rather clumsy; and the limbs in all are very small in proportion to the other parts, and ill-made; with large feet and projecting ankles.

Their complexion could not be satisfactorily ascertained, as their bodies were incrustated with paint and dirt; though, in particular cases, when these were rubbed off, the whiteness of the skin appeared almost to equal that of Europeans, though rather of that pale cast which distinguishes those of southern nations. Their children, whose skins had never been stained with paint, also equalled the Europeans in whiteness. During their youth, some of them have an agreeable look; but this seems to be entirely owing to the particular animation attending that period of life; for, after attaining a certain age, there is hardly any distinction. In fact, it is said that a remarkable sameness seems to characterize the countenances of the whole nation.

The common dress consists of a flaxen garment, ornamented on the upper edge by a narrow strip of fur, and at the lower edge by fringes or tassels: it passes under the left arm, and is tied over the right shoulder by a string before, and one behind, near its middle, by which means both arms are left at liberty; and it hangs perfectly even, covering the left side, but leaving the right open, except from the loose part of the edges falling upon it, unless when the mantle is fastened by a girdle round the waist; over this, which reaches below the knees, is worn a small cloak of the same substance, likewise fringed at the lower part. In shape this resembles a round dish-cover, being quite close, except in the middle, where there is a hole just large enough to admit the head; and then, resting upon the shoulders, it covers the arms to the elbows, and the body as far as the waist. The head is covered with a truncated conical cap, made of fine matting, having the top frequently ornamented with a round or pointed knob, or a bunch of leathern tassels.

Besides this dress, which is common to both sexes, the men frequently throw over their other garments the skin of a bear, wolf, or sea-otter, with the hair outward, and tie it, as a cloak, near the upper part, wearing it sometimes before, and sometimes behind. In rainy weather they throw a coarse mat about their shoulders. They have also woollen garments, which, however, are little in use. The hair is commonly worn hanging down loose; but some, when they have no cap, tie it in a bunch on the crown of the head. Their dress, upon the whole, is convenient, and would by no means be inelegant, were it kept clean. But, as they rub their bodies constantly over with a red paint, of a coarse ochry substance, mixed with oil, their garments contract a rancid smell, and a greasy nastiness, so that they make a very wretched dirty appearance: and, what is still worse, their heads and their garments swarm with vermin.

Though their bodies are always covered with red paint, their faces are often stained with a black, a brighter red, or a white, colour, by way of ornament. The last of these gives them a ghastly disgusting aspect. They also strew brown mica upon the paint, which makes it glitter. The ears of many of them are perforated in the lobe, where they make a pretty large orifice, and two others higher up on the outer edge. In these holes they hang bits of bone, quills fixed upon a leathern thong, small shells, bunches of woollen tassels, or pieces of thin copper. The septum of the nose, in many, is also perforated, through which they draw a piece of soft cord, and others wear, at the same place, small thin pieces of iron, brass, or copper, shaped almost like a horse-shoe, the narrow opening of which receives the septum, so that the two points may gently pinch it; and the ornament thus hangs over the upper lip. About their wrists they

wear bracelets of shelly substance, broad black sh about their ankles, and leathern thongs.

Thus far we have seen the names; but the natives are of an extraordinary strength, and are as strange as the animals themselves. Amongst the wolves or bears, they are mented at the end of the woollen-stuff, These are worn on the arms. On such occasions, there is a quantity of which, at the same time, particularly those with small white variously painted, of different colours, and is besmeared with is afterwards for and appears like parated into about two inches together behind. Thus dressed, this is much he called their mo variety of carved to the upper p these resemble and eye-brows; ularly of eagle of land and sea and others; but the natural size pieces of foliage serves to augmen

The only dress is particularly adapted to which, from its buffalo, tanned, ner, and it is quite to the the heels. It is ent compartments, sist arrows, but be considered Upon the same leathern cloak, disposed horizon

wear bracelets of white huckle-heads, made of a conic shelly substance; bunches of thongs, with tassels; or a broad black shining horny substance, of one piece; and about their ankles they also frequently wear many folds of southern thongs, or the twisted sinews of animals.

Thus far we have described their *ordinary* dress and ornaments; but they have some that seem to be used only on extraordinary occasions, either when they exhibit themselves as strangers in visits of ceremony, or when they go to war. Amongst the first may be considered the skins of wolves or bears, tied on in the usual manner, but ornamented at the edges with broad borders of fur, or of a woollen-stuff, ingeniously wrought with various figures. These are worn either separately, or over their other garments. On such occasions, the most common head-dress is a quantity of half-beaten bark, wrapped about the head, which, at the same time, has various large feathers, particularly those of eagles, stuck in it, or is entirely covered with small white feathers. The face at the same time is variously painted, having its upper and lower parts of different colours, the strokes appearing like fresh gashes; or it is besmeared with a kind of tallow, mixed with paint, which is afterwards formed into a great variety of regular figures, and appears like carved work. Sometimes the hair is separated into small parcels, which are tied at intervals of about two inches to the end with thread, and others tie it together behind, and stick branches of the cypress in it. Thus dressed, they have a truly savage appearance; but this is much heightened, when they assume what may be called their monstrous decorations. These consist of a variety of carved wooden masks, applied to the face, or to the upper part of the head or forehead. Some of these resemble human faces, furnished with hair, beards, and eye-brows; others represent the heads of birds, particularly of eagles; and many are in imitation of the heads of land and sea animals, such as wolves, deer, porpoises, and others; but, in general, these representations exceed the natural size, and they are painted, and strewed with pieces of foliaceous mica, which makes them glitter, and serves to augment their deformity.

The only dress amongst these people that seems peculiarly adapted to war, is a thick leather mantle, doubled, which, from its size, appears to be the skin of an elk or buffalo, tanned. This they fasten on in the common manner, and it is so contrived that it may cover the breast quite to the throat, falling, at the same time, almost to the heels. It is sometimes ingeniously painted in different compartments, and is not only sufficiently strong to resist arrows, but even spears cannot pierce it, so that it may be considered as their most complete defensive armour. Upon the same occasion, they sometimes wear a kind of leathern cloak, covered with rows of dried hoofs of deer, disposed horizontally, appended by leathern thongs, co-

vered with quills, which, when they move, make a loud rattling noise.

Though these people cannot be viewed without a kind of horror, when equipped in such extravagant dresses yet, when divested of them, they have no appearance of ferocity in their countenances; but appear, on the contrary, to be of a phlegmatic and inactive disposition. Their orations, which are made either when engaged in any altercation or dispute, or to explain their sentiments publicly on other occasions, seem little more than short sentences forcibly repeated, but in a monotonous tone, and accompanied only with a single gesture, which they use at every sentence, jerking their whole body a little forward, by bending the knees, their arms hanging down by their sides.

They seem to have very little curiosity; as few expressed any desire to see or examine things wholly unknown to them, and which, to those possessed of that passion, would have appeared astonishing. They were always contented to procure the articles they knew and wanted, regarding every thing else with perfect indifference; nor did the persons, apparel, and manners, of the Europeans, so different from their own, or even the extraordinary size and construction of their ships, seem to excite admiration, or even engage attention.

In trafficking with the Europeans, some of them betrayed a knavish disposition, and carried off goods without making any return; but, in general, there was reason to commend the fairness of their conduct. Their eagerness, however, to possess iron and brass, and, indeed, any kind of metal, was so great, that few of them could resist the temptation to steal it, whenever an opportunity offered.

The houses in the village at the entrance of the Sound are disposed in three rows, rising gradually behind each other, the largest being that in front, and the others less, besides a few single ones, at each end. These ranges are interrupted, at irregular distances, by narrow paths, that pass upward; but those which run in the direction of the houses, between the rows, are much broader. Though there is some appearance of regularity in this disposition, there is none in the single houses, for each of the divisions made by the paths may be considered either as one house, or as many, there being no regular separation, either without or within. They are built of long and broad planks, resting upon the edges of each other, fastened by withes of pine-bark, here and there, and have only slender poles, at considerable distances, on the outside, to which they also are tied; but within are some larger poles, placed aslant. The height of the sides and ends of these habitations is seven or eight feet, but the back part is a little higher, by which means the planks that compose the roof slant forward, and are laid on loose, so as to be moved

about, either to be put close to exclude the rain, or, in fair weather, to be separated, to let in the light, and carry out the smoke. They are, upon the whole, miserable dwellings, and constructed with little care or ingenuity; for, though the side-planks be made to fit pretty closely in some places, in others they are quite open, and there are no regular doors into them; the entrance being by a hole where the unequal length of the planks has accidentally left an opening. There are also apertures in the sides of the houses to look out at, but without any regularity of shape or disposition.

On the inside, one may frequently see from one end to the other of these ranges of building without interruption. For though, in general, there be the rudiments of separations on each side, for the accommodation of different families, they are such as do not intercept the sight, and often consist of no more than pieces of plank, running from the side toward the middle of the house, so that, if they were complete, the whole might be compared to a long stable, with a double range of stalls, and a broad passage in the middle. Close to the sides, in each of these parts, is a little bench of boards, raised five or six inches higher than the rest of the floor, and covered with mats, on which the family sit and sleep. These benches are commonly seven or eight feet long, and four or five broad. In the middle of the floor, between them, is the fireplace, which has neither hearth nor chimney.

The furniture consists chiefly of a great number of chests and boxes of all sizes, which are generally piled upon each other, close to the sides or ends of the house, and contain spare garments, skins, masks, and other articles of dress or ornament. Some of these are double, or one covers the other as a lid; others have a lid fastened with thongs; and some of the very large ones have a square hole or scuttle, cut in the upper part, by which the things are put in and taken out. They are often painted black, studded with the teeth of different animals, or carved and decorated with figures of birds or animals. Their other domestic utensils are square and oblong pails or buckets, round wooden cups and bowls, and small shallow wooden troughs, about two feet long, out of which they eat their food, and baskets of twigs, bags of matting, &c. Their fishing implements, and other things, also, lie or hang up in different parts of the house, but without the least order, so that the whole is a complete scene of confusion.

The nastiness and stench of their houses are, however, at least equal to the confusion; for, as they dry their fish within doors, they also gut them there, which, with their bones and fragments thrown down at meals, and the addition of other sorts of filth, lie every where in heaps, and are never carried away till it becomes troublesome to walk over them.

The images which are found in these houses are nothing more than the trunks of large trees, four or five feet high, set up singly, or by pairs, at the upper end of the apartment, with the front carved into a human face, the arms and hands cut out upon the sides, and variously painted, so that the whole is a truly monstrous figure. The general name of these images is *Klumma*. A mat, by way of curtain, generally hangs before them, which the natives are not willing, at all times, to remove; and, when they do unveil them, they seem to speak of them in a very mysterious manner.

The principal employment of the men seems to be that of fishing, and killing land or marine animals, for the sustenance of their families. The women are occupied in manufacturing their flaxen or woollen garments, and in preparing the sardinias for drying, which they also carry up from the beach in twig-baskets, after the men have brought them in their canoes. The women are also sent in the small canoes to gather muscles and other shell-fish, and perhaps on some other occasions: for they manage these with as much dexterity as the men, who, when in the canoes with them, seem to pay little attention to their sex, by offering to relieve them from the labour of the paddle. The young men appeared to be the most indolent set in this community; for they were observed either sitting about, in scattered companies, or laying, to bask in the sun, in the sand upon the beach, without any covering.

Though their food, strictly speaking, may be said to consist of every thing, animal or vegetable, that they can procure, the quantity of the latter bears an exceedingly small proportion to that of the former. Their greatest reliance seems to be upon the sea, as affording fish, muscles, and smaller shell-fish, and sea-animals. Of the first, the principal are herrings and sardinias, two species of breani, and small cod; but the herrings and sardinias are not only eaten fresh, in their season, but likewise serve as stores, which, after being dried and smoked, are preserved, by being sewed up in mats, so as to form large bales, three or four feet square. The herrings also supply them with another grand resource for food, which is a vast quantity of roe, incrustated about small branches of the Canadian pine. They also prepare it upon a long narrow sea-grass, which grows plentifully upon the rocks, under water. This *caviare*, if it may be so called, is kept in baskets of mat, and used occasionally, being first dipped in water. The next article, on which they seem to depend for a large proportion of their food, is the large muscle, great abundance of which are in the Sound. These are roasted in their shells, then stuck upon long wooden skewers, and taken off occasionally as wanted, being eaten without any other preparation, though they sometimes dip them in oil, as a sauce.

Of the marine animals, the most common in use amongst them, as food, is the porpoise, the fat or rind of which, as well as the flesh, they eat in large pieces, and, having dried them as they do herrings, eat them without any farther preparation. They also prepare a sort of broth from this animal, in its fresh state, in a singular manner, putting pieces of it in a square wooden vessel, with water and then throwing heated stones into it, till they think the contents are sufficiently stewed. The oil, which they procure from these and other sea-animals, is also used by them in great quantities. Upon the whole, it seems, from a variety of circumstances, that these people procure almost all their animal-food from the sea, except a few birds, of which the gulls or sea-fowl, which they shoot with their arrows, are the most material.

The Canadian pine-branches, and sea-grass, on which the fish-roe is stewed, may be considered as their only winter vegetables; but, as the spring advances, they make use of several others as they come in season. The most common of these are two sorts of liliaceous roots, one simply tunicated, the other granulated upon its surface, called *mahkutte* and *kookquoppa*, which have a mild sweetish taste, and are mucilaginous, and eaten raw. The next, which they have in great quantities, is a root called *sheita*, resembling liquorice in taste, and another fern-root. They also eat raw another small sweetish root, about the thickness of sarsaparella.

Their manner of eating is consonant to the filthiness of their houses and persons; for the troughs and platters in which they put their food appear never to have been washed from the time they were first made, and the dirty remains of a former meal are only swept away by the succeeding one. In fact, they seem to have no idea of cleanliness; for they even eat the roots which they dig from the ground without so much as shaking off the soil that adheres to them. It is uncertain if they have any regular hours for meals, for they were seen to eat at all times in their canoes; and yet, from seeing several messes of the porpoise-broth preparing at the village, it should seem that they make a principal meal about noon.

Their weapons are bows and arrows, slings, spears, short truncheons of bone, and a small pick-axe, not unlike the common American tomahawk. The spear has generally a long point, made of bone. Some of the arrows are pointed with iron; but in general their points are of indented bone. The tomahawk is a stone, six or eight inches long, pointed at one end, and the other end fixed into a handle of wood. This handle resembles the head and neck of the human figure, and the stone is fixed in the mouth, so as to represent an enormously large tongue. To make the resemblance still stronger, human hair is also fixed to it. They have another stone weapon, called *seeaik*, nine inches or a foot long, with a square point.

From the number of stone weapons, and others, it might be concluded that it is their custom to engage in close fight, and it is evident, that their wars are both frequent and sanguinary, as vast numbers of human skulls were offered for sale to the Europeans.

Their manufactures and mechanic arts are far more extensive and ingenious than could have been expected from the natural disposition of the people, and the little progress that civilization has made amongst them in other respects. The flaxen and woollen garments, with which they cover themselves, must be ranked under the head of manufactures. The former of these are made of the bark of a pine-tree, beat into a hempen state. It is not spun, but, after being properly prepared, is spread upon a stick, which is fastened across to two others that stand upright. It is disposed in such a manner, that the manufacturer, who sits on her hams at this simple machine, knots it across with small plaited threads, at the distance of half an inch from each other. Though, by this method, it is less close than cloth that is woven, the bunches between the knots make it sufficiently impervious to the air, by filling the interstices, and it has the additional advantage of being softer and more pliable. The woollen garments, though probably manufactured in the same manner, have the strongest resemblance to woven cloth; but the various figures which are invented in them, destroy the supposition of their being wrought in a loom, it being extremely unlikely that these people should be so dexterous as to be able to finish such a complex work, unless immediately by their hands. They are of different degrees of fineness; some resembling our coarsest blankets, and others almost equal to our finest sorts, and certainly warmer. The wool of which they are made seems to be taken from different animals, as the fox and brown lynx; the last of which is by far the finest sort, and, in its natural state, differs little from the colour of our coarser wools; but the hair, with which the animal is also covered, being intermixed, its appearance, when wrought, is somewhat different. The ornamental figures in these garments, which are disposed with great taste, are commonly of a different colour, being dyed either of a deep brown or of a bright yellow.

They seem to be particularly fond of carving, in every thing which they make of wood. Nothing is without a kind of freeze-work, or the figure of some animal, upon it; but the most general representation is that of the human face, which is often cut out upon their images, and even upon their weapons. The general design of all these things is perfectly sufficient to convey a knowledge of the object they are intended to represent; but the carving is not executed with the nicety that a dexterous artist would bestow ever upon an indifferent design. The same, however, cannot be said of many of the human masks and

heads, where they shew themselves to be ingenious sculptors. They not only preserve, with great exactness, the general character of their own faces, but finish the more minute parts, with a degree of accuracy in proportion, and neatness in execution. The strong propensity of this people to works of this sort, is remarkable in a vast variety of particulars. Small whole human figures; representations of animals, birds, and fish; models of their household utensils and of their canoes; were found amongst them in great abundance.

To their skill in working figures in their garments, and carving them in wood, they add that of drawing them in colours. Captain Cook's people saw the whole process of their whale-fishery painted on some of their caps. This, though rudely executed, serves at least to shew that, though there be no appearance of the knowledge of letters amongst them, they have some notion of commemorating and representing actions, in a lasting way, independently of what may be recorded in songs and oral traditions.

Their songs are generally slow and solemn; but the music is not characterised by that monotony usually found amongst many rude nations; for their variations are numerous and expressive, and the melody powerfully soothing. Besides their full concerts, sonnets, of the same grave cast, are frequently sung by single performers, who keep time by striking the hand against the thigh. But the music is sometimes varied from its predominant solemnity of air, and there are instances of stanzas being sung in a more gay and lively strain, with a degree of humour.

The only instruments of music (if such they may be called) which Captain Cook's people saw among them, were a rattle, and a small whistle, about an inch long, incapable of any variation, from having but one hole. They use the rattle when they sing, but upon what occasions they use the whistle our navigators could not determine, unless it be when they dress themselves like particular animals, and endeavour to imitate their howl or cry. One of them was seen dressed in a wolf's skin, with the head over his own, and imitating that animal, by making a squeaking noise with one of these whistles, which he had in his mouth. Their rattles are for the most part made in the shape of a bird, with a few pebbles in the belly, and the tail is the handle.

Captain Vancouver visited this sound, for the last time, in September, 1794, and paid a visit, with a party of English and Spanish officers, to the chief, at the village where he resided, on which occasion he was entertained in the following manner:

On a signal given, a man entered the apartment in the chief's habitation where the party were seated, fantastically dressed in a war-garment: this was variously ornamented, as was his face, with black and red paint, so that his fea-

tures appeared to be extravagantly distorted. His hair was covered with the most delicate white down of young sea-fowl, and in his hand he bore a musket with a fixed bayonet, making altogether a most savage, though, at the same time, a whimsical, figure. This man was followed by about twenty more, decorated with a considerable variety, after the same fashion, but differently armed; some, like himself, with muskets, others with pistols, swords, daggers, spears, bows, arrows, and hatchets; seemingly with intent to display their power, by an exhibition of the several implements they possessed.

When this ludicrous group retired, the chief performed a mask-dance by himself, in which, with great adroitness, he frequently, and almost imperceptibly, changed his mask: this seemed to be a favourite amusement with him, as he appeared to be in high spirits, and to take great delight in the performance. His dress consisted of a cloak and a kind of short apron, covered with hollow shells and small pieces of copper, so placed as to strike against each other, and to produce a jingling noise, which, being accompanied with the beating of a stick on a hollow board, as a substitute for a drum, and some vocal exertions, produced a savage discordant noise, as offensive to the ear as the former exhibition had been to the eye. But, in compliment to the chief, the party applauded the exhibitions, which highly gratified him and the crowd of spectators assembled on the occasion. There was another vocal and instrumental performance, in which another chief acted as master of the ceremonies, and passed many compliments on the Spanish and English officers, at the breaking up of the entertainment.

Their canoes are constructed with great simplicity, but well calculated for every useful purpose. Even the largest, which carry twenty people or more, are formed of one tree. Many of them are forty feet long, seven broad, and about three deep. From the middle, towards each end, they become gradually narrower, the stern ending abruptly, or perpendicularly, with a small knob on the top; but the fore-part is lengthened out, stretching forward, and ending in a notched point or prow, considerably higher than the sides of the canoe, which run nearly in a straight line. For the most part they are without any ornament, but some have a little carving, and are decorated by setting seals' teeth on the surface, like studs. A few have, likewise, a kind of additional head or prow, which is painted with the figure of some animal. They have no seats, nor any other supporters, on the inside, than several round sticks, little thicker than a cane, placed across, at mid-depth. They are very light, and their breadth and flatness enables them to swim firmly, without an out-rigger, which none of them have; a remarkable distinction between the navigation of all the American nations, and that of the southern parts of the East-Indies, and the islands in the Pacific Ocean.

Their paddles measure, resembling the bottom.

Their implements are both ingenious and lines, harpoons, the last is about two feet long, and about half an inch thick, the thirds of its length are two inches long, small fish as common; which is caught either by harpoons, which are made of bone, the harpoon, with sea-animals, shells. It is composed of wood, in which is fixed a line, containing the harpoon, about two or three feet long, to which the end of which is the shaft, and when the animal is caught.

Captain Cook's people saw the chief of their catching fish, which he supposed to be supposed to be the purpose of the nets, which they use, when they are sometimes decorated with skin, and run very nimbly, as which they extend the same time; and heads, as well as the mals, are put in the nets.

As to the articles, it is to be formed of wood, and is formed

Their paddles are small and light, the shape, in some measure, resembling that of a large leaf, pointed at the bottom.

Their implements for fishing and hunting, which are both ingeniously contrived, and well made, are nets, hooks and lines, harpoons, and an instrument like an oar. This last is about twenty feet long, four or five inches broad, and about half an inch thick. Each edge, for about two-thirds of its length, is set with sharp bone-teeth, about two inches long. Herrings and sardinias, and such other small fish as come in shoals, are attacked with this instrument; which is struck into the shoal, and the fish are caught either upon or between the teeth. Their hooks are made of bone and wood, and rather inartificially; but the harpoon, with which they strike the whales, and smaller sea-animals, shews a considerable degree of contrivance. It is composed of a piece of bone, cut into two barbs, in which is fixed the oval blade of a large muscle-shell, containing the point of the instrument. To this is fastened about two or three fathoms of rope; and, to throw this harpoon, they use a shaft of about twelve or fifteen feet long, to which the line or rope is made fast; and to one end of which the harpoon is fixed, so as to separate from the shaft, and leave it floating upon the water as a buoy, when the animal darts away with the harpoon.

Captain Cook's people knew not any thing of the manner of their catching or killing land-animals, unless it might be supposed they shoot the smaller sorts with their arrows. For the purpose of catching land-animals they have several nets, which they frequently threw over their heads, to shew their use, when they brought them for sale. They, also, sometimes decoy animals, by covering themselves with a skin, and running about upon all fours, which they do very nimbly, as appeared from the specimens of their skill, which they exhibited, making a kind of neighing at the same time; and, on these occasions, the masks, or carved heads, as well as the real dried heads, of the different animals, are put on.

As to the materials of which they make their various articles, it is to be observed, that every thing of the rope kind is formed either from thongs of skins, and sinews of

animals, or from the same flaxen substance of which their mantles are manufactured. The sinews often appeared to be of such a length, that it might be presumed they could be of no other animal than the whale. And the same may be said of the bones of which they make their weapons already mentioned; such as their bark-beating instruments, the points of their spears, and the barbs of their harpoons.

Their great dexterity in works of wood, may, in some measure, be ascribed to the assistance they receive from iron tools: for, as far as we know, they use no other; at least, the Europeans saw only one chissel of bone: and though, originally, their tools must have been of different materials, it is not improbable that many of their improvements have been made since they acquired a knowledge of that metal, which now is universally used in their various wooden works. The chissel and the knife are the only forms, as far as appeared, that iron assumes amongst them. The chissel is a long flat piece, fitted into a handle of wood. A stone serves for a mallet, and a piece of fish-skin for a polisher. Some of these chissels are eight or ten inches long, and three or four inches broad, but in general they are smaller. The knives are of various sizes; some very large, and the blades are crooked, somewhat like pruning-knives; but the edge is on the back or convex part. Most of them are about the breadth and thickness of an iron-hoop. These iron tools are sharpened upon a coarse slate whet-stone, and are always kept bright.

Of the political and religious institutions established amongst this people, it cannot be supposed that much should be known. The chiefs are distinguished by the title of *Acweek*, and to them the others are, in some measure, subordinate. But the authority of each of these great men seems to extend no farther than the family to which he belongs, and who acknowledged him as their head.

Captain Cook's people did not see any thing that could give the least insight into their notions of religion, besides the figures called *Klumma*. Most probably these were idols; but, as they frequently mentioned the word *acweek*, when they spoke of them, it may be supposed that they are the images of some of their ancestors.

## CHAPTER VII.

## GREENLAND.

**T**HE country thus denominated is the remotest tract of land in the north of our globe, and has been generally classed, by geographers, among those northern countries that remain unknown; but it is now clearly ascertained to belong to North-America. As far as it has been explored, it has been found to reach, on the north-east side, from the fifty-ninth to the eightieth degree of north latitude; and on the side opposite North-America to about the seventieth degree.

When seamen speak of Greenland, they generally mean the islands of Spitzbergen, lying north of Lapland, between the seventy-fifth and eightieth degree of latitude, with the eastern coast of Greenland lying opposite thereto. This eastern coast is but thinly, if at all, inhabited at present; but the western side of Greenland, from the sixty-second to the seventy-first degree north, is colonized by Europeans. The islands of Spitzbergen are uninhabited, except during the season of the whale-fishery. The globe here is so round, that, even at the distance of six miles, in a calm, sailing east or west, the masts of a ship only are discoverable; at eight miles, no other part can be seen than the topmast, and, at twelve miles distance, the flag only; yet the mountains of Spitzbergen rise so high as to be seen forty-eight miles off. Captain Constantine Phipps, afterwards Lord Mulgrave, in his voyage to the north pole, in 1773, coasted round them.

The land, on the western side of Greenland, is barren, high, and rocky, and rises, in most places adjoining the ocean, in such lofty mountains and inaccessible cliffs, as may be seen at sea at the distance of about forty leagues. The cliffs and mountains being continually covered with ice and snow, these, by constantly falling, have filled the valleys, and seem annually to increase their height. The plains between the rocks are also covered with ice, except when there is a scanty portion of earth and grass, an occasional little brook and pond, and some few low scattered shrubs. Within land there are no inhabitants, and but very few upon the coast. Of the European settlements, the most southern is the colony of *Frederic's Haab*, or *Frederic's Hope*, situated in the sixty-second degree of north latitude, planted by the Danes, in 1742. It lies one mile and a half from the open sea, and is a good haven, and place of trade. In the islands opposite, where the Dutch merchant-ships formerly harboured,

many Greenlanders reside, they being well situated for catching fish, seals, and rein-deer. This colony is yet but small.

About twelve leagues north of this colony is the shining ice, called in the charts *Eis-blink*. It is a large high field of ice, whose glances in the air, resembling the aurora borealis, may be seen at sea for many leagues. It was an inlet within the land, whose entrance is now blocked up in such a manner, by many vast pieces of ice, driven out by the ebb, that it forms, as it were, an arched ice-bridge, eight leagues in length, stretching from land to land, and two in breadth. Such Greenlanders as wish to enter this harbour, carry their little canoes over land upon their heads, and, when they have passed this bridge, they find open water, for twenty leagues in length, and two in breadth. Places are found here where Greenland houses formerly stood; a proof that the mouth of the harbour was once open.

About thirty-six leagues north of *Frederic's Hope* is another colony, called *Fischer's Fiorte*, or *Fisher's Bay*, begun in 1754; but, as few Greenlanders live about this place, it has but little trade. In this neighbourhood are seen many ruins, supposed to be relics of the old Norwegians.

A third colony, called *God-haab*, or *Good-hope*, lies in about forty-six degrees fourteen minutes, thirty-six leagues north of *Fisher's Bay*. Here there are a number of small islands, crowded together in the compass of six leagues. The Moravians have here established a congregation, built a church, a provision-house, a smith's shop, and a brew-house; and the houses of the natives are scattered round them. This is the oldest colony in Greenland, having been founded in 1721. It was formerly inhabited by some thousands of Greenlanders; but the small pox having made great ravages in 1733, the number is so decreased, that there are now few natives settled in it. It was calculated, in 1746, that, on the whole western coast of Greenland, in the space of four hundred leagues, there were not above twenty thousand Greenlanders there settled; whereas, in the year 1730, the number was computed at thirty thousand, the remainder having been destroyed by the small-pox.

A fourth colony, established in 1734, lies in seventy-nine degrees. There are also three or four others; but the twelfth, and farthest north, is in seventy-one degrees,

and was erect country is inh although very th fowls and anim almost impos than dreary building their southern plac clay, seal-skin

and was erected in 1758. The natives assert, that the country is inhabited as far north as seventy-eight degrees, though very thinly; for, notwithstanding there are numerous fowls and animals, yet, from the long winter-nights, it is almost impossible to live there, the land being little else than dreary rock and ice. In these parts, instead of building their houses with wood and turf, as in more southern places, the natives are obliged to erect them with clay, seal-skins, &c.

*Climate.*] This country, being covered perpetually with snow, must necessarily be very cold. In such places, in winter, where the inhabitants enjoy the sun for an hour or two in the day, the cold is tolerable; but, where the sun is entirely below the horizon, it is most intense, inasmuch that, while people are drinking tea, the emptied cup, when put down, will freeze to the table. Paul Egede, a missionary, in his journal of January 7, 1738, says, that in latitude sixty-eight degrees, when he was there, the ice and hoar-frost reached through the chimney to the stove's mouth, without being thawed by the fire, even in the daytime, so that over the chimney was an arch of frost, with little holes, through which the smoke issued.

The summer, in Greenland, is from the beginning of May to the end of September, during which time the natives encamp in tents; yet the ground is not mellowed by a thaw till June, and then only on the surface, nor does it cease snowing till this time. In August it begins snowing again, but not any snow continues on the ground till that which falls in October. In the longest summer-days, particularly in serene and clear weather, it is so hot that people are not only obliged to throw off their winter-garments, but, on the sea, the pitch will melt from the ships; and, from April to August, the fogs are so thick, almost every day, that people cannot see forty yards before them. It has been often remarked, that the weather in Greenland is just the reverse of what it is in Europe. In the year 1763, when it was extremely cold throughout Europe, it was remarkably mild in Greenland. In general, however, the air is so pure, that, if a man clothe himself warm, eat moderately, and take good exercise, he will enjoy a good state of health and spirits. The winds are as variable here as in other countries; but, when it once begins to be stormy, which happens mostly in autumn, they rage so vehemently, that the houses shake and crack; tents and the lighter boats fly up into the air, and the sea-water scatters about on the land like snow-dust. When any one is obliged to leave his house, in order to put his boats into shelter, he must creep upon his belly, lest the wind should take him off his legs.

There is not any night in this country, during the summer, beyond the sixty-sixth degree north; in the longest days, the sun does not set; but it does not shine with such lustre at night as at noon, resembling only a very bright moon,

which a person may look at without being dazzled. On the other hand, the winter-nights are so much the longer; and in the sixty-seventh degree the face of the sun is never seen above the horizon, from November 30 to January 12. And yet there are no dark nights here, as in other countries; the inhabitants enjoy a moderate twilight, and the moon and stars, added to the snow and ice, give such a light that one might see plainly to read print of an ordinary size. In the shortest days the moon never sets; but very little is seen of it in the summer-time, and the stars never appear from May till August.

*Vegetable Productions.*] The valleys, in general, have no other herbage than moss and sour moor-grass, and the uninhabited islands furnish only a few low shrubs, heath, and herbs; the land, however, near the Greenland houses and encampments, from many years cultivation with the blood and fat of seals, though in itself nothing but a barren sand, produces the finest and largest herbs. Grass grows here, not only in fenmy, sandy, and turfy ground, but also in the cliffs of rocks, where any earth has lodged, and especially near the houses. One sort of moss is like a soft thick fur, which the natives use to stop the crevices of their houses; another sort serves them for tinder, and wicks for lamps. They have a kind of white moss, on which the rein-deer feed in winter, and which is said to be very medicinal. There is also another kind of moss, that serves them instead of bread, being occasionally boiled with milk, as a substitute for oatmeal. As the season will not admit of sowing till the middle of June, they cannot raise many vegetables. Radishes grow as well here as in most other countries; but salad and cole are very small, and will not bear transplanting. Wortle-berries and cranberries are here met with, and a fruit like the mulberry, only yellow, instead of red: these last are very refreshing, and a remedy for the scurvy. There are plenty of large juniper-berries; but they are held in no estimation. There are also three kinds of willows, but the cold will not suffer them to rear their heads. The birch, though somewhat different from ours, is in the same predicament. The Greenlanders mention alders, that grow in the southern parts to an immense height and size, and say that the wild service-tree grows there in abundance, and brings its fruit to maturity.

*Animals.*] This desolate land affords nourishment to a very few kinds of beasts, which supply the natives with food and raiment. The hares are white, both in summer and winter, are pretty large, and subsist on grass and white moss. The rein-deer are of that kind which are met with in Siberia, Norway, Lapland, and the northern parts of America. The largest are about the size of a two-year old heifer; their colour is brown, or grey, with white bellies; their skin very thick of hair, about an inch long; their antlers differ only from those of the common

buck, in being smooth, grey, and broad at top; and their flesh is tender, and well-tasted. They are very cleanly and contented creatures; live, in summer, on the tender grass, which they find in the valleys, and, in winter, on the white moss, which they dig for under the snow, between the rocks. Here are also foxes, but somewhat different from those of southern countries. Some are white, but, in general, they are blue or grey: they bark like dogs, and resemble them about the head and feet; they live on birds and their eggs, berries, muscles, crabs, and what the sea casts up. The natives catch them in traps; and, if in want of food, prefer them to hares.

The Greenland dogs frequently snarl and howl, but are never heard to bark: they are timorous, and, consequently, unfit for the chase; yet, if not tamed when young, they become remarkably wild and mischievous. The natives use these creatures to draw their sledges, yoking four, six, and sometimes eight, to a sledge, loaden with five or six large seals; and it is said that they often travel sixty miles in a winter's day upon the ice.

The white bears of Greenland differ from those of other countries, in having the head and neck of a more lengthened form, and the body longer in proportion to its bulk. The hair of these animals is long, and soft as wool; the ears and eyes are small, but the teeth are large, and the limbs remarkably long. They are not only seen at land, but often on ice-floats, several leagues at sea. They are sometimes transported in this manner to the coast of Iceland; and it sometimes happens that, when a Greenlander and his wife are paddling out at sea, a white bear unexpectedly gets into their boat, and, like a passenger, suffers himself to be rowed to shore.

It appears, however, that the Greenland bear is an animal of great spirit, and, if attacked, will make astonishing exertions to revenge himself on his assailant. Barentz had the most horrid proofs of their ferocity at Nova Zembla, where they attacked and devoured many of his seamen, even in the sight of their comrades. And an instance still more remarkable is thus narrated by the Rev. Mr. Bingley, in his Animal Biography: "Not many years ago, the crew of a boat, belonging to a ship in the whale-fishery, shot at a bear at a little distance, and wounded it. The animal immediately set up the most dreadful howl, and ran along the ice towards the boat. Before he reached it, a second shot was fired, and hit him. This served but to increase his fury. He presently swam to the boat, and, in attempting to get on board, reached one of his fore-feet upon the gunnel; but one of the crew, having a hatchet in his hand, cut it off. The animal still, however, continued to swim after them, till they arrived at the ship; and several shots were fired at him, which also took effect: but, on reaching the ship, he immediately ascended the deck; and the crew having fled into

the shrouds, he was pursuing them thither, when a shot from one of them laid him dead upon the deck."

During the summer, these creatures reside chiefly on the ice-islands, frequently swimming from one to another; but, at the approach of winter, they retire, and conceal themselves deep beneath the snow, where they pass the long Arctic night in a state of torpidity. Great numbers of them, however, are annually driven from their favourite retreats, by impetuous winds or currents, and perish in the open sea.

These bears produce one or two cubs at a time; and their maternal affection is so strong, that they will rather die than desert their young in the hour of danger. We shall relate one instance, which seems peculiarly worthy of attention.

While a frigate, which was sent out some years ago to make discoveries towards the north pole, was locked in the ice, a man at the mast-head gave notice, that three bears were advancing over the frozen ocean, and directing their course directly toward the vessel; having, probably, been invited by the scent of some blubber of a sea-horse, which was burning on the ice at the time of their approach. The animals, which proved to be a she-bear and two large cubs, ran eagerly to the fire, and drew out the flesh that remained unconsumed. The mariners then threw some other lumps of flesh upon the ice, which the old bear fetched away singly, and, dividing each lump, gave a share to each of her cubs; but, as she was fetching away the last piece, she received a wound from a musket-ball, and her young ones were both shot dead. The scene now became truly affecting, and the tender concern expressed by the poor animal in the last moments of her expiring cubs, might have drawn tears of pity from any but unfeeling minds. Though desperately wounded, and scarcely able to crawl to the place where the victims lay, she carried the lump of flesh thither, divided it between them, and laid her paws first upon one and then upon the other, anxiously endeavouring to raise them up. When she found that she could neither stir them, nor entice them to eat, she went off to some distance, looked back, and mourned most piteously; but this not availing, she returned, and, with signs of inexpressible affection, walked round them, pawing them and moaning. At length, perceiving them to be cold and lifeless, she raised her head towards the ship, and uttered a growl of despair. This was immediately returned by a discharge of musketry; and the affectionate animal, having fallen between her cubs, expired in the act of licking their wounds.

The usual food of these quadrupeds consists of seals, fish, and the carcasses of whales; but, when on land, they prey on deer, hares, young birds, and other animals; and they are also said to eat various kinds of berries. When allured by the scent of the flesh of seals, they assemble in

large droves, and habitations of the by the smoke

Of their astonishing lowing particular land, notwithstanding exquisite sense of the armen have died floating on the these animals and, raising the air, till they comes. They directly towards coarse, and the skins are used tendons, when thread.

large droves, and sometimes attempt to break into the habitations of the Greenlanders; but they are easily repulsed by the smoke of burnt feathers.

Of their astonishing sagacity in searching for prey, the following particulars are related. "The white bears in Greenland, notwithstanding the coldness of the climate, have an exquisite sense of smelling, and sometimes, when the fishermen have dismissed the carcass of a whale, and left it floating on the waves three or four leagues from the shore, these animals will stand as near the water as they can, and, raising themselves on their hind-legs, snuff in the air, till they are, at length, satisfied whence the odour comes. They then cast themselves into the sea, and swim directly toward the carcass." Their flesh is said to be coarse, and the liver is extremely unwholesome; but their skins are used for coverings of various kinds; and their tendons, when split asunder, are said to form excellent thread.

Of land-birds, the principal is the northern partridge, known in Switzerland by the name of the snow-hen: they cast their feathers twice a year. The colour of the cocks is grey in summer, and white in winter:—a wise precaution of Providence to preserve them from birds of prey, which hunt after them, and, but for this circumstance, would readily find them. Their claws have, within, a thick ball, covered with small feathers, to enable them to endure the cold, and, as their toes are not divided the whole way up, they are capable of swimming. Here are also snipes, and some small singing-birds; and among the birds of prey are the great dark-brown eagle, grey and spotted falcons, white owls, and ravens.

The eider-duck is, on account of its down, a profitable article of commerce. Its flesh is eaten by the Greenlanders, and of its skin they make their warmest undergarments. This fowl is, however, most valued for its down, which is found in great quantities, when stripped of its coarse feathers. As the down, when stripped from the dead bird, is apt to heat by lying, and will not distend itself properly, they contrive to procure it from the fowl whilst living: for this purpose, they visit the nests, which the tender mother lines with this soft substance, either dropped or plucked from her body, to prepare a warm bed for her callow brood.

In treating of Greenland, it is indispensably necessary to give some account of the whale and its fishery, which annually employs so many ships of different nations, and that in a compass of two degrees, from the seventy-seventh to the seventy-ninth. These ships sometimes catch from one thousand eight hundred to two thousand whales in the space of two months.

The Greenland whale is described, in *Marten's Voyage to Spitzberg*, and *Zordrager's Greenland Fishery*, to be from fifty to eighty feet long. The head is a third part

of the length of the whole body; it has only two fins, on each side of the head, from five to eight feet long, but with these it rows along very fast. Its tail is six or eight yards broad, and, turning up at both ends in a curve, it is enabled with it to dash the strongest boat in pieces; it is, however, a timid animal, never commencing an attack, but retiring at the least alarm. Its skin, above, is commonly black and smooth, like velvet, and white underneath. On the head is a bunch, where are two nostrils, through which it breathes, and spouts out the water it takes in at its mouth, with a noise that can be heard at three miles distant. Its eyes are placed between its nostrils and fins, and are not larger than those of an ox. It has no flaps to its ears, nor any teeth in its mouth, but contains in its upper-jaw, which is six yards long, those blades, or whiskers, as they are called, of which whalebone is made. There are commonly three hundred and fifty on each side; but the fifty largest only are taken. The tongue consists wholly of soft fat, which will fill from five to seven large barrels. This fish brings forth its young full-formed, generally one at a time, but never more than two, which it suckles: when pursued, it wraps up its young in its fins, close to its body. Whales have two skins, the inner an inch thick, the outer one as thin as parchment; under these lies the fat, from six to twelve inches thick; about the under-lip it is two feet in thickness. The entire fat of the whale will, according to the size of the fish, fill from one hundred to three hundred barrels. Its flesh is coarse. The bones are hard; full of holes on the inside, and filled with train-oil.

The taking of whales in the seas of Greenland, among the fields of ice that have been increasing for ages, is perhaps one of the boldest enterprises of man. These fields of ice are frequently more than a mile in length, and upwards of one hundred feet in thickness; and, when they are put in motion by a storm, nothing can be more terrible: the Dutch had thirteen ships crushed to pieces by them in one season.

When the scamen see a whale spout, the word is immediately given, a *fall! a fall!* when every one hastens from the ship to his boat; six or eight men being appointed to a boat, and four or five boats usually belong to one vessel.

When they come near the whale, the harpooner strikes him with a barbed dart, called a harpoon; and the animal, finding himself wounded, dives swiftly down into the deep, and would carry the boat along with him, if they did not give him line fast enough. To prevent the wood of the boat taking fire, by the violent friction of the rope on the side of it, some person wets it constantly with a mop. After the whale has run some hundred fathoms deep, he is forced to come up for air, when he makes such a terrible noise with his spouting, that some have com-

pared it to the firing of cannon. As soon as he appears on the surface of the water, some of the harpooners fix another harpoon in him, upon which he plunges again into the deep. When he comes up a second time, they pierce him with spears in the vital parts, till he spouts out streams of blood, instead of water, beating the waves with his tail and fins till the sea is all in a foam, the boats continuing to follow him some leagues, till he has lost his strength; and when he is dying he turns himself upon his back, and is drawn on shore, or to the ship, if they be at a distance from the land. There they cut him in pieces, and, by boiling the blubber, extract the oil, if they have conveniences on shore; otherwise they barrel up the pieces, and bring them home. Every fish is computed to yield between sixty and a hundred barrels of oil.

In these seas there are five or six species of seals; some two and some three yards in length. They, in general, yield a great quantity of blubber; and the train that drops from them is not more rancid than stale oil of olives: with their skins the Greenlanders frequently make waistcoats. They cannot easily be caught by a single person; but, as they are animals of passage, retiring from Greenland in March, to cast their young, and returning in June, like a flock of sheep, the seal-hunters endeavour, on their return, to surround them on the ice, where they often lie sleeping in herds. They first frighten them by shouting, which occasions them to stretch out their necks, and yell, at which time the catchers take the opportunity to stun them, by giving them a violent blow on their noses; after which they kill and skin them.

To the Greenlanders the seal-fishery is of the greatest importance. Seals' flesh, with that of the rein-deer, is their most delicious and substantial food: the fat supplies their lamps and fires with oil, softens their dry food, and, by barter, furnishes them with all the necessaries of life. Of the fibres of seals' sinews, they make thread; the transparent skins of the entrails serve them for windows, curtains for their tents, shirts, &c.; and of the maw they make train bottles. When there is a scarcity of iron, they make instruments and tools of their bones: their blood, with other ingredients, they convert into soups; and make their clothes, bedding, and boats, of their skins. Catching seals, therefore, is the great end of Greenland education; to which the children are trained from their infancy, and by which they obtain a subsistence.

In this fishery they use two kinds of boats; a large one and a small one. The large one they call *umiak*, or the woman's boat; and the small one, *kaiak*. The woman's boat is from thirty-six to fifty-four feet long, four or five wide, and three deep; the other about seventy-two feet long, eighteen inches broad, and barely twelve inches deep; they are flat-bottomed, widest in the middle, go off sharp at each end, and are covered with seal-skin. The large

boats are open at the top, and are generally rowed by four women; one steering with an oar behind. In the fore-part is a mast, with a sail, six feet high, and nine feet wide.

*Customs, Manners, &c.*] The Greenlanders are of low stature, not exceeding five feet in height; but they are well shaped, and proportionate in their limbs. Their faces are generally broad and flat, with high cheek-bones, but their cheeks are round and plump. Their eyes are small and black, but without any animation, and their noses project but little from their faces; their bodies are of a dark grey, but their faces are of an olive-colour. As their children are born white, this tinge may proceed in part from their filthiness; for they are continually handling train-oil and grease, sitting in the smoke, and seldom wash themselves: their food also may contribute to the same end; for their breath smells like train-oil, and their hands feel clammy. But there are a few whose complexions are fairer, and who might pass undistinguished among the natives of Switzerland. The hair on their heads is universally long and black; but the men have seldom any beard, as they take great pains to pluck it out. Their hands and feet are small and soft, but their head and limbs are large. They have high breasts and broad shoulders, especially the women, who accustom themselves to carry heavy burdens, and, being corpulent, can endure the cold, with bare heads and necks, and very thin clothing. They are very light and active, do not want strength, and can endure great fatigue. They are of a phlegmatic nature, but good-humoured, sociable, and far from covetous: being so little concerned for the future, as not to hoard up any thing.

The pacific disposition of these people is much to be admired. As several families live in one house, if any one conceives himself injured, he removes to another habitation, and that without a murmur. They cheerfully assist each other, and live, in some measure, in common, yet without any one relying on the labour of another. If a man return home with provision in the evening, he divides it with the families under the same roof; but, poor as they may be, not one presumes to ask for any thing; nor, indeed, is it necessary in a country where such hospitality is practised.

Their clothes are made of skins of rein-deer, seals, and birds. Their outer garment has some resemblance to a waggoner's frock, and they put it on by drawing it over their heads, like a shirt; at the top of it is a hood, which they can occasionally pull up over their heads. Their under-garment is a kind of shirt, made of the skins of birds, with the feathers inwards. Some of them make their upper-garment of cloth, or cotton. Their breeches are of seal's skin, very short above and below; their stockings are made of the skin of a seal's fectus, taken

out of the bodice, black leather soles of their shoes before and behind. The ri- heels. out of the body of the dam; and their shoes are of smooth black leather, tied with a thong on the instep. The soles of their shoes stand out, bending upwards, both before and behind, two inches broad, but they have no heels. The rich natives wear woollen stockings, breeches, and caps; and, when they make a voyage, cover themselves with a black smooth seal's hide, as a great coat. The dress of the women is much the same, only their jackets have higher shoulders, and a higher hood, and are not cut round at the bottom, like the men's, but, from the thigh, drop in a point before and behind, below the knee, and are bordered with red cloth. The women also wear short drawers, and a kind of high shoes, of white or red leather, the seam of which is before, and ornamented. Mothers and nurses wear an upper-garment, wide in the back, with a pocket in the shoulders large enough to hold a child, which is left there naked, and is no otherwise taken care of. They are very careful of their best clothes, but their ordinary garments drip with grease, and their heads swarm with vermin, which they are said to kill between their teeth.

The men wear their hair cut short in the poll, and squared off on their foreheads; but, as it is a reproach to a woman to cut her hair, except in cases of deep mourning, or when they resolve never to marry, they tie it up to the top of their heads, so as to ornament their crowns, binding it with glass-beads, or some gay bandage. The same kind of ornaments they wear round their arms and necks, and in their ears, and round the borders of their clothes and shoes: but such as wish to be admired draw threads, blacked with soot, under their chins, cheeks, hands, and feet, which leave a black mark behind, somewhat resembling a beard.

The habitations of the Greenlanders are huts in winter, and tents in summer. The former, which are built with stones and sods, are generally erected on some eminence near the sea, in order that the snow may run from them. They are seldom more than about four yards broad, and from eight to twenty-four yards in length, according to the size of the family, and just high enough for a person to stand upright in. They have neither door nor chimney, but the deficiency is supplied by a passage, five or six yards long, by which they can pass through the middle of the hut; the roof of the passage is so low, that they are obliged to creep in almost on their hands and feet. This long entrance excludes the wind and cold, and lets out the thick air, for, as they burn only oil within, they have no smoke. The inside of the walls are hung with old skins, and the roofs covered with the same. From the middle of the hut to the back wall, there is a raised broad bench, made of wood, and covered with skins, and this is divided by skins, stretched from the posts that support the roof, into apartments, like horse-stalls, in each of

which a family lives, so that houses contain from three to ten families, some more, and some less. On these benches they sit in the day-time, the men with their legs hanging down, the women behind, cross-legged, and in the night they sleep on them. Along the front wall, opposite to this wall, are several square windows, made of seals' entrails and halibuts' maws, and sewed so neatly as to keep out the weather, and yet admit the light. A bench runs along the whole length of the house, under the windows, where strangers sit or sleep. By every post is a fire-place. A block of wood is laid upon the ground, and upon that a flat stone; on the stone, a low three-legged stool, and on that stool a lamp, resembling a half moon, hewn out of marble; it stands in an oval wooden bowl, placed under the lamp, to receive the waste oil. In this lamp, filled with seal-oil, they lay some moss, rubbed fine, which burns so bright, and gives such a heat, as not only lights, but warms the apartment. Over this lamp hangs a marble kettle, by four strings, fastened to the roof, in which they boil their meat; and over this is placed a wooden rack, on which they lay their clothes and boots to dry. At the outside of these mansions they have little store-houses, where they lay up their provision, and close by are their boats, drawn on the land, and laid with their bottoms upwards, to preserve them.

Their cookery, like their persons, is marked by filthiness; as they seldom wash their kettles, but leave them to the dogs to clean. Their broth they eat with bone-spoons, from a wooden dish, but their meat they eat with their fingers, and tear with their teeth; and, when the repast is over, scrape their lips with a knife, lick the blade, and put it in their pockets. When they entertain a stranger, they first lick the meat he is to eat clean from the scum it had contracted in the kettle, and this is to be considered as a particular mark of attention and respect. They eat whenever they are hungry, but the evening meal is their chief repast, when they frequently invite their neighbours, or send them a part of it. They take no thought for the morrow, but, when they have plenty, will dance and eat to excess. But when March comes, and the seals retire, till May, if bad weather ensue, they are obliged to struggle with hunger for many days together; and, in fact, they are sometimes reduced to the necessity of eating muscles, seaweed, old tent-skins, &c.

Their beverage is clear water, which stands in the house in a large copper vessel, or in a wooden tub, which is very neatly made, and ornamented with fish-bones and rings.

The principal employments of the men are hunting and fishing; but when they have towed their booty to land, they trouble themselves no farther about it; nay, it would be accounted beneath their dignity even to draw out the fish upon the shore. The women are the butchers

and cooks, and also are expected to dress the skins, and make them up into clothes, shoes, and boots. The women also build and repair the houses and tents, so far as relates to the masonry, the men doing only the carpenter's work.

The Greenlanders seldom marry a relation, or any person bred up with them, yet there have been instances of a man's marrying two sisters, or a mother and the daughter. Polygamy is allowed among them; but scarcely one married man in twenty has more than one wife. If a woman do not breed, she is sometimes put away, and this with little more ceremony than a sour look, on the part of the husband, and packing up her clothes, on that of the wife. When this happens, the woman returns to her own friends. Where a wife cannot agree with other women in the same house, she will elope, especially if she have no son, for sons are the pride of a Greenlander's heart, his greatest treasure, and the best security of his property.

The women are not very prolific, having seldom more than three or four children. Very few die in child-birth, and a still-born or deformed child is scarcely ever heard of, though the mother works just before and immediately after her delivery. Mothers love their children excessively, and carry them with them, wherever they go, in the pocket of their outer garment.

The Greenlanders are unacquainted with salutations and tokens of respect, and laugh at a man's standing uncovered in presence of his superior; yet the young have a due respect for the aged, and each man entertains a proper regard for the other. Assiduous to please, and cautious not to displease, they study to avoid every thing that will create uneasiness. They never contradict or interrupt any one in his discourse, but one person is suffered to finish his speech, before another begins. When they make a visit in their boats, they never fail to take with them a present; if their company be approved, they are welcomed on the shore with singing, and all hands are ready to draw the boat upon land. Every one is anxious to have the guest at his house; but, as the visitor is unwilling to have it thought that he is come abroad with mercenary views, he waits in silence till pressed to partake of their hospitality. The men sit among the men, and the women by themselves. The conversation of the former turns upon the weather, hunting, and fishing; that of the latter, on the death of their relations, which they close with a general howl, and then proceed to divert their guests with little entertaining anecdotes. In the mean time the horn goes round with snuff, and the repast is prepared.

Their traffic is very simple. They have no money; of course they barter with each other for what they want; and, as they are as eager for new things as children, they are constantly changing, and often to their disadvantage. They will give the most useful article in exchange for a

trifle that pleases their fancy; and will reject a useful thing in exchange for a bauble, if it does not please them. They seldom cheat one another, but they consider it a proof of superior adroitness if they can over-reach an European. They keep a kind of annual fair among themselves; and as the people in the south have no whales, and those in the north have no wood, the Greenlanders coast the country every summer, from two hundred to four hundred leagues, with new boats and tackling, exchanging them for wood, horns of the unicorn-fish, tecth, whalebone, &c.; part of which they barter on their return.

The sun-feast is a rejoicing at the return of the sun, in the winter solstice, about the twenty-second of December. On this occasion, they assemble, all over the country, in large parties, and treat each other with the greatest hospitality. When they have feasted, they rise up to play and to dance, but have nothing but water to drink. The only musical instrument they have is a drum, which the performer beats with a stick to common time, skipping at every stroke, and making antic motions with his head and his body. This music he accompanies with a song, in honour of seal-catching, and expresses his joy at the return of the sun. When one is tired, another begins, and thus they continue the whole night through; the next day they sleep, and in the evening feast, dance, and sing, again. This festival generally lasts several days and nights.

When the moon shines, they amuse themselves by playing at ball, and they have various methods of trying each other's strength; such as striking one another on the bare back, and trying who can bear it the longest; sitting down, and linking their legs and arms together, endeavouring to out-pull each other; hooking their fingers together, and trying their strength by drawing, &c. Dancing assemblies are also appointed, at different seasons of the year.

But the most singular custom in Greenland is their singing and dancing combats, by which they decide their quarrels. If a man conceives himself injured, he does not vent his anger in words, nor proceed to any revenge, but composes a satirical poem: this he rehearses so often, with singing and dancing, before his family, that they all get it by heart. The man publishes his design of fighting with his antagonist, not with a sword, but a song; and a place of meeting is appointed. The party challenged attends at the place, encircled with his friends, when the challenger begins his song, to the beat of a drum, and chorussed by his party. In this song he points many mortifying invectives at his adversary. When he has done, the accused renews his attack, and so on, and he that has the last word, gains the cause. The body of the people present constitute the jury, and bestow the palm of victory, and the two contending parties become perfectly reconciled.

The Greenlanders have some traditionary notions of the creation, and a future state; but they are so enveloped in idle tales, as to bear very little affinity to the truth. The Moravian missionaries, however, have taken great pains to instruct them in the glorious truths of the gospel.

They have no conception of writing, nor can they count more than twenty; they contrive to reckon their years by winters, and their days by nights, but when they get beyond twenty, they leave off counting. In physic, they have methods of curing themselves; and in surgery, of bleeding, setting a fracture, and couching an eye.

When a Greenlander is at the point of death, they dress him in his best clothes; and, as soon as he expires, they carry every thing within the house into the air, that the smell of the corpse may go off: they then silently bewail him, for about an hour, and proceed to bury him, which is done usually in some remote place, the nearest relation carrying the body, which is sewed up in a skin, and laid on some moss on the ground, and heaped round and covered with large broad stones, to defend it from the

birds and foxes. Near the spot they deposit the boat and tools of the deceased, and, if a woman, her knife and sewing implements. After the interment, those who attended the procession retire to the house of mourning. The men sit some time, leaning with their elbows on their knees, and their heads between their hands, and the women lie prostrate with their faces on the ground, softly weeping and sobbing. At last the father, son, or nearest relation, repeats a funeral discourse, in praise of the deceased; and, at every period, they utter loud cries and lamentations.

When the oration is ended, the women continue their howl in one tremulous tone, the men only sobbing. At last the viands left by the deceased are spread upon the floor before the mourners, who eat heartily, and never fail to repeat their visits daily, whilst there is any thing left. All condoling visitors afterwards are received by the mistress of the house with expressions to this effect:—"Him that you seek you will find no more; alas, you are come too late!"

## CHAPTER VIII.

### AMERICAN ISLANDS, OR THE WEST-INDIES.

#### GENERAL DESCRIPTION.

**B**ETWEEN the northern and southern continents of America lie a multitude of large and fertile islands, denominated the West-Indies, in contradistinction to the islands of Asia, beyond the Cape of Good Hope, which are called the East-Indies. Those which are worthy of cultivation belong to five European powers:—Great Britain, Spain, France, Holland, and Denmark.

The climate in all these islands is nearly the same, allowing for those differences which are produced by the various situations and qualities of the lands. As they lie between the tropics, and the sun goes quite over them, passing beyond them to the north, and never returning farther from any of them than about thirty degrees to the south, they are continually subjected to a heat which would be intolerable, if the trade-wind, rising gradually as the sun gathers strength, did not blow in upon them from the sea, and refresh the air in such a manner as to enable the people to attend to their concerns, even under the meridian sun. On the other hand, as the night advances, a breeze begins to blow from the land as it were

from the centre, towards the sea, to all points of the compass at once.

In the same manner, when the sun has made a considerable progress towards the tropic of Cancer, and becomes in a degree vertical, it draws after it such a vast body of clouds as shield the earth from its direct beams; and, dissolving into rain, cool the air, and refresh the country, parched with the long drought, which commonly continues from the beginning of January to the latter end of May.

The rains in the West-Indies are by no means so moderate as those in Europe. The former are rather floods of water, poured from the clouds with a prodigious impetuosity: the rivers rise in a moment, new rivers and lakes are formed; and, in a short time, all the low country is completely inundated. Hence it is, that the rivers which have their source within the tropics swell and overflow their banks at a certain season; but so mistaken were the ancients in their idea of the torrid zone, that they imagined it to be dried and scorched up with a continued and fervent heat; and to be, for that reason, uninhabited.

bitable, when, in reality, some of the largest rivers in the world have their course within its limits, and the moisture is, in several parts, one of the greatest inconveniences of the climate.

The rains make the only distinction of seasons in the West-Indies. The trees preserve their verdure the whole year round; they have no cold, frosts, or snows, and but rarely some hail; the storms of hail are, however, very violent, when they happen, and the hailstones very large and heavy. Whether it be owing to this moisture, which alone does not seem to be a sufficient cause, or to a greater quantity of sulphureous acid, which predominates in the air of this country, metals of all kinds, that are subject to the action of such causes, rust and canker in a very short time; and this cause, perhaps, as much as the heat itself, contributes to make the climate of the West-Indies unfriendly to an European constitution.

In the rainy season, the inhabitants are assaulted by hurricanes, the most terrible calamity to which they are subject from the climate: these destroy, at a stroke, the labours of many years, annihilate the most exalted hopes of the planter, and often just at the moment when he thinks himself out of the reach of injury. A hurricane is a sudden and violent storm of wind, rain, thunder, and lightning, attended with a furious swelling of the seas, and sometimes with an earthquake; in short, with every circumstance which the elements can assemble that is terrible and destructive. As the prelude to the ensuing havoc, whole fields of sugar-canes are whirled into the air, and scattered over the face of the country; the strongest trees of the forest are torn up by the roots, and driven about like stubble; the windmills are swept away in a moment; the utensils, the fixtures, the ponderous copper-boilers, and stills of several hundred weight, are wrenched from the ground, and battered to pieces; the houses afford no protection; the roofs are torn off at one blast; whilst the rain, which in an hour rises to the height of five feet, rushes in upon them with irresistible violence.

The grand staple commodity of the West-Indies is sugar; an article which was not at all known to the Greeks and Romans, though it was made at a very early period in China, whence we had the first knowledge of it; but the Portuguese were the first who cultivated it in America, and brought it into request, as one of the materials of universal luxury in Europe. Writers are not agreed whether the cane, from which this substance is extracted, be a native of America, or brought thither to their colony of Brazil, by the Portuguese, from India and the coast of Africa; but, however that may be, in the beginning they made the most, as they still do the best, sugars which come to market in this part of the world. The juice within the sugar-cane is the most lively, least cloying, sweet in nature; and, sucked raw, has proved ex-

tremely nutritive and wholesome. From the molasses, rum is distilled, and from theummings of the sugar an inferior spirit is procured. Rum finds its market in North-America, where it is consumed by the inhabitants employed in the African trade, or distributed from thence to the fisheries of Newfoundland, and other parts, besides what comes to Great Britain and Ireland. A very great quantity of molasses is also taken off raw, and carried to New England to be distilled there. The tops of the canes, and the leaves which grow upon the joints, make very good provender for the cattle; and the refuse of the cane, after grinding, serves for fuel.

It is computed that, when a plantation is well managed, the rum and molasses pay the expences, and the sugars are clear gain. It is true, the expences of a plantation in the West-Indies are very great, and the profits at the first view precarious: for the chargeable articles of the windmill, the boiling, cooling, and distilling-houses, and the buying and subsisting of a suitable number of slaves and cattle, will not suffer any person to begin a sugar-plantation of consequence, not to mention the purchase of the land, which is very high, under a capital of at least five thousand pounds. There are, however, no parts of the world in which great estates are made in so short a time, from the produce of the earth, as in the West-Indies. The produce of a few good seasons generally provides against the ill effects of the worst, as the planter is sure of a speedy and profitable market for his produce, which has a readier sale than perhaps any other commodity in the world.

Large plantations are generally under the care of a manager, or chief overseer, who has commonly a salary of one hundred and fifty pounds a year, with overseers under him, in proportion to the extent of the plantation, one to about thirty negroes, with a salary of about forty pounds. Such plantations, also, have a surgeon at a fixed salary, employed to take care of the negroes who belong to it. But the course which is the least troublesome to the owner of the estate is, to let the land, with all the works, and the stock of cattle and slaves, to a tenant, who gives security for the payment of rent, and the keeping up repairs and the stock. The estate is generally estimated to such a tenant at half the net produce of the best years. Such tenants, if industrious and frugal men, soon realize good estates for themselves.

The negroes in the plantations are subsisted at a very easy rate. This is generally done by allotting to each family of them a small portion of land, and allowing them two days in the week, Saturday and Sunday, to cultivate it. Some planters, however, find their negroes a certain portion of Guinea and Indian corn, and to some a salt herring, or a small portion of bacon or salt-pork, a day. All the charge consists in a cap, a shirt, a pair of breeches,

and a blanket ten or twelve of their first and men and gro families as a generally bu with another man, expert fifty guineas put from

A more 59.

and a blanket; and the annual profit of their labour is ten or twelve pounds. The price of male-negroes, upon their first arrival, is from thirty to thirty-six pounds, women and grown boys fifty shillings less; but such negro families as are acquainted with the business of the islands generally bring above forty pounds, upon an average, one with another; and there are instances of a single negro-man, expert in his business, bringing one hundred and fifty guineas: the wealth of a planter is generally computed from the number of slaves in his possession.

