It is unnecessary to detail the circumstances attending the murder of the illustrious Cook, as they are generally known to those who know any thing of that hero. His death was an irreparable loss to science, and his discoveries will hand down his fame to posterity. "He had," says his biographer, "led his gallant crews twice round the world; reduced to a certainty the non-existence of a southern continent, about which the learned of all nations were in doubt; settled the boundaries and demonstrated the impracticability of a north-west passage from the Atlantic to the great Southern Ocean, for which our ablest geographers had contended, and in pursuit of which vast sums had been spent in vain, and many valuable mariners had perished. His death was doubtless premature, yet he lived to accomplish the great undertaking for which he seemed particularly designed."

During the existence of hostilities, which were untrappily protracted for several days after the death of Captain Cook, a great number of the natives, and several of their chiefs, were killed; and the village of Kouraua, and with it the dwelling of the priests, who had all along shown themselves sincerely attached to the English, were burnt to the ground. Directions had been given to the mariners to destroy only a few straggling houses, which afforded shelter to the islanders in annoying the seamen when taking in supplies of water. But, in the execution of these orders, resentment for repeated insults, as well as the death of their beloved commander, hurried the party into unnecessary acts of devastation and cruelty.

In this unfortunate warfare, the natives displayed great bravery. One trait of heroism we cannot forbear to notice. A number of the islanders had made an attack upon the morai, where a party of the British, under Mr. King's orders, were stationed, to protect the astronomical observatory. After a warm encounter they were beat off, and one of their number killed. A native, on perceiving his friend fall, boldly turned back, amidst the fire of the whole party, with a view of carrying off the dead body: he re-

ceived a wound, which obliged him to quit it and retreat. A few minutes afterwards, he returned; he received another wound, and was again under the necessity of retiring. Faint with the fatigue he had undergone, and with the loss of blood which was still streaming from his wounds, he approached the third time. Mr. King, at this moment informed of what had happened, immediately gave orders to desist from firing. The islander was suffered to carry off the body of his friend; and he was just able to accomplish it, when he fell down, and expired.

The English had eight or ten men, besides their commander, killed. The mangled remains of Captain Cook were sent on board the *Resolution*, now under the command of Captain Clerke, and they were solemnly committed to the deep.

By the 22d of February, a perfect reconciliation had taken place. Many of the chiefs came on board, and expressed their sincere grief for what had happened—others sent presents; and, when the vessels were unmooring and preparing to depart, several of the natives took their leave in a very affectionate manner.

About twenty leagues from Karakakooa Bay, in the direction of north-north-east, Captain Clerke passed a small uninhabited island, called Tawrooa. He again touched at Mowee, where the intelligence of what had taken place at Owhyhee had already reached. The natives, however, discovered no symptom of resentment. Ranai, another of the Sandwich groupe, was descried on the 25th, and the following day, Morotoi. Captain Clerke landed on neither of these, but shaped his course to Woahoo, which he reached on the 27th.

Next day he bore away for Atooi, and in the afternoon cast anchor in the old station. Several canoes came to the ships. It was evident; however, from the countenances of the natives, as well as their subsequent conduct, that they could have dispensed with this second visit of the English; and not without reason: for, notwithstanding all the precautions which Captain Cook had taken to prevent it, these friendly islanders were contaminated with the venereal disease, of which great numbers had already died. The humane mind will not be surprised at the contemptuous treatment the English now received from the natives; and had not the former prudently exercised that forbearance which the fatal events at Owhyhee had shown to be necessary, matters might here also have taken a very serious turn. The people demanded a hatchet for every ton of water of which the vessels stood in need, and imposed contributions upon the English officers who came ashore: from the critical situation of affairs, these demands were necessarily complied with. Had it not been for the fortunate arrival of the chiefs, who had for some time been absent from Atooi when the English landed, it is probable that the necessary supplies of water and provisions would not have

26.

VOL. I.

been procured. The king, however, and some other chiefs, came on board, and apologized for the conduct of the people, who after this gave the English no further trouble. Captain Clerke left Atooi in the middle of March; and, after searching in vain for an island named Modoo-pappapa, which he had been informed lay to the south-west, he bade a final adieu to these islands on the 17th of March, 1779.

In May, 1785, the Sandwich Islands, were again visited by the unfortunate La Perouse, who seems to have possessed the talents, as he was doomed to be heir to the fate of his illustrious archetype. He was only sixteen days upon these coasts, fourteen of which were spent in ascertaining their identity with the islands visited by the Spaniard, Gaetand, in 1542. It was certainly of importance to geography, to remove from our maps six or seven islands which have no real existence; and the most patient labour, accurate calculation, and nautical skill, were displayed, before he drew the conclusion.

Mowee was the only island of the cluster this navigator touched at. It was one of those upon which Captain Cook, during the four months he spent in these parts, had not landed, and he coasted it, too, in a direction his precursor had not taken. He had thus an opportunity of describing the whole of the southern coast, and of detecting the inaccurate representation given of it in Cook's chart; but to its correctness in those parts which Cook himself had an opportunity of surveying, he gives decided testimony.

In coasting, as we have said, the south-east side of Mowee, La Perouse observed, about eight leagues to the westward, a small island; but he was at too great a distance to discover whether it was inhabited; and he did not deviate from his track in order to ascertain it.

Having doubled the southern point of Mowee, the French vessels stood north-north-west, and found anchorage in twenty-three fathoms of water, about a mile from the shore, very imperfectly sheltered from the winds, which were constantly shifting. On this account they were next morning under the necessity of removing a little farther northward, and cast anchor in a very deep bay; but it proved little superior to their former station.

On the landing of the French, the Indians flocked around their visitors, with hogs, potatoes, bananas, &c. which they bartered for iron, the chief object of their desire. They had acquired, since Captain Cook's time, considerable knowledge of exchange, which they evinced by never bringing into the market a large quantity of any of their commodities at one time, and by their demanding a distinct price for every article. However they maintained, in these dealings, the strictest honesty, and a high degree of confidence in their visitors.

The intelligence respecting the north-west coast of

4 F

America, which the voyages of Cook had given to Europe, quickly attracted the attention of the mercantile world, and a new emporium of a lucrative branch of commerce excited the rivalry of Spain, Britain, and America. The trade in furs was formerly confined to the British and the Russians; the great market for both, but especially for the latter, was China. It was an object worthy the consideration of the British government, to endeavour to undersell their rivals; and to supply themselves with the vast quantities of teas, which they were annually obliged to order from China, by giving in exchange this commodity, instead of gold and silver. It became necessary, therefore, to procure from Nootka large supplies of that article, which they formerly imported in very small quantities from Hudson's Bay and Canada.

A company of opulent merchants in London being incorporated by royal charter, and invested with the exclusive privilege of trading to Nootka, they fitted out, in the year 1785, two vessels of large burden, and placed them under the command of Captains Portlock and Dixon. To these gentlemen, and to others in the same trade, we are indebted for a variety of facts, respecting the islands now under consideration. Their geographical situation, the friendly disposition of the natives, and the necessary supplies with which they abound, render them an indispensable point of rendezvous to all vessels in their passage through the Pacific Ocean to the fur coast. Captain Vancouver, who sailed from Britain in 1790, besides the settlement of the differences which had arisen with Spain, respecting the right of possession to the north-west territory of America, had it also in charge from the British government, to make a new examination and survey of the Sandwich Islands. For an enterprise of this kind he was naturally well qualified; but he had also the advantage of having formerly traversed the Southern Ocean, in company with the illustrious Cook. As the voyage of Vancouver was a professed voyage of discovery, science had more to expect from the result of his labours, than the mere transient observations of a commercial enterprise; and the expectation was gratified.

Vancouver, in the course of this voyage, made three visits to the Sandwich Islands; during the last of which, the English commander had, by his affability and kindness, so far ingratiated himself into the esteem of the chiefs, that Tamaahuaaha, the sovereign, offered to surrender the island of Owhyhee to Vancouver, in the name of the king of Britain, and the offer was accepted. The main object of the Owhyheans in this cession seems to have been the securing of the English as an ally against their enemies, whether of the neighbouring isles, or of any other country. It appears that, since the commencement of the trade for furs on the American coast, various foreign vessels had landed on these islands, by some of which the

natives had been maltreated. And it would seem to be necessary, now that the Sandwich Islands are daily becoming of more consequence, that they should be under the protection of some maritime power, to secure them from the mischiefs which may be introduced among them, by the conduct of different mercantile adventurers.

*Situation, Climate, Soil, &c.* The Sandwich Islands lie at about an equal distance to the north, with the Society Islands on the opposite side of the Equator. The groupe stretches in a line from the south-east to the north-west, between two hundred and two hundred and three degrees of east longitude, and between nineteen and twenty-one degrees of north latitude. They consist of twelve islands, called, by the natives, *Owhyhee, Mowee, Woahoo, Atooi, Morotoi, Ranai, Oneehou, Oreehou, Tahourawa, Morotinne, Modoopapapa, and Tahooru*; all of which are inhabited, except the last four.

OWHYHEE is the most easterly, and, in point of extent and population, it is the most considerable of the whole. Its circumference is about two hundred and ninety-three English miles; its greatest breadth, from the west side to the most easterly point, is twenty-four leagues; and its extreme length, from north to south, twenty-eight and a half. Its form is that of a triangle nearly equilateral, the angles of which are its northern, eastern, and southern, extremities.

The whole island is divided by the natives into six districts, viz. *Amakooa* and *Aheedoo*, which comprehend the country from the northern to the eastern point; *Kaoa* and *Apoona*, stretching from the east to the south; and *Akama* and *Koarra*, which comprise all the territory on the west side of the island.

Of the interior of the country, little is known. At Owhyhee, as in other islands, where the want of cattle supersedes the necessity of pasture lands, and where the inhabitants are impelled towards the ocean for a principal means of subsistence, it is only near the sea-coast that we must look for the settlements of the natives; and these extend little farther than six or eight miles from the shore.

The only circumstance known with certainty respecting the interior, is the existence of two very high mountains, one situated in the northern, and the other in the southern part of the island.

That in the northern division is called *Mouna Kaah*, and may be seen at the distance of forty leagues from the shore, rising into three peaks, which are perpetually covered with snow: it is very steep, and the bottom of it is clothed with wood. The altitude of its summit is about eighteen thousand four hundred feet, an elevation considerably greater than the Peak of Teneriffe.

*Mouna Kaah* is higher by two thousand three hundred and eighty feet than that situated to the southward of it

about twenty miles, called *Mouna Roa*; or the extensive mountain. The summit of the latter, which is flat, is also perpetually involved in snow. The intense cold of the atmosphere, occasioned, no doubt, by the winds blowing from off these mountains, is so great, that a party of the English, who attempted to penetrate into the country as far as *Mouna Roa*, with a view to explore it, were obliged to desist from the enterprise, after having got within fourteen miles of the object of their journey. This may be another reason, added to those already mentioned, why the native settlements extend so short a distance from the coast.

From the aspect of the country to the southward, it is evident that *Mouha Roa* must, at some period, have been a volcano. The whole district of *Kaoo* exhibits a most dismal and dreary prospect. It is totally covered with cinders, and, in many places, intersected with blackish streaks, which seem to mark the progress of a lava from the mountain to the sea; and the southern promontory appears like the mere dregs of a volcano. For sixteen or eighteen miles to the eastward of it, the ground, which is split into deep fissures, is covered with loose burnt stones, that break under the feet.

The district of *Apoona* is by far the most beautiful part of the island. Towards the north-east, the coast is rather low and flat, and, in the inland part, the acclivity is gradual, and the country abounds with bread-fruit and cocoa-nuts: but the hills to the south-west rise with more abruptness from the sea. The sides of these hills are covered with verdure. But, notwithstanding the natural beauty which characterises this district, the adjacent country is thinly inhabited: for, owing to the heavy surf which sets in upon the shores of *Apoona*, the district is not conveniently situated for fishing; and the natives, from necessity, prefer the dreary region of *Kaoo*, which is better adapted for this purpose, as well as for the cultivation of plantains. Amidst the volcanic ruins of *Kaoo* are many spots of fertile soil, which the inhabitants have laid out in plantations to great advantage; and the neighbouring seas abound with a variety of excellent fish. On this account, the district of *Kaoo* contains more villages, and a larger population, than the beautiful mountains of *Apoona*.

Those parts of the district of *Akoma*, which lie to the south-west, and border on *Kaoo*, lie about an equal distance from *Mouna Roa*, and are in their bleak appearance much the same with *Kaoo*. Along the coasts scarcely any thing is seen but fragments of black scorched rocks, behind which the ground rises gradually for the space of twenty-two miles. The whole district seems to have been once entirely covered with loose burnt stones; but, towards the north, the industry of the natives has cleared the soil frequently to the depth of three or four feet, and its fer-

tility has amply rewarded their labour. Cloth-plants and potatoes are here produced in abundance. Groves of cocoa-nuts are scattered among the fields, and beyond these, upon the higher grounds, the bread-fruit flourishes with amazing luxuriance. This part of the district has been cultivated to the highest pitch of perfection, and is the most populous part of the whole island. To this, no doubt, the advantages which the district derives from the beautiful bay of *Karakakooa*, the only safe harbour which the island possesses, has contributed. This bay extends about a mile in depth. At the head of it stands the village of *Kakooa*, and, at its entrance, upon the north, that of *Kowroa*.

The district of *Koarra*, which extends from the most westerly point to the northern extremity of the island, lies immediately to the north of *Akooma*. The whole of its shore forms itself into an extensive bay, and two hills bound it on the north. The country appears fertile, and tolerably populous; but no fresh water is to be found near the bay. The soil is nearly similar to that of *Kaoo*.

The two districts that remain to be noticed are *Ama-kooa* and *Aheedoo*. The former joins itself to the northern point of *Koarra*, and the latter stretches to *Apoona*, on the south. These two districts are separated by *Mount Kaah*. To the northward of this mountain, the coast is composed of lofty and abrupt cliffs, and rendered highly picturesque by many beautiful cascades. The country rises gently to the bottom of *Mount Kaah*, and is intersected by narrow and deep chasms. It is populous and well cultivated. The coast of *Aheedoo* is moderately elevated, and the interior of this district is more level in its nature than the country to the north-west of it.

*MOWEE* is next in size to *Owhyhee*, from which it is situated about eight leagues to the north-north-west. It is one hundred and forty miles in circumference. A low isthmus divides it into two peninsulas, of which that to the west is twice as large as that to the eastward. The former of these is named *Whamadooa*; the latter, *Owhy-rookoo*. The northern shores have the same aspect of fertility and verdure as those of *Owhyhee*, and, like them also, they afford no soundings. To the southward of the eastern point, the sea forms an extensive bay, where vessels may anchor. The natives told *Captain Cook*, that there was upon this coast a harbour superior to that of *Karakakooa*. They, perhaps, meant, that it was superior in size, as *La Prouse*, who carefully examined these shores, could find no other anchorage than the above bay, and this was none of the best. The shores from the eastern to the southern point form nearly a line, and the country upon this coast, particularly to the eastward, is the most beautiful part of the island. The torrents rush in cataracts from the lofty summits of the mountains, and discharge themselves into the sea, watering in their course

the habitations of the natives, which are so numerous, that a space of three or four leagues seems to form only one village. The houses are all situated by the sea-side, and the mountains run so close upon them, that the habitable skirt seems to be no more than half a league in breadth. Most of the habitations are surrounded with banana-trees, and the hills are covered with a charming verdure. Approaching the south point, the scene becomes less interesting, the hills retire inwards, the population diminishes, and the villages are very small; and, towards the north-west, the eye beholds nothing but a frightful shore, from which lava formerly rolled, like the cascades that now fall from the precipices in the eastern part. In both divisions of the island, the mountains rise, almost perpendicularly, to a very great height, and may be seen at the distance of thirty leagues, exhibiting a variety of peaked forms. Their sides, as well as the deep chasms which divide them, are prettily feathered with bananas and bread-fruit trees; but their summits are perfectly bare, and of a reddish brown hue.

The soil of the country is wholly composed of lava and other volcanic matter. The water is bad, and to be had only from small wells, which do not afford to the inhabitants more than half a hogshcad each day. Inland from the bay, on the south-west coast, are three or four villages, the houses of which are built of straw, not unlike those of the lowest class of English peasants—the roofs in the form of a pent-house. The door is placed at the gable end, and admits of no entrance without stooping.

RANAI is situated to the south-west of the passage between Mowee and Morotoi, about nine miles distant from both. Towards the south, the country appears elevated and craggy; but the rest of the island has a better appearance, and its population is considerable. Edible roots, such as yams, taro, and potatoes, grow here in abundance; but plantains and bread-fruit trees are very scarce.

In the direction of west-north-west from Mowee, and distant from it about seven miles, lies MOROTOI, which appears to be destitute of wood. Its south-western coast is very low; but the land behind is considerably elevated. On the south and west the coast contains several bays, which afford shelter from the trade-winds.

TANDOROWA is situated off the south-western part of Mowee, from which it is distant about nine miles. It is a small island, destitute of wood, of a sandy and sterile soil.

Between this and Mowee stands the little isle of Morotinee, which has no inhabitants.

WOAHOO lies about seven leagues, in a north-westerly direction, from Morotoi. The Bay of Whyteete, on the west side of the island, affords very good anchorage, and is, perhaps, the most secure of any of the Sandwich Islands. The shores on this side are populous and well

cultivated. The villages are numerous; and the surrounding country is interspersed with pleasing valleys. A well formed cauey, about eight feet wide, lined by a ditch on each side, runs northward from the village of Whyteete, and opens an easy communication with the numerous plantations of the Indians. They are finely laid out in small enclosures, planted with taro, between which and the mountains a spacious plain intervenes, somewhat similar to a large English common. The sides of the hills are rocky and barren, but the intermediate valleys are inhabited, and well cultivated. By a large aqueduct from the mountains, the enclosures can be inundated at pleasure, in order to hasten the growth of the taro. The dykes are raised several feet above the ground, to serve as roads in time of an inundation. The soil is very good, and the land richly cultivated. Though not so fertile as that of Otaheite or Tongataboo, where the luxuriant crops are reaped with less labour, it is, upon the whole, a very delightful island, and one of the most beautiful of the Sandwich groupe.

Its eastern shores, like those of Ranai, consist of rocky and high precipices. Its northern point is a remarkable promontory, the top of which resembles a volcanic crater. There is another nearly similar on the southern part of the island. The coast to the northward consists of detached hills, which ascend perpendicularly from the sea, the sides of them are covered with wood, and the intermediate valleys are fertile and well cultivated.

ATOOI, though only thirty miles in length, is, perhaps, of more importance to Europeans than any other part of this archipelago, as it is capable of affording to navigators a more plentiful supply of provisions and fresh water than others of larger extent. Excepting the coast to the north-east and north-west, a beautiful variegation of hill and dale delights the eye in every direction. Agriculture is here in the highest perfection, and the soil amply remunerates the easy labours of the husbandman.

In the interior, the mountains are very high; but their descent towards the shore is gradual, and they are susceptible of cultivation to their very summits. Towards the bottom they are clothed with wood. The ground, from the woody part to the sea, is covered with fine grass, about two feet high, sometimes growing in tufts, and which might be easily converted into fine hay. The soil, in the low grounds, is of a loose darkish brown; but, on the high grounds, it is more red, stiff, and clayey. The valleys produce taro larger than that of the other islands of the Pacific; the more elevated ground furnishes sweet potatoes, of from ten to fourteen pounds weight. In the low grounds, the plantations are regularly divided by deep ditches, the fences are formed with considerable neatness, and the roads through them are such as would not disgrace the skill of an European.

So piercing is it was common have a regular eb at Atotoi, and the tide is barely dis 26. VOL. I

In a valley to the north of the village of Wymoa, there is a piece of wicker-work, in the form of a pedestal; about twenty feet high, very curiously wrought. It is placed in the middle of a morai, which resembles those of Otaheitee and other islands.

Wymoa Bay lies on the south-west side of the island. Although not fully sheltered from the trade-winds, it affords, otherwise, good anchorage.

About sixty-one miles from the north-east point of Atooi, Vancouver observed a small islet, uninhabited.

ONEEHEOW is the most westerly of this archipelago, if we except the small isle Tahoorā. It is about six leagues west of Atooi. Its eastern coast rises abruptly from the sea, and is pretty high: the other parts of the island are generally low. Its chief produce is yams, and a sweet root, called *tee*. The only anchorage-place it possesses is situated in twenty-one degrees fifty minutes north latitude, and one hundred and ninety-nine degrees forty-five minutes east longitude.

OREEHOUA and TAHOORA are two small islands, in the neighbourhood of Oneeheow. The first of these is wholly composed of one naked rock, to all appearance destitute of soil, and without inhabitants. It lies close upon Oneeheow, to the north. The other lies to the south-east of it, at some small distance, and is also uninhabited.

The Sandwich Islands, though situated in the same latitude with some of those in the West-Indies, which are visited by earthquakes and hurricanes, appear to be free from these dreadful convulsions of nature. The winds blow here generally from the points between the north-east and south-east; and from these the villages of the Indians, which in all the islands are commonly situated to the windward, are protected by the mountains, which occupy a large portion of the interior country. The atmosphere all around the coast is warm and serene, and forms a complete contrast with that of the high land of the interior, where clouds and rain alternately embosom the hills, above which are seen the high summits of Kaah and Roa, perpetually enveloped in a mantle of snow. The contrast in this respect is not greater than the sudden transition from heat to cold so frequently experienced at Owhyhee, in a difference of situation not more than ten or twelve miles.

So piercing is the atmosphere for fifteen or twenty miles around Mount Roa, that an English party, were totally deprived of sleep for some nights, although only twelve miles distant from the bay, where the mean height of the thermometer at noon was eighty-three degrees. In Wymoa Bay it was commonly about seventy-six. At Owhyhee they have a regular ebb and flow of the tide every six hours; but at Atooi, and the other islands to the north-west, a regular tide is barely discernible. The currents preserve no re-

gularity in their courses, setting sometimes to windward, and sometimes to leeward, without appearing to be directed in any measure by the winds.

*Animals, Vegetables, &c.]* The Sandwich Islands are not infested by any beast of prey. Their quadrupeds are confined to three sorts; namely, hogs, dogs, and rats. The dogs are of the same species, though not so numerous, as those at Otaheitee. Their domestic qualities are here unknown, and will probably remain so, as the islands contain no objects of chance: they seem to be kept merely for the table; and, on this account, are turned out to feed and herd with the hogs. The last of these are of a larger breed than those of the Society Isles, and so numerous, that Owhyhee alone afforded to Captain Cook's frigates about one hundred and twenty puncheons, of five hundred weight each, without seeming in the least exhausted. Birds, though not in great variety, are seen in vast numbers, and some of them remarkably beautiful: among these are four species, that seem to belong to the trochili, or honey-suckers, of Linnæus. One of them, called by the natives *hoo-hoo*, is of a glossy black, and a little larger than a bullfinch; and a second, named *ceeece*, is of a bright scarlet, with black wings, white on the edges; another is variegated with brown, yellow, and red; the fourth is entirely green, with a yellow tinge, and is called *akaiearooa*. Thrushes, parrots, ravens, common water hens, and large white pigeons, besides curlews, petrels, plovers, and owls, are also inhabitants of this groupe.

The vegetable productions of the Sandwich Islands are much the same with others of the Pacific Ocean. Bread-fruit trees are not found here in the same abundance as at Otaheitee, but they yield a double produce; and the taro-root is superior to any found in the South Seas. Large brown roots, the juice of which is an excellent succedaneum for sugar, and which the natives use as a common article of food, are found at Oneeheow. These seem to be indigenous to the Sandwich groupe. The sugar-canes grow to an uncommon size. One of them was seen at Atooi, which had fourteen feet eatable, and was eleven inches and a quarter in circumference.

*Buildings, &c.]* The houses or huts, in which the Sandwich islanders reside, are of various dimensions, from forty-five feet long and eighteen feet broad to twenty-four feet long and two feet broad. They are thatched, on the outside, with straw, and their appearance and shape differ very little from that of English hay-stacks; but they are not so high on the sides for support of the roof. The doors are necessarily low, and are placed either in the gable end or sides of the hut. In most of the islands, some houses are built for the accommodation of strangers or travellers, which are about fifty feet in length by thirty in breadth. Some of the best habitations have a courtyard before them, very neatly railed in, and, around this,

small habitations are erected for the servants. In this area the family usually eat and sit in the day-time.

The inside of their abodes are kept remarkably clean, and the floor is usually strewn with dried grass, over which is thrown a mat, on which the inmates both sit and sleep. At one end is placed a bench, for the purpose of holding the household utensils, which consist of gourd-shells, wooden bowls, and trenchers of various sizes. The shells are used as bottles for holding water, and as baskets to contain various small articles.

In the sides of the rocks, in various places, are dug large caves, which seem to be inhabited. These fastnesses are meant as places of retreat, in case of invasion or otherwise. They are defended in front by strong wicker-work, and still more effectually secured within by a wall, placed near the opening.

Huts of this kind, built without any regularity, to the number of one and sometimes two hundred, compose a village. The houses are placed close to each other, but so disposed as to allow a winding path to extend through the middle of the village. Loose detached walls, intended for shelter and defence, flank them generally on the side that lies next the sea.

*Arts, Manufactures, &c.*] In the construction of their canoes, the inhabitants of the Sandwich Islands display much neatness and ingenuity. They are made of a single tree, and are from twelve to forty or fifty feet long. The hollowing of the trees, and bringing each end to a proper point, with rude unfashioned tools, must be a work of time and unremitting attention: they are, in general, about an inch thick, and heightened with additional boards, neatly fitted round the sides. The single canoes are steadied by an outrigger, and the double ones are held together by semicircular poles, firmly lashed to each part of the canoe: over these, and parallel with the canoe, is a kind of platform, which serves to carry hogs, vegetables, or any thing they want to convey from one place to another, and, at the same time, is a convenient seat for the principal persons of both sexes, whilst the tow-tows, who paddle, always sit in the body of the canoe. Their paddles are about four or five feet long, and bear some resemblance to a baker's peel.

The natural ingenuity of these people is in nothing more evident than in the manufacture of their cloth. Its excellence is certainly adequate to the means and advantages which they possess, and the staining or painting of it does honour to the taste of the females, to whom this branch is entrusted. It is made of the *morus papyrifera*: the first stage of the process is the same as at the Society Islands. That which they intend to paint is of a strong and thick texture, several folds being beaten and incorporated together; after which they cut it in breadths, two or three feet wide, and then paint it in a great variety of patterns,

with such regularity and comprehensiveness of design, as evinces an extraordinary portion of taste and ingenuity. The exactness with which the most intricate patterns are continued is really astonishing, as they have no stamps, and the whole is performed with a piece of bamboo-cane, dipped in paint; the hand being supported by another piece of the same sort of cane. They extract their colours from the same sort of berries, and other vegetable articles, which are used at Otaheitee for this purpose. The operation of staining or painting their cloth is denominated *kipparee*; which term is also used in speaking of European writing. The young women, it is said, would frequently take the pen from the hand of their English visitors, telling them that they were better acquainted with the use of it than themselves, and that our pens were inferior to theirs. They considered a sheet of paper, which had been written on, as a piece of cloth striped after the English manner; and it was with difficulty they could understand, that our figures contained a meaning, of which their's were destitute.