It has been justly remarked by a modern geographer, that "to particularise the commodities proper for the West-India market would be to enumerate all the necessities, conveniences, and luxuries of life; for they have nothing of their own but cotton, coffee, tropical fruits, spices, and the commodities already mentioned. Traders there make a very large profit upon all they sell; but from the numerous shipping constantly arriving from Europe, and a continual succession of new adventurers, each of whom carry out more or less as a venture, the West-India market is frequently overstocked; money must be raised, and goods are sometimes sold at prime cost, or under. But those who can afford to store their goods, and wait for a better market, acquire fortunes equal to any of the planters. All kinds of handicraftsmen, especially carpenters, bricklayers, braziers, and coopers, get very great encouragement. But it is the misfortune of the West-Indies, that physicians and surgeons even outdo the planter and merchant in accumulating riches."

The state of the population in the British West-Indies, a few years since, was said to be about sixty-five thousand whites, and four hundred and fifty-five thousand blacks. There was likewise in each of the islands a considerable number of mixed blood, and native blacks of free condition. In Jamaica they were reckoned at ten thousand and four; and they did not fall short of the same number in all other islands, collectively taken. The whole of the inhabitants, therefore, may be properly divided into four great classes:—1, European Whites; 2, Creole, or native Whites; 3, Creoles of mixed blood, and free native Blacks; and, 4, Negroes in a state of slavery.

The West-Indian Islands lie in the form of a semicircle, stretching almost from the coast of Florida, north, to the River Oroonoko, on the main continent of South-America. Some call them the Caribbees, from the first inhabitants; though this is a term that most geographers confine to the Leeward Islands. Sailors distinguish them into Windward and Leeward Islands, with regard to the usual courses of ships from Old Spain or the Canaries, to Carthagea or New Spain and Porto Bello. Geographical tables and maps distinguish them into the Great and Little Antilles.

A more particular account of the respective islands

which, unitedly, constitute the West-Indies, will be found in the following sections.

## SECTION I.

### JAMAICA.

*Discovery, Settlement, &c.]* Jamaica, which is the largest of the British West-Indian Islands, was first discovered by Columbus, in the year 1494, but at that time he did not attempt to make any settlement there. Some years after, in his fourth expedition, he was cast ashore here by a storm; the loss of his ship putting it out of his power to get away, he implored the humanity of the natives, and received from them all the help of a natural compassion; but these people, who planted only for their own necessities, were soon tired with maintaining strangers, who exposed them to the risk of a famine, and, therefore, gradually removed themselves from the neighbourhood. The Spaniards no longer kept any measures with the Indians, and soon grew so mutinous as to take up arms against their commander. Columbus, forced to yield to their menaces, to extricate himself from a desperate situation, took advantage of one of those appearances of nature, where a man of genius sometimes finds a resource pardonable through necessity. His astronomical knowledge informed him, that there would soon be an eclipse of the moon, and he desired all the *caciques* to assemble together, to hear from him some things very important to their safety. When he was in the midst of them, after having reproached them for their cruelty towards himself and his companions, "To punish you for it," said he, with an air of great importance, "the God whom I adore is going to inflict on you one of his most terrible strokes: this evening you will see the moon redden, grow dark, and refuse you light. This is only the prelude of your misfortunes, if you persist in refusing to give me provisions." Columbus had hardly ceased speaking, when his prediction was accomplished: the fright was general among the savages: they thought they were going to be destroyed, begged for mercy, and promised every thing. He then declared to them, that Heaven, touched with their repentance, had appeased its wrath, and that nature was about to resume its course. After this, provisions were sent from all parts, and Columbus had every thing he could wish for till his departure.

The court of Spain had granted the property of Jamaica to Columbus, who gave it the preference to all other parts, on account of its populousness and pleasant situation. He called it the Sicily of the Indies. Don Diego, his son, was the first governor of it, with the title of Duke de la Vega, from the city of St. Jago de la Vega, founded by him, which became its capital. Don Diego

had caused about an hundred Indians to go over from St. Domingo, under the conduct of Juan d'Esquimel; others soon followed them; but in a few years after they all deserted the island.

The Spaniards had erected several other cities here, but all their settlements fell to decay as fast as the population decreased, and as the ravagers were convinced the island produced no gold, they were soon reduced to that of St. Jago de la Vega, which then consisted of one thousand one hundred houses, four churches, and an abbey. The inhabitants of this city, plunged into that indolence which follows tyranny after devastation, contented themselves to live on some plantations, the overplus of which they sold to the vessels which passed by their coasts. The whole people of the island, collected into a small territory, which nourished this useless race, was confined to one thousand five hundred slaves, commanded by their tyrants; when the English, coming at last to attack their capital, made themselves masters of it, and settled there in 1655.

At first their new colony contained only three thousand inhabitants, part of the militia that had fought under the rebellious standard of Oliver Cromwell. They were soon joined by a number of royalists, who went to America to meet with some alleviation for their defeat, and to enjoy the calm of peace. The spirit of division, which had so long and so cruelly rent the two parties in Europe, followed them beyond the seas; there was enough to renew in the New World the scenes of horror and bloodshed so often repeated in the Old. But Admiral Penn and Colonel Venables, after conquering Jamaica, had left the command to one of the wisest and bravest men, who fortunately was the senior officer: it was D'Oyley, a friend of the Stuarts. Cromwell twice substituted some of his party in his place, and both times their deaths restored D'Oyley to the head of affairs. His manner of ruling was quite military. He had to keep in order and govern an infant colony entirely composed of soldiers, and to prevent or repel the invasions of the Spaniards, who might try to recover what they had just lost. But on the restoration of Charles II. a civil government was established at Jamaica, formed, like those in the other islands, after the model of the mother-country; but the first attempts were confined to compiling, without any methods, some provisional regulations for the police, justice, and finances. It was not till 1682 that the body of the laws was formed by which the island is at present governed.

After the Restoration, this colony increased so considerably, that it soon contained eighteen thousand persons, who had little other trade but their depredations on the Spaniards. Sir Thomas Modiford, a rich planter of Barbadoes, who came to Jamaica to increase his possessions, was then governor: he introduced into this island the art of making sugar, and of planting cocoa-trees, and erected

salt-works. His attention to encourage culture and industry could not make the people of Jamaica give up their maritime expeditions; adventurers of all kinds increased the crowd of these romantic pirates, known by the name of free-booters and buccaneers: they infested the whole West-Indian Sea, and laid waste all the coasts of the New World. The plunder of Mexico and Peru was always carried to Jamaica, both by the natives and strangers: they found in this island a greater degree of ease, and received more protection and liberty than elsewhere, both to disembark and to spend, at their own pleasure, the booty they had acquired in their courses. There the extravagance of their debaucheries soon plunged them into distress; and this made them fly to new combats and to new prey. Then the colony profited by their continual changes of fortune, and enriched itself by the vices which were the origin and ruin of their treasures: and when this lawless race was destroyed by its own activity, these same treasures became the basis of a new opulence, by the help they offered to increase the plantations and productions, or to open a contraband trade with the Spaniards. It is, indeed, evident that England owes the possession of Jamaica, as well as the means which determined the grandeur of its settlement, to the Buccaneers.

*Situation, Extent, &c.*] This island lies between seventy-five and seventy-nine degrees of west longitude from London, and between seventeen and eighteen degrees of north latitude. From the east and west it is about one hundred and seventy British miles in length, and in the middle about sixty in breadth, growing less towards each end, in the form of an egg. It lies nearly four thousand five hundred miles south-west of England.

The large islands of Cuba and St. Domingo defend it from the winds which desolate the Atlantic, whilst the number and disposition of its harbours put it in a condition to carry on a considerable trade with either these and the other islands of the West-Indian Sea, or with the continent. There are about sixteen principal harbours, besides thirty bays, roads, or good anchoring-places. Though this situation may expose it to the insults of its too-powerful neighbours, it at the same time facilitates the entrance of the succours which the mother-country has at all times lavished on it.

The longest day in summer is here about thirteen hours, and the shortest in winter about eleven. The air is, in most places, excessively hot, and unfavourable to European constitutions; but the cool sea-breezes, which set in every morning at ten o'clock, render the heat more tolerable; and the air upon the high grounds is temperate, pure, and cooling. The sea-breeze is stronger at some times than at others, and more so near the coast than within land; whereas it is just the reverse with the land-breeze. Sometimes the sea-breeze blows day and night for a week or

two. In the winter the wind blows from the north and all other winds but the south-east. In the summer, when the thunder, with astonishing violence, is followed by violent storms, or March to October the rain falls in times for a week or more.

The dew is very heavy, and had rained in the plain, or savanna.

Mountains are everywhere hills, called mountains, and the island from the different kinds of mahogany, and other navigable rivers. A lower ridge of savanna pasture, and on the south side of the savanna grass, that is burnt up.

Though the soil is very sandy, with sand and gravel, it has been found that the island are several lakes, well-watered, and medicinal, excepting the terrible diseases.

678

two. In December, January, and February, the north wind blows furiously, checking the growth of the canes, and all other vegetables, on the north side of the island; but the south side is sheltered from them by the mountains. It lightens almost every night, but without much thunder, which, when it happens, is very terrible, and roars with astonishing loudness; and the lightning, in these violent storms, frequently does great damage. In February or March they expect earthquakes, and in May and October the rains are extremely violent, and continue sometimes for a fortnight together.

The dews here are so great within land, that the water drops from the leaves of the trees in the morning, as if it had rained; but there are seldom any fogs, at least in the plain, or sandy places near the sea.

*Mountains, Rivers, and Lakes.*] There is a ridge of hills, called the Blue Mountains, that runs through the island from east to west; the tops are covered with different kinds of trees, particularly cedar, lignum vitæ, and mahogany. Several fine rivers, well stored with fish, and navigable by canoes, take their rise from these mountains. A lower ridge runs parallel to the greater, and the valleys or savannahs are exceeding level, without stones, fit for pasture, and fruitful, when cleared of wood, especially on the south side of the island. After the rains, the savannahs are very pleasant, and produce such quantities of grass, that the inhabitants are sometimes forced to burn it; but, after long droughts, they are quite parched and burnt up.

Though this island abounds with rivers and lakes, water is very scarce in some places, and in others so mixed with sand and sediment, that it is not fit for use till it has been purified for some days in earthen jars. In the island are several salt-springs, which form a salt-river, and several lakes. Near the sea, as well as at Port Royal, the well-water is brackish and unwholesome. In the mountains, not far from Spanish Town, is a hot bath, of great medicinal virtues. It affords relief in the dry cholic, which, excepting the bilious and yellow fever, is one of the most terrible distempers of Jamaica.

The soil is, in general, exceeding fertile, yet it is supposed that not one-fourth of the sugar-ground upon the island is cultivated. Even the grounds lying near the rivers and the sea are, in many places, over-run with wood, insomuch that a planter who has planted three or four thousand acres, has seldom above five hundred well cultivated.

*Vegetable Productions.*] This island produces a number of trees, shrubs, and useful plants, some of them natives of the soil, and others brought from the other American islands. The principal trees are the cedar; the cabbage-tree, remarkable for the hardness of its wood; the palma, affording an oil much esteemed by the savages;

the soap-tree, whose berries answer all purposes of washing; the mangrove and olive-bark, useful to tanners; and the fustic and red-wood, used in dying. The indigo-plant was formerly much cultivated; and the cotton-tree is still so. No sort of European grain grows here; but they have maize or Indian-corn, Guinea-corn, peas of various kinds, and a variety of edible roots. Among the fruits of the island are citrons, Seville and China oranges, common and sweet lemons, limes, shadocks, pomegranates, soursops, papas, pine-apples, custard-apples, star-apples, prickly pears, allicada pears, melons, pompions, guavas, and several kinds of berries; also culinary vegetables in great plenty. The bread-fruit and other useful plants have been introduced into this island by the exertions of Sir Joseph Banks. Here are, likewise, various sorts of medicinal drugs, such as the guaiacum, China-root, sarsaparella, cassia, vanilla, aloes, and the wild cinnamon-tree, which is esteemed an excellent antidote against flatulency and indigestion.

The most valuable production of this island is sugar. The cane, from which it is extracted, is a kind of reed, which rises commonly about eight or nine feet, taking in the leaves growing out of the top; and the most common thickness is from two to four inches. It requires a light, porous, and deep, soil, and is usually cut at the end of eighteen months. Within twenty hours after the canes are cut down, they are broken between two rollers of iron or copper, which are put in motion by an horizontal wheel, usually turned by oxen or horses.

The juice, with which the inner part of the cane is filled, is received in a reservoir, whence it is successively carried to several boilers, to reduce it into crystals. This liquor is called treacle or molasses. After the draining, they have muscovado, or rough sugar, which is greasy, brown, and soft. This sugar does not become white, shining, and hard, till it is refined, which is generally done in Europe, though there are two refining-houses at Kingston. The molasses are usually the twelfth part of the value of the sugar. A great proportion of this article is consumed in the north of Europe, and in North-America, where they supply the place of butter and sugar to the common people. The Americans use them to produce a fermentation; and they give an agreeable taste to a drink called pruss, which is nothing more than the infusion of the bark of a tree. These molasses are likewise prodigiously useful, since the secret has been discovered of converting them, by distillation, into rum. The operation is performed by mixing one-third of syrup with two thirds of water. When these two substances have sufficiently fermented, at the end of twelve or fifteen days, they are put into a still, where the distillation is carried on with great facility. The annual exports of Jamaica, in these several articles, the produce of sugar-canes, are upwards

of one hundred thousand hogsheads of sugar, between thirty and forty thousand puncheons of rum, and three hundred thousand gallons of molasses.

Next to the sugar, the most considerable production of this island is pimento, great quantities of which are annually exported. There are several kinds, more or less strong and acrid. The tree which produces that kind of pimento known by the name of Jamaica pepper, was not cultivated in regular plantations till about the year 1668. It commonly grows on the mountains, and rises above thirty feet high. It is very straight, and covered with a grey, close, shining bark. The leaves resemble those of the laurel; and at the end of the branches grow the flowers, to which succeed berries, a little larger than those of the juniper. They are gathered green, and laid to dry in the sun, where they become brown, and exhale that spicy smell, which has given to pimento the name of allspice. To the culture of pimento the people on this island join that of ginger, which is the root of a small plant, about eighteen or twenty inches high. This island also produces some tobacco, but of a coarse kind, and cultivated only for the sake of the negroes, who are fond of it; together with cabbages, and a variety of roots, particularly cassava, yams, and potatoes.

The cattle of this island are very small, and the flesh is tough and lean. The sheep, however, are superior, and their flesh is very good; but the wool, which is long and full of hairs, is of little use. Hogs are very numerous, and their flesh is sweet and delicate. Horses, asses, and mules, are plentiful; the former are small and hardy, and, when well made, fetch a good price. There are various sorts of fowl, both wild and tame, and more parrots than in any of the other islands; besides parroquets, humming-birds, pelicans, snipes, teal, Guinea-hens, geese, ducks, and turkeys. The bays and rivers contain an abundance of excellent fish; but the turtle is the most valuable. The manati, or sea-cow, which is often taken in calm bays, is reckoned by the Indians very good eating. In the mountains are numberless adders and other noxious animals; and in the fens and marshes the guana and gallewasps; but these last are not venomous.

The ciror, or chegoe, is an insect which eats into the nervous and membranous part of the flesh of the negroes; and the white people are sometimes plagued with them. These insects get into any part of the body, but chiefly the legs and feet, where they breed in great numbers, and shut themselves up in a bag. As soon as the person feels them, which is not, perhaps, till a week after they have been in the body, they pick them out with a needle, or the point of a penknife, taking care to destroy the bag entirely, that none of the breed, which are like nits, may be left behind. These insects sometimes get into the toes, and devour the flesh to the bone.

*Government.*] The administration of public affairs in Jamaica is by a governor, who represents the king, a council of twelve, and forty-three representatives of the people. The government, next to that of Ireland, is the best in the king's gift. The established religion here, as well as in all the British Islands, is that of the Church of England; but there are no bishops. The Bishop of London's commissary is the principal ecclesiastic.

*Principal Towns.*] KINGSTON, in the county of Surrey, is the most considerable town in the island, and, at present, the capital, being the residence of the merchants, and the chief place of trade. It is about a mile and a half long, and half a mile broad. All the streets, which are broad and regular, cross each other at right angles. The Jews, who are very numerous here, have a fine synagogue. This town received considerable damage by a dreadful hurricane, which happened in the month of August, 1781. Many houses were blown down, and numbers of vessels, that lay in the harbour, as well as at Port-Royal, were driven ashore, some of which were sunk, and many others materially damaged. Kingston harbour is one of the most commodious in America, and so capacious, that one thousand sail of ships may ride in safety.

ST. JAGO DE LA VEGA, commonly called Spanish Town, is a small city, pleasantly situated in the county of Middlesex. It is the residence of the governor, and of the courts of justice, and where the assembly is held. The greater part of the inhabitants are persons of fortune or rank, which contributes much to its splendour and magnificence. The principal building is the governor's house, which is one of the most handsome in America. Here are also a handsome church, a chapel, and a Jewish synagogue.

PORT-ROYAL was formerly the capital of Jamaica: it stood upon the point of a narrow neck of land, which, towards the sea, formed part of the border of a very fine harbour, of its own name. The conveniency of this harbour, which was capable of containing one thousand sail of large vessels, and of such depth as to allow them to load and unload with the greatest ease, induced the inhabitants to build their capital on this spot, though the place was a hot dry sand, and produced none of the necessaries of life, not even fresh water: but the advantage of its harbour, and the resort of pirates, made it a place of great consideration. These pirates, called Buccaneers, fought with an inconsiderate bravery, and then spent their fortune in this capital with an inconsiderate dissipation. About the beginning of the year 1692, no place, for its size, could be compared with Port-Royal for trade, wealth, and an entire corruption of manners. In the month of June, however, in the same year, an earthquake, which shook the whole island to its foundations, totally overwhelmed this city, so as to leave, in one quarter, not even

the smallest vestige remaining. In two minutes the earth opened, and swallowed up nine-tenths of the houses and two thousand people. The water gushed out from the openings of the earth, and threw the people on heaps; but some of them had the good fortune to catch hold of beams and rafters of houses, and were afterwards saved by boats. Several ships were cast away in the harbour, and a frigate, which lay in the dock to careen, was carried over the tops of sinking houses, and did not over-set, but afforded a retreat to some hundreds of people. An officer, who was in the town at this time, says, the earth opened and shut very quickly in some places, and he saw several people sink down to the middle, and others appeared with their heads just above the ground, and were squeezed to death. At Savannah, above one thousand acres were sunk, with the houses and people in them; the place, appearing for some time like a lake, was afterwards dried up, but no houses were seen. In some parts mountains were split; and at one place a plantation was removed to the distance of a mile. After some time, the city was rebuilt; but, ten years after, it was destroyed by a great fire. The extraordinary convenience of the harbour tempted them to build it once more; and once more, in 1722, it was laid in ruins by a hurricane, the most terrible on record. The same fate attended it in 1774, by another hurricane, and as above. Such repeated calamities seemed to mark out this place as a devoted spot; the inhabitants, therefore, resolved to forsake it for ever, and to reside at the opposite bay, where they built Kingston.

*Commerce and Population.*] The whole commercial produce of this island may be reduced to these heads: First, sugars, of which article was exported to Great Britain, in 1787, eight hundred and twenty-four thousand seven hundred and six hundred weight; in 1790, one million one hundred and eighty-five thousand five hundred and nineteen hundred weight. Most of this goes to London, Bristol, and Glasgow, and some part of it to North-America, in return for the beef, pork, cheese, corn, peas, staves, planks, pitch, and tar, which they have from hence. Secondly, rum, of which they export about four thousand puncheons. The rum of this island is generally esteemed the best, and is the most used in Great Britain. Thirdly, molasses, in which they make a great part of their returns for New England, where there are vast distilleries. All these are the produce of the grand staple, the sugar-cane. According to the late testimony of a respectable planter in Jamaica, that island has two hundred and eighty thousand acres in canes, of which two hundred and ten thousand are annually cut, and make from sixty-eight to seventy thousand tons of sugar, and four millions two hundred thousand gallons of rum. Fourthly, cotton, of which they send out two thousand bags. The indigo, formerly

much cultivated, is now inconsiderable; but some cocoa and coffee are exported, with a considerable quantity of pepper, ginger, drugs for dyers and apothecaries, sweet-meats, mahogany, and manchinel-planks. But some of the most considerable articles of their trade are with the Spanish continent of New Spain and Terra Firma; for in the former they cut great quantities of logwood, and both in the former and latter they carry on a vast and profitable trade in all kinds of European goods: and, even in time of war with Spain, this trade between Jamaica and the Spanish main goes on; which it will be impossible for Spain to stop, whilst it is so profitable to the British merchant, and whilst the Spanish officers, from the highest to the lowest, show so great a respect to presents properly made. Upon the whole, many of the people of Jamaica, whilst they appear to live in such a state of luxury, as, in most other places, leads to beggary, acquire great fortunes, in a manner instantly. Their equipages, their clothes, their furniture, their tables, all bear the tokens of the greatest wealth and profusion imaginable. This obliges all the treasures they receive to make but a very short stay, being hardly more than sufficient to answer the calls of their necessity and luxury on Europe.

In the beginning of the present century, it was computed that the number of whites in Jamaica amounted to sixty thousand, and that of the negroes to one hundred and twenty thousand. At present, the inhabitants are stated at thirty thousand whites, ten thousand freed negroes and people of colour, and two hundred and fifty thousand negro-slaves. The militia is computed at eight thousand men.

The decrease of inhabitants, as well as the decline of commerce, arise from the difficulties to which their trade is exposed, of which they have often complained to the court of Great Britain: these are, their having been of late deprived of the most beneficial part of their trade, the carrying of negroes and dry goods to the Spanish coast; the low value of their produce, which they ascribe to the great improvements the French make in their sugar-colonies, who are enabled to undersell them by the lowness of their duties; and the trade carried on from Ireland and the northern colonies to the French and Dutch islands, where they pay no duties, and are supplied with goods at an easier rate. Some of these complaints, which equally affect the other islands, have been heard, and some remedies applied, but many yet remain unredressed.

The current coin of the island is Spanish. There is hardly any place where silver is more plentiful, or has a quicker circulation.

*Inhabitants, Customs, Manners, &c.*] The inhabitants of Jamaica consist of English, or persons of English extraction, born on the island, Indians, Negroes, Mulattoes, and their descendants. The better sort of the English, on Sundays or particular days, appear very gay; at other

times they generally wear thread stockings, linen drawers, a Holland cap, and a hat upon it. Men-servants wear a coarse linen frock, with buttons at the neck and hands, long trousers of the same, and a check shirt. The negroes, except those who are immediately employed in domestic services, go naked. The morning habit of the ladies is a loose night-gown, carelessly wrapped about them. Before dinner they put off their dishabille, and appear with a good grace, in all the advantages of a rich and becoming dress. There is no country in the world where luxury is carried to a higher pitch than in this island.

The common beverage of persons in affluent circumstances is Madeira wine mixed with water, sherbet, or weak punch. Ale, London porter, and claret, are extravagantly dear; but the general drink, especially among those of inferior rank, is rum-punch, which they call *kill-devil*, because, being frequently drunk to excess, it heats the blood, and brings on fevers, which sends numbers of people to an untimely grave, especially those who are just come to the island, which is the reason that so many die very soon after their arrival.

Learning is here at a very low ebb. There are, indeed, some persons well versed in literature, and who send their children to Great Britain to be educated; but the majority of the inhabitants take little care to improve their minds, being generally engaged in trade or dissipation. The former hardships of the negroes were truly pitiable; and the ill-treatment they received so shortened their lives, that, instead of increasing by the course of nature, many thousands were annually imported to the West-Indies, to supply the place of those who died. Some of the negroes, however, who are in the possession of gentlemen of humanity, find their situations more easy and comfortable.

They believe every negro returns to his native country after death. This thought is so agreeable, that it cheers the poor creatures, and renders the burthen of life easy, which would otherwise, to many of them, be quite intolerable. They look on death as a blessing, and it is surprising to see with what courage and intrepidity some of them meet it: they are quite transported to think their slavery is near at an end, that they shall revisit their native shore, and see their old friends and acquaintance. When a negro is at the point of death, his fellow-slaves kiss him, wish him a pleasant journey, and send their respects to their relatives in Guinea. They make no lamentations, but inter the deceased with the liveliest emotions of joy, fully believing that he has returned to his native country.

## SECTION II. BARBADOES.

*Situation, Climate, &c.*] Barbadoes is the most considerable of all the British sugar-islands, next to Jamaica:

it lies between fifty-nine degrees fifty minutes and sixty degrees two minutes of west longitude, and between twelve degrees fifty-six minutes and thirteen degrees sixteen minutes of north latitude; extending twenty-one miles from north to south, and fourteen from east to west. The climate is hot, especially for eight months in the year, but not unwholesome; for though there are no land-breezes, there are others arising from the sea, which increase as the sun advances to, and decrease as it declines from, the meridian. A temperate regimen renders it as safe to live in as any climate in Europe, south of Great Britain. The days are very nearly equal, the sun rising and setting about six o'clock all the year round.

The following remarks of Dr. Pinckard, describe some phenomena of the climate.

"The beautiful appearance of the iris, resting in a number of small circles upon the surface of the ocean, frequently attracted our notice. These were only seen near the ship, and it will occur to you, that they arose from the minute particles of water, beat off by the vessel, dividing the rays of light, and causing them to fall upon the sea in the form of rich and distinct rainbows. They are often extremely brilliant, and are seen, as it were, lying in numbers upon the water. The very beautiful rising and setting of the sun and moon, were the frequent and admired subjects of our contemplation. Viewed from a West-India sea, the surface of these orbs does not appear, like a mere plane fixed in the heavens, as in Europe, but their convexity and globular form are seen very distinctly. When rising, they appear as detached globes protruding from the deep; at setting they resemble distinct spheres sinking, or rather dropping, divested of their rays, into the ocean.

"The moon is brighter than in England, and reflects a clearer light. When only a few days old, the whole orb is visible, not decked in uniform brightness, as when it is at the full, but with the great body in shade, while the horned edge alone is dressed in silver. The appearance of the western sky was likewise an object of novelty to us. By day the whole canopy is one fine azure expanse, bright and unclouded; but, at evening, dark mountainous clouds accumulate, and, gathering into deep heavy masses, impend in awful majesty of form over the horizon."

*Face of the Country, Natural Curiosities, &c.*] This island is, in general, a plain level country, with some small hills. The woods have been all cut down to make room for the plantations of sugar-canes, which now occupy the greatest part of the island, and render it a most valuable possession to Great Britain. The soil is various, being in some places sandy and light, in others rich, and in others spongy; but all of them are cultivated according to their several qualities. There are, likewise, two streams that are called rivers, on each side, with wells of

good water  
rain-water.

good water all over it, and large ponds or reservoirs for rain-water.

Dr. Pinckard gives the following account of a natural curiosity in Barbadoes:—

"The cool shelter of the forest was derived from the mountain-cabbage, from large cedars, and from others of the oldest and finest trees of the island. Amidst these shades we descended to a narrow gully, between two mountains, to see one of the reported phenomena of Barbadoes, 'a boiling spring.' On approaching the spot, we came to a small hut, in which was living an old black woman, who employed herself as a guide to exhibit, under a kind of necromantic process, all the details of this boiling and burning fountain. The old dame, bearing in her hand a lighted taper, and taking with her an empty calabash, and all the other necessary apparatus of her office, led the way from the hut down to the spring. In a still and most secluded situation, we came to a hole, or small pit, filled with water, which was bubbling up, in boiling motion, and pouring from its receptacle down a narrow channel of the gully. Here our sable sorceress, in all the silence and solemnity of magic, placing the light at her side, fell down upon her knees, and, with her calabash, emptied all the water out of the hole, then, immersing the taper in the deep void, she suddenly set the whole pit in a flame, when she instantly jumped upon her legs, and looked significantly round, as if anxious to catch the surprise expressed upon our countenances from the workings of her witchcraft. The taper being removed, the empty space continued to burn with a soft lambent flame, without the appearance of any thing to support the combustion. We observed fresh-water slowly distilling into the pit from the earth at its sides, and dropping to the bottom; and as this increased in quantity, it raised the flame higher and higher in the pit, supporting it upon its surface, and conveying the appearance of the water itself being on fire, although it was very clear and pure, and not spread with any oily or bituminous matter. When the water had risen to a certain height, the flame became feeble, then gradually declined, and presently was extinct. The water was now seen to boil and bubble as before, and, soon overflowing the pit, resumed its course down the narrow channel of the gully, and all was restored to the state in which we had found it.

"You will, before this," says Dr. P. "have discovered that the water was cold, and that the boiling and burning of this fiery deep was only the effect of inflammable gas, which, escaping from the bowels of the earth, and rising from the bottom of the pit, supported the flame when it was empty, and, bubbling through it, when it was filled with water, gave it the appearance of a boiling spring. During the combustion, the smell of the inflammable air was very powerful. In the stones and soil, in the very rocks

and roads, we traced the origin of this phenomenon of nature. Asphaltic productions abounded in every quarter; and, upon inquiry, we found that we were in the very part of the country which produces the celebrated Barbadoes tar, the smell of which saluted us as we rode along; and we even saw it distilling from the hills of hardened clay, and likewise issuing from the rocks at the sides of the road. The argillaceous soil of this neighbourhood is every where strongly impregnated with bitumen, in which you will readily perceive the origin of the boiling, or inflammable spring."

*Vegetable and Animal Productions.*] The fruits here are various and very plentiful, particularly pine-apples, guavas, plantains, oranges, lemons, citrons, limes, tamarinds, mangroves, cedars, prickly-apples, pomegranates, papays, custard-apples, figs, bullace, cocoa, and cocoanuts. Indian corn can be imported from North-America cheaper than it can be sold when growing upon the island. There are great quantities of hogs, also oxen, cows, horses, asses, goats, monkeys, and raccoons, with a few sheep and rabbits.

The wild fowl are teals, curlews, plovers, snipes, wild pigeons, wild ducks, and a kind of bird called a man-of-war. The tame pigeons, pullets, ducks, and poultry of all kinds, that are bred in Barbadoes, have a fine flavour, and are accounted more delicious than those of Europe.

Insects are very numerous here, but they are not venomous, nor do either the snakes or scorpions ever sting. The surrounding sea abounds with fish, some of which are almost peculiar to itself, as parrot-fish, snappers, grey cavallos, tarbuns, &c. The mullets, lobsters, and crabs, are excellent, and the green turtle are caught here in vast quantities.

This island abounds with *land-crabs*, of which a respectable writer has given the following interesting account:—

"These creatures are of various sizes, the largest about six inches wide: they walk sideways, like the sea-crab, and are shaped like them; but they differ considerably in colour; some being black, some yellow, some red, and others variegated with red, white, and yellow, mixed. Some of these are poisonous, and several people have died by eating them, particularly the black kind. The light coloured are reckoned best; and when full of flesh are very well tasted.

"These animals live not only in a kind of orderly society in their retreats among the mountains, but regularly once a year march down to the sea-side, in a body of some millions at a time. As they multiply in great numbers, they choose the month of April or May to begin their expedition; and then sally out by thousands from the stumps of hollow trees, from the clefts of rocks, and from the holes which they dig for themselves under the

surface of the earth. At that time the whole ground is covered with this band of adventurers, insomuch that a person cannot set down his foot without treading upon them. The sea is their place of destination, and to that they direct their march with the utmost precision. No geometrician could send them to their destined station by a shorter course, for they neither turn to the right nor left, whatever obstacles may intervene; and, even if they meet with a house, they will attempt to scale the walls, to keep the unbroken tenor of their way. But, though this be the general order of their route, they, upon other occasions, are obliged to conform to the face of the country; and, if it is intersected with rivers, they are then seen to wind along the course of the stream.

"The procession sets forward from the mountains with the regularity of an army under an experienced commander. They are commonly divided into three battalions; of which the first consists of the strongest and boldest males, who, like pioneers, march forward to clear the route, and face the greatest dangers. They are often obliged to halt for want of rain, and to go into the most convenient encampment till the weather changes. The main body of the army is composed of females, which never leave the mountains till the rain is set in for some time, and then descend in regular battalia, being formed into columns of fifty paces broad, and three miles deep, and so close that they almost cover the ground. The rear-guard follows three or four days after; a straggling undisciplined tribe, consisting of males and females, but not so vigorous as the former. The night is their chief time of proceeding; but, if it rain by day, they do not fail to profit by the occasion; and they continue to move forward in their slow uniform manner. When the sun shines hot upon the surface of the ground, they make a general halt, and wait till the cool of the evening. When terrified, they march back, in a confused disorderly manner, holding up their nippers, with which they sometimes tear off a piece of the skin, and then leave the weapon where they inflicted the wound. They even try to intimidate their enemies; for they often clatter their nippers together, as if to threaten those who disturb them. But, though they thus strive to be formidable to man, they are much more so to each other: for they are possessed of one most unsocial property, which is, that if any of them by accident is maimed in such a manner as to be incapable of proceeding, the rest fall upon and devour it on the spot, and then pursue their journey.

"When, after a fatiguing march, and escaping a thousand dangers, (for they are sometimes three weeks in getting to the shore,) they have arrived at their destined port, they prepare to cast their spawn. They have no sooner reached the shore, than they go to the edge of the water, and let the waves wash over their bodies two or three

times. This seems only a preparation for bringing the spawn to maturity; for, without farther delay, they withdraw to seek a lodging upon land. In the mean time, the spawn grows larger, is excluded out of the body, and sticks to the bars under the tail. This bunch is seen as big as a hen's egg, and exactly resembles the roes of herrings. In this state, they once more seek the shore, and, shaking off their spawn into the water, leave accident to bring it to maturity. At this time whole shoals of hungry fish are at the shore, in expectation of this annual supply; the sea to a great distance is black with them; and about two-thirds of the crabs' eggs are immediately devoured by these rapacious invaders. The eggs that escape are hatched under the sand; and, soon after, millions of little crabs are seen quitting the shore, and slowly travelling up to the mountains. The old ones, however, are not so active to return; they have become so feeble and lean that they can hardly creep along, and their flesh at this time changes its colour. Most of them, therefore, are obliged to continue in the flat parts of the country till they recover, making holes in the earth, which they cover at the mouth with leaves and dirt, that no air may enter. There they throw off their old shells, which they leave quite whole; the place where they opened on the belly being unseen. At that time they are quite naked, and almost without motion for six days together, when they become so fat as to be delicious food. They have then under their stomachs four large white stones, which gradually decrease in proportion as the shell hardens, and, when they come to perfection, are not to be found. It is at this time that the animals are seen slowly making their way back; which is commonly performed in six weeks.

"When possessed of its retreats in the mountains, the land-crab is impregnable; for, only subsisting upon vegetables, it seldom ventures out; and its habitation being in the most inaccessible places, it remains for a great part of the season in perfect security. It is only when impelled by the desire of bringing forth its young, and when forced to descend into the flat country, that it is taken. At that time the natives wait for their descent in eager expectation, and destroy thousands; but, disregarding their bodies, they only seek for that small spawn which lies on each side of the stomach within the shell, of about the thickness of a man's thumb. They are much more valuable upon their return after they have cast their shells; for being covered with a skin resembling soft parchment, almost every part except the stomach may be eaten. They are taken in the holes, by feeling for them with an instrument, and are sought after by night, when on their journey, by flambeaux. The instant these animals perceive themselves attacked, they throw themselves on their backs, and with their claws pinch most terribly whatever they happen to fasten on. But the dexterous crab-catcher takes

them by the head, and cannot touch the bottoms of the mouth, and then soon

mal is found,

Chief Town does, is situated of the island, in it. It is the Caribbean colonies. It of it, erected bouring marsh some years a seat of the government of the court of mile out of town on account of forts and batt town, which Codrington,

Mr. M'K West-Indies, mode of building

"The most certainly those in the West- wind generally for building to the draught well contrived. But to be greatly increased need go far native India was shown convenient represented a tight that ting the building including the net-work, them of considerable. The house was, rain, or they might easily work reserved nor of the West-Indies constructed

them by the hinder legs in such a manner that the nippers cannot touch him, and thus he throws them into his bag. Sometimes also they are caught when they take refuge in the bottoms of holes in rocks by the sea-side, by covering the mouth of the hole to prevent their getting out, and then soon after, the tide enters the hole, and the animal is found, upon its ebbing, drowned in its retreat."

*Chief Town.] BRIDGE-TOWN*, the capital of Barbadoes, is situated on Carlisle-Bay, in the south-west part of the island, and has the best, or rather the only, harbour in it. It is reckoned the finest and largest town in all the Caribbee Islands, if not in all the British West-Indian colonies. It takes its name from a bridge in the east part of it, erected over the waters that come from the neighbouring marshes; but a dreadful fire, which happened some years ago, destroyed a great part of it. It is the seat of the governor, council, and assembly, and also of the court of chancery. The governor's house is about a mile out of the town, which is not reckoned very healthy, on account of the neighbouring marshes. There are several forts and batteries about the bay. There is a college in the town, which was founded and liberally endowed by Colonel Codrington, who was a native of this island.

Mr. McKinnen, in the account of his voyage to the West-Indies, makes the following remarks on the general mode of building.

"The most agreeable situations in the country are certainly those to *windward* (which is a term universally used in the West-Indies to denote the east, from whence the wind generally blows); and the spots commonly chosen for building are those which are highest and most exposed to the draught of air. Some of the country-houses are well contrived for all the purposes of comfort and coolness. But the mode of building generally practised might be greatly improved upon; nor should I apprehend one need go farther for a perfect example than that of the native Indians, in the construction of their dwellings. I was shown a model of a house, with all the domestic conveniences, imported from South America. The sides represented a wicker-work of bamboo-canes, and the roof a tight thatch, I believe of palmetto-leaves; thus admitting the breeze horizontally in every direction, and excluding the rain at top. The beds were a loose elastic net-work, like the hammocks of the Caribs, who made them of cotton, and of a texture remarkably neat and durable. The only objection I found to the model of the house was, that it did not provide against an admission of rain, or the sun's rays, in an oblique direction (which might easily be done by substituting the moveable lattice-work resembling Venetian blinds, now partially in use); nor of the damps affecting always the lower parts of the West-Indian houses, and which ought necessarily to be constructed of more solid materials."

*Inhabitants.]* The inhabitants of Barbadoes, like those of the other islands, may be divided into three classes, viz. the masters, the white servants, and the black servants. The first of these are either English, Scotch, or Irish, with some Dutch, French, Portuguese, and Jews. The white servants lead more easy lives than the common day-labourers in England; and when they come to be over-seers, their wages, and other allowances, are considerable. Most of the negroes are employed in the fields; but some of them work in the sugar-mills and storehouses, while those of both sexes, who are most likely, are employed as housemaids and menial servants. Every negro family has a cabin, and a small piece of ground adjoining to it, in which the more industrious sort plant potatoes, yams, and other roots, and rear live-stock, which they are at liberty to eat, or convert into money for their own use. They are fond of rum and tobacco.

The governor of Barbadoes has a considerable salary. The council consists of twelve members, and the assembly of twenty-two, chosen yearly, out of the several parishes, viz. two for each, by a majority of votes. Most of the civil officers are appointed by the governor, who also collates rectors to the parishes of the island. Their perquisites are very considerable. The church-affairs of Barbadoes are governed by a surrogate of the bishop's appointment. There are upon the island some Jews and Quakers, but very few other dissenters. The inhabitants of this island support their own military establishment, which is respectable, with great credit. The island is divided into five districts. In each of the districts are a judge and five assistants, who hold a court of common pleas every month, from January to September; and if any difficult matter arises, it is referred to the arbitration of the governor.

*Commerce and Population.]* The principal articles of exportation are aloes, cotton, ginger, sugar, rum, and molasses. Those of importation are timber of various kinds, bread, flour, Indian corn, rice, tobacco, some salt beef and pork, fish, pulse, and other provisions, from the northern colonies; slaves, from the coast of Africa; wine, from Madeira, Tercera, and Fial, as also some brandy; beef and pork, from Ireland; salt, from Curaçoa; linnen of all sorts, broad-cloth, kerseys, silks and stuffs, red caps, stockings and shoes of all sorts, gloves and hats, millinery-ware and perriwigs, laces, peas, beans, oats, strong beer, pale ale, pickles, candles, butter and cheese, iron-ware for the sugar-works, leaden-ware, powder and shot, brass and copper articles, &c.

In 1786, the number of inhabitants was sixteen thousand one hundred and sixty-seven whites, eight hundred and eighty-eight free people of colour, and sixty-two thousand one hundred and sixty-seven negroes; a proof that this island is much upon the decline from its former state.

This island, as well as Jamaica, suffered the greatest calamities by the dreadful hurricane which happened in the month of October, 1780. The plantations were almost all destroyed, and Bridge-Town was reduced to a mere heap of ruins, scarcely a building in it being left standing. No less than eleven parish-churches, and two chapels, were levelled with the ground, among which was the fine church of St. Michael. The streets were covered with the ruins of the houses; and it was supposed that no less than three thousand persons perished. The ships in Carlisle Bay were driven out to sea, and several of them cast ashore and lost. The damage was so great throughout the island as not to be estimated; and the whole formed a scene more melancholy and deplorable than it is possible for words to describe.

### SECTION III.

#### TRINIDAD.

This island is about ninety British miles in length, by about thirty in breadth. The climate is excellent, and free from those hurricanes which are the scourges of the other American isles. Rains prevail from the middle of May till the end of October; and there are so many rivers, that the drought of the other part of the year is of no consequence. Sometimes slight earthquakes are felt. In the interior are four groups of mountains, which, with some other ridges towards the shores, are computed at a third part of the territory; the other two-thirds consist of a very fertile soil; and on the west is a large harbour, which is reputed very secure in all seasons.

Dr. Anderson, of St. Vincent's, has given the following account of a remarkable phenomenon in the Isle of Trinidad: "A most remarkable production of nature," says he, "is a bituminous lake, or plain, known by the name of Tar Lake, from its resemblance to, and answering the purposes of, ship-pitch. It lies in the leeward side of the island, about half-way from the Bocas to the south end, where the mangrove-swamps are interrupted by the sand-banks and hills, and on a point of land which extends into the sea about two miles, exactly opposite to the high mountains of Paria, on the north side of the gulf.

"The cape, or headland, is about fifty feet above the level of the sea, and is the greatest elevation of land on this side of the island. From the sea it appears a mass of black vitrified rocks; but, on a close examination, it is found a composition of bituminous scoria, vitrified sand, and earth, cemented together; in some parts, beds of cinders only are found. In approaching this cape, there is a strong sulphureous smell, sometimes disagreeable. This smell is prevalent in many parts of the ground, to the distance of eight or ten miles from the spot.

"This point of land is about two miles broad, and on the east and west sides, from the distance of about half a mile from the sea, falls with a gentle declivity to it, and is joined to the main land on the south by the continuation of the mangrove-swamps, so that the bituminous plain is on the highest part of it, and only separated from the sea by a margin of wood which surrounds it, and prevents a distant prospect of it. Its situation is similar to a savannah, and, like them, it is not seen till treading upon its verge. Its colour, and even surface, present at first the aspect of a lake of water, but it is possible it got the appellation of lake when seen in the hot and dry weather; at which time its surface, to the depth of an inch, is liquid, and then, from its cohesive quality, it cannot be walked upon.

"It is of a circular form, about three miles in circumference. At my first approach, it appeared a plain as smooth as glass, excepting some small clumps of shrubs and dwarf-trees, that had taken possession of some spots of it; but, when I had proceeded some yards on it, I found it divided into areolæ of different sizes and shapes; the chasms, or divisions, anastomosed through every part of it; the surface of the areolæ is perfectly horizontal and smooth; the margins undulated, each undulation enlarged to the bottom till they join the opposite. On the surface, the margin or first undulation is distant from the opposite from four to six feet, and the same depth before they coalesce; but, where the angles of the areolæ oppose, the chasms or ramifications are wider and deeper. When I was at it, all these chasms were full of water, the whole forming one true horizontal plane, which rendered my investigation of it difficult and tedious, being necessitated to plunge into the water a great depth, in passing from one areolæ to another. The truest idea that can be formed of its surface will be from the areolæ and their ramifications on the back of a turtle. Its more common consistence and appearance is that of pit-coal, the colour rather greyer. It breaks into small fragments, of a cellular appearance, and glossy, with a number of minute and shining particles interspersed through its substance; it is very friable, and, when liquid, is of a jet black colour. Some parts of the surface are covered with a thin and brittle scoria, a little elevated. As to its depth, I can form no idea of it, for in no part could I find a substratum of any other substance: in some parts I found calcined earth mixed with it.

"Although I smelled sulphur very strong in passing over many parts of it, I could discover no appearance of it, nor any rent or crack through which the steams might issue; probably it was from some part of the adjacent woods; for although sulphur is the basis of this bituminous matter, yet the smells are very different, and easily distinguished; for its smell comes the nearest to that of pitch

of any thing surface without it a little soft. A little of it crackling noise vivid flame, removed. A without sufficient time's severe scoria, under not to render when cold; action on it does not exert the was told by was an uniform ravins contained neither of them to the first, than an extensive appearances second being fixed channels open exposed parts, evaporated short time from the surface possibility of the progress at the time thirds of the afternoon the case undoubtedly was ration; for perceived any outlet

"The

of any thing I know. I could make no impression on its surface without an axe; but, at the depth of a foot, I found it a little softer, with an oily appearance in small shells. A little of it held to a burning candle makes a hissing or crackling noise, like nitre, emitting small sparks, with a vivid flame, which extinguish the moment the candle is removed. A piece put in the fire will boil up a long time without suffering much diminution; and, after a long time's severe heat, the surface will burn, and form a thin scoria, under which the rest remains liquid. Heat seems not to render it fluid, nor to occupy a larger space than when cold; from which I imagine there is but little alteration on it during the dry months, as the solar rays cannot exert their force above an inch below the surface. I was told by one person, that, in the dry season, the whole was an uniform smooth mass; and, by another, that the ravins contained water fit for use during the year. But neither of these assertions can I believe; for if, according to the first, it were an homogenous mass, something more than an external cause must affect it, to give it the present appearances; nor, without some hidden cause, can the second be granted. Although the bottoms of these ramified channels admit not of absorption, yet, from their open exposure, and the black surface of the circumjacent parts, evaporation must go on amazingly quick, and a short time of dry weather must soon empty them; nor, from the situation and structure of the place, is there a possibility of supply but from the clouds. To show that the progress of evaporation is inconceivably quick here, at the time I visited it, there were, on an average, two-thirds of the time incessant torrents of rain; but from the afternoon being dry, with a gentle breeze, (as is generally the case during the rainy season in this island,) there evidently was an equilibrium between the rain and the evaporation; for in the course of three days I saw it twice, and perceived no alteration on the height of the water, nor any outlet for it but by evaporation.

"I take this bituminous substance to be the *bitumen asphaltum* of Linnæus. A gentle heat renders it ductile: hence, mixed with a little grease or common pitch, it is much used for the bottoms of ships, for which intention it is collected by many; and I should conceive it a preservative against the borer, so destructive to vessels in this part of the world.

"Besides this place, where it is found in a solid state, it is found liquid in many parts of the woods, and at the distance of twenty miles from this, about two inches thick, in round holes of three or four inches diameter, and often in cracks or rents. This is consequently liquid, and smells stronger of tar than when indurated, and adheres strongly to any thing it touches: grease is the only thing that will divest the hands of it.

"The soil, in general, for some distance round this

lake, consists of cinders and burnt earths; and, where not so, it is a strong argillaceous soil; the whole exceedingly fertile, which is always the case where there are any sulphureous particles in it. Every part of the country, to the distance of thirty miles round, has every appearance of being formed by convulsions of nature from subterraneous fires. In several parts of the woods are hot springs; some, which I tried with a well-graduated thermometer of Fahrenheit, were twenty and twenty-two degrees hotter than the atmosphere at the time of trial. From its position to them, this part of the island has certainly experienced the effects of the volcanic eruptions, which have heaped up those prodigious masses of mountains that terminate the province of Paria on the north; and no doubt there has been, and still probably is, a communication between them. One of these mountains, opposite to the bituminous lake in Trinidad, has every appearance of a volcanic mountain: however, the volcanic effects have been very weak here, as no traces of them extend above two miles from the sea in this part of the island, and the greater part of it had its origin from a very different cause to that of volcanoes; but they have certainly laid the foundation of it, as is evident from the high ridge of mountains which surrounds its windward side, to protect it from the depredations of the ocean, and is its only barrier against that overpowering element, and may properly be called the skeleton of the island.

"From every examination I have made, I find the whole island formed of an argillaceous earth, either in its primitive state or under its different metamorphoses. The bases of the mountains are composed of *schistus argillaceous* and *talcum lithomargo*; but the plains or lowlands remaining nearly in the same moist state as at its formation, the component particles have not experienced the vicissitudes of nature so much as the more elevated parts, consequently retain more of their primitive forms and properties. As argillaceous earth is formed from the sediment of the ocean, from the situation of Trinidad to the continent, its formation is easily accounted for; granting first the formation of the ridge of mountains that bounds its windward side, and the high mountains on the continent that nearly join it: for the great influx of currents into the gulf of Paria from the coasts of Brazil and Andalusia must bring a vast quantity of light earthy particles from the mouths of the numerous large rivers which traverse these parts of the continent: but the currents being repelled by these ridges of mountains, eddies and smooth water will be produced where they meet and oppose, and, therefore, the earthy particles would subside and form banks of mud, and, by fresh accumulations, would soon form dry land; and from these causes it is evident such a tract of country as Trinidad must be formed. But these causes still exist, and the effect from them is

evident; for the island is daily growing on the leeward side, as may be seen from the mud-beds that extend a great way into the gulf, and these constantly increase. But, from the great influx from the ocean at the south end of the island, and its egress to the Atlantic again, through the Bocas, a channel must ever exist between the continent and Trinidad."

# SECTION IV.

## ST. CHRISTOPHER.

This island, called by mariners St. Kitt's, is situated in seventeen degrees of north latitude, and is about twenty miles long and seven broad. It received its name from Columbus, in his first voyage to America. The French and English arrived here on the same day, in 1625, and divided the island between them. Three years after their settling, the Spaniards drove them out of it. They soon returned, and continued to live in harmony till 1666, when, war being commenced between the two nations, St. Christopher became, at different periods, the scene of war for half a century. In 1702, the French were entirely expelled, and the peace of Utrecht confirmed this island to the English. In February, 1782, it was taken by the French, but restored again to Great Britain, by the treaty of peace in 1783.

The assemblage of a great number of high and barren mountains make St. Christopher appear, to those who approach it by sea, like one huge mountain covered with wood; but, on a nearer approach, they find that the coast grows more easy, as well as the ascent of the mountains, which, rising one above another, are cultivated as high as possible.

For the following particulars relative to the great mountain on this island we are indebted to the Rev. Mr Smith, the historian of Nevis:

"From Basse-Terre, the chief town of the island, I set out with a friend for Chianne, and, after riding through many plantations of sugar and some of cotton, we came to thick woods, where we were agreeably entertained with the soft notes of a vast number of turtle-doves, which, with the murmurs of the sea beating gently against the rocks at half a mile's distance, were enough to lull any one to sleep who was so inclined. To avoid the heat of the sun, we travelled along the deep valley, which runs upwards from the sea-side, growing steeper the farther from the coast, and plentifully stocked with wild palm, pimento, cassia fistula, and other fragrant trees. Through the whole length of this valley, which is about two hours' journey, runs a little, but exceedingly transparent, river of very sweet water; and not far from the side of this rivulet there is a pleasant garden, regularly planted with rows of citrons,

lemons, oranges, limes, pomegranates, &c., besides pine-apples, asparagus, lettuces, and all sorts of European roots and herbs that will grow in so warm a latitude. To this garden the gentlemen and ladies often resort from Basse Terre, to divert themselves with singing, dancing, cards, and other amusements.

"In the evening, we arrived at my friend's house at Chianne, which is about eight miles from Basse Terre, the road thither having the ocean on the right, and the vast Conorrhée Hills on the left, whose lofty tops then touched the clouds, and seemed to rise to that height almost perpendicularly. The next morning we diverted ourselves with catching cray-fish in Chianne River, or rather brook, for it is narrow and shallow, but a very clear stream, which they poisoned with green tobacco, pounded and mixed with unslacked lime. This poison is so strong, that the fish creep out of the water to shun it; at which I was not a little surprised, but my friend assured me it was a common thing."

Proceeding through the woods, our traveller, in company with nine others, whites and negroes, began to ascend the mountain, the ascent growing steeper and steeper the higher they advanced; and, in the like proportion, the large trees began to dwindle and grow shorter. Before they passed all the trees, they entered among the clouds, which felt raw and cold, not unlike a fog in a winter's morning. From these woods to the top, which is almost half a mile, there are no trees at all, and very rarely a bush, the ground producing scarcely any thing but a sort of wild pine-apple plant, which bears no fruit. Being at last arrived at the top with great fatigue, the clouds were at least half a mile beneath them, but, the wind dispersing them, a charming view was opened of the woods and plantations below, besides an unbounded prospect of the Atlantic Ocean.

The top of this mountain is a small plain, not three hundred yards wide, ending at the verge of a vast deep cavity, exactly round, and about a mile in circumference. Our author judges its perpendicular depth to be about two hundred and twenty yards, and observes that he looked down into it with horror, observing large and continual clouds of steam arise from the veins of sulphur, &c., with which the bottom of it every where abounds. The rim of this cavity, except where it joins to, and makes part of, the plain, is not above twenty, and, in some places, scarcely ten, yards broad; and the inside of it, for at least half-way downwards, appears to be solid rock, over-run with very short blackish moss. "Upon maturely weighing the whole state of this mountain," says our author, "we unanimously agreed that it was on fire underneath us, and that the cavity was formerly occasioned by some furious and dreadful eruption, when it might be a volcano for a time, like Vesuvius or Etua."

Upon the ridge large and steep an unfortunate piece, left back point of land, owned a mile and Mr. Smith this This vast mountain chain of lesser

At length the called the "de

Upon the rim of the cavity, to the south-east, there is a large and steep rocky mount, called Mount Misery, from an unfortunate man, who, attempting to climb the precipice, fell backwards, and was killed. It is the highest point of land on St. Christopher's, its height being reckoned a mile and a half perpendicular from the sea; but Mr. Smith thinks it not so high by a quarter of a mile. This vast mountain is situated in the middle of a long chain of lesser and lower ones, that run across the island.

The whole breadth of one part of the above-mentioned rim is taken up by a large single rock, in the form of a triangular pyramid, equilateral, and almost as smooth as if it had been cut by the chisel of a skilful workman. From angle to angle, at the base, it measures seven or eight yards, is somewhat blunted or rather broken off, at the top, and a third part downwards from thence it seems to be cracked quite through sideways. The colour of the rock resembles the red part of oriental granite, and, like that, it is so extremely hard, that a strong arm can scarcely make a visible impression on it with the point of a sharp cutlass. This triangular pyramid on one side of the cavity, and Mount Misery on the other, each taking up the breadth of the rim, prevent a person's walking more than half way round the circle.

Near this pyramid, by the help of bushes and roots, our author and his companions ventured to slide down forty or fifty yards into the cavity, till they came to some wild bananas, which were ready to quench their thirst with most clear and excellent water, that runs out of them upon sticking in a penknife just where the leaves join to the top of the body of the tree, and so form a small hollow, as if on purpose to receive the blessings of Heaven, the rain and dew, and reserve them for the thirsty traveller. It is observable of these trees, that they are annuals, dying quite to the ground every autumn, and shooting up again from the roots in the spring, till they are thicker than a man's thigh; but the wood is so very soft and porous, that one may easily cut it through at a single stroke with a sharp hatchet.

Keeping on, in a very steep descent, through this wood of bananas, cabbage-trees, &c., they arrived at the bottom of the cavity, where, having crossed a little plain, they came to an uneven spot of ground, consisting of thirty acres or upwards. Here they found a very large rock, jutting out of the side of the bill; and at the bottom of it were three or four round holes in the earth, as wide as a hat-crown, from which issued hot steams, like smoke out of chimneys, which tinged the edges of the holes with seemingly fair brimstone. The little plain above mentioned is so sulphureous, that it bears nothing but long deadish grass, or rather weeds, with a few stunted bushes.

At length they came to some boiling springs, vulgarly called the "devil's coppers," each of them about three

feet in diameter. The water is of a muddy colour, and rises within twelve inches of the surface of the earth, boiling fiercer than a sugar-copper, and sending up strong clouds of steam into the air. No kind of grass will grow within twelve yards of these springs, the soil being wholly sulphureous, and so excessively hot, that the travellers found it warm through very thick shoes which they had bought on purpose for this expedition. A negro in company was much frightened at the sight of these coppers, and could not be dissuaded from believing that jumbo, or the devil, had his residence underneath them.

On the south side of the plain before mentioned there is a pond, about forty yards over, not supplied by springs, but by rains, which fall very heavily in that warm latitude. The bottom of this pond consists entirely of clay, which is as beautifully veined as the finest Castile soap, and as delicate as well-polished marble. Near this pond grew a bed of rushes, on which the company sat down and dined; and afterwards returned to Chianne, not a little fatigued with their journey.

The climate is hot; and the island is subject to frequent storms, hurricanes, and earthquakes. The soil is, in general, light and sandy, but very fruitful, and well watered by several rivulets, which run down both sides of the mountains. The animal and vegetable productions are the same with those of Barbadoes. The whole island is covered with plantations, whose owners live in clean and convenient habitations, adorned with fountains and groves of orange and lemon trees.

The most considerable town upon the island is Basse-Terre, formerly the capital of the French part: The other is called Sandy-Point, and always belonged to the English. There is no harbour; on the contrary, the surf is continually beating on the shore at the few places fit to land, which not only prevents the erection of any quay or wharf, but renders the landing or slipping of goods always inconvenient, and very often dangerous. A singular method is, therefore, adopted in embarking heavy goods, such as hogsheads of sugar or rum. For this purpose they use a small boat of a peculiar construction, called a *moses*; this boat sets off from the ship with some active and expert rowers: when they see what they call a *lull*, that is, an abatement in the violence of the surge, they push to land, and lay the sides of the *moses* on the strand; the hogshead is rolled into it, and the same precautions are used to carry it to the ship. It is in this inconvenient and hazardous manner, that the sugars are conveyed on board by single hogsheads. Rum, cotton, and other goods that will bear the water, are generally floated to the ship both in going and coming.

The public affairs of the island are administered by a governor, a council, and an assembly chosen from the nine parishes into which the island is divided, and which

have each a large handsome church. St. Christopher sustained great damage by a violent hurricane, which happened in October, 1780. All the goods in the warehouses and cellars near the beach were totally destroyed, and upwards of eight hundred vessels were driven out to sea, many of which were lost, and the crews perished.

## SECTION V.

### NEVIS.

This island, which is no more than a vast mountain rising to a very considerable height, is situated about four miles to the south of St. Christopher's. The soil is fruitful, and the staple commodity is sugar, which serves all the purposes of money. Here are sometimes violent rains and hurricanes, as in the other islands, and the air is even hotter than in Barbadoes.

On the south side of St. John's parish in this island there is a considerable spot of sulphureous ground, at the upper end of a deep rupture in the earth, commonly called Sulphur-gut, which is so exceedingly hot as to be presently felt through thick shoes; and some eggs being buried in it about an inch deep, for the space of three or four minutes, were as hard in that time as boiling or roasting could have made them.

At the foot of the declivity adjoining to the south side of Charles-Town, there is a little hot river, called "the bath," supposed to flow from the above-mentioned sulphureous ground, which is not above three-quarters of a mile higher up in the country. This rivulet runs at least half a mile before it loses itself in the sands of the sea; and towards the sea-side there is a particular part of it where a man may set one foot upon a spring that is excessively cold, and the other upon another spring that is surprisingly hot. All distempered people, both whites and blacks, find great benefit from this hot river; and Mr. Smith says, he knew a negro-boy, who was sent from Barbadoes to Nevis for this purpose, cured of the leprosy by drinking and bathing in it three or four times a day, after having been twice salivated in vain. Our author himself bathed in it once a fortnight, and owns that it contributed not a little to his health and vivacity; and the last nine months of his stay in Nevis, it was his custom to walk to the river every morning at sun-rising, and drink a pint of its water, which operated well, and proved very beneficial.

At another place, a little to the southward of Charles-Town, there is a sharp point of land that jets out a considerable way into the sea; on the rocky extremity of which Mr. Smith stood, whilst a negro slipped down from it into the water, and, taking some sand from the bottom, he gave it into our author's hand, who found it to be very

warm, the man at the same time affirming that the spring at the bottom was so excessively hot, that he could scarcely bear to set his foot upon it. The water of Black-rock Pond, about a quarter of a mile from Charles-Town, is milk-warm; occasioned, no doubt, by a mixture of such hot and cold springs.

Many remarkable insects and reptiles are found on this island, particularly the flying-tiger, the horn-fly, and a kind of snail called a soldier. The sea abounds with a variety of excellent fish, as groopers, rock-fish, cavallies, mud-fish, wilks, cockles, lobsters, &c. The only venomous creatures are scorpions and centipedes.

The most remarkable vegetable production of Nevis is a tree called *diddle-doo*, which bears a lovely blossom of the finest yellow and scarlet colours, and is esteemed a sovereign remedy in some disorders. The liquorice-bush runs wild along the stone walls of common fields, like the vine. The butter here is not good, and the new cheese far worse. The sheep have neither horns nor wool, but are clothed with smooth hair, and generally full of small red or black spots, resembling those of a fine spaniel. They breed twice a year, and generally bring two, three, or four, lambs at a time, and, what is more extraordinary, suckle them all. The rams are of a pale red colour, with a thick row of long red hair, hanging down from the lower jaw to the breast, as far as the fore-legs.

Here are three tolerable roads or bays, on which are as many little towns, viz. Newcastle, Littleborough on Moreton Bay, and Charles-Town, the capital, with a fort that defends the anchoring-place, where the governor, council, and assembly, meet: the last is composed of five members for each of the three parishes into which the island is divided.

Here, as in some of the other Caribbees, if a white man kill a black, he cannot be tried for his life for the murder; and all that he suffers is a fine of thirty pounds currency to the master for the loss of his slave. If a negro strike a white man, he is punished with the loss of his hand; and, if he should draw blood, with death. A negro cannot be evidence against a white man.

The trade of Nevis consists in molasses, rum, and a prodigious quantity of lemons.

## SECTION VI.

### ANTIGUA.

Antigua was discovered by Columbus, but not colonized till the year 1632, when the English took possession of it. It is situated in seventeen degrees of north latitude, and is of a circular form, about twenty miles each way, and near sixty in circumference. It is more noted for good harbours than all the English islands in these

seas, yet so generous access not well acquired than that of St. John, a good harbour defended by Fort Vernon-general where the assembly, where the great sides, a lieutenant, composed into six parishes each two repre

seas, yet so encompassed with rocks, that it is of dangerous access in many parts, especially to those that are not well acquainted with the coast. The climate is hotter than that of Barbadoes, and very subject to hurricanes. The soil is sandy, and much overgrown with wood. There are but few springs, and not so much as a brook in the whole island; so that the principal dependence of the inhabitants arises from the water supplied by casual rains, which they save in cisterns. The capital of Antigua is St. John, a regular built town on the western shore, with a good harbour of the same name, whose entrance is defended by Fort James. It is the residence of the governor-general of the Caribbee Leeward Islands, the place where the assembly for this island is held, and the port where the greatest trade is carried on. Antigua has, besides, a lieutenant-governor, a council, and its own assembly, composed of twenty-four members. It is divided into six parishes, and eleven districts, of which ten send each two representatives, and that of St. John four.

## SECTION VII.

## ST. VINCENT.

This island is situated in thirteen degrees of north latitude, and sixty-one degrees of west longitude, about fifty miles north-west of Barbadoes. It is about twenty-four miles in length, and eighteen in breadth. Out of the ridge of mountains, which crosses it from south to north, rise a great number of rivers, which are well stored with fish. These mountains are, in general, of an easy ascent, and the valleys and plains, some of which are of considerable extent, are exceeding fertile, producing most of the necessaries of life.

The volcanic mountain on this island, called *Morne-garou*, is too remarkable to be passed over in silence. It was visited, in the year 1784, by Mr. James Anderson, surgeon, who is the only person that ever ascended to its summit, and from whose account, in the seventy-fifth volume of the Philosophical Transactions, the following particulars are extracted.

This mountain is situated on the north-west part of the island, and is the highest in it. It is reported to have constantly emitted volcanic eruptions; and the ravines at the bottom seem to corroborate the traditions of the inhabitants in this respect. The structure of it, when viewed at a distance, appears different from that of any other mountain in the island, or that Mr. Anderson had seen in the West-Indies. He could perceive it divided into many different ridges, separated by deep chasms, and its summit appeared quite destitute of every vegetable production. Several ravines, that run from the bottom a great way up the mountain, were found quite destitute of water; and pieces of pumice-stone, charcoal, and several earths

and minerals of a particular quality, found in them; plainly indicated some very great singularity in this mountain. Some very old men also informed our author, that they had heard it related by the captain of a ship, that between this island and St. Lucia he saw flames and smoke rising from the top of the mountain, and next morning his decks were covered with ashes and small stones.

Mr. Anderson's curiosity was so much excited by these circumstances, that he formed a resolution of going up to the top; but was informed that this was impossible; nor could he find either white man, Caribbee, or negro, who would undertake to show him the way. Having examined the basis as well as he could, in order to discover the most proper place for attempting an ascent, he found several dry ravines that seemingly ran a great way up, though he could not be certain that they were not intersected by rocks or precipices lying across. Having examined the mountain with a good glass, he thought he perceived two ridges, by which there was a possibility of getting up; and, though they appeared to be covered for a great way with wood, he hoped by a little cutting to open a way through that impediment.

On the 26th of February, 1784, our author began his journey, having been furnished by a friend with two stout negroes, and having another boy who waited on himself. They arrived at the foot of the mountain a little before seven in the morning, having each a good cutlass, to cut through the woods, or to defend themselves in case of an attack from the Caribbees or runaway negroes. Before they could get at either of the ridges, however, they had a rock to climb, upwards of forty feet high. Having scrambled up this with great difficulty, they found themselves in the bottom of a deep and narrow ravine, which having ascended a little way, they arrived at the habitation of M. Gasco, a Frenchman. Our author expresses his surprise, that a young and healthy man, and a good mechanic, should sequester himself from the world among woods and precipices, where he was in continual danger of being swept away, with his whole habitation, by the torrents occasioned by the rain. He found him, however, to be an intelligent man, and was hospitably entertained by him.

"The difficulty," says Mr. Anderson, "in going through woods in the West-Indies, where there are no roads nor paths, is far beyond any thing an European can conceive. Besides tall trees and thick underwood, there are hundreds of different climbing plants, twisted together like ropes, and running in all directions to a great extent, and even to the tops of the highest trees. These cannot be broken by pushing on; and many of them are not to be cut without difficulty. Besides these, a species of grass, with serrated leaves, cuts and tears the hands and face terribly."

By reason of these obstructions, it was upwards of two hours before Mr. Anderson and his attendants got upon the ridge; and there they found their passage more difficult than before. They were now surrounded by a thick forest, rendered more impracticable by the large piles of trees blown down by the hurricanes, which obliged them in many places to creep on their hands and knees to get below them, while in others it was necessary to climb to a considerable height to get over them; at the same time that, by the trunks being rotten, they often tumbled headlong from a great height, and could not extricate themselves without great difficulty.

The fatigue of cutting their way through the woods soon became intolerable to the negroes; so that, about four in the afternoon, it was impossible to persuade them to go any farther. Mr. Anderson, therefore, returned to M. Gasco's, where he spent the night, determining to try another route the next morning. The hospitable Frenchman entertained him in the best manner he could; but though he parted with his own hammock to him, and slept on a board himself, our author found it impossible to close his eyes the whole night, by reason of the cold. "The hut," says he, "was built of large reeds, between each two of which a dog might creep through, and the top was covered with dry grass. It is situated in the bottom of a deep gully, where the sun does not shine till nine in the morning, nor after four in the afternoon. It is also surrounded by thick wood, and during the night the whole of the mountain is covered with thick clouds, from which it frequently rains, and which renders the night air exceedingly cold."

Early next morning, Mr. Anderson set out in company with the negro boy, who continued very faithful to him during the whole of the journey. He now resolved to take his course up the ravine, and proceeded for about a mile and a half without any considerable obstruction. However, it now began to narrow fast; and there were numbers of rocks and precipices to climb over, with many bushes and vines, which could scarcely be got through. At length the ravine terminated at the bottom of a very high precipice. It was impossible to know the extent of this, as the top was covered with thick wood; but from the bottom upward, as far as our author could see, was loose sand, with ferns and tufts of grass, which, as soon as he took hold of them, came up by the roots. Though the ascent was evidently at the risk of his life, Mr. Anderson resolved to attempt it; and, therefore, telling the boy to keep at some distance behind, lest he should tumble and drive him down, he began to ascend, digging holes with his cutlass to put his feet in, and taking hold of the tufts of grass as lightly as possible. Notwithstanding all his care, however, he frequently slipped down a considerable way; but as it was only loose sand, he could easily

push his cutlass into it up to the huddle, and thus, by taking hold of it, recover himself again. At last he got up to some wild plantains, which continued all the way to the place where the trees began to grow. Here he rested himself for some time, waiting for the boy, who got up with much less difficulty than he had done. On getting up to the top of the precipice, he found himself on a very narrow ridge, covered with wood, and bounded by two ravines, the bottoms of which he could not see, the descent to them appearing to be nearly perpendicular, though all the way covered with thick wood. Proceeding onwards, they found the ridge exceedingly narrow, with a tremendous gulf on each side, into which they were every moment in danger of falling; so that Mr. Anderson was obliged to lie down on his belly with great caution, in order to see through the bushes how the ridge tended.

Here a sulphureous smell, or rather one like gunpowder, began to be perceived; which our author knew must proceed from the top of the mountain, as the wind then blew that way; and as it grew stronger as he advanced, he was in hopes that the summit could not be very far distant. Perceiving a rising before him, he imagined that, by getting upon it, he might have a view of the top of the mountain; but when this was done, he could only see a peak on the north-west side of the mountain, to which, by appearance, he judged himself very little nearer than when at the bottom.

The woods now became extremely difficult, great quantities of fallen trees lying buried among the grass, and these being rotten, our author was frequently buried deep among them when he thought himself walking upon firm ground. About noon he was alarmed with a rustling among the bushes, and something like a human voice behind him; but as he was preparing to defend himself against Caribbees or run-away negroes, he was agreeably surprised with the sight of those who had formerly left him, with three others, sent by Mr. Maloune, with plenty of provisions. After refreshing themselves, they renewed their labours with fresh vigour, and Mr. Anderson thought himself sure of reaching the top before night. In a little time he had a fair view of the ravine on the left, which was of prodigious depth, and ran from near the top of the mountain to the sea. Its bottom seemed to be a rock nearly resembling lava in colour, and it seemed as if there had been vast torrents of sulphureous matter running upon it for some time. He now regretted that he knew not of this ravine before he commenced his excursion, as, by passing a headland in a canoe, and getting into it, he might have gained the summit without all those difficulties he had encountered.

About four o'clock in the afternoon, he had no prospect of the top of the mountain, but imagined that, if he could get into the ravine before night, he might easily reach it

next morning a great way, h brink of a pre by catching h half way down pendicular pu the top of th there was no had left.

next morning. After cutting through wild plantains for a great way, however, he found himself, at sun-set, on the brink of a precipice, where he fortunately escaped falling, by catching hold of some shrubs. They were now about half way down, but all the rest of the way seemed a perpendicular precipice, which it was impossible to pass: the top of the mountain was yet at a great distance, and there was no other resource than to attempt the ridge they had left.

The evening was now so far advanced, that they were obliged to take up their residence where they were; and there was only time to place two or three sticks against the stump of a tree, and slightly to cover them with plantain-leaves, for a night's habitation. Their situation was extremely uncomfortable; for it began to rain and blow violently, which prevented them from making a fire, and almost chilled them with cold. At break of day they renewed their work with great alacrity; in a short time they had the satisfaction to perceive the woods become thin; and about eleven o'clock they obtained a full view of the top, about a mile distant. It seemed to be composed of six or seven ridges, very much broken in the sides, as if they had suffered great convulsions, and they were also divided by excessively deep ravines, without any water in them. Mr. Anderson directed his course towards a high peak that overlooked a large excavation where the ridges met, and which he supposed to be the crater of the volcano. In his way he found the last wood composed of a most beautiful species of trees; and he then entered into a thick long grass, intermixed with fern, which branched and ran in every direction. Through this they were obliged to cut their way with almost as much difficulty as they had done through the woods, and it seemed to continue very near to the top of the mountain. The fatigue of this work soon reduced them to such a situation, that they were scarcely able to stand; and they were obliged to quench their thirst by chewing some leaves, there being no water to be had in the place. Two of the negroes now returned, and the rest refused to proceed any farther; so that Mr. Anderson himself was obliged to abandon his enterprise for the present, and they all began to descend about half an hour after twelve; at sun-set they arrived at M. Gasco's, and, notwithstanding his extreme weariness, our author continued his journey to Mr. Maloune's, which is about a mile distant from the foot of the mountain.

Having refreshed himself till the 4th of March, in order to sustain the fatigues of his journey the better, our traveller set out, about four in the morning, in company with a Mr. Fraser, who had resolved to go with him. They met with little difficulty till they came to the place whence they had formerly returned. Here, however, they were obliged for a quarter of a mile to cut their way through the grass and ferns before mentioned; which being done,

they met with no further obstruction. When they came within a quarter of a mile of the top, they found the climate suddenly altered, the air being extremely cold, and the whole summit of the mountain barren. On the confines of the barren region, however, our author found some beautiful plants, and he observes that this is the only place in the West-Indies where he ever found moss; but here it grew in such plenty that he frequently sunk in it up to his knees.

About noon they reached the summit, and were instantly surprised with the sight of a most extraordinary cavity. It is situated in the very centre of the mountain, at the place where all the ridges meet. Its diameter is somewhat more than a mile, and its circumference, to appearance, a perfect circle. Its depth from the surrounding margin is above a quarter of a mile, and it narrows a little, but very regularly, to the bottom. Its sides are very smooth, and for the most part covered with short moss, except towards the south, where there are a number of small holes and fissures. This is the only place where it is possible to go down to the bottom, and here the descent is very dangerous, on account of the numberless small chasms. On the west side is a section of a red rock, like granite, cut very smooth, and having the same declivity with the other parts. All the rest of the surrounding sides seem to be composed of sand which has undergone the action of an intense fire. It has a crust quite smooth, and about an inch thick, almost as hard as rock; on breaking through which, nothing appears but loose sand. In the centre stands a burning mountain, about a mile in circumference, and of a conic form, but quite level. Out of the middle of the summit rises a small eminence, eight or ten feet high, and perfectly conical; from the apex of which a column of smoke constantly issues. It is composed of large masses of red granite, like rock, of various shapes and sizes, which appear to have been split into their present forms by some terrible convulsion of nature.

Great quantities of smoke issue from most parts of the mountain, especially on the north side, which appears to be burning from top to bottom; and the heat is so intense, that it is impossible to ascend it. It is even dangerous to go round the base, as large masses of rock are constantly splitting with the heat, and tumbling down. At the bottom, on the north side, is a very large rock split asunder: each of the halves, which are rent in all directions, are separated to a considerable distance from each other, and the crevices have glossy efflorescences, tasting like vitriol. There are also some beautiful crystallizations of sulphur; and on all parts of the mountain are great quantities of sulphur, alum, vitriol, &c.

From the external appearance of this mountain, Mr. Anderson conjectures, that it had but lately begun to burn;

west from Guadalupe, and two hundred and forty from Barbadoes. It is of an oval figure, about three leagues in length, the same in breadth, and eighteen in compass. The Spaniards gave it the name of Montserrat, from a fancied resemblance it bore to a mountain of that name near Barcelona in Old Spain. It was settled in 1632, by Sir Thomas Warner, and taken in the beginning of the reign of Charles II. by the French, who restored it to England at the peace of Breda. The first settlers were Irishmen, and the present white inhabitants are principally composed either of their descendants, or natives of Ireland. The whole of the inhabitants amount to thirteen hundred whites, and about ten thousand negroes.

The climate, soil, and produce, of Montserrat, are much the same as those of the other English Caribbee Islands. The mountains yield cedars, the cypress-tree, the iron-tree, with other woods, and some odoriferous shrubs. It is well watered and fruitful, and the planters formerly raised a great deal of indigo. The surrounding seas produce some hideous monsters, particularly two, which, from their remarkable ugliness, as well as the poisonous quality of their flesh, are called sea-devils. The laman-ture, by some called the sea-cow, is found in this island, and generally at the entrance of fresh-water rivers.

In the month of June, 1733, a hurricane happened here, which blew down three-fifths of the houses in the island. A few days previous, there were thirty-four wind-mills going, many of which were entirely destroyed. A large copper, that held two hundred and forty gallons, was carried over a high wall, and beat close together by the fall. An empty sugar hogshead was lifted off the ground by the wind, and carried thirty or forty yards over a dwelling-house. But, what is most surprising of all, a cattle-mill-house, weighing at least twenty thousand pounds, was carried some distance from its situation, and, by the force of the fall, was broken into innumerable pieces. Such havoc was made among the sugar-canes, that some planters, who had a prospect of making two or three hundred hogsheads the next year, would gladly have compounded for sixty or eighty. In a word, the whole damage, exclusive of the shipping, was reckoned not less than fifty thousand pounds of their currency.

## SECTION X.

### ANGUILLA

Is situated in nineteen degrees north latitude, and sixty-two degrees fifty-seven minutes west longitude, about seventy-five miles north-west of St. Christopher's. It is very long and narrow, which induced the Spaniards to give it the name of Anguilla, or "The Eel." It is so low and flat, that the French, who were there first, did

not think it worth cultivating, or even keeping. The English adopted the same opinion, when they took possession of it, and the island was a long time in their hands before they perceived the contrary. Within a few years, however, the indefatigable labours of the planters of Anguilla demonstrated that the island produces not only all the necessaries of life, but, besides, many provisions, which they sell to their neighbours, as well as sugar and cotton. The climate is salubrious, and the inhabitants are strong and vigorous. Their principal exports are sugar, rum, and cotton.

## SECTION XI.

### DOMINICA.

This island was discovered by Columbus, who called it Dominica, because he first saw it on a Sunday. It is situated in sixteen degrees of north latitude, and sixty-two degrees of west longitude, about half-way between Guadalupe and Martinico, and is about twenty-eight miles in length, and thirteen in breadth. The soil is thin, and better adapted to the rearing of coffee than sugar; but the sides of the hills bear the finest trees in the West-Indies, and the whole island is well supplied with rivulets of fine water. Here, as in some other of the Caribbees, is a sulphur-mountain, and a hot spring, equal, in salubrity, to those of Bath, in England. At the north-west end of the island is a deep and spacious bay, called Prince Rupert's, which is sheltered from the winds, by mountains on all sides.

The principal place in this island is the town of Roseau, situated on a spacious harbour. The houses are low and irregularly placed, and the town is sheltered by the circumjacent mountains, some of which rise to a considerable height. The most advantageous view of the town is from the bay or harbour, where ships of considerable burthen ride at anchor with the greatest safety.

## SECTION XII.

### BARBUDA, AND THE ADJACENT ISLES.

BARBUDA lies in eighteen degrees north latitude, and sixty-one degrees thirty-five minutes west longitude, fifteen miles north-east of Montserrat; its length being about twenty miles, and its breadth twelve. It is the property of the Codrington family, who have the appointment of the governor. Part of the estate arising from it, amounting, as it is said, to two thousand pounds a year, with two plantations in Barbadoes, were bequeathed, in 1710, by Christopher Codrington, Esq. governor and captain-general of Barbadoes, to the society for propagating the gospel, towards the instruction of the negroes in the Ca-

ribbee Islands in the Christian religion, and the erection of a college at Barbadoes for teaching the liberal arts.

The land of this island lies low, but is fertile: the inhabitants apply themselves chiefly to the breeding of cattle and raising provisions, with which they supply the neighbouring islands. There are some large serpents on the island, but they are so far from being poisonous or noxious, that they destroy rats, toads, and frogs; though the sting or bite of others is mortal, unless an antidote be quickly applied. On the west side of the island is a well-sheltered road, clear from rocks and sands.

To the north of Barbuda are several small uninhabited islands. The most remarkable of them lies at six leagues distance, and is about a league long. It consists of an eminence, in which the Spanish discoverers finding some resemblance to a hat, they gave it the name of Sombrero, which it has always preserved.

To the west of Barbuda and Sombrero, after having crossed a channel of eight leagues, begin the Virgin Islands. These occupy a space, from east to west, of about twenty-four leagues in length, quite to the eastern coast of Porto-Rico, with a breadth of about sixteen leagues. They are composed of a great number of isles, whose coasts, rent throughout, and sprinkled with rocks, are famous for shipwrecks, and particularly of the Spanish galleons. Happily for the trade and navigation of these islands, Nature has placed in the middle of them a large basin, of three or four leagues broad, and six or seven long, the finest that can be imagined, and in which ships may anchor land-locked, and sheltered from all winds.

One of these islands is called the Tropic Keys, from the astonishing quantity of tropic-birds which breed there. These birds are about the size of a pigeon, but round and plump like a partridge, and very good to eat. Their plumage is white, except two or three feathers in each wing, which are of a clear grey. Their beaks are short, thick, and of a pale yellow: they have a long quill, about seven inches long, which comes out of their rump, and is all the tail they have; they obtained their name from not having been ever seen but between the tropics.

The Virgin Islands are all of them small, and the greatest part uninhabited.

### SECTION XIII.

#### THE BERMUDAS, OR SUMMER ISLANDS.

Having described the British Islands in the West-Indies, we shall advert to a group, which, though they cannot be considered under the denomination of the former, come under the class of North-American Islands, appertaining to Great Britain.

These are a cluster of very small islands, and were discovered by John Bermudez, a Spaniard, from whom they received their first name, as they did their second from Sir George Summer, who was cast away upon them in 1609, since which they have belonged to Great Britain. They are situated in the Atlantic Ocean, in thirty-two degrees of north latitude. They have a clear temperate air, with plenty of flesh, fish, poultry, fruits, herbs, roots, &c. The climate, however, of late years, is altered for the worse. Cedars grow here; ambergris is found on the shores; and whales and turtles are caught on the coast. Here is a breed of black hogs, which are much valued. White chalk-stones and tobacco are exported. Oranges and palmettos abound; and many things are found in great plenty, water excepted; for the inhabitants have none but what falls from the clouds.

The chief island is St. George, which is sixteen miles in length, and three in breadth, and contains some handsome buildings. The chief employment of the inhabitants is building small vessels.

Having thus described the various American Islands which belong to *Great Britain*, we shall present our readers with the general character of the white residents in this part of the world, extracted from the second volume of Edward's Civil and Commercial History of the British Colonies in the West-Indies.

"It appears to me," says our author, "that the leading feature in the character of these people is an independent spirit, and a display of conscious equality, throughout all ranks and conditions. The poorest white person seems to consider himself nearly on a level with the richest, and, emboldened by this idea, approaches his employer with an extended hand, and a freedom which, in the countries of Europe, is seldom displayed by men in the lower orders of life towards their superiors. It is not difficult to trace the origin of this principle. It arises, without doubt, from the pre-eminence and distinction which are necessarily attached even to the complexion of a white man, in a country where the complexion, generally speaking, distinguishes freedom from slavery. Of the two great classes of people in most of these colonies, the blacks outnumber the whites in the proportion of seven to one. As a sense of common safety, therefore, unites the latter in closer ties than are necessary among men who are differently situated, so the same circumstance necessarily gives birth among them to reciprocal dependence and respect. Other causes contribute to the same end. 'Where slavery,' says a great writer, 'is established in any part of the world, those who are free, are by far the most proud and jealous of their freedom. Freedom is to them not only an enjoyment, but a kind of rank and privilege. Not

seeing there the common blessing of great misery, and looks among the liberal. Thus America are more stubborn northward. Such were our the Poles; and not slaves there.

seeing there that freedom, as in countries where it is a common blessing, may be united with much abject toil, with great misery, and with all the exterior of servitude, liberty looks among them like something that is more noble and liberal. Thus the people of the southern colonies of America are much more strongly, and with a higher and more stubborn spirit, attached to liberty than those to the northward. Such were all the ancient commonwealths; such were our Gothic ancestors: such, in our days, are the Poles; and such will be all masters of slaves, who are not slaves themselves.

"Possibly, too, the climate itself, by increasing sensibility, contributes to create an impatience of subordination. But, whatever may be the cause of this consciousness of self-importance in the West-Indian character, the consequences resulting from it are, on the whole, beneficial. If it sometimes produces an ostentatious pride, and a ridiculous affectation of splendour, it more frequently awakens the laudable propensities of our nature—frankness, sociability, benevolence, and generosity. In no part of the globe is the virtue of hospitality more generally prevalent than in the British sugar-islands. The gates of the planter are always open to the reception of his guests. To be a stranger is of itself a sufficient introduction. This species of hospitality is indeed carried so far, that, as Mr. Long has remarked, there is not one tolerable inn throughout all the West-Indies.

"To the same cause may, perhaps, be ascribed, on the other hand, that eagerness for litigation and juridical controversy, which so remarkably predominates in most of these islands. From this unfortunate passion, ruinous as it frequently proves to individuals, this advantage, however, results to the community at large; that the lower orders of men, from their frequent attendance on the courts of law, acquire a degree of knowledge, and a clearness and precision of reasoning, which are not generally to be found in men of the same rank in England. Thus the petty juries in the West-Indies are commonly far more intelligent and respectable than those in Great Britain. Every candid person, who has attended the courts of criminal jurisdiction in both countries, must confirm this observation.

"But it is to the Creoles, or natives, that we must look for the original and peculiar cast of character impressed by the climate, if, indeed, the influence of climate be such as many writers imagine. For my own part, I am of opinion, that the climate of the West-Indies displays itself more strongly on the persons of the natives than on their manners, or on the faculties of their minds. They are obviously a taller race, on the whole, than the Europeans; but I think, in general, not proportionably robust. I have known several who were full six feet four inches in height; but they wanted bulk, to meet our ideas

of masculine beauty. All of them, however, are distinguished for the freedom and suppleness of their joints; which enable them to move with great ease and agility, as well as gracefulness, in dancing. From the same cause, they excel in pennmanship and the use of the small sword. It has been truly observed, that the effect of climate is likewise obvious in the structure of the eye, the socket being considerably deeper than among the natives of Europe. By this conformation, they are guarded from those ill effects which an almost continual strong glare of sunshine might otherwise produce; and it is a curious circumstance, that their skin feels considerably colder than that of a European; a proof, I think, that nature has contrived some peculiar means of protecting them from the heat, which she has denied to the nations of temperate regions, as unnecessary. Accordingly, though their mode of living differs in no respect from that of the European residents, they are rarely obnoxious to those inflammatory disorders, which frequently prove fatal to the latter.

"The ladies of these islands have indeed greater cause to boast of this fortunate exemption than the men; a pre-eminence undoubtedly acquired by the calm and even tenor of their lives, and by an habitual temperance and self-denial. Except the exercise of dancing, in which they delight and excel, they have no amusement or avocation to impel them to much exertion of either body or mind. Those midnight assemblies and gambling conventions, wherein health, fortune, and beauty, are so frequently sacrificed in the cities of Europe, are here happily unknown. In their diet, the Creole women are, I think, abstemious even to a fault. Simple water, or lemonade, is the strongest beverage in which they indulge; and a vegetable mess at noon, seasoned with cayenne pepper, constitutes their principal repast. The effects of this mode of life, in a hot and oppressive atmosphere, are lax fibres, and a complexion in which the lily predominates rather than the rose. To a stranger newly arrived, the ladies appear as just risen from the bed of sickness. Their voice is soft and spiritless, and every step betrays languor and lassitude. With the finest persons, they certainly want that glow of health in the countenance, that delicious crimson which, in colder countries, enlivens the coarsest set of features, and renders a beautiful one irresistible.

Youth's orient bloom, the blush of chaste desire,  
The sprightly converse, and the smile divine,  
(Love's gentler train) to milder climes retire,  
And full in Albion's matchless daughters shine.

"In one of the principal features of beauty, however, few ladies surpass the Creoles; for they have, in general, the finest eyes in the world; large, languishing, and expressive; sometimes beaming with animation, and sometimes melting with tenderness; a sure index to that native

goodness of heart and gentleness of disposition for which they are eminently and deservedly applauded, and to which, combined with their system of life and manners, (sequestered, domestic, and unobtrusive,) it is doubtless owing, that no women on earth make better wives, or better mothers.

"Perhaps, the circumstance most distinguishable in the character of the natives to which the climate seems to contribute, is the early display of the mental powers in young children; whose quick perception, and rapid advances in knowledge, exceed those of European infants of the same age, in a degree that is perfectly unaccountable and astonishing. This circumstance is, indeed, too striking to have escaped the notice of any one writer who has visited the tropical parts of America; and the fact being too well established to be denied, the philosophers of Europe have consoled themselves with an idea that, as the genius of the young West-Indians attains sooner to maturity, it declines more rapidly than that of Europeans. Nature is supposed to act in this case in a manner analogous to her operations in the vegetable kingdom, where the trees that come soonest to perfection are at the same time less firm and durable than those which require more time for the completion of their growth. It is, indeed, certain, that the subsequent acquirements of the mind of the natives do not always keep pace with its early progress; but the chief cause (as Ulloa has observed) of the short duration of such promising beginnings seems to be the want of proper objects for exercising the faculties. The propensity, also, which the climate undoubtedly encourages to early and habitual licentiousness, induces a turn of mind and disposition unfriendly to mental improvement. Among such of the natives as have happily escaped the contagion and enervating effects of youthful excesses, men are found of capacities as strong and permanent as among any people whatever.

"As I cannot, therefore, admit that the Creoles, in general, possess less capacity and stability of mind than the natives of Europe, much less can I allow that they fall short of them in those qualities of the heart which render man a blessing to all around him. Generosity to each other, and a high degree of compassion and kindness towards their inferiors and dependents, distinguish the Creoles in a very honourable manner. If they are proud, their pride is allied to no meanness. Instructed from their infancy to entertain a very high opinion of their own consequence, they are cautious of doing any act which may lessen the consciousness of their proper dignity. From the same cause they scorn every species of concealment. They have a frankness of disposition beyond any people on earth. Their confidence is unlimited and entire. Superior to falsehood themselves, they suspect it not in others.

How far this nobleness of disposition may be ascribed to the influence of a genial climate, and how far to education and example, I presume not to discriminate. The effects of heat on the body are sufficiently visible; but, perhaps, philosophers have relied too much on a supposed sympathy between the body and mind. 'The natives of hot climates (says one writer) are slothful and timid;' but timidity is by no means the necessary consequence of indolence. The mind may require great force to rouse it to due exertion; but, being properly urged, may display qualities very opposite to those of a timid disposition. At least, timidity constitutes no part of the character of the natives of the British West-Indies. Indolence, I will admit, is too predominant among them; but that they are deficient in personal courage, no man, who has the smallest acquaintance with them, will allow for a moment. Even the indolence of which they are accused is rather an aversion to serious thought and deep reflection than a slothfulness and sluggishness of nature. Both sexes, when the springs of the mind are once set in motion, are remarkable for a warm imagination and a high flow of spirits. There seems, indeed, universally to reign among them a promptitude for pleasure. This effect has been ascribed, and perhaps justly, to the levity of the atmosphere. To the same cause is commonly imputed the propensity observable in most of the West-Indians to indulge extravagant ideas of their riches; to view their circumstances through a magnifying medium, and to feast their fancies on what another year will effect. This anticipation of imaginary wealth is so prevalent, as to become justly ridiculous; yet I am inclined to think it is a propensity that exists independent of the climate and atmosphere, and that it arises principally from the peculiar situation of the West-Indian planters as land-holders. Not having, like the proprietors of landed estates in Great Britain, frequent opportunities of letting their plantations to substantial tenants, they are, for the most part, compelled to become practical farmers on their own lands, of which the returns are, in the highest degree, fluctuating and uncertain. Under these circumstances, a West-Indian property is a species of lottery. As such, it gives birth to a spirit of adventure and enterprise, and awakens extravagant hopes and expectations, too frequently terminating in perplexity and disappointment."

To these remarks we shall append those of the same writer on the manners, dispositions, and customs, of the *Caribbees*, the ancient inhabitants of the islands which have been described:—

"Enquiries into the origin of a remote and unlettered race can be prosecuted with success only by comparing their ancient manners, laws, language, and religious ceremonies, with those of other nations. Unfortunately, in all or most of those particulars respecting the *Caribbees*,

our knowledge is limited within a narrow circle. Of a people engaged in a perpetual warfare, hunted from island to island by revenge and rapacity, few opportunities could have offered, even to those who might have been qualified for such researches, of investigating their natural dispositions and habitual customs with minuteness and precision. Neither indeed could a just estimate have been formed of their national character, from the manners of such of them as were at length subjugated to the European yoke; for they lost, together with their freedom, many of their original characteristics; and, at last, even the desire of acting from the impulse of their own minds. 'We discern,' says Rochefort, 'a wonderful change in the dispositions and habits of the Caribbees. In some respects, we have enlightened, in others (to our shame be it spoken,) we have corrupted them.' An old Caribbee thus addressed one of our planters on this subject:—'Our people,' he complained, 'are become almost as bad as yours. We are so much altered since you came among us, that we hardly know ourselves, and we think it is owing to so melancholy a change, that hurricanes are more frequent than they were formerly. It is the evil spirit who has done all this—who has taken our best lands from us, and given us up to the dominion of the Christians.'

"My present investigation must, therefore, be necessarily defective. Nevertheless, by selecting and combining such memorials as are least controverted, I shall hope to exhibit a few striking particulars of this ill-fated people, which, if I mistake not, will lead to some important conclusions in the study of human nature.

"Their fierce spirit and warlike disposition have already been mentioned. Historians have not failed to notice these among the most distinguishable of their qualities. Restless, enterprising, and ardent, it would seem they considered war as the chief end of their creation, and the rest of the human race as their natural prey; for they devoured without remorse the bodies of such of their enemies (the men, at least,) as fell into their hands. The custom is so repugnant to our feelings, that for a century past, until the late discoveries of a similar practice in the Pacific Ocean, the philosophers of Europe had boldly impeached the veracity of the most eminent ancient voyagers who had first recorded the existence of it. Even Labat, who resided in the West-Indies at a period when some of the islands still remained in the possession of the Caribbees, declares it to be his opinion, that instances of this abominable practice among them were at all times extremely rare;—the effect only of a sudden impulse of revenge, arising from extraordinary and unprovoked injury; but that they ever made premeditated excursions to the larger islands for the purpose of devouring any of the inhabitants, or of seizing them to be eaten at a future time, he confidently denies. Yet there is no circumstance in the history of mankind better at-

tested than the universal prevalence of these practices among them.

"Thus far, it must be confessed, the disposition of the Caribbees leaves no favourable impression on the mind of the reader; by whom it is probable they will be considered rather as beasts of prey, than as human beings; and he will think, perhaps, that it was nearly as justifiable to exterminate them from the earth, as it would be to destroy the fiercest monsters of the wilderness; since they who shew no mercy are entitled to no pity.

"But, among themselves, they were peaceable; and, towards each other, faithful, friendly, and affectionate. They considered all strangers, indeed, as enemies; and of the people of Europe they formed a right estimation. The antipathy which they manifested towards the unfriendly natives of the larger islands appears extraordinary; but it is said to have descended to them from their ancestors of Guiana: they considered those islanders as a colony of Arrowauks, a nation of South-America, with whom the Caribbees of that continent are continually at war. We can assign no cause for such hereditary and irreconcilable hostility. It is allowed that, with regard to the people of Europe, whenever any of them had acquired their confidence, it was given without reserve. Their friendship was as warm as their enmity was implacable. The Caribbees of Guiana still fondly cherish the tradition of Raleigh's alliance, and to this day preserve the English colours, which he left with them at parting.

"Of the loftiness of their sentiments, and their abhorrence of slavery, a writer, not very partial towards them, gives the following illustration: 'There is not a nation on earth,' says Labat, 'more jealous of their independency than the Caribbees. They are impatient under the least infringement of it; and when, at any time, they are witnesses to the respect and deference which the natives of Europe observe towards their superiors, they despise us as abject slaves, wondering how any man can be so base as to crouch before his equal.' Rochefort, who confirms this account, relates, also, that when kidnapped and carried from their native islands into slavery, as they frequently were, the miserable captives commonly sunk under a sense of their condition, and, finding resistance or escape hopeless, sought refuge in death from the calamities of it.

"To this principle of conscious equality and native dignity, must be imputed the contempt which they manifested for the inventions and improvements of civilized life. Of our fire-arms they soon learnt, by fatal experience, the superiority to their own weapons, and those, therefore, they valued: but our arts and manufactures they regarded as we regard the amusements and baubles of children: hence the propensity to theft, so common among other savage nations, was altogether unknown to the Caribbees.

"The ardour which has been noticed in them for military enterprise, had a powerful influence on their whole conduct. Engaged in continual warfare abroad, they seldom appeared cheerful at home. Reflections on past miscarriage, or anxious schemes of future achievement, seemed to fill up many of their hours, and rendered them habitually thoughtful, pensive, and silent. Love itself, which exerts its influence in the frozen deserts of Iceland, maintained but a feeble dominion over this people. Their insensibility towards their women, although they allowed a plurality of wives, has been remarked by many writers; and it must have arisen from extrinsic causes; from the predominance of passions strong enough to counteract the effects of a climate which powerfully disposes to voluptuousness, and awakens the instincts of nature much sooner than in colder regions. The prevailing bias of their minds was distinguishable even in their persons. Though not so tall as the generality of Europeans, their frame was robust and muscular; their limbs flexible and active, and there was a penetrating quickness, and a wildness in their eyes, that seemed an emanation from a fierce and martial spirit. But, not satisfied with the workmanship of nature, they called in the assistance of art, to make themselves more formidable. They painted their faces and bodies so extravagantly, that it was with difficulty their natural complexion, which was nearly that of a Spanish olive, was discoverable under the surface of crimson. However, as this mode of painting themselves was practised by both sexes, perhaps it was at first introduced as a defence against the venomous insects so common in tropical climates, or possibly they considered the brilliancy of the colour as highly ornamental; but the men had other methods of deforming their persons, which mere perversion of taste alone would not, I think, have induced them to adopt. They disfigured their cheeks with deep incisions and hideous scars, which they stained with black, and they painted white and black circles round their eyes. Some of them perforated the cartilage of the nostrils, and inserted the bone of some fish, a parrot's feather, or a fragment of tortoise-shell; a frightful custom, practised also by the natives of New Holland; and they strung together the teeth of such of their enemies as they had slain in battle, and wore them on their legs and arms, as trophies of successful cruelty.

"To draw the bow with unerring skill, to wield the club with dexterity and strength, to swim with agility and boldness, to catch fish, and to build a cottage, were acquirements of indispensable necessity; and the education of their children was well suited to the attainment of them. One method of making their boys skilful, even in infancy, in the exercise of the bow, was to suspend their food on the branch of a tree, compelling the hardy urchins to pierce it with their arrows, before they could obtain permission

to eat; but these were subordinate objects:—the Caribbees instructed their youth, at the same time, in lessons of patience and fortitude; they endeavoured to inspire them with courage in war, and a contempt of danger and death; above all things, to instil into their minds an hereditary hatred, and implacable thirst of revenge, towards the Arrowauks. The means which they adopted for these purposes were in some respects superstitious, in others cruel and detestable.

"As soon as a male child was brought into the world, he was sprinkled with some drops of his father's blood. The ceremonies used on this occasion were sufficiently painful to the father, but he submitted without emotion or complaint; fondly believing that the same degree of courage which he had himself displayed, was by these means transmitted to his son. As the boy grew, he was soon made familiar with scenes of barbarity; he partook of the horrid repasts of his nation, and he was frequently anointed with the fat of a slaughtered Arrowauk; but he was not allowed to participate in the toils of the warrior, and to share the glories of conquest, until his fortitude had been brought to the test. The dawn of manhood ushered in the hour of severe trial. He was now to exchange the name he had received in his infancy for one more sounding and significant;—a ceremony of high importance in the life of a Caribbee, but always accompanied by a scene of ferocious festivity and unnatural cruelty.

"The severities inflicted on such occasions by the hands of fathers on their own children, exhibit a melancholy proof of the influence of superstition in suppressing the most powerful feelings of nature; but the practice was not without example. Plutarch records the prevalence of a similar custom among the Lacedæmonians: 'At Sparta,' says the historian, 'boys are whipped for a whole day, oftentimes to death, before the altar of Diana, and there is a wonderful emulation among them who best can sustain the greatest number of stripes.' Nor did the Caribbee youth yield in fortitude to the Spartans. If the severities he sustained extorted the least symptom of weakness from the young sufferer, he was disgraced for ever; but if he rose superior to pain, and baffled the rage of his persecutors, by perseverance and serenity, he received the highest applause. He was thenceforth numbered among the defenders of his country, and it was pronounced by his relations and countrymen, *that he was now a man like one of themselves.*

"A penance still more severe, and torments more excruciating—stripes, burning, and suffocation, constituted a test for him who aspired to the honour of leading forth his countrymen to war; for in times of peace the Caribbees admitted of no supremacy but that of nature. Having no laws, they needed no magistrates. To their old

men, indeed, they allowed some kind of authority, but it was at best ill-defined, and must at all times have been insufficient to protect the weak against the strong. In war, however, experience had taught them that subordination was as requisite as courage; they therefore elected their captains in their general assemblies with great solemnity; but they put their pretensions to the test with circumstances of outrageous barbarity.

"If it appear strange that, where so little was to be gained by pre-eminence, so much should be so willingly endured to obtain it, it must be considered that, in the estimation of the candidate, the reward was doubtless more than adequate to the cost of the purchase. If success attended his measures, the feast of the triumph awaited his return. He exchanged his name a second time; assuming in future that of the most formidable Arrowauk that had fallen by his hand. He was permitted to appropriate to himself as many of the captives as he thought fit, and his countrymen presented to his choice the most beautiful of their daughters in reward of his valour.

"It was probably this last-mentioned testimony of public esteem and gratitude, that gave rise in these islands to the institution of polygamy, which prevailed universally among them, and still prevails among the Caribbees of South-America; an institution the more excusable, as their women, from religious motives, carefully avoided the nuptial intercourse after pregnancy. I am sorry to add, that the condition of these poor creatures was at the same time truly wretched. Though frequently bestowed as the prize of successful courage, the wife thus honourably obtained was soon considered of as little value as the captive. Deficient in those qualities which alone were estimable among the Caribbees, the females were treated rather as slaves than companions. They sustained every species of drudgery: they ground the maize, prepared the cassavi, gathered in the cotton, and wove the hammocks; nor were they allowed even the privilege of eating in presence of their husbands. Under all these cruel circumstances, it is not wonderful that they were far less prolific than the women of Europe. But brutality towards their wives was not peculiar to the Caribbees. It has prevailed in all ages and countries among the uncivilized part of mankind; and the first visible proof that a nation is emerging from savage manners, is a display of tenderness towards the female sex.

"Perhaps a more intimate knowledge (not now to be obtained) would have softened many of the shades which thus darkened the character of these islanders, and have discovered some latent properties in their principles and conduct, tending to lessen, though not wholly to remove, the disgust we naturally feel in beholding human nature so debased and degraded; but of many particulars wherein curiosity would desire to be gratified, we have not suffi-

cient materials to enable us to form a full and correct idea. We know but little, for instance, concerning their domestic economy, their arts, manufactures, and agriculture; their sense of filial and paternal obligations, or their religious rites and funeral-ceremonies. Such further information, however, in these and other respects, as authorities the least disputable afford, I have abridged in the following detached observations.

"Besides the ornaments which we have noticed to have been worn by both sexes, the women, on arriving at the age of puberty, were distinguished also by a sort of buskin, or half-boot, made of cotton, which surrounded the small of each leg: a distinction, however, which such of their females as had been taken in the chance of war dared not aspire to. In other respects, both male and female appeared as naked as our first parents before the fall.

"Their hair was uniformly of a shining black, straight, and coarse; but they dressed it with daily care, and adorned it with great art; the men, in particular, decorating their heads with feathers of various colours. As their hair thus constituted their chief pride, it was an unequivocal proof of the sincerity of their sorrow, when, on the death of a relation or friend, they cut it short, like their slaves and captives; to whom the privilege of wearing long hair was rigorously denied. Like most other nations of the new hemisphere, they eradicated, with great nicety, the incipient beard, and all superfluous hairs on their bodies; a circumstance which has given rise to a notion that all the aborigines of America were naturally beardless. This opinion is, indeed, countenanced by many respectable writers; but, after much enquiry, and some instances of ocular inspection, I am satisfied that it is groundless.

"The circumstance the most remarkable concerning their persons, was their strange practice of altering the natural configuration of the head. On the birth of a child, its tender and flexible skull was confined between two small pieces of wood, which, applied before and behind, and firmly bound together on each side, elevated the forehead, and occasioned it, and the back part of the skull, to resemble two sides of a square; an uncouth and frightful custom still observed, if I am rightly informed, by the miserable remnant of Caribbees in the island of St. Vincent.

"They resided in villages, which resembled an European encampment; for their cabins were built of poles fixed circularly in the ground, and drawn to a point at the top. They were then covered with leaves of the palm-tree. In the centre of each village was a building of superior magnitude to the rest. It was formed with great labour, and served as a public hall or state-house, wherein we are assured that the men (excluding the women) had their meals in common; 'observing that law,'

says the Earl of Cumberland, who visited these islands in 1569, 'which in Lycurgus's mouth was thought strange and needless.' These halls were also the theatres where their youth were animated to emulation, and trained to martial enterprise by the renown of their warriors, and the harangues of their orators.

"Their arts and manufactures, though few, displayed a degree of ingenuity which one would have scarcely expected to have found amongst a people so little removed from a state of mere animal nature, as to reject all dress as superfluous. Columbus observed an abundance of substantial cotton-cloth in all the islands which he visited, and the natives possessed the art of staining it with various colours, though the Caribbees delighted chiefly in red. Of this cloth they made hammocks, or hanging beds, such as are now used at sea; for Europe has not only copied the pattern, but preserved also the original name.

"They possessed likewise the art of making vessels of clay for domestic uses, which they baked in kilns like the potters in Europe. The ruins of many of these kilns were visible not long since in Barbadoes, where specimens of the manufacture are still frequently dug up; and Mr. Hughes, the historian of that island, observes, that they far surpass the earthen-ware made by the negroes, in thinness, smoothness, and beauty. Besides these, they invented various other utensils for economical purposes, which are enumerated by Labat. The baskets, which they composed of the fibres of the palmetto-leaves, were singularly neat and elegant; and we are told that their bows and arrows, and other weapons, displayed a neatness and polish, which the most skilful European artist would have found it difficult to have excelled, even with European tools.

"Of the nature and extent of their agriculture, the accounts are slender and unsatisfactory. We are told, on good authority, that, among the Caribbees on the continent, there was no division of land, every one cultivating in proportion to his exigencies. Where no criminal jurisdiction is established, the idea of private property must necessarily be unknown or imperfect; and in these islands, where land is scarce, it seems probable that, as among some of the tribes of South-America, cultivation was carried on by the joint labour of each separate community, and their harvests were deposited in public granaries, whence each family received its proportion of the public stock. Rochefort, indeed, observes, that all their interests were in common.

"Their food, both vegetable and animal, excepting in the circumstance of their eating human flesh, seems to have been the same, in most respects, as that of the natives of the larger islands. But, although their appetites were voracious, they rejected many of the best bounties of nature. Of some animals they held the flesh in abhor-

rence: these were the peccary, or Mexican hog, the manati, or sea-cow, and the turtle. Labat observes, that they scrupled likewise to eat the eel, which the rivers, in several of the islands, supply in great plenty.

"The striking conformity of these, and some other of their prejudices and customs, to the practices of the Jews, has not escaped the notice of historians. But whether the Caribbees were actuated by religious motives, in thus abstaining from those things which many nations account very wholesome and delicious food, we are no where sufficiently informed."

## SECTION XIV.

### CUBA.

Cuba is the largest of the West-India islands belonging to Spain, and was discovered by Columbus in 1492. He had but a slight view of it, yet it proved fatal to the natives; for having presented him with gold, some pieces of which he carried into Spain, it occasioned an immediate resolution to settle in it, which was accordingly effected in 1511.

The Island of Cuba extends in latitude from twenty degrees twenty minutes to the tropic of Cancer; and from seventy-four degrees to eighty-five degrees fifteen minutes west longitude. It is about seven hundred miles in length from east to west, but very narrow in proportion, not being above seventy in breadth. It lies sixty miles to the west of Hispaniola, twenty-five leagues to the north of Jamaica, one hundred miles to the east of Yucatan, and as many to the south of Cape Florida. It commands the entrance of both the Gulfs of Mexico and Florida, and the Windward Passage; so that the Spaniards, who are the only possessors of it, may, with a tolerable fleet, not only secure their own trade, but annoy their neighbours.

In Cuba there are no winters; but in the months of July and August, when the sun is vertical, the rains and storms are great, otherwise the climate would be intolerably hot. The fairest season is when the sun is farthest off, and then it is hottest in the morning; for towards noon a breeze springs up, which blows pretty brisk till the evening. The trade-winds in these seas blow from the north-east. At the full and change of the moon, from October to April, there are brisk winds at north and north-west, which, in December and January, often turn to storms; though this is called the fair season.

The country is well watered, and agreeably diversified with woods, lawns, and valleys. The soil is capable of producing, in the greatest plenty, every thing that grows in the other American islands; but the Cuba (commonly called the Havana) tobacco is thought to excel that of all

the world; and goodness, had other products: cassia, mastic, trees; oaks, pine trees, plantains, and two sorts of first like a china with a juice betwixt

The number besides the home arrobas of sugar HAVANNAH

the world; and their sugar would equal their tobacco in goodness, had they industry to cultivate the canes. The other products are ginger, long pepper, and other spices; cassia, mastic, aloes, large cedars, and other odoriferous trees; oaks, pines, palm-trees, large vines, fine cotton-trees, plantains, bananas, apanas, guavas, lemons, cocoas, and two sorts of fruit called camilor and guanavana; the first like a china-orange, and the other shaped like a heart, with a juice between sweet and acid.

The Spanish plantations are furnished by the mines of Cuba with a sufficiency of metal for all their brass-guns. Gold-dust is found in the sands of the rivers; but it is uncertain whether there are any gold or silver-mines, the hopes of which occasioned the massacre of all the ancient inhabitants, who were either unable or unwilling to discover them. If there be any, they are not worked. A chain of hills runs through the middle of the island; but the land near the coast is generally a level champaign country. The interior parts lie quite uncultivated and uninhabited.

The ports and harbours here are of great advantage to ships for passing the gulf in safety; but there are scarcely any navigable rivers. Both the coasts and rivers abound with fish, and also with alligators. There are great conveniences for making salt; but the inhabitants avail themselves very little of them. The cattle brought hither by the Spaniards have multiplied exceedingly, great numbers now running wild in the woods, of which many are killed, chiefly for their hides and tallow, that are sent to Spain. Their flesh, also, being cut into pieces and dried in the sun, serves to victual ships. These cattle are often so fat, that they die through the burthen of their grease. Here are likewise abundance of mules, horses, sheep, wild boars, and hogs; together with wild and tame fowl, parrots, partridges, large tortoises, &c.

On the first conquest of this island, the following ludicrous circumstance occurred. Narvaez, a Spanish captain, being employed with thirty men to survey the country, had procured an ass, which, like the horse, was an animal totally unknown to the natives. Arriving at one of their villages, and lodging his ass in the same hovel with himself, he went to sleep. But in the meanwhile a number of warriors had assembled to surprise the party, having some suspicion of their designs. Hearing the tumult, Narvaez rose in his shirt, mounted his ass, and rode out to discover the cause. Upon the sight of this apparition, the warriors fled with the greatest confusion, and never ventured any further opposition against the Spaniards or their asses.

The number of sugar-mills exceeds six hundred; and, besides the home-consumption, more than two millions of arrobas of sugar are annually sent to Europe.

HAVANNAH, the capital town, is situated on the north-

west coast of the island, fifty leagues from Cape Antonio, its westernmost point; four hundred and ninety miles west from St. Jago; and forty-one leagues south of the Cape of Florida, the gulf of which it commands, by being situated at its mouth.

This city was originally called the "Port of Carenas;" but afterwards, when it began to increase, it was called "St. Christopher of the Havannah." In 1536, it was so inconsiderable, that, being taken by a French pirate, he ransomed it for seven hundred dollars. Some time after, it was taken by the English, and a second time by the French; yet its value was not understood, nor any care taken to put it in a posture of defence, till the reign of Philip II. But since the accession of the house of Bourbon to the Spanish crown, it has been completely fortified.

This town is particularly famous for its harbour, which is, in every respect, one of the best in the West-Indies, and, perhaps, in the world. It is entered by a narrow passage, upwards of half a mile in length, which afterwards expands into a large basin, and is sufficient, in extent and depth, to contain a thousand sail of large vessels, having almost six fathoms water throughout, and being perfectly sheltered from every wind.

The city stands on the west side of the harbour, in a pleasant plain, and is the residence of the governor and other royal officers of Cuba. The buildings are chiefly of stone, and some of them superbly finished; among which are eleven churches and monasteries, and two handsome hospitals. The churches are remarkably rich and magnificent; the lamps, candlesticks, and ornaments for the altars, being of gold and silver, and some of the lamps weighing near a hundred pounds. The Recollect's church has twelve beautiful chapels in it, and in the monastery are cells for fifty monks. The church of St. Clara has seven altars, adorned with a profusion of plate, and the nunnery contains a hundred women and servants, clothed in blue. The church of the Augustines has thirteen altars; and that of St. Juan de Dios nine; with an hospital for soldiers, of twelve thousand dollars revenue.

The city is supplied with water by the Lagida, which runs through it by two streams. The entrance to the harbour is defended, on the east side, by a strong castle, called *El Moro*, situated on a high rock; and on the walls and bastions are mounted forty pieces of cannon. Under the faces of the south-west bastions of the Moro, and within the entrance of the harbour, is a stone battery, called the *Twelve Apostles*, almost level with the water; and the guns carry each a ball of thirty-six pounds. A little higher, and opposite to the Point-gate, is the *Divina Pastora*, or Shepherd's Battery, of fourteen guns, level with the water. On the west side of the entrance, at the Point, is a square fort, called the *Punta*, with four bas-

tions well mounted with cannon. On the bastions of the town, next the harbour, are a number of cannon; and about the middle of the city is the *Fuerte*, a square fort with four bastions, mounted with twenty-two pieces of cannon. In this last the governor resides, and his Catholic majesty's treasures are deposited till the arrival of the galleons.

On the land-side, from the Punta-gate to the dock-yard, there is a rampart with bastions, faced with stone, and earthen parapets, with a ditch, which, in several places, is fallen in, and is almost filled up, particularly behind the Punta and land-gates, near the stone quarries, which, if joined to one another, might be of great detriment to the place in case of a siege, as a lodgment might be made in them. The ground here rises with an easy ascent to the land-gate; and is either open pasture or garden ground, well stocked with cabbage-trees. Before the land-gate is a ravelin. The hill on a rising ground from this gate, (which is the highest part of the town,) to the dock-yard, is steeper than on the other side.

The fortifications of the Havannah, though strong, have many defects; and, from the situation of the town and forts, are commanded by many eminences, of which an enemy might take advantage. On the east side of the harbour, the Cavannas, on a part of which the Moro is built, commands, in a great measure, that fort, and absolutely commands the Punta, the *Fuerte*, and the whole north-east part of the city, which is the best fortified. On the west runs a suburb called Guadalupe, whose church is situated on an eminence about half a mile from the land-gate, with which it is on a level, and higher than any other part of the fortifications. From the north side of this rising ground, the Punta-gate may be flanked; and from the south-east side the dock-yard is commanded. Along the north side runs an aqueduct, which, falling into the ditch at the land-gate, runs down to the dock-yard, both for watering the ships and turning a saw-mill. About half a mile from the church is a bridge, thrown across a rivulet that runs into the bay about a hundred yards. From this bridge to the Lazaretto is about two miles, with a rising ground between them; and, if a trench were thrown up betwixt these two places, it would cut off the communication with the town by land. From these observations, therefore, it plainly appears, that the Havannah is not impregnable.

The Havannah has greatly contributed to the maritime strength of Spain, many ships having been built there within these few years, from sixty to eighty guns; the island furnishing the finest materials, such as oak, pine, cedar, and mahogany. The only defect of the harbour is the narrowness of its entrance; for, though free from bars and shoals, yet only one ship at a time can enter it; from which circumstance the galleons have sometimes been in-

sulted, and even captured, at the mouth of the harbour, the forts being unable to afford them any assistance.

Upon the rupture with Spain, in 1762, the British ministry sent a squadron and army against this place, under Admiral Pocock and Lord Albemarle. The Spaniards had in the harbour at that time a fleet of twelve sail of the line, two of them but just launched, two more on the stocks nearly finished, and several merchant-ships. The men of war were almost ready for sea; but the governor had received no intimation of the projected attack. The place, however, was gallantly defended, and sustained a siege of two months and eight days before it could be reduced; but, at the expiration of that time, a capitulation was signed, and a district of a hundred and eighty miles was yielded up along with the city. This conquest was the most considerable, and, in its consequences, the most decisive, of any the English had made since the beginning of the war; and in no operation were the courage and perseverance of the British troops and the conduct of their leaders more conspicuous. The acquisition of this place united in itself all the advantages which can be acquired in war. It was a military achievement of the highest class; by its effect on the Spanish marine, it was equal to the greatest naval victory; and, in the plunder, it equalled the produce of a national subsidy. Nine line-of-battle ships were taken; three capital ships had been sunk by the Spaniards at the beginning of the siege; and two more were afterwards destroyed by the captors. The Spaniards on this occasion lost a whole fleet of ships of war, besides a considerable number of merchant-ships; and in ready money, tobacco, and other valuable merchandise, the sum lost did not fall short of three millions sterling. Havannah was restored by the peace of 1763; and is of the greatest importance to Spain, being the rendezvous for all her fleets to return from America to Europe, lying at the mouth of the Gulf of Florida, through which they are all obliged to pass. Here the Spanish navy stationed in the West-Indies rides; and here the galleons, flota, and merchant-ships from other ports, meet in September, to take in provisions and water, with great part of their lading, and likewise for the convenience of returning to Spain in a body.

The male inhabitants of this city use the Spanish cloak, sometimes so richly laced as to cost five hundred dollars; the hair generally in a net. The women rarely wear gowns, being contented with a petticoat and corset, with an apron of gauze or muslin; their hair plaited, or rolled up under their head-dress, with some sprigs of rue or wormwood over the ear. With other ornaments they wear massy bracelets of gold, and are fond of displaying a beautiful arm. Two round patches are worn on the temples, changed at night for bits of white linen, like little plaisters, and in the morning for leaves of the orange-flower.

The manner of eating in Spain. In the country is taken a savoury which they have animal-food, *fiage*, a kind of agave, a kind of tears to run down, there is a and lard, broiled, two last meals, pressed from credible.

ST. JAGO is two leagues from island. It is addition of di Since the unsu Admiral Verno have been repree of its for with Old and naries. The has a tolerable and sixty-three Principe, situated south-east of north-east part

PORTO-RICO seven degrees of north latitude Christopher's. and forty in diversified with extremely fertile islands. It is the air is extremely unwholesome is the most barren formerly produced was on account here; but the found in it. other fowl. and the coast the Spaniards natives, are seen upon land-crabs. The price 62. VO

The manner of living is as objectionable as in New Spain. In the morning, with chocolate, coffee, or milk, is taken a savoury dish, called *chuleta*, or ribs of pork, which they have fresh throughout the year, or some other animal-food, fried in lard: at mid-day, the usual dish is *agiac*, a kind of fruit of so hot a taste, that it causes tears to run down the cheeks of the guests. In the evening, there is a regular supper of rice, seasoned with salt and lard, broiled flesh, salads, and other dishes. At the two last meals, the usual dessert is sweetmeats, or sugar pressed from the cane, the consumption of which is incredible.

ST. JAGO stands at the bottom of a large bay, about two leagues from the sea, on the south-east side of the island. It is distinguished from St. Jago, in Chili, by the addition of di Cuba, as the other is by that of di Chili. Since the unsuccessful attempt made by the English, under Admiral Vernon and General Wentworth, the fortifications have been repaired, and the town has recovered some degree of its former splendour, carrying on a good trade with Old and New Spain, and, above all, with the Canaries. The other towns of note are Santa Cruz, which has a tolerable harbour, and stands about one hundred and sixty-three miles east of the Havannah; Porto del Principe, situated on the coast, about three hundred miles south-east of the Havannah; and Baracoa, situated on the north-east part, which has a small harbour.

## SECTION XV.

### PORTO-RICO.

PORTO-RICO is situated between sixty-four and sixty-seven degrees of west longitude, and in eighteen degrees of north latitude, lying between St. Domingo and St. Christopher's. It is about one hundred miles in length, and forty in breadth. The chief part of the country is diversified with woods, valleys, and plains; and it is extremely fertile, producing the same fruits as the other islands. It is well watered with springs and rivers; but the air is excessively hot, and, during the rainy season, very unwholesome. The north part of the island, which is the most barren, contains several mines, some of which formerly produced great quantities of silver and gold. It was on account of the latter that the Spaniards settled here; but there is no longer any considerable quantity found in it. In the woods are parrots, wild pigeons, and other fowl. European poultry is found here in plenty, and the coast abounds with fish. A breed of dogs, which the Spaniards brought over to hunt the defenceless natives, are said to run wild in the woods, and subsist upon land-crabs that burrow in the ground.

The principal commodities here are sugar, ginger,

hides, cotton, thread, cassia, mastic, &c. Their pork is excellent, as is likewise the flesh of their kids; but their mutton is very indifferent. They have good ship-timber and fruit-trees.

This island was taken from the Spaniards by Sir Francis Drake. It was afterwards conquered by the Earl of Cumberland, in the reign of Queen Elizabeth; but he was obliged to abandon it, having lost most of his men by sickness, in the latter end of the summer, when this and all other places in these latitudes are very unhealthy.

Porto-Rico, the capital town, is situated on a small island on the north coast. This island forms a very convenient harbour, and is joined to the chief island by a causeway. It is defended by forts and batteries, which render the place almost inaccessible. The town is well-built, and populous, and the seat of a governor, as well as a bishop's see. The only place worthy of notice in this island, exclusive of the capital, are Port del Agnada, where the flota provide themselves with water, and other necessaries, in their voyage to Old Spain; and Boroba de Infernes, which is remarkable for having an excellent turtle fishery.

## SECTION XVI.

### ST. DOMINGO, OR HISPANIOLA.

*Situation, Productions, &c.*] This island, the second in the American archipelago, is situated between seventeen and twenty-one degrees of north latitude, and sixty-seven and seventy-four degrees of west longitude, lying in the middle between Cuba and Porto-Rico, and is four hundred and fifty miles long, and one hundred and fifty broad. When first discovered by Columbus, the number of its inhabitants was computed to be, at least, a million. But such was the cruelty of the Spaniards, that they were reduced, in the space of fifteen years, to sixty thousand. The face of the island presents an agreeable variety of hills, valleys, woods, and rivers; and the soil is allowed to be extremely fertile, producing sugar, cotton, indigo, tobacco, maize, and cassava-root. The European cattle are so multiplied here, that they run wild in the woods, and, as in South-America, are hunted for their hides and tallow only. In the most barren parts of the rocks, they formerly discovered silver and gold. The mines, however, are not now worked. The north-west parts, which were in the possession of the French, consist of large fruitful plains, which produce the articles already mentioned in vast abundance. This, indeed, is the best and most fertile island in the West-Indies.

The species of dog called the *blood-hound*, so often used by the Spaniards to hunt down the negroes, were formerly bred in St. Domingo. The following was the mode of rearing and exercising them by the chasseurs.

"The moment the blood-hounds were taken from the dam, they were confined in kennels, with iron bars in front, like the dens used by showmen for confining wild beasts, where they were sparingly fed on the blood and entrails of animals. As they grew up, their keepers frequently exposed in the front of their cage a figure resembling a negro, male or female, and of the same colour and dress, the body of which contained the blood and entrails of beasts, which being occasionally suffered to gush out, the figure attracted the attention of the dogs as the source of their food. They were then gradually reduced in their meals, till they were almost famished, when the image was more frequently exposed to their view; and when they struggled with redoubled ferocity against their confinement to come to their prey, the image was brought nearer at intervals, till at last it was abandoned to their hunger, and, being of wicker-work, was in an instant torn to pieces, and thus they arrived at a copious meal. While satiating themselves with this, the keeper and his colleagues caressed and encouraged them. By this execrable artifice, the white people at once ingratiated themselves with the dogs, and taught them to regard a negro as their proper prey. As soon as the young dogs were thus well initiated, they were taken out to be exercised on living objects, and were trained with great care till they arrived at the necessary exactness in the pursuit of the poor wretches they were doomed to destroy. The common use of the dogs in the Spanish islands was in chase of runaway negroes in the mountains. When once they got scent of the object, they speedily ran him down, and devoured him, unless he could evade the pursuit by climbing a tree, in which case the dogs remained at the foot of the tree, yelping in the most hideous manner till their keepers arrived. If the victim were to be preserved for a public exhibition of a cruel punishment, the dogs were then muzzled, and the prisoner loaded with chains. On his neck was placed a collar, with spikes inward, and hooks outward, the latter for the purpose of entangling him in the bushes, if he attempted to escape. If the unhappy being proceeded faster than his guard, it was construed into an attempt to run from them, and he was given to the dogs, who instantly devoured him. Not seldom, on a journey of considerable length, these causes were feigned by the keepers, to relieve them of their prisoners, and the inhuman monster who perpetrated the act received the reward of ten dollars from the colony, on making oath of his having destroyed his fellow-creature! The keepers, in general, acquired an absolute command over these dogs; but when the French army used them in their war against St. Domingo, while they had possession of the Cape, the dogs frequently broke loose in the neighbourhood, and children were devoured in the public way; sometimes they surprised a harmless family of labourers

at their simple meal, tore the babe from the breast of its mother, and involved the whole party in one common and cruel death. Even the defenceless huts of the negroes have been broken into by these dreadful animals, and the sleeping inhabitants have shared in a like miserable fate!"

*Commerce, &c.*] In 1788, the trade of this island employed five hundred and eighty large ships, carrying one hundred and eighty-nine thousand six hundred and seventy-nine tons, in which the imports amounted to twelve millions of dollars, of which more than eight millions were in manufactured goods of France, and the other four millions in French produce. The Spanish ships exported, in French goods or money, one million four hundred thousand dollars, for mules imported by them into the colony; ninety-eight French ships, carrying forty thousand one hundred and thirty tons, imported twenty-six thousand five hundred and six negroes, who sold for eight millions of dollars.

*Principal Towns.*] The most ancient town in this island, and in all the New World, built by Europeans, is St. Domingo, situated on the west bank of the Ozama, three miles below the mouth of Isabella River, where it is twenty-four feet deep, having a bottom of mud or soft sand, and banks twenty feet in perpendicular height. The port is extremely magnificent; being a real natural basin, with a great number of careenings for the vessels that can get at them. There is a rock at the entrance, which will only admit vessels drawing eighteen or twenty feet water, which, it is said, might be easily removed. But the road before the Ozama is very indifferent, and lies so much exposed, that it is impossible to anchor in it during the south winds, and the north winds drive the vessels from their moorings out into the sea, which here runs exceedingly high.