Their mats, which are commonly the workmanship of the erees, are made of the leaves of plantains; and these, as well as their cloths, are beautifully wrought in various patterns, and stained with divers colours. Some of them have a ground of straw-colour, embellished with green spots; others are of a pale green, spotted with squares or rhomboids of red; and some are ornamented with elegant stripes, either in straight or waved lines of red and brown. In this branch of manufacture, whether we regard the fineness, beauty, or strength, these islanders may be said to excel most civilized nations.

The neatness, as well as the strength, of their fish hooks, considering the materials of which they are made, is amazing; and they answer their purpose better than those in use among Europeans. They are formed of bone, or mother-of-pearl, shaped like a fish, and serve for both hook and bait. Those intended for catching the shark are made of wood, larger by four inches than those commonly used for taking small fish. Of the bark of the cloth-tree they form the lines which they use for fishing, for making nets, and for some other purposes. They are of different degrees of fineness, and may be continued to any length. They have also a sort made of the bark of a shrub named *areemah*; and the finest is composed of human hair: this last, however, is principally used in the way of ornament. They likewise make cordage of a stronger kind, from cocoa-nut fibres, for the out-rigging of their canoes.

The warlike weapons of these islanders are daggers, which they call by the name of *pahooa*, spears, slings, and clubs. The *pahooa* is made of a black heavy wood, that resembles ebony: it is commonly from one to two feet in length, and has a string passing through the handle, by

which it is usually rounder than a peg, and is used in a particular manner in the process of the daggers; and is destructive of hair, and is formed of hair, and is what like mat, and is in length, well known from the seven inches from the five or six, and are used in the which the war are from twelve being barbed, of the daggers. ones, except in marring, instead of indifferently of and of rude work.

one to two feet in  
gh the handle, by

which it is suspended from the arm. The blade is some-  
what rounded in the middle; the sides are sharp, and ter-  
minate in a point. This weapon is intended for close en-  
gagements; and, in the hands of the natives, it is a very  
destructive one. Their spears are of two kinds, and are  
formed of hard wood, which, in its appearance, is some-  
what like mahogany. One sort is from six to eight feet  
in length, well polished, and increasing gradually in thick-  
ness from the extremity till within the distance of six or  
seven inches from the point, which tapers suddenly, and  
has five or six rows of barbs. It is probable, that these  
are used in the way of javelins. The other sort, with  
which the warriors at Atooi and Owhyhee are chiefly armed,  
are from twelve to fifteen feet in length, and, instead of  
being barbed, terminate towards the point, in the manner  
of the daggers. Their slings are the same with European  
ones, except in this respect, that the stone is lodged on  
matting, instead of leather. Their clubs, which are formed  
indifferently of several kinds of wood, are of various sizes,  
and of rude workmanship.

The method universally practised to dress their victuals  
is baking, which is done in the following manner: a hole  
is dug in the ground, sufficiently deep to answer the pur-  
pose of an oven, at the bottom of which a number of hot  
stones are laid: these being covered with leaves, whatever  
they want dressed is laid on them; more leaves are then  
laid on, and another layer of hot stones being added, the  
oven is covered. If a hog is baked, the belly is filled  
with hot stones. Custom has rendered this mode of dress-  
ing victuals so very familiar, that they can tell the exact  
time when any thing is sufficiently done; and it must be  
owned, that, in baking their taro or yams, they far excel  
us; they also dress the young tops of taro so us to be  
an excellent substitute for greens, though their English  
visitors never could boil them to their own satisfaction.

The ingenuity of man naturally guides him, in every  
climate, to the supply of his natural wants; and invention  
is not less displayed in the calabash of the Sandwich  
Islands, than in the more elegant utensils of polished na-  
tions. The ground, it is true, every where furnishes the  
raw materials of earthen-ware; but, without the furnace,  
how shall it be calcined?—and where iron is not to be  
had, it is plain that ingenuity could not discover the pro-  
cess. Nature, however, has given to the South Seas  
islands of such enormous magnitude, that some of them  
will contain twelve gallons. In order to adapt them the  
better to their respective purposes, the natives give them  
different shapes, by means of bandages, fastened around  
them during their growth. Thus some of them, in the  
form of a dish, serve to hold puddings, vegetables, and  
salted provisions; others, of a cylindrical form, contain  
their fishing-tackle; and others, resembling a long-necked  
bottle, contain water. They have the appearance of being

painted with a variety of elegant designs, by being singed  
with a heated instrument.

The pans in which they make their salt are formed of  
earth, lined with clay: they are commonly about six or eight  
feet square, and two-thirds of a foot deep. They are ele-  
vated on a bank of stones near the high-water mark,  
whence the salt-water is conducted to the bottom of them  
in trenches, out of which they are filled, and in a short  
time the sun performs the process of evaporation. The  
salt obtained at Karakakooa is the best, and is also pro-  
cured in great quantities.

In the art of sculpture these islanders have made con-  
siderable proficiency. The bowls out of which the crees  
drink their yava are formed of wood, and finely polished.  
These are in general eight or ten inches in diameter, and  
perfectly round. They are supported by three or four  
small human figures, represented in different attitudes,  
very neatly finished, and accurately proportioned; even the  
anatomy of the muscles is well expressed.

Their knives are of different kinds. Those used in  
killing and dressing hogs are made of sharks' teeth. They  
seem to answer the purpose very well; and are handled  
by the natives with equal dexterity and dispatch.

Both sexes make use of fans and fly-flaps, of very  
curious workmanship. The former are usually made of  
cocoa-nut fibres, neatly woven; the mounting is of a square  
form, the handle frequently decorated with hair. The  
handle of the fly-flap is ornamented with an alternate  
mixture of wood and bone; the upper part, or, more  
properly, the fan itself, is composed of the feathers of  
the man-of-war bird.

*Customs, Manners, &c.]* The Sandwich islanders are in  
their persons rather taller than Europeans. Their physi-  
ognomy is not marked with any of that fierceness which  
characterizes the savages of Maouna, and which we are  
apt to ascribe to uncivilized tribes in general. Their eyes,  
on the contrary, are expressive of sweetness and sensi-  
bility, in a greater degree than that of any other Indians  
of the Pacific Ocean, if we except those of the Pelew  
Isles. Their complexion is somewhat darker than that of  
the Otaheiteans. Their dark brown hair is not inclined  
uniformly to curl, like that of the African, nor is it,  
like that of the American, uniformly straight, but varies,  
in these respects, like our own. They walk in an up-  
right graceful manner, are capable of undergoing much  
fatigue, and run with great agility. But, upon the whole,  
they are not quite so handsome as the natives of the So-  
ciety Islands. Like them, the crees of this groupe are  
superior in person to the common people; but the im-  
moderate use of the yava frequently debilitates their chiefs;  
covers them with a white leprous scurf, and paralyzes their  
limbs, producing, at the same time, an uncouth redness  
of the eyes, and a disability to raise the head erect. The

towtows, or common people, are free from these calamities, being prohibited the use of this pernicious drug; but they are subject to scorbutic eruptions, which may probably result from their living too much upon salt provisions; of which they are so fond. At Atooi, as at the Friendly Islands, the yava is drank diluted with water; and the chiefs of this island are on this account a much finer set of men than those of Owhyhee. The pernicious effects of this root, however, are not so lasting as those of British spirits; for whenever the use of it is left off, even after very long habit, the powers of the body quickly revive, and the skin resumes its pristine colour. The constant use of it does not appear to shorten life, but it invariably occasions a premature and decrepit old age.

In the size and figure, as well as the colour, of both sexes, there is a remarkable conformity. The delicacy of feature that usually distinguishes the female, is here scarcely discernible; and the limbs of the women are not so handsomely formed as those of the Otaheitean females. They are far, however, from being ugly; and they possess a lively open countenance. Both sexes enjoy a frank cheerful disposition, equally remote from the sedate cast of the inhabitants of Tongataboo, and the fickle levity of those of Otaheitee. Husbands are here not the tyrants but the protectors and helpmates of their wives. Maternal tenderness is lively and strong, nor does it exceed the anxious care of the father for his children. That same respect, however, for the female character, which is observed in some of the other islands, and which is undoubtedly a criterion of civilized manners, is not common here; and in general the women live in a detached manner by themselves.

The custom of tattooing or puncturing the body is also common in the Sandwich Islands, but the practice of ornamenting the face in this manner is peculiar to them and to New Zealand. Contrary to the general custom of the southern islands, they do not perforate or wear any ornament in the ear. They adorn their neck, however, with plaitings of small black cord, and sometimes with strings of small shells, or of the dried flowers of the Indian mallow. The men sometimes adorn their heads with the feathers of the tropic bird, or of the cock, fastened round some neatly-polished sticks. Other ornaments for the head are in use, which vary according to the fancy of the wearer; and the same is observed with regard to their mode of wearing or plaiting the hair. They almost universally permit the beard to grow; some, however, wear it on the upper lip only, while a few cut it off entirely.

The common dress of the men of all ranks consists of a piece of thick cloth, called the maro, about a foot in breadth, which passes between the legs, and is fastened round the waist. Their mats, which are, for the most part, about five feet in length, and four in breadth, are thrown

over their shoulders, and brought forward before. These, however, are rarely worn, except in time of war, for which purpose they appear to be better calculated than for common use, as they are of a thick heavy texture, and capable of breaking the blow of a stone, or of any blunt weapon. They generally go bare-footed, except when they travel over burnt stones, when they secure their feet with a sandal, made of cords, twisted from cocoa-nut fibres.

Besides their ordinary dress, there is another, which is appropriated to their chiefs, and worn only on extraordinary occasions. It consists of a feathered cloak and cap, or helmet, of uncommon magnificence. These cloaks are of different lengths, according to the rank of the person who wears them; some trailing on the ground, and others reaching no lower than the middle. The chiefs of inferior rank have likewise a short cloak, which resembles the former, and is made of the tail-feathers of the cock, the man-of-war bird, and the tropic bird, having a broad border of small red and yellow feathers, and also a collar of the same. Others are composed of white feathers, with variegated borders. The cap, or helmet, has a strong lining of wicker-work, sufficient to break the blow of any warlike weapon; for which purpose it is evidently intended. These feathered dresses seem to be very scarce, and to be worn only by the male sex on some remarkable occasion.

In the common dress of the men, and that of the women, there is but little difference. The latter wear a piece of cloth wrapped round the waist, which descends half way down their thighs; and sometimes, during the cool of the evening, they throw loose pieces of fine cloth over their shoulders, like the females of Otaheitee. They have another kind of dress, called the *pan*, which consists of the thinnest and finest cloth, wrapped several times about the middle, and reaching down to the leg; so that it has the appearance of a full short petticoat.

The singular taste of these islanders with regard to ornaments displays itself in various forms. Both men and women wear below the knee, and sometimes upon the arm, a sort of belt, round which are hung rows of shells, that make a tinkling noise when they move. At times the men wear a sort of mask, composed of a large gourd, having holes cut in it for the eyes and the nose, the top of it being stuck full of green twigs, and pieces of cloth depending from the bottom of it in front.

The animal-food of the common people is chiefly fish. The flesh of hogs and dogs, dressed after the manner of the Society Isles, is reserved for the chiefs and people of distinction. Fowls are sometimes used, but they are not held in estimation. The vegetable diet consists of plantains, yams, taro, bread-fruit, sweet potatoes, and sugar-canes. They are fond of salt provisions, and the chiefs consider pickled pork as a great delicacy. They also eat their fish, and preserve them in gourds and large shells.

## SANDWICH

At their meetings, made of dressings, King informs us of the manners among them, or of the extraction of the natives apart from the natives, and some say

These people, being those brought least, is the opinion of them, except these Indians with either from their from the effects of general and more, lieve, as enfeebled, acquaintance with and his observations six or eight hours, particulars wherein he be stated as facts

In the division of the natives of the follow what appear come forth from him, prosecute his labour, manufacture of mats, retire to rest, after an hour or two after have visited them, the day is spent in vain, although they suspecting this people clothing, and the labours must be exacted, and their abundance, respect, perhaps, tions, for it is very ments such nations their happiness, the sweat of the brow, is the necessary aliment of nature; while many of old age at the point to gratify an unnatural want.

ple is chiefly fish- ter the manner of eifs and people of but they are not consists of pla- tatons, and suga- us, and the chiefs y. They also sit and large shells.

At their meals they are remarkably cleanly; and their mode of dressing both animal and vegetable food, Mr. King informs us, is far superior to ours. The higher orders among them begin their meals with a draught of yava, or of the extract of pepper-root. The women, who eat apart from the men, are interdicted from eating pork, turtle, and some species of the plantain.

These people are subject to very few diseases, excepting those brought on by their own imprudence. Such, at least, is the opinion of all modern travellers who have visited them, except La Perouse, who, in his comparison of these Indians with those of Easter Island, represents them, either from their being liable to many other maladies, or from the effects of those we have mentioned, being more general and more fatal than other navigators seem to believe, as enfeebled and greatly emaciated. But his acquaintance with the Sandwich Islands was so transient and his observations upon the whole founded on a call of six or eight hours only, at one of the islands, that the particulars wherein he differs from his fellow-voyagers cannot be stated as facts.

In the division of their time between rest and labour, the natives of the Sandwich Islands, like other Indian tribes, follow what appears to be the design of Nature: they come forth from their cabin at sun-rise,—the tow-tow to prosecute his labours in the field, and the eree to the manufacture of mats, or the construction of his canoe. They retire to rest, after enjoying the cool of the evening, an hour or two after sun-set. None of the Europeans who have visited them seem to have ascertained how much of the day is spent in labour: but it is not difficult to ascertain, although they had given us no other information respecting this people than their simple state with regard to clothing, and the natural fertility of their soil, that their labours must be easy in proportion to the fewness of their wants, and their abundant means of supplying them. In this respect, perhaps, they are happier than more civilized nations, for it is very problematical whether, if the improvements such nations have made in science have increased their happiness, they have increased their leisure. The sweat of the brow, with which the Indian earns his bread, is the necessary aliment of health, and the manly discipline of nature; while more polished nations, in the decrepitude of old age at the prime of life, are wasting their strength to gratify an unnatural appetite, or to supply a factitious want.

It is the common practice among the inhabitants of the Sandwich Islands, to eat their meals without doors, frequently under the shade, and generally alone. They have certain ideas of delicacy in this matter, which are foreign to Europeans; and, at this season, they enjoy none of the pleasures resulting from the conversation of friends. Their friendly and convivial hours are not those of eating and

drinking; and in a state of society like theirs, where a very limited share of knowledge gives them but few topics of conversation, amusement must necessarily fill up the vacuity.

The youth of both sexes are particularly fond of dancing; and, on certain occasions, they entertain themselves with wrestling and boxing matches, performed after the manner of the natives of the Friendly Islands; to whom, however, they are greatly inferior in these respects. Their dances are generally introduced with a solemn kind of song, in which the whole number join, at the same time slowly moving their legs, and striking gently upon their breasts; their attitudes and manner being very easy and graceful. After this has continued about the space of ten minutes, they gradually quicken their motions and tune, and do not desist till completely tired. This part of the performance is the counter-part of that of the inhabitants of New Zealand; and, as among those people, the person whose action is the most violent, and who continues this exercise the longest, is applauded by the spectators as the best dancer. It must be remarked, that, in this dance, women only engage; and the dances of the men resemble those of the small parties at the Friendly Isles; and which may, perhaps, more properly, be termed the accompaniment of songs, with correspondent motions of the whole body. But, as some boxing exhibitions are seen, of the same kind, with those that occur at the Friendly Isles, it is not improbable, that they have here likewise their grand dances, wherein both men and women are performers. Their music, on these and other occasions, is of a rude kind; for the only instruments observed among them, are drums, of various sizes. Their songs, however, which they are said to sing in parts, and which they accompany with a gentle motion of their arms, have a very pleasing effect.

Both sexes are very expert in swimming; an art which, among these people, is deemed necessary, and constitutes their favourite diversion. One particular method, in which they sometimes amuse themselves, is worthy of notice: The surf that breaks on the coast round the bay extends about one hundred and fifty yards from the shore; and, within that space, the surges of the sea are dashed against the beach with great violence. Whenever the impetuosity of the surf is augmented to its greatest height, they make choice of that time for their amusement, which they perform in this manner:—about twenty or thirty of the natives take each a long narrow board, rounded at both ends, and set out in company with each other from the shore. They plunge under the first wave they meet, and, after they have suffered it to roll over them, rise again beyond it, and swim farther out to sea. They encounter the second wave in the same manner with the first. The principal difficulty consists in seizing a favourable opportunity of diving under it; for, if a person miss the proper mo-

ment, he is caught by the surf, and forced back with great violence; and his utmost dexterity is required to prevent his being dashed against the rocks. When, in consequence of these repeated efforts, they have gained the smooth water beyond the surf, they recline themselves at length upon the boards, and prepare for their return to shore. The surf being composed of a number of waves, of which every third is observed to be considerably larger than the rest, and to flow higher upon the shore, while the others break in the intermediate space; their first object is to place themselves upon the top of the largest surge, which drives them along with astonishing rapidity towards the land. If, by mistake, they happen to place themselves on one of the smaller waves, which breaks before they gain the shore, or find themselves unable to keep their board in a proper direction on the upper part of the swell, they remain exposed to the fury of the next; to avoid which they are under the necessity of diving again, and recovering the place whence they set out.

Those who succeed in reaching the shore are still in a dangerous situation; for, as the coast is skirted by a chain of rocks, with a small opening between them in several places, they are obliged to steer their plank through one of these openings; or, in case of ill success in that respect, to quit it before they reach the rocks, and, diving under the wave, nuke their way back again as well as they are able. This is considered as highly disgraceful, and is attended with the loss of the plank, which is frequently dashed to pieces, at the very instant the native quits it. The amazing courage and address with which they perform these dangerous achievements are almost incredible. The following accident evinces at how early a period they are so far accustomed to the water, as to lose all apprehensions of its perils, and even set them at defiance.—A canoe, in which were a woman and her children, happening to overset, one of the children, an infant of about four years old, appeared to be greatly delighted, swimming about at its ease, and playing a number of tricks, till the canoe was brought to its former position. Among the amusements of the children, there is one that is frequently played at, and which shows a considerable share of dexterity. They take a short stick, through one extremity whereof runs a peg, sharpened at both ends, extending about an inch on each side; then throwing up a ball, formed of green leaves, moulded together, and fastened with twine, they catch it on one of the points of the peg; immediately after which, they throw it up again from the peg, then turn the stick round, and catch the ball on the other point. Thus, for some time, they continue catching it on each point of the peg alternately, without missing it. They are also equally expert at another diversion of a similar nature, throwing up in the air, and catching, in their turns, many of these balls; and the

little children thus keep five balls in motion at the same time.

The common method of showing respect to their chiefs is prostration; and a very high degree of deference, amounting to religious adoration, is expressed by throwing over the shoulders a piece of red cloth, the same with which they array their idols, and by presenting an offering of a hog. This ceremony was gone through the first time that Captain Cook landed at Owhyhee. Another very strange piece of homage was offered to the captain at this place, which we will give in the language of Mr. King, who was present. It seems requisite, however, in the first place, to give a brief description of the morai at Karakakooa, where the scene chiefly lay.

This morai consists of a square solid pile of stones, forty yards long, twenty broad, and fourteen feet high. The top of it is flat, and it is surrounded with a wooden railing, whereon are displayed the skulls of those natives who have been sacrificed on the death of their chiefs. A ruinous wooden building is situated in the centre of the area, connected with the railing by a stone-wall, dividing the whole space into two parts. Five poles, about twenty feet high, support an irregular kind of scaffold, on the side next the country; and on that towards the sea are two small houses, with a covered communication.—“To the top of this pile,” says our author, “we were conducted by Koah, one of the priests. At our entrance, we saw two large wooden images, with distorted features, having a long piece of wood, of a conical form, inverted, proceeding from the top of their heads. Here Captain Cook was received by a tall young man, having a long beard, who presented him to the images, and chaunted a kind of hymn, in which he was assisted by Koah. We were then led to that side of the morai where the poles were erected; at the foot of which twelve images were placed, and ranged in the form of a semi-circle; the middle figure having a high table before it, on which we saw a putrid hog; and under it some cocoa-nuts, plantains, potatoes, bread-fruit, and pieces of sugar-cane. Captain Cook was conducted under this stand by Koah; who, having taken down the hog, held it towards him; when, having again addressed him in a long and vehement speech, he suffered it to fall to the ground, and ascended the scaffold with him, though every moment in danger of falling.

“We now beheld, advancing in solemn procession, and entering the top of the morai, ten men, bearing a live hog, and a piece of cloth of considerable dimensions. Advancing a few paces, they stopped, and prostrated themselves; and Kaireekkea, the tall young man already mentioned, approaching them, received the cloth, and carried it to Koah, who wrapped it round the commodore, and made him an offering of the hog. The commodore was now aloft, in a situation truly whimsical, being

swathed in red

respect to their degree of deference, expressed by throwing with, the same with emitting an offering of the first time that another very strange Mr. King, who was in the first place, at Karakakooa, a pile of stones, fourteen feet high, with a wooden of those natives of their chiefs. At the centre of the stone-wall, dividing poles, about twenty scaffold, on the side of the sea are two indication.—“To the we were conducted entrance, we saw features, having arm, inverted, pro Here Captain Cook having a long beard, chanted a kind of h. We were then poles were erected; placed, and ranged little figure having a putrid hog; and potatoes, bread-fruit, ok was conducted ing taken down the again addressed suffered it to fall with him, though

solemn procession, ten men, bearing considerable dinner-stopped, and pro the tall young man received the cloth, it round the com- the hog. The com- y whimsical, being

swathed in red cloth, and hardly able to keep his hold on the rotten scaffolding. In this situation he was entertained with the chaunting of Koah and Kaireekoa, sometimes alternately, and sometimes in concert. After this service was performed, Koah let the hog drop; upon which he immediately descended with Captain Cook. He then conducted him to the images just mentioned, to each of which he expressed himself in a sneering tone, and snapped his fingers at them as he passed. He then presented him to that in the centre, which, from its being habited in red cloth, appeared to be held in the highest estimation. Before this Koah fell prostrate, and requested of Captain Cook to do the same, which he readily submitted to, being determined to follow Koah's directions throughout the whole of a ridiculous ceremony, in which his curiosity and vanity were equally gratified. We were now conveyed into the other division of the morai, where a space of about twelve feet square was sunk three feet below the level of the area. When we had descended into this, the commodore was seated immediately between the two idols, one of his arms being supported by Koah, and the other by Mr. King. A second procession of natives at this time arrived, with a baked hog, a pudding, some cocoa-nuts, bread-fruit, and other vegetables. As they drew near, Kaireekoa placed himself before them, and presented the hog to the commodore in the usual manner, chaunting as before, and his companions making regular responses; but we observed their speeches and responses grew gradually shorter; and, towards the conclusion, Kaireekoa's did not exceed three or four words, which was answered by the word *orono*. This was a common appellation among the natives, sometimes applied to an invisible being inhabiting heaven; at others used as a title of high rank in the island. At the conclusion of this offering, the natives seated themselves opposite to us, and began to cut up the baked hog, to break the cocoa-nuts, and to peel the vegetables. Others were employed in chewing the yava, and making the liquor, in the same manner as it is extracted at the Friendly Isles. Kaireekoa then chewed part of the kernel of a cocoa-nut, and wrapped it in a piece of cloth, with which he rubbed the captain's head, face, hands, arms, and shoulders. The yava was afterwards handed round; and, when we had all tasted it, Koah and Pareea pulled the flesh of the hog in pieces, and proceeded to put some of it in our mouths. Mr. King had no particular objection to being fed by Pareea, who was remarkably cleanly in his person; but Captain Cook, to whom a piece was presented, could not swallow a morsel, the putrid hog being strong in his recollection; and as the old man, from motives of civility, had chewed it for him, his reluctance was much increased. This ceremony being concluded, we quitted the morai, after distributing among the populace some pieces of iron

and other articles, with which they were much delighted. We were then conducted, in procession, to the boats, the men with wands attending, and pronouncing sentences as before. We returned on board full of the idea of what we had seen, and perfectly satisfied with the honest dispositions of our new friends.”

That the religious system of these people has the same origin with that of the inhabitants of the Society and Friendly Islands is clearly evident; for their morais and whattas, their hymns and orations, their priests, oblations, and ceremonies, are all the same. The worship of birds, which obtains in different degrees in all the islands of the Pacific, is here chiefly appropriated to the raven. Two of these, which to appearance had been tamed, were seen by Mr. Banks. The Indians told him to be cautious of touching them, as they were eatooas; and though he could have bought all their whattas, or idols, for two or three nails a piece, these ravens they would not part with at any price. The crude notions respecting the Creator, which prevail in the Otahitean creed, are not more definite in that of Owhyhee. His residence must be limited to a certain place; and, after the arrival of Captain Cook at these islands, the inhabitants conceived such a notion of the superior power of the English, that they were of opinion the great Eatooa had his abode in *Pretané*, the name they give to our island. They bestowed on the commodore the name of *orono*, the common title of their high-priest, which implies a character somewhat similar to that ascribed by Roman Catholics to their pontiff, the supposed vicegerent of the Almighty.

Although the same religious system is common to the Society, the Friendly, and the Sandwich tribes, it is only at Owhyhee that its ministers are formed into a regular society, and reside in dwellings appropriated to their order. The chief priesthood is hereditary. The family in whom it is vested is commonly allied to the blood royal; and the incumbent, as well as heir to the office, receives honours not inferior to those given to the monarch.

It is doubtless owing to the more general influence and superior power of the order, that the rites and ceremonies of this people are more numerous than in the islands above mentioned. So extensive is the field which occupies the attention of the priest, that it seems impossible to draw a line of distinction between their religious and civil usages.

Among their religious ceremonies may be classed the prayers and offerings made by the priests before their meals. As they always drink yava before they begin a repast; while that is chewing, the superior in rank begins a sort of hymn, in which he is soon after joined by one or more of the company; the bodies of the others are put in motion, and their hands are clapped together in concert with the fingers. The yava being ready, cups of

it are presented to those who do not join in the hymn, and are held in their hands till it is concluded; when, with united voice, they make a loud response, and drink their yava. The performers are then served with some of it, which they drink; after the same ceremony has been repeated. And if any person of a superior rank be present, a cup is presented to him last of all; who having chaunted for a short time, and hearing a response from others, he pours a small quantity on the ground, and drinks the rest. A piece of the flesh, which has been dressed, is then cut off, and, together with some of the vegetables, is placed near the figure of the eatooa; and, after another hymn has been chaunted, the devotees begin their meal. A ceremony, in many respects resembling this, is also performed by the chiefs, when they drink yava before their regular meals.

It does not seem to have been ascertained whether the *taboo* be a part of their religious or civil code: but it is performed by the priesthood, and no command, either of the king or the orono, can be more implicitly obeyed. It is an interdiction, not only applied to places, but to persons and things; the word is also expressive of any thing sacred, devoted, or eminent. If the natives be prohibited from approaching a bay, the bay is said to be *taboo'd*; women, after assisting at a funeral, or touching a dead body, have their meat put into their mouths by others; and, so long as this is the case, the women are thus characterised; the king, in virtue of his superior station, is called *ereetaboo*; a human victim, *tangata-taboo*; and, at the Friendly Islands, Tonga, the place of residence of the monarch, is called *Tonga-taboo*.

It is natural to suppose, that the ceremony which takes place at their funerals should form a part of their religious code. If any notions of a future state of rewards and punishments be entertained, (and we have reason to conclude, that some imperfect ideas of this kind obtain here,) and if any reliance be placed in the superior efficacy of the intercessions of those devoted by their office to the service of the Supreme Deity, the terrors of death will undoubtedly confirm these notions, and the prayers of the mediator will not be unimplored. In the Sandwich Islands, the intercessions of the priesthood are prolonged till the burial of the deceased. Their practice in this respect would seem to be the consequence of some crude opinion respecting an intermediate state, in which the soul, after having left the body, resides for some time in the precincts of the *morai*, before its destination is finally determined.

On the demise of a chief, a crowd of people collect round his dwelling, and seat themselves in the area fronting the house. The priest, whose orations and prayers are heard within, frequently comes to the door, with dismal howlings and contortions of his face: a large mat is

afterwards spread upon the area, upon which the people belonging to the house place themselves in three equal rows: they are habited in feathered ruffs, and their shoulders decorated with broad green leaves. Some boys are placed around, waving the sticks which the priest uses in laying on the *taboo*. The company seated on the mat sing a melancholy tune, accompanied with gentle motions of the arms and body. Their music, as well as their motions, quicken apace, and, at length, become very raptid, but gradually subside again into their former measure. An hour passes in this manner, and more mats are spread upon the area. The widow of the chief, and three or four elderly women, then advance from the house with a slow and solemn pace; and, seating themselves, begin a piteous moaning, in which they are joined by the people seated behind them. Night only puts a period to these lamentations; and the body is removed some hours after. Next day, the bitter cries of the relations are renewed, and the lower parts of their faces are painted perfectly black. A human sacrifice takes place on this occasion; and the body of the person thus unhappily devoted is placed in the *morai* beside that of the chief. The funeral-rites of the common people are not so long, nor so pompously diversified as those of an eree.

Were it not for the luxuriance and plenty which prevail in the Sandwich Islands, we should be apt to conclude, that this people have no great aversion to the eating of human flesh; at least, there occurred, when Cook was upon their coasts, one or two circumstances, which render it probable, that the practice has not altogether ceased. It is but just, however, to say, that these were but equivocal proofs, and they did not produce more than suspicion in the minds of any of the travellers, who at that time or since have visited them. Human sacrifice is certainly a relic of that savage meal; and among this tribe it is manifestly frequent. Every new war demands a fresh victim to propitiate the deity, and ensure a victory; and, at the installation of a sovereign, or on the death of a chief, this dreadful offering is never dispensed with. At the death of Tereeeoboo, ten of his people were thus devoted. After being pitched upon by the priesthood, the unhappy object is assassinated, while asleep, in the dead hour of the night. There is something in this deliberate process which appears more cruel than even the inhuman repast of the New Zealander. It has all its horrors, without any of its dreadful motives; and if a human being can commit the one, his humanity will not scruple, when want urges him on, to gratify his savage appetite with the other.

The Sandwich Islands are the constant scene of cruel wars. Their claims respecting territorial right are the continual source of discord, which never ends but with the submission of the weaker party. On the demise of their *ereetaboo*, or kings, quarrels respecting the succession

ing the succession

to the throne are disputed with all the cruelties of civil war. Their broils are not limited by the boundaries of their several islands; their fertile fields are frequently ravaged by the hands that cultivate them, in the numerous contests in which the petty chiefs of the districts are involved.

Woahoo and Owhyhee, from their magnitude as well as their internal strength, generally hold the other islands under their subjection; and the endeavours of these to throw off the yoke only increase the tribute levied by the victors. When Vancouver visited Mowee, in 1790, it had recently been the theatre of a very sanguinary war between the chiefs of the two former islands, and every where was seen nothing but the traces of devastation. This contest had lasted longer, and been more obstinate, than any these islanders ever maintained, owing to the impudence of the mercenary captains of merchant vessels, who, to secure plentiful supplies of fresh provisions, had given the natives European fire-arms and ammunition.

The impolicy of this conduct was quickly visible; for, on the arrival of Vancouver, he could with difficulty revictual his ships; and, if a traffic of this nature becomes common, these people will certainly give the Europeans reason to repent of their conduct.

In the Sandwich, as well as most of the other islands in this ocean, society appears much in the same state as Europe under the ancient feudal despotism. The islands are divided into districts, and each district has its chief, subject to no control but that of the king, who receives the appellations of eree-taboo and eree-mowee; the first of these denoting his authority, and the other signifying that in his presence all must prostrate themselves. Under the chiefs are another class, who have the privilege of possessing property, but enjoy no share of power. The body of the people are the towtoos, or servants, who have neither rank nor property.

The information hitherto obtained respecting the administration of justice in civil or criminal matters affords only room for conjecture. Quarrels among the common people are generally referred to the judgment of the eree of the particular district; but the disputes of the chiefs are only settled by the sword. When, however, an inferior chief has offended one of superior rank, his punishment is immediate, and most frequently dictated by the feelings of the superior at the moment. The culprit very often compounds for his offence with a part or the whole of his property.

In a nation where the people lie at the mercy of an arbitrary sovereign and restless chiefs, it may be easily supposed, that the limits of right and wrong are neither accurately defined, nor subject to any other interruption than that of caprice. But, where the wants of men are few, and these plentifully supplied, property is of little

value; and it is natural to think, that it will afford but small scope for that fermenting self-interest which genders in the bosom of civilized society a class of men that rankle in its vitals and feed on mischief. All their plantations, houses, hogs, and cloth, are left ungarded, without fear or apprehension of plunderers. In the plain country, they separate their possessions by walls; and, in the woods, where plantains grow, they use white flags to discriminate property, in the same manner as they do bunches of leaves at Oteheite. These circumstances strongly indicate, that, where property is concerned, the power of the erees is not arbitrary, but so far limited as to afford encouragement to the inferior orders to cultivate the soil, which they occupy distinctly from each other.

The chiefs possess an unlimited power over the people; but they appear to exercise it with the greatest mildness: the people indeed are implicitly obedient; and, were it otherwise, it is highly probable, that they would be subject to the same cruelty which the erees universally exercise upon one another, even if a general revolt did not take place. The mildness of their rulers will, in all probability, prevent an alternative of this kind, which would, no doubt, hasten the overthrow of their power.

The Sandwich islanders seem to be contented and happy. Their affluence gives them a thoughtless cheerfulness, and an easy passage through life. The half-starved inhabitant of New Zealand beholds in every stranger an enemy come to dispossess him of the little he enjoys: but an European finds at the Sandwich Islands nothing but friendship and a welcome reception. With presents he is invited on shore; and, should he make an excursion up the country, he is solicited, at the door of every hut, to come in and partake of a meal.

Gaming, a common source of dissolute amusement, is not foreign to these climes. One of their games somewhat resembles the English mode of playing at drafts. Besides others, in which their invention seems to be pretty fertile, they play at bowls, nearly in the same manner as Europeans. They often entertain themselves with races between boys and girls, on which they lay wagers with great spirit. A man was seen beating his breast, and tearing his hair, in the violence of rage, for having lost, at one of these races, three hatchets, which he had purchased with nearly half his property a very little time before.

It is not fully ascertained in what manner marriage takes place among them. It is evidently connected with no ceremony; but, prior to regular cohabitation, some sort of compact seems to exist: whether polygamy be allowed, or whether it be mixed with concubinage, has not been verified; but an individual man and woman, to whom the children are subject, have the management of one house.

"The following," says Mr. King, "is the only instance of any thing like jealousy which we have seen among

them, and which shows that, among married people of rank, not only fidelity, but even a degree of reserve, is required. At one of their boxing matches, Omeah rose two or three times from his place, and approaching his wife with marks of displeasure, commanded her, as we supposed, to withdraw. Whether he thought her beauty engaged too much of our attention, or whatever might be his motives, there certainly existed no real cause of jealousy. She, however, continued in her place; and, at the conclusion of the entertainment, joined our party, and even solicited some trifling presents. She was informed, that we had not any about us; but that, if she would accompany us to the tent, she should be welcome to make choice of what she liked. She was, accordingly, proceeding with us; which being observed by Omeah, he followed in a great rage, seized her by the hair, and, with his fists, began to inflict severe corporal punishment. Having been the innocent cause of this extraordinary treatment, we were exceedingly concerned at it, though we understood it would be highly improper for us to interfere between a husband and wife of such superior rank. The natives, however, at length interposed; and, the next day, we had the satisfaction of meeting them together, perfectly satisfied with each other; besides, what was extremely singular, the lady would not permit us to rally the husband on his behaviour, which we had an inclination to do, but plainly told us, that he had acted very properly."

#### SECTION V.

#### THE MARQUESA ISLANDS.

This groupe of islands was discovered in 1595, by Mendana, a Spaniard, and received from him the general appellation of Marquesas, in honour of Mendoza, Marquis of Cande, then viceroy of Peru. He also gave the respective islands which compose it the names of *La Magdalena*, *St. Pedro*, *La Dominica*, and *Santa Christina*.

*Hood Island*, not seen by Mendoza, but discovered by Captain Cook in April, 1774, was so called from the name of one of the crew of the *Resolution*, who first saw the land. The whole groupe of these islands occupies one degree of latitude, and near half a degree of longitude. Four contiguous islands have been discovered since the time of Captain Cook. These are *Treven's Island*, *Riou's Island*, *St. Martin's Island*, and *Robert's Island*: in clear weather they are visible from Hood Island, the most northern of the Marquesas, and are now considered as belonging to that groupe, though neither the Spanish navigator Mendana, nor Captain Cook, had any knowledge of their existence. They were seen by Lieutenant Hergest, of

the *Dædalus*, in his passage to the northward, after leaving Resolution Bay, and then supposed by him to have been new discoveries; though he appears to have been mistaken, as they were discovered and landed on by some American traders.

*Customs, Manners, &c.*] The inhabitants of these islands collectively are represented as the finest race of people in the South Sea, and surpassing in symmetry of form and features all the other nations; not one disproportioned person was seen upon the island of Christina; but all were robust and well-made.

Their complexion, naturally tawny, is rendered almost black by punctures over the whole body. The figures are various, and seem to be directed more by fancy than custom; but the women, who are but little punctured, youths, and young children, who are not punctured, are of a light tawny colour. The men are, in general, tall, that is, about five feet ten inches, or six feet; none were seen that were corpulent, like the erees of Otaheite; nor were any seen that could be called meagre. The women were inferior to the men in stature, but well proportioned: their general complexion was lighter than that of the men. Their faces are not so good, nor are their eyes so full and lively, as those of many other nations. Their hair is of many colours, except red, of which none was seen. Some have it long; but the most general custom is to wear it short, except a bunch on each side of the crown, which they tie in a knot. They observe different modes in trimming the beard, which is generally long. Some part it, and tie it in two bunches under the chin; others plait it; some wear it loose, and others quite short.

Their habitations, which are in the valleys, and on the sides of the hills near the plantations, resemble in form those of Otaheite, but are much meaner, and covered with leaves of the bread-fruit tree. They are built, in general, on a square or oblong pavement of stone, raised some height above the level of the ground. They have also a pavement near their houses, for the purpose of sitting to eat, regale, and amuse themselves. The Europeans, by the help of glasses, could discern, along the uppermost edge of the mountain, a row of stakes or pallsades, closely connected together, like a fortification, which seemed to resemble the Hippahs of New Zealand.

The house appropriated by the chief, Tenai, for the residence of the two English missionaries, who were intended to have been left on the island, is described by them as twenty feet in length, and six in width, ten feet high in the back part, and four in front. At the corners, four strong stakes are driven into the earth, on which are laid horizontal pieces, and from these last to the ground are bamboos, neatly ranged in perpendicular order, about half an inch distant from each other, and, without them, long blinds, made with leaves, are hung, which renders the

inside very close and warm. The door is about the mid-  
dle, on the low side.

The furniture is represented as consisting of a large  
floor-mat, from end to end, several large calabashes, some  
fishing tackle, and a few spears. In one end the chief kept  
his ornaments, which he shewed to his European guests;  
among others, he took out of the bamboo cases two bun-  
dles of feathers, of the tail of the tropic bird, not less  
than a hundred in each bunch, forming a very beautiful  
and elegant ornament, upon which he seemed to place a  
great value.

Their clothing is the same as at Otaheite, and made of  
the same materials; but they have it not in such plenty,  
nor is it so good.

The dress of the women is a piece of cloth, made of  
the mulberry-bark, wrapped two or three times round the  
waist, and the ends tucked up between their thighs; above  
this is a piece of cloth, nearly as large as a sheet, tied at  
the upper corners: they lay the knot over one shoulder,  
and the garment, hanging loose, reaches half way down the  
leg.

Their principal head-dress is a sort of broad fillet, cu-  
riously made of the fibres of the husk of the cocoa-nut.  
In the front is fixed a mother-of-pearl shell, wrought  
round to the size of a tea-saucer. Before that is an-  
other, smaller, of a very fine tortoise-shell, perforated in  
curious figures. Before and in the centre of that, is  
another round piece of mother-of-pearl, about the size  
of a half-crown piece, and before this another piece of  
perforated tortoise-shell, the size of a shilling. Besides  
this decoration in front, some have it also on each side,  
but in smaller pieces; and all have fixed to them the tail-  
feathers of cocks or tropic birds, which, when the fillet is  
tied on, stands upright, so that the whole together makes  
a very brilliant appearance. They wear round the neck a  
kind of ruff or neck-lace, made of light wood, the out  
and upper sides covered with small red peas, fixed on with  
gum. They also wear small bunches of human hair, fas-  
tened to a string, and tied round the legs and arms. Some-  
times, instead of hair, they wear short feathers; but all  
the above-mentioned ornaments are seldom seen on the  
same person. Captain Cook saw only one chief com-  
pletely dressed in this manner. Their common ornaments  
are necklaces, and amulets made of shells. He did not  
see any with ear-rings; and yet all of them had their ears  
pierced.

They had a kind of fan to cool themselves in hot wea-  
ther, formed of a tough bark, very firmly and curiously  
plaited, and frequently whitened with shell-lime. Some  
had large feathered leaves of a kind of palm, which an-  
swered the purpose of an umbrella.

The chief's house stood on a square platform, raised  
with stones, having a wall about six feet high on the

lowest side; in the inside was a kind of escutcheon, in  
memory of Honoo, the chief's father: it was curiously  
wrought with small reeds, laid upright, oblique, and ho-  
rizontal, and about eight feet in height, forming a side  
of a pyramid. There was a drum at each end, made like  
those of the Otaheiteans. Nearly adjoining, and upon the  
same platform, was another, built on a small eminence,  
leaving a space in front, where were placed two rude figures  
of men, carved in wood, nearly the size of life; behind  
these, against the side of the house, were three other es-  
cutcheons, wrought in the same manner as the above men-  
tioned: that in the middle, which was the largest, had the  
figure of a bird on the top; and the reeds, which composed  
the whole, being stained of different colours, produced a  
beautiful and solemn effect. The house had no door nor  
opening of any kind; but as the officer's curiosity was ex-  
cited, he opened a hole on the side of it, to see what it  
contained, and beheld a coffin, fixed upon two stakes about  
a yard from the ground. Just at this time the chief came  
up, and, seeing he was not angry, the English officer  
again opened the hole, and pointed to the coffin; he in-  
stantly exclaimed Honoo, and repeated it several times,  
by which the officer knew it was his father, and thought  
the chief pleased to see him notice the honour he paid to  
his memory. The coffin was cylindrical, and bound about  
with various coloured plaiting, made of the fibres of the  
cocoa-nut. This sepulchre, the trees, and every thing  
within the platform, was considered sacred, and must not  
be approached by the women.

In the article of eating, these people are by no means  
so cleanly as the Otaheiteans. Pork and fowls were  
dressed in an oven of hot stones, as at Otaheite; but fruit  
and roots they roast on the fire, and, after taking off the  
rind or skin, put them into a platter, or trough of water,  
out of which both men and hogs eat at the same time.  
Captain Cook once saw them make a batter of fruit and  
roots, diluted with water, in a vessel that was loaded with  
dirt, and out of which the hogs had been but that moment  
eating, without giving it the least washing, or even wash-  
ing their hands, which were equally dirty; and, when he  
expressed dislike, he was laughed at.

The missionaries observe that, "With respect to their  
manner of living, like most uncivilized nations, they have  
no regular meals, but eat when they are hungry, though  
not a great quantity at a time, as on their arrival it was  
their season of scarcity. When they have a hog, they eat  
of it five or six times a day; and when without animal  
food, they use the roasted bread-fruit, mahie, puddings  
made of other vegetables, ahee-nuts, and a paste made of  
a root resembling the yam; and this they do often in the  
course of the day. The women are not allowed to eat  
hog's flesh, and probably are under other prohibitions, as  
at Otaheite, as they seem very harshly treated.

The tame fowls are cocks and hens; and their only quadrupeds are hogs and rats; but the woods are inhabited by small birds, whose plumage is exceedingly beautiful, and their notes sweetly varied. The Europeans left cats and she-goats, and were concerned that they had no he-goats to give them, as they were so fond of those animals, that the chief took them wherever he went.

The trees, plants, and other productions of these isles, as far as could be known to our people, were nearly the same as at the Society Isles. There are plantains, yams, and some other roots; likewise bread-fruit and cocoa-nuts.

Their canoes are made of wood and the bark of a soft tree, which grows near the sea, and is very proper for the purpose: their length is from sixteen to twenty feet, and about sixteen inches broad. The head and stern are formed out of two solid pieces of wood; the former is carved, and the latter ends in a point, which, projecting horizontally, is decorated with a small carved figure, having a faint resemblance to the human face. Some of the canoes have a latteen-sail, but they are generally rowed with paddles. Their weapons are clubs and spears, resembling those of Otaheite, but somewhat larger. They have also slings, with which they throw stones to a great distance, but not with a good aim.

Their religious ceremonies resemble those of the Society Islands. They have a morai in each district, where the dead are buried beneath a pavement of large stones. They have a great number of deities, under a variety of appellations, but there does not seem to be any superiority among them. They offer hogs in sacrifice, but never any of the human race.

## SECTION VI.

### THE SOCIETY ISLES.

All the islands from a hundred and sixty degrees of west longitude from Greenwich to the eastern extremity of Polynesia may be included under the general name of the Society Islands; a range which will thus even exceed the Carolines in number. The principal of these are Otaheite, Huaheine, Ulietea, Bolabola, Otaha, Tubai, and Mausia; but the first is by far the most considerable in size, being about one hundred and twenty miles in circumference. They appear to have been first discovered by Captain Wallis, in 1767; and the subsequent visits of Captain Cook, Vancouver, and the English missionaries, have successively afforded new and interesting particulars concerning them.

*General Aspect, Climate, and Productions.*] The objects which present themselves to view in the South Seas, are both grand and sublime. Gliding along the immense ocean, where natural appearances are widely different from

those in the northern hemisphere, the stranger is agreeably surprised with the appearance of islands, or little worlds, amid the ocean. Thus stationed in his vessel, he beholds the vast watery scene beginning to be diversified by rising mountains, seen at a great distance, at first scarcely visible to the eye, but gradually assuming an elevation that renders them perceptible at the distance of sixty miles.

But, approaching nearer, instead of beholding these mountains barren and naked, he is surprised with the view of heights almost inaccessible, lined with steep and lofty hills, and crowned with a luxuriant vegetation. Plantains, yams, and a variety of other roots, which afford support to the inhabitants, are found growing spontaneously in these elevated regions. Here also grow trees, of various kinds, with which the mountains are clothed to the very summits, presenting to the distant beholder the appearance of a green lawn. The prospects from the tops of these hills fill the mind with mingled sensations of majestic dread, uncommon pleasure, and inexpressible amazement.

"We hardly believed our eyes," says M. de Bougainville, "when we saw a peak covered with woods up to its highest summit, which rises above the level of the mountains in the interior parts of Otaheite. Its apparent size seemed to be more than thirty toises in diameter, and grew less in breadth as it rose higher. At a distance it might have been taken for a pyramid of immense height, which the hand of an able sculptor had adorned with garlands and foliage." One of the mates of the *Dolphin*, with a party of marines and seamen, penetrated into the interior of this island; and having ascended a mountain, which they supposed to be a mile high, they discovered mountains before them so much higher, that, with respect to them, they seemed to be in a valley. Towards the sea, the view was enchanting, the sides of the hills were beautifully clothed with wood, villages were every where interspersed, and the intermediate valleys afforded a still more beautiful prospect; for there the houses stood thicker, and the verdure was more luxuriant. Mr. Forster, with other gentlemen, ascended to the summit of one of the highest mountains in this island, whence they had a prospect of the Island of Huaheine, and some others, lying at the distance of forty leagues. The view of the fertile plain below them, and of a river making innumerable meanders, was delightful in the highest degree. The vegetation of the upper part of the mountains was luxuriant, and the woods consisted of many unknown trees and plants.

The rivers are both numerous and large. Issuing from the bowels, or flowing from the tops of the mountains, they are augmented in their course by the descending rains, and swell into such mighty torrents, that the rocks are sometimes removed by their violence, and the stoutest trees torn up by the roots. But, at other times, these ri-

vers glide in singular beauty from their lofty sources, meandering through the fertile valleys, amid the verdant scenery of those luxuriant plains, and, if possible, adding to their fertility and beauty.

Nor are these islands devoid of lakes. Between the declivities of one of the mountains, in the district of Bye-orde, is a lake of excellent fresh water, and around its banks are many dwellings, where the inhabitants enjoy plenty of every thing, except the bread-fruit, for which they substitute the mountain plantain. This lake issues forth with a pleasant flow into the valley, and greatly enriches the circumjacent scenery.

These islands, for the most part, are encircled with bays and creeks, and some are favoured with excellent harbours, where vessels may safely rest. These render commerce both practicable and easy; and the time may not be very distant, when in these harbours European articles shall be exchanged for the improved produce of these highly-favoured islands.

Bread-fruit, cocoa-nuts, bananas, sweet potatoes, yams, juniper, sugar-cane, the paper-mulberry, and several sorts of figs, are natural and almost spontaneous productions. The mountain sloe-tree, the plantain-tree, the precious sandal-tree, and many others, also flourish in all their beautiful verdure. And if these arrive at such perfection in their present state, what would they not under the fostering hand of cultivation? Nor can it be doubted, that the fertile valleys which border the coasts might produce sugar-cane in equal perfection to any in those places where it proves such a profitable article. And how pleasant to humanity would it be to see these planted, cultivated, and manufactured by the natives, rather than by those poor unhappy partners of human nature, who groan under the lash in the West-India Islands!

The climate of these islands, considering their latitude, is very temperate, so which the elevation of the greater part of them may probably contribute.

The seasons are variable; for in some islands the crop is some months earlier than in others; but in all they merit the appellation of *favorable*. In this the kindness of the Ruler of the universe is peculiarly obvious; because the untutored state of the human mind in these regions is unqualified to combat the hardships of unfavourable seasons, or to provide against the direful consequences.

Besides the domesticated animals, which aid in feeding the inhabitants, the winged tribe is very numerous. Nor are these confined merely to the tame race, but widely extended to many wild fowl, which the ingenuity of the inhabitants, even in their uncultivated state, find means to convert to substantial use. Hogs, dogs, and poultry, compose their tame animals; and wild ducks, pigeons, parquets, doves, woodpeckers, with a vast multitude unknown in the northern world, compose their wild race. The

mountains both sparkle with the beauty of their feathered inhabitants, and resound with the melody of their songs; nor is it easy to describe the sensations of a contemplative European, when he wanders amid such a profusion of natural pleasures.

But the sea also affords her tribute to the Otaheitean table. All around the coasts of these different groupes of islands, multitudes of fine fish, unknown to Europeans play in crowds; so that, when the land withholds her stores, the natives have recourse to the sea; and thus the year is crowned with plenty, and they pass their days in luxuriant indolence.

*Arts, Manufactures, &c.*] The southern islanders, living in a warm climate, possessing a luxurions country, and surrounded with countless blessings of life, have consequently had but few calls of necessity to exert the powers of ingenuity. The first of these, however, were of a mechanical nature. Favourable as the climate is, yet there was not wanting some necessity to erect a dwelling, that might prove a better shelter from the descending rains and the blowing tempest, than either the shady tree or the dark excavated rock. Hence the southern genius began to display its strength in the mechanical art of building.

Fertile as the soil is, and numerous as the spontaneous productions are, yet the desire of having a greater quantity of some provisions, or the desire of having them in a season beyond the usual time of their spontaneous production, would induce the ancient islander to invent the means of cultivating and maturing these favourite plants: hence originated the rude beginnings of the science of agriculture. But as these incentives are both few and very feeble, the progress of that science is singularly slow.

A desire of change of food, or the necessity arising from the periodical suspension of vegetable production, naturally induced the islander to betake himself to that animal food which every where surrounded him: hence the invention of the bow and the javelin succeeded to the ruder sling and stone.

The agreeable variety or the convenient supply from this quarter induced him to attempt another region, and to invent means to lay on the table the fish that swam around him, as he amused himself with imitating that watery race hence originated both the fishing-boat, the fishing-hook, and line, together with those lamps and that oil which they burn during the time of their fishing in the night-season; for these islanders have this custom, in common with the Neapolitans and Maltese: they fish in the night, and repose themselves in the day; and, also, like them, burn torches of the cocoa-nut, while engaged in it. The insulated situation of this people would likewise, at a very early period, suggest the advantage of visiting the inhabitants of the neighbouring islands; and these visits would become more frequent, as avarice and the love of power

prompted to martial contendings. Hence originated the destructive art of war: nor is it difficult to conceive, that the more violent passions of the human mind, being once embroiled, would suddenly force into the field of battle all the former productions of honourable invention. The various disappointments in military enterprises would induce to strengthen, enlarge, and polish, the canoe, and to sharpen the javelin and the arrow; repeated successes would lead to new attempts: the martial productions of enemies would also soon be employed against themselves by the opposite power.