The city was originally founded on the east side of the Ozama, by Bartholomew Columbus, who gave it the name of "New Isabella." But Christopher Columbus gave it the name of his father, and the inhabitants of Isabella on the north coast of the island removed to New Isabella, in 1496. In the year 1502, a hurricane destroyed most of its buildings, which induced Orando to remove the inhabitants to the west side of the river. The new city was soon built, with a grandeur of design not unworthy of the first metropolis of the new world. The plan of it is a trapezium of about five hundred and forty fathoms on the east side, along the Ozama; near five hundred fathoms on the south, bordering upon the sea; and about eighteen hundred fathoms in circumference. On the west and north, the land is rough and rocky, for about half a league; but after that it becomes good, and the country delightful. Towards the sea, the site of the city lies very high, and forms an insurmountable dyke against the fury of the waves. It is also surrounded with a rampart eight

feet in diameter. A great deal of business is not wanted in the streets.

The streets are straight, and the line, which gives the cast part of the island, is found in the streets of Spain and are of a sort of a case, and this case is rammed down the wall between the houses of St. Domingo, and they, built over with the are generally the rain-water.

Among the ruins, we may see the son of Christ stone. The sculpture round the ever, are fallen cattle; and a den by the house.

The cathedral and finished Rome. It is the boldness of the vases of earth, these forty years pile is a space is the town-ledge, and a built by Ovamine of mercurcity are superable and of precious stones, in every respect.

The French which is neither only two batt the other be 1793, it co whites, people residence in peace. The

feet in diameter, and about ten feet high. There is a great deal of ordnance at St. Domingo, but the fortifications are not strong; and the height of the Ileignes commands it entirely.

The streets of St. Domingo are spacious, and straight as a line, which gives the city a pleasing appearance. The greatest part of the houses first built are of a sort of marble, found in the vicinity, and in the style of the ancient towns of Spain and Italy: those of a more recent construction are of a sort of *pisé* called *tapia*. To erect these buildings, a case is made of planks between pillars of masonry; and this case is gradually filled with a reddish clay, which is rammed down as it is thrown in, until it forms a solid wall between the pillars. The clay thus pressed together acquires an amazing hardness, and the walls are sometimes so solid and strong, that the pillars are useless. The houses of St. Domingo are tolerably handsome, in a simple style, and nearly uniform. A considerable part of them, built within these forty years, are of wood, covered with the leaves of taches of palm-trees. The roofs are generally platformed, being shaped so as to conduct the rain-water to the cisterns.

Among many public edifices that are worthy of attention, we may reckon the ruins of the house that Diego, son of Christopher Columbus, had begun, entirely of hewn stone. The walls are yet remaining, and some of the sculpture round the windows. The roof and ceilings, however, are fallen in; the lower floor is become a pen for cattle; and a Latin inscription over the portal is now hidden by the hut of a herdsman.

The cathedral is a noble gothic pile, begun in 1512, and finished in 1540, after the model of a church at Rome. It particularly merits admiration on account of the boldness of its vault, which, notwithstanding the ravages of earthquakes in its vicinity, has never till within these forty years had a single flaw. Opposite to this pile is a spacious square, at the south-west end of which is the town-house. Here also are three hospitals, a college, and a gaol. The convent of the Cordeliers was built by Ovanno, in 1503, on a little hill, containing a mine of mercury. All the three parochial churches of this city are superbly adorned with pictures, statues of marble and of metal, vases of gold and silver, set with precious stones, &c.; but the cathedral surpasses the others in every respect.

The French towns are Cape François, the capital, which is neither walled nor palisaded, and is said to have only two batteries, one at the entrance of the harbour, and the other before the town. Before its destruction, in 1793, it contained about eight thousand inhabitants, whites, people of colour, and slaves. It is the governor's residence in time of war, as Port-au-Prince is in time of peace. The Mole, though inferior to these in other re-

spects, is the first port in the island for safety in time of war, being by nature and art strongly fortified. The other towns and forts of any note are Fort Dauphin, St. Mark, Leogane, Petit Goave, Jeremie, Les Cayes, St. Louis, and Jacmel.

*History.* Since the French revolution, in consequence of some injudicious decrees of the National Assembly, this island has been a scene of confusion and bloodshed. On the night of the 22d of August, 1791, a most alarming insurrection of the negroes began on the French plantations on this island, and a scene of the most horrid cruelties ensued. In a little time, no less than one hundred thousand negroes were in rebellion, and all the manufactories and plantations of more than half the northern province appeared as one general conflagration. The plains and the mountains were deluged with blood. In this dreadful conflict, which has been of long continuance, the white colonists of St. Domingo have been extirpated or expelled, and the whole power of the island consequently vested in the mulattoes, the negroes, and the lower classes of the French inhabitants. The sovereign authority fell into the hands of some of the people of colour: and the negroes, who were slaves, have been subsequently emancipated from their chains, and the majority of them trained to arms. This was the origin of all those scenes of desolation and horror which have succeeded in that devoted island.

In the month of October, 1793, the English effected a landing on this island, and made themselves masters of Jeremie, Cape Tiburon, the Mole, and several other places on the coast. The troops, however, suffered greatly by the insalubrity of the climate; several of the places they had gained possession of were soon retaken; nor could they have retained the others, had it not been for the contests and mutual jealousies of the whites and people of colour. An expedition was afterwards undertaken by the English government against St. Domingo, in which a regiment of hussars was reduced, in little more than two months, from one thousand to three hundred, through the climate, and another regiment perished entirely. About the end of the year 1797, of fifteen thousand British and foreign troops, not more than three thousand were left alive, and fit for service; the loss of seamen being computed at five thousand. The negro troops in St. Domingo offered to join the English, on condition of cutting off all the mulattoes. Toussaint, the black chief of St. Domingo, had an army at his command, computed at eighteen thousand infantry and one thousand cavalry: he was opposed by the mulattoes under Rigaud, to the amount of about twelve thousand. In October, 1798, St. Domingo was abandoned by the British troops. The French then waged war against the blacks, which was prosecuted by the contending parties with various success. In 1802,

the negro-general was taken prisoner, and conducted to France, where he was thrown into a dungeon, and was put to death, by order of Buonaparte. The blacks, however, took a dreadful revenge: they put to death, in the most horrid manner, all the French prisoners who fell into their hands, and in a short time the whole army, which, with the reinforcements sent at different times, amounted to, at least, forty thousand men, was annihilated by disease and the sword. The commander-in-chief, General Leclerc, who married a sister of Buonaparte, fell a victim to the former; and, after all his threats of extirpation, the French chief was obliged to abandon his intentions. Dessalines, the black commander of the native army, was then invested with unlimited power by his desperate companions, and he effected a horrid retaliation, by causing all the white inhabitants in the French part of the island to be massacred, without regard to age or sex.

But the most ludicrous part of his conduct was the affectation with which he imitated the measures of his brother-usurper in Europe. As soon as it was known in St. Domingo that Buonaparte had caused himself to be raised to the dignity of Emperor, Dessalines erected his island into an *Empire*, declared himself *Emperor*, appointed his body-guard, his members of a *legion of honour*, and adopted all the absurd regulations of his ambitious prototype; concluding with an oath of eternal enmity to France, and of his determination to defend with his blood the system which he had established. He kept his word; but his reign was short. A part of his army, disgusted with his numerous acts of cruelty and despotism, secretly revolted, and placed themselves under Christophe, who was, to him, as Moreau stood with respect to Buonaparte:—a general high in command, of equal abilities, and more moderation. On the 12th of January, 1807, Christophe's party seized Dessalines, and put him to death, declaring their chief his successor; on which the greatest part of the army came over to his standard. Christophe, soon after being declared Emperor, thought proper to change the government of the island again to a *republic*, and published a new constitution, offering to the people of all nations protection and liberty of commerce. Since that time, some changes have been effected; but the sovereign power still remains in the hands of the blacks; nor is it probable that the island will ever be reduced by any European power, without a massacre of the inhabitants, bordering upon extermination.

## SECTION XVII.

### MARTINICO.

The Island of Martinico is situated between the fourteenth and fifteenth degrees of north latitude, and in the

sixty-first degree of west longitude. It lies about forty leagues north-west of Barbadoes, and is about sixty miles in length, and thirty in breadth. The climate is not esteemed unwholesome, though there is a dampness in the air, which, at times, must be disagreeable. The inland parts are mountainous, and the interior abounds with hills, whence issue many rivulets, which, in their course towards the sea, at once adorn and fertilize the country. The productions of this island consist of sugar, tobacco, cotton, ginger, indigo, aloes, pimento, cocoas, plantains, and other tropical fruits.

In the year 1700, the French settled upon this island were computed to be one thousand five hundred, besides the negroes whom they employed, and great numbers of Caribbees, who were re-admitted into the island, but were obliged to work as slaves, and to live among the French, that they might have no opportunity to form conspiracies or plots with their countrymen, or to associate together. Before it was subdued by the English, in 1756, it contained ten thousand white inhabitants fit to carry arms, and above forty thousand negroes or slaves. Besides this force, some companies of regulars were always quartered in the island; so that nothing but the most notorious misconduct could have rendered the British troops masters of it with so little loss as they suffered on that occasion.

Martinico is not only the residence of the governor-general and intendant, but likewise of a sovereign council, which superintends all their other islands, and even the settlements of St. Domingo and Tortuga. The island owes its flourishing state to the old French government having transported thither great numbers of its protestant subjects, some of whom voluntarily settled there.

The two principal towns in this island are Fort-Royal and St. Pierre, or St. Peter's. The first is the seat of government: its streets are regular, the houses agreeable, and the inhabitants much addicted to all kinds of luxury: they are the Parisians of the West-Indies. To the east of the town, on a neck of land, is an irregular fort, badly built, and worse designed, which gives name to the town which it poorly defends. Fort Royal, as well as the rest of the island, fell under the power of the English in the year 1756; but they restored it at the peace of 1763. The French have since built a citadel upon Morne Carnier, an eminence higher than the most elevated points of Mornes Patate, Tartanson, and Cartouche, all of which command Fort Royal. It was again taken by the English in 1794, but given up at the peace of 1802. It was again captured by the British in 1809, and restored by the peace of Paris, in 1814.

The harbour of Fort Royal, where the men of war anchor in winter, is one of the best of the Windward Islands, and its security against the hurricanes generally acknowledged. It is supposed that the inner part has

been spoiled by a fence against the sea.

The Fort of Fort Royal, the first communication between the residence and the port, situated on a healthy spot, is built upon small fortresses convenient for the facility of communication in winter-time. St. Pierre sufficient which happened to two hundred injury was done by the town. The climate is vast quantities

The Fort of St. Pierre is five leagues to the leeward of Fort Royal, in a round bay on the western coast. The town, the first built in the island, is the place of communication between the colony and the mother-country. It is the residence of merchants, and the centre of business. That port, situated along the sea-side, on the strand itself, called Le Mouillage, (the anchoring-place,) is very unhealthy. The other port, separated from this by a river, is built upon a low hill; and they call it the Fort, from a small fortress which defends the shipping. The road is very convenient for loading and unloading the vessels, and the facility of coming in or going out; but they are obliged in winter-time to take shelter at Fort Royal. The town of St. Pierre suffered great damage by a dreadful hurricane, which happened in the month of October, 1780, in which two hundred houses were blown into the sea, and great injury was done among the shipping that lay in the harbour. The chief export of Martinico is sugar, of which vast quantities are annually shipped for Europe.

### SECTION XVIII.

#### GUADALOUPE.

This island is situated about thirty leagues north-west of Martinico, in sixteen degrees of north latitude. It is about forty-five miles in length, and thirty-eight in breadth, and is divided by a deep gulf or bay, and a channel called the Salt River. The air of Guadeloupe is preferable to that of Martinico, being more salubrious and less sultry; and the soil is very fertile. Its products are sugar, coffee, cotton, bastard cinnamon, indigo, ginger, and many other vegetables, besides the capua-tree, from which is extracted a most excellent balm; the milk-shrub, so called from its yielding a substance like milk, when pressed, which falls little short of the capua-balsam; the moubine-tree, which bears a yellow plum, with which the natives fatten their hogs; and the corbary-tree, the gum of which, when hardened in the sun, becomes so translucent, that the Caribbees wear it formed into beads and bracelets. Many of the mountains, with which Guadeloupe abounds, are covered with wood, and nothing can be more verdant, or more beautifully variegated, than the large plains which lie beneath them. One of the mountains, called La Soufriere, or the Brimstone Mountain, emits a continual smoke, and communicates a sulphureous taste to the neighbouring streams.

Labat visited this mountain, the top of which he found bare of vegetable productions, except the fern and stunted shrubs already mentioned, which he ascribed partly to the cold of so high a situation, and partly to the sulphureous exhalations. He walked round the hill for three hours and

a half, among burnt stones and whitish ashes, which, in some places, were above his ankles, and smelt strongly of brimstone. On the east side of the mountain he saw two chasms, one of which was an oval hole, about a hundred feet in diameter; but he could not venture near enough to fathom the depth of it, because it frequently sent out black clouds of smoke, mingled with sparks of fire. A little below the least of these chasms, there are three little basins of hot water, one of which is dark coloured, and smells like the water in a smith's forge; the second is whitish, and has the taste of alum; and the third is blue, and seems impregnated with vitriol.

From all the neighbouring hills flow numberless springs, which fertilize the plains below, and moderate the burning heat of the climate, by a refreshing stream, so celebrated, that the galleons, which formerly used to touch at the Windward Islands, had orders to renew their provision with this pure and salubrious water.

The most remarkable bird on this island is that called the Devil's Bird, which is peculiar to this island and Dominica: it is a bird of passage, of the size of a pullet, and all its plumage coal-black. These birds live on fish, which they catch in the sea at night, being unable to bear the light in the day-time when flying, so that they often run against interposing objects and fall down. After their fish-hunting in the night, they repair to a mountain called the Devil's Mountain, where they lodge by pairs in holes, like rabbits. Here they lay their eggs, and hatch their young, which are ready to fly about the end of May, and are very tender food, but their fat resembles oil. The flesh of the old ones is blackish, and has a fishy taste, but otherwise it is very good and nourishing. The negroes and poor people have scarcely any other sustenance than these birds during the season; and it may be deemed a great providence that they harbour in places so difficult of access, otherwise the French would long ago have destroyed the species.

Labat tells us, that he once indulged his curiosity to accompany four negroes in this kind of fowling, not without great fatigue and danger. It took them up six hours to get to the summit of the mountain, where they lay all night; and next morning, when the birds were returned from their fishery, the negroes repaired to their holes, with dogs trained to the sport. Each negro carried a switch in his hand, seven or eight feet long, with a crook at the end of it; and as soon as the dogs, which smelt at every hole, had discovered one with a devil-bird in it, they barked, and began to scratch up the ground at the entrance, but they were prevented from doing this by the fowlers, who thrust their switches into the holes, on which the birds either fasten with their beak, and suffer themselves to be dragged out rather than quit their hold, or else the crook is turned round the hole till one of the wings is en-

tangled by it, and so the bird drawn out by force. Our author adds, that by noon they had taken a hundred and ninety-eight of these birds, and acknowledges that he fed on them very heartily.

It is observable that the bees of Guadeloupe differ considerably from those of Europe in size and colour, as well as in the structure of their honey-combs, and the quality of their wax and honey. These insects are blacker and rounder than ours, but much smaller; nor do they seem to have any sting, or, if they have, it is too weak to pierce the skin. Their nests are in hollow trees, and their combs consist of little bladders of wax, of the form and size of pigeons' eggs, but more pointed, and almost like the bladder of a carp. They deposit their honey in these bladders, which, though they may be easily separated from one another, are so artfully disposed and ranged, that there seems to be no vacuity between them. Most of the bladders are filled with honey, but in some of them there is a yellow matter, seeded like the eggs of a fish, glutinous, and smelling like honey. The honey is always liquid, of the consistence of olive-oil, and never settles. The wax is black, or at least of a deep purple colour; and Labat says, that all the art of his countrymen could not make it either white or yellow, so as to be fit for candles; besides that, it is too soft for that purpose, and is scarcely used for any thing but to cement the corks of bottles after it is thoroughly purified.

The island is troubled with an insect, called a ravet, shaped like a cock-chaffer, of a stinking smell, which destroys both books and furniture, and whatever it does not gnaw is discoloured by its ordure; but great numbers of them are destroyed by a kind of spider, found on the island, some of which are as large as a man's fist. The *Cul de Sacs*, as the French call them, or gulfs, about this island, abound with turtle, sharks, land-crabs, &c.

One of the two divisions of this island is called *Grande-Terre*; and the other is divided into *Cape Terre*, or *Cable's Terre*, and *Basse-Terre*, which last is also the name of the capital, a very considerable town, situated on both sides of *Bailliff River*, and well fortified.

Like *Martinico*, this island was formerly attacked by the English, who gave up the attempt: but, in 1759, it was reduced by the English arms, and was given back at the peace of 1763. It was reduced by the English in 1794, and evacuated a few months after. On the 5th of February, 1810, however, it once more capitulated to the British forces under the command of the gallant *Beckwith*, and was given up by the treaty of Paris.

#### SECTION XIX.

##### ST. LUCIA.

St. Lucia is situated in fourteen degrees north latitude, and in sixty-one degrees west longitude, eighty miles north-

west of Barbadoes, and is twenty-three miles in length and twelve in breadth. It received its name from being discovered on the day dedicated to the virgin martyr, St. Lucia. The English first settled on the island in 1637. From this time they met with various misfortunes, from the natives and French; and at length it was agreed on, between the latter and the English, that the island, together with *Dominica* and *St. Vincent*, should remain neutral. But the French, before the war of 1756 broke out, began to settle on these islands, which, by the treaty of peace, were yielded up to Great Britain, and St. Lucia to France. The soil of this island, in the valleys, is extremely rich. It produces excellent timber, and abounds in pleasant rivers and well-situated harbours, and has been declared a free port, under certain restrictions. The English made themselves masters of it in 1778; but it was restored again to the French in 1783. It was taken by the English in 1794, surrendered again to the French in 1795, re-captured by Great Britain in 1796, and restored to the French in 1802. It was again taken by the British soon after the commencement of hostilities in 1803, and given up at the restoration of the house of Bourbon.

St. Lucia sustained considerable damage by a dreadful hurricane, which happened in the month of October, 1780. Great numbers of houses were levelled with the ground; and the ships in the harbour being driven out to sea, many were lost.

#### SECTION XX.

##### ST. EUSTATIA.

This island is situated in seventeen degrees twenty-nine minutes of north latitude, and sixty-three degrees ten minutes of west longitude, three leagues north-west of St. Christopher's. It rises out of the sea like a pyramid, and is about twenty-nine miles in circumference. But though small, and inconveniently laid out by nature, the industry of the Dutch has made it turn to very good account, and it is said to contain five thousand whites and fifteen thousand negroes. The sides of the mountain are disposed in decent settlements; but they are destitute of springs and rivers.

The air is wholesome, but it is subject to terrible thunder-claps, earthquakes, and hurricanes; and there is a scarcity of fresh-water. Before a hurricane, it is said, the birds lay themselves flat on the ground; and the rain that precedes it is always salt and bitter. This island, as well as *Curacoa*, is engaged in the Spanish contraband trade, and it has drawn the same advantage from its neutrality. But when hostilities were commenced by Great Britain against Holland, Admiral Rodney and General Vangham were sent with a considerable land and sea force against St. Eustatia, which, being incapable of defence, surrendered

at discretion, on the 27th of November, 1797, French, under the command of General Maitland, consisted of one ship of the line, about three hundred and thirty men, and a considerable number of small boats. In October, 1797,

Besides tobacco, sugar, and exported goods, hogs, rabbits,

## ST. THOMAS

The Island of St. Thomas, Porto-Rico, is a small island, and has a safe harbor, open to trade. It is generally very fertile, and the Indian commerce is very extensive.

The principal exports are excellent harbor, and the island is in safety. It is at the same time a safe harbor for ships, when

## TERRA

between the equator and the tropics, and between the tropics and the equator, being a part of the Atlantic Ocean, the east; by the south; and by the west. It is the Golden Land, and contains the province of St. Mark.

at discretion, on the 3d of February, 1781: but on the 27th of November, the same year, it was retaken by the French, under the Marquis de Bouillé, though their force consisted of only three frigates and some small craft, and about three hundred men. This island sustained considerable damage by the dreadful hurricane which happened in October, 1780.

Besides tobacco, the inhabitants have of late years raised and exported great quantities of sugar. They also breed hogs, rabbits, goats, and most sorts of poultry.

### SECTION XXI

#### ST. THOMAS, ST. JOHN'S, AND SANTA CRUZ.

The Island of St. Thomas is situated to the east of Porto-Rico. It is about fifteen miles in circumference, and has a safe and commodious harbour, which, by being open to traders of all nations, enriches the inhabitants. It is greatly infested with mosquitoes; and the soil is, in general, very sandy; but it produces most of the West-Indian commodities.

The principal advantage of this island consists in an excellent harbour on the south side, where fifty ships may lie in safety. It is defended by a fort, whose batteries, at the same time, protect the small town built round the shore. This harbour is much frequented by merchants; when they are chased; in time of war, they find

here a safe protection; and, in time of peace, a market for their goods, by the clandestine trade which the boats of St. Thomas continually carry on with the Spanish coasts.

Two leagues to the south of St. Thomas is another island, about the same size, called St. John's. Its harbour is said to be superior to that of St. Thomas, and is accounted the best to the leeward of Antigua. But, notwithstanding these advantages, there is so little good land in the island, that its exportations form only a very trifling object. This island has suffered the most destructive ravages, in late years, from accidental fires. In 1801, upwards of four-fifths of the houses were destroyed by an event of this kind; and, in the autumn of 1806, a similar calamity occurred, which was equally disastrous in its consequences, and from which the unfortunate inhabitants will not recover for many years.

Santa Cruz is a small and unhealthy island, lying about five leagues east of St. Thomas, ten or twelve leagues in length, and three or four where it is broadest. These islands, while they remained in the hands of the Danish West-India Company, were ill-managed, and of little consequence to the Danes; but the late king of Denmark purchased the company's stock, and laid the trade open; and since that time the Island of St. Thomas has been so greatly improved, that it is said to produce upwards of three thousand hogsheads of sugar, of one thousand weight each, and other West-India commodities in tolerable plenty.

## CHAPTER IX.

### SPANISH DOMINIONS IN SOUTH-AMERICA.

#### SECTION I.

##### TERRA FIRMA.

**T**ERRA FIRMA, or Castile del Oro, is situated between the equator and twelve degrees of north latitude, and between sixty and eighty-two degrees of west longitude, being about one thousand four hundred miles in length, and seven hundred in breadth. It is bounded by part of the Atlantic Ocean, on the north; by Guiana, on the east; by Peru and the country of the Amazons, on the south; and by New Spain and the Pacific Ocean, on the west. It derived the name of Castile del Oro, or the Golden Coast, from the great quantity of gold it contained. The northern division of Terra Firma contains the provinces of Terra Firma Proper, or Darien, Carthagena, St. Martha, Rio de la Hacha and New Andalusia,

or Paria. The southern division contains the provinces of New Granada and Popayan.

The isthmus of Darien joins North and South America. A line drawn from Porto-Bello, in the North, to Panama, in the South Sea, or rather a little west of these two places, is the proper limit between North and South America; and here the isthmus is only sixty miles over. The principal rivers are the Rio Grande, Darien, Chagre, and the Oroonoko.

The principal bays in Terra Firma are the Bay of Panama and the Bay of St. Michael's, in the South Sea; the Bay of Porto Bello, the Gulf of Darien, Sino Bay, Carthagena Bay and Harbour, the Gulf of Venezuela, the Bay of Maracaibo, the Gulf of Triesto, the Bay of Guaira, the Bay of Curiaco, and the Gulf of Paria, or Andalusia, in the North Sea. The chief capes are, Samblas Point,

Point Canoa, Cape del Agua, Swart Point, Cape de Vela, Cape Conquistador, Cape Cabelo, Cape Blanco, Cape Galera, Cape Three Points, and Cape Nassau; all on the north side of Terra Firma.

Terra Firma is a very mountainous country. Terra Firma Proper, in particular, consists of prodigious high mountains and deep valleys, which are flooded more than half the year. The mountains in the province of Cartagena and St. Martha, according to Dampier, are the highest in the world, being seen at sea at a distance of two hundred miles. From these run a chain of hills, of almost equal height, quite through South-America, as far as the Straits of Magellan, called the Cordilleros des Andes. The province of Venezuela, and the district of the Caracacas, are likewise very mountainous; but these will be described under another section. Some of the mountains in the province of Popayan contain volcanos; but towards the shore of the Pacific Ocean the country is low and marshy.

As the mountains of South-America constitute some of the grandest objects in natural geography, being not only the most lofty on the face of the globe, but intermixed with volcanos of the most sublime and terrific description, some account of the principal ones shall be here inserted. The extent of some of the chains is prodigious, the Andes stretching in one line from the capes of Isidro and Pilares, in the southern extremity of the continent, to the Caribbean Sea, a space not less than four thousand six hundred miles, as they generally follow the windings of the coast, at the medial distance of about one hundred miles. The breadth is from ninety to a hundred and fifty miles; so that, as Ulloa observes, entire kingdoms are situated in the mountains. The principal summits are near the equator, not far from the city of Quito.

The best account of these celebrated mountains is that given by Bouguer, one of the French mathematicians, who, between the years 1735 and 1743, measured a degree near the equator. Chimborazo, the highest of these mountains, about one hundred British miles to the south of Quito, and about ten miles to the north of Riobamba, was computed by these mathematicians to be three thousand two hundred and seventeen French toises above the level of the sea, or twenty thousand two hundred and eighty feet; about one quarter higher than Mont Blanc. That part of Chimborazo which is covered with perpetual snow is about two thousand four hundred feet from the summit. But these mountains stand on the high plain of Quito, which constitutes more than one-third of the computed height.

The next in height is supposed to be the volcano called Cotopaxi, estimated at about eighteen thousand six hundred feet, and situated about twenty-five miles to the south-east of Quito. Other grand summits are Pichincha, a few

miles to the north-west of Quito; the Altar and Sanga, to the south-east of Chimborazo. In general, the Andes here proceed in a double chain, the interval being the plain of Quito: to the western ridge belong Pichincha, Illinissa, Chimborazo, &c.; while the eastern is crowned by Cotopaxi, the Altar, Sanga, &c., and this form continues at least for about five hundred miles from the south of Cuenca to the north of Popayan.

The highest deserts of the Andes are in the north called *Paramos*, and in Peru, *Punas*; and the air is often of so peculiar a cold, as rather to strike to the lungs than to affect the exterior feelings. Travellers have frequently perished from the cold in these regions; and, when their bodies are found, there is an appearance of laughter in the face, owing to the contraction of the muscles. Ulloa observes, that while the high mountains may have a medial height of fourteen thousand feet, the table land has from eight to ten thousand; so that this prodigious belt is of itself more surprising than the lofty summits which crown it. The Spaniards consider the mountains under two appellations, the *Sierres* and the *Andes*, from which it would appear, that the Sierra is a name applied to the exterior ridges, while the Andes are the high central mountains. At some distance from the Andes, on either side, one ridge only being observable, the vast upland plains, with their rivers, valleys, and mountains, would never be supposed to exist; nor would the spectator expect to find those precipices of amazing depth, called *quebradas*, or breaks, which appal the firmest spectator, as if the globe were gradually bursting into ruin. Yet, in general, they seem the work of the waters, as a stream commonly runs in the midst.

*Climate.*] In these high regions the winter generally commences in December, and continues till April; but in the northern provinces of the viceroyalty of La Plata, and in the Andes of Chili, the order of the seasons is reversed, the heat of the summer being in December, January, and February. In the summer the heat is excessive; and affects the more, as the air itself is at the same time so cold, as to prevent perspiration. A distance of two feet makes summer or winter; in the sun it burns, while in the shade it freezes. Ulloa asserts, that the seasons contradict the course of the sun, being solely determined by the circumstances and the force of reproduction; yet as the central rivers of the viceroyalty of La Plata, descending from the Andes on the west, are in a state of inundation in January and February, owing to the melting of the alpine snows, this remark seems capable of refutation. In the *quebradas* the air is far more dense and warm than on the heights; Humboldt and Boopland, indeed, found it so rare, that the blood burst from their eyes and nostrils.

The climate at Terra Firma, particularly in the north-

ern parts, is extremely rich and fertile. The heats raise the crops in such rains as fall in part of the cold season; and this, it is said, moderates the air, which is extremely unwholesome.

*Soil and Vegetation.* The soil, like that of the most fertile parts of the world, is extremely rich and fertile. The heats raise the crops in such rains as fall in part of the cold season; and this, it is said, moderates the air, which is extremely unwholesome. The country, however, is incapable of producing more than a few remarkable fruits, the most remarkable of which are the mara, and the yuca, particularly remarkable for its size, but which, under the most subtle preparation, is to be the best of the fruit of a sembling an. This kernel is a remedy for the are very common. The frequent the water kernel, fasting apprehension tions are Indian sorts of fruit, woods.

*Animals.*] The most remarkable to a man and feet, and appearance. It never stirring to be several blows make it is attended with as at once persists the whole the first hostilities, which is the reach of the wild fruits of loaded, which crying, and it plucks off save itself success.

eru parts, is extremely hot; and as the heat of the warmest day in Paris is continual in Carthagena, the excessive heats raise the vapours of the sea, which are precipitated in such rains as seem to threaten a general deluge. Great part of the country, therefore, is almost continually flooded; and this, together with the excessive heat, so impregnates the air with vapours, that in many provinces it is extremely unwholesome.

*Soil and Vegetable Productions.*] The soil of this country, like that of the greater part of South-America, is extremely rich and fertile. It is impossible to view, without admiration, the perpetual verdure of the woods, the luxuriance of the plains, and the towering height of the mountains. This, however, only applies to the interior of the country, for the coasts are generally barren sand, and incapable of bearing any species of grain. The trees most remarkable for their dimensions are the caobo, the cedar, the maria, and balsam-tree. The manchineel-tree is particularly remarkable: it bears a fruit resembling an apple, but which, under this specious appearance, contains the most subtle poison, against which common oil is found to be the best antidote. The Habella de Carthagena is the fruit of a species of willow, and contains a kernel resembling an almond, but less white, and extremely bitter: this kernel is found to be an excellent and never-failing remedy for the bite of the most venomous serpents, which are very common all over this country. Those who frequent the woods, therefore, usually take a little of this kernel, fasting, and then repair to their work without any apprehension of danger. The other vegetable productions are Indian corn, balm, gums, and drugs, several sorts of fruit, sugar, tobacco, and various sorts of dying woods.

*Animals.*] Among the animals peculiar to this country, the most remarkable is the sloth. It bears some resemblance to a monkey in shape and size; but its bare hams and feet, and a wrinkled skin, give it a most wretched appearance. It stands in no need of either chain or hutch, never stirring unless compelled by hunger; and it is said to be several minutes in moving one of its legs, nor will blows make it mend its pace. When it moves, every effort is attended with such a plaintive and disagreeable cry, as at once produces pity and disgust. In this cry consists the whole defence of this wretched animal; for on the first hostile approach it is natural for it to be in motion, which is always accompanied with disgusting howlings, so that the pursuer flies in his turn, to be beyond the reach of this horrid noise. When this animal finds no wild fruits on the ground, it looks out for a tree well loaded, which it ascends with great uneasiness, moving, crying, and stopping, by turns. At length, having mounted, it plucks off all the fruit, and throws it on the ground, to save itself such another troublesome journey; and, rather

than be fatigued with coming down the tree, it gathers itself up, and, with a shriek, drops to the ground.

The monkeys in this country are very numerous: they keep together, twenty or thirty in company, rambling over the woods, leaping from tree to tree; and, if they meet with a single person, they chatter and make a frightful noise, throw things at him, hang themselves by the tail on the boughs, and seem to threaten him all the way he passes; but where two or three people are together, they usually scamper away. Their flesh is highly esteemed by the negroes and creoles, who make no scruple of eating them.

Many birds are found in this country, whose plumage is particularly beautiful and brilliant; but the most remarkable is the toucan, or preacher. The bill of this bird is variegated with all those bright colours which adorn the plumage of others. It is called the preacher, from its custom of perching on the top of a tree, and making a noise resembling ill-articulated sounds. The rivers, sea, and lakes, abound with a variety of fish.

The Isthmus of Darien swarms with reptiles and insects of various species; many of which are baneful to the inhabitants, and others are objects of philosophical speculation.

*Minerals.*] There were formerly rich mines of gold here, which are now in a great measure exhausted. The silver, iron, and copper, mines have been since opened; and the inhabitants find emeralds, sapphires, and other precious stones.

*Provinces, Towns, &c.*] Terra Firma Proper, which lies in the form of a crescent round the Bay of Panama, is three hundred miles in length, but only sixty in breadth, where the isthmus which joins South and North America is narrowest. It is tolerably fruitful, and abounds in gold and pearls.

The city of Panama, which, in 1737 and 1756, was entirely consumed by fire, has since been rebuilt in a neat, though not magnificent, manner. It is strongly fortified and garrisoned, and the walls mounted with large cannon. Here is the residence of the governor of the province, and it was the seat of a royal audience; but the latter was abandoned in 1752. It has a convenient harbour, well secured against storms by a number of surrounding islands.

The dangers of the road between Panama and Porto-Bello, occasioned by mountains, precipices, marshes, continual rains, horrible storms, deep fords, and, above all, the infinite number of venomous serpents, can scarcely be conceived; yet the mulattoes frequent it on foot, and even regard the passage as a kind of amusement. Some huts are found, where they sleep on straw and the leaves of trees, taking care to clean the floor, and stop up all passages for the snakes. The journey commonly occupies three days. The only remaining trade of Panama is

with the villages in its jurisdiction, and with the province of Veragua, the goods being received by Porto-Bello, mostly from Carthagena; the vessels from Peru commonly return empty. The neighbouring mountains produce excellent wood, especially the most esteemed mahogany and cedar, with many precious balsams. Some excellent gold is found in the mines, or rather lavaderos, of Santa Rita; but the pearl-fishery is almost abandoned. The following is the manner in which it is performed:—At the bottom of the sea are found numbers of pearls, and the oysters which contain them are exceedingly delicious. This fishery was formerly very beneficial to the inhabitants of all the islands in the bay; and there were few persons of property about Panama who did not employ a part of their slaves in it. The slaves thus employed must be expert swimmers, and capable of holding their breath a long time. During the season, eight, ten, or twenty, of them set out, under the command of an officer, in a boat, from the islands, where they have huts built for their lodgings, to such parts of the bay as are known to produce pearls, and where the depth of the water is not above ten, twelve, or fifteen, fathoms: here they come to an anchor, and the negroes, having a rope fastened round their bodies, and the other end to the side of the boat, take with them a small weight, to accelerate their sinking, and plunge into the water. On reaching the bottom, they take up an oyster, which they put under the left arm; the second they hold in their left hand, and the third in their right. With these three oysters, and sometimes another in their mouth, they rise to breathe, and put them in a bag. After a short rest, they dive a second time; and thus continue till they have either completed the task, or their strength fails them. Every one of these negro-divers is obliged daily to deliver to his master a certain number of pearls; so that when they have got a sufficient number of oysters in their bag, they begin to open them, and deliver the pearls to the officer, till they have made up the number due to their master; and, if the pearl be but formed, it is sufficient, without regard to its being small or faulty. The remainder, however large or beautiful, are the negroes' own property; nor has the master the least claim to them, the slaves being allowed to sell them to whom they please; though the master generally purchases them himself at a low price.

Besides the toil of this fishery, from the oysters adhering strongly to the rocks, the negroes are exposed to imminent danger from some kinds of fish, which either seize them, or run against them so violently, as to crush them against the bottom. Every negro, to defend himself against these animals, carries with him a sharp knife, with which the fish being struck, immediately flies off. The officers keep a watchful eye on these voracious creatures, and, on discovering them, shake the ropes fastened to the bodies

of the negroes, that they may be upon their guard. Many, on the diver's being in danger, have thrown themselves into the water, with the like weapon, to assist in his defence: but all their dexterity and precaution have frequently been insufficient to protect the diver from being devoured by sharks, or losing a leg or an arm by their bite.

The following is an account of the expedition to Panama, made by the celebrated Buccaneer Captain Morgan.

"This enterprising genius, who was of a good family in Wales, set sail from Jamaica, on this expedition, with nine ships and sloops, well manned. Arriving on the coast of Terra Firma, he informed his people that his first design was against Porto Bello: some of them objecting that his force was too small to reduce so important a fortress, he boldly replied, 'If our numbers are small, our hearts are great; and the fewer we are, the greater will be our share of the plunder.' He soon made himself master of a castle which defended the harbour, and this capture was succeeded by the surrender of the city; but the governor, and many of the principal inhabitants, having retired into another castle with their treasure and effects, kept up a brisk fire on the Buccaneers. This occasioned Morgan to use the following stratagem. He seized all the friars and nuns in the town, and compelling them to march before him up to the very wall, he obliged them to fix the scaling ladders; in doing which many were killed by the fire of their friends, as well as enemies, crying for mercy in vain: at length the Buccaneers scaled the walls, took the place by storm, and afterwards employed fifteen days in removing the immense treasures on board his ship. He then obliged the governor to give up one hundred thousand pieces of eight, which had been carried off, in order to ransom the town from being laid in ruins.

"Having received intelligence that the governor of Panama was in full march against him, Morgan possessed himself of a difficult passage, and there totally defeated him. He then dismantled the forts, took some of the best artillery on board his ships, and returned to Jamaica, it being computed that the Buccaneers brought back with them two hundred and fifty thousand pieces of eight, besides other rich effects; but the seamen soon squandered every shilling that came to their share, and made money more plentiful in that island than ever it had been before.

"The captain, having gained great reputation by the Porto Bello expedition, the seamen crowded to be admitted to serve under him. Having assembled five hundred of them, he sailed to Tortuga, a little island near the northern coast of Cuba, where he was joined by two thousand additional seamen, whom he employed in hunting, and salting beef, in the island of St. Domingo, to victual his fleet; and being now ready to sail, he divided his fleet, consisting of thirty-seven ships, into two squadrons, constituting admirals and other officers, to whom

he gave command. The fleet lay here four ships and a Chagre, at the time they reduced, Morgan received Chagre, following leaving a garrison of hundred men, towards Panama. him, his men want of provisions which lay over impassable; and through an untried path, he seemed to appear on the ninth day, the Bay of Panama. they seemed to sound their drums, had been already of the town, ing; but they went out against the and two squadrons and defeated the men dead upon the side of the Bay. they scaled the wall that day. Morgan so elated with victory they were convinced the wine was all the avenue on a sudden been set on fire, probably, to prevent of the Buccaneers days, and very that two thousand people, were sand more beautiful churches and it being the Peru, which be transported

he gave commissions to commit hostilities against the Spaniards, declaring them enemies to the crown of England, and caused articles to be signed by his officers, wherein every man's share of the prizes which should be taken was specified, reserving an hundredth part of them only to himself.

"Their first enterprise was against the island of Providence, which they retook from the Spaniards; and while the fleet lay here, he sent Brodley, his vice-admiral, with four ships and four hundred men, to take the castle of Chagre, at the mouth of the river of that name, which they reduced, though it was very obstinately defended. Morgan received advice of the success of his squadron at Chagre, followed them with the rest of his fleet, and, leaving a garrison in the castle, selected one thousand two hundred men, with whom he marched over the isthmus towards Panama, and the country being destroyed before him, his men underwent incredible hardships, as well for want of provisions, as from the badness of the roads, which lay over rocks, mountains, and morasses, almost impassable; and at length was obliged to fight his way through an army, which the governor of Panama had assembled to oppose him. Ascending a mountain on the ninth day, they obtained a view of the South Sea, and the Bay of Panama, at which they were so overjoyed, that they seemed to despise all danger, threw up their caps, sounded their drums and trumpets, and shouted as if they had been already masters of the city, and halted in view of the town, designing to attack the place the next morning; but they were prevented by the governor's marching out against them at the head of four regiments of foot and two squadrons of horse, whom Morgan engaged, and defeated; when they fled, leaving six hundred of their men dead upon the field of battle, and the loss on the side of the Buccaneers was very considerable; however, they sealed the walls, and became masters of the place that day. Morgan, apprehending that his men would be so elated with success that they would get intoxicated, now they were come into plentiful quarters, gave out that all the wine was poisoned, and proceeded to place guards at all the avenues of the city, to secure his conquest, when on a sudden the whole city appeared in flames, having been set on fire in several places at the same instant, probably, to prevent the treasures from falling into the hands of the Buccaneers. The city continued burning several days, and very few houses were left standing. It was said that two thousand of the houses, inhabited by the principal people, were built with cedar; and that there were five thousand more belonging to the tradesmen, with several beautiful churches and monasteries, in the place before this accident, it being the magazine of all the treasures of Chili and Peru, which were annually deposited there, in order to be transported to various parts of Europe.

"The soldiers afterwards found great quantities of plate and money melted down among the ruins, and more hid in wells, or buried; and took two hundred thousand pieces of eight out of a ship that lay at anchor in the harbour.

"Morgan, having remained near a month at Panama, and collected the ransom which his prisoners had agreed to pay, loaded two hundred beasts with the treasure he had obtained, and returned to Venta de Cruz, where he put it into boats, and sent it down the River Chagre to the castle of that name; but the Buccaneers of the French and Dutch nations murmured that not more than two hundred pieces of eight fell to the share of each private man, and charged their admiral with concealing the most valuable part of the prizes; the foreigners, in consequence, left him, and sailed to the islands of Tortuga and St. Domingo, to join their countrymen; and Morgan, after he had blown up the castle of Chagre, and the fortifications about it, returned to Jamaica with the rest of his fleet."

Porto Bello is situated close to the sea, on the declivity of a mountain, which surrounds the harbour. This harbour is so large, deep, and safe, that Columbus gave it the name of Porto Bello, or Fine Harbour. The governor is always a military officer, subordinate to the president of Panama. The town is but thinly inhabited, owing to the insalubrity of the air, and contains not more than two hundred wooden houses. At the east end of the town there is a quarter called Guinea, where all the negroes and many of the mulattoes reside. The extinction of the galleons, after the peace of Aix la Chapelle, also contributed to ruin this, and most of the other towns in Terra Firma. In the year 1739, the gallant Admiral Vernon, with six ships only, took this place, demolished the forts, and dismantled the fortifications.

The circumjacent country is full of forests and mountains. One of the latter, named Capira, which is extremely high, serves as a barometer to the people; for, by the appearance of the clouds on its summit, they can prognosticate what weather will ensue, the changes of which are very sudden and frequent. The heat here is excessive, the torrents of rain impetuous, and the storms of thunder and lightning dreadful; so that not only the people die very fast, but the cattle brought from distant places soon lose their flesh.

In 1695, a Scotch company, having obtained from the English government permission to trade to Africa and the East and West Indies, planted a colony on the Isthmus of Darien, near the north-west point of the Gulf. Here a fortress was erected, called New Edinburgh, and the surrounding district was termed Caledonia. The Indian princes were pleased at this, as they thought, by the help of the Scotch, to expel the Spaniards. For some time the colony flourished; but at last the company was ruined,

by the jealousy of the English East-India Company, and the remonstrances of the court of Madrid.

The province of Carthagena produces some valuable gums, balsms, and drugs, but no mines of gold or silver, nor any great quantity of corn or cattle. Carthagena, the metropolis, is not only a fine opulent city, but a strong fortress, situated on a sandy island. The harbour lies between the island and the main, and the entrance is at the south-east end; the other passage, called Bocchachica, having been filled up by an order from the court of Spain, since the attack made upon the town, in 1741, by Admiral Vernon and General Wentworth. To the eastward, the town has a communication, by means of a wooden bridge, with a large suburb, called Xexemani, built on another island, which is joined to the continent by a bridge of the same materials. The fortifications, both of the city and suburbs, are constructed in the modern fashion, and built with free-stone: and, in times of peace, the garrison consists of ten companies, besides the militia. The city and suburbs are well laid out, and the streets are broad, uniform, and well-paved. The houses are built of stone or brick, with balconies and lattices of wood, which is more durable in this climate than iron, the latter being sooner corroded by the acrimonious quality of the nitrous atmosphere. The city is populous, though most of the inhabitants are descendants of the Indian tribes; but it is by no means opulent, compared with many other cities in South-America, the country producing no mines. At a small distance from the suburb of Xexemani, on a hill, is a fort called Lazaro, commanding both the city and suburbs, and affording a very extensive and agreeable prospect over the sea and land.

The government of Carthagena was independent of any other till the year 1739, when the viceroy of New Grenada was appointed. It extends about fifty-three leagues from west to east, and eighty-five from south to north, containing several fruitful valleys, called, by the natives, savannahs, in which are many settlements of Europeans, Spanish Creoles, and Indians. The Bay of Carthagena is the first place in America at which the galleons touch. The climate is hot and unhealthy, and, among other diseases, the black vomit and leprosy are particularly fatal to Europeans. The Guinea-worm is very troublesome, as it occasions painful tumours in the muscles of the legs and thighs; and another insect, peculiar to this country and Peru, is still more dreadful; it is called *higue*, and, being extremely small, is scarce visible to the naked eye. It breeds in the dust, and insinuates itself into the soles of the feet, giving exquisite pain, and the puncture frequently attended with imminent danger.

The province of Santa Martha is two hundred miles long, and one hundred and forty broad, very mountainous; but produces gold, jewels, marble, salt, &c. The capi-

tal, of the same name, on a branch of the Rio Grande, is the see of a bishop, and residence of a governor.

Rio de la Hacha is a pleasant and fertile province. It has a pearl-fishery, and mines of jasper and chalcedony. The capital, which gives name to the province, contains nothing remarkable.

*Inhabitants, &c.* Besides the Indians in this part of the country, who fall under the general description of Americans, there is another species, of a fair complexion, delicate habit, and of a smaller stature than the ordinary Indians. Their dispositions, too, are more soft and effeminate; but what principally distinguishes them is their large weak blue eyes, which, unable to bear the light of the sun, see best by moonlight, and from which they are, therefore, called Moon-eyed Indians.

It has already been mentioned how this country fell into the hands of the Spaniards. The inhabitants, therefore, do not materially differ from those of Mexico; but the original inhabitants of Spain are variously intermixed with the negroes and Indians. These intermixtures form various gradations, which are carefully distinguished from each other, because every person expects to be regarded in proportion as a greater part of the Spanish blood runs in his veins. The first distinction, arising from the intermarriage of the whites with the negroes, is that of the mulattoes; next to these are the *tercerones*, produced from a white and a mulatto. From the intermarriage with these and the whites arise the *quaterones*, who, though still near the former, are disgraced with a taint of the negro blood; but the produce of these and the whites are the *quinterones*, who, it is said, are not to be distinguished from the real Spaniards, except by being of a still fairer complexion. The same gradations are formed, in a contrary order, by the intermixture of the mulattoes and the negroes; and, besides these, there are many others, hardly distinguishable by the natives themselves.

The inhabitants are differently dressed, according to the Spanish fashion. The men wear a cassock without folds, descending to the knees, a large cape, and sleeves open at both sides. It has button-holes, and two rows of buttons. The habits of the better sort are made of embroidered stuffs. Mechanics wear a blue stuff, of the manufacture of the country, but in make it differs not from the other. The Indians of distinction are singular in wearing a kind of trowsers of white cotton, which descend from the waist to the middle of the leg. The barbers here are distinguished by the fineness of their linen, and elegance of their dress in general. They have shirts without sleeves; about the neck they wear a kind of black collar, with a lacc of four fingers' breadth, which forms a sort of fringe that falls on the stomach and shoulders; and wear shoes, with gold or silver buckles, but no stockings.

The women wear a rather jump, a mantle, consisting of a whole dress, the labouring ladies, of the same. A mantle, of his habit, a mantle, a cloth, faster

The women wear the faldelin, a species of stays, or rather jumps; a shift, which descends only to the waist, a mantle, which encloses the upper part of the body, consisting of about an ell and a half of stuff; and their whole dress is ornamented with rich laces. The dress of the labouring women is not distinguishable from that of the ladies, except by its inferiority, the fashion being the same. A mongrel, or creole, is known by the superiority of his habit, and his ingenuity. The Indian peasant wears a mantle, and the common native Indian a piece of sack-cloth, fastened over the shoulders by two pins.

## SECTION II.

### THE CARACCAS.

The government of the Caraccas is so denominated from the chief town, Leon de Caraccas; but was properly the indigenal appellation of a tribe in that quarter. Estalla says, that four districts were disjoined from Venezuela to constitute the new province of Varinas; namely Apuri, Meta, Nutrias, and San Jayme. The largest province was originally called Vencuela, or Little Venice, from a village of the savages in the Lake of Maracaibo; but the government now comprises the adjacent provinces of Varinas, Maracaibo, Cumana, including Spanish Guiana, and the Isle of Margarita. The government, in this extent, has existed since 1730, and the governor acknowledges no superior except the king. The province of Merida is merged in that of Varinas; and the name of New Andalusia has been properly exchanged for that of Spanish Guiana; while that part of Brazil which is to the north of the Oroonoko has assumed the name of Portuguese Guiana. The establishment of the Royal Audiency of the Caraccas, when the Spanish part of Hispaniola was resigned to the French, farther ascertained the clear jurisdiction and boundaries of the Caraccas.

In 1498, Columbus inspected that part of the coast called Paria, on the west of the strait called by him the Dragon's Mouth; but little progress was made in the settlement till Charles V. sold the country to the Welsers of Augsburg, who were dispossessed about the year 1550. The chief conqueror was Losado, who founded the city of Caraccas in 1567.

The following statement of the population of the Caraccas is given by Depons:

Venezuela, including Varinas, five hundred thousand; Maracaibo, one hundred thousand; Cumana, eighty thousand; Spanish Guiana, thirty-four thousand; and the Isle of Margarita, fourteen thousand: total, seven hundred and twenty-eight thousand souls.

Of this population, the whites form about two-tenths, the slaves three, the freed men or their descendants four,

and the Indians the remainder. The Spaniards do not easily pass to the colonies, a permission from the king being required, which is commonly limited to two years; and Spain watches over the innocence of her colonies by requiring a certificate of good morals. Strangers encounter still greater difficulties; and, by a royal ordinance of the 3d of August, 1801, a considerable sum is required for their residence.

*Lakes.*] As the description of a country necessarily includes every thing that can tend to convey a just idea respecting it, we must not omit to notice the lakes, which are produced by a collection of rain-water, and by the reservoirs of rivers. Many of the first species are met with in the low lands, in the vicinity of the Oroonoko; the most magnificent of the second kind are those of Maracaibo and Valencia, which appear to merit a particular description.

The Lake of Maracaibo, according to Oviedo, is about fifty leagues in length, nearly thirty in its greatest breadth, and rather more than one hundred and fifty in circumference. It seems to have owed its formation to the slow and successive excavation produced in the land by the numerous rivers which flow into it from the east, the west, and the south. It is navigable for ships of the greatest burden; and, by means of the rivers which disembogue themselves into it, the town of Maracaibo is supplied with provisions of all kinds, either for its own consumption or for exportation. Storms seldom occur on this lake; but it is continually subject to a kind of undulatory motion, which appears to be in proportion to the action of the winds on its surface; and, during sudden squalls, canocs and other small vessels are frequently overset and lost. At such times only the water of the lake becomes brackish; for in general it is perfectly fresh and potable.

To the north-east of this lake, on the most sterile parts of its banks, near a place called Mena, there are several inexhaustible pits of mineral tar, which seem in all respects the same as the asphaltus of the ancients. This bituminous matter, mingled with fat, is employed for paying the sides of ships, and various other purposes. The exhalations which arise from these bituminous minerals so readily take fire in coming into contact with atmospheric air, that they throw out a pretty vivid light during the whole night. It has been remarked, that this phenomenon is more constant during great heats than when the weather is less sultry. These lights are styled by the inhabitants *the lantern of Maracaibo*, because they serve as a pharos to the Spaniards and Indians, who navigate this lake without a compass or instrument of any kind.

"The sterility, and still more the insalubrity, of the banks of this lake," says a modern geographer, "have hitherto prevented them from being inhabited. Even the Indians prefer living in a sort of floating huts upon the

lake itself, which they construct of a durable species of wood, similar to the iron-wood. According to the testimony of Oviedo, which is confirmed by that of the inhabitants themselves, every portion of this wood which is under the water becomes petrified in a very few years.

"The Spaniards, on finding many of these aquatic villages, constructed without order, but with a considerable degree of solidity, gave to them the name of Venezuela, which is the diminutive of Venice; an appellation that has since been transferred to the province. It was long supposed that these habitations had been constructed as a place of security against the wild animals with which the country abounded; but this is now discovered to be an error, as the Indians refuse to abandon them for others ashore, although every idea of danger from the approach of wild beasts is at an end.

"Since 1529, when Alfinger carried devastation and death among the peaceable inhabitants of the lake, these numerous villages have disappeared, except four, which are situated on its eastern extremity, at unequal distances from each other. They are named Lagunillas, Misou, Tumoporo, and Moporo. There is a church upon the water, in which a pastor performs service, and distributes spiritual aid to these aquatic Indians; but it is far from being a desirable situation, since seldom a few days elapse before his health begins to suffer; and scarcely a single instance can be recollected, in which the life of any of their clergymen was prolonged beyond six months.

"These Indians sometimes come ashore, in search of provisions; but their chief subsistence is on fish. They also find a considerable resource in the wild ducks, which abound on this lake, and which they take in a very singular and ingenious manner. For this purpose, they constantly allow empty calabashes to float on the lake around their habitations; in order that these birds, by being habituated to see them, may not be intimidated. When an Indian wishes to procure any of these fowls, he puts on his head a calabash, perforated so as to permit him to see without being seen. In this manner he goes into the lake, keeping always his head above the surface of the water, but taking care that no part of his body shall be visible; he proceeds thus swimming to the spot where the wild ducks are collected in the greatest number, then seizing them by the feet, he immediately drags them below the water, so that they have neither time to cry out, nor to make any motion that can warn the others of the impending danger. As fast as they are taken, he fastens them to his girdle, and never thinks of retiring till his wants be fully satisfied. Such a mode of entrapping these animals is attended with this advantage, that it does not frighten them, and may always be renewed at pleasure, and without expence. The fertility of the soil, on the west side of the lake, has induced a few Spaniards to brave

the inclemency of the air, and raise a few plantations of cocoa and other provisions. In the centre of these scattered habitations stands a chapel, in which a pastor performs divine service, and administers the sacrament."

The Lake of Valencia is less extensive, but it displays a more pleasing aspect than that of Maracaibo: its shores are also more fertile, and the climate of a milder temperature. This lake is upwards of thirteen leagues in length, and about four in its greatest breadth. Its form is that of an oblong square. It is situated about a league from the town of Valencia, and in a valley hemmed in by mountains on all sides, except on the western, towards the interior of the country. It is about six leagues distant from the sea; and the intermediate space is occupied by almost inaccessible mountains. It is very difficult to conceive how this lake should have no visible outlet, while rivers flow into it in all directions; a circumstance which seems to prove that it is merely a basin. But how then, on this supposition, can we explain why it has remained of the same dimensions for a succession of ages? Can it be supposed that evaporation alone, however great it may be between the tropics, is equivalent to carry off the water which so many rivers pour into it? The supposition is altogether incongruous, when we consider the small extent of the lake's surface. "Hence," says M. Depons, "it should seem that there must be some subterraneous vent, by means of which a quantity of water, equal to that which is poured into it, continually escapes. This opinion, though only conjectural, is yet supported by such strong probabilities, as to give it every appearance of truth."

*Face of the Country, Productions, &c.*] While the line of mountains along the coast presents granite, and other barren rocks, with the singular circumstance of rivers that rise near the sea and flow inward; in the interior the cultivable soil of the plains, exposed to the solar heat, only presents pasturage for oxen, horses, and mules; and the vales are of all other parts the most fertile. The cacao, or chocolate-tree, which cannot withstand the rays of the sun, is protected by trees of taller growth. To this main article of cultivation, indigo was added in 1774, and cotton in 1782. The sugar-cane of Otateite was tried in 1796, but is found of little advantage; as, though larger, the juice is not of equal strength. Tobacco forms another article of culture; but, with all these rich products, few planters are worth more than five thousand dollars a year.

No mines are explored in these provinces, except one of copper at Aroa, which is little worked: but a good revenue arises from cock-fighting, and from the monopoly of guarapo, an intoxicating liquor, made from the fermentation of coarse sugar and water, of universal use in the Caraccas, as the pulque is in New Spain. The papal

bulls form a luxury is entitled to demand his sins! The purchaser; and are available. They cost a dollar, and are necessary forms. Snopolly, and in

Among the Oroonoko, the name of *curbitt* is given to the tree, as they are tory. The fruit, weight, is of as an article of of two stones which is usual which are regular urine, sell for grains of this of water or wine effect. These resemble in color is smaller than every animal, reach. It even to proceed a success are supposed The name car of its ferocious gerous in this form, and from mouth, which double range other. hulls form a lucrative branch; and the purchaser of two is entitled to double favour, and the repeated pardon of his sins! They are sold, according to the rank of the purchaser; and, if bought at an inferior price, are of no avail. They cost from fifteen dollars to a quarter of a dollar, and are printed on coarse paper, with the necessary forms. Since 1779, tobacco had become a royal monopoly, and in 1802 the product was considerable.

Among the various species of fish found in the River Oroonoko, there are two, to which the Spaniards give the name of *curbinata* and *caraiibe*, highly deserving of notice, as they are not mentioned in any book of natural history. The first, which never exceeds two pounds in weight, is of an excellent flavour; but it is not so much as an article of subsistence that it is valued, as on account of two stones situated in its head, exactly in the place which is usually occupied by the brain. These stones, which are regarded as a specific in cases of retention of urine, sell for their weight in gold. The dose is three grains of this stone, well pulverized, mingled in a cupfull of water or wine: this is said to produce an instantaneous effect. These stones are of the shape of an almond, and resemble in colour mother-of-pearl. The second, which is smaller than the *curbinata*, attacks with great ferocity every animal, whether dead or alive, which falls within its reach. It even wounds the legs of any who may happen to proceed a short way into the river; and these injuries are supposed to be attended with serious consequences. The name *caraiibe* has been given to this fish on account of its ferocious habits. Caymans are numerous and dangerous in this great river. The cayman is of the lizard form, and from fifteen to eighteen feet in length. Its mouth, which is extremely large, is furnished with a double range of sharp teeth, a little separated from each other. Its eyes are prominent, and the animal usually keeps on a level with the surface of the water: it is thus enabled to view every object without being observed in its turn. Its skin is covered with strong sharp scales, impenetrable by a musket-ball: it devours vast numbers of fishes, and is regarded with great terror by the inhabitants. The Indians eat its flesh, which is white, but of an insipid taste: it is caught by means of large iron hooks. Its teeth are employed by the Indians as an ornament for the neck and arms; they are also regarded as an antidote to certain poisons, and as an alexipharmic in general. The teeth, and other parts of its body, are exhibited in a pulverized state, in a dose of twelve grains of either the one or the other, or six grains of each, as an antispasmodic, and repeated according to the necessity of the case. A drop of the gall, insinuated into the inner angle of the eye, is regarded as a powerful remedy in cases of cataract and dimness of sight. It produces at first a sensation of heat, which soon, however, abates.

The guana is very common in the Oroonoko. It is of the lizard tribe, about two feet and a half long, and of a green colour; it is furnished with a row of sharp points along its back, like the cayman, which gives it a horrible aspect. It frequently remains on trees ashore, but retreats into the water on the slightest appearance of danger. The Indians, as well as the Spaniards, regard the flesh of this animal as equal to that of the finest chicken. The female lays nearly thirty eggs, about the size of a nut, which are of a yellow colour, and covered with a sort of membrane, instead of a shell: they are usually eaten roasted, in the same manner as the eggs of domestic fowls.

Another animal, which abounds in the Oroonoko and the neighbouring rivers, is termed, by the Indians, *chiquire*, and, by the Spaniards, *guardatinajas*. Its muzzle resembles that of a sheep; its skin is red, and the tail so short, as scarcely to be perceptible. These animals are eaten by the inhabitants on fast-days, from the idea that they partake more of the nature of fish than of land-animals. They always swim in shoals, and occasionally raise their heads above the water, in order to respire. They feed upon the herbs which grow on the banks of the lakes and rivers, and are regarded by the Indians as a delicious morsel.

The lapa, which is another amphibious animal, common to Spanish Guiana and most parts of the Caraccas, is called by the Indians *tamem*. It is about the size of a terrier-dog; its hair is red, and variegated with whitish spots; its flesh is extremely tender, and resembles that of a sucking pig. It feeds upon the herbage and fruits growing on the banks of the rivers which it inhabits, but, on the least noise, retires to the waters. It is esteemed a great delicacy by the South-Americans. An animal, to which the Spaniards have given the appellation of *water-dog*, is also found in the Oroonoko. Its head is about the size of that of a common dog, and its ears are exactly similar to those of the beaver; its tail is long, and the fore-feet of the same shape as, but somewhat larger than, those of a fox; its hind-feet are flat and membranous, and the skin soft, and of a whitish colour. It inhabits holes, which it scoops out on the banks of rivers, from which, however, it frequently proceeds a considerable distance into the country. This animal does not live solely upon herbs and fruits, but devours a considerable number of fishes, which it catches with inconceivable dexterity.

A small amphibious animal, known by the name of the *liron*, is also frequently met with in the rivers and marshes of South-America. It is covered with thick soft white hair, with black bands, so disposed as greatly to add to the beauty of its appearance. Its head is small, like that of the dormouse, and is furnished with whiskers, like a cat. Its feet are membranous, and its tail prehensile,

and destitute of hair from the middle to the extremity. This animal is provided with a pouch under its belly, into which its young ones occasionally retire.

*Principal Towns.* CARACAS, the capital, is a considerable town, on the little river of Guayra. Its elevation of four hundred and sixty fathoms above the sea, cools the temperature, so that spring may be said to be perpetual. During winter, the thermometer of Fahrenheit marks from fifty-two to seventy-six degrees, and in summer, from sixty-nine to eighty-five degrees. It is built among the mountains of the great chain which runs along the sea from Coro to Cumana. The site is steep and irregular, from the northern heights to the river Guayra, which bounds the city on the south. Water is also amply supplied from three rivulets which join the Guayra. The streets are straight, paved, directed towards the four points of the compass, and at the usual distance of three hundred feet from each other. The principal square occupies the same extent. It is well paved, and is the general market; while the cathedral decorates the eastern side. There are five or six other churches, all accompanied with the usual squares. The houses are large and handsome, some of brick, but generally of masonry laid in moulis, after the Roman manner, as revived by Tardiff, in 1757, for constructions in marshes, the sea, &c. The houses built in this manner have all the appearance of stone: they are decorated with handsome mirrors, curtains of crimson damask, antique gilt chairs and sofas, bedsteads, silk counterpanes, and pillows covered with fine muslin, adorned with lace. The archbishopric of Venezuela was erected in 1803, extending from the River Unari to Coro: on the east, it is bounded by Cumana; on the south, by the Oroonoko; on the west, by the bishopric of Merida: the income may be about sixty thousand dollars. Festivals and processions abound, as in all Spanish America. The theatre is miserable; the admission costs six-pence; and the declamation resembles the monotonous chaunt of a child of ten years, repeating a lesson. The other amusements are tennis and billiards. The population of this city, according to an enumeration made in 1802, is about forty-two thousand souls, of which the whites form about one quarter. Every white person regards himself as a noble, and a creole esteems nothing degrading except industry. The most industrious inhabitants are those from Biscay, Catalonia, and the Canaries. The women, though small, are of a beautiful complexion, with hair of a jet black. About two hundred unfortunate creatures draw from the vice of the evening a precarious sustenance, and are distinguished by a white petticoat and cloak, and a silk bonnet decorated with flowers. The university of Caraccas was founded in 1682, and improved in 1727. In 1802, the students amounted to four hundred and sixty-six. The Spanish phlegmatic character renders quarrels

very rare. Silence reigns in the streets of Caraccas, and three or four thousand persons will issue from a church without making more noise than tortoises walking on the sand.