By a similar process of the mind would the various mechanical arts either originate, or advance in improvement; and their frequent intercourse with Europeans, as well as the use of their mechanical instruments, will greatly tend to accelerate the progress of these arts among them; though at present they are all in a very rude state.

Nor are the other arts in great perfection among these islanders. Dr. Solander and Sir Joseph Banks, who attended Captain Cook, were at a loss to find the existence of the science of arithmetic among them. They could not ascertain their method of dividing time. When they spoke of time, they used the term *malama*, which signifies the *moon*; and they reckon thirteen of these moons, beginning again when they are expired. This fact, however, tends to prove, that they have some idea of the solar year; but these gentlemen could not discover how they computed their months, to make thirteen equal to the year; as they said, that these months consisted of twenty-nine days, one day in which the moon was invisible being included. Experience, however, shews, that they had a knowledge of the prevailing weather which was to be expected, and also the fruits that would appear in different seasons.

The inhabitants of the Society Isles display but little ingenuity in the construction of their houses. The common people lodge in huts scarcely sufficient to shelter them from the inclemency of the weather. Those of superior rank dwell in more comfortable habitations. The common dwellings are of an oblong form, round at both ends, and the ridge is about eighteen feet long. A house of the second order is about twelve feet in height, twenty in breadth, and thirty in length. The houses of the highest order are in proportion to the taste or wealth of their owners, and some are spacious and considerably elegant.

Their houses resemble European sheds, or thatched roofs, supported by rafters and posts. The floor is raised with earth, gently smoothed, and covered with thick matting. Some have their houses open all round, but they are generally enclosed with strong mats, or branches interwoven in a dexterous manner. Partitions are not in use, yet more decency is observed than might be expected from their general conduct with strangers. Nor can it be denied

that many of those acts of indelicacy which have tarnished their character, are chargeable upon the Europeans. Hence it has become proverbial among them, that Englishmen are ashamed of nothing.

But although they have no partitions, there is an enclosed space for the master and mistress of the house, which is formed with a thick mat, about three feet broad, bent in a semi-circular form, and placed edge-ways, with the ends touching the side of the house. The rest of the family sleep upon any part of the floor, the unmarried men and women sleeping apart from each other. If the family in the southern region be large, they have little huts adjoining their houses, in which their servants sleep. The whole of their household furniture consists of some wooden stools, a few baskets, of different sizes, in which they put their combs, fish-hooks, and tools; two or three bowls, in which they make their kava, some cocoa-nut shells, a few gourds, and a bundle of cloth. Some have also a large chest, on which the master and mistress sleep, and some employ a canoe-house, just sufficient for their length, but not high enough for them to stand erect. They now begin to experience the advantage of bedsteads, and the demand for them greatly increases. Their pillow is a little wooden stool, neatly wrought out of one block; and those who are unprovided with one, use the stool on which they sit in their canoes. They usually sit cross-legged on the ground, but commonly have seats for the accommodation of strangers.

Greater ingenuity is displayed in constructing their canoes, which may be properly deemed the most perfect of their mechanical productions. The double canoes are capable of carrying about fifty persons, and sail with great rapidity. They are built of the bread-fruit tree, and the workmanship is so extremely neat, that they bear the external appearance of one solid piece; but, upon a closer inspection, they are found to consist of a great number of planks, exactly fitting each other, and, by means of a ledge on the inside, are secured together with cocoa-line. The single canoes are formed with an out-rigger. Unacquainted with the method of warping a plank, they shape their canoes with the hand.

Two kinds of canoes are used; the one called *ivahahas*, and the other *pahies*: the former are used for long, and the latter for short, voyages. These vessels are similar in shape, but not proportionate, being from sixty to seventy feet in length, and not more than the thirtieth part in breadth. Some are employed in going from one island to another, and others in fishing.

The *ivahahas* are also used for war. These are the longest; and the head and stern are considerably above the body. When going to sea, they are fastened together, side by side, at the distance of a few feet, by strong wooden poles, which are laid across them, and joined to each side. A platform of ten or twelve feet long is raised

These are the considerably above fastened together, feet, by strong m, and joined to feet long is raised

upon the fore-part, on which the fighting men stand, whose missile weapons are slings and spears. The rowers are placed beneath, to supply the place of the wounded.

The fishing canoes are from ten to thirty or forty feet long. The travelling canoes have a small house on board, for the better accommodation of those of higher rank, who occupy them both night and day.

The canoes called *pahies* vary in size, being from sixty to seventy feet long, and sometimes very narrow. The natives employ these for fishing, and sometimes for long voyages. They are very useful in landing, and also in putting off from the shore in a surf; for, by their great length and high stern, they can land dry, when the English boats can scarcely land at all. In going from one island to another, these islanders are sometimes a month, and sometimes fourteen or twenty days; and, if they could carry sufficient provisions with them, they would stay much longer.

The method of constructing these canoes is singularly curious. The principal parts are separately formed, without either saw, plane, chissel, or any iron tool. These parts being prepared, the keels are fixed upon the blocks, and the planks are supported with props, till they are joined together with strong plaited strings, which are passed several times through holes, bored with a chissel or bone, such as they commonly use; and, when finished, they are sufficiently tight without caulking. These boats are preserved with great care, in a kind of shed prepared for the purpose.

The only tools used in the construction of their canoes, are hatchets, of a smooth black stone, augers made of sharks' teeth, and rasps composed of the rough skin of a fish fastened on flat pieces of wood. The same tools are employed for all other kinds of work, and, except a chissel made of the bone of a man's arm, and shells which serve them for knives, they have no other instruments.

Their cordage is composed of the fibres of the cocoa-nut husk, which, though not ten inches long, they plait, about the thickness of a quill, to whatever length may be required, and roll it up into balls; and, by twisting these together, form their ropes of a considerable size. Their fishing lines are not inferior to those of Europe, either for strength or smoothness. Their small hooks are of pearl-shell; but the large ones are only covered with it on the back, and the points are generally of tortoise-shell. With the large ones they catch albigores and bonettocs, by putting them to a bamboo-rod, about twelve feet long, with a line of the same length. They have also a number of small seines, some of which are of the most delicate texture.

The general employment of the women is not fatiguing, and is usually performed in the house. The making of cloth is entirely entrusted to their care; and this article is the chief manufacture of Otaheite. The bark of the mul-

berry, the bread-fruit, and a tree which bears some resemblance to the West-Indian wild fig-tree, are employed for this purpose. From the first of these is manufactured the finest cloth, which is seldom worn but by those of high rank. The second sort is made from the bread-fruit tree; the third of that tree which resembles the wild fig: and it is a singular fact that the last of these, though coarsest, is scarcer than the other two, because manufactured in smaller quantities.

The mode of manufacturing these different sorts of cloth is the same. The bark of the tree is stripped off, and soaked in water for two or three days; then the inner bark is separated from the external coat by scraping it with a shell; after which it is spread out upon plantain-leaves, placing two or three layers over one another, care being taken to make it of an equal thickness in every part. In this state it is allowed to remain until almost dry, when it adheres so strongly, that it is taken from the ground without breaking. This process being finished, it is laid on a smooth board, and beaten with an instrument made for that purpose of the compact heavy wood called *etoa*. This instrument is about fourteen inches long, and seven in circumference, of a quadrangular shape; and each of the four sides is marked with longitudinal grooves, or furrows, differing in this particular, that there is a regular gradation in the width and depth of the grooves on each of the sides, the coarser side not containing more than ten of these furrows, and the finest side above fifty.

The progress of this manufacture is also gradual. They begin with that side of the mallet where the grooves are deepest and widest, and proceed regularly, finishing with that which has the greatest number. By this operation the cloth is extended, in a manner similar to gold formed into leaves by the hammer: it is also marked with small channels, resembling those which are visible on paper, but rather deeper. They generally beat this very thin; but when they wish to make it a little thicker, they unite two or three pieces together, with a kind of glue prepared from a root called *rea*.

This cloth is capable of being rendered very white by bleaching, and may also be died red, yellow, brown, or black. The first of these colours is exceedingly beautiful, and equal, if not superior, to any in Europe. The red is formed from a mixture of the juices of two vegetables, neither of which separately used produces the same effect.

This people also excel the Europeans in manufacturing various kinds of matting. During the rainy season, they wear the finest kind of it, and they use the coarse kind to sleep on. They excel also in basket or wicker-work, which both men and women frequently make of different patterns.

They make ropes and lincs, of all sizes, of the bark of a tree, and their nets for fishing are wrought of

these lines; of the fibres of the cocoa-nut they make thread, with which they fasten their canoes: the sizes of these are various, according to their respective uses. Their fishing-lines are made of a kind of nettle that grows in the mountains, and are sufficiently strong for taking very large fish; in which art the inhabitants of this part of the globe display great ingenuity.

In these islands the sphere of agriculture is very contracted, yet, according to its extent, it is in tolerable perfection. In those parts where spontaneous productions afford food for the inhabitants, agricultural exertions are very feeble; but, where the inhabitants live upon cultivated roots and nursed fruits, they are more vigorous. In the management of yams and plantains, considerable ingenuity is displayed: small holes are first dug for their reception; and they afterwards root up the surrounding grass.

When they plant their vegetables, they observe such exactness, that in all directions the rows present themselves to the eye complete and regular. The bread-fruit and the cocoa-nut are dispersed without any order, and when arrived at a certain height, require no farther cultivation. Similar is their culture of another large tree, producing a roundish compressed nut, called *eeffee*, and of a smaller one bearing an oval nut, with two or three triangular kernels. There is another plant, called *kappe*, which is regularly planted, and in large plots. The *mawhaha*, the yams, and the *jeejee*, are usually interspersed among other roots; the sugar-cane is planted in small spots, and closely crowded. It often grows spontaneously, of a size equal to any in the Indies; and, if cultivated, it would probably grow both longer and richer: but the natives make little use of it, unless to chew while they are travelling. So negligent are they, indeed, of this valuable plant, that, when it grows tall, they set it on fire to clear the land. The mulberry, of which the cloth is made, has a large space allowed for its growth, and is kept very clean. The *pandanus* is commonly planted in rows, close together, at the sides of the fields. The cabbage-tree grows in the mountains, but to no great perfection, and the natives seldom use it.

In many parts they have also laid out their grounds with some small degree of elegance; for the divisions are very regular, and the fences strong and well placed. Many of the plantations, also, are more beautiful and better arranged than could have been expected from the rude state of the inhabitants.

*Religion, Government, &c.]* The religious system of the Society Isles abounds with mysterious singularities, of which few persons, except the priests, can be supposed to have a competent knowledge. The idea of one supreme Deity seems to be universally held by the people, although they believe in a plurality of deities, each of which is supposed to be invested with ample powers

The prevalence of both good and evil in the material world has induced the Otahiteans to believe in the existence of evil as well as good deities, and they deem it advisable to offer sacrifices to both. The good deities are supposed to delight in conferring happiness, and the evil ones in performing injuries. But, at the same time, they believe, that the good, as well as the bad, deities inflict punishments, and are the source of many misfortunes.

Different islands, and different districts of the same island, have their respective gods, and, as may naturally be supposed, each of them esteem their own as the most eminent. Relying on the protection, support, and favour of their gods, they deem it no impiety to change one or more of these, if they happen to fail in the discharge of their duty. An instance of this nature occurred in Tiaraboo, where two divinities were dismissed, and Ora, the god of Bolabola, adopted. The victories of that people occasioned this change, and they were also victorious after the adoption of the new god.

Many of their notions of the supreme Deity are singularly extravagant. Instead of considering the inferior gods as dependant upon him, they suppose, that he is dependant upon them. Nay, to such a height of extravagance is this carried, that they suppose these have power to eat him, whilst they grant that he is possessed of power to re-create himself. Few ideas can equal this in absurdity and self-contradiction.

In a large building, called *Tourooa*, the departed souls are said to assemble, for the purpose of recreating themselves, and there the deity is supposed to enquire whether or not they intend to destroy him; and, if they express such a resolution, the same remains unalterable. It is supposed that this action is known not only to the spirits themselves, but also to the inhabitants of this lower region. The universal opinion among mankind, that all human knowledge is derived from some great superior source, may have given rise to this extravagant notion. Convinced that all excellence comes from the deity, it appears to them the surest method to attain it by consuming him altogether; and the knowledge which these lesser gods receive from the greater is dispersed among their votaries.

We are also informed, that when the moon is in its wane, they are imagined to be devouring the deity; and in proportion to its increase they suppose that he is renewing himself. If these men worshipped the moon, this extravagant notion might be accounted for; but, as this is not the case, the task is more difficult. It is probable, however, that, in some former period, the "queen of heaven" might be numbered among their deities; and from hence may have originated this unaccountable idea. It is also added, that both the superior and inferior gods are exposed to this sad fate of occasional devouring.

This deluded people show the utmost veneration for

their deities. In a chaunting particularly for modern Christians they will not be apart for the respect are also opinion is, that are stored with human victims gratitude. To is the professes The idea is constantly conferring affected with the malevolent being

It is probable, the "queen of" their deities; and accounttable idea- and inferior gods devouring. st veneration for

their deities. Their prayers, which are usually delivered in a chaunting tone, are frequently offered; and they are particularly fervent in expressions of gratitude: many modern Christians may blush, when they are informed, that they will not begin a meal without first setting a portion apart for the deity, to whom they suppose such marks of respect are always acceptable. The consequence of this opinion is, that the places destined to receive the offerings are stored with fruits and animals of all kinds. Nor are human victims spared in the prodigality of superstitious gratitude. To avert misfortunes, and to obtain blessings, is the professed design of these offerings and sacrifices. The idea is not entertained that the deity must be constantly conferring favours upon them; for they are less affected with this than they are with the attempts of some malevolent being to injure them.

Temporal blessings are supposed to be the result of the careful performance of religious duties. The powerful influence of the divine spirit, they imagine, is universally diffused throughout all nature. Convinced of this, it is not matter of surprise that many absurd notions obtain concerning his operations. Sudden deaths or unfortunate accidents are supposed to be effected under the immediate influence of some divinity. Nay, to such a degree is this carried, that if a man hurt his toe by striking it against a stone, the cause is instantly attributed to a god.

These islanders join in the general opinion respecting the immortality of the soul; and also believe that it is immaterial. The soul they imagine to be eaten by the deity, and peculiarly acceptable to him; hence human sacrifices are accordingly offered up, that he may enjoy his favourite banquet. Believing in the immaterial nature of the soul, they suppose that during the pangs of death it keeps fluttering about the lips, and that at death it ascends to the upper regions, continues in that state for some time, then takes its flight to a certain place appointed for the reception of the souls of mortals, and enjoys there a kind of eternal night.

But they suppose that other places are also prepared for the reception of departed spirits. Thus they imagine, that those who are drowned in the sea continue there, and enjoy a delightful country, splendid habitations, and every thing else which can contribute to their felicity. To such a pitch, indeed, do they carry their ideas of immortality, that, in their system, animals, trees, fruits, and stones, are endowed with immortal souls; and at death, or upon consumption, or on being broken, they ascend to the deity, and pass into their destined mansion.

Supposing that the souls both of good and bad men are consumed by the deity, they expect no permanent punishment for crimes committed on the earth. The consuming of souls by the deity they deem a necessary purification previous to entering into the purer region. Their reli-

gious system, in consequence of this idea, teaches, that a refraining from carnal indulgence for a certain period before death, exempts from that consuming purification, and qualifies for an immediate entrance into the mansions of bliss.

It is scarcely needful to add, that the sublime conceptions of happiness unfolded by the Christian religion are unknown in the religious system of these islanders. The beneficial nature of immortality they suppose chiefly consists in an exemption from annihilation, and the enjoyment of those very passions which agitate the human breast, even in this world. They have imbibed this sentiment to such a degree, as to suppose that the souls of enemies, meeting in the next world, will revenge the injuries received in this, and that many severe battles will ensue: these conflicts they own cannot be destructive, since the soul is invulnerable; but to such a height of folly has the human mind advanced in that untaught state, that they believe in the reality of such intellectual battles.

Similar ideas are entertained concerning man and wife meeting in a future state of existence; for it is firmly believed, that if the husband die first, the soul of the wife will instantly recognize that of her husband upon her arrival in the land of spirits. In a large and spacious building, where the gods assemble, they renew their former acquaintance; and upon this the husband conducts her to his own habitation, where they renew their former connection, and are blessed with a numerous offspring of immortal children.

The belief in the existence of evil spirits also obtains. Superstition and foolish dread are the same in every country. The ignorant and superstitious in Europe are startled at the apprehension of ghosts or the solemn scenery of a church-yard; so, in these islands, the inhabitants are affrighted in approaching a burial-ground during night.

The ignorant and superstitious also place implicit confidence in dreams, as supposing them to be immediate communications from the deity. They sometimes imagine, that in these the spirits of their departed friends revisit them, and communicate intelligence concerning things to come. Thus one of them pretended, that the soul of his father informed him, that the English would land in a few days. He failed, however, in his prophetic attempt, for they did not arrive at the time predicted.

Among these people, however, the same as among every other nation where ignorance and superstition reigns, dreams are held in great veneration. Their priests and priestesses are considered as endowed with the spirit of prophecy, and universally credited, and the same holds true with respect to dreamers. It is very seldom, therefore, that any important undertaking is entered upon without the concurrence either of dreams or of divine inspiration.

The influence of the moon and the planets on the events of human life, is supposed to be very great; and these islanders make it a point to regulate all their public councils by the appearance of the moon. By its different positions, when rising, they confidently determine that line of conduct which they ought to pursue. For instance, if, on the first appearance of the moon after its change, it lie horizontally, they deem it proper to engage in war, and are confident of success; but, if the contrary, they are dissuaded from it with equal confidence.

There are some obscure traditions existing among them with respect to the creation of the world, which are extremely curious. "Some goddess," say they, "had a lump of earth, suspended in a cord, and giving it a swing round, scattered about several pieces of land, which formed Otaheite and the adjacent islands." These, they supposed, were peopled by one of each sex, who originally dwelt at Otaheite. This, however, only respects their own creation, because they admit of an universal creation, previous to their formation.

Their remotest traditions extend to two, called *Tatooma* and *Tapippa*, who are esteemed male and female rocks, and supposed to support the material globe. "These," say they, "begat *Totorro*, who was killed, and divided into different parcels of land. Afterwards *Otaia* and *Oroo* were produced, who being married, their first-born was land; then they begat a race of gods. *Otaia* being slain, *Oroo* married her son *Temorrha*, who, being of the race of the gods, occasioned the creation of more land for the animals to dwell on, and every kind of food necessary for their sustenance. This ancient wife extended her authority so far over her husband as to command him to create a sky, which was to be supported by a race of men called *Teefeerei*.

"The spots," say they, "upon the moon, are the groves of a certain tree, which once grew at Otaheite, and, being accidentally destroyed, some doves carried its seeds thither, where they were planted, and flourish in continual verdure and fruitfulness."

Among a variety of religious and historical legends prevalent among these people, there is a particular one respecting the eating of human flesh. On this they narrate, that a long time ago there lived at Otaheite two men, who were called *Taheei*, a name given to eaters of human flesh. These inhabited the mountains, whence they issued forth, and murdered the natives, whom they afterwards devoured, thereby preventing the population of the islands. Two brothers, determined to deliver the country from such enemies, formed and executed a plot, which proved successful. These two magnanimous heroes lived farther up the country upon higher ground than the *Taheei*, and, therefore, were so situated, that they could converse with them without hazarding their own safety. Living upon

these friendly terms, they one day invited the *Taheei* to partake of an entertainment, to which they readily consented, expecting to add the two brothers to the other provisions. In this, however, they were greatly disappointed, for the brothers heated some stones in the fire, thrust them into pieces of bread, called *mahee*, and requested one of the *Taheei* to open his mouth, when one of these pieces was instantly dropped into it; and some water being poured into his mouth, it made such a hissing noise in quenching the stone, that it killed him. The other *Taheei* was entreated to do the same, but declined, perceiving the effect which it had upon his companion. The brothers, however, prevailed in persuading him, that the food was excellent, that these effects were only temporary, and that his companion would soon recover. Hereupon the credulous *Taheei* swallowed the morsel, and so perished; while the government of the island was conferred upon the victorious brethren; and their fallen enemies were buried amidst universal acclamations. Tradition farther adds concerning these *Taheei*, that they resided at *Uha-paenoo*, where there still remains a bread-fruit tree, which was once their property; and that they had a woman, who lived with them, possessed of two teeth of enormous size, but she did not, like the men, feed upon human flesh. After the death of these two men, she lived at Otaheite, and, upon her death, she was numbered with the gods.

Upon this singular narration the writer of Cook's Voyages remarks, "It does not appear, that there is any moral couched under this story, any more than under most of the old fables, which have been received as truths in ignorant ages. However, it was not injudiciously introduced, as serving to express the detestation entertained here against cannibals: and yet it appears probable, from some circumstances, that the natives of these isles formerly fed upon human flesh. Omai, one of the natives, being asked a few questions on this subject, resolutely denied it, though, at the same time, he related a fact within his own knowledge, which almost tended to establish such a conjecture.

Thus far we have followed the accounts given by Captain Cook and former navigators respecting the religion of the southern islanders; but, as it appears advisable to throw every possible light on a subject of so interesting a nature, we shall now lay before our readers an abridged view of the account given by the writer of the missionary voyage to Otaheite.

The information concerning this matter may be arranged under the following divisions:—that which respects their religious doctrines, that which respects their traditions, and that which respects their religious duties.

Among the religious opinions maintained by the Southern islanders, the following are particularly worthy of notice:—

tained by the South- ularly worthy of no-

The deities of the South Seas are very numerous. Each family has a guardian spirit, to whom they pay divine honours. The name of their great god is *Eatooa*. There are three deities, which are held supreme; and, what is peculiarly singular, these three are known by personal appellations, which have a strong resemblance to the three persons in the Godhead revealed in holy writ—The Father—God in the Son—and the Bird, the Spirit. The work of a geographer is not to wander in the field of conjecture, or many things might be advanced concerning this resemblance.

To these supreme deities they offer prayers and supplications only in times of great calamity. In their estimation they are so dignified, that they suppose it derogatory to attend to any matter of less importance than the illness of a chief, the calming of a boisterous storm, the preventing invasion, or averting the calamities of war. Among unenlightened people, the principles of hope and fear strongly operate, as well as among every barbarous tribe. Indeed, it is an incontrovertible fact, that in the rude state of the human mind, pain and dread are more powerful motives to religious veneration and homage than either gratitude or love. The house of the supreme deity of Otaheite is at Oparre, where the chief resides. The connection between religion and civil government has universally prevailed.

It is worthy of observation, that, in their daily adorations, more respect is paid to the inferior than to the superior gods. Each family pays their devout acknowledgments to their domestic guardian, supposed to be one of their departed friends, who, in consequence of his superior excellence, has been elevated to the rank of a god. They also believe in the existence of a malignant deity, who delights in injuring man, and is envious of his happiness. From the influence of this deity they believe that their domestic deity can defend them; and, therefore, they daily make their supplications to him. They are also firmly persuaded, that this deity can both inflict and remove personal and domestic affliction.

They believe in the immortality of the soul and the existence of a future state. In that state, however, they admit of no punishments; but suppose, that men enjoy a kind of rank and dignity, in proportion as they have acted towards the deities, when in this world. The departed souls of their ancestors they imagine to be raised to the dignity of gods; and to them they offer their confident prayers in the day of calamity. Such are their ideas of remunerative justice, that they look upon every unfortunate accident as the consequence of some criminal offence. Actuated by this principle, they send their peace-offering to the person offended, and by every conciliating measure seek reconciliation. The fear of death and veneration for their priests have also approached to high eminence. Per-

suaded of the virtue of the prayers of the priests, when they are afflicted with sickness, they send for them, and will cheerfully give them any thing they ask to supplicate the god in their behalf. Nature in this, as well as in every other climate, shrinks from death, and grasps at life. But, when all hope of life is gone, they will composedly take leave of their friends, recommending them to the guardian spirit, and entreating them to be more obedient and dutiful than they have been.

When the spirit departs from the body, they have an idea of its being devoured by the *Eatooa* bird, which frequents their burying-grounds and places of public worship. Departed souls, they imagine, are employed by the deity to attend other human beings, and to inflict punishments, or remove sickness, as merit or circumstances may require.

These deluded mortals suppose, that the manner in which the evil demon injures them is by entering into them, mingled along with their food, and so producing madness or some other disease; but they are, at the same time, fully confident, that their tutelar saint can prevent or remove these diseases; and they rejoice in the belief that their dread adversary can only exercise his power on this earth.

The stars are deemed the children of the sun and moon, and they suppose that they are begotten at the time of the eclipse of the moon. By the external appearance of the heavenly luminaries, they pretend to predict the approach of war, sickness, or other calamities.

The inhabitants of Otaheite have a tradition, that once the great gods, in their anger, broke in pieces the whole world; and that all the islands are but small parts of the great land, and that their island is the chief.

Another tradition is narrated from the high-priest, who is deemed the oracle of tradition in that country, as mentioned in the Missionary Voyage. "In the beginning," say they, "*Tane* took *Turoa*, and begat *Aye*, fresh water; *Aye*, the sea; *Awa*, the water-spout; *Matai*, the wind; *Arye*, the sky; and *Po*, the night; then *Mahammai*, the sun, in the shape of a man, begat *Oeroa Tabooa*; when he was born, all his brethren and sisters turned to earth; only a daughter was left, by name *Townoo*; she became the wife of *Oeroa Tabooa*, by whom she conceived thirteen children, who are the thirteen months, viz. *Papeeree*, *Ounoono*, *Oaroromooa*, *Paroromoree*, *Moreeha*, *Heiuiha*, *Ta'oa*, *Hoerogorerci*, *Hooreeama*, *Teayre*, *Tetai*, *Waeaho*, and *Weaha*.

"*Townoo* now returned to earth; and *Oeroa Tabooa* embraced a rock, called *Poppoharra Harreha*, which conceived a son, *Tetoobooamatahato*, after which the rock returned to its original state, and the fathers of the months died and went to dust. The son he left embraced the sand of the sea, which conceived a son, of the name of *Tee*, and

a daughter, called *Oheera*; then he also died and returned to the earth: *Tee* took *Oheera* to wife, who produced a daughter, *Oheera*. *Reene Moonoa*, the mother, died, and the father survived: in her illness she entreated her husband to cure her, and she would do the same for him, when he fell sick, and thus they might live for ever; but the husband refused, and preferred her daughter, whom, on her decease, he took for his wife. The daughter bore him three sons and three daughters: the sons, *Ora*, *Uauoo*, and *Tytory*; the daughters, *Henatoomorroora*, *Heuaroo*, and *Noowyra*. The father and mother dying, the brothers said, Let us take our sisters for wives, and become many. So men began to multiply upon the earth."

Such is the account given in the *Voyage of the Duff*; and it will readily occur, that there are several obscure allusions to some parts of the Mosaic history.

We shall add another tradition from the same author. "They entertain," says he, "a high idea of the power of spirits. In the beautiful and romantic view of *Taloo Harbour*, the remarkable peaked mountain is said to be but a part of the original one. Some spirits from *Ulietea* had broken off the other half, and were transporting it down the bay, in order to carry it away with them; but, being overtaken by the break of day, they were obliged to drop it near the mouth of the harbour, where it now stands conspicuous as a rock; for, like the elves and fairies of our ancestors, these spirits are supposed to walk and work by night."

The practice of moral duties in *Otaheite* has arrived at small perfection. Relative duties are, in numerous instances, grossly neglected, and mournful cruelty is exercised towards their infant offspring, in the destruction of many of them; while those whom they think proper to spare are indulged beyond what the good of society requires. It will readily be admitted that, devoid of revelation, proper morality is not to be expected: but, among some people destitute of revelation, this approaches nearer to pure morality than among others; and the morality of the south islands is very deficient. It is, however, but doing them justice to add, that, in respect of their worship, they reproach many who are called Christians. To use the words of the author of the *Missionary Voyage*—"You see no instances of an *Otaheitean* drawing near the *Eatooa* with carelessness and inattention; he is all devotion; he approaches the place of worship with reverential awe, uncovers when he treads on sacred ground, and prays with a fervour that would do honour to a better profession. While this is calculated to raise the blush of shame on the cheek of the formal Christian, it naturally excites our ardent wish that these simple partners of our nature were made acquainted with the sublime doctrines and precepts of the gospel."

Priestly honours and employments are divided among

two orders of men in the Southern Islands. The one called the priests of the morai, and the other of the *Eatooa*, or Supreme Deity. The latter are honoured with divine inspiration and the higher functions, and the former perform the less dignified offices of religion. These officiate in all the prayers and oblations performed at the morai, and their prayers are uttered in a low chaunting tone, which was formerly deemed a sacred language; but this mistake is now rectified, and it is fully understood that the obscurity originates from the mode of articulation.

As the sacerdotal and medical functions are here united, the priests have full employment; and, on all the more remarkable occurrences of domestic life, at births, deaths, festivals, and on all occasions of sickness, they are amply rewarded. Taking advantage of the credulity of their countrymen, they affect very extensive powers, and consequently render themselves the objects of dread and veneration. To promote conception, or occasion abortion, to inflict diseases, or remove them at pleasure, to render food pernicious, and sometimes actually to occasion death, are some of the powers which the *Otaheitean* priests appropriate to themselves. Nor is this baneful power ever called in question by their deluded votaries. It is, however, acknowledged, that this power does not extend to Europeans; because the priests are ignorant of the names of their gods and their grandfathers.

The following example of conjuration was shown to some of the English missionaries, when on a visit to *Tamarre*:—

A man presented himself in an old blue coat, turned up with red, his head encircled with numerous feathers, so as entirely to conceal his countenance. Thus arrayed, the conjuror ran up to the missionaries, making a squeaking noise, and addressing them in a jargon quite unintelligible, at the same time acting in such a ridiculous manner, that he appeared to be delirious. The Englishmen not appearing at all frightened, the natives told them it was the *Etooa ete*, or the little god, which had killed several of their countrymen. A dog, however, belonging to the missionaries, fell upon the priest, and obliged him to fly. He returned in a short time with a large club, threatening destruction to all around, and directing his vengeance particularly against the dog. In the midst of the affray, one of the missionaries seized his arm, and, lifting up the veil from his face, discovered a well-known character, who had been obliged to leave *Matavai* for theft.

This person seems to have been one of those called *Tahowra Etooa*, who affect inspiration. Of these, some pretend to belong to a particular deity, others to many: such as claim acquaintance with the three superior *etooas* are the most consequential, and procure high reverence from the part they presume to act; indeed, they do it with so much cunning and address, that the Swedes, who were found

s, who were found

on the island, as well as the mariners who preceded them, really believed the appearances supernatural, and that the devil actually was the agent. When they are called upon to consult the deity, they assume an odd fantastic dress, enriched with red and black feathers; to which they say the Etooa is so partial, that, on their approach to him thus, he descends to the earth at their call, in one of the sacred birds which frequent the morais, and feed on the sacrifices. As soon as the bird lights on the morai, the Etooa quits the bird, and enters the priest. He instantly begins to stretch and yawn, and rub his arms, legs, thighs, and body, which begins to be inflated, as if the skin of the abdomen would burst; his eyes are thrown into various contortions, sometimes staring wide, then half closed, then sinking into stupor; while, at other times, the whole frame is agitated, and appears to have undergone some surprising change. The speech now becomes low, the voice squeaking and interrupted; then, on a sudden, raised to an astonishing degree. He now speaks intelligibly, though affecting not to know what he says, nor the persons of those around him; but his words are regarded as oracular, and whatever he asks for the deity, or himself, is never refused, if it can possibly be procured. Of this the actor affects to have no consciousness; but his colleague and assistant takes care to minute the claims of the deity, and receives them from the person on whose account he was so condescending as to appear.

When the deity quits the inspired Tahowra, he does it with such convulsions and violence as leaves him motionless, and quite exhausted. This departure of the god is also so dexterously managed, as to happen at the time the sacred bird leaves the morai. On recovering his reason, the conjurer utters a loud shriek, and seems to awake from a profound sleep, as if unconscious of all that has happened.

The priests, who officiate for the lower orders, act in a similar manner, only varying according to circumstances and abilities. Women also arrive at sacerdotal honours, and officiate for the benefit of their own sex. To such a height has superstition arrived, that it is thought quite impossible for a child to come into the world without their assistance. The opulent have generally several priests and priestesses attending them when sick; and he who is deemed sufficiently fortunate to perform the cure is amply remunerated for his trouble.

The manner in which the priest approaches the house of the afflicted ought also to be mentioned. He provides himself with a young plantain, which he carries in his hand; and, previous to his entering the house, he offers up a prayer, fixes a leaf of the plantain in the thatch, and throws the remainder upon the roof.

The sacrifices and oblations of the South Sea islanders are both numerous and liberal. Before they partake of

any feast, a certain portion is invariably devoted to the god, and every part of the produce of the country is offered in sacrifice to appease the offended deities. Human victims are also offered upon extraordinary occasions, such as the inauguration of a young king, the dangerous sickness of a chief, the declaration of war, or any other emergency.

The human victim is selected in the following manner:—A priest having announced the necessity of a human sacrifice, the chief and his counsellors assemble to deliberate upon the unfortunate victims. These are, in general, persons guilty of great crimes, or strangers, who, having been offenders in their own islands, have fled thither from public punishment. The determination of the council is kept a profound secret; but, at midnight, the victim is dragged from his place of repose, and generally dispatched with one blow of a stone on the nape of his neck, to prevent any blemish in his body; for, according to their sacrificial law, a bone of him must not be broken, nor the corpse mangled. And if a man has been disfigured by any accident, he is unclean for ever, and cannot be offered in sacrifice. The mode of conducting a human sacrifice has been already described.

If the chief and his counsellors declare that they can find none in their district deserving death, or if they should refuse to provide a human sacrifice, in either case, they may substitute a hog in his place. They also suppose, that it greatly lessens the criminality and horror of the deed, that none but notorious criminals can be taken. But it may easily be conceived what a liberty is given to partiality, private enmity, and revenge.

The sacred ground around the morai affords a safe sanctuary to criminals of every description. Apprehensive of any danger of being selected for victims, they flee thither, and are perfectly safe. The habitations of the European missionaries are also deemed sacred, and afford protection to the guilty.

The form of government in the island of Otaheite is monarchical, and hereditary in one family; Temarre reigned, although a child, when Captain Wallis visited the island, and the queen his mother acted as regent. The king, her husband, quarrelled with her about the saving of his life, and, according to the custom of the country, retired to a private station, upon his son being born and declared king.

The manner of investing a young sovereign with the regal power is peculiarly interesting. On such an occasion the people assemble at the great morai; where the red sash of royalty, composed of net-work, and bordered with red and yellow feathers, is deposited. The public orator approaches, and, in a long speech, narrates the hereditary right to royal authority, and then invests with the regal cincture. If the chief of a neighbouring island

should be subdued, or reduced under his power, he first pays homage to the young king, who is carried upon men's shoulders, and surrounded by all his chieftains. The homage of a neighbouring chief is accompanied with a sacrifice of human victims, conducted from his own dominions in a canoe. From each of these the officiating priest cuts out one eye, and presents it to the young king, upon the leaf of a plantain-tree. During the time of his presenting this offering, he makes a long harangue, and the bodies of the victims are afterwards interred in the morai. The same ceremonies are performed by the chiefs of the different districts.

The king receives this present with his mouth open, as if devouring the human eye. Convinced that superiority of rank requires superiority of mental powers, they suppose that by this the king acquires additional wisdom; because the head is reputed the most sacred part of the body, and the eye the most sacred part of the head. Impressed with these superstitious notions, they imagine, that the eye is a proper representation of the wisdom of the people being transferred to the monarch.

The religious system of the country teaches, that the tutelar deity presides upon such a solemn occasion, for the express purpose of accepting the sacrifice; and, by the communication of the vital principle, strengthens and invigorates the mind of the young prince. The royal sash is afterwards deposited in the morai, along with the different canoes which brought the victims from different districts.

This solemn and horrid ceremony being ended, the king and his nobles repair to a feast provided with all that the country can afford. On such occasions they both eat and drink plentifully, and, in some instances, the public rejoicings are extended to the length of two months.

The king and queen are always attended by a numerous train of domestics and favourites, who are deemed sacred, live without families, and attend only on the royal pair: and it is a remarkable fact that the domestics of the king are frequently selected from among the baser sort.

The usual mode of carrying the king and queen is upon men's shoulders, and it is customary for them to lean upon the heads of their carriers. Their persons being deemed sacred, every person in their presence must uncover to the waist; and from this even the father and mother of the royal pair are not exempted. Every spot on which they tread becomes their own property; they therefore, only alight upon their own ground, and walk but very seldom. The king is absolute; yet, nevertheless, he lives in habits of great familiarity with his subjects.

A variety of ranks obtains among these islanders. The first rank is called *Earee Rahie*, which signifies a king, or supreme governor; the second is that of *Earee*, answering to the title of baron; the third, that of *Manna hoontes*, cor-

responding to that of vassal; and the fourth, that of the *Toutou*, including the lower orders of the people.

The first of these are held in the highest veneration by all ranks of men, to a degree approaching adoration; the second are lords of one or more districts, which they divide by lot among their vassals, who cultivate the portion they hold under them, and all the vassals are so firmly attached, that the cause of their lord becomes theirs, and they are ready to arm in his defence; nay, in general, the cause of one becomes the cause of all his district. But, although these vassals hold their lands of the baron, all the servile work is performed by the lower orders of society.

Both the king and barons are succeeded in their titles and honours by their children; and, what is very singular, they succeed to these dignities upon their birth, but their estates remain in the possession of their parents. In the time of war, each district furnishes a certain number of fighting men; and these are all subject to the direction of the sovereign.

It may be naturally supposed, that they have no written code of laws; but the crimes which call for public interference are few in number. Nothing similar to money is used as the general medium of commerce; neither can any permanent advantage be obtained by fraud or violence. But it is proper to add, that, in their uncultivated state, the want of distributive justice is not so severely felt as in more civilized countries.

During the minority of the king, his father acts as regent, and has the distribution of justice vested in his hands. Many of the barons exercise regal power in their own districts, although subject to the crown. The younger brothers of the king are next in dignity, and they have a competency assigned them suitable to their rank.

The owners of small estates have a power of laying a prohibition upon them; and this power, though sometimes abused, is frequently employed to salutary purposes. The principal objects of prohibition are hogs and other provisions. In some seasons, when fish is scarce upon the reef belonging to a particular person, he lays a prohibition upon his portion, by erecting at the extremities thereof two branches of a tree, with a white cloth suspended on them. This being done, no person ventures to fish within the prohibited boundaries; but, upon the restraint being taken off, an offering of a hog or a fish is made; the place becomes free, and great rejoicings ensue.

When these prohibitions are removed from a whole district, the chief makes a public entertainment, similar to an European fair, and every person carries home something, to shew that he has been there. Numerous presents are distributed on these occasions, but it is seldom that any whole article falls to the share of an individual; for they are all rent in pieces, and he who obtains the

largest piece is esteemed the best man. He who first catches a hog, carries him off; and if several members of a family carry off a canoe, it becomes their property.

The articles intended for distribution and for sport are all brought into one large spot, and the servants of the chief keep hold of the hogs, goats, and fowls, until the time appointed for the sport of letting them loose, to be caught by those of greatest strength and agility.

In the scale of rank, birth holds a particular eminence. A chief always retains his dignity; and although he should lose his command, be expelled from his district, or have his honours transferred to his child, still he continues noble and respected. But the road to eminence is open only to the lower ranks in the improved state of society; no mental endowments, therefore, nor any acquisitions whatever, can raise a man above the rank of a gentleman, in these uncultivated regions. It is alleviating, however, to add, that even the meanest are subjected to no slavish dependence.

The lowest class in society resemble European cottagers; and their principal employments are to cultivate the land, to build houses, to make cloth, and aid in any laborious employment; but their service is voluntary. They may change their chief at pleasure, and repair to another district, but still they remain in a servile state.

Custom appears to operate more than the fear of punishment in support of authority. For even the chief admits all to be his companions; and such freedoms are used, that, in respect of external appearance, he can scarcely be distinguished. The king himself often converses with the meanest of his subjects, and condescends to visit them. His retinue receive no wages, and they may leave his service at pleasure; some, however, remain in his family during life.

Experience proves, that, in the more simple state of men, the selfish and more sordid passions are not so predominant. It is, therefore, an undeniable fact, that, in the uncultivated parts of Europe, generosity and friendship reign with more universal sway than in the more refined circles; and human nature, displaying her usual efforts, appears all friendly and generous in the islands of the South Seas. There the inhabitants are profuse in their presents, and can scarcely refuse any thing that is solicited from them.

Almost under every government, indigence exposes to neglect and a certain degree of reproach; but, among this people, poverty never renders a man contemptible; and to be affluent, and at the same time avaricious, clothes a man with universal infamy and disgrace; nay, should any individual refuse to part with his provisions in time of necessity, his neighbours would suddenly rise against him, and destroy all his property. And such is the strength of generosity, or the force of custom, that they

will even part with their clothes, rather than be deemed avaricious.

This disposition in the southern mind operates strongly in respect of property. Tradition and land-marks supply the place of written records. Every man knows his own property, and he who should presume to encroach upon that of his neighbour would be considered as the basest of characters. When a man bequeaths his property to another upon his death-bed, witnesses prove the legacy, and it is held sacred. The property is equally secure in the absence as in the presence of the heir. The land-marks set by their ancestors speak a language that no man dares to resist. The father points out to his son the land-marks; and should any dispute arise concerning their decay or removal, multitudes are ready to prove the fact. Similar is the case in all disputes, for the matter is referred to a neutral person; and he who is declared in the wrong submits, and makes the offended an offering of a plantain-stalk.

*Customs, Manners, &c.]* The inhabitants of the Society Isles are, in general, of a larger make than the Europeans. Nourished with plenty, and fostered in indolence, the human body appears more vigorous and larger. The males are tall, robust, and well-proportioned; and some of them arrive at the height of six feet. Unlike the original inhabitants of America, they have long beards, which they wear in various forms. Their shoulders are broad, and their complexion conveys the idea of strength rather than beauty. Their features are so various, that it is very difficult to fix upon any general likeness which characterises them. They possess what are deemed good eyes and teeth, but the latter are not so well set, nor so white as among the Indian nations. Few of them, however, have that unpleasant thickness of lips so common to the natives of other islands. The initiatory rite of the He brews is generally practised among them, from a motive of cleanliness, and they upbraid those who do not adopt this custom. Contrary to the fashion of other countries, the men wear their hair long, and the women cut theirs short.

The women are less distinguished from the men by their features, than by their general form, which is destitute of the strong firmness of the latter. Though the features of some of them be very delicate, and a true index of their sex, yet the rule is not so general as in most other countries. Their shape is usually well proportioned, and some of them are perfect models of a beautiful figure; but the extraordinary smallness and delicacy of their fingers forms the most striking distinction of the Otahitean females.

The women of the higher class are above the size of English ladies; but those of the inferior rank are below the common standard, and some are uncommonly short

The obvious causes of this diversity are the circumstances in which the latter are placed. The natural complexion is a fine clear olive colour, and the skin delicately smooth and soft. Their faces are, in general, handsome, and their eyes full of vivacity. Their teeth are remarkably white and regular, their hair usually black, and their breath, in general, is perfectly sweet.

Their dress, like their persons, is widely different from that of Europeans. During the dry weather they wear cloth, and in the rainy season matting; but no shape is preserved in the pieces, nor are they sewed together. The women of superior rank wear three or four pieces; one, of a considerable length, they wrap several times around the waist, and allow it to fall down to the middle of the leg. Two or three other short pieces, with a hole cut in each, are placed in one another; and their heads coming through the holes, the long ends are suspended before and behind, both sides being open; by which means they have the free use of their arms. A piece of cloth, of the manufacture of the country, is frequently tied round the head, in the manner of a turban; and the women plait human hair, in a very curious manner, into long strings, which, being folded into branches, are sometimes bound by way of ornament upon their foreheads.

The men dress in a similar manner, differing only in this particular, that one part of the garment, instead of falling below the knees, is brought between the legs. This dress is worn by all ranks, the only distinction consisting in its quality. At noon, both sexes appear almost naked, wearing only a piece of cloth round the middle of their bodies. They shade their faces with a kind of bonnets, constructed of cocoa-nut leaves, which they dexterously weave in a few minutes. Both men and women wear earrings on one side, made of shells, stones, berries, and small pearls; the European beads, however, upon their arrival, soon supplanted these. Boys and girls go quite naked, the former to the age of five, and the latter to that of seven or eight. The children soon acquire strength to walk, and are not long in learning to swim.

All the inhabitants have a singular custom of staining their bodies, by indenting the flesh with a small instrument, made of bone, cut into short teeth; and the indentures are afterwards filled with a dark blue mixture, prepared of an oily nut and water. This operation, which is usually undergone about the age of twelve, is extended to different parts of the body, and the consequent pain is endured with singular resolution, because these marks are deemed peculiarly honourable.

This country is stored with plenty for the food and comfort of man. Both animal and vegetable food loads the tables of the natives. The vegetable chiefly consists of plantains, cocoa-nuts, bread-fruit, yams, and some others, that have been introduced by Europeans. And as the

soil is not only qualified to produce the vegetables of England, but also to rear them in great perfection, there is reason to hope that the kitchen-garden will soon increase in its productions.

The animal-food of the natives is very plentiful. Hogs are there in abundance, and their number is greatly increasing. The fowls common to this country load the table, and even dogs are highly relished. Hogs, fowls, and turtle, seem, however, to be considered as dainties, and are chiefly found on the tables of persons in the higher ranks of life.

Their cookery consists chiefly in baking, the mode of which deserves particular notice. When the bread-fruit is ripe, they make a large oven, and the chief summons all his dependents to bring a certain quantity of bread-fruit, against an appointed day, to his house. They are next sent to the hills, and every man brings a burden of wood; they then dig a hole, eight or nine feet deep, paving it in the bottom, and building it round with large pebbles; this done, they fill the hole with wood, and set it on fire, and when it is burnt, and the stones thoroughly consumed, they spread the embers on the bottom of the pit with long poles, and strew leaves at the bottom. Then the oven is thatched as quickly as possible with grass and leaves, and the earth which was dug out cast over the whole. After some days, it is fit for use, and, making an opening, they take it out as it is wanted: they use little else during the time it lasts.

The delight they have in this food has induced them to contrive means to preserve it, so that it may be used cold: this is done by making it into balls, and rolling it up in plantain-leaves. To such a perfection have they already arrived in this, that they will preserve it for several weeks.

Their drink is generally confined to water, or the milk of cocoa-nut. There is a kind of juice, however, called the kava, of which their chiefs and more opulent people drink; and the natives have sometimes been known to drink English liquors, until they have been inebriated; but, upon feeling its effects, they have carefully avoided repeating the same a second time.

The inhabitants of these islands begin their meals with the ceremony of washing the mouth, and some of them with an act of devotion: after this, they eat a handful of bread-fruit and fish, dipped in salt-water alternately, until the whole is consumed; they also take a sip of salt-water between every morsel. This dish is succeeded, among the chiefs, by a second course of plantains or apples, which are always peeled. After this, a soft fluid of paste is prepared from the bread-fruit, which they drink out of cocoa-nut shells, and this concludes their meal. Having thus refreshed themselves, they again wash their hands and their mouths. Mr. Banks says, these people eat an astonishing quantity of food at a meal, for he saw one of them

devour three fish, of the size of a small carp; four bread-fruits, as large as a common melon; thirteen plantains, seven inches long, and about half as large round; to all which he added a quart of paste, by way of drink. It is singular, however, that they are capable of enduring hunger to a great degree; and, notwithstanding their voracious disposition, they will voluntarily suffer want, rather than not afford plenty to a stranger. This fact affords an indisputable proof of the hospitality of their dispositions.

Although fond of society, they are quite averse to any conversation during the time of meals: and, indeed, they are so rigid in the observance of this, that even brothers and sisters have separate baskets of provision, and generally sit at the distance of some yards, with their backs to each other, when they eat, and do not exchange a single word during the whole time. The middle-aged, who occupy the superior ranks of life, usually go to sleep after dinner; but those who are more advanced in life seldom or never take that indulgence.

The horrible custom of human sacrifices is one of those uncommon facts, for the belief of which the mind requires the strongest evidence; therefore we shall accurately follow the narration given by Captain Cook, who, in order to obtain the strongest certainty, was present at one of the melancholy solemnities.

Having obtained leave of the king of the island, he set forward, with two other gentlemen, in a canoe, in which was placed a half-starved dog, and two or three red feathers, tied up in a tuft. A priest also went along with them, who was to assist in the solemnities. On their arrival at the morai, or burying-ground, the sailors were ordered to remain in the boat, and the captain and his companions were requested to uncover their heads. Several men and some boys went along with them, but no women were present.

They found four priests with their assistants waiting, and on their arrival the ceremonies commenced. The dead body was in a small canoe that lay on the beach, fronting the morai. Two priests, with several of their attendants, sat by the canoe, and the rest at the morai. The king of the island, with Captain Cook and his companions, stopped at the distance of thirty paces from the priests; and the crowd of spectators were placed at a greater distance.

After some time, one of the assistants of the priests approached with a young plantain branch, and laid it before the king, and another approached, bearing a small tuft of red feathers, twisted on some fibres of the cocoanut husk, with which he touched one of his majesty's feet, and afterwards retired with it to his companions. One of the priests at the morai now began a long prayer, and, at particular intervals, sent down young plantain-trees, which were placed upon the sacrifice. During the prayer, one of the natives stood by the priest, holding in his hands

two bundles, in which were the royal ensigns, and the ark of the deity. The prayer being ended, the priests at the morai, and their assistants, went off, carrying the two bundles, and placed themselves by the two priests who were upon the beach. Here prayers were renewed, and the young plantain-trees were taken off the dead body. The sacrifice was then wrapped up in cocoa-leaves and small branches, taken out of the canoe, and laid upon the bench. The priests surrounded the victim, some sitting, others standing, and one or more of them repeating sentences for about ten minutes. The body was next stripped of the leaves and branches, and placed parallel with the sea-shore. Then one of the priests, standing at the feet of the victim, uttered a long prayer, in which he was occasionally joined by others, each of whom held a tuft of red feathers in his hand. During the progress of this part of the service, some hairs were pulled off the head of the intended sacrifice, and the left eye taken out: these were wrapped up in a green leaf, and presented to the king; but, instead of touching them, he gave the bearer a tuft of red feathers, which, together with the hair and the eye, were taken to the priests. Not long after, the king sent another tuft of feathers, in the course of the last ceremony, and on a king's-fisher's making a noise, he turned to the captain, saying, "That is the *Eatooa*," or deity; and seemed to consider this as a favourable omen.

The body was next carried a little way, and laid under a tree, near which were fixed three thin pieces of wood, neatly carved. Some bundles of cloth were then placed on a part of the morai, and the tuft of red feathers laid at the feet of the sacrifice, round which the priests stood. The chief priest spoke for about a quarter of an hour, with different tones and gestures, appearing sometimes to expostulate with the dead, at other times asking him questions, and then making various demands. He then prayed about half an hour in a whining tone, in which he was joined by two other persons; and one of them, during the course of the prayer, plucked some hairs from the head of the sacrifice, and placed them upon one of the bundles; then the high-priest prayed alone, holding in his hand the tuft of feathers he received from the king. Having finished, he gave them to another priest, who prayed in like manner, and then all the tufts of feathers were placed upon the bundles of cloth, which terminated the ceremony at this place.

The victim was next conducted to the most conspicuous part of the morai, with the feathers and the two bundles of cloth, the drums in the meantime beating slowly. The bundles and the feathers were then laid against a pile of stones, and the sacrifice at the foot of them; while the priests again encircled the body and renewed their prayers, and their assistants dug a hole in the earth about two feet deep, into which they threw the victim; and covered it

with earth and stones. While they were depositing the body in the grave, a boy squeaked aloud; upon which the captain was informed, that it was *Eatooa*, or the god. Then a fire was kindled, and a half-starved dog produced, killed by the twisting of its neck, the hair singed off, the entrails taken out, thrown into the fire, and left to be consumed; but the kidneys, heart, and liver, were baked on heated stones. The victim, having been rubbed with the blood of the animal, was, with the liver, heart, and kidneys, laid down before the priests, who were seated around the grave, praying. They continued for some time uttering ejaculations over the dog, while two men at intervals beat very hard upon two drums, and a boy screamed in a loud shrill voice three times: this was intended to invite the *Eatooa* to feast on the banquet they had prepared for him.

When the priests had finished their prayer, the body of the dog, with the heart, liver, and kidneys, were placed on a scaffold, about six feet high, on which lay the remains of two other dogs and of two pigs, that had been lately offered. The priests and their attendants uttering a loud shout, the ceremony concluded for that day.

Early next morning, the captain and his companions were conducted to the morai, where the priests and a great multitude of people were assembled. The two bundles of cloth were in the place they occupied the former night, the two drums were in the front of the morai, and the priest stationed beyond them. The king placed himself between the drums, and desired Captain Cook to stand by him.