CUMANA is the most ancient town in the Caraccas, having been founded in 1520, on a sandy soil, about a league from the sea. Here is only one parish-church, which stands on the south-east side of the city, near to a dilapidated fort; but there are two convents, one of which belongs to the order of St. Dominic, and the other to that of St. Francis. The inhabitants are reckoned at twenty-four thousand; and their augmentation has been so rapid, that they have of late been forced to build on the left bank of the River Mansanares, to the west of the village Guayqueris. These new buildings already constitute a populous village, which communicates with the city by means of a bridge. To the first street the inhabitants gave the name of Eniparan, in honour of the governor who contributed so much to promote their interest.

All the houses in Cumana are low, and superficially built. The frequent earthquakes which it has experienced for ten years have constrained the inhabitants to attend more to their personal safety, than to elegance and beauty, in the construction of their houses. The violent shocks which occurred during the month of December, 1797, overturned nearly all the houses built with stone, and rendered uninhabitable those which remained. The earthquake which was felt in the month of November, 1799, occasioned a variation of the needle of forty-five minutes.

MARACAIBO is the principal town in the province of that name, situated at the distance of six leagues from the sea, on a sandy spot, and in a hot and dry climate, chiefly felt from March to October; but in July and August the air seems to proceed from an oven. The only antidote is to bathe in the lake; and endemial disorders are unknown. The thunder-storms are terrible; and, if they fail, earthquakes are sure to follow. Most of the houses are meanly covered with reeds; and there is no water but that derived from the lake, which is healthy, though not pleasant, especially in March and April, when the strong breezes impregnate it with sea-spray. According to an enumeration in 1801, there were about twenty-two thousand inhabitants; and they were increased by the Spanish refugees from St. Domingo: the slaves do not exceed five thousand. The habit of sailing on the lake encourages the spirit of navigation, and many of the natives become seamen. Even in the dry savannas they contrive to feed numerous herds; and the youth are celebrated for intelligence and ingenuity; but many of the inhabitants are noted for want of probity. There is only one church, and a convent of Franciscans.

TRUXILLO was a flourishing town, till it was ravaged by the buccaners in 1678; since which event the popu-

lation has grown for sweetmeats in 1787, the testament of Mar government. 1803. The though not vertheless, that every c Hamhurgh, is sold at two quality. The judice, ship baeco, in w under this d pulation of f

lation has greatly declined, and Truxillo is chiefly noted for sweetmeats and confections made by the women. In 1787, the town of Varinas was detached from the government of Maracaibo, and chosen for the seat of a separate government. A militia was appointed for its defence in 1803. The tobacco of Varinas is highly celebrated, though not equal to that of some parts of Cumana; nevertheless, the opinion of its superiority is so prevalent, that every cargo of tobacco imported into Amsterdam or Hamburgh, under any other name than that of Varinas, is sold at twenty-five per cent. less, whatever may be its quality. The Spaniards, availing themselves of this prejudice, ship for the European market most of their tobacco, in whatever province it may have been raised, under this denomination. The town of Varinas has a population of ten thousand.

PORTO CAVELLO has a commodious harbour, and the population may be seven thousand five hundred; but the situation is unhealthy, and extremely dangerous to the crews of foreign vessels.

VALENCIA contains about eight thousand inhabitants, and its advantageous situation may lead to great future advantages.

There are several other towns, which contain from four to eight thousand inhabitants: they are Tulmera, Victoria, Coro, Carora, Tocuyo, Guanara, Calaboso, Pao, and San Felipe.

SAN FILIPPE is a regular town, with about six thousand eight hundred inhabitants. Nirgua, built in the expectation of mines, has been abandoned to the Zambos, or offspring of negroes and Indians; a race so remarkable for crimes, that of ten which are committed, eight may be ascribed to them. This mixture is radically bad; while the children of a white by an Indian woman, who are of a pale complexion, are always delicate, lively, good-tempered, and docile.

*Customs, Manners, &c.]* The Spaniards in the Caracas marry very early; the girls at twelve or thirteen, and the boys at fifteen. If not destined for the church, an unmarried youth of twenty is regarded as an old bachelor: this proceeds, in a great degree, from the authority of the parents being restricted; for a girl who wished to marry might demand her deliverance from their power; and a public assertion of a boy and girl, that they took each other for husband and wife, was considered as a legal marriage. This freedom probably arose from a wish to increase the population; but, by an ordinance of 1803, his catholic majesty has declared, that young men under twenty-five, and girls under twenty-three, cannot marry, without the consent of their father: and the penalty on the clergyman, who shall join such persons, is banishment and confiscation of goods. The old Spanish etiquette maintains its ascendancy in these provinces; and a li-

gious spirit is so prevalent, that, in 1792, there were more than seventy Spanish lawyers in the city of Havannah. There are also such numerous retainers, that the annual law-expences incurred in the Audiency of the Caracas have been computed at one million five hundred thousand dollars.

The Spanish Americans are more frequently engaged in processes before the different tribunals for some contested point respecting prerogative, than on account of mercantile and pecuniary concerns. They are passionately fond of attacking each other with the pen; and this disposition, which frequently terminates in the ruin of both parties, administers to the subsistence and rapacity of a set of lawyers, whose reputation augments in proportion to their talents at fomenting discord.

The laws of civility are supposed to be violated by an individual leaving his residence without intimating his departure to his friends and neighbours by a circular letter, which is answered by a personal visit, unless the families have been not only strangers but enemies. Visits are also paid by their friends and acquaintances to every new-married couple; and the same ceremony on the birth of each child, or after the recovery of any of the members of a family from a fit of sickness.

All the Spaniards receive their friends on the anniversary of their patron-saint; and a neglect to comply with this custom would be considered as a gross offence against the laws of good breeding. On entering a house, a Spaniard generally makes a noise, in order to warn the family of his approach, and waits for permission to enter. If any one were silently to enter the dwelling of another, it would be supposed he either meant to surprise them, when off their guard, or to listen to their discourse. The Spanish ladies always receive company seated on a sofa; and this custom is never deviated from, whatever may be the rank, age, sex, or intimacy, of the visitor. When they intend going abroad, they send in the morning a message, intimating this intention; and these visits are always paid between five and eight o'clock in the evening. Husbands seldom accompany their wives on such occasions: they go without any retinue, merely followed by two or three servants, in a black petticoat and a white veil. If you praise the sword, the cane, the watch, or even the house, of a Spaniard, he replies, with the most ridiculous grimace, "they are at your disposal!"

The dress on days of ceremony consists of a coat and breeches of taffety, satin, or velvet; the Spaniards never wear cloth, except they be in mourning, or when it is richly embroidered. The waistcoat is either of gold or silver stuff, or, at least, covered with embroidery: they wear a cocked hat: but their dress, after all, would be deemed incomplete, without the accompaniment of a gold or silver-hilted sword.

We must now turn our attention to the *Indians* of Terra Firma; and our observations on the natives of this division of South-America will apply, with little variation, to all the tribes in that part of the continent.

Very few physical or moral distinctions of character are discoverable among the different Indian tribes. The structure of body common to the whole of them is, a straight forehead, eyes of a middle size, long and soft black hair, a pointed nose, wide mouth, large visage, and the head very big: they are, in general, of a copper colour, which varies according to the temperature of the province they inhabit: their ordinary height is from four and a half to five feet; but a few tribes are from five and a half to six feet. They have very little beard; but it is not true, as some writers have affirmed, that they are wholly beardless. Their limbs are large and muscular, which would seem to indicate that they are extremely robust: this appearance is, however, deceitful, as they are wholly incapable of any labour which requires much strength or exertion.

Indolence, taciturnity, a paucity of ideas, and a strong propensity to falsehood, may be ranked among the characteristic traits of the South-American Indians. It has been justly observed, that those who live in the interior of the country are less cruel than the inhabitants of the coast.

There appeared to be among these tribes no other mode of terminating any differences that might arise, but by an appeal to arms. Vindictive and ferocious, their contests were carried on with a rage more resembling the fury of a wild animal than the valour of an honourable warrior. Deceit and treachery were ranked by them among the first of military virtues. Poisoned arrows were in general use; they murdered the prisoners taken in battle, and not unfrequently devoured them. From the poverty of the different tribes, the love of plunder never animated them to the attack; their object in going to war was to devastate rather than conquer, to destroy rather than possess. But, notwithstanding their thirst for blood, two Indian armies were never observed to meet on the open plains. In Terra Firma, the Caribbees, who inhabited the banks of the Oroonoko, alone openly attacked their enemies; hence they enjoyed a reputation which made them the terror of all the surrounding tribes. They owed to their courage the peaceable possession of a vast tract of country, on which no other nation durst attempt an establishment.

According to the creed of all the civilized Indians, and even of some of the Spaniards themselves, diseases were supposed to proceed from witchcraft. They even sometimes accused the physicians of this practice; but they never reproached them on that account, because, according to them, they only could counteract or destroy it.

It was an universal opinion among all the Indians of

Terra Firma, that the soul, when emancipated from the body, could not exist without food. They mourned much at the funerals of their friends, and chaunted the exploits of the deceased. They sometimes interred their dead, but more frequently converted the body into a kind of mummy, by means of heat, and afterwards hung it up in their habitations. When they adopted the former mode, they uniformly buried provisions along with it. If the deceased belonged to a superior class, his friends regularly assembled, and celebrated his anniversary. These ceremonies were performed during the night. They disinterred the body, if it had been buried, and spent the whole night in dancing, drinking, and howling.

Such was the mental darkness of the Indians of Terra Firma, that it never entered into their minds to enquire into the cause of the wonderful harmony of Nature. Insensible to her benefits, they never offered her any homage; she never excited in their minds either admiration or gratitude. They resembled man in nothing but the figure; their organization indicated the most wretched degradation.

The Indians of the Oroonoko, who were not much less ignorant, believed, however, in an author of all things, to whom they addressed their prayers and adoration. Some tribes considered the sun as the supreme Being and the first cause: it was to him that they attributed the productions of the earth, scanty or copious rains, and all other temporal blessings; others, on the contrary, believed that every thing depended on the influence of the moon, and conceived, when she suffered an eclipse, that she was angry with them. When such a phenomenon occurred, these Indians practised the most ridiculous ceremonies, in order to prevent the chastisements with which they believed themselves to be menaced on account of their indolence and ingratitude. They played on warlike instruments, or took arms in their hands, to evince their valour, felled wood, or undertook other laborious exercises, to prove that they could not be charged with effeminacy, and punished for it, without injustice. The women left their huts, threw maize and other grains into the air, sending forth, at the same time, the most dolorous cries, promising to amend what was amiss in their conduct, and to be more laborious for the future. No sooner, however, was the eclipse over, than they congratulated each other on having averted the moon's wrath by specious promises; they afterwards gave themselves up to dancing, which terminated, like all their other festivals, in drinking and other acts of brutality. The Indians, who have not yet been subjugated, still preserve all these customs; and even several of the civilized tribes retain a few of them.

Some other tribes of Indians, who likewise dwelt upon the banks of the river Oroonoko, paid to toads the honours due to the divinity. Far from injuring these animals, they

carefully kept them in fine weather; power in this as their prayers rite performed dancing, to the small idols, to the temporaneous

carefully kept them under pots, in order to obtain rain or fine weather; and so fully persuaded were they of their power in this respect, that they scourged them as often as their prayers were not answered. The only religious rite performed by some other of these tribes, was that of dancing, to the sound of noisy instruments, before two small idols, to which they paid reverence by chaunting extemporaneous couplets.

All the Indians seem to agree respecting the immortality of the soul, but they do not concur as to what becomes of it after death. Some are of opinion that the soul takes up its abode in the same fields which the individual, to whom it belonged, cultivated during life. Others suppose that it retires to certain lakes, and is swallowed by monstrous serpents, which transport it to a paradise, where its time is occupied in constant dancing and drinking. When an Indian slays a wild beast, he opens its mouth, and pours down its throat some intoxicating liquor, in order that its soul may inform others of a similar species, of the kind reception it received, and that they may be encouraged to come and share the same favour.

Drinking and indolence constitute the supreme felicity of the Indians. The most intoxicating liquors are considered as preferable to all others. Their women formerly prepared a species of vinous liquor from fruits, such as ananas, &c., which possessed very inebriating qualities; but since the introduction of tafia, and other similar liquors, it is seldom prepared. The Indians never leave their hammocks unless when imperious necessity forces them to go a hunting or fishing; on which occasions they take their measures so well, that, by a single day's exertion, they generally secure subsistence and repose for a whole week.

The Otomaques, who occupy the upper parts of the Oroonoko, constitute an exception to this rule; possessing greater intelligence and activity than the other Indians, they spent almost their whole time, before the entrance of the missionaries among them, in constant action and sport, except those moments which were dedicated to sleep and lamentations over the dead.

On the rising of the sun, all of them, who were capable of labour, repaired to their respective chiefs, who assigned to each individual his task for the day. In seed-time, and harvest, a certain number of persons also applied themselves to the labours of the field, the products of which were lodged in public granaries, and shared out by the chiefs.

Annually, on the decrease of the waters of the Oroonoko, which occurs during February, incredible numbers of turtle repair to the banks of that river to deposit their eggs in the sand, and remain till they are sufficiently grown to procure subsistence for themselves. At this period, all the Indian tribes, who live near the borders of the Oro-

noko, resort with their families to the shores of that river, to lay in a supply of turtle, which, after drying, they store up for use; they also preserve the eggs, except those from which they extract an oil, that is no ways inferior to the best olive-oil. With these articles, independent of home-consumption, they carry on a considerable traffic with the Indians who live at a distance from the Oroonoko.

Marriage is established among all the Indian tribes throughout America. This institution is not considered by them as a religious rite; on the contrary, its sanctity is profaned by the universal practice of polygamy. But though there be no code prohibiting alliances between near relations, incestuous unions are never sanctioned by the form of marriage.

Fathers possess no control over the inclinations of their male children, but they exercise the most unlimited sway over those of the females of their family. They must implicitly submit to give their hand to the man of their parent's choice. Instead of giving a portion with his daughter, the father receives one from his son-in-law, who pays it under the form of labour, in game, fish, or other articles. Dancing and drinking constitute the whole ceremony of marriage.

On these occasions, the relatives of the bridegroom and bride are invited. The men bring along with them materials to build a hut for the young pair, and the females present them with fish, fruit, bread, and drink; the former chaunt couplets to the bridegroom, and the latter to the bride. As soon as it becomes dark, the young wife is presented to her husband, which concludes the ceremony. In order to render a female worthy of the hand of a chief, it is necessary she should be descended from a family distinguished by military exploits, or should have had one ancestor, at least, a great warrior.

Similar ceremonies prevail among all the tribes inhabiting the banks of the Oroonoko; they merely differ with respect to the kind of couplets chaunted by the old women to the bride.

The Otomaques are the only Indians who admit their women to participate in their diversions: among them, as elsewhere, the females are doomed to sustain the whole weight of domestic labour; but they are allowed occasionally to associate in the public amusements. This is also the only tribe among whom the practice of polygamy is not admitted. A singular custom prevails among these Otomaques, of always uniting a young man to an old woman, or a young woman to an old man: the reason assigned by them for establishing such alliances is, that the elder party is thus enabled to guide and instruct the younger. The other Indians marry as many wives as they please; but they are all, without distinction, equally oppressed, and equally unfortunate.

From the practice of polygamy, we may naturally infer

the frequency of divorces; and, in fact, a single word from a discontented husband is sufficient to effect a separation from a wife, who is, by this mean, condemned to perpetual infancy.

It has been asserted that jealousy cannot exist independently of love; notwithstanding, by a kind of fatality attached to the Indian women, the same man who never regards them with an eye of affection, punishes with the greatest severity their slightest infidelities. Among the Caribbees, adulterers are put to death by the people, in the public streets; but, among the greatest part of the other tribes, the husband himself takes vengeance upon the offending wife, and his vengeance is always commensurate to the offence.

From the manners of the Indians, we may readily conceive what kind of education they bestow upon their children; it is sufficient to have seen them as husbands, to be convinced how ill they must perform the duty of parents. From the tenderness they sometimes bestow upon their young children, they have been pronounced not wholly destitute of parental affection; but these demonstrations of kindness proceed from a different source. As soon as the children are able to procure sustenance for themselves, the father never thinks more of them, but to give them lessons of indolence, drunkenness, falsehood, and deceit. On the contrary, there are no children more unnatural than those of the Indians. Far from respecting the authority of their being, they bear towards him the most implacable hatred, and frequently wait, with impatience, until their own increasing strength, and his weakness, enable them to lift their hand against his life; and this species of outrage is always committed with impunity. The Indian children bear not, however, the same hatred towards their mother: witnesses of her sufferings, and the companions of her unfortunate life, until they arrive at a state of adolescence, they feel for her sentiments of pity, which ripen into affection.

An Indian never believes himself in a proper costume, unless his whole body be covered with red paint. Even infants at the breast are bedaubed in the same manner, twice a day. It is a law of hospitality among these tribes, when a stranger arrives at their dwelling, to cause the women to remove the paint from their bodies, and apply it anew. On the occasion of any public festival, in addition to the red paint, they ornament the body with designs of different colours; and the men appear with plumes of feathers on their head, and bits of gold or silver suspended from the ears and nose.

Such were the men with whom the Spaniards found it necessary to dispute the possession of Terra Firma; and such, at this day, are those tribes who have still preserved their independence, notwithstanding the arms of the conquerors, and the religion of the missionaries.

## SECTION III.]

## PERU.

*Situation, Extent, Boundaries, &c.*] This viceroyalty is situated between the equator and twenty-five degrees of south latitude, and extends from sixty to seventy-five degrees of west longitude, being about fifteen hundred miles in length, and five hundred in breadth. It is bounded by Terra Firma, on the north; by the Andes, on the east; by Ghili, on the south; and by the Pacific Ocean, on the west. It is said, that the Spaniards who discovered it, meeting with one of the natives on the coast, and demanding what country it was, the Indian answered Peru, or Beru, that is, What do you say? The Spaniards, apprehending he understood them right, concluded the name of the country was Peru, by which it has been called from that time to the present. The northern division contains the province of Quito. The middle division that of Lima, or Los Reyes; and the third division that of Los Charcos.

The limits of Peru were greatly restricted during the course of the last century; as, in 1718, the provinces of Quito in the north, as far as the river Tumbez, were annexed to the viceroyalty of New Grenada, which has an easy intercourse with Europe, by the harbour of Carthagena, and the intermediate station of Havannah; and in 1778, a number of opulent provinces in the south of Peru were allotted to the new viceroyalty of La Plata. Modern Peru, therefore, extends north and south from the river Tumbez to the chain of Vilcanota, being, by the computation of Estalla, two hundred and eighty-nine geographical leagues; but along the coast to the river Loa, the length may be four hundred and twenty-three leagues. The irregularity of its breadth offers a medium of about eighty leagues, so that the contents may be thirty-three thousand six hundred and thirty square leagues.

*Seas, Bays, Rivers, &c.*] The only sea which borders on Peru is the Pacific Ocean. The principal bays and harbours are Payta, Malabrigo, Cuanchaco, Cosma, Vermeio, Guara, Callao, Ylo, and Arica. The rivers Granada, Oroonoko, and Amazon, or Plata, rise in the Andes. Many other rivers rise also in the Andes, and fall into the Pacific Ocean, between the equator and eight degrees of south latitude. There are some waters in this country which have such a petrifying quality, that, in their course, they cover whatever they pass over with stone; and there are springs of liquid matter, resembling pitch and tar, and used by seamen for the same purpose.

*Soil and Climate.*] Though Peru lies within the torrid zone, yet having on one side the South-Sea, and on the other the great ridge of the Andes, it is not so hot as other tropical countries. The sky, too, which is generally cloudy, defends it from the direct rays of the sun; but, what is extremely singular, it never rains. This defect,

however, is falls gradually the plants greatest fertility barren and extremely poor country.

*Minerals.* one which value, consumed, and The principal caveica, di mass, reser latilized by of glass ve water, at the heavy liquid called *plati* and, from its itself.

*Animals.* are the Pe are about the body is cov

however, is sufficiently supplied by a gentle dew, which falls gradually every night on the ground, and so refreshes the plants and grass, as to produce in many places the greatest fertility. Along the sea-coast is generally a dry barren sand, except by the banks of rivers, where it is extremely fertile, as are all the low lands in the inland country.

*Minerals.*] Peru contains mines of gold and silver, and one which produces quicksilver, an article of immense value, considering the various purposes to which it is applied, and especially the purification of gold and silver. The principal mine of this metal is at a place called Guancavelica, discovered in 1567, where it is found in a whitish mass, resembling brick ill burned. The substance is volatilized by fire, and received in steam by a combination of glass vessels, where it condenses, by means of a little water, at the bottom of each vessel, and forms a pure heavy liquid. In Peru, likewise, is found the new substance called *platina*, which may be considered as an eighth metal, and, from its superior qualities, may almost vie with gold itself.

*Vegetable Productions.*] A considerable article in the produce and commerce of this country is the Peruvian bark; better known by the name of Jesuit's bark. The tree which produces this drug grows chiefly in the mountainous parts of Peru, and particularly in the province of Quito. The best bark is always produced on the high and rocky grounds: the tree which bears it is about the size of a cherry-tree, and produces a kind of fruit resembling the almond; but it is only the bark which has those excellent qualities that render it useful in fevers, and other disorders. Cayenne pepper is produced in the greatest abundance in the vale of Arica, a district in the southern parts of Peru, whence they export it annually to the value of six hundred thousand crowns. Peru also produces the opuntia, or prickly pear, the fruit of which nourishes the cochineal, an insect which constitutes one of the most valuable articles of the commerce of this country. A very useful tree here is called *maguey*, which at once supplies a delicious drink, honey, vinegar, timber, hemp, and thread; the two last being made from the leaves, stalk, &c. Needles are made of the prickles, and the fruit is converted into a kind of soap. Rhubarb, tamarinds, sarsaparilla, dragon's blood, storax, guaiacum, bananas, melons, &c. are other vegetable productions of Peru. Here are European corn and fruits in plenty, but the principal part of the bread is made of cassava-root: but most of that balsam which bears the name of Peru comes, in fact, from Mexico.

*Animals.*] The most remarkable animals of this country are the Peruvian sheep, called pacos or huancu. They are about the size of a stag, and resemble a camel. The body is covered with a coarse kind of wool: they are very

tractable, and were formerly the only beasts of burden among the Indians. Their flesh is very palatable, as white as veal, and easy of digestion. Their height is from four feet to four and a half. They walk with wonderful gravity and majesty, and at so regular a pace, that no beating will make them alter it. At night it is impossible to make them move with their burden; they lie down till it is taken off, and then go to graze. Their common food is a sort of grass, somewhat like a rush, with which all the mountains are covered. These sheep eat little, and never drink; so that they are very easily kept. The Spaniards use them in the mines to carry the ore to the mills. The vicunas (another species of sheep) are shaped like the pacos, only they are smaller and lighter. The Spaniards call them Indian goats, because they resemble that animal. Their wool is very fine, and much valued; the bezoar stone, which is said to perform many great cures, is found in them. The lama has a small head, resembling that of a horse and a sheep at the same time. It is about the size of a stag, its upper lip is cleft like that of a hare, through which, when enraged, it spits a kind of venomous juice. The flesh of the lama, however, is agreeable and wholesome, and the animal is not only useful in affording wool and food, but also as a beast of burden. It can endure amazing fatigue, and will travel over the steepest mountains with a burden of sixty or seventy pounds. It feeds very sparingly, and never drinks. The deer are much less than ours. They have not many wild beasts, and such as they have are neither very fierce nor dangerous. The cattle imported from Europe are much increased; and most of them run wild, and are hunted, like other game. The Peruvians have no tame fowl, except the nuana, which somewhat resembles the duck, but is considerably larger.

*Antiquities.*] The antiquities of Peru are deserving of notice. A high road is mentioned, said to pass for not less than four hundred leagues to the northern and southern provinces. The ruins of the temple of the Sun at Cuzco are formed of stones fifteen or sixteen feet square, and which, though of the most irregular shapes, are so exactly adjusted, that no void is perceivable. This is similar to the Pelasgian style of building, which is found in the most ancient monuments of Greece and Italy. Many ruins are also found of the edifices called *tambos*, where the Incas lodged when they travelled. Bouguer says that the walls are often of a kind of granite, and the joints very perfect; there are sometimes even moveable rings hewn out of the stone itself. Subterranean passages appear leading from the fortresses. The tombs, like those of other ancient nations, were barrows resembling natural hillocks; and in a space fenced off with stakes was placed the body, with various dresses, little images of gold, silver, copper, or clay, and various weapons and utensils: the treasures found in these tombs have some-

times been immense. In those of the women were found round mirrors, made of marcasite or compact pyrites, thence called the mirror of the Incas; and figures of quadrupeds, birds, and reptiles, have also been found, as in Egypt.

*Government.*] The authority of the viceroy extends over all Peru, except Quito, which has recently been detached from it. The viceroy is as absolute as the king of Spain. All officers are appointed, and places filled up, by him. For the security of his person he has two corps of guards, one of horse, and the other of halberdiers. The horse-guards consist of one hundred and sixty, under the command of a captain and lieutenant; and their uniforms are blue, laced with silver. The halberdiers, fifty in number, are clad in crimson velvet waistcoats, deeply laced with gold, and do duty in rooms leading to the royal audience-chamber. Besides these, there is another guard within the palace, of one hundred men, being a detachment from the garrison of Callao. All officers are occasionally employed in executing the orders of the viceroy, and enforcing the decrees of the tribunals, after they have received the royal assent, for such the concurrence of the viceroy is esteemed; who, besides assisting at the courts of justice and councils, gives daily audience to all ranks of persons. The supreme tribunal of Lima, called Audiencia, is held in the viceroy's palace, and consists of eight auditors, and a fiscal, for civil affairs. Here are also a chamber of accounts, a board of treasury, a court for the effects of persons dying intestate and without lawful heirs, a council of commerce, and a tribunal of the inquisition. The government of the viceroy is triennial, though at the expiration of that term the sovereign may renew his commission.

*Cities and Towns.*] LIMA, the capital of Peru, is situated in the middle of a spacious and delightful valley; and is so well watered by the river Rimac, that the inhabitants, like those of London, may be said to command a stream. There are many magnificent structures, particularly churches, in this city; though the houses in general are built of slight materials, the equality of the climate, and want of rain, rendering stone houses unnecessary; and, besides, it is found, that these are more apt to suffer by shocks of the earth, which are very frequent all over this province. The population amounts to nearly sixty thousand inhabitants, of whom the whites constitute a sixth part.

All travellers unite in stating that the churches are profusely decorated with gold, silver, and precious stones. The merchants of Lima may be said to deal with all quarters of the world, and that both on their own accounts and as factors for others. Here all the products of the southern provinces are conveyed, in order to be exchanged, at the harbour of Lima, for such articles as the inhabitants

of Peru stand in need of; and the commodities of Asia, Europe, and America, are here bartered for each other. What there is no immediate sale for, the merchants of Lima purchase on their own accounts, and lay up in warehouses, knowing that they must soon find a market for them; since, by one channel or other, they have a communication with almost every commercial nation. Some of the barks, or vessels, are made like double canoes, joined together with poles which pass cross-ways, and, being covered with a skin, serve the boatmen to sit upon. Others are constructed in the form of rafts, with a large sail made of matting, and a rudder at one end, near which there is a fire-place, or hearth, and a fire always alight. Between the two masts there is a kind of a cabin on the deck, and the masts themselves join at the top, and support not only the sail, but a little pennant.

The place of bridges is supplied by contrivances called *tarabites*: these are ropes, or thongs of leather, extended from one side of the river to the other, and fastened to piles of wood fixed in the earth. A hammock, with two loops, hangs to these, in which a man may lie at his ease. Those who attend on the side from whence he sets off, give him a push, which carries him into the middle with great velocity: from the middle, those on the opposite side pull the hammock by ropes fastened to it, and the person thus gets over in a few seconds. For the passage of horses or mules, there are two ropes, at a small distance from each other. The animal, being tightly girded, is suspended upon a flat piece of wood, between the two ropes, to which he is fastened by grooves, and drawn over by ropes. Some beasts will go over very quietly, but others are forced to have their legs tied. In many places the tarabites are made of skins spread all the way over the river, for people to walk upon, who hold by a rope on each side, which secures them in the manner of a railing, and enables them to pass the unsteady bridge without any danger.

All the wealth of the inhabitants, all the beauty of the situation, and fertility of the climate of Lima, are not sufficient to compensate for one disaster, which always threatens, and has sometimes actually befallen, them. In the year 1747, a most tremendous earthquake laid three-fourths of the city level with the ground, and entirely demolished Callao, the port town belonging to it. Never was any destruction more terrible or complete; not more than one of three thousand inhabitants being left to record this dreadful calamity, and he by a providence the most singular and extraordinary imaginable. This man, who happened to be on a fort which overlooked the harbour, perceived, in one minute, the inhabitants running from their houses, in the utmost terror and confusion; the sea, as usual on such occasions, receding to a considerable distance, returned in mountainous waves, foaming

with the violence of the agitation, and buried the inhabitants for ever in its bosom; immediately all was silent; but the same wave which destroyed the town drove a little boat by the place where the man stood, in which he threw himself, and was saved.

The public entrance of the viceroy is a solemnity the most splendid, in which the amazing pomp of Lima is particularly displayed. Nothing is seen but rich coaches, calashes, and other splendid equipages, in which the nobility carry their emulation to an astonishing height.

On the landing of the viceroy at Paita, two hundred and four leagues from Lima, he sends a person of distinction (generally some officer of his retinue) to Lima, with the character of an ambassador, and, by a memoir, informs his predecessor of his arrival, in conformity to his majesty's orders, who had been pleased to confer on him the government of that kingdom. On this ambassador reaching Lima, the late viceroy sends a messenger to compliment him on his safe arrival; and, on dismissing the ambassador, presents him with some jewel of considerable value, and a jurisdiction or two, which happen at that time to be vacant, together with an indulgence of officiating by deputy, if most agreeable to him. The corregidor of Piura receives the new viceroy at Paita, and provides litters, mules, and every other necessary, for him and his retinue, as far as the next jurisdiction. He also orders booths to be built at the halting-places in the deserts; attends him in person, and defrays all the expences, till relieved by the next corregidor. Being at length arrived at Lima, the viceroy proceeds, as it were, incognito, through the city to Callao, about two leagues and a half distant. In this place he is received and acknowledged by one of the ordinary alcades of Lima, appointed for that purpose, and also by the military officers. He is lodged in the viceroy's palace, which, on this occasion, is adorned with astonishing magnificence. The next day all the courts, secular and ecclesiastical, wait on him from Lima, and he receives them under a canopy.

The second day after his arrival at Callao, he goes in a magnificent equipage, provided for him by the city, to the chapel de la Legua, so called from its being about half-way between Callao and Lima, where he is met by the late viceroy, and, both alighting from their coaches, the latter delivers to him a truncheon, as the ensign of the government of the kingdom. After this, and the usual compliments, they separate.

If the new viceroy intend to make his public entry into Lima in a few days, he returns to Callao, where he stays till the day appointed; but, as a longer space is generally allowed for the preparations necessary to such a ceremony, he continues his journey to Lima, and takes up his residence in his palace; the fitting up of which, on this

occasion, is committed to the junior auditor and the ordinary alcade.

On the day of public entry, the streets are cleaned, and hung with tapestry; and magnificent triumphal arches are erected at proper distances. At two in the afternoon, the viceroy goes privately to the church belonging to the monastery of Montserrat, which is separated by an arch and a gate from the street, where the cavalcade is to begin. As soon as all who are to assist in the procession are assembled, the viceroy and his retinue mount on horses, provided by the city for this ceremony, and, the gates being thrown open, the procession begins in the following order:—

The militia; the colleges, the university, with the professors in their proper habits; the chamber of accounts; the audiencia, on horses with trappings; the magistracy, in crimson velvet robes, lined with brocade of the same colour, and a particular kind of caps on their heads, a dress only used on this occasion. Some members of the corporation, who walk on foot, support the canopy over the viceroy; and the two ordinary alcades, who are in the same dress, and walk in the procession, act as equerries, holding the bridle of his horse.

This procession is of considerable length, the viceroy passing through several streets till he comes to the great square, in which the whole company draw up facing the cathedral, where he alights, and is received by the archbishop and chapter. *Te Deum* is then sung, and the officers are placed in their respective seats; after which the viceroy again mounts his horse, and proceeds to the palace-gate, where he is received by the audiencia, and conducted to an apartment, in which a splendid collation is provided, as are also others for the nobility, in the anti-chambers.

The next morning the viceroy returns to the cathedral in his coach, with the retinue and pomp usual in public ceremonies. He is preceded by the whole troop of horseguards, the members of the several tribunals, in their coaches; and after them the viceroy himself, with his family, the company of halberdiers bringing up the rear. On this occasion all the ornaments of the church are displayed; the archbishop celebrates, in his pontifical robes, the mass of thanksgiving; and the sermon is preached by one of the best orators of the chapel. From hence the viceroy returns to the palace, attended by all the nobility, who omit nothing to make a splendid figure on the occasion. In the evening of this, and the two following days, the collations are repeated. And, to increase the festivity, all women of credit have free access to the halls, galleries, and gardens, of the palace, where they are fond of shewing the dispositions of their genius, either by the vivacity of their repartees, or their spirited conversations.

This ceremony is succeeded by bull-feasts, at the city's

numerous volcanos, and the high mountain of Catopaxi, has been frequently described as a terrestrial paradise. But on the 4th of February, 1797, a quarter before eight o'clock in the morning, the most terrible earthquake commenced that had been known since the conquest. At Quito little damage was sustained, but the subterraneous thunder, and the shocks repeated every six hours, occasioned unceasing horrors and dismay. On the 5th, in the evening, it was known that Latacunga, and all the adjacent hamlets, were utterly destroyed, not one stone remaining upon another. Many persons perished, and the stench of the dead bodies infected the survivors. Near Ambato many mountains split, and by their sudden fall occasioned still greater destruction among the human race. Quero, with all its inhabitants, were buried, in one instant, by a cliff which fell on the town. Pelileo was overwhelmed by a stream of water and mud; the circumjacent lands were all transposed; and a deadly silence marked the general ruin.

The elegant town of Riobamba became one heap of ruins and desolation, and soon totally disappeared; for the peak of Sicalpa falling on the town, and stopping the two rivers which pass by it, formed a lake, so that even the ruins were not visible. Of nine thousand inhabitants, only about four hundred escaped destruction.

*Customs, Manners, &c.*] The manners of the inhabitants do not remarkably differ over the whole Spanish dominions. Pride and indolence are the two predominant passions. It is said; by the most authentic travellers, that the manners of Old Spain have degenerated in its colonies. The Creoles, and all the other descendants of the Spaniards, according to the above distinction, are guilty of many mean and pilfering vices, which a true-born Castilian could not think of but with detestation. This, no doubt, in part arises from the contempt in which all but the real natives of Spain are held in the Indies; mankind generally behaving according to the treatment they meet with from others. In Lima, the Spanish pride has made the greatest descents, and many of the first nobility are employed in commerce.

The Peruvians possess a quickness of wit, and strength of judgment. Such of them as have had the advantage of masters, since the arrival of the Spaniards, have generally made an extraordinary proficiency. When the Spaniards first appeared among them, they acknowledged one Almighty Being, maker of heaven and earth, whom they called *Pacha Camac*, or The Soul of the Universe. The next object of adoration was the sun; the priests of which, who officiated at Cuzco, were of the blood-royal. Besides their festivals, celebrated every month, they had four other grand ones, the principal of which was celebrated in June, in honour of their first Inca, Mango Capac.

The meanest of the Europeans assume a degree of pomp, as soon as they find themselves transported among the Indians, blacks, mulattoes, mestizoes, &c. Any good or generous actions, performed by them, are the effects of their vanity and imaginary nobility. The Creoles bear a great antipathy to the native Spaniards, of which one reason is supposed to be, because they see those strangers in possession of the prime places of the state. In their outward behaviour they affect great gravity, like the European Spaniards, to whom they are not inferior in wit and genius, acuteness, and understanding, but less active and hardy. Effeminacy and sloth seem to be peculiar to the inhabitants of this country; for it is observed, that those who have been bred to labour in Spain, grow idle here in a short time, like the Creoles. They are sober as to wine, but eat a great deal, and in an indecent manner, sometimes all out of the same dish, and without forks.

The Creoles freely sacrifice to their passions. Illegitimate are as much regarded here as lawful children, provided they are owned by the father, and there is no disgrace inherent to that birth. The Creole females, though not under the restrictions of the Spanish women, seldom go abroad in the day-time; but at night they pursue their pleasures with great freedom, and are fond of intriguing, though they usually conduct their gallantries under the shade of their veils.

*History.*] The empire of the Incas is supposed to have lasted between three and four hundred years. There were seventeen of these sovereigns:—*Manco*, the first Inca, is supposed to have reigned in the twelfth century: he declared himself and his sister, Oello, children of the sun, and married her; and, after many laws and institutes to reclaim a savage race, received from his people the title of *Capac*, or *rich in virtue*. He founded the temple of the Sun at Cuzco, the capital of his empire, and appointed virgins of the royal blood to serve that divinity. *Sayri Tupac*, the last of the Incas, resigned the sovereignty to Philip II. of Spain, and died a Christian, leaving only one daughter, who married Onez de Loyola, a Spanish knight, from whom have descended the marquises of Orepesa and Alcanises.

The monarchy of the Incas extended from the river Tumbez in three and a half degrees, (not to speak of the subjection of Quito,) to the river Mauli in Chili, in thirty-five degrees, that is, nearly one thousand nine hundred geographical miles, while the Mexican princes only ruled a country of about one third of the extent. The comparative magnificence of the Peruvian monarchs is not, therefore, a matter of surprise. The Peruvians were also far above the Mexicans in civilization. The former had advanced beyond the latter in the necessary arts of life. Manures and irrigation were known to them. Their edifices were sometimes of bricks hardened in the sun: but others were

constructed of large stones, the walls, however, never exceeding twelve feet in height. Their weapons and ornaments also displayed a great degree of skill, and they were expert in cutting and piercing emeralds: nevertheless superstition led them to sacrifice numerous victims on the death of a chief; and a favourite monarch was sometimes followed to the tomb by a thousand servants intended for slaughter. At present, however, it is impossible to discover in the manners of the Peruvian natives any marks of their ancient advancement.

The language of the Peruvians was called the Quechua, and it is still cultivated by the Spanish clergy, who consider it indispensable in the conversion of the natives.

#### SECTION IV.

#### LA PLATA, OR BUENOS AYRES.

This viceroyalty was erected in the year 1778, and is not only the most important of all the divisions, but that by which the chief opulence of the Spanish dominions in South-America passes to the parent country, and is interwoven with the commerce and interests of Europe. Including the savage Chiquitos and Mojos, in the north, and extending to the southern limits of Tuyu and the plains called the Pampas, its length from the chain of Vilcanota to near the river Negro may be twenty-four degrees, or one thousand six hundred and sixty-eight British miles. The breadth, which is pretty equal, may be estimated at twelve degrees, or eight hundred and thirty-four British miles. Estalla computes the extent at one thousand American leagues, but includes Chili in a vague manner, and the greatest breadth at three hundred and fifty, forming a triangle of one thousand leagues in height, on a base of three hundred and fifty, equal to one hundred and seventy-five thousand square leagues; which might, he adds, support fifty millions of persons, while it in fact contains scarcely one million of civilized inhabitants, and a few hordes of savages.

[Provinces.] Before the erection of this viceroyalty, most of the jurisdiction belonged to that of Peru, although the three provinces of Buenos Ayres, Paraguay, and Tucuman, were considered as *Capitanias Generales*, that is, the governors had an authority independent of the viceroys of Peru, except in instances of great importance and difficulty. The part of Peru now annexed to La Plata, was divided into several provinces or districts; and the missions of the Chiquitos, Mojos, and Guaranis, formed three distinct governments. When this new viceroyalty was proclaimed, the form of government remained the same, the title alone being changed. The ordinance of his Catholic majesty, for the subdivision of the viceroyalty, was issued in 1782, and appointed nine Intend-

encies. But, in a geographical description, an account of the *principal* provinces will be the clearest method.

The province of Buenos Ayres, in the lower part of the viceroyalty, comprehends three other cities besides the capital, namely, Monte-Video, Corrientes, and Santa Fé. The chief products of this province are oxen and mules. Cordova is celebrated for woollen manufactories, being seated on the eastern side of a grand branch of the Andes. The rivers in these parts are mostly torrents, which swell with the rains, but at other times they are left nearly dry. Several are lost in lakes and marshes, in the wide plains of Chaco.

The name of Tucuman has become obsolete, and that town is now in the intendency of Salta. The province of Cuyo lies amidst the mountains which extend from the great chain towards Cordova, but there are many fertile valleys: being separated from Chili by the Andes, the administration is annexed to that of Cordova. Cuyo produces, in great abundance, grapes, figs, pears, apples, and most kinds of European fruits, which form the chief articles of its trade. Wines, brandy, and dried fruits, are also carried to Buenos Ayres, Cordova, and other parts. The wines differ considerably from those of Europe, but are preferred for daily use. Mendoza and San Juan de la Frontera are said to have exported, in one year, more than twenty thousand barrels of wine, which produced two hundred thousand dollars, besides brandy. The mountains of Cuyo and Rioja also abound in metals; but the passes being more difficult than that of Mendoza, there is no inducement to work them. There are many flocks of vicuñas in the northern part of the same chain, whose wool is sometimes used in the country, but it is chiefly sent to Europe, where it is celebrated as the best for making broad cloths, uniting the gloss of silk with the fineness and warmth of wool; while the native fawn-colour can scarcely be exceeded in beauty.

The villages of the Guaranis, which compose a government called that of the Missions, amount to thirty, from the river Tebiqueri, in Paraguay, to the frontiers of Buenos Ayres, being mostly to the east of the river Parana; the eastern borders of the Guaranis extend along Brasil, while on the west they border on Paraguay, Corrientes, and Santa Fé:

Although the fertile province of Paraguay produces none of the precious metals, it is one of the most opulent in the new viceroyalty, from its vegetable productions, and from the prodigious herds of horses, mules, cattle, and sheep, which cover its extensive plains. The northern parts of Paraguay have, however, been little explored, as the settlements of the Jesuits were chiefly in the southern skirts, and among the adjacent Abipons and Guaranis.

valuable drug called by the name of the country. This is an excellent emetic, and of itself might form a considerable article of commerce. There is a variety of fruit, and prodigious rich pastures, in which are bred such herds of cattle, that, it is said, the hides of the beasts are all that is really bought, the carcasses being, in a manner, given into the bargain. A horse, some years ago, might be bought for a dollar; and the usual price of a bullock, chosen out of the herd of two or three hundred, was only four rials. But, contrary, to the general nature of America, the country is destitute of woods.

The whole of this province abounds with bees, which make their hives in the hollow trees. There are ten different species of these useful insects. The most esteemed, for the whiteness of its wax, and the delicacy of its honey, is called *openus*, but this is very scarce. The cotton-tree is a native of this country. The Spaniards sow and use hemp in large quantities.

Venomous herbs, with which some Indians poison their arrows, abound here; but the antidotes are no less common.

Here are vast numbers of all kinds of serpents, and the rattle-snake, in particular, is a very formidable creature. This reptile suffers greatly when its gums are too much distended with venom; to get rid of which, it falls upon every thing in its way, with two crooked fangs, terminating in a point; and, by means of a hollow in these fangs, pours into the wound it makes, all the venomous matter which tormented it. The effects of the bite are sudden, and the consequences dreadful, unless antidotes are speedily applied. The chief antidote is a stone, to which they have given the name of St. Paul Bezoar, and a poultice of chewed garlick. The surest method, however, is to make an incision directly in the part that has been stung, and then apply brimstone to it; it is even said that this drug alone has been frequently found to make a perfect cure.

*Bays, Lakes, &c.]* The principal bay is that at the mouth of the river La Plata, on which stands the capital city of Buenos Ayres; and Cape St. Antonio, at the entrance of the bay, is the only promontory. This country abounds with lakes, one of which, Casacoroes, is one hundred miles long.

*Rivers.]* This country, besides an infinite number of small rivers, is watered by three principal ones, the Paraguay, Uruguay, and Parana, which, united near the sea, form the famous Rio de la Plata, or Plate River, and which annually overflow their banks; and, on their recess, leave them enriched with a slime that produces the greatest plenty of whatever is committed to it.

*Manners, Customs, &c.]* The natives of this country are, in general, of a moderate stature, and well made. They have flat round faces, olive complexions, and long

black hair. Their garments were formerly the skins of beasts, but now, in most things, they conform in dress to the Spanish fashions. Previous to their embracing Christianity, they worshipped the sun, moon, stars, thunder, lightning, groves, rivers, animals, &c. The women are allowed to propose matches, as well as the men. When an Indian woman wishes to be united to a man, she acquaints one of the missionaries with it, who immediately sends for the young man: if he does not like her, the priest persuades the woman to overcome her passion; but, on the contrary, if the man be inclined to return her affection, the priest immediately marries them, and gives his blessing. The wives of the petty princes wear a kind of triple crown, made of straw, and their lords hang doekins over their shoulders. The boys and girls go entirely naked. They wrap up their infants, as soon as born, in a tiger's skin, and give them the breast for a little while, and then a piece of half-raw meat to suck. Their beds are the hides of oxen, or tigers, spread on the ground; but people of rank use hammocks of net-work.

The uncultivated inhabitants of Paraguay, especially the Chaconese and the Guaranis, are of an extraordinary stature; and there have been found men among them near seven feet high. Their features differ greatly from those of the inhabitants of Europe; and the colours with which they paint themselves give them a terrifying aspect. Most of the men go naked, except a parcel of feathers, of different colours, hanging to a string about the waist. But at their public solemnities they wear caps, made of the same feathers. In very cold weather they wrap themselves up in a kind of cap and cloak, made of skins, adorned with figures. Among some tribes, the women are not better covered than the men. The bad qualities common to all these people are, ferocity, inconstancy, perfidy, and drunkenness. There is, properly speaking, no form of government among them. Every town, indeed, has its cacique; but these chiefs have no authority, but in proportion to the esteem they have acquired. Many of them do nothing but rove from place to place with their furniture, which consists of a mat, a hammock, and a calabash. The cabins of those who live in towns are no better than wretched hovels, made with branches of trees, and covered with straw, or rather grass. Those who live nearest to Tucuman are better lodged and clothed.

Their favourite beverage is chicha. They assemble to drink it, and to dance and sing; and in these exercises they persist till they are all intoxicated. They then quarrel, and from words soon proceed to blows; so that their merry-makings seldom terminate without bloodshed. These exercises are almost peculiar to the men. The women generally withdraw the moment they perceive the men to be inebriated, and carry off with them all the weapons they can lay their hands on.

Their arms are bows, arrows, and lances, which they use with equal strength and dexterity. They fasten a rope to the latter, by which they can, as the end is barbed, draw the wounded person to them. Besides sawing the necks of their prisoners with the jaw-bone of a fish, they scalp them, and preserve the scalps as tokens of victory. They are admirable horsemen, and tame and manage wild horses with great address, which has made the Spaniards repent ever having stocked the country with those useful animals.

The Chaconese women have a custom of pricking their faces, breasts, and arms, in order to mark them. They are strong and robust, and bathe themselves and their children immediately after delivery. They are very jealous of their husbands, yet entertain but little affection for their offspring.

These people usually bury their dead on the spot where they expire; plant a javelin, and the skull of an enemy, (if they can get one,) over the grave; and then remove to a distance from the place.

When the Spaniards first arrived in this country, the people lived in populous towns, and were governed by caciques, who were hereditary, and independent of each other. But if the succession failed, the election of a new cacique usually fell upon one famed either for his valour or eloquence. At the death of a cacique, it was lawful for one of his brothers to marry the widow; but this seldom happened. In general, these Indians did not approve of such marriages between near relations; and the men among them, who have embraced the Christian religion, never marry any of their relations, even within those degrees with which the church dispenses.

A number of forms and customs, some ridiculous, and others barbarous, were observed amongst them. The ceremonies they observed in giving names to their new-born children, will best serve to give a just idea of the savageness of this nation. Thinking it unlawful to perform the ceremony without the death of a prisoner of war, they deferred it till they could take one. After entertaining him plentifully for several days, they cut his throat, on the day appointed for that purpose, with great solemnity. As soon as he was dead, every one touched his body, or struck it with a stick; and during this operation they gave names to all the children that had not as yet received any. This done, the body was cut up, and every family took home a piece of it to make into broth, of which every one took a mouthful, not excepting children at the breast, whom their mothers took care to make partakers of this dreadful repast.

Their manner of receiving persons returning from a long journey, was very singular. The traveller, on entering his cabin, immediately seated himself, without uttering a syllable; and the next moment the women began

to walk round him, observing the same silence all the time, till at last they suddenly burst out into exclamations, which were followed by a long relation of all the disagreeable events that had happened in his family during his absence. The men, covering their faces, repeated the same things in a low tone of voice. This ceremony lasted a longer or shorter time, in proportion to the esteem they had for the traveller. At last they all congratulated him on his happy arrival, and entertained him in the best manner they were able.

Previous to marriage, the intended bride was placed under the care of a woman appointed for that purpose, for the space of eight days. It was the business of the latter, during the whole time, to make the former work hard, to tease and thwart her, and in fine not permit her to have any peace. If she went patiently through this severe trial, her hair was cut off, and she was declared marriageable. Physicians and fortune-tellers were formerly in great repute here. They were, however, only jugglers, pretending to prophecy from the singing of birds, and to cure diseases by sucking the part affected.

*Cities, &c.* BUENOS AYRES was founded by the Spaniards in 1515, and received its name from the excellence of the air on the south side of the river La Plata. This is one of the most considerable cities in South-America, and the only place of traffic to the southward of Brazil. Here we meet with the merchants of Europe and Peru; but no regular fleet comes here, as to the other parts of Spanish America; two, or at most three, register-ships, make the whole of their regular intercourse with Europe. Their returns, however, are very valuable, consisting chiefly of the gold and silver of Chili and Peru, sugar, and hides. Those who have now and then carried on a contraband trade to this city, have found it more advantageous than any other whatever. The benefit of this contraband is now chiefly in the hands of the Portuguese, who keep magazines for that purpose, in such parts of Brazil as lie near this country.

Buenos Ayres, by the latest observations, is situated in thirty-four degrees forty-six minutes of south latitude, and in fifty-two degrees sixteen minutes of west longitude, from the royal observatory at Cadiz. The streets are broad and straight, but they are rather inconvenient in the rainy season, having little or no declivity, while, during drought, the dust is rather troublesome. As stone is rare, the houses are built of brick, the lime being procured from banks of shells; nor is there any edifice that deserves the epithet of magnificent: but the agreeable regularity of the buildings gives it the air of an English city. The houses of the rich have generally a vestibule, and a court surrounded by the apartments. The cathedral is in the square, being a new structure on the site of the former, which became ruinous in the middle of the last century. The

present has three naves, besides several chapels; in 1798, it had cost half a million of dollars, and would cost as much more to complete it, which is probably now accomplished.

The population of this city, which is rapidly augmenting, is supposed to be about forty thousand souls, of whom the Spaniards compose one half, the other half consisting of negroes, mulattoes, and some few Indians, who come from other parts. Of those called Spaniards, some are creoles, born in the country of white parents; and all are chiefly employed in commerce, the arts, and agriculture, while the people of colour are mostly servants. The merchants form a great part of the population, and the greater number are not natives. From Spain, and particularly from Cadiz, are imported most of the necessaries, as silks, woollens, cotton, linens, hats, &c. They are debarked at Monte-Video, and carried in boats to Buenos Ayres, whence they may pass to any part of the viceroyalty, paying four per cent. on the sale, if carried to the frontier provinces, and six per cent. in other cases. The merchants are esteemed men of character and good credit. The introduction of money into Peru is prohibited. But if Buenos Ayres were not the capital of the viceroyalty, and at present the grand mart of Peruvian commerce, its trade would be inconsiderable. The prodigious number of mules bred in the interior provinces of Cordova and Salta, is of great importance, as they are indispensably necessary in Peru, where many thousands are annually sold.

In manners and accent, the inhabitants greatly resemble the Andalusians. Though all are ambitious to shine, and the means of acquiring riches are more abundant than in Lima or Mexico, there is neither perceivable the excessive opulence, nor the contrast of misery and poverty, of those capitals. Female dress is rarely decorated with diamonds, but topazes are in general use.

The market of Buenos Ayres is abundantly supplied with all kinds of plants, fruits, meat, bread, fish, fowl, milk, &c. Nearly one thousand head of cattle are slaughtered in the neighbourhood for the daily use of the city, and are brought in carts to the market, where they are examined by a sworn proveditor. Fish is also abundant.

MONTÉ-VIDEO is celebrated for its harbour, the most considerable and advantageous in this viceroyalty. Struck with the situation, Don Bruno de Zaballa, with fourteen or fifteen families, from the isle of Palma, one of the Canaries, established himself here in 1731; since which time the population has been gradually on the increase. Such is the abundance of the country, that it is a check to the industry of the poor, and there is a class of vagabonds, called *gauderos*, whose manner of life resembles that of the gipsies of Europe, excepting that they do not steal. These *gauderos* go meanly clothed, while the coverings

of their horses serve them for a bed, and the saddle for a pillow. The guitar and amoros ditties form their sole occupation; and they thus delight the rustics, who, in recompense, lodge them, and give them abundance of food. If a horse be lost among them, another is given, or caught among the wild ones, which abound in the neighbourhood. The wild cows, or heifers, supply abundance of food, and are sometimes killed for the tongue, the marrow-bones, or other delicate parts. The marrow is eaten liquid, the bone itself serving as a pot. Sometimes, in their rude cookery, an ox is gutted, and all the tallow lodged within, which, being set on fire, serves to roast the remainder.

## SECTION V.

### CHILI.

*Situation, Extent, and Boundaries.*] This country is very extensive, reaching from the frontiers of Peru to the Straits of Magellan. It is situated between twenty-five and forty-five degrees of south latitude, being about one thousand two hundred miles in length, and five hundred in breadth. It is bounded, on the north, by Peru; on the east, by La Plata; on the south, by Patagonia; and, on the west, by the Pacific Ocean.

*Provinces, Climate, and Productions.*] Chili is divided into three provinces, St. Jago, Concepcion, and Chicuito; and, lying south of the equator, the seasons are almost opposite to those in the northern hemisphere; but the face of the country, except on the sea-coast, is beautiful, and the climate wholesome. On the east the country is screened by the Andes, while, from the west, the air is cooled by refreshing breezes. Along the coast of the Pacific Ocean they enjoy not only a fine temperate air, but a serene sky, most part of the year. Sometimes, indeed, the winds that blow from the mountains are exceedingly sharp in winter; but, in general, this is one of the most pleasant climates in the world, being a medium between the intense heats of the torrid, and the piercing winds of the frigid, zone.

This country abounds in gold, silver, copper, tin, quicksilver, iron, lead, &c. The soil produces Indian and European corn, hemp, and fruits, in great variety and abundance. Among several remarkable herbs produced in this country, some of which are medicinal, and others applied to various uses, is the panqua, which is of infinite service in tanning leather.

The animals are horses, mules, oxen, goats, and sheep, all excellent in their kind. Birds, tame and wild, are found in profusion; and the coast abounds with most sorts of fish. The country is not infested with venomous insects.

*Lakes, Rivers, &c.*] The principal lakes are those of

Tagatagua, near St. Jago, and that of Pareña; besides which they have several salt-water lakes, that have a communication with the sea part of the year. In stormy weather, the sea forces a way through them, and leaves them full of fish; but, in the hot season, the water congeals, leaving a crust of fine white salt, a foot thick. The only sea that borders upon Chili is the Pacific Ocean, on the west. The principal rivers are the Salado, or Salt River, Guasco, Coquimo, Chiapa, Bohio, and the Baldivia, all scarcely navigable, except at their mouths. The principal bays, or harbours, are Capiapo, Coquimbo, Govanadore, Valparaiso, Iata, Concepcion, Santa Maria, La Moucha, Baldivia, Castro, and Brewer's-haven.

*Cities, Towns, &c.*] St. Jago, the capital of the province of the same name, was founded in the year 1541, by Valdivia. It is situated on the river Mapocho, which gives name to a valley of great extent, and supplies the city with water. In the centre stands the grand piazza, which is square, with a beautiful fountain in the middle. Here are the apartments of the governor or president, the palace of the royal audience, the town-house, the public prison, the cathedral, and many other handsome public and private buildings. The Spaniards in St. Jago, and the suburb of Chimba, on the other side of the river, are reckoned to amount to eight thousand, and the other inhabitants to about thirty thousand. Those who have acquired fortunes at Valdivia, Valparaiso, and Concepcion, repair hither to spend their days in ease and enjoyment. In the neighbourhood are the gold-mines of Tilti and the Lavaderos, by their concerns in which, many of the citizens amass considerable fortunes. The royal audience, residing in St. Jago, since its removal from Concepcion, is composed of a president, four auditors, and a fiscal, together with an officer, who bears the title of protector of the Indians. Though subordinate, in some respects, to the viceroy of Peru, the determinations of the court are without appeal, except to the council of the Indies. The president is also governor and captain-general of Chili, in which quality he resides one half the year in the capital, and the other at Concepcion. There is a tribunal of the inquisition in this city, and the see of a bishop, subordinate to the archbishop of Lima. Earthquakes have often done great damage here. That of 1647 was so violent that it almost overturned the whole town, and left such unwholesome vapours in the air, that all the inhabitants died, except about three or four hundred. Another dreadful shock, in 1780, laid the city in ruins.

VALPARAISO, a small town, is situated in thirty-two degrees fifteen minutes of south latitude. The bay, or harbour, though exposed in winter to the north winds, which then blow with great violence, is much frequented by ships from Callao and Panama.

CONCEPCION, the capital of the province of that

name, is the oldest European settlement in Chili. The most modern and authentic account that we can lay before our readers, not only of this place, but of Chili in general, is that of M. de la Perouse, the French navigator, which we shall therefore give in his own words:—

"The Bay of Concepcion is one of the most commodious harbours to be found in any part of the world. The water is smooth; and there is scarcely any current, although the tide rises six feet three inches, the flood being at its height, at the full and change of the moon, at forty-five minutes after one o'clock. The bay is sheltered from all winds but the north, which, in these climates, only blow during the winter; that is, from the end of May to October, which is also the rainy season. The weather is constantly wet while that monsoon lasts; for the name of monsoons may, with propriety, be given to those steady gales that are followed by southerly winds, which blow all the rest of the year, and which are accompanied by the most delightful weather. The only anchorage sheltered from the north-east wind, that prevails during the winter, is off the village of Talcaguana, on the south-east shore, which is now the only Spanish settlement in the bay, the old city of Concepcion having been destroyed by an earthquake in 1751. It was situated at the mouth of the river St. Peter, to the eastward of Talcaguana, and its ruins are still to be seen. They will not exist, however, so long as those of Palmyra have done, all the houses in the country being either built of mud, or of bricks, dried in the sun. The roofs are covered with pantiles, the same as in several of the southern provinces of France.

"After the destruction of this city, which was rather swallowed up by the sea than overturned by an earthquake, the inhabitants dispersed, and encamped upon the neighbouring heights. It was not till 1763 that they made choice of a new site, at a quarter of a league from the river Biobio, and at three leagues distance from Old Concepcion, and the village of Talcaguana. The bishopric, the cathedral, and the religious houses, were transferred to the new city, which is of great extent, because the houses are built only one story high, that they may be the better able to resist the earthquakes that happen every year.

"The new town contains about ten thousand inhabitants. It is the residence of the bishop, and of the major-general, who is at the head of the military department. This bishopric borders on that of San Jago, the capital of Chili, where the governor-general resides. It is skirted to the eastward by the Cordilleros, and extends southward as far as the Straits of Magellan; but its true limits are the river of Biobio, at a quarter of a league distance from the city. All the country, south of that river, belongs to the Indians, except the island of Chiloe, and a small district round Baldivia. It is improper to give to those people the name

of subjects most always mandant a commande gives him in their c He is, be the countr santly.

"As m riferous, t it is said, abundant, Without c with our l ficient ene fore, lies who devo rivers, wh any trade of the ri that all t parts.

of subjects of the king of Spain, with whom they are almost always at war. The functions of the Spanish commandant are consequently of the greatest importance. He commands both the regular troops and the militia, which gives him great authority over all the citizens, who, in their civil concerns, are governed by a corregidor. He is, besides, charged exclusively with the defence of the country, and obliged to fight and to negotiate incessantly.

"As most of the rivers in the adjacent country are auriferous, the inhabitant, by washing the earth, can earn, it is said, half a dollar a day; but, as provisions are very abundant, he has no real want to incite him to labour. Without communication with foreigners, and unacquainted with our luxury and arts, he can desire nothing with sufficient energy to overcome his sloth. The ground, therefore, lies waste, the most active of the natives being those who devote a few hours to the washing of the sand of their rivers, which exempts them from the necessity of learning any trade. The consequence is, that the houses, even of the richest inhabitants, are bare of furniture, and that all the workmen at Concepcion come from foreign parts.

"The dress of the women consists of a plaited petticoat of those old-fashioned gold and silver stuffs formerly manufactured at Lyons. These petticoats, which are reserved for gala-days, may, like diamonds, be entailed in a family, and descend from the grand-mother to the granddaughter. Such dresses are, however, confined to a small number of females, the rest having hardly wherewithal to hide their nakedness.

"Sloth, still more than credulity and superstition, has peopled this place with nuns and monks, the latter of whom enjoy greater liberty than in any other country in the world. The misfortune of having nothing to do, the want of family-ties, the profession of celibacy, without being separated from the world, and their living in the convenient retirement of their cells, have rendered, and could not fail to render, them the greatest profligates in America. Their effrontery is inconceivable. I have seen some of them stay till midnight at a ball, aloof, indeed, from good company, and seated among the servants. These same monks gave our young folks more exact information than they could get elsewhere, concerning places with which priests ought only to have been acquainted, in order to interdict the entrance.

"The common people of Concepcion are much addicted to thieving, and the women are exceedingly easy of access. They are a degenerate and mongrel race. The peasants in the neighbourhood have great address in the use of the noose and lance. With these they will combat the fiercest bull, throwing the noose so artfully, as to lay certain hold of some part of the body. When

a bull is haltered, they draw the knot; at the same time setting spurs to their horses, and ham-stringing him with their lances, so that the animal is taken and disabled at the same instant. This dexterity in throwing the noose, and ham-stringing the animal, while they ride at full speed, cannot fail of surprising Europeans. In private quarrels, also, they fight with the noose and lance; all attacks from which they are taught to parry with such dexterity, that, after a combat of an hour, it is no uncommon case to see the parties separate untouched, notwithstanding both have exerted the greatest alertness.

"The inhabitants of the first class, the true-bred Spaniards, are polite and obliging in the extreme. I should be wanting in gratitude, if I did not paint them in colours suitable to their character, which I shall endeavour to make known, while giving an account of our own transactions.

"I was scarcely at anchor when a dragoon brought me a letter from M. Quexada, commandant *pro tempore*, in which he told me, that we should be received like fellow-countrymen. He added, with great politeness, that the orders he had received in that respect were conformable to the sentiments of his heart, and to those of all the inhabitants of Concepcion. This letter was accompanied by refreshments of all sorts, which every one hastened to send on board. The quantity was so great, that we could neither consume them, nor know how to stow them away.

"Obliged to attend, in the first place, to the refitting of my ship, and to the depositing of our astronomical clocks and quadrants on shore, I could not go immediately to return my thanks to the governor. I was impatient for an opportunity of acquitting myself of that duty, but he was beforehand with me, and came on board, attended by the principal officers of his colony. The following day I returned his visit, accompanied by M. de Langle, and several of the officers and scientific men. We were preceded by a detachment of dragoons, the commanding officer of which had stationed half a troop at Talcaguana. Ever since our arrival, both they and their horses were at our command. M. Quexada, M. Sabatero, commandant of the artillery, and the town-major, came to meet us at a league's distance from Concepcion. We all alighted at the house of M. Sabatero, where an excellent dinner was put upon the table; and, at night, there was a splendid ball, to which the principal ladies of the place were invited.

"The dress of these ladies was very different from that to which our eyes had been accustomed. A plaited petticoat, which leaves half the leg exposed, and which is tied a great way below the waist; stockings, striped red, blue, and white; shoes so short, that the toes are bent double, which makes the foot appear nearly round; such

is the habit of the ladies of Chili. They wear their hair divided behind into small braids, which hang down their backs. Their corset, or bodice, is generally of gold or silver stuff, and is covered with two small cloaks, the first of muslin, and the second, which is worn over it, of wool of different colours, blue, yellow, or pink. With these woollen cloaks they cover their heads when they are in the streets, and the weather is cold; but, when in a room, they usually lay them on their knees; and there is a game played with the muslin cloak, by shifting it about incessantly, at which the ladies of Conception display a great deal of grace. They are in general pretty, and so politic, that there is certainly no maritime city in Europe, where foreign navigators are received with so much kindness and civility.

"About midnight the ball was at an end. As the houses of the commandant, and of M. Sabatero, could not contain all the French officers and passengers, the inhabitants pressed us to accept of beds; and in this manner we were quartered in the different parts of the town.

"Before dinner we had been to pay visits to the principal citizens, and to the bishop, a man of great sense, of agreeable manners, and of a liberality, of which the Spanish bishops afford frequent examples. He is a Creole, born in Peru, was never in Europe, and is solely indebted to his merit for his elevation. He talked to us of the regret which Major-General Higuins would feel at being detained upon the frontiers by the Indians during our short stay in his government. The favourable report made of that officer by every one, and the general esteem in which he was held, made me lament the circumstances that occasioned his absence. A courier had been despatched to him, and his answer, which was brought while we were still at Conception, announced his speedy return. He had just concluded a peace, that was highly necessary to the people of his government, their distant habitations being exposed to the ravages of savage nations, who massacre the men and children, and make the women prisoners."

*Manners, Customs, &c.*] The natives of Chili are of a middle stature, strong built, of a tawny complexion, and have long black hair on their heads, but pluck off that on their chins, and other parts of their bodies. They are tall, robust, active, and courageous; enduring fatigue, heat, and cold, to admiration. They have, in several instances, impeded the progress of the Spanish arms, and sometimes even been victorious: their history abounds with so many instances of bravery, as to have won for them, even from the proudest Spaniards, the honourable title of *Indios bravos*; nor have their present descendants lost the animating remembrance of the deeds of their ancestors. The Araucans, in particular, are highly deserving of notice, as having vigorously defended their coun-

try against the progress of the Spaniards. They inhabit a beautiful tract of country, extending from the river Bi-bio, on the north, to that of Valdivia, on the south; bounded on the east by the Andes, and on the west by the ocean. The name is derived from the province of Arauca, which, though the smallest of their state, has become the leading name of their country and nation; but they also voluntarily receive the appellation of *Aucas*, or *Irec Men*. They are, in general, robust, well formed, and of a truly warlike aspect. Their complexion, though copper, is more clear than that of other Americans. The face is nearly round, the eyes, though small, lively and full of expression, the nose rather flat, but the mouth well made, with white and uniform teeth; the leg muscular and elegant, and the feet small and flat. The hair of the head is black and copious, and bound up in a knot; and, like the Franks, they esteem long hair a mark of honour. The women are often handsome, especially in Boroa. Possessing a strong constitution, and being free from sedentary operations, they seldom become grey before the age of sixty or seventy, or bald before that of eighty; and not a few exceed a hundred, whose teeth, sight, and memory, remain perfect.

These people seem to have a complete system in their warfare. Advancing with great shouts, they generally attack the centre of the enemy, their clubs often making terrible havoc. The booty is equally divided among the captors, no officer, not even the general, having any preference. The prisoners remain slaves till exchanged or ransomed. Sometimes one is sacrificed, to pacify the manes of the slain; but this very seldom occurs. Formerly the heart of the victim was handed to the general, who, sucking a little of the blood, presented it to the officers, who performed the same ceremony. The head was raised on a pike, amid the horrid sound of the war-song. A sheep's head was then fixed to the carcase; and a drunken festival was celebrated. If the skull had not been broken with a club, a cup was formed of it, to be used at solemn banquets.

They all admit the immortality of the soul, and that man is composed of a body called *anca*, and of a soul called *am*, or *pilli*. They think that after death the soul passes to the west, to a country called *Galceman*, where they believe that delights abound for the good, while the bad are punished by privation. They watch the dead all night; and on the third day carry the body to the cemetery of the family, which is commonly situated in a wood, or upon a hill. The bier is surrounded by women, who affect to weep; while others strew ashes behind, that the soul may not return to the house. The body being set down, the warlike weapons are placed around; or, if a female, her ornaments: plenty of food, and vases of liquor, are also prepared, that there may be no want on the journey to the other

world. So leave of the happy journey, stones, in a cyder in about soon arrive across the Elysian Fields passenger pleasures band, if he are no children are also wa the air, cau on the And taking place those of th ing the tr double dru lery. world. Sometimes a horse is slain for provision. Taking leave of the dead with many lamentations, and wishing a happy journey, the body is covered with earth, or with stones, in the form of a pyramid, over which they pour cyder in abundance. They believe that an old woman soon arrives, in the form of a whale, to carry the soul across the ocean, where another old woman guards the Elysian Fields, and sometimes exacts an eye, when the passenger cannot satisfy her demands. The business and pleasures of another life remain the same: and the husband, if he choose, may have his wife again; but there are no children, because it is the abode of the dead. There are also wars and battles; and armies, which, meeting in the air, cause thunder and lightning. During every tempest, on the Andes or the ocean, they suppose an engagement is taking place between the souls of their countrymen and those of the Spaniards; the low sound in the clouds being the trampling of horses, the thunder the sound of double drums, and the lightning the discharge of artillery. If the storm bear towards the Spanish territory, they suppose that their souls are victorious, and exclaim, in triumph, "Follow, follow, friends, kill, kill." If the contrary, they are very sad, and exclaim, in consternation, "Halt; take courage." They have an idea of a great deluge, during which many were saved on the mountain Thetgeg, which can float on water. This idea, according to Ercilla, has arisen from the earthquakes and volcanos so common in their country; for, during a severe earthquake, they still run to the mountains, with provisions; in hopes they may escape, if the sea should overwhelm their country.

It is remarkable that these Indians, in their contests with the Spaniards, have generally spared the white women, carrying them to their huts, and intermarrying with them, which is the reason that many Indians of these parts have the complexion of Spaniards born in that country.

The ordinary dress of the men is a kind of long frock, which reaches half-way down the legs. From the neck is suspended a chain of gold or copper rings. Women, of the common class, have a short covering, hardly reaching down to the knee: but the dress of the better sort is long, and they wear a petticoat under the outer garment. Their heads are ornamented with rings.

They have no gold nor silver, though these metals are so common in their country. All their bedding is some skins laid on the ground; and they eat on the ground, or else on a little bench, and wipe their hands on a broom, instead of a napkin. Their food consists of maize, fruits, herbs, and what they catch by hunting and fishing. Their furniture consists of four or five dishes, and some wooden spoons or shells, a calabash or gourd, to drink out of, and a leaf of a tree for a salt-cellar. When they make bread,

they set great earthen platters, full of sand, upon the fire, and, when hot enough, take them off, put the grains of maize into the hot sand, stir them about till they be toasted enough for the purpose, and then grind them between two stones. They let blood with a sharp flint, fixed in a little piece of wood, and just long enough to open a vein. Though they cannot read or write, yet they have a peculiar way of registering events, and keeping accounts of things committed to their charge, by strings of different sizes, in which they make knots of several colours, called quipos. A French writer tells us, that the knowledge of these knots is a secret science, which fathers do not reveal to their children till they find themselves at the point of death.

## SECTION VI.

### ISLANDS IN SOUTH-AMERICA,

BELONGING TO THE SPANIARDS.

#### JUAN FERNANDES.

The island of Juan Fernandes, situate in thirty-three degrees of south latitude, and eighty-three degrees of west longitude, is of an irregular figure, about fifteen miles long, and six broad; and is remarkable for its beauty. The face of the country, at least of the north part of the island, is extremely singular: the woods that cover most of the hills, being free from bushes and underwood, afford an easy passage through every part of them; and the irregularity of the hills and precipices trace out, by their various combinations, a great number of romantic valleys, most of which have a stream of clear water running through them, that falls in cascades from rock to rock; as the bottom of the valley, by the course of the neighbouring hills, is broken into a sudden sharp descent. In these valleys, are some particular spots, where the shade and fragrance of the contiguous woods, the loftiness of the overhanging rocks, and the transparency and frequent falls of the neighbouring streams, exhibit scenes of such elegance and dignity as would with difficulty be rivalled in any other part of the globe; for here the simple productions of unassisted nature may be said to excel all the fictitious descriptions of the most animated imagination.

This island was very propitious to the remains of Commodore Anson's squadron, in 1741; after they had been buffeted with tempests, and debilitated by an inveterate scurvy. The piece of ground, on which the Commodore pitched his tent, was a small lawn, that lay on a little ascent, at the distance of about half a mile from the sea. In the front of his tent was a large avenue cut through the woods to the sea-side, which, sloping to the water with

a gentle descent, opened a prospect of the bay and the ships at anchor. This lawn was screened behind by a tall wood of myrtle, sweeping round it in form of an amphitheatre; the slope, on which it stood, rising with a much sharper ascent than the lawn itself; though not so much but that the hills and precipices within land towered up considerably above the tops of the trees, and added to the grandeur of the view. There were likewise two streams of crystal water, which ran to the right and left of the tent within a hundred yards distance; and were shaded by the trees, which bordered the lawns on either side, and completed the symmetry of the whole.

The island of Juan Fernandes formerly abounded with goats; but their number is now greatly diminished; for the Spaniards, being informed of the advantages which the Buccaneers and privateers derived from the goats' flesh, with which they were here furnished, endeavoured to deprive their enemies of this relief, by setting on shore a number of large dogs, which have increased so fast, that they have destroyed all the goats in the accessible part of the country, only a few remaining among the crags and precipices, where the dogs cannot follow them. These are divided into separate herds, which inhabit distinct fastnesses, and never mingle with each other. A respectable writer mentions an extraordinary dispute between a herd of these animals, and a number of dogs. Some men, going in a boat into the eastern bay, perceived the dogs running very eagerly; and, being willing to discover what game they were pursuing, they lay upon their oars to view them, and at last saw them take to a hill, where, looking a little farther, they observed, upon the ridge of it, a herd of goats, that seemed drawn up for their reception. There was a very narrow pass, skirted on each side by precipices, on which the master of the herd posted himself fronting the enemy, the rest of the goats being all behind, where the ground was more open. As this spot was inaccessible by any other path, except where this champion had placed himself, the dogs, though they ran up the hill with great alacrity, yet, when they came within about twenty yards of him, did not dare to encounter him, as he would infallibly have driven them down the precipice. They therefore desisted, and, giving over the chase, quietly laid themselves down, panting for breath. There are but few birds, and those chiefly hawks, blackbirds, owls, and humming-birds.

Upon this island are great numbers of seals and sea-lions: the latter has some resemblance to a seal, but is much larger, and its flesh has some resemblance to that of beef. When full-grown, they are from twelve to twenty feet in length, and from eight to fifteen in circumference; and so extremely fat, that, having cut through the skin, which is about an inch in thickness, there is at least a foot of fat, before you come at either lean or bones. They

are also very full of blood; for, if they are deeply wounded in a dozen places, there will instantly gush out as many fountains of blood, spouting to a considerable distance. Their skins are covered with short hair, of a light dun-colour; but their tails and their fins, which on shore serve them for feet, are almost black; these fins are divided at the ends like fingers, the web which joins them not reaching to the extremities; and each of these fingers is furnished with a nail. The head, which is small, in proportion to the rest of the body, terminates in a snout, and they have whiskers like those of a cat, with small eyes and ears; and the nostrils, which are also very small, are the only parts destitute of hair. In each jaw they have a row of large pointed teeth. The males have a large snout or trunk hanging down five feet six inches below the end of the upper jaw, which the females have not; and this renders it easy to distinguish the sexes; and, besides, the males are much the largest. These animals divide their time equally between the sea and land, continuing at sea all the summer, and coming on shore at the setting in of winter, where they reside during that whole season. In this interval they bring forth their young, having generally two at a birth, which they suckle with their milk, they being at first about the size of a full-grown seal. While the sea-lions continue on shore, they feed on the grass and verdure that grows near the banks of the fresh-water streams; and, when not employed in feeding, sleep in herds, in the most airy places they can find. As they are of a lethargic disposition, and not easily awakened, each herd places some of the males at a distance, which never fail to alarm them, when any one attempts to molest, or even to approach, them; which they do by making a very loud noise, sometimes grunting like hogs, and at others snorting like horses in full vigour. The males have often furious battles, when they gore each other with their teeth, and cover one another with blood. The author of Lord Anson's voyage takes notice of one, whom, he says, they named the bashaw, he generally lying surrounded with a number of females, which no other male dared approach; but he had not acquired that envied pre-eminence without many sanguinary contests, as appeared from the numerous scars visible in every part of his body.

The bay is plentifully stored with the greatest variety of fish, particularly cod, of a prodigious size, which are no less numerous than on the banks of Newfoundland; also large bream, silver-fish, cavalries, gropers, maids, a black fish, called by some the chimney-sweeper, in shape resembling a carp; excellent cray-fish, that generally weigh eight or nine pounds, and are of an exquisite taste; besides congers, of a peculiar kind, large sharks, and dog-fish.

There are instances of two men living, at different times, alone, on this island for many years; the one a

Mosquito Indian, the other Alexander Selkirk, a Scotchman, who was, after five years, taken on board an English ship, and brought back to Europe.

This extraordinary man was born in the county of Fife, about the year 1676, and was bred a seaman. He went from England, in 1703, in the capacity of sailing-master of a small vessel, called the Cinque Ports Galley, Charles Pickering captain; and, in September the same year, he sailed from Cork, in company with another ship, called the St. George, commanded by William Dampier, intending to cruise on the Spaniards in the South Sea. On the coast of Brazil, Pickering died, and was succeeded in his command by Lieutenant Stradling. They proceeded on their voyage round Cape Horn to the island of Juan Fernandez, whence they were driven by the appearance of two French ships of thirty-six guns each, and left five of Stradling's men there on shore, who were taken off by the French. From hence they sailed to the coast of America, where Dampier and Stradling quarrelled, and separated by agreement, on the 19th of May, 1704. In September following, Stradling came again to the island of Juan Fernandez, where Selkirk and his captain had a difference, which, with the circumstance of the ship's being very leaky, induced him to determine on staying there alone. When his companions were about to depart, his resolution was shaken, and he desired to be taken on board; but the captain positively refused to admit him, and he was consequently obliged to remain, having nothing but his clothes, bedding, a gun, and a small quantity of powder and ball; a hatchet, knife, and kettle; and his books, and mathematical and nautical instruments. He kept up his spirits tolerably well, till he saw the vessel put off; but then (as he afterwards related) his heart yearned within him, and melted at the thought of parting with his comrades and all human society at once.

"Such is the rooted love we bear mankind,  
"All rush as they were, I never heard  
"A sound so dismal as their parting ours."

Thomson's *Agamemnon*.

Thus left sole monarch of the island, with plenty of the necessaries of life, he found himself in a situation hardly supportable. He had fish, goats' flesh, turnips, and other vegetables; yet he grew dejected, languid, and melancholy, to such a degree as to be scarcely able to refrain from putting a period to his existence. Eighteen months passed before he could, by reasoning, reading his bible, and meditation, be thoroughly reconciled to his situation. At length, however, he grew happy, employing himself in decorating his hut, and chasing the goats, which he seldom failed of catching. He also tamed young kids, laming them, to prevent their running away; and he constantly kept a guard of tame cats about him, to defend him from the rats, which were exceedingly troublesome.

When his clothes were worn out, he made others of goats' skins, but could not succeed in making shoes, with the use of which, however, he was, in time, enabled to dispense. He computed that he had caught a thousand goats, during his abode in the island, of which he had released five hundred, after marking them by slitting their horns. He made companions of his tame goats and cats, often dancing and singing with them. He also frequently read aloud, and performed his devotions at stated hours; yet, when he was taken off the island, his language, from disuse of conversation, was become scarcely intelligible.

In this solitude Selkirk continued nearly five years; during which time only two incidents happened which he thought worth relating, the occurrences of every day being, in his circumstances, nearly similar. The one was, that, pursuing a goat eagerly, he caught it just on the edge of a precipice, which was covered with bushes, so that he did not perceive it, and he fell over to the bottom, where, he supposed, by the alteration of the moon, that he had lain three days. When he came to himself, he found the goat lying under him dead, and it was with great difficulty that he could crawl to his habitation, whence he was unable to stir for ten days. The other event was the arrival of a ship, which he supposed to be French; and, so strong was the love of society in his mind, that he was eager to abandon his solitary felicity, and surrender himself to them, although enemies; but, upon their landing, he found them to be Spaniards, of whom he had too great a dread to trust himself in their hands. They were by this time so near, that it required all his agility to escape, which he effected by climbing into a thick tree, being shot at several times as he ran off.

His enemies having departed, Selkirk returned to his situation, and reconciled himself as much as possible to his solitary life, till the 2d of February, 1709, where Captains Rogers and Courtney arrived in two privateers from Bristol, and, after a fortnight's stay at Juan Fernandez, appointed him master's mate of one of their vessels. In October, 1711, he arrived in England, where the public curiosity was so strongly excited concerning him, that he was persuaded to put his papers into the hands of Daniel De Foe, to arrange and form them into a regular narrative. From this account De Foe took the idea of writing the romance of Robinson Crusoe, and basely robbed Selkirk of both the honour and profits of his manuscripts.

#### FUERA, OR MASA-FUERO.

This island lies in thirty-three degrees forty-five minutes south longitude, and in eighty degrees forty-six minutes west from Greenwich. It is very high and mountainous, and, at a distance, appears as one hill, or rock. It is of

a triangular form, and seven or eight leagues in circumference. Here is such a plenty of fish, that a boat, with a few hooks and lines, may presently catch as much as will serve one hundred people. Here are coal-fish, cavilliers, cod, halibut, and cray-fish. The sharks here are so ravenous, that, in taking soundings, one of them swallowed the lead, by which he was hauled above water; but he regained his liberty by disgorging his prey. Seals are so numerous here, that, Captain Carteret says, if many thousands were killed in a night, they would not be missed the next morning. These animals yield excellent train-oil, and their hearts and plucks are very good food, having a taste something like those of a hog. Their skins are covered with very fine fur. There are many birds here, and some very large hawks. Of the pintado-bird, the crew of the *Swallow* caught seven hundred in one night.

Commodore Byron anchored off this island in 1765, and sent out his boats to endeavour to get wood and water; but as the shore was rocky, and a surf broke with great violence upon it, he ordered the men to put on cork-jackets, by the help of which they brought off a considerable quantity of both. Here they found plenty of goats, which proved to be as good food as venison in England. In this expedition, the gunner, and a seaman who could not swim, went on shore with the waterers, and, when the business was completed, the violence of the surf, which beat against the shore, made them afraid to venture off to the boat: they were, therefore, left behind on the island. The next day the commodore sent out a boat to bring them back. The gunner swam through the surf, and got on board; but the seaman had so thorough a presage of being drowned in the attempt to reach the boat, that, preferring life to social intercourse, he chose to remain on the island at all events. Having formed this resolution, he took an affectionate leave of the people in the boat. A midshipman, however, just as they were about to return without him, taking one end of a rope in his hand, jumped into the sea, and swam through the surf to the beach, where the poor isolated despondent sat ruminating on his situation. The young man remonstrated with him on the

absurdity of the resolution he had formed, and, having made a running noose in the rope, suddenly threw it over the sailor, and fixing it round his body, the people in the boat began to drag him through the surf, and thus brought him on board; but he had swallowed so great a quantity of water on his passage, that he was to all appearance dead; but proper means being used, he soon recovered, and was, no doubt, abundantly thankful for the friendly violence that had forced him from the dreary solitude which his fears had before courted.

### CHILOE.

Chiloe, a considerable island on the coast of Chili, lies in forty-two degrees of south latitude, and is above one hundred and twelve miles long, and twenty-one broad. The south part of it is divided from the continent by a narrow sea, and the continent there makes a bay. This coast is subject to tempestuous weather, especially in March, when winter begins. The Spaniards have but one little fort in this island, called Chacao, always ill-provided with warlike stores. With the exception of wine, this island produces all necessary refreshments and provisions; and a great deal of ambergris is found here. Around this island are forty more, all taking name from it.

These islands of Chiloe are reputed barren; but their soil is not really so, only the excessive rains choke the seed, and let no corn thrive; so that they are without wheat, wine, or oil, and other plants which need much sun.

The nature of the climate of this cluster of islands is such, that it rains almost all the year; so that only maize, or other such grain, can ripen, that want not so much sun. The diet of the natives is mostly of a root called papas, which grows bigger here than in any other place. The manufactures are clothing for the Indians, who have a kind of vest, which they call *maeun*, without sleeves, over which is a kind of cloak. They have vast woods of cedar-trees, of a prodigious size, so as hardly to be encompassed by a rope six yards long. The principal town is called *Castro*.

## CHAPTER X.

## PORTUGUESE DOMINIONS IN SOUTH-AMERICA.

## SECTION I.

## BRAZIL.

*Situation, Extent, and Boundaries.*

**T**HIS country is situated between the equator and thirty-five degrees of south latitude. Its length is about two thousand five hundred miles, and its breadth about seven hundred. It is bounded, on the north, by the mouth of the river Amazon and the Atlantic Ocean; on the east, by the same ocean; on the south, by the mouth of the river Plata; and, on the west, by a chain of mountains, which divide it from Paraguay.

*Provinces.* According to the most recent authorities, Brazil is divided into the capitánias of Rio de Janeiro, St. Paul, Rio Grande, Minas Geraes, Bahia, Goyaz, Matto Grosso, Pernambuco, Sears, Maranhão, and Pará.

Of the first of these provinces we have no particular account; but the others have been described by that intelligent traveller, Mr. Mawe, to whose interesting travels we are indebted for the substance of the following particulars.

*Rio Grande*, one of the most important capitánias in Brazil, is of considerable extent, and is bounded by the capitania of St. Paul, on the north; by Matto Grosso, on the west; and by the Spanish territories, between it and the Rio de la Plata, on the south.

The climate is very fine, and the soil so productive, that this province may be called the granary of Brazil: the wheat grown here is shipped to all the ports on the coast where bread is used. Farming, however, is carried on in so slovenly a manner, that the grain is always rough, badly skinned, and very foul. Being packed in raw hides, which are sewed up like sacks, it swells and heats on the passage from Rio Grande to the more northerly ports; and frequently, after being landed at Rio de Janeiro, it is left on the quay, exposed for several days to the rain.

In a circuit of twenty leagues around the capital of this province, the inhabitants, including the troops, are estimated at one hundred thousand. Their chief occupations are, the breeding of cattle, for which their immense tracts of pasture-land are well calculated; the drying and preparing of hides; and the making of *charque*, or jug-beef. The preparation of this article of commerce is as follows:—After the ox is skinned, the flesh is stripped from the bones in as large slakes as possible, and put into hot

brine, where it remains from twelve to forty hours, according to the thickness. It is then taken out, drained, and dried in the sun, afterwards made up into packages, and shipped to all parts of Brazil. This forms a considerable article of food among the negroes and lower classes, and is frequently seen at respectable tables, being in taste somewhat similar to hung-beef. It forms part of every cargo sent out from this port, and has found its way to the West-Indies, where it is in great request.

The quantity of hides exported from hence is very considerable: they furnish many vessels with complete cargoes, which are carried to the northern ports, and thence embarked for Europe. The annual average may be computed at not less than three hundred thousand.

Another considerable article of commerce is tallow, which is generally shipped in the crude state, and not refined, as in the river Plata. The greater part is consumed in Brazil, and the dealers find it preferable to refine the article on the spot where they manufacture it into candles. Horns and horse-hair are also shipped from hence in great quantities.

The above are the staple productions of Rio Grande, which give employment to about a hundred sail of coasters, some of which make two or three voyages in a year, carrying thither rum, sugar, tobacco, rice, cotton, mandioca, sweetmeats, &c.

Of European merchandise, they bring wine, oil, olives, glass, and a variety of English commodities, particularly iron, baizes, stout woollen-cloths, velvets, printed cottons, calicoes, muslins, handkerchiefs, hosiery, flannels, hats, &c. To these may be added sail-cloth, cordage, anchors, tar, paints, fowling-pieces, ammunition, hardware of every description, and fancy articles. A great part of the goods are conveyed upon horses into the interior, where they are carried from house to house for sale or barter.

The large river Uruguay rises in this capitania, and disembogues itself into the river Plata, a little above Buenos Ayres; there are several others of less consequence, the banks of which are well stored with wood. Of the geology of this province very little is known.

Jaguars, and other beasts of prey, are here very common. Among the granivorous animals are capivaras, of a large size, deer in great numbers, and armadillos, which are considered excellent food, when roasted. Of birds,

there are dark-coloured ostriches, which go about in flocks in great numbers. There are eagles, hawks, and other birds of prey, particularly a species of crow, of the vulture kind. Cranes, storks, wild turkeys, ducks, partridges, horned plovers, goat-suckers, horned owls, small parrots, cardinals, humming-birds, &c. are also very numerous.

It appears singular to Europeans, that, in this fine climate, where the thermometer is frequently below forty degrees of Fahrenheit's thermometer, and where are bred as fine cows as any in the world, and every convenience is at hand for dairies, neither butter nor cheese is made, except on particular occasions; nor is milk even for coffee to be procured at all times.

Several years ago, some hemp was grown here, by order of government, and it proved excellent; but, as it was troublesome to dress, the cultivation of it was abandoned.

The capitania of *Minas Geraes*, from north to south, extends from six hundred to seven hundred miles; and, from east to west, the distance is nearly the same. It is bounded, on the north, by the capitania of Bahia; on the west, by that of Goyaz; and on the south, by the river Paraibuna, which divides it from the capitania of Rio de Janeiro. It is separated from the district of Espiritu Santo and the coast by an immense chain of mountains, which country, being inhabited by the Anthropophagi, remains unexplored.

This province is supposed to contain three hundred and sixty thousand inhabitants, of whom two hundred thousand are negroes, or their immediate offspring. The population of Indians is not included in this estimate, nor can it be ascertained: they are considered as by no means numerous, as they never make any opposition against an armed force, however small.

The military establishment of this capitania consists of one thousand four hundred cavalry, which number is prescribed by law, and cannot be increased. Their principal station is at Villa Rica, where the general resides, who, jointly with the governor, issues all orders respecting them. They form a disposable force for the general service of the capitania; they are appointed to guard certain places known to contain valuable products; also to receive tolls, collect tithes, patrol the roads, and search suspicious persons; for which purposes parties of them are stationed at the various guard-houses and registers. They go in quest of felons, guard the prisons, and likewise impress men for service in Rio de Janeiro. They are employed exclusively in the mining country, which they never quit, except when they escort treasure to the capital, or are despatched on any particular service. The regiment enjoys so high a reputation, that numbers are continually offering to enlist in it; and, whilst our author was at Villa Rica, nearly two hundred volunteers were serving, with-

out any remuneration, waiting to be placed on the establishment, according to their seniority, as vacancies should occur. This affords the general an opportunity of choosing the most soldier-like men, and those of best character, in which respects, it is said, that the corps is unrivalled. The officers enter very young, and serve as cadets for a certain period, during which they perform the duty, and receive the pay, of privates; from whom, however, they are distinguished by a star on the right shoulder. Besides this force, there is a militia, in which all the male inhabitants of the capitania are enrolled, and are liable to be called out upon any emergency.

Great quantities of gold, precious stones, iron, &c. are produced in this country. Galena, or sulphuret of lead, is found only in the neighbourhood of Abaité. Antimony abounds in the vicinity of Sabara; native bismuth is found near Villa Rica; arsenical and martial pyrites are very common; titanium is found in octaedral crystals, also in beautiful prisms and tender spiculae, finely grouped in rock-crystal. Platina may be obtained at Largos, in tolerable quantities, but the place which produces it has been abandoned, from want of a market. Copper can scarcely be said to exist in this province; the only place at present known to produce it is a mountain, about twenty leagues from Tejuco, where small particles appear in a rock of quartz and hornblende: but even there the matrix is so hard, and the quantity of copper so trivial, as to afford no encouragement to work it. No mines of silver have been discovered in the capitania, but the gold is generally found to contain that metal, sometimes in a considerable proportion. The finest clays are here found in great plenty, fit for porcelain and earthenware of every description, which are entirely neglected. Conglomerate masses, of recent formation, enveloping diamonds and grains of gold, are sometimes, though rarely, met with; also a silicious substance, of a fine dark blue colour, which seems to have been hitherto unknown.

In the immense woods of Minas Geraes, the finest trees are frequently destroyed by the creeping plants, which cannot grow without adhering to some support. When they attach themselves to a tree, they shoot up rapidly, encircling it with numerous fibres, and, in a few years, become so strong as entirely to stop the growth of the tree, and at length destroy it. When in a young state, they are so flexible, that the negroes make their bridles of them, and ride with them for a day together.

As these forests remain unexplored, many of the trees are, consequently, unknown. However, the barks of some of them are used by the inhabitants in dying yellow; and some are said to yield a black colour, which cannot be washed out.

Gum tragacanth is plentiful, and of a very good quality. There are immense quantities of aromatic shrubs;

and, in particular, gives to various groves of arcades of

and, in many places, upon the bark of trees, and more particularly upon old wood, is found a lichen, which gives to water a most beautiful crimson colour. Jointed canes grow spontaneously, and, in many places, form arcades over the road.

Ferns grow so large in this capitania, that our author states he has seen them of the height of twelve feet. These, and other succulent plants, when reduced to ashes, serve to make soap, of which almost every negro understands the process, and most families make it for their own consumption. It is very sharp, and washes white articles uncommonly well.

The *palma Christi* grows spontaneously, and great quantities of castor-oil may be extracted from its seeds. Beans, peas, and pulse in general, are very fine; pumpkins, also, and cabbages, grow to a great size. The roses are peculiarly fragrant, and are in bloom all the year. Pinks and carnations grow in great profusion, and varieties of the passion-flower are found in all parts.

The capitania of *Bahia*, to the northward of Minas Geraes, extends a considerable distance along the coast; being bounded, on the north, by the great river St. Francisco, which runs into the sea in eleven degrees of south latitude, and separated from the district of Ilheos by the river Das Contas, in fourteen degrees of south latitude. The soil of this capitania is esteemed the best in Brazil for the growth of the sugar-cane. This advantage, and the convenience arising from the numerous rivers that flow from the interior into the bay, have occasioned the establishment of several sugar-plantations, which have produced immense quantities of that article. The soil most adapted to the plant is a black greasy loam, apparently a deposition from the rivers, containing a considerable quantity of vegetable matter.

If the cane be planted in new soil, it is fit for cutting in fourteen months, but in old and poorer land it requires from eighteen to twenty months. When ripe, the canes are cut and dressed, by taking off the top leaves, &c., which afford excellent provender for cattle; they are then brought to the mill, which consists of three cylinders, moving on their axes in a perpendicular position, and between them the canes are repeatedly passed, until all the juice is expressed.

The liquor is conducted through spouts to a large boiler, where a certain quantity of alkaline matter, called *temper*, is added to it. Afterwards it is conducted to the largest of a range of boilers, consisting of three, or sometimes four, one smaller than another. Here the syrup boils for a limited time, and is continually skimmed; it is then laded into the next vessel, where it continues to boil until more of the aqueous fluid has evaporated; after which it is laded into the third boiler, and is there sometimes sufficiently boiled without removing it into the fourth. They

judge of its consistency by the touch; a little of the syrup is taken between the thumb and finger, and, if it form into threads, and break on being drawn about an inch, it is supposed to be sufficiently boiled. It is then gently laded into earthen pots, of the form of a sugar-loaf, about two feet deep, and ten inches in diameter at the open end, where, on cooling, it becomes concrete. In the lower end of each pot is a small hole, which at first is nearly closed; but, after the sugar begins to cool, it is unstopped, and a piece of cane is put in, to admit the molasses to pass through. Soon after the moulds are filled, they are removed into an airy room, where they are placed so that the molasses may drain into a cistern, from which they are conveyed into the fermenting vats.

Most of the sugars made here are clayed, by a very simple operation, which consists merely in covering the sugar with very moist clay, the water from which penetrates the mass, and carries with it the remaining molasses. When the earthy matter becomes dry, more is applied, until the sugar is nearly white. After remaining in the drying-house about six weeks, the moulds are placed with the large end downwards, and the sugar-loaves leave them; they are then beaten down to powder in large strong cases, holding from fifteen to sixteen hundred weight. The cases, when filled, are nailed down, and are ready for exportation.

More sugar is shipped from Bahia than from all the other ports of Brazil united, and, in general, it is superior in quality. It is not, however, esteemed of so strong a body as the best produced in the West-Indies.

The tobacco of this capitania is peculiar to it; and the mode of growing and manufacturing it is as follows:—First, a good piece of ground is prepared, the finer dressed the better; the seed is sown broad-cast, and, when the plants have grown about six weeks or two months, they are transplanted into ground prepared as before. In eight or ten months they arrive at their full growth, and, when ripe, the leaves are taken from the stem, which varies in height from four to seven feet. They are laid upon the ground, or upon any support which will preserve them from absorbing moisture, and admit a free circulation of air underneath. When they become slightly withered, they are twisted with a strong winch, the end of one leaf uniting with the other, and the twist is coiled into a roll, weighing from thirty to forty pounds. By this operation the viscid juice of the leaf is expressed, and, when oxidated, becomes of a black colour, like molasses. The tobacco, after this last operation, is fit for sale.

Cotton has of late years been grown here in great quantities, and has been sent to England at nearly the same price with that grown in Pernambuco, and the plantations are daily increasing.

Rice is produced in tolerable quantity, and its quality

is superior: but the husk is so difficult to separate from the grain, that a great part is bruised in the operation, and is thus rendered of little value. The only method of cleansing it that has hitherto been practised, is by wooden pestles, worked in wooden mortars, either by hand or machinery. Coffee is also grown in considerable quantities, but is not esteemed so fine as that from Rio de Janeiro.

The beautiful dye-wood, called Brazil-wood, is one of the articles prohibited from general commerce, being the property of the royal household. Fustic, in small quantities, is brought from the interior.

Produce, to a considerable amount, was formerly exported from hence to the River Plata, whence a great quantity of hides and tallow were returned; but the trade has never been so favourable as it appeared, on account of the difficulty attending the payments. It is considered that the Spaniards in the River Plata are much indebted to the Portuguese.

Respecting the mineralogy of this capitania, our author has not given any particular account. It is well known, however, to have produced the largest piece of native copper that has ever appeared, being in weight upwards of two thousand pounds. The piece was discovered, several years ago, by some persons who were preparing to wash for gold; but, contrary to the general laws of nature, it was found perfectly insulated, and not the slightest appearance of a vein of that metal was to be traced.

The capitania of *Goyaz* is bounded chiefly by Minas Geraes, on the east; by *Matto Grosso*, on the west; and by *Para*, on the north. Its greatest extent in length is from six to twenty-one degrees of south latitude. Here are many gold-mines, some of which produce gold of a very fine quality. Diamonds have been found in some parts, which are different in their appearance from those found in *Cerro do Frio*, having more brilliancy on their exterior; but they are, in general, not of so pure a water, though of a very desirable size. As this district lies at a distance from the coast, it has very little commerce in any of its productions, except the valuable substances above mentioned, and cattle, which are bred on the frontiers; also some cotton, and occasionally a few peculiar articles, which are sent to Rio de Janeiro. The mules, on the return-journey, are all loaded with salt, iron, cheap cotton-prints, baizes, hats, fire-arms, powder and shot, and a variety of artificers' tools. When any of the inhabitants have any thing peculiarly valuable to dispose of, they generally take it to Rio de Janeiro, and lay out the proceeds in the purchase of negroes, iron, salt, and other commodities. The population is very inferior to the extent of the district, but is likely to be increased by new settlers.

This capitania communicates with *Matto Grosso*, *St. Paul's*, and *Para*, by rivers which are navigable, though frequently interrupted by falls.

The extensive capitania of *Matto Grosso* is separated from the neighbouring territory belonging to Spain by the intervening channels of the rivers *Paraguay*, *Madeira*, *Mamoré*, and *Guaporé*, which form a natural trench around it of five hundred leagues in circuit, by means of which, and by upwards of thirty rivers that disembogue into it, a communication is opened, through many and distant points, with the interior of Brazil. This capitania, from its geographical position, has ever been considered as the grand outwork of Brazil, not only because it covers the interior divisions of this vast portion of the new continent, which is the cradle of its greatest rivers, branching in innumerable channels, and enriched with great and untouched treasures; but also because, by this extensive channel, the Portuguese are enabled to penetrate to the establishments of Spain in Peru.

*Pernambuco* is situated on the north of *Bahia*, nearly in the latitude of eight degrees. It produces vanilla, cocoa, and a considerable quantity of sugar; but the chief article of its trade is cotton, which for many years had the reputation of being superior to any other; but, of late, it has much deteriorated, from neglect, either in the cultivation, or in the gathering the pods and cleaning it from the seeds, or probably from general inattention to the whole management of it. In delicacy of colour and staple, it has been surpassed by the cotton called *South-Sea-Island* *Georgia*, of which great quantities have been imported, and for which great prices have been given. The cotton is pressed into raw hides, so hard as to form very heavy packages. This operation is superintended by an officer authorised by government, who puts a stamp upon it, describing its quality, which enables the shipper to pass it through the custom-house, where it pays a small duty on exportation.

The district of *Seara* is little known, and enjoys but a trifling trade. *Maranhão*, though a very small district, has of late raised itself considerably into notice, by its excellent productions, which are the same as those of *Pernambuco*. Cotton is the staple article, with some sugar and rice, several cargoes of which are exported every year.

The dye-wood of these districts is excellent, and is sometimes shipped from this coast. The tree which produces the annatto is very common, and the seeds from which it is washed are of the best quality, and might be obtained in great abundance. Cocoa may be grown in any quantity: capsicum, pimento, ginger, &c. are also very plentiful.

The capitania of *Para* is considered the largest in Brazil; but its extent is imperfectly known. The land is low and unhealthy; the great river, or port, is much interrupted by shoals and currents. It is a dangerous coast, and exposed to a continual swell, so as to render it hazardous for ships to anchor upon it.

*Rivers.]* The River *Grande*, or *Araguaya*, which has received the latter appellation from the numerous nations inhabiting its banks, has its remotest source in latitude nineteen degrees, and running north and south, intersected at various points by the meridian of fifty-two degrees thirty minutes, flows in latitude six degrees into the Tocantines, where it loses its name; and both, thus united in one ample stream, continue their course for about three hundred and seventy leagues, and fall into the southern estuary of the River Amazons, in latitude one degree forty minutes, opposite to the great island of Joannes, or Murajo, and twenty leagues west of the city of Pará.

The banks of this river are peopled by many tribes of savages: they abound in all the productions peculiar to the state of Pará, and afford an uninterrupted communication from the city of that name, and, by the river, with the centre of Brazil and the capitania of Matto Grosso. The same is practicable by the River Das Mortes, and other western branches which enter the Rio Grande below. These branches, in all probability, contain unexplored mines; for there is no physical reason why gold should be found in the rivers that enter the Araguaya on the eastern side, and not likewise in the branches on the opposite side.

The River *Chingu* is the clearest, and one of the largest, branches of the Amazon, which it enters on the south side, after a course of three hundred leagues, in latitude one degree, forty-two minutes, and longitude fifty-three degrees, one hundred west of the city of Pará.

Its remote sources supply, not only the lands in which rise also the rivers forming to the east and north the upper part of the river Cuiaba; but also that large space north of the river Das Mortes, intersected by the great road from Goiaz, extending as far as the river Porrudos. There is a tradition among the Indians established on the banks of this river, that, after ascending the first large falls, much gold was found in it, of which the Jesuits obtained a large quantity. Mr. Mawe thinks it probable that the now unknown mines of Dos Martiros, famous as the first discovery made by Bart. Bueno, of which he heard repeated mention in St. Paul's, exist only on some of the numerous branches that form the river Chingu.

The River *Tapajos* is the third which derives its copious sources, flowing through numerous large branches, from the capitania of Matto Grosso. It runs north between the Madeira and the Chingu for three hundred leagues, flowing into the Amazons in about two degrees twenty-four minutes of latitude, and fifty-five degrees of longitude, which is the geographical position of the town of Santarem, situated at its mouth, one hundred and eighteen leagues from the city of Pará. This river rises in the plains of the Parexis, which occupy a vast space, not

level, but formed by undulating heaps of sand and light earth, resembling large waves. "The spectator," says our author, "who is in the midst of these plains, ever sees before him a distant and extended mount; he advances towards it by a gentle and long declivity, traverses the plain, and advances by an ascent equally gentle until he gains imperceptibly the heights he saw; another eminence then presents itself, and he proceeds with the same recurring circumstances. The soil of these wide plains is sandy, and so light, that loaded beasts in passing sink into it so much as to impede their progress. The pasturage is poor, consisting of a grass composed of wiry stalks a foot high, and small rough lancet-shaped leaves; the animals in grazing pluck them up with the roots covered with sand; on this account the passage by land is difficult and tedious; though, on finding any of the streams, which abound in these plains, there is grass and other mild herbage, which afford tolerable pasturage." The plains of Parexis form, to a considerable extent, the summit of those high mountains of the same name, and are situated on some of the most elevated land in Brazil; for from them descend the two greatest rivers of South-America, the Paraguary, and the Madeira.

From its geographical position, it is evident that the Tapajos facilitates navigation and commerce, from the maritime city of Pará to the mines of Matto Grosso and Cuiaba, by means of its large branches, the Jurueña and Arinos; if the short passages overland should be found troublesome to drag canoes, the goods may be forwarded immediately on mules. This navigation to Matto Grosso is at least two hundred leagues shorter than that performed through the Madeira and Guapore; it is consequently less tedious and equally advantageous to the mines of Cuiaba.

The River *Jauru*, which disembogues into the Paraguary, in latitude sixteen degrees twenty-four minutes, is remarkable for the boundary-mark erected at its mouth in 1754, as well as for being entirely Portuguese, together with the lands on its south bank, and bordering on the Spanish possessions. It rises in the plains of the Parexis in latitude fourteen degrees forty-two minutes, and longitude fifty-eight degrees thirty minutes, and running south to latitude fifteen degrees forty-five minutes, the situation of the Register of the same name, it there turns to the south-east for thirty-four leagues, till, by a course of sixty leagues, it reaches its junction with the Paraguay.

The mark placed at the mouth of the Jauru is a beautiful pyramid of marble, brought to this spot from Lisbon. It bears inscriptions commemorative of the treaty between the courts of Spain and Portugal, by which the respective territories, of which it stands as the boundary, were defined.

The River *Parana* is of great breadth, and is navigated

against its current up to the mouth of the Tieté. Five leagues above the island of Manuel Homeni, the Rio Verde falls into the Parana, by a mouth of forty-two fathoms; on its western bank, and at an equal distance above, on the opposite eastern side, the river Aguapehy enters, by a mouth apparently above sixty feet wide. Eight leagues above this river, and on the west side of the Parana, the large river Sucuriu has its mouth, at least fifty fathoms wide, and, after four leagues of navigation further, on the same side of the Parana, is found the mouth of the large and interesting river, called the Tieté. The distance between the rivers Tieté and Pardo, according to the windings of the Parana, may be computed at thirty-five leagues.

*Climate, Soil, &c.*] To the northward of Brazil, which lies almost under the equator, the climate is hot and unwholesome, subject to great rains and variable winds, particularly in the months of March and September. But to the southward, beyond the tropic of Capricorn, there is no part of the world enjoys a more serene and wholesome air. The land near the coast is in general rather low than high, but exceedingly pleasant, it being interspersed with meadows and woods; but on the west, far within land, are mountains, from whence issue many noble streams. The soil, in general, is extremely fertile.

*Vegetables.*] The whole country contains abundance of timber, but that which is termed Brazil wood, is the principal species. This wood has a red colour, grows to a great height and considerable thickness, and thrives best among the rocks. The flowers are of a bright red, and have a strong agreeable aromatic scent. The wood is red, hard, and dry, and is used in dyeing. It is, likewise, used medicinally, both as a stomachic and an astringent. The palm-trees of Brazil are of five different kinds, besides which there are woods of ebony, mastic, cotton-trees, citron, and many others, which produce admirable fruits and balsams, and diffuse around a most delicious fragrant.

Toward the north there are woods of fine large pines, exceedingly hard, tough, and full of resin. The boughs branch off from the upper part of the tree only, and have tufts of leaves at each extremity. A tree eighty feet high, for instance, will appear without branches to the height of about fifty-five feet; the branches there extend horizontally in every direction, with leaves at their extremities, the lowest and largest to a distance of fourteen or fifteen feet from the stem, and the higher ones gradually diminishing in length towards the top, which ends in a tuft of leaves, as a crown for the whole. These trees are very picturesque and beautiful.

Among the esculent plants there is a favourite bulbous root, called the *cara*, which is equal to the best potatoe, and even more farinaceous; it grows to about five inches in

diameter, and affords excellent food, either boiled or roasted. Here are fine cabbages, salad-herbs, turnips, cauliflowers, artichokes, and potatoes; the latter, however, though very good, are little used.

*Animals.*] The north and south parts of Brazil abound with horned cattle, which are hunted for their hides, and of which twenty thousand are annually exported to Europe. Here are ant-bears, tigers, or madilloes, porcupines, janonveras, a very fierce ravenous animal, somewhat like a greyhound, various sorts of monkeys, and the topirassou, a creature between a bull and an ass, but without horns, and very harmless. The flesh of the topirassou is good, and tastes like beef. Brazil abounds with birds, some of which are remarkable for their beauty, and others for their taste. Of the first sort is the humming-bird, so called from the noise he makes with his wings, when he sucks the juice of flowers. A naturalist, who calls it colubri, says, it is not much larger than a large beetle. Their feathers, which way soever you turn them, appear of a different colour, like those of the sun-beams, on which account it is not unfitly called, by the natives, the sun-beam. The anhimá has a horn two or three inches long, growing out of its forehead, and, on that account, is called, by Europeans, the unicorn-bird. The toucan is of the size of a wood-pigeon, and of a perfect jet black all over, except under the breast and belly, which is of a fine yellow, and a small circle of red about the neck; but what is most extraordinary in this bird is, that its bill is larger than its body, yellow without, red within, and about a span long. The guirara, called, by Europeans, the sea-curlew, is remarkable for often changing its native colour, being at first black, then ash-coloured, next white, afterwards scarlet, and last of all crimson, which last grows richer and deeper the longer the bird lives. Paroquets, parrots, cockatoos, macaws, and a variety of others, are common here.

Among the poultry, fowls, turkeys, geese, and ducks, are abundant, and reasonable in price; the latter are of the Muscovy breed, enormously large, some weighing ten or fourteen pounds. In the district of St. Paul there is a singular breed of cocks; they resemble the common English in plumage and shape, but they crow very loud, and continue their last note for a minute or two. When their voice is good, they are much esteemed, and are sent for as curiosities from all parts of Brazil.

The sea-coasts, lakes, and rivers, are stored with great plenty and variety of fish, among which is the globe-fish, called, by the Latins, *orbis minor*, from its orbicular form, which is so completely armed with sharp spikes, like those of a hedge-hog, that it bids defiance to all fishes of prey. But of all the living creatures in this sea, the most remarkable is the sea-bladder, so called, because it greatly resembles one, and swims on the surface of the waves. The

inside is only filled with air, except about a spoonful of water, that seems to poise it. The skin is thin and transparent, and, like a bubble raised in the water, reflects a great number of colours.

A great variety of serpents and venomous creatures infest this country; among which are the Indian salamander, a four-legged insect, whose sting is mortal; the ibibaboka, a kind of serpent, about seven yards long, and half a yard in circumference, whose poison is instantaneously fatal to the human race; the rattle-snake, which grows here to an enormous size; the liboya, or boa constrictor, which is between twenty and thirty feet in length, and two or three yards in circumference; scorpions, one sort of which are between four and five feet long; lizards, of three or four feet long; venomous millipedes, and many others.

*Minerals.*] There are mines of gold and silver in Brazil, inland, to a great extent. There are, also, many diamond-mines of topazes and diamonds; but the latter are not so brilliant as those of Hindoostan, being of a brownish obscure hue.

The mode of working the gold-mines, or rather of obtaining that precious metal, by washing, is thus familiarly explained by Mr. Mawe:—

"Suppose a loose gravel-like stratum of rounded quartzose pebbles and adventitious matter, incumbent on granite, and covered by earthy matter of variable thickness. Where water of sufficiently high level can be commanded, the ground is cut in steps, each twenty or thirty feet wide, two or three broad, and about one deep. Near the bottom a trench is cut to the depth of two or three feet. On each step stand six or eight negroes, who, as the water flows gently from above, keep the earth continually in motion with shovels, until the whole is reduced to liquid mud, and washed below. The particles of gold contained in this earth descend to the trench, where, by reason of their specific gravity, they quickly precipitate. Workmen are continually employed at the trench to remove the stones, and clear away the surface, which operation is much assisted by the current of water which falls into it. After five days' washing, the precipitation in the trench is carried to some convenient stream, to undergo a second clearance. For this purpose wooden bowls, called *gamellos*, are provided, in the shape of funnels, about two feet wide at the mouth, and five or six inches deep. Each workman, standing in the stream, takes into his bowl five or six pounds weight of the sediment, which generally consists of heavy matter, such as oxide of iron, pyrites, ferruginous quartz, &c. of a dark carbonaceous hue. They admit certain quantities of water into the bowls, which they move about so dexterously, that the gold, separating from the inferior and lighter substances, settles to the bottom and sides of the vessel. They then rinse their bowls in a larger vessel of

clean water, leaving the gold in it; and begin again. The washing of each bowlful occupies from five to eight or nine minutes; the gold produced is extremely variable in quantity, and in the size of its particles, some of which are so minute that they float, while others are found as large as peas, and sometimes much larger. This operation is superintended by overseers, as the result is of considerable importance. When the whole is finished, the gold is carried home to be dried, and, at a convenient time, is taken to the permutation office, where it is weighed, and a fifth is reserved for the prince. The remainder is smelted by fusion with muriate of mercury, cast into ingots, assayed, and stamped according to its intrinsic value, a certificate of which is given with it. After a copy of that instrument has been duly entered at the mint-office, the ingots circulate as specie."

The following is an account of the greatest of the diamond works in Brazil, situated on the river Jigitonhenha, which affords employment to about a thousand negroes.

"This rich river, formed by the junction of a number of streams, is as wide as the Thames at Windsor, and varies in depth from three to nine feet. The part now in working is a curve, from which the current is diverted into a canal cut across the tongue of land round which it winds, the river being stopped, just below the head of the canal, by an embankment formed of several thousand bags of sand. This is a work of considerable magnitude, and requires the co-operation of all the negroes to complete it; for, the river being wide, and occasionally subject to overflows, they have to make the embankment sufficiently strong to resist the pressure of the water, admitting it to rise to the height of four or five feet.

"The deeper parts of the channel of the river are laid dry by means of large chain-pumps, worked by a water-wheel. The mud is then carried off, and the *cascalhão* is dug up, and removed to a convenient place for washing. This labour was, until lately, performed by the negroes, who carried the *cascalhão* in gamellas on their heads, but recently two inclined planes have been formed, about one hundred yards in length, along which carts are drawn by a large water-wheel, divided into two parts, the ladles or buckets of which are so constructed, that the rotatory motion may be altered by changing the current of water from one side to the other; this wheel, by means of a rope made of untanned leather, works two carts, one of which descends empty on one inclined plane, while the other, loaded with *cascalhão*, is drawn to the top of the other, where it empties itself into a cradle, and descends in its turn.

"The stratum of *cascalhão* consists of the same materials with that in the gold district. On many parts, by the edge of the river, are large conglomerate masses of rounded

pebbles, cemented by oxide of iron, in which gold and diamonds are sometimes enveloped. They calculate on obtaining as much cascalhão in the dry season as will occupy all their hands during the months which are more subject to rain. When carried from the bed of the river whence it is dug, it is laid in heaps, each containing apparently from five to fifteen tons.

"Water is conveyed from a distance, and is distributed to the various parts of the works by means of aqueducts, ingeniously constructed. The method of washing for diamonds at this place is as follows:—A shed is erected in the form of a parallelogram, seventy-five or ninety feet long, and about forty-five wide, consisting of upright posts, which support a roof, thatched with long grass. Down the middle of the area of this shed a current of water is conveyed through a canal, covered with strong planks, on which the cascalhão is laid two or three feet thick. On the other side of the area is a flooring of planks, from twelve to fifteen feet long, imbedded in clay, extending the whole length of the shed, and having a slope from the canal, of about an inch to a foot. This flooring is divided into about twenty troughs, each about three feet wide, by means of planks placed on their edge. The upper ends of all these troughs (here called canoes) communicate with the canal, and are so formed that water is admitted into them between two planks, that are about an inch separate. Through this opening the current falls about six inches into the trough, and may be directed to any part of it, or stopped at pleasure, by means of a small quantity of clay. For instance, sometimes water is required only from one corner of the aperture, then the remaining part is stopped; sometimes it is wanted from the centre, then the extremities are stopped; and sometimes only a gentle rill is wanted, then the clay is applied accordingly. Along the lower ends of the troughs a small channel is dug, to carry off the water.

"On the heap of cascalhão, at equal distances, are placed three high chairs, without backs, for the officers or overseers. After they are seated, the negroes enter the troughs, each provided with a rake, of a peculiar form, and short handle, with which he rakes into the trough about fifty or eighty pounds weight of cavalhão. The water being then let in upon it, the cascalhão is spread abroad, and continually raked up to the head of the trough, so as to be kept in constant motion. This operation is performed for the space of a quarter of an hour; the water then begins to run clearer, having washed the earthy particles away, the gravel-like matter is raked up to the end of the trough; after the current flows away quite clear, the largest stones are thrown out, and afterwards those of inferior size; then the whole is carefully examined for diamonds. When a negro finds one, he immediately stands upright and claps his hands, then extends them, holding

the gem between his fore-finger and thumb; an overseer receives it from him, and deposits it in a gamella, suspended from the centre of the structure, half full of water. In this vessel all the diamonds found in the course of the day are placed, and, at the close of the work, they are taken out, and delivered to the principal officer, who, after they have been weighed, registers the particulars in a book kept for that purpose.

"When a negro is so fortunate as to find a diamond of the weight of seventeen carats and a half, he is crowned with a wreath of flowers, and carried in procession to the administrator, who purchases his freedom, gives him a new suit of clothes, and permits him to work on his own account. When a stone of eight or ten carats is found, the negro receives two new shirts, a complete new suit, with a hat, and a handsome knife. For smaller stones, of trivial amount, proportionate premiums are given. During my stay at Tejuco, a stone of sixteen carats and a half was found: it was pleasing to see the anxious desire manifested by the officers that it might prove heavy enough to entitle the poor negro to his freedom; and when, on being delivered and weighed, it proved only a carat short of the requisite weight, all seemed to sympathise in his disappointment.

"Various precautions are taken to prevent the negroes from embezzling diamonds. Although they work in an inclined position, and consequently never know whether the overseers are watching them or not, yet it is easy for them to omit gathering any which they see, and to place them in a corner of the trough for the purpose of secreting them at leisure hours, to prevent which they are frequently changed while the operation is going on. A word of command being given by the overseers, they instantly move into each other's troughs, so that no opportunity of collusion can take place. If a negro be suspected of having swallowed a diamond, he is confined in a strong room until the fact can be ascertained. Formerly the punishment inflicted on a negro for smuggling diamonds was confiscation of his person to the state: but, it being thought unjust for the owner to suffer for the offence of his servant, the penalty has been commuted for personal imprisonment and chastisement.

"There is no particular regulation respecting the dress of the negroes: they work in the clothes most suitable to the nature of their employment, generally in a waistcoat and a pair of drawers, and not naked, as some travellers have stated. Their hours of labour are from a little before sun-rise until sun-set, half an hour being allowed for breakfast, and two hours at noon. While washing, they change their posture as often as they please, which is very necessary, as the work requires them to place their feet on the edges of the trough, and to stoop considerably. This posture is particularly prejudicial to young growing

negroes, as it renders them in-kneed. Four or five times during the day they all rest, when they are regaled with snuff, of which they are very fond.

The negroes are formed into working parties, called troops, containing two hundred each, under the direction of an administrator, and inferior officers. Each troop has a clergyman and a surgeon to attend it. With respect to the subsistence of the negroes, although the present governor has in some degree improved it, by allowing a daily portion of fresh beef, which was not allowed by his predecessors, yet it is still poor and scanty."

The following relation of an occurrence, which transpired during Mr. Mawe's residence at Rio de Janeiro, is particularly interesting, and may possibly induce the reader to refer for more ample information to the original work of that gentleman.

"A free negro of Villa do Principe, about nine hundred miles distant, had the assurance to write a letter to the Prince Regent, announcing that he possessed an amazingly large diamond, which he had received from a deceased friend some years ago, and which he begged he might have the honour to present to his Royal Highness in person. As the magnitude which this poor fellow ascribed to his diamond was such as to raise imagination to its highest pitch, the commander of Villa do Principe was ordered to send him forthwith to Rio de Janeiro, accommodated with a conveyance, and escorted by two soldiers. As he passed along the road, all who had heard the report considered him as already honoured with a cross of the order of St. Bento, and as certain of being rewarded with the pay of a general of brigade. The soldiers also anticipated great promotion; and all persons envied the fortunate negro. At length, after a journey which occupied about twenty-eight days, he arrived at the capital, and was straightway conveyed to the palace. His happiness was now about to be consummated; in a few moments the hopes which he had for many years indulged would be realized, and he would be exalted from a low and obscure condition to a state of affluence and distinction; such, no doubt, were the thoughts which agitated him during the moments of suspense. At length he was admitted into the presence; he threw himself at the prince's feet, and delivered his gem; his highness was astonished at its magnitude; a pause ensued; the attendants waited to hear the prince's opinion, and what he said they seconded. A round diamond, nearly a pound in weight, filled them all with wonder; some ready calculators reckoned the millions it was worth; others found it difficult to enumerate the sum at which it would be valued; but the general opinion was, that the treasury was many millions of crowns the richer. The noise which this occurrence created among the higher circles may be easily conceived; the general topic of remark and surprise was the negro's offering. It was shewn

to the ministers, among whom an apprehension was expressed that a substance so large and round might not prove a real diamond; they, however, sent it to the treasury, under a guard, and it was repositied in the jewel-room.

"On the next day, the Condé de Linhares sent for me, and related all the circumstances which had come to his knowledge respecting this famous jewel; adding, in a low tone of voice, that he had his doubts about its proving a genuine diamond. His Excellency then directed me to attend at his office in a few hours, when letters from himself and the other ministers to the Treasury should be given me, for permission to view this wonderful gem, in order to determine what it really was. I accordingly prepared myself, and attended at the hour appointed, when I received the letters, which I presented at the Treasury to an officer in waiting. I was led through several apartments, in which much business seemed to be transacting, to the grand chamber, where presided the treasurer, attended by his secretaries. Having my letters in his hand, he entered into some conversation with me relative to the subject: I was then shewn through other grand apartments, hung with scarlet and gold, and ornamented with figures as large as life, representing justice holding the balance. In the inner room, to which we were conducted, were several strong chests, with three locks each, the keys of which were kept by three different officers, who were all required to be present at the opening. One of these chests being unlocked, an elegant little cabinet was taken out, from which the treasurer took the gem, and in great form presented it to me. Its value sunk at the first sight, for before I touched it I was convinced that it was a rounded piece of crystal. On examining it, I told the governor it was *not* a diamond, and, to convince him, I took a diamond of five or six carats, and with it cut a very deep nick in the stone. This was proof positive; a certificate was accordingly made out, stating that it was an inferior substance, of little or no value, which I signed.

"Other boxes were now unlocked, from one of which they shewed me two large slabs of diamond, each a full inch on the superficies, and about the eighth of an inch in thickness, of a very bad brown colour. When found, they formed one entire piece, which, being amorphous, was not known to be a diamond, until the administrator, or chief of the working party, after keeping it by him many days, had recourse to the old experiment of placing it on a hard stone, and striking it with a hammer. The result of this experiment is, that if the substance resist the blow, or separate in laminæ, it must be a diamond: the latter was the case in the present instance, and the man, having thus made two diamonds from one, transmitted them to the intendant.

"The river Abaité, from whence these pieces came,

has produced one, of an octaëdral form, which weighs seven-eighths of an ounce troy, and is perhaps the largest diamond in the world. It was found, about twelve years ago, by three men, who were under sentence of banishment for high crimes; but, on presenting this valuable gem to the then viceroy, they were pardoned and rewarded. It is now in the private possession of the Prince Regent.

"I was afterwards favoured with a sight of the remaining diamonds in the Treasury: they appeared to be in quantity about four or five thousand carats. The largest did not generally exceed eight carats, except one, of a fine octaëdral form, full seventeen. Among the few coloured diamonds, one of the smallest was a beautiful pink, one a fine blue, and several of a green tinge: the yellow were the most common, and least esteemed."

*Revenue.*] The revenue of Brazil, which is, perhaps, unequalled by that of any other country consisting of the same population, consists of the following branches:

1. A fifth upon all the gold obtained in any and every part of the country.

2. A duty of fifteen per cent. upon all merchandise entered at the custom-house and imported, except such articles as are imported in Portuguese vessels, which pay something less.

3. A small tax upon exports.

4. Tithes upon the productions of the land. This branch of revenue yields a large income to the state, to which it has belonged since the first settlement of the colony, when the reigning sovereign, by contract with the pope, agreed to pay the salaries of the clergy, in order to induce them to emigrate to that uncivilized country. It is also claimed by the state, in virtue of the order of Christ, of which the monarchs of Portugal are grand masters. It is portioned into distinct districts, each of which is either contracted for, or put up at auction separately, in the treasury, under such arrangements as to be allotted to those who have most interest. The several renters collect it by ascertaining the number of negroes upon each estate, or possessed by every housekeeper, and agree to receive a certain rate per head, instead of taking it in kind. The amount for which the various tithes are sold it is not easy to calculate, but it must be very considerable.

5. Indulgencies, which are disposed of under the same regulations as the tithes, the contractor of the district appointing agents in every parish to sell them for him.

6. A duty upon every thing that enters the mining district. This tax is about six shillings the arroba, or rather more than two-pence per pound, for all commodities indiscriminately. New negroes pay ten milreis each; and oxen, going to Rio de Janeiro, pay two milreis per head.

A considerable sum arises from the tolls paid on pass-

ing the various rivers. Two milreis for each mule, unless with cargo.

A new tax of five reis per pound has been imposed on all hutchers' meat sold in the principal towns.

Spiritous liquors, transported to Rio de Janeiro, pay ten dollars per pipe.

A new tax has been laid upon the rents of houses, which, however, is levied very favourably.

The gold-dust that was formerly permitted to circulate in the mines, has been called in, and paper-money, peculiar to the district, has been issued, to the amount of a hundred thousand pounds sterling.

A considerable sum has been produced by the stamping of dollars, which were received at seven hundred and fifty reis, and re-issued, after being stamped, at nine hundred.

*Cities.*] RIO DE JANEIRO, or St. Sebastian, is now considered the capital of Brazil, and is the residence of the court of Portugal. The best view of the city is from the harbour, whence its lofty eminences, crowned with convents, and the hills in its environs, ornamented with villas and gardens, have a magnificent appearance. The royal palace skirts the beach, and is seen to great advantage from the principal landing-place, which is only sixty yards distant. This palace, though small, is the residence of the Prince Regent and the royal family: the mint and the chapel royal also form parts of the structure. Parallel with the beach runs the main street, consisting of noble buildings, from which the smaller streets diverge at right angles, and are intersected by others at regular distances.