The ceremony recommenced with bringing a young plantain-tree, and laying it at the king's feet. The priests then prayed, holding in their hands several tufts of red feathers, and a plume of ostrich-feathers. The prayer being ended, the priests placed themselves between the Englishmen and the morai; and one began to pray, and continued about half an hour. During this prayer, the red feathers were put one by one upon the ark of the *Eatooa*. Then four pigs were produced, one of which was instantly sacrificed, and the other three were taken to a neighbouring sty.

The maro, with which the Otaheiteans invest their kings, was now taken out of a cloth, and spread on the ground before the priests. It was a girdle of about fifteen feet long and one foot and a quarter broad, and appears to be put on in the same way as those islanders wrap the piece of cloth round their middle. The ornaments of this royal robe were yellow and red feathers, ranged in two rows, in square compartments, so as to produce a very pleasing effect. They had originally been fixed upon a piece of cloth, manufactured in the island, and afterwards sewed to the upper end of the pendant which Captain Wallis left flying on the shore upon his first arrival at Matavai. The priest pronounced a long prayer, relative

to this part of the ceremony, and the badge of royalty was again folded up and put into the cloth.

The other bundle was next opened; but the English gentlemen were not permitted to approach sufficiently near to examine its mysterious contents. The intelligence obtained respecting it was, that it contained the *Eatooa*, or a representation of him. This sacred repository nearly resembles the ark of the God of Israel: its figure is circular, and one end considerably thicker than the other.

The pig which had been slain was now cleansed, and the entrails taken out. It happened to have many of those convulsive motions which frequently appear in an animal when killed, and this was considered as a very favourable omen by the spectators. Having been exposed for some time, the entrails were laid down before the priests, one of whom closely inspected them, and for this purpose gently turned them with a stick. When sufficiently examined, they were thrown into the fire; whilst the sacrificed pig, with the heart, liver, and kidneys, were put upon the scaffold, where the dog had been previously deposited; and all the feathers, except the ostrich-plume, being enclosed in the ark, the whole solemnity closed.

Four canoes lay upon the beach, opposite to the morai, all the time of the solemnity, which were intended to carry the things belonging to the *Eatooa*: and on the fore part of each was fixed a small platform, covered with palm-leaves, tied in mysterious knots.

The unhappy victim on these occasions is unapprised of his fate, and suddenly slain unawares. Some great chief fixes upon the victim, and sends one of his trusty servants to slay the person. The presence of the king is also needful on such an awful solemnity; it is called the "king's prayer;" and the place where such sacrifices are performed is usually the burying-place of the Otaheitean monarchs.

This horrid practice of offering human sacrifices can upon no principles whatever cease to be detestable; but if possible, it is rendered still more abominable by the levity and indifference attending it. Instead of the mind being impressed with solemn reverential awe, the multitude remained unconcerned spectators; and even the priests, when not directly employed, displayed the most shocking insensibility. They conversed familiarly together, and the only decorum observed was, to defend the consecrated spot from the populace and the English strangers.

It is proper, however, to mention, that they are open and candid in answering any questions which are put to them concerning their religious system. Being asked, what was the design of this inhuman institution? they replied, that it was an ancient custom, and highly pleasing to their god, who came and feasted upon the sacrifice, in consequence of which he answered their prayers. When it was objected, that he did not certainly feed on these, as he

on these, as he

was not seen to do so, nor were the bodies of the conse-  
crated animals seen consumed, and that the interring pre-  
vented his feeding upon the human sacrifice,—they replied,  
that he came in the night invisibly, and fed only on the  
soul or immaterial part, which, they say, remains about  
the place of sacrifice until the carcase is totally wasted by  
putrefaction.

It is highly probable, that human sacrifices prevail in  
all or most of the South Sea islands, however separated  
they may be; and although it appears that not more than  
one of these are devoted at once, yet they occur so fre-  
quently, that they certainly make great havoc of the hu-  
man race; for Captain Cook counted no less than forty-  
nine skulls of former victims lying before the morai, and  
none of them had suffered any considerable decay.

But that of human sacrifices is not the only horrid cus-  
tom prevailing in the southern isles. For, besides cutting  
out the jaw-bones of their enemies slain in battle, and car-  
rying them about as trophies of their victory, they in some  
measure sacrifice the whole of their bodies to the god of  
the country. Whenever they have gained a victory in bat-  
tle, they collect all the dead; and bringing them to the  
morai, they dig a large hole, and, with great form and ce-  
remony, bury them as so many offerings to their divinities.

If any of their own chiefs fall in battle, their bodies  
are brought to the morai, where the priests cut out their  
bowels before the great altar, and their remains are after-  
wards interred, near a great pile of stones. The common  
men, who lose their lives in battle, are interred in one  
large hole, dug at the foot of the pile. This is done the  
day after the battle, amidst a great concourse of people,  
with much pomp and ceremony, as a thank-offering to the  
Eatooa for their success.

There is another base custom, that prevails in a society  
composed of a certain class. These having no concern  
in the government, or any distinct property, associate for  
their own amusement, and that of the public. They travel  
from place to place, and from island to island, not unlike  
the strolling players in England. These admit of no mar-  
riages, and no married people can obtain admittance into  
their society. It is also a rule among them never to be  
encumbered with children: and if any of the women hap-  
pen to be pregnant, they must either secretly murder their  
offspring, or endure the shame of being expelled the so-  
ciety. It appears, however, that the circumstances of an  
indiscriminate connection among these islanders is either  
misunderstood or greatly exaggerated; for those acts of  
lewdness, which have so generally stained the character of  
these islanders, are chiefly to be ascribed to the brutal  
conduct of European sailors.

Marriage appears to be performed among these people  
without any religious formality, but various ceremonies  
ensue. If a woman be a virgin, the father and mother

present an offering of a hog or a fowl, and plantain-tree,  
to their son-in-law, before they can touch any of his pro-  
visions; but if the woman be a widow, or separated from  
her former husband, this ceremony is dispensed with. The  
relations of the bride make a present of hogs, cloth, and  
other articles, to the new-married pair. So long as they  
agree, they live either on the husband's or the wife's estate;  
but, if they separate, each retains their own property.

When a woman marries, she immediately provides her-  
self with a shark's tooth, fastened, with the gum of the  
bread-fruit, upon an instrument, which leaves about a  
quarter of an inch of the tooth bare, resembling a lancet,  
for the purpose of wounding the head. Some have two  
or three teeth, and, when struck forcibly, they bring blood  
in copious streams; according to the love they bear the  
party, and according to the violence of their grief, the  
strokes are repeated on the head. To such a degree has  
this ridiculous practice been sometimes carried, that a  
fever has ensued, and terminated in lunacy. If any acci-  
dent happen to the husband or his relations, and even if  
his child fall down and hurt itself, the shark's tooth is  
immediately seized, and, through the use of this instrument  
and the violence of grief, the blood and tears of the  
mourner soon mingle. The child succeeding to the ho-  
nours of the family, any insult offered to him is more  
deeply felt by the parents than if done to themselves.  
And, should the child die, the house is immediately filled  
with the relations, wounding their heads and making bitter  
lamentations.

Grief is a strong and powerful emotion in the mind, and  
generally most violent in the uncultivated state of human  
nature. Thus the inhabitants of the southern isles express  
their grief by the most violent emotions, and it is from  
the custom of beating their faces upon these occasions that  
originates the mark which most of them have upon their  
cheek-bones. The repeated blows inflicted by them upon  
this part, rub off the skin, and cause some blood to flow  
out; and, when the wound is green, it resembles a hollow  
circle made by burning.

On some more calamitous occasions, they cut this part  
of the face with an instrument. This, however, is prin-  
cipally confined to the chiefs. When any person of qua-  
lity who was related to them dies, they burn their temples;  
on the death of a mother, the mark is made upon the left  
side; on the death of a father, it is made upon the right  
side; and on the death of the high-priest, the first joint  
of the little finger is amputated.

Parents, upon the death of their children, besides other  
tokens of grief, cut their hair short upon one part of their  
head, leaving the remainder long. This frequently forms  
a square patch on the forehead, but is sometimes left in  
its usual state, and all the rest of the hair cut off. Some-  
times a bunch is left over both ears, at other times over

one only; and sometimes one half is clipped quite close, and the other left to grow long. These signs of mourning are often prolonged for two or three years.

The manner of treating their women in child-bearing is peculiarly pernicious. When a woman brings forth a child, a kind of hut is raised in the house, with cloth and matting; heated stones are then placed, with sweet herbs and grass spread over them; water is afterwards poured upon them; and the woman is closely shut up in the steam, which rises till she be in a strong perspiration, and can endure the heat no longer. Hastening from this vapour-bath, she plunges in the river; and having washed herself, she puts on her clothes, and takes the child to the morai. This often brings on an ague: but such is the strength of prejudice, that no arguments can persuade them to abandon a practice so injurious to their health.

A temporary house is erected on the sacred ground adjoining the morai; where the mother and the child remain for a certain time, and the father usually makes an offering of a young pig or a fowl, with a plantain-tree. The period of seclusion for a male is two, and for a female three weeks; during which time the mother touches no food, but is fed by another: and, should any person inadvertently touch the child in this period of seclusion, he must undergo the same restrictions, until an offering of a young pig or fowl be presented, which finishes the ceremony of separation.

The child is then removed to another temporary house, in which the father and the mother reside; but, according to the prejudices of the country, they may not touch the child in the same clothes in which they take their victuals. To remove this prohibition, a second offering must be made by the father and uncles, a third by the mother and aunts, a fourth before the child returns to the house where the father and uncles eat, and a fifth on the same account, for the mother and aunts.

If the child happen to touch any thing previous to the termination of these days of purification, it is deemed sacred; and if any thing touch the child's head before the offering of purification, it must be instantly deposited in a consecrated place; but should it be a branch of a tree, the tree must be cut down; and if, in its fall, it penetrate the bark of another tree, that must also be cut down, because reckoned unclean.

No small degree of respect is displayed towards a chief when he travels. When a chief or stranger of superior rank comes from another island, all those of his own rank present their peace-offering. There are also large and spacious houses erected for the reception of strangers; to one of which the noble visitor is conducted; the chiefs of the district assemble round him, attended by a priest, who offers up a long prayer, and having several young plantain-trees, he places a bunch of red feathers on one of these,

and, with a pig or fowl, lays them at the stranger's feet, who takes the feathers, and fixes them in his ear, or among his hair. The inferior priests repeat a similar offering, and a feast is immediately provided with the usual presents. When one of the higher class visits any place, he is sure to find a numerous body of men waiting to receive him; the preparations are sumptuous, and he may every day have a repetition of feasts, without any diminution in respect of plenty or a welcome reception. The force of example is also so powerful among the lower order, that they frequently manifest their hospitality, when they can very ill afford it.

The singular custom of exchanging names also obtains among these islanders. This often produces considerable embarrassment to strangers, so that the persons with whom they were formerly acquainted may soon be unknown to them. The names of places and things continue, unless they happen to consist of syllables containing the king's name; and, should this be the case, they are changed during his life-time, and upon his death the common name is resumed.

Another singularity among these islanders is disrespect for old age. The writer of the *Voyage of the Duff* informs us, that a venerable priest, grandfather to the king, was scarcely noticed by those who visited Captain Wilson. And on that occasion one of the aged seamen was frequently the object of their derision. The reverse, however, appears to be the case at Tongataboo; for there the younger persons observe a respectful silence in the presence of the aged.

It is customary to preserve the bodies of the chiefs, and even those of their children. This is done by taking out the viscera, drying the body with a cloth, and anointing it, both internally and externally, with perfumed oil, which operation is frequently repeated. The agent is consequently deemed unclean, and may not touch provisions for the space of a month. The relations of the deceased perform their part of the funeral-rite, by presenting the corpse with a piece of cloth and some provisions. They indulge their superstition yet farther, by acting some of the more tender and affectionate scenes of life anew before the corpse. The shark's tooth is frequently employed, and the garments of the dead stained with the flowing blood. During the continuance of any noxious smell, they cover the body with garlands of flowers, and anoint it with sweet-scented oil.

Upon the death of a king or chief, the corpse is carried to every part where he had property, or where his particular friends reside; the funeral-ceremonies are repeated; and, after the regular tour, the body rests at the place of his usual residence. These preserved bodies are kept above ground, and are liable to be taken prisoners in war. Nay, the person who seizes the body of a chief

tain has a right to assume his name; consequently, in the time of war, these are conveyed to the mountains: and it is customary also to take Captain Cook's picture along with them, because the loss of it would be equally afflictive as that of a chief; nay, the conqueror might, according to their law of succession, lay claim to the district allotted him.

Our readers may probably be gratified with the narrative of the following ceremony. According to the editor of Cook's Voyages, Mr. Banks being informed that he could not be present unless he performed a particular part, consented thereto, rather than not have his curiosity gratified. Accordingly, he repaired in the evening to the place where the body was deposited, and was there joined by the relations of the deceased, and afterwards by some other persons. The principal mourner had a very whimsical dress, although not altogether ungraceful.

Mr. Banks was constrained to change his European dress, and had no other covering than a piece of cloth bound round his waist. His body, and the bodies of several others, were blacked over with charcoal and water, and among the company were some females.

The funeral-procession then commenced, and the chief mourner, on approaching the body, uttered some words, which were judged to be a prayer; and he repeated these words as he came up to his own house. They then went on, by permission, towards the fort. It is usual for the rest of the natives to shun these processions as much as possible; and, therefore, they ran into the wood immediately upon the view of the funeral.

From the fort, the mourners proceeded along the shore, crossed the river, entered the woods, and passed several houses, from which the inhabitants fled, and not a native was seen during the remainder of the procession. Those who assisted at the ceremony bathed in the river, and then resumed their former dress.

The predilection for music is very strong, and the mode of performing singular in the southern world. The musicians perform on an instrument somewhat resembling a flute; but the performer blows with his nostril, instead of his mouth, and he is accompanied by others singing a certain tune. The principles of his art are few, and these very imperfect.

There are also a kind of itinerant musicians, who afford entertainment to their countrymen by a rude concert of drums and flutes. The drummers sing to the music; and it was the cause of no small astonishment to the English, that they were the subject of their song. It is, therefore, obvious, that these songs must have been extempore effusions; which evinces that, in some, the power of ready invention is singularly strong, even among these untaught natives. These songs consist of only two lines, and are frequently sung for evening amusements between sunset

and bed-time. During this period, they burn candles made of an oil-nut, fixing them one above another upon a small stick that is run through the middle. Some of these candles will burn a long time, and afford a very tolerable light.

The drums used in musical entertainments are formed of a circular piece of wood, hollow at one end only, which is covered with the skin of a shark, and beaten with the hand, instead of a stick.

These islanders are for the most part dexterous wrestlers. In challenging each other to this combat, they strike the bend of the left arm, and, if left-handed, they reverse the stroke. The bended arm receives the hand upon its cavity, and emits a loud report. The man who accepts the challenge throws both his arms forward to seize his antagonist. Sometimes a few engage in these combats, and sometimes a whole district. When the latter happens to be the case, both men and women wrestle, and the females are always honoured with wrestling first. The late visitors of that part of the world inform us, that the queen excelled in this amusement; and when the women of any district are victorious, they immediately strike up a dance. The queen usually determines the number of falls which shall ascertain the victory, nor do the vanquished manifest the least dissatisfaction. It is true, indeed, that, in consequence of the warmth of the female temper, the women usually bear their disappointment worse than the men, and exhibit stronger signs of anger at being overcome. When any one throws his antagonist, he walks round the spectators, clapping his hands, and the vanquished party retires in silence.

Feasts of wrestling are sometimes performed for public entertainment. Captain Cook was entertained with one of these, upon a visit to a chief. He and his associates were conducted to a court-yard, near the house of the chief, who was placed at the upper extremity of the area, and several of the principal men on each side, who appeared to be the judges of the contest. Ten or twelve combatants entered the area; after the usual modes of challenging, they engaged, and each endeavoured to throw his antagonist by mere strength. Seizing each other by the hand, or some other part of the body, artfully grappling until one, either by having a greater hold or possessing stronger muscular force, threw the other on his back.

One engagement succeeded another; but, if the combatants could not throw each other in the space of a minute, careful that even these wrestlings should be attended with no injury, they then parted, either by consent or by the intervention of friends. A man, with a large stick, officiated as master of the ceremonies, and severely beat those who rashly pressed forward.

During these athletic sports, another party of men per-

formed a dance. But neither party took the least notice of each other, their whole attention being only engaged to please and to conquer. Equally careful to avoid injury, this contest only continued about the space of a minute. In this circumstance, the Otaheiteans exceed both the Roman and the European wrestlers, who continue till the body is injured, if the life be not taken away.

\*The science of defence is greatly cultivated among them, a wound in battle conferring no honour, but rather disgrace. From their earliest years they are practised in this art. They frequently exercise at quarter-staff, and soon become expert at defending the head and every other part of the body.

The sling constitutes one of the boyish sports of Europe, and those children in improvement manifest a strong partiality for this amusement. Nor has the want of proper materials for slings prevented the enjoyment of this pleasure. Invention has enabled them to plait the fibres of cocoa-nut husk. These slings have a loop for the hand in one end, in order to keep the sling fast, when they discharge the stone, and a broad place is constructed for the reception of the stone. In charging the sling, they hold it round their shoulders, keeping the stone fast with their left thumb, and, jumping, swing the sling three times round their heads, holding the left hand grasped on the wrist of the right; and thus they discharge the stone with a force sufficient to enter the bark of a tree at two hundred yards distant, the stone flying at an equal distance from the ground all the way.

Their bows are constructed of porow, and their arrows of small bamboos; the bark of the roava affords them bow-strings; with these they contend, not at a mark, but for the greatest distance. The bow is never honoured with employment in war, but the sling appears in that destructive science. Since they have learned the use of fire-arms from the Europeans, they have become excellent marksmen. It is a singular fact, that, as in more cultivated nations, the sportsman and the hunter have a dress peculiar to that employment, so these islanders have a dress sacred to the game, and never worn but on such an occasion:

The javelin succeeds to the sling and bow. It is from eight to fourteen feet long, and pointed with palm-tree wood. They hold the javelin in the right hand, and pitch it over the fore-finger of the left hand, in which position they will hurl it with great exactness against a mark set up at the distance of thirty or forty yards. As one district in the highlands of Scotland was formerly accustomed to contend against another in playing at the ball, so one district of the southern world, in their present rude state, often contend against each other in throwing the javelin. Nor are the females exempted or less eager than the men. The only prize is, that the district in which the game is played affords an entertainment. It is proper, however,

to remark, that the women and the men contend separately: the women combat with women, and the men with men.

Swimming is another exercise, of which they are extremely fond. Those who live in the vicinity of the sea, or upon the brink of a river, universally manifest a partiality to swimming: The insulated situation of these men invite to this employment, which they have carried almost to incredible perfection. The children learn to swim almost as soon as they learn to walk; and, therefore, gradually arrive at perfection. Swimming in the surf is an amusement in high repute with both sexes, and the entertainment is estimated in proportion to the largeness and violence of the surf.

## SECTION VII.

### THE FRIENDLY ISLES.

This groupe extends chiefly from south-west to north-east, including the Feejee Isles, those called the Isles of Navigators, and several detached isles in a more northerly position. The name was imposed by Captain Cook, in testimony of the disposition of the people; but they had been discovered by Tasman, in 1643, who called the chief island, now styled by the native term Tongataboo, by the name of Amsterdam.

In the Missionary Voyage, 1797, there is an interesting map of this island, which appears to be a plain country, in an universal and surprising state of cultivation, the whole island consisting of enclosures, with reed fences, about six feet high, intersected with innumerable roads. The whole is such a picture of industry as to form a reproach to nations who call themselves civilized. The length of Tongataboo is only about sixteen miles, by about eight at its greatest breadth. On the north side there is a lagoon, with several isles, constituting a tolerable harbour.

*Soil, Climate, and Productions.* The soil is every where prolific, and consists of a fine rich mould, upon an average about fourteen or fifteen inches deep, free from stones, except near the beach, where coral rocks appear above the surface. Beneath this mould is a red loam, four or five inches thick; next is a very blue clay, in small quantities; and in some places has been found a black earth, which emits a very fragrant smell, resembling bergamot, but it soon evaporates, when exposed to the air. The air is pure and wholesome, much sharper in winter than would be imagined, particularly when the wind is from the southward.

No other domestic animals were seen on this island, but hogs, dogs, and fowls; the former of the same sort as at the other isles in this sea; but the latter are far superior, being as large as any in Europe, and their flesh equally

good, if not better than ours. Rats were exceeding numerous. There are water-doves, lorises, parrots, parakeets, a variety of birds, and a variety of insects, which the natives call the mission.

Cook have been gored by the hogs, and have lost any bad accident, and three or four of the crew except one young man.

Captain Wilson, the missionaries, and the dog, of which there were several.

This island abounds with cocoa-nut-trees, and produces a variety of materials for building, such as shallocks, yam, cane, nutmegs, Ceylon, and a few figs, and, and, and, called *vacoua*, the pepper-tree, which produces their intoxicating drink, *pūs edulis*, produced from its fruit, bruised: its flavor is very strong. Forster, the naturalist, found the same pepper-tree in the neighbouring islands, and cultivation of it with this difference, whereas the whole of the island is in perfection.

*Customs, Manners, and the middle stature of the people are well proportioned to such indolent lives; and when the sailors, they always are various; nor like, unless it is the common complexion, chestnut-brown, and some may be the effect of the women, in their bodies and limbs, particularly distinguishing*

good, if not better. But few dogs were seen, as they were exceedingly desirous of those which were on board the ships. Rats were in great abundance. They have also a species of the lizard, which they esteem a dainty food. There are water-snakes, about thirty inches long, but they are not venomous. The land-birds are pigeons, turtle-doves, lorises, rails, wild ducks, resembling our widgeons, parrots, parroquets, owls, bald crows, with a blue plumage, a variety of small birds, and large bats in abundance, which the inhabitants say are very good eating.

The missionaries relate, that the cattle left by Captain Cook have been destroyed. The horse and mare were gored by the bull, and put them in great terror: to prevent any bad accident, they destroyed him, and also the cow and three calves, which were all they had produced, except one young bull, which was sent to Fejee.

Captain Wilson, in his second visit to this island, left to the missionaries eight goats, three cats, and an English dog, of which the islanders are very fond.

This island abounds with the bread-fruit, cotton-trees, cocoa-nut-trees, paper-mulberry, the bark of which furnishes materials for making cloths, plantains, bananas, shaddockes, yams, sweet potatoes, and other roots; sugar-cane, nutmegs, which are not so aromatic as those of Ceylon, and a fruit like a nectarine, called, by the natives, *figheea*, and, at Otaheite, *ahcege*: there is also a plant called *vacoua*, the leaves of which serve for making mats. The pepper-tree is also much esteemed, as from it is produced their intoxicating liquor, called kava. The *inocarpus edulis* produces a fruit, which the inhabitants eat bruised: its flavour is much like that of the chesnut. Mr. Forster, the naturalist, told Captain Cook, that he not only found the same plants here that are at Otaheite and the neighbouring islands, but several others. The produce and cultivation of Tongataboo is the same as at Eooa, with this difference, that a part only of Eooa is cultivated; whereas the whole of Tongataboo is in a high state of perfection.

*Customs, Manners, &c.*] The men, in general, are of the middle stature, though some measured six feet. They are well proportioned, and, though muscular, they lead such indolent lives, that they are incapable of making great efforts: and when they made trial of strength with the sailors, they always had the disadvantage. Their features are various; nor are they characterised by any general likeness, unless it be a fulness at the point of the nose. The common complexion of the natives is mahogany, or chesnut-brown, and black hair. Some are of an olive-colour; and some of the women are much fairer, which may be the effect of being less exposed to the sun.

The women, in general, are not so tall as the men: their bodies and limbs are well-proportioned; and what particularly distinguishes them is, the uncommon smallness

and delicacy of their fingers, which may be put in competition with any of the Europeans. Their hair, in general, is black. Different colours were found amongst the men, sometimes on the same head, caused by something they put upon it, which stains it white, red, and blue. Both sexes wear it short: but two exceptions to this custom were seen, and most of them combed it upwards. Many of the boys had it cut very close, except a single lock on the top of the head, and a small quantity on each side. The men cut or shave their beards quite close; which operation is performed with two shells. They have fine eyes, and, in general, good teeth, to an advanced age. The custom of tattooing, or puncturing the skin, prevails: the men are tattooed from the middle of the thigh to above the hips. On the tenderest part of the body are marked configured scars, which must be very painful, as well as dangerous. The chiefs are exempted from this custom; the women have it only on their arms and fingers; and there but very slightly.

What particularly characterises these people is, that most of them want the little finger on one, and sometimes on both hands; nor did the difference of age or sex exempt from this amputation, for the very children were observed to have suffered that loss. They suppose that the little finger will be accepted by the deity as a kind of propitiatory sacrifice, sufficiently efficacious to procure their recovery. In cutting it off, they make use of a stone hatchet. There is scarcely one person in ten who is not thus mutilated; and they sometimes cut so close, as to incroach upon that bone of the hand which joins the amputated finger. It is also common for the lower class of people to cut off a joint of their little finger, on account of the sickness of the chiefs to whom they respectively belong. They had also a round spot on each cheek-bone, which appeared to have been burned, or blistered. On some it appeared to have been recently made; on others, it was covered with scurf, and the mark was slight, but the reason of it was mysterious.

The lobes of the ears are perforated with two holes, in which they wear cylindrical pieces of ivory, stuck through both sides of the holes. Some use reeds, filled with a yellow pigment. This seems to be a fine powder of turmeric, with which the women rub themselves all over, in the same manner as the European females use rouge upon their cheeks.

The language of the natives of the Friendly Islands bears a striking resemblance to those of New Zealand and the Society Isles. The pronunciation, however, differs, in many instances, from that of Otaheite and New Zealand; but a great number of words are either very little changed, or exactly the same; so that the difference is not greater than what is found betwixt the most northern and western parts of England. The language, as spoken

by the Friendly Islanders, is sufficiently copious to express all their ideas; and, being tolerably harmonious in common conversation, is easily adapted to music. They have terms to signify numbers as far as a hundred thousand, beyond which they either would not or could not reckon.

With respect to disposition, the natives possess many excellent qualities; their bounty and liberality to strangers is great, and their generosity to each other unequalled. When they kill a hog, or make any mess for themselves, they always send part to their friends, who return the favour as soon as circumstances permit; this keeps up a constant friendship among them, which is seldom interrupted by quarrels.

Their honesty to one another seems unimpeachable; though there is no reason to think that the accounts of their dishonesty to strangers are at all exaggerated; as, in this instance, they have an universal and unconquerable propensity to theft. Upon most occasions, the females shewed a strong propensity to pilfering, in which they were full as expert as the Otaheiteans. The murder of children, and other horrid practices, which prevail among the Otaheiteans, are unheard of here.