The convents and churches are well built, and tolerably handsome; and the cathedral is in a superior style of architecture. The streets were formerly incommoded by latticed balconies, which had a very heavy appearance, and obstructed the circulation of the air; but these have been removed by order of government. The greatest nuisances now remaining are those which arise from the custom of equestrians of all ranks riding on the foot-paths, and from the absurd hanging of shop and house doors, so as to open outward into the street, to the great annoyance of foot-passengers. To these nuisances may be added the numerous pools of stagnant water, which, from the lowness of the situation, cannot, without much labour, be drained away, and which, through the heat of the weather, emit the most unpleasant exhalations. Water for the use of the city flows from the hills through aqueducts, and is distributed to several fountains in various public places; but it is to be regretted that there are not more of these for the supply of the inhabitants, numbers of whom live a mile distant from any of them, and are obliged to employ persons continually in carrying water. The fountains, in dry weather, are frequently so crowded, that the carriers have to wait for hours before they can be supplied. The water is good, and, when kept in large

jars, drinks cool and pleasant. The inns and public-houses are almost destitute of accommodations, and so very uncomfortable, that a stranger will not reside in them if he can possibly find a friend to take him in. House-rent is, in general, as high as in London, owing to the dearness of building materials, and the exorbitant price of masonry. Timber, in particular, is unaccountably scarce, considering the quantity which grows in almost every part of Brazil. Provisions are tolerably plentiful, but not very choice in quality: the beef is very indifferent; the pork is better, and, if the feeding were properly attended to, might be rendered fine; mutton is almost unknown, as the natives will not eat it; the poultry of every description are excellent, but they are very dear. Pulse and vegetables of all kinds are very abundant; and the fish-market is not ill supplied.

The police is pretty well regulated; and, from the attention which has been paid to it since the arrival of the court, there is reason to hope that it will be placed on a footing equally respectable with that of any European capital. The prisons are loathsome, and require the benevolent genius of a Howard to reform them altogether. One great step, however, in favour of humanity has been gained: the detestable inquisition has been abolished, and with it the spirit of persecution, so that no one can now be offended for his religious tenets, unless he openly insult the established religion.

Perhaps no colonial port in the world is so well situated for general commerce as Rio de Janeiro. It enjoys, in an eminent degree, a convenient intercourse with Europe, America, Africa, the East-Indies, and the South-Sea Islands, and seems formed by nature as a grand link to unite the trade of those great portions of the globe. Commanding, also, as the capital of a rich and extensive territory, resources of immense amount, it seemed to require only the presence of an efficient government to give it political importance; and this advantage it has now gained, by becoming the stated residence of the court of Portugal.

The articles imported from the River Plate, and from Rio Grande de St. Pedro, consist of immense quantities of dried beef, tallow, hides, and grain. Those from the United States are chiefly salt provisions, flour, pitch, tar, and household furniture. The North-Americans generally send cargoes of these articles on speculation, and, as the market for them is fluctuating, and not to be depended on; they frequently take them to other ports. Their provisions are commonly sent to the Cape of Good Hope. They bring European merchandise, which they exchange for specie, wherewith to trade to China, and also take in necessities on their voyages to the South-Seas.

From the western coast of Africa, Rio de Janeiro imports wax, oil, sulphur, and some woods. The negro-

trade has been restricted to the kingdom of Angola, by a decree of the Prince Regent, who has declared his intention of abolishing it altogether as soon as possible.

Before the Isle of France was taken by the British, the intercourse of Rio de Janeiro with India, in common with Mozambique, was much annoyed by the French privateers, but it will, in all probability, flourish by their suppression. A voyage thither and back is performed with great expedition: one large ship, of eight hundred tons, sailed, loaded at Surat, and returned within the space of seven months. A voyage to China seldom occupies a longer period. The trade thither will, no doubt, be revived; and it is not improbable that this port may, at a short distance of time, become an entrepôt for India goods destined for Europe.

Rio de Janeiro is conveniently situated for supplying a variety of necessities to the Cape of Good Hope, and to New South-Wales; indeed, of late years, English manufactures have been sold here so cheap, that it has been found more advantageous to ship them hence for those colonies, than from home. Ships going on the South-Sea whale-fishery touch here, and lay in large stocks of spirituous liquors, wine, sugar, coffee, tobacco, soap, and live-stock. Iron is occasionally brought from Sweden; and the imports from the mother-country consist principally in wine and oil.

The principal exports are cotton, rum, sugar, ship-timber, cabinet-woods, hides, tallow, indigo, and coarse cotton-cloths, for clothing the Peons in the provinces of the River Plate. Among the more precious articles of export may be enumerated gold, diamonds, topazes of various colours, amethysts, tourmalines, aqua-marinas, chrysoberyls, and wrought jewelry.

This market has been overstocked with British manufactures, in consequence of the sanguine speculations excited by the emigration of the court from Portugal. The supply exceeded the demand in a tenfold degree, and the excess gave rise to auctions, where goods were sold at unprecedentedly reduced prices. In proportion as English merchandise lowered, that of Brazil rose in value; and so great was the demand for it, owing to the numerous vessels waiting for cargoes, that, within a year after the arrival of the Prince Regent, every article of produce was doubled. Gold quickly disappeared; for the monied Portuguese, perceiving the avidity and eagerness with which the English impolitely forced their goods upon them, cautiously withheld their specie, and, by the alternative of barter, got rid of their own produce at a very high price, and obtained the British merchandise almost at their own valuation. The losing party in this unequal traffic, though they had chiefly to blame their own imprudence in engaging in it, were loud in their complaints and remonstrances against the Portuguese merchants. A treaty of commerce was therefore concluded, by which the duties on English, and,

indeed, all foreign, merchandise, which had been twenty-five per cent., were reduced to fifteen per cent. *ad valorem*: and a judge was appointed to attend solely to the concerns of the English, and to see justice done them.

The harbour of Rio de Janeiro is generally easy of entrance and egress, as there is a daily alternation of land and sea breezes, the former blowing until about noon, and the latter from that hour until sun-set. Ships find here every convenience for repairing, heaving down, &c.; but it is to be hoped that docks will soon be formed, which will render the latter operation unnecessary. An anchorage-duty is paid here, which forms an item in the bill of port-charges.

The Portuguese inhabitants are, in general, rather punctilious and reserved in admitting a foreigner to their family-parties; but, having once received him, they are open and hospitable.

The ladies are affable and courteous to strangers, extremely fond of dress, but less proud than those of other nations. In their mixed assemblies, the utmost gaiety prevails, and is seasoned by that politeness for which the Portuguese are generally distinguished. The conversation of the best-bred men, however, is more lively than instructive; for education is here at a low ebb, and comprises a very limited course of literature. Since the arrival of the court, however, measures have been adopted for effecting a reform in the seminaries, and other institutions for public instruction; and the Prince Regent has zealously patronised every attempt to diffuse among his subjects a taste for useful knowledge. Under his auspices, the college of St. Joaquim has undergone considerable improvement: a lectureship on chemistry has been instituted, to which a native of England, Dr. Gardner, has been nominated by his Royal Highness; and it is probable that from this appointment may be dated the introduction of experimental philosophy in that establishment.

St. SALVADOR, the capital of Bahia; was originally the seat of the supreme government of Brazil: it consists of two parts, one built on low ground, near the shore, where the commerce is carried on, and the other on a high hill, which, being considered the most salubrious, is the residence of all the people of fashion. Its population is said to be not less than seventy thousand souls. The houses are built with latticed windows and balconies. The churches are the public buildings most worthy of notice: they are said to be richly ornamented within. The government of the city is vested in a governor, who is nominated by the court, for three years. Here all law proceedings, civil and criminal, come before the respective magistrates, whose sentence is, in general, final, though appeals, in certain cases, may be made to the court at Rio de Janeiro.

Both the town and bay are as well defended as circum-

stances will permit. On the shore is a royal arsenal, and numerous houses for stores. The custom-house and wharfs are conveniently situated. Ships of war have been built here, also many large and fine vessels for the merchant-service. For these purposes a large supply of fine timber is readily obtained from the interior, from the number of fine rivers which flow into the bay.

The manners of the people differ little from those of the inhabitants of the capital; but it is said that, in the best societies here, more gaiety and refinement prevail, and the higher classes are more sociable, than in Rio de Janeiro. A taste for music is so general, that there are few houses without the guitar; and all the more respectable families have piano-fortes. The ladies dress in the English style, and ornament themselves with gold-chains, but wear very few diamonds. For dishabille at home they wear a kind of loose dress, over which they throw a veil, on the entrance of strangers. They are considered as far less industrious than the females of the southern districts. The domestic dress of the men consists of a jacket and loose trousers, of printed cotton.

Religious processions take place here, as in Rio de Janeiro, on great festivals and rejoicing days; and these solemnities are attended by various amusements, which continue from morning to night. At these times, the Brazilians have a custom of covering the walls and balconies of their houses with beautiful silks, made and ornamented for the purpose.

One of the most memorable seasons of rejoicing, of late years, was when the Prince Regent touched at this city on his voyage to Rio de Janeiro, and remained several days. The inhabitants testified their loyalty by every public demonstration of joy, and by a display of all the magnificence which they could possibly furnish. As a more solid proof of their attachment, they unanimously voted to subscribe a sum equal to half a million sterling, to build a palace for the royal family, if the prince would condescend to fix his residence among them.

This city is plentifully supplied with provisions. Beef and pork are abundant; the former is decidedly bad, the latter tolerable. Fish are in great plenty and variety, and form a principal article in the diet of the inhabitants. Cold fish, with salad, is the general supper of almost all ranks. Numbers of retail shopkeepers, who sell wine, cheese, groceries, &c., buy fish and fry it, and afterwards retail it in small quantities. Poultry is plentiful, but not cheap; vegetables, and pulse of every description, are in very great profusion. The markets are well supplied with all the tropical fruits, many of which are said to be in great perfection, particularly the pine, the mango, and the banana; the latter is esteemed the best in America. Preserved fruits are in great abundance, owing to the cheapness of sugar; great varieties of them are sold in

the streets, and two or three preserved limes, in a cup of syrup, may be bought for a penny. Even the lower orders conclude the meanest dinner with this delicacy.

The inns and houses for the accommodation of strangers, are as bad, or worse, here than in any other part of Brazil. The owners are indifferent to the comfort of their guests, and, indeed, have no motive to be otherwise; for the Portuguese pay very poorly for bare necessities, and generally go to the place where they can obtain them at the least expence.

ST. PAUL'S, the chief town of the province of that name, is situated on a pleasing eminence, of about two miles in extent, surrounded on three sides by low meadow-land, and washed at the base by rivulets, which almost insulate it in rainy weather, and flow into a pretty large stream, called the Tieti, which runs within a mile of the town. Over them there are several bridges, some of stone, and others of wood, built by the late governor. The streets of St. Paul's, owing to its elevation, and the water which almost surrounds it, are, in general, very clean; the material with which they are paved, is a sort of grit-stone, cemented by oxide of iron, and containing large pebbles of rounded quartz. This pavement is an alluvial formation, containing gold, many particles of which metal are found in the clinks and hollows after heavy rains, and, at such seasons, are diligently sought for by the poorer class of the inhabitants.

Here are several squares, and about thirteen places of religious worship, viz. three monasteries, two convents, and eight churches, the greater part of which, as well as of the whole town, are built of earth. To erect the walls, a frame is constructed of six moveable planks, placed edge-wise, opposite each other, and secured in that position by cross-pieces, bolted with moveable pins. Earth is put in by small quantities, which the workmen beat with rammers, and occasionally moisten with water, to give it a consistency. Having filled the frame, they remove it, and continue the same operation till the whole shell of the house is completed, taking care to leave vacancies, and put in the window-frames, door-frames, and beams, as they proceed. The mass, in course of time, becomes hardened, the walls are pared perfectly smooth inside, and take any colour the owner chooses to give them: they are generally enriched with very ingenious devices. This species of structure is durable: I have seen some houses thus built that have lasted two hundred years; and most of them have several stories. The roofs are made to project two or three feet beyond the wall, in order to throw off the rain to a distance from the base; spouts might be a more effectual preservative against wet, but their use is little known here. The houses are covered with gutters; but, though the country affords excellent clay, and plenty of wood, very few bricks are burnt.

The population of this place is said to amount to nearly twenty thousand souls; the clergy, including all ranks of religious orders, may be reckoned at five hundred. They are, in general, free from that excessive bigotry and illiberality which is the reproach of the neighbouring colonies, and their example has a beneficial effect on the rest of the inhabitants.

Here are but few manufactures of importance; a little coarse cotton is spun by the hand, and woven into cloth, which serves for wearing-apparel, sheets, &c. They make a beautiful kind of net-work for hammocks, which are fringed with lace, and form an elegant piece of furniture, being slung low, so as to answer the purpose of sofas. The ladies are particularly fond of using them, especially when the heat of the weather disposes them to indolence. The making of lace is a general employment for females, some of whom excel in it. The shop-keepers are a numerous class, who, as in most colonial towns, deal in a variety of articles, and sometimes make great fortunes. Here are few doctors of medicine, but many apothecaries; some silver-smiths, whose articles are equally indifferent, both in metal and workmanship; and tailors and shoemakers in great numbers. In the outskirts of the city live a number of Creolian Indians, who make earthen-ware for culinary purposes, large water-jars, and a variety of other utensils, tastefully ornamented. The greatest proportion of the inhabitants, however, consists in farmers and inferior husbandmen, who cultivate small portions of land, on which they breed large stocks of pigs and poultry for sale.

TEJUCO, the capital of the diamond district, owing to its situation by the side of a hill, is very irregularly built; its streets are uneven, but the houses, in general, are well constructed, and in good condition, compared with those of other towns in the interior. Its name, which, in the Portuguese language, signifies a muddy place, is derived from places of that description in its neighbourhood, which are rendered passable by being covered with large pieces of wood.

Notwithstanding the idleness of a great number of the inhabitants, Tejuco may be called flourishing, on account of the circulation of property created by the diamond-works. The annual sum paid by government for the hire of negroes, salaries of officers, and various necessities, such as nitre and iron, does not amount to less than thirty-five thousand pounds; and this, added to the demands of the inhabitants of the town and its vicinity, occasions a considerable trade. The shops are stocked with English cottons, baizes, and cloths, and other manufactured goods; also hams, cheese, butter, porter, and other articles of consumption, which are brought hither upon mules from St. Salvador and Rio de Janeiro.

*Customs, Manners, &c.*] The inhabitants of this country D

try, which are very numerous, consist of Portuguese, negroes, Indians, and original natives. The portrait given of the manners and customs of the Portuguese in Brazil, by the majority of travellers, is very far from being favourable. They are described as a people, who, while sunk in the most effeminate luxury, practise the most desperate crimes; of a temper hypocritical and dissembling; of little sincerity in conversation, or honesty in dealing; indolent, proud, and cruel; in their diet, penurious; for, like the inhabitants of most southern climates, they are much more fond of show, state, and attendance, than of the pleasures of free society, or a good table; yet their feasts, which are seldom made, are sumptuous to extravagance. From the accounts given by Mr. Mawe, however, these particulars appear to have been exaggerated. When they appear abroad, they cause themselves to be carried out in a kind of cotton hammocks, called serpentes, which are borne on the negroes' shoulders, by the help of a bamboo, about twelve or fourteen feet long. Most of these hammocks are blue, and adorned with fringes of the same colour; they have a velvet pillow, and above the head a kind of tester, with curtains, so that the person carried cannot be seen, unless he pleases; but may either lie down, or sit up, leaning on his pillow. When he has a mind to be seen, he pulls the curtain aside, and salutes his acquaintance whom he meets in the streets; for they take a pride in complimenting each other in their hammocks, and even hold long conferences in them in the streets; but then the two slaves who carry them make use of a strong well-made staff, with an iron fork at the upper end, and pointed below with iron: this they stick fast in the ground, and rest the bamboo, to which the hammock is fixed, on two of these, till their master's business or compliment is over. Scarcely any man of fashion, or any lady, will pass the streets without being carried in this manner.

The Brazilian women, in the opinion of Lieutenant Tuckey, of the Calcutta, who was there in 1803, can seldom claim the epithet of pretty; though he observes, that their black eyes, large, full, and sparkling, give a degree of brilliancy to their dark complexions, and throw some expression into their countenances; but it is too generally the mere expression of animal vivacity, untempered by the soft chastising power of tender sensibility. Their eye-brows are finely arched; their eye-lashes long and silken; their hair is long, black, and coarsely luxuriant. In their persons, they are unacquainted with that delicate *propreté*, from which our countrywomen derive so large a portion of their power over the other sex, and for which they are conspicuous over all the nations of Europe.

It is not a little remarkable, that the young ladies, who are educated in the convents, are by no means subjected

to such restraints as are imposed on them in similar institutions on the old continent. They are permitted to speak with strangers through the grating, and seem uncommonly partial to the conversation of Englishmen, who often, by ingenuity and the aid of bribery, contrive to carry them off. Mr. Tuckey contradicts the assertions of the gentlemen who accompanied Captain Cook, relative to the dropping of *bouquets* on the heads of passengers, as a signal for assignations; and asserts, that he found the manners of the unmarried ladies approaching near to the easy familiarity of those of England. On this subject Mr. Mawe, also, has the following remarks:—

"I may observe, that neither in St. Paul's, nor in any other place which I visited, did I witness any instance of that levity in the females of Brazil which some writers allege to be the leading trait in their character. I allude to the custom which has been said to prevail among them, of throwing flowers from the balconies on such of the passers-by as they take a fancy to, or of presenting a flower or a nosegay to their favourites, as a mark of partiality. The circumstance which seems to have given rise to such an ill-founded conjecture is this: Flowers are here considered an indispensable part of the female head-dress, and, when a stranger is introduced to a lady, it is nothing more than an act of common courtesy for her to take one from her hair to present to him. This elegant compliment he is expected to return in the course of the visit, by selecting a flower from the profuse variety which adorn the garden or the balcony, and presenting it to her.

"One singular custom I must not omit to notice, that of artificial fruit, such as lemons or oranges, made very delicately of wax, and filled with perfumed water. On the two first days of Lent, which are here celebrated with great festivity, persons of both sexes amuse themselves by throwing these balls at each other; the lady generally begins the game, the gentleman returns it with such spirit, that it seldom ceases until several dozens are thrown, and both parties are as wet as if they had been drawn through a river. Sometimes a lady will dexterously drop one into the bosom of a gentleman, which will infallibly oblige him to change his linen, as it usually contains three or four ounces of cold water. On these days of carnival, the inhabitants parade the streets in masks, and the diversion of throwing fruit is practised by persons of all ages. It is reckoned improper for men to throw at each other. The manufacture of these missiles, at such periods, affords no inconsiderable occupation to certain classes of the inhabitants: I have been informed, that, in the capital of Brazil, many hundreds of people derive a temporary subsistence from the sale of them. The practice, however, is very annoying to strangers, and not unfrequently engenders quarrels which terminate seriously."

r. Mawe's

entertainment at the house of Captain Rodrigo de Lima, in the village of Bordo do Campo:—

"While supper was preparing, we had some conversation with the captain respecting the agriculture and produce of the neighbourhood; in the course of which he paid much attention to our observations, and promised next day to shew us the system he pursued. At the repast, which was speedily announced, he introduced us to his wife and daughter, and a lady who was then on a visit to them. This was an unexpected act of politeness, and one which had never yet been exercised towards us by any master of a family in the whole course of our journey. The few females we occasionally saw at any former place generally secluded themselves on our arrival, and during our stay; and, when they came near us by chance, they commonly ran away, in as much apparent alarm as if they had been accustomed to be frightened at the name of an Englishman. The ladies appeared in very neat dresses, of English manufacture, with a profusion of gold chains about their necks, which are always worn on receiving or paying visits. Their conversation was gay and enlivening: they were very inquisitive respecting the costume of English women, and seemed astonished at hearing that they wore caps, it being never the custom among the Brazilian females to cover their heads, until advanced in years. They ornament their hair with combs, frequently of gold, and very richly wrought. Wine was introduced, of which the ladies could not be persuaded to partake; but they gave our healths, by putting the glass to their lips. After supper, the table was covered with delicious sweetmeats; when, being desirous of paying the lady of the house a compliment, I spoke highly of their excellence, and presumed that the fruits were preserved under her immediate direction: but she assured me to the contrary, and observed that her negro did all that sort of domestic work. I perceived, or imagined, that she was rather offended at my remark, and therefore apologised, by saying, that it was not uncommon for the ladies in England to interest themselves personally in the concerns of housewifery. The remainder of the evening passed off very agreeably.

"On looking out of my chamber-window, the following morning, I was surprised to see two small and very neat inclosures, in one of which flax was growing, and, in the other, wheat. The latter, which apparently had been sown about seven weeks, was very poor and unpromising: the ground had too much water, and seemed of late to have been flooded. Our host regaled us with a breakfast of stewed fowl, excellent coffee and milk, and a dish of feijones, with mandioca, and buttered toast; after which he conducted us to his inclosures.

"The flax was very healthful and strong: he told us he cut it three or four times a year, and that it was dressed,

spun, and woven, in his own house. He grew but little, having occasion for no more than what answered his domestic purposes. The wheat, he told us, was blighted. He shewed us a sample of last year's growth, which was very poor, coarse, and foul. The mills are of similar construction to those used at Santa Gallo, but I did not observe a pair of stones fit for the grinding of wheat.

"I now expressed a wish to see his dairy, which the good gentleman immediately complied with. Instead of an apartment, such as I expected to find, fitted up and kept in order for that sole purpose, I was shewn into a kind of dirty store-room, the smell of which was intolerable. The present, I was told, was not the time for making cheese, as the cows gave milk only in the rainy season. I begged to see the implements used in the process; and, on examining them, found, to my utter astonishment, that neither the vats nor cloths had been washed since they were last used, and the milk-pails, &c. were in the same condition. This sufficiently accounted for the offensive smell which I had perceived on entering the place. When I asked to see the utensil for making butter, an apology was made, by stating that it was not in the way: they had observed my disgust at the other vessels, and probably thought that this was equally unfit to be inspected. I did all in my power to inform our worthy host of the manner in which English dairies were conducted, and gave him several directions, which he wrote down, but seemed quite indifferent about adopting them. On enquiry, I found that no provision was made for the cows; there were no houses erected for milking, and that operation was frequently neglected, and at all times badly performed.

"The premises bore traces of the industry and taste of the former occupants: there was a mud-wall round them, encompassing about an acre of ground, which, when perfect, must have given the whole a retired and comfortable appearance; but it was now partly broken down and in ruins. The steps leading to the front-door of the dwelling were of pot-stone, of which substance there is a stratum in the vicinity.

"Our cattle being ready, we mounted about eleven in the forenoon, returning thanks to our host, and offering to pay for the accommodations we had met with; but the only compensation he required was, a promise on our part to pass a day or two with him on our return. The ladies, who had not appeared at breakfast, came out upon the gallery, and very pleasingly and politely wished us a good journey."

*History.* Brazil was first discovered by Americus Vesputio, in 1498; but the Portuguese did not plant it till 1549, when they fixed themselves at the bay of All Saints, and founded the city of St. Salvador. They met with some interruption, at first, from the court of Spain, who

considered the whole continent of South-America as belonging to them. However, the affair was at length compromised by treaty; and it was agreed that the Portuguese should possess all the country lying between the two great rivers Amazon and Plata, which they still enjoy. The French, also, made some attempts to plant colonies on this coast, but were driven from thence by the Portuguese, who remained without a rival till the year 1580, when, in the very zenith of their prosperity, they were struck by one of those blows which generally decide the fate of kingdoms: Don Sebastian, the king of Portugal, lost his life in an expedition against the Moors in Africa; and, by that event, the Portuguese lost their independence, being absorbed into the Spanish dominions.

The Dutch, soon after this, having thrown off the Spanish yoke, and being not satisfied with supporting their independence by a successful defensive war, being flushed with the juvenile ardour of a growing commonwealth, pursued the Spaniards into the remotest recesses of their extensive territories, and grew powerful and opulent by the spoils of their former masters. They particularly attacked the possessions of the Portuguese; they took almost all their fortresses in the East-Indies, and then turned their arms upon Brazil, where they took seven of the capitaniats, and would have subdued the whole colony, had not their career been stopped by the archbishop, at the head of his monks, and a few scattered forces. The Dutch were, about the year 1645, entirely driven out of Brazil; but their West-India Company still continuing their pretensions to this country, and harassing the Portuguese at sea, the latter agreed, in 1661, to pay the Dutch eight tons of gold, to relinquish their interest in that country, which was accepted; and the Portuguese have remained in peaceable possession of all Brazil from that time, till about the end of the year 1762, when the Spanish governor of Buenos Ayres, hearing of a war between Portugal and Spain, took, after a month's siege, the Portuguese frontier fortress, called St. Sacramento; but, by the treaty of peace, it was restored.

The most recent event in the history of this country is the emigration of the royal family of Portugal, who were induced to seek in this part of America an asylum from the persecutions of Napoleon Buonaparte.

## SECTION II

### ISLANDS IN SOUTH-AMERICA,

#### BELONGING TO THE PORTUGUESE.

The islands belonging to the Portuguese, in South-America, are Fernando Nohrono, St. Martin Vaz, Ascension, Trinidad, and St. Catharine. The three former are not worthy of notice, the two latter are described in the voyage of M. de la Perouse, as follows:—

### TRINIDAD.

Trinidad is thus described by M. de Monneron, chief engineer in the expedition of M. de la Perouse.

"The island of Trinidad, situated in the southern hemisphere, a hundred and eighty leagues from the coast of Brazil, remained uninhabited till the war which terminated in 1783, when the English took possession of it, doubtless with a view of converting it into a station, whence they might cruise with success on the French, Spaniards, and Dutch. It was said, that they had abandoned the island at the peace: the intention of M. de la Perouse was to ascertain the truth of this. A little time after making the island, we saw a Portuguese flag on a rising ground, at the head of a small bay, on the south-east side of the island.

"M. de la Perouse, having hoisted out a boat, ordered me to go and endeavour to survey the coast. The officer commanding this expedition was forbidden to disembark, unless he could do it without running any hazard. We came very near the shore, but were unable to land; we had an opportunity, however, of examining, at a very little distance, this establishment. It is situate about a third of the way up a hill, facing a sand-bank, that forms a creek in the south-east of the isle. The western side of this little opening is bounded by bluffs of bare rock, which, like the rest of the island, are of volcanic origin. On the eastern side is a broad-based sugar-loaf hill, about three hundred feet high, which adjoins to a kind of table-hill, the diameter of which is much more considerable than that of the former, but, in height, it scarcely equals two-thirds of it. There is, on the sand-bank, from forty-five to sixty fathoms depth of water: hence the land rises into a steep and very regular, though natural, glacis, at the summit of which is a kind of platform, very sloping on the side next the sea, and which, to make use of a technical term, I call *terre plein*: the inclination of this is so considerable as hardly to afford a shelter from the fire of a ship at the anchorage. I saw no parapet, though there probably is one in barbets. I looked as narrowly as I could for cannon or batteries, but saw no traces of them. On the *terre plein* were five or six huts, resembling those of the negroes on the sugar-plantations; of these one was considerably larger than the rest, and situate near the salient angle of the *terre plein*. This fortification, if such it may be called, resembles a redan, one side of which is parallel to the sand-bank, and the other to a ravine, which is the boundary of the glacis in this direction.

"This establishment resembles rather a resort of banditti than a post occupied by a civilized nation. Except the natural obstacles, which render the approach to this island difficult and dangerous, there is nothing which can make a shadow of resistance: I can, also, confidently affirm, that there is not a single vessel there, of any de-

scription, which induces me to think that the Portuguese have but very lately arrived here, or are very negligent of their establishments.

"M. de Vaujous, who landed on the island, brought back word to M. de la Perouse, that he estimated the number of persons there at two hundred. For my own part, I reckoned their numbers with great care, repeatedly counting those who came within sight, but I could not make out more than about thirty-three persons on the brow of the hill, and thirty-six who were observing us from the platform; so that the rest of the exiles to this rock had not curiosity enough to come within sight of us. They told M. de Vaujous, that they were supplied every six months with provision from Rio de Janeiro, and were relieved annually.

"As the bottom of the bay is probably rocky, it might be difficult for ships or frigates to bring their broadsides to bear on the post; but if the place remain in its present situation, I should advise taking a safer anchorage to the south-west, whence, in all probability, it would be easy to turn the post, which is on the south-east side of the bay, by making a lodgment on the crest of the hill, at the bottom of which is the platform that has been already described."

#### ST. CATHERINE.

"This Island of St. Catherine," says M. de la Perouse, "extends from twenty-seven degrees nineteen minutes to twenty-seven degrees forty-nine minutes of south latitude. Its breadth, from east to west, is only two leagues, and it is only separated from the main by a channel two hundred toises over. On the point that forms this narrow passage is situated the city of Nostra-Senara del Destero, the capital of the government, and the place of residence of the governor. It contains, at most, three thousand inhabitants, and about four hundred houses. Its appearance is exceedingly pleasant. According to Frezier's account, this island served, in 1712, as a retreat to vagabonds, who made their escape from different parts of the Brazils, who were only nominal subjects of Portugal, and who acknowledged no authority whatever. The country is so fertile, that they were able to subsist without any succour from the neighbouring colonies; and they were so destitute of money, that they could neither tempt the cupidity of the governor-general of the Brazils, nor inspire him with any desire of subduing them. The ships that touched at the island gave them in exchange for their provisions nothing but clothes and shirts, of which they were in the utmost want. It was not till about 1740, that the court of Lisbon established a regular government in the island of St. Catherine, and the parts of the continent adjacent. This government extends sixty leagues north and south from the river San Francisco to Rio Grande, its popula-

tion being about twenty thousand persons; but I saw so great a number of children in the different families, that I think it will soon be much more considerable. The soil is exceedingly fertile, and produces all sorts of fruit, vegetables, and corn, almost spontaneously. It is covered with trees of everlasting green, but they are so interwoven with briars and creeping plants, that it is impossible to get through the forests otherwise than by opening a path with a hatchet. Danger is besides to be apprehended from snakes, whose bite is mortal. The habitations, both on the island and the continent, are all close to the sea-side. The woods that surround them are delightfully fragrant, owing to the great number of orange-trees, and other odoriferous trees and shrubs that they contain. But, notwithstanding all these advantages, the country is very poor, and totally destitute of manufactured commodities, so that the peasants are almost naked, or else covered with rags. Their soil, which is very fit for the cultivation of sugar, remains unproductive for the want of slaves, whom they are not rich enough to purchase. The whale-fishery is very successful; but it is the property of the crown, and is farmed by a company at Lisbon, which has three considerable establishments upon the coast. Every year they kill about four hundred whales, the produce of which, as well oil as spermaceti, is sent to Lisbon by the way of Rio de Janeiro. The inhabitants are idle spectators of this fishery, from which they derive not the smallest advantage. If the government does not come forward to their assistance, and grant them such franchises and immunities as may invite commerce to their shores, one of the finest countries in the universe will remain everlastingly miserable, and will be utterly useless to the mother-country. It is very easy to make St. Catherine's. A muddy bottom is found in seventy fathoms water, at eighteen leagues distance in the offing, the water gradually shoaling till within four cables' length of the land, where there is still four fathoms.

"It appeared to me that our arrival spread great terror through the country. The different forts fired several alarm-guns, which induced me to anchor earlier than I should otherwise have done, and to send a boat on shore with an officer, to make known our pacific intentions, and our want of wood, water, and fresh provisions. The officer, whom I charged with this negotiation, found the little garrison of the citadel all under arms. It consisted of forty men, commanded by a captain, who immediately sent off an express to the city, where the governor, brigadier of infantry, resided. He had been informed of our expedition by means of the Lisbon Gazette; and a bronze medal I sent him, left him no doubt concerning the object of our visit. The most speedy and positive orders were given to sell us whatever we stood in need of, at the lowest price; an officer was appointed to attend on each frigate;

he was entirely at our command, and we sent him, with the purser's steward, to buy provisions of the inhabitants.

"Provisions of all kinds were in the greatest abundance; a large ox cost eight dollars; a hog, of one hundred and fifty pounds weight, four; two turkeys were to be had for a dollar; it was only necessary to cast the net, in order to haul it up again full of fish; five hundred oranges were brought on board, and sold to us for less than half a dollar; and vegetables were also at a very moderate price. The following fact will give an idea of the hospitality of these good people:—One of my boats having been overset by the surf, in a creek where I was cutting wood, the inhabitants, who assisted in saving it, forced our half-drowned sailors to sleep in their beds, and passed the night themselves upon mats spread on the ground, in the same room in which they exercised this noble hospitality. A few days afterwards they brought on board the Boussole, the masts, grapnel, and colours of the boat, articles truly valuable to them, and which would have been of the greatest use in their canoes. Their manners are mild: they are kind, polite, and obliging; but superstitious, and jealous of their wives, who never appear in public.

"Not having foreseen the obstacles that detained us twelve days in this road, we did not send our astronomical clocks on shore, thinking that we should only pass five or six days at anchor. We had, however, little reason for regret, as the sky was constantly cloudy. The longitude of the island was consequently determined by distances from the sun to the moon. According to our observations, the most northerly point of the island of St. Catherine may be fixed at forty-nine degrees forty-nine minutes west longitude, and twenty-seven degrees nineteen minutes south latitude."

To this account we shall subjoin the following particulars from the travels of our worthy countryman, Mr. Mawe:—

"Entering the port of St. Catherine's by the north, we passed several islands, on one of which, westward of the entrance, stood the respectable fort of Santa Cruz. After running a few miles in shoal water, we sailed into a narrow passage, guarded by two forts, which forms the harbour. From the anchorage, and more particularly from the landing-place, which is at the bottom of a verdant slope of about five hundred yards, the town has a beautiful appearance, and the perspective is nobly crowned by the cathedral. The green is interspersed with orange-trees, and forms an agreeable parade. The houses are well built, have two or three stories, with boarded floors, and are provided with neat gardens, well stocked with excellent vegetables and flowers. The town consists of several streets, and may contain from five thousand to

six thousand inhabitants. It is a free port. The produce of the island consists in rice, maize, mandioca, excellent oranges, and a variety of other fruits. Sugar and indigo are likewise produced, but in small quantities.

"The surface of the island is diversified with mountains, plains, and, in some places, swamps; here is found a stratum of excellent red clay, which is manufactured into jars, culinary vessels, large water-pots, &c. which are exported in considerable quantities to the Plata and to Rio de Janeiro. The lands capable of cultivation are under considerable improvement; a great extent of them was formerly covered with large trees, but as great quantities have of late years been cut down and used for ship-building, good timber may now be considered scarce. They grow flax here of a tolerably good quality, of which the fishermen make their lines, nets, &c. The sea hereabouts produces an abundant variety of excellent fish, and some fine prawns; so large is the supply to the market, that a quantity of fish, sufficient to dine a dozen persons, may be had for a shilling. Meat is hard and lean; and its general price is about three halfpence per pound. Pigs, turkeys, ducks, poultry, and eggs, however, are plentiful and cheap.

"The climate is serene and wholesome, its solstitial heats being constantly moderated by fine breezes from the south-west and north-east, which are the winds that generally blow here; the latter prevails from September to March, and the former from April to August.

"The mountains of the interior, and the rocks on the coast, are of primitive granite. Close to the fort, on the left hand of the entrance to the harbour, is a vein of grüstein, in various states of decomposition, which ultimately migrates into clay, of a superior quality to that generally found in the valleys. The soil in the interior, being rather humid, is extremely fertile. It consists principally of a rich vegetable decomposition, on which shrubs and plants grow in great luxuriance. Myrtles appear in all parts, and a most beautiful variety of the passion-flower is found in equal abundance.

"The animals are chiefly opossums, monkeys, and armadillas. Of birds, there are cranes, hawks, parrots, of various species, humming-birds, and toucans, the latter, of every variety, in great numbers. There are also a variety of serpents.

"The island is divided into four parishes; viz. Nossa Senhora de Dereito, St. Antonio, Laguna, and Riberon. The divisions of the opposite part of the continent are likewise under the jurisdiction of the governor of St. Catherine's, who is subject, in certain cases, to the capitania of St. Paul's, and in others to the government of Rio de Janeiro.

"Of the fortresses which defend this island, the most considerable are Santa Cruz, already mentioned; Porto Groel, Ratones, Estreito, and Conceição. Off the

former there is safe anchorage for a fleet of men of war, and the harbour which it protects may be entered by ships of three hundred tons, if not of a heavy draught of water. Ships passing the channel are required to send a boat on shore at Santa Cruz before they proceed.

"The trade of this place is inconsiderable, as the produce does not much exceed the consumption of the inhabitants, who are, in general, far from rich. It affords an agreeable retirement to merchants who have discontinued business, masters of ships who have left off going to sea,

and other persons, who, having secured an independence, seek only leisure to enjoy it. Few places are better calculated for such a purpose than this; it is enlivened by the numerous coasting-vessels from St. Salvador, Pernambuco, and other ports, bound for the Plata, which frequently touch here; and it is amply provided with artisans of all descriptions. The inhabitants, in general, are very civil and courteous to strangers: the ladies are handsome, and very lively: their chief employment is making of lace, in which they display great taste and ingenuity."

## CHAPTER XI.

### FRENCH AND DUTCH DOMINIONS IN SOUTH-AMERICA.

#### SECTION I.

##### FRENCH GUIANA.

**T**HIS tract of country extends about two hundred and forty miles along the coast, from Cape Orange, in north latitude four degrees twenty-seven minutes, to the River Maroni, in north latitude six degrees forty-six minutes. The settlements are not extended above twenty miles from the sea-coast, the interior being still inhabited by the native Indians. The land all along the coast is low and marshy, and the climate extremely insalubrious: but on the higher parts, where the trees are cut down, and the ground laid out in plantations, the air is healthy, and the heats are considerably mitigated by the sea-breezes.

The principal settlements of the French in Guiana are situated in the Isle of Cayenne, which lies one hundred miles west of Cape Orange, at the mouth of the river of the same name. It is about forty-five miles in circumference, well wooded and watered, admirably cultivated, and extremely fertile in sugar, tobacco, Indian corn, plants, fruits, &c. This country produces the Cayenne-pepper, which the inhabitants use to excess. On the easternmost point of the island are the town and fort of St. Louis. The town contains about two hundred houses, occupied by mechanics and tradesmen, and the fort has a good garrison; but the fort, which stands at the bottom of the harbour, has no other fresh water than what is saved from rain in large cisterns.

The French first established themselves here in 1635: the place was afterwards possessed alternately by the English and French, to whom succeeded the Dutch, but the French finally prevailed, and still retain it.

#### SECTION II.

##### DUTCH GUIANA.

*Situation, Climate, and Vegetable Productions.* That part of Guiana belonging to the Dutch is sometimes distinguished by the appellation of Surinam. It is situated between five and seven degrees of north latitude, extending a hundred miles along the coast, from the mouth of the River Omonoko, north, to the River Maroni, or French Guiana, on the south.

The climate is by no means disagreeable, for the trade-winds by day, the land-breezes in the evening, and the invariable lengths of the nights, with refreshing dews, render the air temperate and salubrious.

Besides trees and plants common to other countries, the Simaruba-tree, peculiar to Guiana, is esteemed a specific in dysenteries. The curatze is a pernicious rat, the powder of which the Indians conceal under their nails, till they have an opportunity of putting it into the food or drink of those they wish to poison.

*Animals.* Among the animals peculiar to the country there is an amphibious creature, called *haribba*, about the size of a small pig. The head and feet are like those of a pug-dog, but it is without a tail, and its flesh, by the Europeans who reside here, is preferred to all other kinds of meat. The monkeys of this country are very numerous, and their species various. Here are bats, twice as large as ours, and without tails. Most people in Guiana sleep in hammocks, as being more secure from serpents and poisonous insects; but this does not secure them from the bats, which approach any part of the body that is uncovered, generally the feet, open a vein and suck the blood

till they are satisfied. There is also peculiar to Guiana a large venomous toad, called the pipa. Its young are bred in the back of the male, where the female deposits the eggs.

There is so great a variety of beautiful birds in Guiana, that several persons in the Dutch colony employ themselves and their slaves in killing and preserving birds for the cabinets of Europe.

Most of the fishes of Guiana, also, are common with those of other countries. The torporific eel, when touched either by the hand or by a rod of iron, gold, silver, copper, or by a stick of some particular kinds of heavy American wood, communicates a shock resembling that of electricity.

Guiana abounds in serpents of various kinds. There is one sort, not venomous, that measures sometimes above thirty feet in length, and three in circumference. It has a taper tail, armed with two claws, like those of a dunghill cock. Small deer have been found in their stomachs. There are also some of those called amphis bœna.

The insects of Guiana are innumerable, owing to the constant warmth and humidity of the climate.

*Principal Town.*] The chief settlement is at Surinam, a town built on a river of the same name; and the Dutch have extended their plantations thirty leagues above the mouth of this river. This was one of the richest and most valuable colonies belonging to the United Provinces; but it is in a less prosperous situation than it was some years since, owing, among other causes, to the wars with the fugitive negroes, whom the Dutch treated with great barbarity, and who are become so numerous, having increased from year to year, that they have formed a kind of colony in the woods, which are almost inaccessible, along the rivers of Surinam, Saramaca, and Copename, and are become very formidable enemies to their former masters. Under the command of chiefs, whom they have elected among themselves, they have cultivated lands for their subsistence, and make frequent incursions into the neighbouring plantations. The chief trade of Surinam consists in sugar, a great deal of cotton, coffee of an excellent kind, tobacco, flax, skins, and some valuable dyeing drugs. They trade with the North-American colonies, who bring hither horses, live cattle, and provisions, and take home a large quantity of molasses.

About twenty-five leagues from Surinam is the colony of Berbice, so called from a river of the same name. Fort Nassau is the seat of government. There are several settlements and plantations on the River Conya, which form a part of the colony of Berbice.

*Inhabitants, Customs, Manners, &c.*] The inhabitants of Dutch Guiana are either whites, blacks, or the reddish brown aboriginal natives of America. The promiscuous intercourse of these different people has likewise generated

several intermediate casts, whose colours immutably depend on their degree of consanguinity to either whites, Indians, or negroes. These are divided into Mulattoes, Tercerones, Quarterones, and Quinterones, with several intermediate subdivisions, proceeding from their retrograde intercourse. The natives are divided into different tribes, more or less enlightened and polished, as they are more or less removed from the settlements of the Europeans. They allow polygamy, and have no division of lands. The men go to war, hunt, and fish; the women look after domestic affairs. Their arms are bows, arrows, clubs, and poisoned darts, blown through a reed. They go almost naked, excepting upon particular occasions, when they ornament their heads with feathers. They are cheerful, humane, and friendly; but timid, and addicted to drinking.

Their houses generally consist of four stakes, with cross-poles, covered with leaves. They set them up, pull them down, and carry the whole with them, at pleasure, as their dwellings are light, and their lives ambulatory. They bury their dead naked, and get drunk at the funeral, to drown their sorrows. When the body has been interred a sufficient time for the flesh to be rotten, they take up the bones, distribute them among the relations and friends of the defunct, and again get intoxicated, to testify their respect for the memory of the deceased. Their wants are easily supplied, and their vices are but few. Continence before marriage is not considered as a virtue, but no injury is so surely revenged as the infidelity of a wife.

Nothing is cultivated here by the natives but plantain, cassava, and yams, and one month's cultivation suffices for all these. The men are all hunters, and they can always find game or fish, if they prefer it, without danger or toil. They dress it by boiling, either in water or in the juice of cassava, and season it very high with Cayenne pepper. The only set time of eating is the evening, when they return from hunting: in general, they eat when they are hungry. They scarcely know salt, but sometimes preserve animal-food by smoke-drying it. Their drink is water, or a fermented liquor, prepared from the plantain, called pievorce: when they have plenty of this, they are continually inebriated; so that their indolence and improvidence, by preventing a constant supply, become public and private blessings.

As supplying the wants of nature, in so fertile and delightful a country, takes up but a small portion of their time, they fill up the intervals by various amusements: they bathe and swim in the rivers, in large companies, several times a day, without paying any regard to distinction of sex; and they swim so well, that they may be almost reckoned among amphibious animals. At other times, they visit each other, and are mutually entertained with the simple occurrences of their lives, and a great variety of fables, which are merry, significant, and moral.

Sometimes they dance, and frequently burst into immoderate laughter; and sometimes they recline indolently in their hammock, where they not only sleep, but eat, converse, and play, blow a kind of rustic flute, pluck out the hair of their beards, or admire themselves in looking-glasses.

The women suffer nothing in parturition, which is attended neither with danger nor pain. The mother and child, immediately after delivery, are plunged into the water, and the next day she returns to her employment, as if nothing had happened. The children are fed, and, during their infancy, no other care is taken of them; none are sickly or deformed: the boys, as they grow up, attend their fathers in hunting, and the girls assist their mothers. In old age, they become wrinkled; but are never

either bald or grey. As they have no method of computing time to any number of years, their age cannot be ascertained; but there is sufficient reason to conclude that their lives are long.

In all their traffic with each other, or with the Europeans, they estimate every thing by their present want of it: they will at one time demand a hatchet for that which, at another time, they will exchange for a fish-hook.

These happy people live together upon terms of perfect equality, having no distinction but of age, or personal merit; neither have they any division of property; each amicably participates the ample blessings of a delightful and extensive country: envy, fraud, and violence, are precluded, natural desires are immediately and innocently indulged, and government rendered wholly unnecessary.

## CHAPTER XII.

### COUNTRIES IN SOUTH-AMERICA IN POSSESSION OF THE NATIVES.

#### SECTION I.

##### AMAZONIA.

###### *Boundaries, Extent, &c.*

**T**HIS extensive country, which derived its name from the Spaniards, under the command of Orellana, being opposed by troops of women, when they entered the river, is bounded, on the north, by Terra Firma; on the south, by Paraguay, or La Plata; on the east, by part of Brazil and the Atlantic Ocean; and, on the west, by Pern. It is about twelve hundred miles in length, and nine hundred and sixty in breadth.

No European nation has yet made any settlement in this country. Indeed, very little of it is known, except along the west banks of the river, and the west frontiers of the Portuguese colonies in Brazil.

*Climate, Soil, and Productions.* The air is cooler here than might be expected so near the equator, which proceeds from the heavy rains, that occasion the rivers to overflow their banks one half of the year; and from the cloudy weather, and shortness of the days, which never exceed twelve hours. A brisk easterly wind also cools the air, which blows from the Atlantic Ocean quite through the country. Here are terrible storms of thunder and lightning, during the time of the rains.

The face of the country is extremely beautiful, and the soil fertile, producing cocoa-nuts, ananas, or pine-apples,

guavas, bananas, and other tropical fruits; cedar, iron-wood, so called from its weight and density; red-wood, oak, ebony, logwood, and many other sorts of dying woods and drugs; together with cotton, tobacco, sugar, maize, cassava-root, yams, potatoes, sarsaparella, and canela, or spurious cinnamon.

The woods produce excellent honey, balm, wild-fowl, and venison. The honey is exquisite, and the balm good against all wounds. Parrots are as numerous here as pigeons in England. They have vast numbers of fish, of all sorts, in the rivers and lakes; and, among others, manatis, or sea-cows, that are amphibious, and feed on the banks; and tortoises, of a large size and delicate taste; but the fishers must be upon their guard against crocodiles, alligators, and water-serpents.

*Customs, Manners, &c.* The natives are of a good stature, have handsome features, long black hair, and copper complexions. They have a taste for the imitative arts, especially sculpture and painting, and are good mechanics. Their cordage is made of the bark of trees, their sails of cotton, their hatchets of tortoise-shells, or hard stones; their chisels, plains, and wimbles, of the teeth and horns of wild beasts; and their canoes are hollowed trees. They spin and weave cotton-garments themselves; and their houses and huts are of wood, thatch, and clay. Their arms, in general, are darts and javelins, bows and arrows, with targets of cane or fish-skins. They are such

good archers, that they kill fish in the water with their arrows, which they eat without bread or salt. The several tribes are governed by their chiefs or caciques; for, it is observable that, the monarchical form of government has prevailed almost universally, both among the ancient and modern barbarians, as requiring by far a much less refined policy than the republican system. The regalia, by which the chiefs are distinguished, are a crown of parrots' feathers, a chain of lions' teeth, or claws, about their middle, and a wooden sword in their hand. Both sexes sometimes wear mantles of the skins of beasts, or cotton, but generally go naked. In some districts the men thrust pieces of cane through their ears and underlips, and hang glass-beads at the gristle of their noses; but in others they wear plates of gold at their ears and nostrils. They allow of polygamy; and the women here, as in the other American nations, do the most laborious work. They worship the images of their ancient heroes, or subordinate deities; but have no temples or orders of priests among them.

Here are a people, called Omaguas, who, to render their children *beautiful*, flatten the fore and hind parts of the head, which gives them a monstrous appearance. This practice is strictly kept up among them; and they make a jest of the other inhabitants of Amazonia, calling them *calabash-heads*.

The Aruacs, or Aruacs, are a most interesting tribe, and are regarded as the ancestors of those amiable West-Indians, whom Columbus found in Hispaniola, Cuba, and Jamaica, where their bitterest enemies were the Caribbees of the Windward Islands. Stedman, in his voyage to Surinam, mentions them as a happy and innocent race, without care or poverty, in a delicious country; and they even die with cheerfulness, in a certainty of passing to a yet more happy land. These Indians delight in personal cleanliness, and both sexes swim with great ease and agility. He saw a party of Aruacs enjoying this favourite recreation, and represents them as wholly different from the other tribes which he had seen. One girl was of extraordinary beauty, fairer than the usual copper-colour. She came out of the river, and her only dress was a little square apron, composed of small beads, while her hair was fastened up with a broad silver-bodkin. Her charming features, her nymph-like form, her health, and playful liveliness, surpassed description; while her physiognomy announced an amiable simplicity and innocence. Taking her bow, she killed a parrot with a round-headed arrow. The Aruacs often kill macaws and pigeons on their flight. They are attached to the Europeans; and are equally remarkable for probity and gratitude; but, when provoked to war, they assume the bow and a heavy club. Although the Aruacs are now considerably removed from the ocean, they descend the rivers in large canoes, sometimes forty

feet in length. Their principal body lives still on the sea, between Cape Nassau and the mouth of the Oroonoko.

[*History.*] Gonzalo Pizarro, brother to Pizarro, the conqueror of Peru, was the first who undertook to explore the climes of Amazonia; and the following account of his proceedings has been given by a respectable writer:—"Previously to the expedition, he raised an army, composed of some Spanish veterans, horse and foot, together with about four thousand Indians. The latter were principally employed in carrying the baggage, and driving a great number of Indian sheep, hogs, &c. before them, for the subsistence of the army by the way. Thus prepared, he set out from Quito, in Peru, about Christmas, in the year 1539. A dreadful earthquake, and a terrible storm, which lasted nearly fifty days, greatly impeded his march, and many of his Indians died through the severity of the weather. After surmounting innumerable difficulties, they arrived at a province called Cumaco, where they found plenty of provisions, a great number of cinnamon-trees, and many naked inhabitants. Here Gonzalo left the principal part of his people, taking with him only a few of the most active to search for a pass into the neighbouring country; for hitherto they had been enveloped with mountains and woods, through the latter of which they were forced to cut their way, and in the former they endured astonishing hardships.

"With inexpressible labour and suffering they came at length to a province, called Cneca, which was more populous than any they had formerly passed. Here provisions were plentiful, and the cacique, or king of the country, came in a peaceable manner to welcome them, and brought them provisions.

"In these parts they remained two months, in expectation of the arrival of those Spaniards whom they had left in Cumaco, and had directed to follow them by such traces and marks as they should find of the way they had taken before them. Their companions being come up and refreshed after their journey, they marched by the banks of a great river, for the space of fifty leagues, in all which way they neither found bridge or ford.

"At length they came to a place, where the whole river falls from the top of a rock, above two hundred fathoms high, which cataract makes a noise that is heard above six leagues from the place; at which, though the Spaniards were amazed, yet it was much more wonderful to see, above forty or fifty leagues lower, that immense quantity of water contracted and straitened within a channel made by one great rock. This channel is so narrow, that, from one side to the other, it is not above twenty feet wide, but so high, that the top, where the Spaniards made their bridge, was two hundred fathoms from the water. other passage to be found on the river, and that it was necessary to pass to the other side, because the country was barren on that side where they were, agreed to make a bridge over the top of the rock.

"The Indians on the opposite side, though few in number, stoutly defended the pass, but were driven from it by the fire of the muskets. The pass being now clear, the Spaniards fell to work on the bridge of timber, which cost much labour before the first beam could be passed over to the opposite rock; by the help of which a second was more easily laid, and then other pieces of timber; so that by degrees they formed a bridge, over which both men and horses passed securely: after this they marched by the side of the river over mountains, covered so thick with wood, that they were forced to open their way again with hatchets. Through these difficulties they came at length to a country called Guema, where the Spaniards, and their Indian servants, were forced to sustain themselves with herbs and roots, and with tender sprouts of trees. Thus, with famine and perpetual rains, many of the Spaniards fell sick and died. They arrived afterwards at a country, where the natives were more civilized than in the former. These ate maize, or Indian corn, and clothed themselves with garments of cotton; but still the climate was subject to violent rains.

"While they staid in this place they sent out parties every way, to see if they could discover a better country, but they met with nothing but wild mountains, full of bogs, lakes, and moorish grounds, over which was no passage. Hereupon they resolved to build a brigantine, to ferry over from one side of the river to the other, which was become two leagues broad. In order to this, the first thing to be done was to set up a smith's forge, for nails and iron-work, which they made of the shoes of the horses they had killed for food, and some iron bars they had carried with them; but iron was now become more scarce than gold.

"Gonzalo Pizarro, though chief commander, was the first that laid his hand to the axe, to hew down the timber, and to make the charcoal, which was requisite to forge the iron; and always the most forward in every menial office, that, by thus giving a good example, none might take occasion to excuse himself. The resin, which issued from certain trees, served them instead of pitch, and their old shirts and rags were made use of instead of oakum, to caulk the seams of their vessel, which, being in this manner finished, they launched into the water with great joy and triumph, imagining that hereby they should quickly escape out of all their dangers and difficulties. But it proved otherwise, for a few days shewed the contrary, and gave them cause to repent that they had ever made it.

"All the gold they had gathered, which amounted to

above the value of one hundred thousand pieces of silver, with abundance of emeralds, some of which were of great value, as also their iron and iron-work, and whatsoever was of any esteem, they loaded in their vessel: and such as were weak and sick, and not able to travel, were also put on board. Then, after a journey of almost two hundred leagues, they departed from this place, taking their course down the stream, some by water and others by land, keeping such a convenient distance from each other, that at night they always joined and lodged together, which journey was performed with great difficulty; for those on the land were forced to open a great part of the way with hatchet and bill, and those on the water were put to hard labour, to keep the vessel from being forcibly carried down by the current from the company on shore. When at any time their passage was interrupted by some mountain, so that they could not keep near the river, they ferried to the other side, by help of their vessel, and four canoes they had made; but this was a great hinderance to them, and very grievous to men starving and perishing with hunger.

"Having in this manner travelled for the space of two months, they at length met with certain Indians, who, by signs, and some words, which were understood by their Indian servants, gave them intelligence, that about ten days' journey from thence they would find a country well peopled, stocked with provisions, and abounding with gold and other riches, of which they were in pursuit; and further signified to them, that this country was situated on the banks of another great river, which joined and fell into that wherein they now were. The Spaniards being encouraged with this news, Gonzalo Pizarro made Francisco de Orellana captain of his brigantine, and put fifty soldiers on board, giving them orders to pass down the stream to that place where the two rivers met, and that, there leaving the goods he had then on board, he should load his vessel with provisions, and return towards them with all speed imaginable, to relieve them in their distress; many of the Spaniards being already dead, and more Indians, who, from four thousand, were now reduced to half the number.

"According to these orders, Francisco de Orellana entered on the voyage, and, in the space of three days, without oars or sail, only by force of the current, was carried to the confluence of the two rivers, mentioned by the Indians, but found no provisions there; whereupon, Orellana, pretending that it was impossible to return to Pizarro against the stream, resolved to set up for himself; to continue his voyage to the mouth of the river, and then go over into Spain, and obtain the government of those countries for himself: but this cruel resolution was opposed by many of those who were then with him. They told him plainly, that he was not to exceed the orders of his

captain-general, and that it was inhuman to forsake his companions in their great distress, knowing how useful and necessary that brigantine was to them. In this point none was more zealous than friar Gaspar Carvajal, and a young native of Badajoz, named Hernando Sanchez de Vargas, whom those of the contrary opinion made their chief, and were so warm in their debates on this subject, that the quarrel had come to blows, had not Orellana, with fair words, appeased the tumult; however, he managed so artfully afterwards with those who had opposed his intentions, that he enticed them all over to his party; and then rudely treated the friar, whom he had exposed to the same famine and misery (had it not been for respect to his habit and profession) as he did Sanchez de Vargas, whom he left in that desert, encompassed with high mountains on the one side, and a great river on the other, to perish by famine.

"Francisco de Orellana afterwards found some provisions amongst the natives on the river below; but, because the women came out at first with their husbands to oppose his landing, he gave it the name of the River of Amazons. Proceeding yet farther down this river, they found these Indians more civil than the other, who received them amicably, admiring the brigantine, and men so strangely habited. These treated the Spaniards hospitably, and furnished them with as much provision as they had occasion for. Orellana remained here, therefore, several weeks, and built another brigantine (for they were very much straightened for room in the first); and, having fitted it up as well as they were able, they adventured out to sea, sailing along the coast of Caribbiana, about two hundred leagues to the northward, till they arrived at the island of the Holy Trinity, having escaped such dangers that they often gave themselves over for lost. At this island Orellana bought a ship, with which he sailed into Spain, where he requested his majesty's commission for the conquest and government of the country of the Amazons, as he thought proper to style it.

"To make this enterprise appear the more desirable, he alleged that it was a country abounding with gold, silver, and precious stones, and in testimony thereof produced the riches which he had brought with him; whereupon his majesty granted the request he made, for the government of what he should conquer there; and Orellana was joined by five hundred volunteers, the greatest part of them men of rank, with whom he embarked at St. Suear, for the river Amazon, in the year 1554; but he lost one of his ships in his voyage thither, and met with so many difficulties and misfortunes before he had sailed one hundred leagues up the river, that he abandoned the enterprise, and died on his return home. Gonzalo Pizarro, who was left in such distress after Francisco de Orellana ran away with the brigantine, first built ten or twelve canoes, and

then floats, to pass from one side of the river to the other, as often as his march was interrupted by impassable mountains or morasses, and proceeded in that manner down the river, in hopes to meet the brigantine they had despatched for provisions. At the end of two months they arrived at the point where two rivers met; but, instead of their brigantine, and the provisions they expected to meet with, they found only Hernando de Vargas, who, with constancy of mind becoming a man of honour, had endured, with great resolution, famine, and all the miseries to which he was exposed in that solitude. From him they received a particular account of the villany of the perfidious Orellana, which Pizarro could scarcely credit, having hitherto reposed an entire confidence in him.

"The general, however, cheered his men, and encouraged them with hopes of better fortune; telling them that they ought, like Spaniards, to bear with equality of mind these labours and disappointments; that the more danger, the more honour, and the greater their renown would be in history, which would transmit the fame of their adventures to future ages. The soldiers, observing the cheerfulness of their general, who had most cause to resent Orellana's usage, took heart, and continued their march by the banks of the river, sometimes on one side, and sometimes on the other.

"But the difficulty of carrying the horses over upon floats (for there still remained about fifty of them) cannot be expressed, any more than the famine they were exposed to. However, the Indians who remained alive served their masters with great faithfulness and affection in these extremities, bringing them herbs, roots, and wild fruit; with snakes, and other vermin, found in these mountains, all which went down with the Spaniards; nor could they have subsisted without such kind of food.

"Gonzalo Pizarro, being now resolved to return to Peru, left the river, and took his way more to the northward, which proved shorter by one hundred leagues than the way they came, but no less difficult, being forced frequently to cut their way through the woods; and, for want of other provisions, they now ate up all their remaining horses and dogs; for the four thousand Indians, who used to purvey for them, all died in this expedition; and there were but eighty Spaniards who returned to Quito alive, and these almost without clothes, and so sun-burnt and emaciated with fatigue and want of food, that their nearest friends scarcely knew them.

"With such insupportable hardships and hazards did the first Spanish adventurers struggle in search of gold, even when they had before acquired enough to have satisfied the most boundless avarice. Gonzalo Pizarro, who was one of the proprietors of the mines of Potosi, had not amassed less than one million of crowns before he entered upon this expedition.

The lot

"Peter de Orsua, who afterwards obtained a commission from the governor of Peru, in the year 1550, to subdue the provinces bordering on the River Amazon, embarked on the River Xauxa, in Peru, with seven hundred armed Spaniards, and two thousand Indians, and sailed down the stream two or three hundred leagues, till he came to the confluence of the two rivers, Amazon and Xauxa, and continuing his voyage afterwards two hundred leagues farther, was killed in a mutiny of his men, which put a period to that enterprise.

"Several other adventurers made the like attempts afterwards, but most of them proved unfortunate, till two monks, and some soldiers, who set out with John de Palacios, from Quito in Peru, in the year 1635, and embarking on the River Amazon, where it first becomes navigable, sailed the whole length of it, till they arrived in Paria in Brazil, which lies on the south side of the mouth of this great river: but their captain, John Palacios, was killed in a skirmish with the natives in their passage.

"The friars having given an account of their voyage to the governor of Brazil, he ordered sloops and boats to be provided, on which he embarked seventy Portuguese and two thousand Indians, and, in October, 1637, ordered them to sail up the river, under the command of Texeira, a mariner of great skill and experience, who, by the help of the easterly wind, which generally blows here, sailed up against the current, till he arrived at Les Reys, a town of Quito in Peru; but the river not being navigable higher for his vessels, he left them there, and went by land to the city of Quito, where he was kindly received by the Spanish governor, and furnished with whatever he wanted to facilitate his return to Brazil. The governor sent two Spanish jesuits down the river with him, ordering them to embark for Spain, when they arrived at Brazil, and communicate the observations they should make in this voyage to his Catholic Majesty; and embarking again at Les Reys, on the River Amazon, with the two jesuits, in the month of February, 1638, arrived at Paria, in Brazil, the December following; from whence the jesuits went over to Spain, and published a narrative of their voyage in 1640."

## SECTION II.

### PATAGONIA, OR TERRA MAGELLANICA.

This country derived its name from a tribe of its inhabitants, called *Patagons*; but the Spaniards called it *Terra Magellanica*, from Ferdinand Magellan, who discovered the adjacent straits, in the year 1520. It extends from Chili and Paraguay to the utmost extremity of South-America, being seven hundred miles long, and three hundred broad. The lofty mountains, called the Andes, traverse the whole

country from north to south. The northern parts contain an almost inexhaustible stock of large timber; but, in the southern districts, there is scarcely a tree fit for any mechanical purpose.

Here is good pasturage, and incredible numbers of wild horned cattle and horses, which were brought hither by the Spaniards, and have increased amazingly. The east coast is chiefly low land, with few good harbours. One of the best is Port St. Julien.

*Animals.*] The most remarkable animal of this country is the Gnanico, which, in size, form, and colour, resembles a deer; but it has a hump on its back, and no horns. They are very shy, and very swift. Some parts abound with seals, many of which are larger than a bullock. The tigers here are very ravenous. Part of a ship's crew being sent on shore to fetch some guanicos, which had been shot the night before, they found nothing left, except the bones, the tigers having devoured the flesh, and even cracked the bones, to come at the marrow. An officer, upon an excursion, shot a tiger-cat, a small but very fierce animal; for, though it was much wounded, it maintained a very sharp contest with a dog, for a considerable time, before it was killed. There are abundance of hares, the flesh of which is white and well flavoured. A great number of dogs are kept by the natives, for the purpose of chasing the wild animals, which serve them for food. The horses are well made and nimble, and in general fourteen hands high. These, as well as the dogs, seem to be of a Spanish breed. The horse-furniture consists of a saddle, stirrups, and bridle. The women ride astride, and, like the men, evince great resolution and dexterity in horsemanship.