The natives of these islands are much commended for their cleanliness; they bathe frequently in ponds, which seem to serve no other purpose. Though the water in most of them is nauseous, they prefer them to the sea, imagining that salt-water hurts their skins. When they bathe in the sea, they commonly have some cocoa-nut shells filled with fresh water poured over them, to wash the salt-water off. The cocoa-nut oil has an admirable effect on the skin, in rendering it smooth; for which they hold it in such estimation, that they not only pour a great quantity of it upon their heads and shoulders, but rub the body over with it.

The dress of men and women is much the same, and consists of a piece of cloth, or matting, about two yards wide, and two and a half long, so as to wrap in great abundance round the waist, to which it is confined by a girdle or cord. In front it is double, and hangs down, like a petticoat, as low as the middle of the leg. This is the general dress; but large pieces of cloth and fine matting are worn only by those of superior rank. The inferior class are satisfied with small pieces, and often wear nothing but a covering made of leaves of plants, or a narrow piece of cloth, or matting, like a sash. This they pass between the thighs, and wrap it round the waist; but the use of it is chiefly confined to the men. From the waist upwards they are generally naked. They have various dresses made for the purpose of their grand entertainments; but the form is always the same; and the richest are adorned, more or less, with red feathers. Both sexes sometimes screen their faces from the sun with little bonnets.

The sexes differ as little in their ornaments as their clothing. Of these the most common are necklaces, made of various sweet-scented flowers, which go under the general name of *kabulla*; they have also bracelets of bone, shells, and beads of mother-of-pearl, tortoise-shells, &c. which are worn by both sexes, loose upon the breast. The women wear on their fingers rings, made of tortoise-shells, and pieces in their ears, about the size of a small quill; but ornaments for the ears are not commonly worn. They have also a curious apron, made of the outside fibres of the cocoa-nut shells, and composed of a number of small pieces, in such a manner as to form stars, half-moons, little squares, &c.: it is studded with beads of shells, and covered with red feathers, so as to have a pleasing effect.

They do not discover much taste or ingenuity in building their houses; though the defect is rather in the design than in the execution. Those of the lower people are poor huts; those of the better are larger and more comfortable. Their houses, properly speaking, are roofs or sheds, thatched with the leaves of the palm-tree, and supported by posts and rafters, disposed in a tolerably judicious manner. The floor is a little raised, covered with a strong thick matting, and kept very clean. A house of a middling size is of the following dimensions, viz. about twelve feet in height, twenty in breadth, and thirty in length. Some of their habitations are open all round, but the major part of them are inclosed on the weather-side with strong mats, or with branches of the cocoa-nut tree, plaited or interwoven with each other. The entrance of their houses are so low, that a person cannot enter but by stooping, and supporting himself by his hands. A thick strong mat, of two or three feet broad, bent into the form of a semicircle, and set upon its edge, with its ends touching the side of the house, in shape resembling the fender of a fire-hearth, encloses a space for the master and mistress of the family to sleep in. The latter, indeed, spends most of her time during the day within it. The rest of the family sleep upon the floor, wherever they please to lie down, the unmarried men and women apart from each other. If the family be large, there are small huts adjoining, to which the servants retire in the night; so that privacy is as much observed here as can be expected. They have mats made on purpose for sleeping on; and the clothes they wear in the day serve for their covering in the night.

Most of their houses are built in the plantations, and they have areas before them, generally planted round with trees, or ornamental shrubs, whose fragrant perfume the air.

Their whole furniture consists of wooden stools, which serve them for pillows; baskets of different sizes, in which they put their combs, fish-hooks, and tools; two or three

wooden bowls, in which they make kava; some cocoa-nut shells, a few gourds, and a bundle or two of cloth. Their chief articles of animal food are hogs, fish, and fowls; but the common people frequently eat rats. Their hogs, fowls, and turtle, are dainties served for people of rank. Their food is, in general, dressed by baking; and they make from different fruits several dishes, which are very good. They sometimes boil their fish in the green leaves of the plantain-tree, which serve as a bag to hold both fish and water: having tied them up, they wrap them again in three or four other leaves, and place them upon stones heated for that purpose: when they are sufficiently done, they not only eat the fish, but drink the liquor or soup.

A dish much in request among the chiefs is called *hoti*, and is made in the following manner: They first pour cocoa-milk into a wooden bowl, then scrape out the kernel with a shell; gee-root is bruised into the milk, and remains till the latter has imbibed a delicious sweetness from it; the root is then taken out of the milk, and the kernel mixed up with it, and this makes a rich dish.

They are not cleanly either in their cooking or manner of eating. Their usual drink at meals is water, or cocoa-nut milk, kava being only their morning beverage. The food that is served up to the chiefs is generally laid upon plantain-leaves. The king, at his meals, is commonly attended by three or four of the natives, one of whom cuts large pieces of fish, or the joint; another afterwards divides it into mouthfuls; and the rest stand by with cocoa-nuts, or whatever else he wafits. The women are not excluded from taking their meals with the men; but there are certain ranks that are not allowed either to eat or drink together.

Their canoes, in point of neatness and workmanship, exceed every thing of the kind in the South Sea. They are built of several pieces, sewed together with bandage, in so neat a manner, that on the outside it is difficult to see the joints; all the fastenings are on the inside, and pass through ridges, which are wrought on the edges and ends of the several boards which compose the vessel, for that purpose. They are, in general, of two kinds: the single ones are from twenty to thirty feet long, and about twenty or twenty-two inches broad in the middle; the stern terminates in a point, and the head is something like the point of a wedge. At each end is a kind of deck, for about one-third part of the whole length, and open in the middle. In some, the middle of the deck is decorated with a row of white shells, stuck on little pegs, wrought out of the same piece which composes it. These single canoes have all out-riggers, and are sometimes navigated with sails, but more generally with paddles, the blades of which are short, and broadest in the middle. The two vessels which compose the double canoes are each about sixty or seventy feet long, and four or five broad in the

middle; each end terminates nearly in a point, so that the body or hull differs a little in construction from the single canoe, but it is put together exactly in the same manner; the single canoes having a rising in the middle round the open part, in the form of a long trough, which is made of boards closely fitted together, and well secured to the body of the vessel. Two such vessels are fastened to, and parallel with, each other, about six or seven feet asunder, by strong cross-beams, secured by bandages to the upper part of the risings above mentioned; over these beams and others, which are supported by stanchions fixed on the bodies of the canoes, is laid a boarded platform. All the parts which compose the double canoe are made as strong and light as the nature of the work will admit, and may be immersed in water to the very platform, without being in danger of filling. Nor is it possible, under any circumstance, for them to sink, so long as they hold together. Thus they are not only made vessels of burden, but fit for distant navigation; they are rigged with one mast, with steps upon the platform, and can be raised or taken down, and are navigated with a latteen-sail, or triangle once, extended by a long yard, which is a little bent. The sail is made of mats; the rope they make use of is laid exactly like ours; on the platform is built a little shed or hut, which screens the crew from the sun and weather, and serves for other purposes. They also carry a moveable fire-hearth, which is a square, but shallow, trough of wood, filled with stones. The way into the hold of the canoe is from off the platform down into a sort of uncovered hatchway, in which they bail out the water. Their eordage, in general, is excellent; and they have also contrived a very good tackle, consisting of a strong rope, with large stones at the end, by means of which they come to an anchor.

Their weapons are clubs, spears, darts, bows, and arrows. The former are of a great variety of shapes, and many of them so heavy as not to be managed with one hand but with difficulty. The most common form is quadrangular. The far greater part are carved all over, in many checkered paterus, with great ingenuity, and require great patience and a long time to work up, as a sharp stone, sharks' teeth, or piece of coral, are the only tools made use of, excepting when they can procure iron instruments. The whole surface of their plain clubs is as highly polished as if finished by an European artist with the best instruments. Their spears are sometimes plain sharp-pointed sticks, and sometimes barbed. Their bows and arrows are of a peculiar construction. The former, which is about six feet long, is about the size of a little finger, and, when slack, forms a slight curve; the convex part is channelled with a single deep groove, in which the bow-string is lodged. The arrow is made of reed, near six feet long, and pointed with hard wood. When the bow is to be bent, instead of drawing it so as

to increase the natural curve, they draw it the contrary way, make it perfectly straight, and then form the curve on the other side.

They have also bows and arrows intended for amusement and shooting birds, but not for the purpose of war. Their stools are about two feet long, with four strong legs and circular feet; the whole composed of brown or black wood, neatly polished, and sometimes inlaid. They likewise inlay handles of fly-flaps; and, with a shark's tooth, shape bones into figures of men, birds, &c. Their running lines are as strong and even as our best cord. The small hooks consist entirely of pearl-shells; but the large ones are only covered with it on the back; and the points of both are, in general, of tortoise-shell. With the large hooks they catch abicores and bonnetos, by putting them to a bamboo-end, about twelve feet long, with a line of the same length. They have also numbers of small seines, some of which are of the most delicate texture.

Conformable to the powers peculiar to their sex, the men are assigned the most arduous and laborious employments. Architecture, boat-building, agriculture, and fishing, are the principal objects of their care. As cultivated roots and fruits form their chief subsistence, they find it necessary to practise husbandry, which they have brought by their diligence to some degree of perfection. In planting yams and plantains, they dig small holes for their reception, and afterwards root up the surrounding grass.

The manufacturers of cloth, who are females, take the slender stalks or trunks of the mulberry, which they cultivate for that purpose. From these they strip the bark, and scrape out the outer rind with a muscle-shell. The bark is then rolled up, to take up the convexity which it had round the stalk, and macerated in water for some time. After this it is laid across the trunk of a small tree, squared, and beaten with a square wooden instrument, about a foot long, full of coarse grooves on all sides, but sometimes with one that is plain. According to the size of the bark, a piece is soon produced; but the operation is often repeated by another hand, or it is folded several times, and beaten longer, which is intended rather to close than divide its texture. When this is sufficiently effected, it is spread out to dry, the pieces being from four to six or more feet in length, and half as broad.

These are given to another person, who joins the pieces, by smearing part of them with the viscus juice of a berry, called *too*, which serves as glue. Having been thus lengthened, they are laid over a large piece of wood, with a kind of stamp, made of a fibrous substance, pretty closely interwoven, placed beneath. They tear a bit of cloth, and dip it in a juice pressed from the bark of a tree called *kakka*, which they rub briskly upon the piece that is making. This at once leaves a dark brown colour, and a dry gloss upon its surface, the stamp at the same time

making a slight impression, that answers no other purpose than to make the several pieces that are glazed together stick a little more firmly. In the mean time, they proceed joining and staining by degrees, till they produce a piece of cloth of such length and breadth as they want, generally leaving a border, of a foot broad at the sides, and longer at the ends, unstained. Throughout the whole, if any parts of the original pieces are too thin, or have holes, which is often the case, they glue a spare bit upon them, till they become of an equal thickness. When they want to produce a black colour, they mix the soot procured from an oily nut, called *doodee*, with the juice of the *kokka*, in different quantities, according to the proposed depth of the tinge. Some say, that the black sort of cloth, which is commonly most glazed, makes a cold dress, but the other a warmer one; and, to obtain strength in both, they are always careful to join the small pieces lengthwise, which makes it impossible to tear the cloth in any direction but one. It is extraordinary that these people do not employ in any of their manufactures the fine cotton which grows in such abundance.

The women frequently entertained Captain Cook with songs, which were very agreeable. They accompany the music by snapping their fingers, so as to keep time to it. Not only their voices, but their music, is very harmonious, and they have a considerable compass in their notes. Captain Cook saw but two musical instruments among them. One was a large flute, made of a piece of bamboo, which they sound with their noses, as at Otaheite; but these have four holes or stops, whereas those of Otaheite have only two. The other was composed of ten or eleven small reeds, of unequal length, bound together side by side, as the Doric pipe of the ancients is said to have been, and the open ends of the reeds, into which they blow with their mouths, are of equal height, or in a line. They have also a drum, which, without any impropriety, may be compared to a hollow log of wood.

The one Captain Cook saw was five feet six inches long, and thirty inches in girth, and had a slit in it from one end to the other, about three inches wide, by means of which it had been hollowed out. They beat on the side of this log with two drum-sticks, and produced a hollow sound, not quite so musical as an empty cask.

About the time Captain Cook was in a condition to sail, a canoe, conducted by four men, came along-side, with one of those drums, on which one man kept continually beating, thinking, no doubt, the music would charm them. He gave them a piece of cloth and a nail for the drum.

The following account of a musical entertainment is given by the French navigators:—

“Thirteen musicians were seated in the shade of a bread-fruit tree, which was loaded with a prodigious quan-

tity of fruit held in the half in length to beat time serving to the sounds some the following sized bamb and a half higher.

“The music self heard n rather hoarse by striking v long, and sp before the o their song L perfectly stud the same man

ity of fruit: they sang together in parts. Four of the m  
behl in their hand a bamboo, from a foot to a foot and a  
half in length, with which they struck the ground, in order  
to beat time; the longest of these bamboos sometimes  
serving to make all the divisions. These instruments gave  
sounds somewhat similar to the tumbourine, and there was  
the following proportion between them: the two middle-  
sized bamboos were in unison; the longest was a note  
and a half lower, and the shortest two notes and a half  
higher.

"The musician who sang the counter-tenor made him-  
self heard much above the others, although his voice was  
rather hoarse. He accompanied himself at the same time  
by striking with two little sticks on a bamboo, two feet  
long, and split longitudinally. Three musicians, placed  
before the others, strove also to explain the subject of  
their song by their gestures, which they had no doubt  
perfectly studied, for they repeated them together, and in  
the same manner.

"From time to time they turned towards the king, who  
was present, making with their arms motions, which were  
not altogether devoid of grace; at other times they in-  
clined their heads suddenly against their breast, and shook  
them repeatedly.

"At this time, one of the ministers of Toubou ordered  
kava to be prepared, which was presently brought in a  
wooden vessel of an oval shape. The musicians had un-  
doubtedly reserved for this moment some of their finest  
pieces, for at every pause they made were heard from all  
quarters shouts of *Mali! Mali!* These reiterated plau-  
dits shewed that the music had produced a very striking  
and agreeable impression on them."

The entertainment called *haivas*, given in these islands,  
from their singularity in point of construction and execu-  
tion, are highly worthy of attention. Captain Cook and  
all the officers were invited by Marcewagee, the old chief,  
to one of these *haivas*, at Tongataboo. Preparatory to  
this, a large space had been cleared, and before the tem-  
porary hut of the chief, near the English post, was an  
area, where the performances were to be exhibited. In the  
morning great multitudes of the natives came in from the  
country, every one carrying a pole about six feet long upon  
his shoulders, and at each end of every pole a yam was  
suspended. These yams and poles were deposited on each  
side of the area, so as to form two large heaps, decorated  
with several sorts of small fish, and piled up to the greatest  
advantage. They were the chiefs present to the two cap-  
tains, Cook and Clarke; and it was difficult to determine  
whether the wood for fuel, or the yams for food, were most  
acceptable. The fish might serve to please the sight, but  
were offensive to the smell; part of them having been kept  
two or three days, to be presented to the officers on this  
occasion. Every thing being thus prepared, about eleven

o'clock they began to exhibit various dances, which they  
called *mai*.

The music consisted at first of seventy men as a chorus,  
who sat down, and around them were placed three drums.  
Another instrument is called *nassa*, and with the chiuk  
turned round towards them, they sit and beat strongly upon  
it with two cylindrical pieces of hard wood, about a foot  
long, and as thick as the wrist, by which they produce a  
loud powerful sound. They vary the strength and rule of  
their beating at different parts of the dance, and also change  
the tones, by beating in the middle, or near the end of the  
instrument.

The first act consisted of four ranks of twenty-four men  
each, holding in their hands a thin light wooden instrument,  
above two feet long, and in shape not unlike a small ob-  
long paddle, called *pagge*.

The second act had only two drums, with forty men for  
a chorus; and the dancers, or rather actors, consisted of  
two ranks, the foremost having seventeen, and the other  
fifteen, persons. Fenou was at their head, or in the mid-  
dle of the front rank. Three drums, which took two, and  
sometimes three, men to convey them, were now brought  
in, and seventy men sat down as a chorus to the third act.  
This consisted of two ranks of sixteen persons each, with  
young Toobou at their head, who was richly ornamented  
with a sort of garment covered with red feathers. These  
danced, sung, and twirled the *pagge* as before, but in ge-  
neral much quicker, and performed so well, that they had  
the constant applause of the spectators. A motion that  
met with particular approbation, was one in which they  
held the face aside, as if ashamed, and the *pagge* before  
it. The back rank closed before the front one, and that  
again resumed its place, as in the two former dances; but  
then they changed again, formed a triple row, divided,  
retreated to each end of the area, and left the greatest part  
of the ground clear. At that instant two men entered very  
hastily, and exercised the clubs which they use in battle.  
They did this, by first twirling them in their hands, mak-  
ing circular strokes before them with great force and quick-  
ness, but so skilfully managed, that though standing quite  
close, they never interfered. They shifted their clubs from  
hand to hand with great dexterity, and, after continuing a  
little time, kneeled, and made different motions, tossing  
the clubs in the air, which they caught as they fell, and  
then went off as hastily as they entered. Their heads were  
covered with pieces of white cloth, tied at the crown, al-  
most like a night-cap, with a wreath of foliage round the  
forehead; but they had only very small pieces of white  
cloth tied about their waist; probably that they might be  
cool, and free from incumbrance. A person, with a  
spear, dressed like the former, then came in, and, in the  
same hasty manner, looking about eagerly, as if in search  
of some one to throw it at. He then ran hastily to one side

of the crowd in the front, putting himself in a threatening attitude, as if he meant to strike with his spear at one of them, bending the knee a little, and trembling as it were with rage. He continued in this manner only a few seconds, when he moved to the other side, and, having stood in the same posture there for a short time, retreated from the ground as rapidly as when he made his appearance. The dancers, who had divided into parties, repeated something slowly all this while, and now advanced, and joined again, ending with universal applause. This dance was considered as one of their capital performances, some of the principal people being engaged in it; for one of the drums was beaten by Futtafahle, the brother of Poulaho, another by Feneou, and the third by Marreewagee himself. The last dance had forty men and two drums as a chorus. It consisted of sixty men, who had not danced before, disposed in three rows, having twenty-four in front. There were not less than ten or twelve thousand people on the spot, that is, within the compass of a quarter of a mile. It was observable, that, though the spectators always approved of the various motions, when well made, a great share of the pleasure they received seemed to arise from the sentimental parts, or what the performers delivered in their speeches. Captain Cook observes, that neither pen nor pencil can describe the numerous actions and motions, the singularity of which was not greater than were the ease and gracefulness with which they were performed.

At night the English officers were entertained by the night-dancers, on a space before Feneou's temporary habitation. They lasted about three hours, in which twelve dances were performed, two of them by women; in which a number of men came and formed a circle within theirs. In another, consisting of twenty-four men, a number of motions were made by the hands, which our people had not seen before, and were highly applauded. The music was also once changed in the course of the night; and in one of the dances Feneou appeared at the head of fifty men, who occasionally performed at Hapaec.

As a recompence for the entertainment which Marreewagee had given to the officers, Captain Cook made some exhibitions according to the English custom, and ordered the party of marines to go through their exercise on the spot where the dances had been performed, and in the evening played off some fire-works at the same place. Poulaho, with all the principal chiefs, and a great number of people of all denominations, were present. The platoon-firing, which was executed tolerably well, seemed to give them pleasure; but they were lost in astonishment when they beheld the water-rockets. They paid but little attention to the fife and drum, or French horns, that played during the intervals. The king, Poulaho, sat behind every one, because no one is allowed to sit behind him; and,

that his view might not be obstructed, not any one sat immediately before him; but a lane was made by the people from him down to the space allotted for the fire-works.

Their athletic exercises, which are exhibited for public diversion, are boxing and wrestling. When any one is inclined to wrestle, he rises from one side of the ring, and crosses the ground in a sort of measured pace, clapping smartly on the elbow-joint of one arm, which is bent, and produces a hollow sound, that is deemed the challenge. If an opponent appears, they come together with marks of the greatest good-nature, generally smiling; and, taking time to adjust the piece of cloth which is fastened round the waist, they lay hold of each other by this girdle, with a hand on each side, and he who succeeds in drawing his antagonist to him, immediately tries to lift him upon his breast, and throw him on his back; and if he is able to turn him round two or three times in that position, before he throws him, his dexterity never fails of procuring him plaudits from the spectators. If they are more equally matched, they close soon, endeavour to throw each other by entwining the legs, in lifting each other from the ground, in which struggles they show great exertion of strength.

When one is thrown, he immediately quits the field; but the victor sits down for a few seconds, then rises, and goes to the side he came from, and proclaims the victory, in a sentence delivered slowly, and in a musical cadence: after sitting a short space, he rises again, and challenges, when, sometimes, several antagonists make their appearance; but he has the privilege of choosing which of them he pleases to wrestle with, and likewise the preference of challenging again, if he should throw his adversary, until he himself is vanquished; when the opposite side sing the song of victory in favour of their champion. It often happens, that five or six rise from each side, and challenge together; in which case it is common to see three or four couple engaged on the field at once. But it is astonishing to see what temper they preserve in this exercise; for no instances were observed of their leaving the spot with the least displeasure in their countenance. When they find they are so equally matched, as not to be likely to throw each other, they leave off by mutual consent. If the fall of one is not fair, or if it does not appear clearly who had the advantage, both sides sing the victory; and they engage again. But no person who has been vanquished can engage with his conqueror a second time.

The boxers advance sideways, changing the side at every space, with one arm stretched fully out before, the other behind, and holding a piece of coral, which they wrap up firmly within the hand, when they meet an antagonist. This, it is supposed, they do to prevent a dislocation of the hand or fingers. Their blows are directed chiefly to the head, but sometimes to the sides, and are repeated with great activity. They shift sides, and box equally

well with both most dexterously as they have some other very small.

The boxing either leave off beaten; but in cases, unless one shows that, of version. Not frequently girls it does not appear disgrace to be down with as the lists. Some them in both ex-

The common ing noses, as is peace to strange such were displaced near the shore.

well with both hands. But one of their favourite and most dexterous blows is to turn round on their heel, just as they have struck their antagonist, and to give him another very smart one with the other, backward.

The boxing-matches seldom last long, and the parties either leave off together, or one acknowledges his being beaten; but they never sing the song of victory in these cases, unless one strikes his adversary to the ground, which shews that, of the two, wrestling is the most approved diversion. Not only boys engage in both exercises, but frequently girls box very obstinately. In all these cases, it does not appear, that they ever consider it as the smallest disgrace to be vanquished, and the person overcome sits down with as much indifference as if he had never entered the lists. Some of our people ventured to contend with them in both exercises, and were sometimes worsted.

The common method of saluting each other is by touching noses, as is done in New Zealand; and their sign of peace to strangers, is the displaying a white flag or flags; such were displayed to the Europeans when they first drew near the shore.

They have a singular custom of putting every thing that is given them to their heads, by way of thanks. This manner of paying a compliment is taught them from their infancy; for when the children had any thing given them, the mother lifted up the child's hand to its head. When Captain Cook made a present to the chief of any thing curious, he frequently saw it handed from one to another, and every one, into whose hands it came, put it to the head. Very often the women would take hold of the captain's hand, kiss it, and lift it to their heads. From all this it appears, that this custom has various significations, according as it is applied, but all complimentary.

In obedience to the commands of their chiefs, in good behaviour and decorum; as well as in harmony and unanimity, none of the civilized nations have excelled them. Such behaviour manifests itself in a remarkable manner, whenever their chiefs harangue a body of them assembled together, which frequently happens. The greatest attention and most profound silence are observed during the harangue; nor is there ever seen a single instance of any one present shewing signs of being displeased, or seeming in the least inclined to dispute the declared will of the speaker.

Great deference, and even worship, may be said to be paid to their chiefs, who are styled lords of the earth, and also of the sun and sky. The order and decorum observed in the king's presence, and likewise in that of the other chiefs, are remarkable. Whenever he sits down, all the attendants seat themselves before him, forming a semi-circle, and leaving a space between them and him, into which no one, unless he has particular business, presumes to come. Nor is any one suffered to sit or pass

behind him, or even near him, without his permission. When a person wishes to speak to his majesty, he comes forward, and having seated himself before him, delivers what he has to say; then, after receiving an answer, retires. If the king speaks to any one, the latter gives an answer from his seat, unless he is to receive an order; in which case he rises from his place, and seats himself cross-legged before his majesty. To speak to the king standing, would be considered as a mark of gross rudeness.

It is a peculiar privilege annexed to the person of the king, not to be punctured, as his subjects are. Whenever he walks out, all who meet him must sit down till he has passed. No person is suffered to be over his head; but, on the contrary, all must come under his feet. The method of doing homage to him and the other chiefs is as follows: the person who is to pay obeisance, squats down before the great personage, and bows the head down to the sole of his foot, which he taps or touches with the under and upper side of the fingers of each hand; then, rising up, he retires. His majesty cannot refuse any one who is desirous of paying him this homage, for the people frequently shew him these marks of submission when he is walking; and he is, on these occasions, obliged to stop, and hold up one of his feet behind him, till they have performed this respectful ceremony. The hands, after having been thus applied, become, in some cases, useless for a time; for, till they are washed, they must not touch food of any sort. This prohibition, in a country where water is not plentiful, would be attended with inconvenience, if a piece of any juicy plant, being rubbed over the hands, did not serve for the purpose of purification.

The government of Tongataboo is formed of a king, or superior chief, who is called Arecka, with other chiefs under him, who are lords of their respective districts, to whom the people pay great obedience; a third rank was also observed here, who distributed justice, and decided disputes only within their territory; they had also great authority over the common people: Attago, Captain Cook's friend, was of this class. All the land on Tongataboo is private property; and there are here, as at Otaheite, a class of people who are servants or slaves, and have no property in land. It is unreasonable to suppose every thing in common to all, in a country so highly cultivated as this. Interest being the greatest spring which animates to industry, few would toil in cultivating the land, if they did not expect to reap the fruit of their labour. Were it otherwise, the industrious man would be in a worse state than the idle sluggard.

Parties of six, eight, or ten, people were frequently seen bringing down to the landing-place, fruit and other things to dispose of, where one person, a man or woman

superintended the sale of the whole: no exchanges were made, but with his or her consent; and whatever was given in exchange went to them; which plainly shews they were the owners of the goods, and the others no more than servants.