In some parts of the country, birds are so numerous, that, when they rise, they literally darken the sky; and their eggs are so numerous, that a passenger is obliged to tread upon them. Among those seen by the Europeans was one very remarkable for its plumage and magnitude. The head resembled that of an eagle, except that it had a large comb upon it. Round the neck was a white ruff, exactly resembling a lady's tippet; the feathers on the back were as black as jet, and as bright as the finest polish could render that mineral. The legs were remarkably strong and large, the talons were like those of an eagle, except that they were not so sharp; and the wings, when extended, measured, from point to point, no less than eight feet. The ostrich is very large here, and constitutes part of the food of the natives.

The most accurate and interesting accounts of the inhabitants of this country are those of Commodore Byron and Captain Wallis, to whom we are indebted for the following particulars:—

Commodore Byron relates that, when he came to anchor on this coast, about two miles from the shore, he could

plainly see with his telescope a number of horsemen, riding to and fro, directly abreast of the ship, and waving something white, as an invitation to the people to come on shore. In consequence of this, the commodore, attended by some of his officers and seamen, advanced in his boat towards the beach, and, on a near approach, saw about five hundred people, some on foot, but the greater part on horseback. They drew up upon a stony spot, and kept waving and hallooing, which the strangers supposed were invitations to land.

Though no weapons were seen among the natives, the commodore deemed it prudent to make signs that they should retire to a little distance, with which they immediately complied. They continued to shout most vociferously; and the commodore having landed with his people, drew them up upon the beach, with his officers at their head, giving strict orders that none of them should quit their station till he should give the signal. He then advanced alone towards the Indians, and, perceiving that they retreated, made signs that one of them should come near. Accordingly a person, who afterwards appeared to be a chief, approached. He was of gigantic stature, and seemed to realise the tales of monsters in human shape. He was not measured; but the commodore judged, from the proportion of his stature to his own, that it could not be much less than seven feet.

When this prodigy came up, he and Commodore Byron muttered something to each other as a salutation. The commodore then walked with him towards his companions, to whom, as he advanced, he made signs to sit down, and they all readily complied. There were among them many women, who seemed to be proportionably large; and few of the men were less than the chief who came forward to meet the commodore. He had heard the voices of the savages very loud at a distance, and, when he came near, perceived a considerable number of old men, who were chanting some unintelligible words, in the most doleful cadence, with an air of solemnity, which inclined him to suppose that it was a religious ceremony.

Having looked round upon these enormous figures with no small astonishment, the commodore took out a quantity of yellow and white beads, which he distributed among them, and which they received with evident marks of pleasure. He then took out a whole piece of green silk-riband, and, giving the end of it into the hand of one of them, made the person that sat next take hold of it, and so on as far as it would reach. During this time, they sat very quietly; nor did any of those that held the riband attempt to pull it from the rest; though they were evidently more delighted with it than with the beads. While the riband was thus extended, Mr. Byron took out a pair of scissors, and cut it between each two of the Indians that held it, so that he left about a yard in the possession of every

one, which he afterwards tied about their heads, where they suffered it to remain, without so much as touching it, while he was with them.

It appeared evident to the commodore, that the Indians, on whom he had conferred these presents, were not entirely unacquainted with European commodities; as, upon a closer observation, he remarked one woman who had bracelets, either of brass or very pale gold, upon her arms; and some beads of blue glass, strung upon two long queues of hair, which, being parted at the top, hung down over each shoulder before her. She was of an enormous size, and her face most hideously painted. The commodore endeavoured, by every possible means, to learn where she procured the beads and bracelets, but could not effect it, through want of being sufficiently understood.

One of the men produced the bowl of a tobacco-pipe, which was made of a red earth; but the commodore soon perceived they had no tobacco among them. He, therefore, beckoned to his people, who had remained upon the beach, drawn up in the order he had left them, and three or four of them ran forward, supposing that he wanted assistance. The Indians no sooner saw these men advance, than they all rose up with a great clamour, and were leaving the place, as imagined, to get their arms, which were probably left at a little distance. The commodore, therefore, ran to meet the people, who were advancing in consequence of his signal, and told them, as soon as he was got within hearing, that he would have only one of them come up with all the tobacco he could collect from the rest. When the Indians perceived this, they recovered from their surprise, and every one returned to his station, except a very old man, who came up to the commodore, and sung a song of considerable length.

After the commodore had distributed the tobacco, four or five of the chief men came up to him, and intimated by signs that they wished him to mount one of their horses, and go with them to their habitations; but as it would have been imprudent to comply, signs were made to them, that he must return to the ship, at which they expressed great concern, and sat down in their former stations.

During this dumb-show conference, an old man often laid his head down upon the stones, and, shutting his eyes for about half a minute, afterwards pointed first to his mouth, and then to the hills, meaning, as the commodore imagined, that if he would stay till the morning, they would furnish him with some provisions; but this offer he was obliged to decline. When he left them, not one of them offered to follow, but, as long as they could be seen, remained quiet in their stations.

Commodore Byron's description of his first interview with the natives of Patagonia, is, in general, confirmed by that of Captain Wallis, who visited this country two years

after him. That navigator relates, that when he approached Cape Virgin Mary, he saw several men riding upon the point of it, who made signals for the people on board to come ashore. Having anchored in a bay close under the south side of the cape, the natives continued abreast of the ship all night, making great fires, and frequently shouting very loud. At day-light great numbers of them were seen in motion, making signals for the Europeans to land.

Having taken the necessary precautions, and left particular orders on board to bring the ship's broadside to bear upon the landing-place, Captain Wallis went in his barge, attended by some officers and men, properly armed, and having reached the beach, made signs to the natives to return to some distance, with which they immediately complied. Having landed with several officers, and ordered the marines to be drawn up, he made signs to the natives to approach, and directed them to sit down in a semicircle, which they did with great order. The captain then distributed among them several knives, scissars, buttocks, beads, combs, and ribands, which were received with evident pleasure.

After the distribution of these presents, the captain endeavoured to make them understand that he had other things to dispose of, but expected some articles in return. He then caused some hatchets and bill-hooks to be produced, and pointed to some guanicoes, that happened to be near, and some ostriches, which he saw dead among them, making signs that he wanted to eat; but they either could not, or would not, understand him: for, though they seemed very desirous of the hatchets and bill-hooks, they gave not the least intimation that they would give any provisions in return.

Captain Wallis, at his first interview with the natives, caused those that appeared to be the tallest among them to be measured. One of these was six feet seven inches high; and several of them were six feet five and six feet six inches. They were well-made, robust, and bony; but their hands and feet were remarkably small. Their complexion was a dark copper-colour, like that of the Indians in North-America. Their hair was straight, and nearly as harsh as hogs' bristles. It was tied back with a cotton-string, but neither sex wore any head-dress. Their teeth were very white, even, and well-set.

The chief, who first came up to Commodore Byron, had the skin of some wild beast thrown over his shoulders, as a Scotch Highlander wears his plaid, and was painted so as to make the most hideous appearance he had ever beheld. Round one eye was a large circle of white, a circle of black surrounded the other, and the rest of his face was streaked with paint of different colours. The whole group seen by the commodore were painted and clothed nearly in the same manner. The circles round the two eyes were

in no instance of one colour; but they were not universally black and white; some being white and red, and some red and black.

The chief clothing of these people is composed of the skins of the guanico, sewed together into pieces about six feet long, and five wide. These are wrapped round the body, and fastened with a girdle, with the hairy side inwards. Some of them have a square piece of cloth, made of the downy hair of the guanico, through which a hole being cut for the head, the rest hang round them as low as the knee. They are described, by Captain Wallis, as wearing buskins, or boots, and painting themselves in the strange manner mentioned by Commodore Byron, with this difference only, that the eye-lids of all the young women were painted black.

The Patagonians commonly carry a missile weapon, of a singular kind, tucked into a girdle. It consists of two round stones, covered with leather, each weighing about a pound, which are fastened to the two ends of a string, about eight feet long. This is used as a sling, one stone being kept in the hand, and the other whirled round the head, till it is supposed to have acquired sufficient force, and then discharged at the object. They are so expert in the management of this double-headed shot, that they will hit a mark, not larger than a shilling, with both the stones, at the distance of fifteen yards. It is not, however, the custom to strike either the guanico or the ostrich with them in the chase; but they discharge them so as that the cord comes against the legs of the ostrich, or two of the legs of the guanico, and is twisted round them by the force and swing of the balls, so that the animal, being unable to run, becomes an easy prey to the hunter.

With respect to food, while the Europeans staid on shore, they observed the natives eat some of their flesh-meat raw, particularly the paunch of an ostrich, without any other preparation or cleaning, than just turning it inside out, and shaking it.

The disposition of these people will appear from the following account of their visit to Captain Wallis, on board his ship:—

"When a proposal was made to them by signs that the captain would take some of them on board, if they were desirous to go, about one hundred eagerly offered to visit the ship, but it was not deemed prudent to admit more than eight of the number. They jumped into the boat with the joy and alacrity of children going to a fair and, having no intention of mischief against our people, discovered no apprehension of harm from them. They sang several of their country songs while they were in the boat, and, when they came on board, did not express either the curiosity or wonder which the multiplicity of objects, to them equally strange and stupendous, which at once presented themselves, might be supposed to ex-

cite. When taken down into the cabin, they looked about with great indifference, till one of them happened to cast his eyes upon a looking-glass, which afforded them infinite diversion. They advanced, retreated, and played a thousand tricks before it, laughing excessively, and talking very earnestly to each other. Some beef, pork, biscuit, and other articles of the ship's provisions, being set before them, they ate of them indiscriminately; but would not drink any thing but water.

"When conducted through the ship, they looked at nothing with much attention, except the animals. They examined the hogs and sheep with some curiosity, and were highly delighted with the Guinea hens and turkeys. They did not seem to desire any thing except apparel, and only one of them, an old man, asked for that. Captain Wallis gratified him with a pair of shoes and buckles, and gave to each of the others a canvas bag, in which were put some needles ready threaded, a few slips of cloth, a knife, a pair of scissors, some twine, a few beads, a comb, and a looking-glass, with some new six-pences and half-pence, through which a hole had been drilled that was fitted with a riband to hang round the neck. They were offered some segars, and smoked a little, but did not seem to enjoy it. When they were shewn the great guns, they did not appear to have any notion of their use. When the marines were drawn up in order to go through part of their exercise, and the first volley was fired, they were struck with astonishment and terror. The old man, in particular, threw himself on the deck, pointed to the muskets, and then striking his breast with his hand, lay some time motionless with his eyes shut. By this it was supposed he meant to indicate that he was not unacquainted with fire-arms and their fatal effects. The rest, seeing the crew merry, and finding themselves unhurt, soon resumed their cheerfulness, and heard the second and third volley fired without much emotion; but the old man continued prostrate upon the deck some time, and did not recover his spirits till the firing was over.

"Being made to understand by signs that the ship was proceeding farther, and that they must go on shore, they discovered much reluctance to comply: all, however, except the old man and one more, were got into the boat without much difficulty; but these stopped at the gangway, where the old man turned about, went towards the stern, and stood some time without speaking. He then uttered what was supposed to be a prayer, as he frequently lifted up his hands and eyes, and spoke in a manner and tone different from what had been observed in their common conversation.

"When Captain Wallis intimated to him that it was expedient for him to go into the boat, he pointed to the sun, and then moving his hand round to the west, paused, looked in his face, laughed, and pointed to the shore

By this it was easy to understand that he wished to stay on board till sun-set, and no little pains were taken to convince him of the necessity of his going into the boat. At length, however, he went over the ship's side with his companion, and when the boat put off they all began to sing, and continued their merriment till they got on shore."

### SECTION III.

#### STRAITS OF MAGELLAN.

Commodore Byron observes, that on his departure from Patagonia, to pass through the Straits of Magellan, his course through the first narrow was very rapid, the tide being remarkably strong. The mariners saw a single Indian on the south shore, who kept waving to them as long as they were in sight. They also saw some guanicos on the hills, though it had been asserted by a former navigator that there were none on that shore.

The vessel coming to anchor off St. Bartholomew's Island, six Indians came down to the water-side, and continued waving and shouting for a long time; but as the seamen wanted rest, the commodore was unwilling to employ them in hoisting out a boat, and the Indians departed. The commodore going in his boat in search of Fresh-Water Bay, landed, with an officer, upon Sandy Point, where they found plenty of wood and good water, and for four or five miles the shore was very pleasant. Over the point there is a fine level country, with a soil that, to all appearance, is very rich, for the ground was covered with flowers of various kinds, that perfumed the air with their fragrance. The grass was very good, and intermixed with a great number of peas in full blossom.

Among this luxuriance of herbage were seen many hundreds of birds feeding, which, from their form, and the uncommon beauty of their plumage, the Europeans called painted geese.

In the course of their walk, during which the commodore and officer found great plenty of fine fresh-water, though not the bay they sought for, they saw great numbers of the huts of the Indians, which appeared to have been recently deserted, as in some of them the fires were hardly extinguished. They were situated in little recesses of the woods, and always close to fresh water. In many places were found plenty of wild celery, and a variety of plants, which might prove of great benefit to seamen after a long voyage. The keen air of this place made the people so hungry, that they could have eaten three times their allowance: the commodore was therefore pleased to find some of them employed in hauling the seine, and others on shore with their guns. Sixty large mullets were taken, and the gunners had good sport, for the place abounded with geese, teal, snipes, and other birds.

Captain Wallis, on his departure from Patagonia, turned into the Straits of Magellan with the flood-tide, between Cape Virgin Mary and Sandy Point. When the ship got abreast of this point, they stood close in to the shore, where they observed two guanicos, and several of the natives on horseback, who seemed to be in pursuit of them. When the horsemen approached, these animals ran up the country, and were pursued by the hunters, with their slings in their hands, ready for the cast, but neither of them was taken.

The ship having come to an anchor about three miles from the shore, the natives made several large fires; and at break of day about four hundred of them were seen encamped in a fine green valley, between two hills, with their horses feeding beside them.

Observing great numbers of the natives on horses abreast of the ship, and being given to understand, by an officer, that this was the place where Commodore Byron had the conference with the tall man, Captain Wallis sent two officers to the shore, but with orders not to land, as the ships were at too great a distance to protect them. The officers, on their return, reported that the boat having lain upon her oars very near the beach, the natives came down in great numbers, whom they knew to be the same persons they had seen before, with many others, particularly women and children; that when they perceived our people had no design to land, they seemed to be greatly disappointed; and those who had been on board the ship waded off to the boat, making signs for it to advance, and pronouncing the words they had been taught, "Englishmen come on shore;" that when they could not get the people to land, they were with great difficulty prevented from getting into the boat; that they presented them with some bread, tobacco, and a few toys, pointing, at the same time, to some guanicos and ostriches, and making signs that they wanted them as provisions, but that they could not make themselves understood; and, finally, that finding they could obtain no refreshment, they rowed along the shore in search of fresh-water, but, seeing no appearance of a rivulet, they returned on board.

At Port Famine, where both our navigators touched, the Spaniards, in the year 1581, built a town, which they called Philippeville, and left in it a colony, consisting of four hundred persons. When the English navigator, Cavendish, arrived here in 1587, he found one of these unhappy wretches (the only one that remained) upon the beach. They had all perished for want of subsistence, except twenty-four. Twenty-three of these set out for the River Plata, and were never afterwards heard of. This man, whose name was Hernando, was brought to England by Cavendish, who called the place where he had taken him up Port Famine. It is a very fine bay, and sufficiently capacious for many ships to moor in great safety.

In this place there is very good wooding and watering, and such a quantity of drift-wood as, the commodore said, would furnish a thousand sail. Many small fish were taken with a hook and line off the ship's side, and the seine was successfully hauled, in a fine sandy bay, a little to the southward of Sedger River. A great number of birds, of various kinds, were shot, particularly geese, ducks, teal, snipes, plovers, and race-horses. The water of Sedger River is excellent, but the boats cannot get in till about the hour of flood, because it is very shallow at low water for about three-quarters of a mile. Commodore Byron went up it about four miles in his boat, but the fallen trees rendered it impossible to go farther.

On each side of this river are the finest trees ever seen. Commodore Byron was of opinion that they would supply the British navy with the best masts in the world. Some of them are of a great height, and more than eight feet in diameter. Among others were found the pepper-tree, in great plenty.

In the woods, notwithstanding the coldness of the climate, there are abundance of parrots and other birds, of most beautiful plumage. The commodore every day shot geese and ducks enough to serve his own table and several others, and every one on board might have done the same. There was, indeed, great plenty of fresh provisions of all sorts; for as much fish was caught every day as served the whole ship's company. The commodore tracked many wild beasts in the sand, but never saw one. Many huts, or wigwags, were found, but not an Indian was met with.

The country between Port Famine and Cape Forward, which is distant about four leagues, is very fine; the soil appears to be pretty good; and there are three large rivers in this part, besides several brooks.

The country along the shore to the northward is very pleasant, the ground being in many places covered with flowers, equally beautiful and fragrant. Commodore Byron gives it as his opinion, that, if it were not for the severity of the cold in winter, this country might, by cultivation, be rendered one of the finest in the world.

Captain Wallis confirms the account of Com.

Byron, with respect to the abundance of provisions in this place. He says that, during his ship's stay there, they caught fish enough to furnish one meal a-day for all his men. Besides a profusion of celery, they gathered great quantities of fruit, that resembled the cranberry, and the leaves of a shrub, somewhat like the English thorn, which were remarkably sour. On the arrival of the ship, all the crew began to look pale and meagre; many had the scurvy to a great degree, and upon others there were manifest signs of its approach, yet in a fortnight there was not a scorbutic person on board. The recovery was effected by their being on shore, eating plenty of vegetables, being obliged

abounded

to wash their clothes, and to keep their persons clean, by daily bathing in the sea.

An officer, who was sent out in quest of anchoring-places, reported, on his return, that he had been on shore at several places, where he had found plenty of wood and water, close to the beach, with abundance of cranberries and wild celery. He had seen a great number of currant-bushes, full of unripe fruit, and a great variety of beautiful shrubs in blossom, bearing flowers of different colours, particularly red, purple, yellow, and white; besides great plenty of winter-bark, a grateful spice, well known to the botanists of Europe. He shot several wild ducks, geese, gulls, a hawk, and other birds.

Port Egmont, so called by Commodore Byron, in honour of the earl who was then First Lord of the Admiralty, is one of the finest harbours in the world, and so capacious, that the whole British navy might ride in it with security from all winds. In every part of this port there is plenty of fresh-water; but there is a deficiency of wood.

Here are muscles, clams, cockles, and limpets. The seals and penguins are innumerable; and the coast abounds with sea-lions, many of which are of an enormous size. The commodore was once attacked by one of these animals very unexpectedly, and it was with the utmost difficulty that he could disengage himself. The people, at other times, had many battles with them, and it has sometimes afforded a dozen of them an hour's work to despatch one of them. A bite of one of these creatures almost tore a very fine mastiff dog to pieces. Nor were these the only dangerous animals found here. An officer, having been sent out to sound the coast upon the south shore, reported, at his return, that four fierce creatures, resembling wolves, ran up to their bellies in water, to attack the people in his boat, and that, as they happened to have no fire-arms with them, they had immediately put the boat off into deep water. On the southern shore the officer afterwards found one of the largest sea-lions ever seen. As the boat's crew were well armed, they immediately engaged him, and, during the contest, one of the other animals was seen running towards them. He was fired at before he came up, and presently killed; though the commodore wished they had taken him alive, which, if they had been aware of his attack, might, he thought, easily have been done. When any of these creatures got sight of any of the crew, though at ever so great a distance, they ran directly at them; and no less than five of them were killed in one day. They were always called wolves by the ship's company, though, except in their size, and the shape of their tails, they had a nearer resemblance to foxes. They are as large as a middle-sized mastiff, and their fangs are remarkably long and sharp. There are great numbers of them upon the coast, though it is not easy to guess how they first came thither.

The commodore, in the course of his passage, observed, at the entrance of Jerome's Sound, on the north side, three or four fires, and soon afterwards saw two or three canoes paddling after the ship. At length the canoes came up, and one of them had the resolution to come on board. The canoe was of bark, badly constructed, and the people on board, consisting of four men and two women, were the most miserable wretches ever seen. They were all naked, except a stinking seal-skin that was thrown loosely over their shoulders. They were armed, however, with bows and arrows, which they readily bartered for a few beads, and other trifles. The arrows were made of reed, and pointed with a green stone. The cord of the bow was the dried gut of some animal.

Soon after the ship was at anchor abreast of Bachelor's River, several Indians came on board, and were presented with beads, ribbonds, and other trifles, with which they appeared highly delighted. Commodore Byron returned the visit by going ashore among them, taking only a few people with him in the boat, that the natives might not be alarmed. The visitors were received with great expressions of kindness, and, to make them welcome, the natives brought some berries, which they had gathered for that purpose, and which, with a few muscles, seemed to be the principal part of their subsistence.

An officer, who had been sent out to look for harbours on the southern shore, reported, on his return, that, being on shore to the westward of Cape Monday, he had fallen in with some Indians, who had with them a canoe of a construction very different from any that had been seen in the strait before. This vessel consisted of planks sewed together; but all the others were nothing more than the barks of large trees, tied together at the ends, and kept open; and short pieces of wood thrust in transversely between the two sides, like the boats which children make of a bean-shell. The people, he said, were the nearest to brutes, in their manner and appearance, of any he had ever seen. They were quite naked, notwithstanding the severity of the weather, except part of a seal-skin thrown over their shoulders. They had with them a large piece of whale-blubber, which stunk intolerably, and one of them tore it to pieces with his teeth, and distributed it to the rest, who devoured it with the voracity of wild beasts. They did not, however, look upon what they saw in the possession of the Europeans with indifference; for, while one of them was asleep, they cut off the hinder part of his jacket with a small flint, which they use as a knife.

While the ship lay at anchor in a bay, about a league to the eastward of Cape Upright, seven or eight Indians, in a canoe, came round the western point of the bay, and, having landed opposite to the ship, made a fire. The sailors invited them to come on board by all the signs they could devise, but without success: the commodore, there

fore, took a boat, and went on shore to them. He introduced himself by presenting them with several trides, with which they seemed to be much gratified. Having sent on board for some bread, he divided it among them, and remarked, with surprise, that if a bit of the biscuit happened to fall, not one of them offered to touch it till he gave his consent. In the mean time some of the crew were cutting a little grass for two or three sheep still remaining on board. At length the inhabitants, perceiving what they were doing, ran immediately, and tearing up all the weeds they could get, carried them to the boat, which was loaded in a short time. They had, indeed, taken such a fancy to the Europeans, that, when they returned on board the boat, they all got into their canoe and followed them. When they approached the ship, however, they stopped, and gazed at her with an apparent mixture of astonishment and terror, till at length, with some difficulty, four or five of them were persuaded to venture on board. As soon as they entered the ship, they received several presents, and soon appeared to be perfectly at ease.

The commodore being desirous to entertain them, one of the petty officers played upon the violin, and some of the crew danced. At this they were so much delighted, and so impatient to shew their gratitude, that one of them went over the ship's side into the canoe, and fetched up a seal-skin bag of red paint, and immediately smeared the fiddler's face all over with it. He was very desirous to pay the commodore the same compliment, which, however, he thought fit to decline, though it was with some difficulty that he defended himself from receiving the honour designed him. After having entertained them for several hours, it was intimated to them that it would be proper for them to go on shore; but such was their attachment, that it was by no means an easy matter to get them out of the ship.

Captain Wallis represents the country about Cape Gallant as dreary and forlorn, and the mountains on each side the straits as of immense height. About one-fourth of the ascent is clothed with large trees; but, from thence to the middle of the mountain, nothing appears but withered shrubs. Above these are masses of snow, and fragments of broken rock. The summit is rude and naked, towering above the clouds in vast craggs, piled upon each other, and devoted to perpetual sterility.

The ship having anchored in Elizabeth Bay, which lies in fifty-three degrees forty-three minutes of south latitude, Captain Wallis sent the boats on shore for water; and, soon after his people landed, three canoes put off from the south shore, and landed sixteen of the natives on the east point of the bay. When they came within a hundred yards, they stopped, called out, and made signs of friendship. The Europeans did the same, shewing them some beads and other toys. At this they seemed pleased, and

begin to shout. On their shouts being returned, the Indians advanced, laughing very loud. When the parties met, they shook hands, and the Indians were presented with several of the toys which they had seen at a distance. They were covered with seal-skins, which stunk abominably; and some of them were eating the raw flesh and blubber with a keen appetite. They were low of stature, the tallest of them not being more than five feet six inches. They appeared to be perishing with cold, and immediately kindled several fires. How they subsist in winter it is not easy to guess; for the weather was at this time so severe, that there were frequent falls of snow. They were armed with bows, arrows, and javelins. The arrows and javelins were pointed with flint, which was wrought into the shape of a serpent's tongue. They discharge both with great force and dexterity, seldom failing to hit a mark at a great distance. To kindle a fire, they strike a pebble against a piece of mummie, holding under it, to catch the sparks, some moss or down, mixed with a whitish earth, which takes fire like tinder. They then take some dry grass, and putting the lighted moss into it, wave it to and fro, and, in about a minute, a blaze will appear.

"Three of the natives," says our author, "came on board with the boat; but they seemed to regard nothing with any degree of civility except clothes and a looking-glass. The looking-glass afforded them as much diversion as it had done the Patagonians, and it seemed to surprise them more. When they first peeped into it, they started back, first looking at our people, and then at each other. They then took another peep, as it were by stealth, starting back as before, and then eagerly looking behind it. When, by degrees, they became more familiar with it, they smiled, and seeing the images smile in return, they were exceedingly delighted, and burst into fits of the most violent laughter. This, however, they left, and every thing else, with perfect indifference; the little they possessed being, to all appearance, equal to their desires. They ate whatever was given them, but would drink nothing but water.

"Captain Wallis went on shore with them when they left the ship, and by this time several of their wives and children were come to the watering-place. He distributed some trinkets among them, with which they seemed pleased for a moment, and gave some of their arms in return. They also gave several pieces of mummie, such as is found in the tin-mines of Cornwall. They gave our people to understand that they found it on the mountains, where there are probably mines of tin, and, perhaps, of more valuable metal.

"When they embarked in their canoes, they hoisted a seal-skin for a sail, and steered for the southern shore, where our people saw many of their havelts, and remarked, that not one of them looked behind; so little impression had

the wonders they had seen made upon their minds, and so much did they appear to be absorbed in the present, without any habitual exercise of power to reflect upon the past.

"About three miles up Bachelor's River, on the west side, between Mount Miscry and another mountain of stupendous height, there is a cataract, which has a very striking appearance. It is precipitated from an elevation of above four hundred yards; half the way it rolls over a very steep declivity, and the other part is a perpendicular fall. The sound of this cataract is not less awful than the sight.

"The country to the southward of the Strait appeared horrid and dreary beyond description. It consisted of craggy mountains, much higher than the clouds, and altogether naked from the base to the summit, there not being a single shrub, nor even a blade of grass, to be seen upon them. The valleys between them were equally desolate, being entirely covered with a deep snow, except in a few places where it had been washed away, or converted into ice, by the torrents which were precipitated from the crags of the mountains above, where the snow had been dissolved; and even those valleys, in the parts that were free from snow, were as destitute of verdure as the rocks between which they lay.

"Having steered for Cape Upright, and anchored in the bay, while the people were employed in getting wood and water, and gathering eelery and muscles, two canoes full of Indians came along-side the ship. They had much the same appearance as the deplorable wretches seen before in Elizabeth's Bay. They had on board some seals' flesh, blubber, and penguins, all of which they ate raw. Some of our people, who were fishing with a hook and line, gave one of them a fish, somewhat bigger than a herring, alive, just as it came out of the water. The Indian took it hastily, as a dog would take a bone, and instantly killed it, by giving it a bite near the gills. He then proceeded to eat it, beginning with the head, and going on to the tail, without rejecting either the bones, fins, scales, or entrails.

"They shivered with cold, yet had nothing to cover them but a seal-skin thrown loosely over their shoulders, which did not reach to their middle, and they were observed, when rowing, to throw even this aside, and sit naked. They had some javelins, rudely pointed with bone, with which they used to strike seals and penguins; and one of them was observed to have a piece of iron, about the size of a common chisel, fastened to a piece of wood, as if intended rather for a tool than a weapon.

Their canoes were about fifteen feet long, three broad, and nearly three deep. They were made of the bark of trees, sewed together, either with the sinews of some beast, or thongs cut out of a hide. Some kind of rush

was laid into the seams, and the outside was smeared with a gum, which prevented the water from soaking into the bark. Fifteen slender branches, bent into an arch, were sewed transversely to the bottom and sides, and some straight pieces were placed across the top from gunwale to gunwale, and securely fastened at each end. On the whole, however, they were poorly made, nor had these people any thing among them in which there was the least appearance of ingenuity. An hatchet or two were given them, with some beads, and a few other toys, with which they went away to the northward, and were no more seen by any of our people.

"A party, sent out in search of anchoring-places, spent a night upon an island adjacent to Cape Upright, called Dolphin Bay. They there saw several small coves, which were all dangerous. While they were there, six canoes landed about thirty Indians, who ran to the boat, and were carrying away every thing they found in her, but our people discovered them just in time to prevent them. As soon as they found themselves opposed, they went to their canoes, and armed themselves with long poles and javelins, pointed with the bones of fish. They did not begin an attack, but stood in a threatening posture. Our people, who were twenty-two in number, acted only on the defensive, and, by distributing a few trifles among them, rendered them friends, and induced them to behave peaceably during their stay."

Captain Wallis, and those under his command, quitted this dreary region, on the 11th of April, 1767, after being exposed for nearly four months to the danger of shipwreck, and undergoing a series of fatigues and hardships.

That our readers may form a judgment of the persons and characters of the original inhabitants of South-America in general, we shall present them with the following description from a geographical work of respectability:—

"All the ancient natives of the country are tawny, of a colour somewhat reddish, and more or less clear. This variety of shades in their complexion is probably owing chiefly to the different temperature of the air in the several climates they inhabit, varying from the intense heat of the torrid zone, to the nipping cold caused by the vicinity of the snows.

"This diversity of climates, with that of woody countries, plains, mountains, and rivers, as also the difference of their diet, and the little correspondence which the neighbouring nations have with each other, with a thousand other causes, must necessarily have produced great variety in the occupations and customs of these people. Besides, it may easily be imagined, that a nation who have been Christians, and subject to the crowns of Spain and Portugal, must have learned some of the manners of their conquerors, and, consequently, that an Indian, who lives in a town or village of Peru, must differ from a savage in

the interior of the continent, and even from a new inhabitant of the missions on the banks of the Marañon. It might be needful, therefore, in order to give any one an exact idea of the Americans, to make almost as many descriptions as there are nations among them. Nevertheless, as all the European nations, though differing among themselves in language, manners, and customs, would still have somewhat in common to all of them in the eyes of an Asiatic, who should examine them attentively, so all the American Indians, of the several countries, have certain features of resemblance in common with each other; and, with some slight variations, all of them appear to be of one common temper, of which insensibility is the basis.

"This undoubtedly proceeds from the small number of their ideas, which extend no farther than their necessities. Gluttons, even to voracity, when they have wherewith to satisfy themselves; yet moderate when needs must, even to shifting without any thing. Pusillanimous and cowardly to the last degree; enemies to labour; unmoved by any incentive to glory, honour, or gratitude; wholly intent upon the object that is before them, and always determined thereby, without any regard to futurity. Incapable of foresight and reflection; giving themselves up, when not under restraint, to a childish joy, which they express by skipping about, and immoderate fits of laughter, without either meaning or design; they pass their lives without thought, and grow old without having taken leave of the failings and follies of infancy."

#### SECTION IV.

#### ISLANDS, CAPES, &c. IN THE SOUTHERN EXTREMITY OF AMERICA.

#### FALKLAND ISLANDS.

These islands are situated near the Straits of Magellan, in the fifty-second degree of south latitude. They were first discovered in 1594, by Sir Richard Hawkins, who named the principal of them Hawkins' Maidenland, in honour of Queen Elizabeth. The present name of Falkland was given them by Captain Strong, in 1639, and being adopted by Halley, it has from that time been received in our maps.

The admiralty having revived the scheme of a settlement in the South Seas, in the year 1764, Commodore Byron was sent to take possession of Falkland Islands, in the name of his Britannic Majesty, and, in his journal, he represents them as a valuable acquisition. But Captain Macbride, who, in 1766, succeeded that officer, represents them as the *outcasts of nature*. "We found," says he, "a mass of islands and broken lands, of which the

soil was nothing but a bog, with no better prospect than that of a barren mountain, beaten by storms almost perpetual. Yet this is summer; and, if the winds of winter hold their natural proportion, those who lie but two cables' length from the shore, must pass weeks without having any communication with it." The plants and vegetables which were planted by Mr. Byron's people, and the fir-tree, a native of rugged and cold climates, had withered away: but the goats, sheep, and hogs, that were carried thither, were found to thrive and increase. Geese, of a fishy taste, snipes, foxes, sea-lions, penguins, plenty of good water, and, in the summer months, wild celery and sorrel, are the natural productions of these parts. They have occasioned some contest between Spain and Great Britain; but, being of little importance, they were silently abandoned by the latter in 1774, in order to avoid giving umbrage to the Spanish court.

#### TERRA DEL FUEGO, AND PLACES ADJACENT.

Terra del Fuego, or the Land of Fire, so called from a volcano in the island, is situated between fifty-three and fifty-five degrees of south latitude, and separated from the continent by the Straits of Magellan.

The most accurate description of this island is that of our illustrious navigator, Captain Cook, to whom we are indebted for the following interesting particulars:—

"On leaving the harbour of Rio de Janeiro, the capital of Brazil, in December, 1768, after passing Falkland Islands, we discovered, on the 11th of that month, the coast of Terra del Fuego, at the distance of about four leagues to the westward of the Strait of Le Maire. We ranged the coast till the 15th, when we anchored at the distance of about a mile and a half from the shore. Two of the natives came down to the beach, expecting us to land; but this spot afforded so little shelter, that I at length determined not to examine it, and therefore left it, and anchored in the Bay of Good Success.

"When the ship was brought to anchor, I went on shore, accompanied by Mr. Banks and Dr. Solander, to look for a watering-place, and to confer with the Indians, several of whom had come in sight. We landed on the starboard side of the bay, near some rocks, which made smooth water and good landing; thirty or forty of the Indians soon made their appearance, at the end of a sandy beach, on the other side of the bay, but seeing our number, which amounted to ten or twelve, they retreated. Mr. Banks and Dr. Solander then advanced about one hundred yards before us, upon which two of the Indians returned, and, having advanced some paces towards them, sat down; as soon as they came up, the Indians rose, and each of them having a small stick in his hand, threw it away in a direction both from themselves and the strangers, which was considered as the renuncia-

tion of weapons, in token of peace. They then walked briskly towards their companions, who had halted at about fifty yards behind them, and beckoned the gentlemen to follow, which they did. The Europeans were received with many uncounted signs of friendship; and, in return, they distributed among them some beads and ribands, with which they were greatly delighted.

"A mutual confidence being thus effected, the parties joined, and the conversation, such as it was, became general, and three of them accompanied us back to the ship. When they came on board, one of them, supposed to be a priest, performed much the same ceremonies as are described by M. Bougainville, which, he is of opinion, were of a religious nature. When this person was introduced into a new part of the ship, or when any thing he had not seen before caught his attention, he shouted, with all his force, for some minutes, without directing his voice either to us or his companions. They ate some bread and beef, but not apparently with much pleasure, though such part of what was given them as they did not eat, they took away with them; but they would not swallow a drop of either wine or spirits: they put the glass to their lips, but, having tasted the liquor, they returned it with strong expressions of disgust. They appeared to have but little curiosity, as they went from one part of the ship to another, and looked at the great variety of new objects, that every moment presented themselves, without any expression of wonder or pleasure; for the vociferations of the supposed priest seemed to be neither.

"The natives, after having been on board two hours, expressed a desire to go on shore. Mr. Banks accompanied them, and conducted them to their companions, among whom he remarked the same vacant indifference as in those who had been on board; for as on one side there appeared no eagerness to relate, so on the other there seemed to be no curiosity to hear, how they had been received, or what they had seen. Soon after Mr. Banks returned to the ship, and the Indians retired from the shore.

"When Mr. Banks, Dr. Solander, and other gentlemen, with their attendants and servants, afterwards set out from the ship, with a few of the men, to penetrate as far as they could into the country, and return at night; the hills, when viewed at a distance, seemed to be partly a wood, partly a plain, and above them a bare rock. Mr. Banks hoped to get through the wood, and made no doubt but that beyond it he should, in a country which no botanist had ever yet visited, find alpine plants, which would abundantly compensate his labour.

"They entered the wood at a small sandy beach, a little to the westward of the watering-place, and continued to ascend the hill, through a trackless wilderness, for several hours, before they had a near view of the places they in-

tended to visit. Soon after they reached what they had taken for a plain; but, to their great disappointment, they found it a swamp, covered with low bushes of birch, and so interwoven and stubborn, that it was necessary to lift the leg over them, which, at every step, was buried ankle deep in the soil. To increase the pain and difficulty of such travelling, the weather, which hitherto had been very fine, became gloomy and cold, with sudden blasts of a most piercing wind, accompanied with snow. They pushed forward, however, notwithstanding their fatigue; but when they had got about two-thirds, over this woody swamp, Mr. Buchan, one of Mr. Banks's draughtsmen, was unhappily seized with a fit. This obliged the whole company to halt, and, as it was impossible he should go any further, a fire was kindled, and those who were most fatigued were left behind to take care of him. Mr. Banks, and the other gentlemen, went on, and in a short time reached the summit. As botanists, they were abundantly gratified by finding a variety of plants, which, with respect to the alpine plants in Europe, are exactly what those plants are, with respect to such as grow in the plain."

*Climate, &c.* "The cold was now become more severe, and the snow-blows more frequent; the day, also, was so far spent, that it was found impossible to get back to the ship before the next morning. To pass the night on such a mountain, in such a climate, was not only comfortless, but dreadful: it could not, however, be avoided, and they were to provide for it as well as possible. While Mr. Banks and Dr. Solander were gathering plants, two of the company went back to the draughtsman and the people that were with him, with directions to bring them to a hill, which, it was thought, lay in a better route for returning to the wood, and which was, therefore, appointed as a general rendezvous.

"Their whole company assembled at this rendezvous, and, though pinched with the cold, were in health and spirits. The draughtsman himself had recovered his strength in a greater degree than could have been expected. Though now near eight o'clock in the evening, it was still day-light, and they set forward for the nearest valley, Mr. Banks himself undertaking to bring up the rear, and see that no straggler was left behind; a caution which soon appeared to be of the utmost importance.

"Dr. Solander, who had more than once crossed the mountains which divide Sweden from Norway, well knew that extreme cold, especially when joined with fatigue, produces a sleepiness that is almost irresistible, and therefore conjured the company to keep moving, however painful it might be. His words were, "Whoever sits down will sleep, and whoever sleeps will wake no more."—Though thus admonished, the cold became suddenly so intense, as to produce the effects most dreaded. Dr. So-

lander himself was the first who felt the inclination, against which he had warned others, as irresistible, and insisted upon being suffered to lie down. Mr. Banks in vain remonstrated; Dr. Solander lay down upon the ground, though it was covered with snow, and it was with great difficulty his friend could keep him from sleeping. Richmond, also, one of the black servants, began to linger, having suffered from the cold in the same manner as the doctor. Mr. Banks, therefore, sent five of the company, among whom was Mr. Buchan, forward to prepare a fire at the first convenient place; while himself, with four others, remained with the doctor and Richmond, whom, partly by persuasion and entreaty, and partly by force, they brought forward; but, when they had got through the greatest part of the birch and swamp, they both declared they could go no farther. Mr. Banks again entreated and expostulated, but without effect. When Richmond was told that, if he did not go on, he would be frozen to death in a short time, he replied that he desired nothing but to lie down and die. Dr. Solander said, he was willing to go on, but that he must first take some sleep, notwithstanding his former declaration, that whoever slept would wake no more.

"As it was impossible to carry them, and there was no remedy, they were both suffered to sit down on the ground, and, in a few minutes, they fell into a profound sleep.

"Soon after, some of those who had been sent forward returned with the welcome news that a fire was kindled, about a quarter of a mile farther on. Mr. Banks then succeeded in awakening Dr. Solander, who, though he had not slept five minutes, had almost lost the use of his limbs; and the muscels were so shrunk, that his shoes fell from his feet. He consented to go forward with such assistance as could be given him: but all attempts to relieve poor Richmond were ineffectual. Mr. Banks, therefore, left his other black servant, and a seaman who seemed to have suffered least from the cold, to look after him, promising that, as soon as two others should be sufficiently warmed, they should be relieved. Mr. Banks, with great difficulty, got the doctor to the fire; and soon after sent two of the people who had been refreshed, hoping that, with the assistance of those who had been left behind, they would be able to bring Richmond, though it might still be impossible to awake him.

"In about half an hour they had the mortification to see the two men return alone. They stated, that, after the most minute search, they could neither find Richmond, nor those who had been left with him; and that though they had repeatedly shouted, no voice had replied. Whilst Mr. Banks was expressing his surprise at this circumstance, he missed a bottle of rum, the company's whole stock, which they concluded to be in the knapsack of one of the absentees. It was supposed that, by means of this,

Richmond had been roused by the two men that had been left with him, and that, having drank too freely of it themselves, they had all rambled from the place where they had been left, in search of the fire, instead of waiting for guides and assistance.

"Another fall of snow came on, and continued incessantly for two hours; so that all hope of seeing them again, at least alive, was given up: but in some time, to the general joy of the company at the fire, a shouting was heard at a distance. Mr. Banks, with four others, immediately went out, and found the seaman with just strength enough left to stagger along, and call for assistance. Mr. Banks having sent him immediately to the fire, proceeded, by his directions, in search of the other two, whom he soon after found. Richmond was upon his legs, but unable to put one foot before the other. His companion was lying upon the ground, completely senseless.

"The whole company was now called from the fire, and an united attempt was made to carry these poor creatures to it, but without effect. The night was extremely dark, and the snow very deep; so that, finding it very difficult to make their way through the bushes and bogs themselves, the only alternative was, to make a fire on the spot; but the snow that had fallen, and was still falling, besides what was momentarily shaken in flakes from the trees, rendered it equally impracticable to kindle one there, or to bring any part of that which had been kindled in the wood thither. They were, therefore, reduced to the melancholy necessity of leaving the unhappy wretches to their fate, having previously made them a bed of boughs from the trees, and spread a covering of the same kind over them to a considerable height.

"After suffering in the region of the cold and snow nearly an hour and an half, some of the rest began to lose their feeling; and Briscoe, another of Mr. Banks's servants, was so ill, that it was apprehended he must die before he could get to the fire. However, at length they reached the fire, and passed the night in a situation dreadful in itself, and rendered more so by the remembrance of past severities, and the uncertainty of what was to follow.

"They were twelve in number, who had set out in health and spirits. Of these two were supposed to be already dead; a third was so bad, that it was doubtful whether he would be able to proceed in the morning; and a fourth (Mr. Buchan) was in danger of the return of his fits, from fresh fatigues after so uncomfortable a night. They were a long day's journey distant from the ship, through pathless woods, in which they might be bewildered till overtaken by the ensuing night; and not having prepared for a journey of more than eight or ten hours, their whole stock of remaining provision was a vulture, which they happened to shoot when they were out, and which, if

equally divided, would not afford each of them half a meal; and they knew not how much more they might suffer from the cold, as the snow still continued to fall; a dreadful proof of the rigour of the climate, as it was now the midst of summer in this part of the world; and every thing might be dreaded from a phenomenon which, in the corresponding season, is unknown even in Norway and Lapland.

"The only object visible at day-break was snow, which seemed to lie as thick upon the trees as upon the ground; and the blasts returned so frequently, and with such violence, that they found it impossible for them to set out. They knew not how long this might last, and had but too much reason to apprehend, that it would confine them in that desolate forest till they perished with hunger and cold.

"A dawn of hope, however, succeeded these terrific apprehensions; for, about six o'clock in the morning, they discovered the place of the sun, through the clouds, which were become thinner, and began to break away. Their first care was to ascertain whether the poor wretches they had been obliged to leave among the bushes were yet living: for this purpose they despatched three of the company, who soon after returned with the melancholy news of their death.

"Favourable as appearances had been, the snow continued to fall so thick as to prevent their setting out for the ship. But a small regular breeze soon sprang up, which, with the prevailing influence of the sun, at length cleared the air, and, to their great joy, they soon after saw the snow fall in large flakes from the trees; a certain sign of an approaching thaw.

"It was now deemed expedient to examine more minutely into the state of the invalids. Briscoë, though he remained very bad, said, he thought himself able to walk; and Mr. Buchan was much better than there was reason to expect. They were now, however, pressed by the calls of hunger, to which every other consideration must give way. They therefore came to an unanimous resolution, before they set forward, to eat their vulture, which was accordingly skinned; and it being thought best to divide it before it was fit to be eaten, it was cut into ten portions, and every man cooked his own as he thought proper.

"After this slender meal, which furnished about three mouthfuls each, they prepared to set out; but it was ten o'clock before the snow was so far dissolved as to render their progress practicable. Having proceeded about three hours, they were most agreeably surprised to find themselves upon the beach, and much nearer the ship than they had reason to expect. Upon reviewing their track from the vessel, they perceived that, instead of ascending the hill in a line, so as to penetrate into the country, they had almost made a circle round it. On their arrival on

board, they congratulated each other, and were congratulated by the crew in general, with an ecstasy of joy that can only be conceived by such as have been exposed to equal danger; and, as I had suffered the greatest anxiety from their not returning in the evening of the day on which they set out, I participated in no small degree of the general joy."

*Vegetable Productions.*] The labour of the botanists was amply rewarded; for they found a vast variety of plants, the far greater part of which were wholly different from any they had seen or heard of before. One was found particularly beneficial: this was the wild celery, as it contained antiscorbutic qualities, which may be of great benefit to the crews of such ships as may hereafter visit this place. I ordered large quantities of this plant to be put into the seamen's soup, which, thus medicated, produced the same salutary effects which seamen generally derive from vegetable diet, after having been long confined to the use of salt provisions.

The tree which produces the winter-bark is known by its broad leaf, shaped like a laurel, of a light green colour without, and inclining to blue within. The bark is easily stripped with a bone or stick, and its virtues are well known. It may be used for culinary purposes as a spice. There is also a species of birch-tree, the stem of which is from thirty to forty feet high, and from two to three feet in diameter; so that, in case of necessity, they would supply a ship with topmasts. They are a light white wood, bear a small leaf, and cleave very straight. Cranberries grow here on a bushy plant, and have a bitterish taste, rather insipid, but may be eaten either raw or in tarts. They are sometimes eaten by the natives.

*Animals.*] No quadrupeds were seen in this country but sea-lions, seals, and dogs. It is remarkable that these dogs barked, which those that are originally bred in America do not. This is a further proof that the people seen here, either immediately, or remotely, communicated with the Europeans. There are, however, other quadrupeds in this country; for when Mr. Banks ascended the highest hill in his expedition through the woods, he saw the foot-prints of a large beast imprinted upon the surface of a bog, though he could not, with any probability, guess of what kind it might be.

The wild fowl are sea-pies, shags, hawks, vultures, ducks, geese, and a large bird, called the Port Egmont hen. There were ducks, called by our people race-horses, on account of the great swiftness with which they run on the water; for they cannot fly, the wings being too short to support the body in the air. The geese here are much smaller than those of England, but in flavour equally agreeable. They have short black bills, and yellow feet. The gander is quite white; the female is spotted black and white, or grey, with a large spot on each wing. Here

are several other aquatic birds, and some land ones, but not many of the latter.

"Scarcely any fish were seen, nor could our people catch any with their hooks that were fit to eat. The shell-fish were limpets, clams, and muscles, and were found in abundance.

"Among the insects, which were not numerous, there was neither gnat, mosquito, nor any other species that was either hurtful or troublesome, which, in an uncleared country, was deemed extraordinary. During the snow-blows, which happened every day while we were here, they hide themselves; and the moment it is fair weather appear again, as nimble and vigorous as the warmest weather could make them.

"The natives were, in appearance, an ugly, half-starved, beardless race. Their colour resembled that of the rust of iron, mixed with oil. They have long black hair. The men are disproportioned in their form. Their stature is from five feet eight, to five feet ten. The women are considerably less. Both sexes have, in general, horrid and dejected aspects. Their language is, in general, guttural, and they express some of their words by a sound exactly resembling that which we make to clear the throat, when any thing happens to obstruct it. Their clothing consists of the skins of the guanico, or seal, thrown over their shoulders, exactly in the same state in which it comes from the animal. A piece of the same skin is drawn over their feet, and gathered about the ankles like a purse; and two or three skins, sewed together, make a cloak, which reaches to their knees: but the major part have only one skin, hardly large enough to cover their shoulders; and the lower parts are quite naked. The women have a small flap, as a succedaneum for a fig-leaf. Their dress, in no other respect, differs from that of the men. The children go entirely naked, and are thus inured in their infancy to cold and hardships. But although they are content to be naked, they are very ambitious to be fine. Their faces are painted in various forms: the region of the eye was, in general, white; and the rest of the face adorned with horizontal streaks of red and black; yet scarcely any two were exactly alike. This decoration seems to be more profuse and elaborate upon particular occasions; for the two natives who introduced Mr. Banks and Dr. Solander into the town, were almost covered with streaks of black in all directions, so as to make a very striking appearance. Both sexes wore bracelets of such beads as they could make themselves of small shells or bones. The women had them both upon their wrists and ankles; the men upon their wrists only; but to compensate for the want of bracelets upon their legs, they wore a kind of fillet of brown worsted about their heads. They seemed to set a particular value upon any thing red, and to prefer beads even to a knife or hatchet.

69. VOL. I.

"Their chief food is shell-fish and seals. The former are collected by the women, whose business it is to attend at low water, with a basket in one hand, a stick pointed and barbed in the other, and a satchel at their backs. They loosen the limpets, and other fish, that adhere to the rocks, with a stick, and put them into the basket, which, when full, they empty into the satchel. The muscles are of a very fine flavour. When they cannot procure a sufficient supply of these, and the other shell-fish, necessity urges them to seek other resources; but as, from their want of ingenuity, they have few implements, and those badly constructed, for the purposes of catching and destroying animals, they are frequently reduced to the utmost distress.

"Their habitations are of the most rude and artificial structure, consisting of nothing more than a few poles, set up so as to incline towards each other, and meet at the top, forming a kind of cone, which resembles some of our bee-hives. On the weather-side they are covered with a few boughs and a little grass; and on the lee-side, about one eighth of the circle is left open, both for a door and a fire-place. Of this kind were the huts seen in a contiguous place called St. Vincent's Bay, in one of which the embers of a fire were still remaining.

"The furniture seen was, if it may be so called, a little grass, which lay within-side of a hovel, and served for chairs and beds. And of all the utensils and implements, which necessity or ingenuity have concurred to produce amongst other savage nations, here were only seen a basket to carry in the hand, a satchel to hang at the back, and the bladder of some beast to hold water, which the natives drink through a hole that is made for that purpose.

"Their weapons consist of a bow and arrows. Their bows are indifferently formed, but the arrows are extremely neat, being made of wood, and polished to the highest degree. The point, which is of glass or flint, and barbed, is formed and fitted with wonderful dexterity. Some pieces of glass and flint, unwrought, were seen among them; besides rings, buttons, cloth, and canvas, with other European commodities. They must, therefore, sometimes travel to the northward, as it is many years since any vessel had been so far south as this part of Terra del Fuego. It was observed that they shewed no surprise at our fire-arms, with the use of which they appeared to be well acquainted; for they made signs to Mr. Banks to shoot a seal, which followed the boat as they were going on shore from the ship. They have likewise harpoons, made of bone, and fitted to a staff, with which they kill seals, whales, and other fish.

"Their canoes were made of bark, and in each was a fire, over which the poor frozen creatures huddled themselves together. I could not suppose they carried a fire

9 K

in their canoes for this purpose only, but rather that it may be always ready to remove on shore wherever they land; as, let their method of obtaining a fire be what it may, they could not always be sure of finding fuel that would kindle from a spark. They likewise carried in their canoes large seal-hides, which I judged were to shelter them when at sea, to serve as coverings to their huts on shore, and to be used occasionally as sails.

"The natives did not appear to have among them any government or subordination: no one was more respected than another, yet they seemed to live together in the utmost harmony and good fellowship. No appearance of religion was discovered among them, except the noises that have been mentioned, and which we supposed to be a superstitious ceremony, merely because it could be referred to nothing else. Upon the whole, these people appeared to be the most destitute and forlorn, as well as the most stupid, of all human beings; the very outcasts of nature, who spent their lives in wandering about the dreary wastes, where two of our people perished with cold in the midst of summer, with no dwelling but a wretched hovel of sticks and grass, which will not only admit the wind, but the snow and rain; almost naked, and destitute of every convenience that is furnished by the rudest art, having no utensil even to dress their food; yet they are contented. They seemed to have no wish for any thing more than they possessed; nor did any thing offered them by our voyagers appear acceptable, except beads, as an ornamental superfluity.

"It is surprising that these people do not clothe themselves better, since nature has certainly provided materials. They might line their seal-skin cloaks with the skins and feathers of aquatic birds; they might make their cloaks larger, and employ the same skins for other parts of clothing; for it cannot be supposed they are scarce with them. They were ready enough to part with those they had to our people, which they hardly would have done had they not known where to get more. These people appear doomed to live in one of the most inhospitable climates in the world, without having sagacity enough to provide themselves with such conveniences as may render life, in some measure, more comfortable; and, strange as it may appear, the clothing they wore, when we were here, in the summer, was scarcely sufficient to prevent their perishing with cold, even in that season. What, then, must they feel from the extreme rigour of their clime in the winter? In a word, they are, without exception, the most dejected, miserable, and uncouth, beings on the face of the earth."

In his second visit to Terra del Fuego, in December, 1774, Captain Cook drew up an account of several parts of the south-west coast, which materially differ from those he had formerly seen. This coast seemed entirely com-

posed of rocky mountains, terminating in horrid precipices, whose craggy summits spire up to a vast height, so that hardly any thing in nature can appear with a more barren and savage aspect. The mountains in the interior were covered with snow, but those on the sea-coast were not.

"To a lofty promontory," says our author, "which terminated in two high towers, enclosing a hill, shaped like a sugar-loaf, I gave the name of York Minster. Leaving this spot, we arrived in Christmas Sound, and came to anchor in a harbour distinguished by the name of the Devil's Basin. It is a very secure place, but nothing could be more gloomy, for the vast height of the rocks which encompassed it deprived great part of the harbour, of the meridian sun.

"On the shore to the westward we found other harbours, in all of which were fresh water and wood for fuel, but, excepting the little tufts of bushes, the whole country appeared as a barren rock, doomed by nature to perpetual sterility. The sea-coast is composed of a number of large and small islands. On one of the latter our people, in an expedition up the country, found several huts which had lately been inhabited: near them grew a good deal of celery, which was gathered and taken on board the ship.

"The island under which the ship was brought to anchor, I called Shag Island, from the shags breeding in great numbers in cliffs of the rocks. Our people shot some of the old ones, but could not come at the young ones, which are by far the best eating. They saw some geese, of which they killed three, which proved highly acceptable.

"One of the lieutenants I sent to explore the east side of the sound, having informed me that the land opposite the spot where the ship was stationed was an island, and that without the island lay a cove in which were many geese, two shooting parties went thither the next day. My party went by the south-west side. As soon as they got under the island, which obtained the name of Goose Island, they found plenty of shags in the cliffs, and on the south side many geese. It happened to be moulting time, and most of them were on shore, and unable to fly. There being a very great surf, the parties found much difficulty in landing, and very bad climbing over the rocks when they were landed; so that hundreds of the geese escaped them, some into the sea, and others up into the island. By some means, however, they got sixty-two, with which they returned on board, all completely tired; but the acquisition overbalanced every other consideration, and they sat down with a good appetite to supper, on part of what the preceding day had produced. The other party had before brought on board fourteen geese, so that I was able, the next day, to make a distribution to the whole crew, which was the more acceptable, on account

of the approaching festival, this being the 24th of December; and had not Providence thus singularly provided for us, our Christmas fare must have been salt provision.

"I now learned that a number of natives, in nine canoes, had been alongside the ship; and little address was required to persuade them to come on board; for they seemed well acquainted with Europeans, and had amongst them some of their knives.

"On the 25th, they made us another visit. I found them to be of the same nation I had formerly seen in Success Bay; and the same which M. de Bougainville distinguishes by the name of Peharas; a word which these had, on every occasion, in their mouths. They are a little, ugly, half-starved, headless race. I saw not a tall person amongst them. They were almost naked: their clothing was a seal-skin; some had two or three skins sewed together, so as to make a cloak which reached to the knees; but the greater part had only one skin, hardly large enough to cover their shoulders. The women, as well as the children, remained in the canoes. I saw two young children at the breast entirely naked; thus they are injured from their infancy to cold and hardships. They had with them bows and arrows, and harpoons, made of bone, and fitted to a staff. I suppose they were intended to kill seals and fish; they may also kill whales with them, as the Esquimaux do. I know not if they resemble them in their love of train-oil; but they, and every thing they had, smelt intolerably of it. I ordered them some biscuit, but they were much better pleased when I gave them some medals, knives, &c.

"They all retired before dinner, and did not wait to partake of our Christmas cheer. Indeed, I believe, no one invited them, for their dirty persons, and the stench they carried about them, were enough to spoil the appetite of any European; and that would have been a real disappointment, as we had not experienced such fare for some time. Roast and boiled geese, goose-pie, &c., was a treat little known to us; and we had yet some Madeira wine left, which was the only article of our provision that was improved by keeping. So that our friends in England did not, perhaps, celebrate Christmas more cheerfully than we did.

"On the 26th, in the evening, when it was cold, the natives made us another visit; and it being distressing to see them stand trembling and naked on the deck, I could do no less than give them some baize and old canvas to cover them.

"On the 27th, a party of us went in two boats to shoot geese, the weather being fine and pleasant. We proceeded round by the south side of Goose Island, and picked up, in all, thirty-one.

"The festival, which we celebrated at this place, occasioned my giving it the name of Christmas Sound.

The entrance, which is three leagues wide, is situated in fifty-five degrees twenty-seven minutes south latitude, and in seventy degrees sixteen minutes west longitude. York Minster, which is the only remarkable land about it, will hardly be known by a stranger, from any description that can be given of it, because it alters its appearance according to the different situations it is viewed from. Besides the black rock, which lies off the end of Shag Island, there is another about midway between this and the east shore. A copious description of this sound is unnecessary.

"The refreshments to be got here are precarious, as they consist chiefly of wild fowl, and may probably never be found in such plenty as to supply the crew of a ship; and fish, so far as we can judge, are scarce. Indeed, the plenty of wild fowl made us pay less attention to fishing. Here are, however, plenty of muscles, and very good eelery is to be met with where the natives have their habitations. The wild-fowl are geese, ducks, sea-pies, shags, and that kind of gull called the Port Egmont hen. Here is a kind of duck, called by our people race-horses, on account of the great swiftness with which they run on the water; for they cannot fly, the wings being too short to support the body in the air. The geese are much smaller than our English tame geese, but eat as well as any I ever tasted. They have short black bills and yellow feet. The gander is entirely white; the female is spotted black and white, or grey, with a large white spot on each wing. There are several other aquatic, and some land, birds, but the latter are not numerous.

"Barren as this country is, it abounds with a variety of unknown plants, and gave sufficient employment to the botanists. The tree which produces the winter-bark is found here in the woods, as is the holly-leaved barberry, and some other sorts, which I believe are common in the Straits of Magellan.

"Leaving Christmas Island, we steered for Cape Horn, which is known at a distance by a high round hill over it; a point to the west-north-west shews a surface not unlike this, but their situations alone will always distinguish the one from the other. It is the most southern extremity of a group of islands, of an equal extent, lying before Nassau Bay, known by the name of Hermite Islands, and is situated in fifty-five degrees fifty-eight minutes south latitude, and in seventy-six degrees sixty-nine minutes west longitude.

"As we had explored the south coast of Terra del Fuego, I resolved to do the same by Staten Land, which I believed to be as little known as the former. Accordingly we bore up for the east end of Staten Land, and as we advanced, we perceived several islands, of unequal extent, lying off the land. On the easternmost of these islands we saw abundance of seals and birds. This was

a temptation too great for people in our situation to withstand, to whom fresh provisions of any kind were acceptable, and determined me to anchor, in order that we might taste of what we now only saw at a distance, which we did in a spot about a mile from the island. We then landed with a large party of men, some to kill seals, others to catch or kill birds, fish, or what came in our way. As to seals, the whole shore was covered with them, and, by the noise they made, one would have thought the island was stocked with cows and calves: but, at length, we found they were a different animal from seals, but in shape and motion exactly resembling them. We called them lions, on account of the great resemblance the male has to that beast. Here were also the same kind of seals which we found in New Zealand, generally known by the name of sea-bears; at least we gave them that name. They were, in general, so tame, or rather so stupid, as to suffer us to come near enough to knock them down with sticks; but the large ones we shot, not thinking it safe to approach them. We also found on the island abundance of shags and penguins; there were also geese and ducks, but not many; birds of prey, and a few small birds.

"Finding, from these circumstances, that nothing was wanting, but a good harbour, to make this a tolerable place for ships to touch at, whom chance or design might bring hither, I sent an officer next day to Staten Land, to look for one. Appearances promised success in a place opposite the ship. I also sent two boats for the sea-lions, &c. which we had killed: and soon after I went myself, and observed the sun's meridian altitude at the north-east end of the island, which gave the latitude of fifty-four degrees forty minutes five seconds south. After shooting a few geese, some other birds, and plentifully supplying ourselves with young shags, we returned on board, laden with sea-lions, sea-bears, &c. The old lions and bears were killed chiefly for the sake of their fat, to make oil of; for, except their haslets, which were tolerable, their flesh was too rank to be eaten. But the young cubs were very palatable, and even the flesh of some of the old lionesses was not much amiss; but that of the old males was abominable. In the afternoon, I sent some people on shore to skin and cut off the fat of those which yet remained dead on shore; for we had already more carcasses on board than necessary; and I went myself, in another boat, to

collect birds. About ten o'clock, the officer returned from Staten Land, where he found a good port, situated three leagues to the westward of Cape St. John. It may be known by some small islands lying in the entrance. The harbour is almost two miles in length; in some places near a mile broad; and has in it from fifty to ten fathoms water, with a bottom of mud and sand. Its shores are covered with wood fit for fuel; and in it are several streams of fresh-water.

"On the islands were sea-lions, sea-bears, &c.; and such an innumerable quantity of gulls, as to darken the air when disturbed, and almost to suffocate our people with their dung, which was more offensive than assafoetida. The day on which this port was discovered, occasioned my calling it New Year's Harbour. It would be more convenient for ships bound to the west, or round Cape Horn, if its situation would permit them to put to sea with an easterly and northerly wind. This inconvenience, however, is of little consequence, since these winds are never known to be of long duration. The southerly and westerly are the prevailing winds; so that a ship can never be detained long in this port.

"As we could not sail in the morning of the second, for want of wind, I sent a party of men on shore to the island, on the same duty as before. Towards noon we got a fresh breeze at west; but it came too late, and I resolved to wait till the next morning, when, at four o'clock, we weighed, and stood for Cape St. John, which, being the eastern point of Staten Land, a description of it is unnecessary. After getting round the cape, I hauled up along the south coast, and, as soon as we had brought the wind to blow off the land, it came upon us in such heavy squalls, as obliged us to double-reef our top-sails. It afterwards fell, by little and little, and at noon ended in a calm. The calm was of very short duration, a breeze presently springing up at north-west; but it was too faint to make head against the current, and we drove with it back. Two hours after, the squalls and rain subsided, and the wind, returning back to the west, blew a gentle gale. All this time the current set us to the north. I now gave over plying, and steered south-east, with a resolution to leave the land; judging it to be sufficiently explored to answer the most general purposes of geography and navigation."