This island bears an unrivalled sovereignty over the whole groupe, Feejee included. The inhabitants of Feejee having long ago discovered this island, frequently invaded and committed great cruelties in it; but, in an expedition which the Tonga people made against them, under the command of Toogahowe, Filatonga, and Cumnavie, they completely routed and brought them into subjection, so that they now pay tribute to Tongataboo, on certain occasions, the same as the other islands, of which an instance was seen at the death of Moomooe. Tongataboo is divided into three large districts, Ahefo, at the north-west end, over which Dugonagaboola reigns with absolute sway; Mooa, the middle district, is under the same subjection to Futtaihe; and Vahorlo has the same power over Ahoge, situate at the south-east part; each claiming a right of disposal over the lives and property of his own subjects, which is exercised most despotically. Each acted the part of a petty sovereign, and not unfrequently counteracted the measures of the king. Nor was the king's court superior in splendour to the chiefs. These districts are subdivided into many smaller ones, which have their subordinate chiefs presiding over them, and exercise the same authority as the superior chiefs, to whom they are in some cases accountable for their conduct; so that the whole resembles the ancient feudal system of our ancestors. The king, at stated times, receives the product of his distant domains at Tongataboo, which is not only the usual place of his residence, but the abode of most persons of distinction among these islands. Its inhabitants frequently call it the Land of Chiefs, and stigmatize the subordinate isles by the appellation of Lands of Servants. The government seems to have been formerly more in the hands of the Futtaihes than at present. Upon the death of the late Poulaho, father of the present Futtaihe, Duatonga being then a minor, the intolerant ambition of his mother, Mahoofoe, of the Toubon, or rather Doubon, family, induced her to attempt extending her power further than any of her predecessors had done. This was tamely submitted to by all the other chiefs, except Fenon Toogahowe, now Dugonagaboola, son of Moomooe, and nephew of Fenon, the celebrated friend of Captain Cook: he at that time reigned over Eooa, and, rejecting her proposals, declared war against her, contrary to the remonstrances of all his friends: he, however, succeeded, drove her entirely from Tongataboo to Vavao, whither he also followed, and, having reduced her to submission, left her there, where she remained, a few years ago, in a state of exile.

It was natural to suppose, on a review of these islands, and the remote distance at which some of them are situated from the seat of government, that many efforts would have been made to throw off the yoke of subjection. But such a circumstance seldom happens. One reason of their not being thus embroiled in domestic commotions may be this, that all the principal chiefs take up their residence at Tongataboo. They also secure the dependence of the other isles, by the decisive celerity of their operations; for if a seditious and popular man should start up in any of them, the commander is immediately dispatched thither to put him to death, by which means they extinguish an insurrection while it is yet in embryo. In their government a very judicious arrangement takes place: a person is appointed as an inspector of all the produce of the island, who takes care that each individual shall cultivate and plant his quota, at the same time directing what shall, and what shall not, be eaten. By so prudent a regulation, they take effectual precautions against a famine, sufficient ground is employed in raising provisions, and every article is secured from unnecessary consumption.

Their rank of precedence could not be easily ascertained. It was generally supposed by Captain Cook, on his last visit to this island, that the sovereign of the Friendly Isles had the highest rank of any person in his dominions; but it was otherwise; for Latoolibooloo, and three women, were superior, in some respects, to King Poulaho. These great personages were distinguished by the title of *Tasmahas*, which implies a chief. The former king, father of Poulaho, left behind him a sister, of equal rank, and older than himself: she, by a native of Feejee, had a son and two daughters; and these three persons, as well as their mother, are of higher rank than the king. Endeavours were made to discover the reason of the *Tasmahas*, but without effect. The crown is hereditary; the Futtaihes have reigned, in a direct line, for the space of at least one hundred and thirty-five years, which have elapsed between Captain Cook's visiting these islands, and Tasmah's discovery of them. Upon enquiring of them, whether any traditional account of the arrival of Tasmah's ships had been preserved among them till this time, it was found that this history had been delivered down to them from their ancestors with great accuracy; for, they said that, his two ships resembled our's, and also mentioned the place where they had lain at anchor, their having continued but a few days, and their quitting that station to go to Annamooka; and, for the purpose of informing us how long ago this affair had happened, they communicated to us the name of the Futtaihe who reigned at that time, and those who had succeeded him in the sovereignty, down to Poulaho, who is the fifth monarch since that period.

Their deities are numerous, and their prejudices are

strong. Their temporal; for punishment upon practice to retort which has its own whom they call is the god of powerful, he presides over the district of Ahoge casions, represents so that their name mere public a which they thirely depend, general; except portion to the two natchees in procure the fr they gather the winds they supply called Cilla F and is sometimes plantain, bread ravages as obli and kava, in the sacred to her, her on the ocean. These storms over before apperative is in little returning a favor is only temporary. Tongalocr, the great many others each acting, and

of these islands, and of them are situated many efforts would be made to subjugate them. The reason of their animosities may be traced to their residence in the dependence of the operations; and start up in anger, and dispatched thither to extinguish an enemy. In their government, a person is placed: a person produces the effect: the individual shall cultivate the soil, and collect what shall be necessary for a regulation, famine, sufficient, and every article of life.

It is easily ascertained that the Friendly Islands, on his visit to the Friendly Islands, in his dominions; and three women, and Poulaho. These the title of *Tamamahi*, the equal rank, and the king. Endeavour of the *Tamamahi*, the space of at which have elapsed islands, and Tasman's ships, it was found to them from or, they said that, no mentioned the having continued station to go to informing us how communicated to at that time, the sovereignty, monarch since that

their prejudices are

strong. Their principal object regards things merely temporal; for they have little conception of future punishment for sins. They believe, they meet with just punishment upon earth; and therefore put every method in practice to render their divinities propitious. Every district has its own deity; and each family of note has one, whom they consider as their peculiar patron. Talliatoo is the god of Ahoe, which being at present the most powerful, he is accounted a great warrior. Futtaihe presides over Moa and Doobludha; Cartow over the district of Ahoge; each of which deities are, on certain occasions, represented by the several chiefs of those districts; so that their natehees, and other annual exhibitions, are not mere public amusements, but religious observances, on which they think the lives and health of their chiefs entirely depend, as also the prosperity of the country in general; expecting the succeeding crop will be in proportion to the offerings made at these times. They have two natehees in the year; one when the yams are set, to procure the favour of Futtaihe; and the other when they gather them, expressive of their gratitude. The winds they suppose to be under the control of a female, called Calla Filatonga, who, they say, is very powerful, and is sometimes provoked to blow down their cocoa-nut, plantain, bread-fruit, and other trees, and commits such ravages as oblige them to give offerings of hogs, yams, and kava, in the most submissive manner. There is a house sacred to her, where a person is appointed to personate her on the occasion, and receive the offering that is made. These storms occurring very seldom, and being generally over before appeasing measures are taken, the representative is in little danger of being detected of falsehood by returning a favourable answer. This office of personator is only temporary, being always chosen for the occasion. Among their subordinate deities, they mention *Footafooa*, who has the administration of the sea and its productions; *Toofoa-bolootoo*, god of the clouds and fogs; *Taleeteebo*, *Mattaha*, *Tureeava*, and others.

It does not appear that they have any priests or stated ceremonial worship. In all the offerings they make, each man kills and presents his own sacrifice. Their frequent earthquakes they account for by supposing the island rests upon the shoulders of a powerful deity, called Mowee, who has supported it for such a length of time as exceeds their conception. This heavy burden often exhausts his patience, and then he endeavours, but in vain, to shake it off; which, however, never fails to excite horror throughout the islands: they sometimes endeavour to reduce him to good behaviour, by beating the ground with large sticks. Tongaloer, the god of the sky, and Fcoulounga, of the rain, they suppose to be males; besides these, they have a great many others, of both sexes, over earth, sea, and sky, each acting, and sometimes counteracting one another.

They also acknowledge the existence of a plurality of strange gods, calling them by the general name of *Fyga*, among whom they rank ours as the greatest; and, when they think it will answer their purpose, they acknowledge him wiser and better than theirs, having taught us to make ships, tools, cloth, &c. so much better than they. Besides, they imagine every individual to be under the power and control of a spirit peculiar to himself, which they call *Odooa*, who interests himself in all their concerns, but, like Calla Filatonga, is little regarded till angry; when they think he inflicts upon them all the deadly disorders to which they are subject. To appease him, the relations and other connections of the afflicted person, especially if he be a chief, run into all the horrid practices of cutting off their little fingers, beating their faces, and abstaining from certain kinds of food. The natives shew the missionaries two logs of wood, rudely carved in a human shape, which were *odooas*, brought from Fejee: they told them, that they could not be spirits, but mere pieces of wood, fit only for the fire; nor did they seem, by the manner of their tossing them about, to have any idea of their sanctity. The horrid custom of human sacrifice exists in a shocking degree. It is said that, when a great chief lays sick, they often strangle their women and relations, to the number of three or four at a time, imagining, by these horrid acts, they appease the angry spirit, and recover their chief. When the *odooa* is inexorable, the death of the person is inevitable, and the surviving friends seem, for a short time, inconsolable; but their grief is soon changed into the opposite extreme, and they run into as great extravagances in their feasts, as, when the sorrowful passions prevailed, they inflicted on themselves sufferings.

The chiefs believe in the immortality of the soul, which, at death, they say, is immediately conveyed in a large fast-sailing canoe to a distant country, called *Doobludha*, which they describe as resembling the Mahometan paradise. They call the god of this region of pleasure, *Higgolayo*, and esteem him as the greatest and most powerful of all, the rest being no better than servants to him. His country, according to their mythology, is the repository of the dead; and those who are conveyed thither are no more subject to death, but feast on all the favourite productions of their native soil, with which this blissful abode is plentifully furnished. This doctrine, however, is wholly confined to chiefs; for as the toos, or lower order, reckon the enjoyments of *Doobludha* above their capacity, so they seem never to think of what may become of them after they have served the purposes of this life. The same system of religion does not extend all over the Friendly Islands; the supreme deity of *Hapae*, for instance, being called *Alo Alo*.

Their marriages are attended with very little ceremony; the only one seen by the Europeans was that of *Vaarjee*,

with whom two of the missionaries had been some time resident. This was conducted in the following manner:—A young female having attracted his attention, he first informed his mother that he wished to add her to the number of his wives. She immediately communicated this to the girl's father, and the proposal meeting his approbation, he clothed her in a new garment, and, with attendants, and such a quantity of baked hogs, yams, &c. as he could afford, she was sent to her intended spouse, who, being apprised of her coming, seated himself in his house, and received her in the same manner, and with as little emotion, as he would have done any other visitor; feasting on the provisions, and a good draught of yava, concluded the whole; and the bride was at liberty either to return to her father, till again sent for, or to take up her residence with her husband, which, in this instance, she preferred. Polygamy is in common practice among the chiefs, each of whom takes as many wives as he pleases; but they are entire strangers to domestic broils, which may, in a great degree, be owing to the absolute power each man has over his own family; every woman being so much at her husband's disposal, as renders her liable to be discarded on the smallest displeasure.

At the funeral of the lower orders of the people, little ceremony is observed; but, when the chiefs die, the ceremonies are not only very pompous, but shocking in the extreme; as appears from the following details, given by the missionaries, respecting the procession which took place on the 27th of April, and of the funeral of the old chief, Moomooe, which followed on the 2d of May, 1797.

"The body of the deceased king was carried past the residence of the missionaries, at a small distance from the beach: it was laid on a kind of bier, made of the boughs of trees, and supported by about thirty men. Several relatives of the deceased preceded the corpse, in mourning dresses: some of them had cut their heads with sharks' teeth, and the blood was running in streams down their faces. Behind the corpse was a multitude of people, of both sexes. A female chief, called Fefene Dnatonga, who was very corpulent, was carried on a kind of frame, made of two long bamboos, between which she sat on a piece of matting, and was borne by four men. Near her Futafaihe walked, and next them two women, who were devoted to be strangled at the funeral; one was weeping, but the other appeared little concerned: they were both wives of the deceased. It is singular that they should in their sacrifices make preference of their nearest relatives for the devoted victims; and it is as singular, that their human sacrifices should be previous, as well as subsequent, to their death; as was the case of the unfortunate Colelallo, who was strangled previous to the death of his father Moomooe. Some of the missionaries followed them to the

fiatooka, near which they deposited the body for some time in a house, carried thither for the purpose, which was hung round with black cloth. This fiatooka is situated on a spot of ground of about four acres. A mount rises with a gentle slope about seven feet, and is about one hundred and twenty yards in circumference at the base: upon the top stands a house, neatly constructed, which is about thirty feet long, and half that in width. The roof is thatched, and the side and ends are left open. In the midst of this house is the grave, the sides, ends, and bottom of which are of coral-stones, with a cover of the same: the floor of the house is of small stones. The etoua and other trees grow round the fiatooka.

"To the left of the tomb, and without the enclosure, sat about four hundred people; the major part of them were men, for whom yava was brewing. Opposite to these were placed five large roasted hogs, twenty baskets of roasted yams, and about one hundred pieces of malie, soor paste. A few paces from the provisions sat seven or eight men, who were taboo'd, and exempt from cutting themselves. One of these gave orders concerning the disposal of the hogs, yams, and yava: all that drank of the latter were mentioned by name, by a person appointed to that office by the female chief Fefene Dnatonga, who now seemed to have the management of the funeral. They did not forget their European friends, but, on dealing out the liquor, sent them each a part, which they gave to the natives who sat near them. Persons of both sexes seated themselves on different parts of the ground, beating their faces dreadfully, and, after having emptied two bowls of yava, dispersed."

One of the missionaries, who was present at the funeral, gives the following account of the ceremonies attending the interment:—He was accompanied by Ambler, and they found, on their approach to the morai, about four thousand persons sitting around it. A few minutes after their arrival, they heard a great shouting and blowing of couch-shells, at a small distance: soon after, an hundred men appeared, armed with clubs and spears, and, rushing into the area, began to cut and mangle themselves in a most dreadful manner; many struck their heads violently with their clubs, and the blows might be heard thirty or forty yards off, which they repeated till the blood ran down in streams. Others, who had spears, thrust them through their thighs, arms, and cheeks, all the while calling on the deceased in a most affecting manner. A native of the island of Fejee, who had been a servant of the deceased, appeared quite frantic: he entered the area with fire in his hand, and, having previously oiled his hair, set it on fire, and ran about with it all in a flame. When they had satisfied themselves with this torment, they sat down, beat their faces with their fists, and retired.

A second party went through the same cruelties, and

me cruelties, and

after them a third entered, shouting and blowing the shells; four of the foremost held stones, with which they used to knock out their teeth; and those who blew the shells cut their heads with them in a shocking manner. A man that had a spear ran it through his arm, just above the elbow, and, with it sticking fast, ran about the area for some time. Another, who seemed to be a principal chief, acted as quite bereft of his senses: he ran to every corner of the area, and, at each station, beat his head with a club, till the blood flowed down his shoulders. The Europeans, unable to bear the scene any longer, quitted the place for about two hours; and at two o'clock in the afternoon they returned, with two men in company, to the fiatooka, where the natives of both sexes were still at the dreadful work of cutting and mangling themselves.

The Europeans had not been long together, before they heard, at a distance, low, but expressive, sounds of the deepest sorrow and lamentation: this was a party of about one hundred and forty women, marching in single file, bearing each a basket of sand; eighty men followed in the same manner, with each two baskets of coarse sand, and sang, as they marched, words importing, "This is a blessing to the dead;" and were answered in responses by the women. Another company of women brought a quantity of cloth, and answered in their turn to the above responses. They then walked towards the tomb, filling or covering part of the mount, between the house and the place where the corpse lay, and the grave, with some fine mats and cloths; after which seven men blew conch-shells, while others sung in a doleful strain, expressive of their grief.

The corpse was now conveyed to the grave upon a large bale of black cloth, with which, and five mats, they covered it. The bearers, as they went, walked stooping low, and carrying the bale in their hands. Whilst these services were performing, a company of men and women came into the area, and cut themselves dreadfully. After them, another file of females, nineteen in number, brought each a bag of their most valuable articles, and twenty-one more had each a fine mat in their hands, all of which they deposited in the tomb, being, as they called it, a present for the dead: immediately after, came a present from Toogahowe, consisting of thirty-five bales of cloth, each bale carried by four men on a frame. After the presents, another party of mourners entered the area, sixteen of whom had recently cut their fingers off. These were followed by another party, with clubs and spears, who beat themselves as before described, and disfigured their faces with

cocoa-nut husks, fixed on the knuckles of both hands. The Europeans noticed that those who held offices, or were related to the deceased, were the most cruel to themselves, some of whom ran two, three, and even four, spears into their arms, and so danced round the area; and some broke the top of the barbed spears in their flesh.

The grave was covered with a hewn stone, about eight feet long, four broad, and one thick: this stone they had suspended with two large ropes, which went round two strong piles driven into the ground, at the end of the house, and thence led to the area, where about two hundred men held by them, and, whilst they lowered it slowly, the women and children wept aloud, or sung words importing, "My father! my father! the best of chiefs," &c. More cloth was then brought to be put into the tomb, and another party entered, and abused themselves as before. After these paroxysms of grief, they sat a whole hour in silence; and, when they had pulled the rope clear off the stone which covered the grave, those on the mount gave a great shout, which was answered by a general tearing of the leaves from the necks of all present: after which they dispersed. This dreadful custom of cutting and mangling was continued for about two months, by the influx of visitors from the distant islands, who came to the morai to pay their respects to the deceased king, by inflicting on themselves these tortures.

The burial-places are of different constructions: those of a square form were not raised above the level of the common ground: a row of large stones formed the sides, and at each corner two high stones were placed erect, at right angles to each other, and in a line with their respective sides; others were such as the missionaries describe that of Moomooe to be; and a third sort were built square, like the first; the largest of which was at the base one hundred and fifty-six feet by one hundred and forty; it had four steps from the bottom to the top, that run quite round the pile: one stone composed the height of each step, a part of it being sunk in the ground; and some of these stones in the wall are immensely large; one that was measured was twenty-four feet by twelve, and two feet thick. It is surprising by what means these people, who are not acquainted with the power of mechanics, can effect the removal of stones of such immense magnitude: these, Tuffafaihe observed, were brought in double-canoes from the island of Lefooga. They are coral-stone, and are hewn into a tolerably good shape, both with respect to the straightness of their sides, and the flatness of their surface.

#### END OF PART THE FIRST

## PART II.

# AFRICA.

**A**FRICA, the second grand division of the globe, once contained several kingdoms and states, eminent for the liberal arts, for wealth and power, and the most extensive commerce. The kingdoms of Egypt and Ethiopia, in particular, were much celebrated; and the rich and powerful state of Carthage, that once formidable rival to Rome itself, extended her commerce to every part of the known world: even the British shores were visited by her fleets, till Juba, who was king of Mauritania, but tributary to the republic of Carthage, unhappily called in the Romans, who, with the assistance of the Mauritians, subdued Carthage, and, by degrees, all the neighbouring kingdoms and states. After this, the natives, constantly plundered and impoverished by the governors sent from Rome, neglected their trade, and cultivated no more of their lands than might serve for their subsistence. Upon the decline of the Roman empire, in the fifth century, the north of Africa was overrun by the Vandals, who contributed still more to the destruction of arts and sciences; and, to add to the calamities of this continent, the Saracens made a sudden conquest of all the coasts of Egypt and Barbary, in the seventh century. These were succeeded by the Turks; and both being of the Mahometan religion, whose professors invariably marked their progress with desolation, the ruin of that once flourishing part of the world was completed.

This continent is a peninsula of a prodigious extent, joined to Asia only by a neck of land, about sixty miles over, between the Red Sea and the Mediterranean, usually called the Isthmus of Suez; and its utmost length, from north to south, from Cape Bona, in the Mediterranean, in thirty-seven degrees north, to the Cape of Good Hope, in thirty-four degrees south, latitude, is four thousand three hundred miles; while the broadest part, from Cape Verd, in seventeen degrees west longitude, to Cape Guardasui, near the Straits of Babel-Mandel, in fifty-one degrees east longitude, is three thousand five hundred miles from east to west. Pinkerton says, that from the southern extremity to the Mediterranean are about seventy degrees of lati-

tude, or four thousand two hundred geographical miles. The breadth, from eighteen degrees west to fifty-one degrees east, may be assumed on the equator at four thousand one hundred and fifty geographical miles. It is bounded, on the north, by the Mediterranean Sea, which separates it from Europe; on the east, by the Isthmus of Suez, the Red Sea, and the Indian Ocean, which divide it from Asia; on the south, by the Southern Ocean; and, on the west, by the Great Atlantic Ocean, which separates it from America.

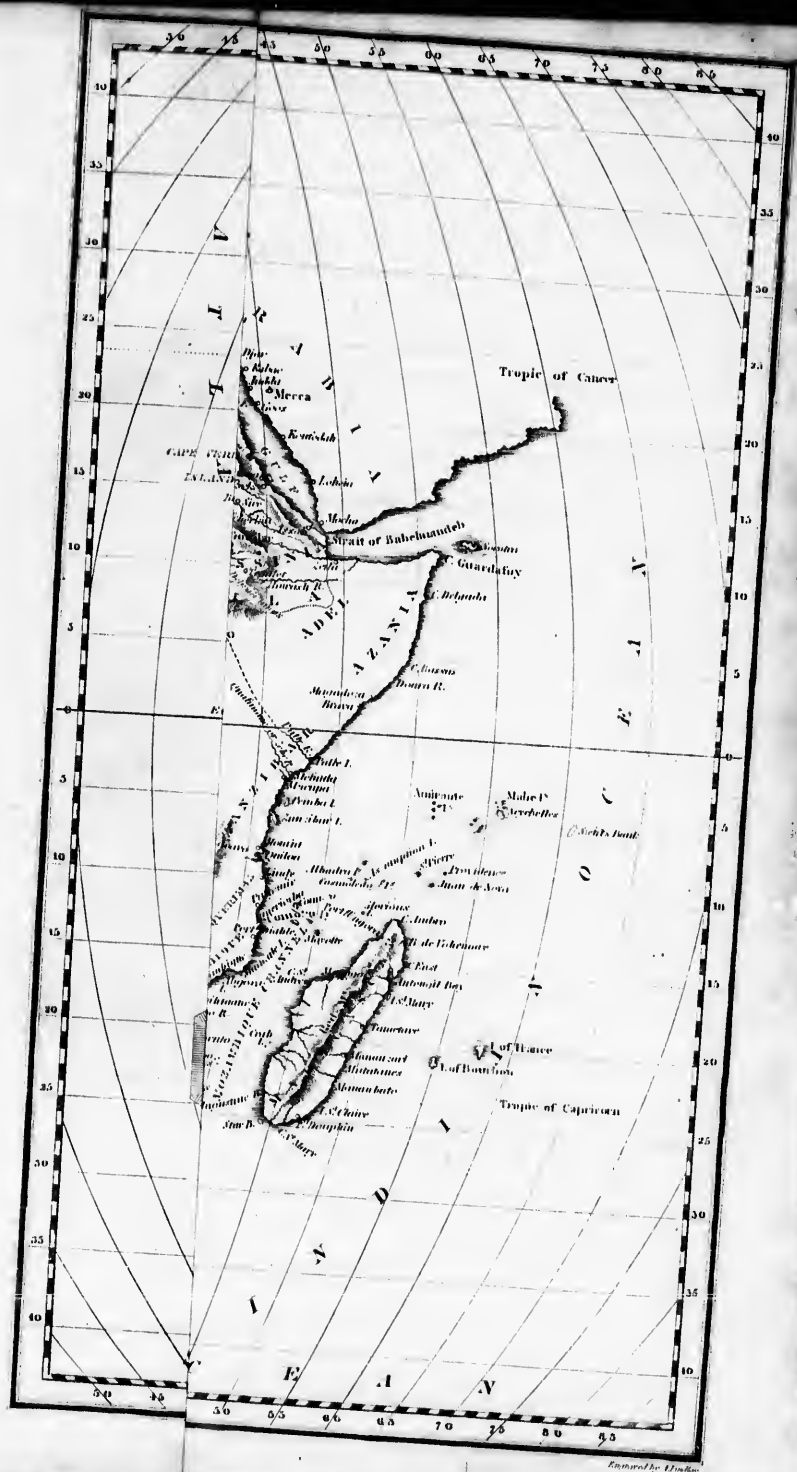

As this extensive country is divided almost in the middle by the equator, and the far greater part of it is within the tropics, the heat is, in many places, almost insupportable to an European, it being there increased by the rays of the sun, from the vast deserts of burning sands. The coasts, however, and banks of rivers, such as the Nile, are generally fertile; and most parts of this region are inhabited, though its population is very inferior to that of Europe and Asia. In many parts of Africa, snow seldom falls in the plains; and, in fact, it is rarely found but on the tops of the highest mountains.

The chief river in Africa is the Nile, which rises in the Gebel-el-Kunr, or Mountains of the Moon, in a district called Donga, in about eight degrees north latitude. It was first known by the name of Bahr-el-Abiad, or the White River; and, about latitude sixteen degrees, is joined by the Bahr-el-Azrek, or the Blue River: the former is tinged, the latter clear; circumstances which occur in the Maranon and Missouri, in which the chief stream is muddy. The comparative course of the Nile may be estimated at about two thousand British miles, thus nearly rivalling the longest Asiatic rivers. The Nile forms some considerable cataracts, the chief being that of Geanadil, in Nubia, before it gains the level of Egypt, after passing rapidly to the south of Syene. The other considerable rivers are the Gambia, which falls into the Atlantic, or Western Ocean, at Cape St. Mary, and is navigable for ships of one hundred and fifty tons burthen, five hundred miles from its source; the Senegal, which rises about one hundred miles

east of the Gambia, and falls into the Atlantic Ocean, about eighty miles north of Cape Verd, after running a much longer course; and the Niger, which rises about ninety miles to the east of the head of the Senegal, and runs eastward, by Tombuctoo, Houssa, and Cashna, terminating as is supposed, in some lakes farther to the eastward.

The most considerable mountains in Africa are the Atlas, a ridge extending from the Western Ocean, to which it gives the name of Atlantic Ocean, as far as Egypt. It derived its name from a king of Mauritania, a great lover of astronomy, who used to observe the stars from its summit; on which account the poets represent him as supporting the heavens on his shoulders. The Mountains of the Moon, extending between Abyssinia and Monomotapa, and which are still higher than those of Atlas. Those of Sierra Leone, or the Mountains of the Lions, which divide Negroland from Guinea, and extend as far as Ethiopia. These were styled by the ancients the Mountains of God, on account of their being subject to thunder and lightning. The Peak of Teneriffe, which the Dutch make their first meridian, is about two miles high, in the form of a sugar-loaf, and is situated on an island of the same name, near the coast. The ranges of mountains in what is called the Country of Dates, cannot be considered as portions of the Atlantic range. Along the western shores of the Arabian Gulf extends a celebrated ridge of red granite, which supplied the famous obelisks of Egypt; and of which one was styled that of emeralds, from the quarries of that gem: in the same vicinity were the quarries of the celebrated marble called *Verde Antico*, recently observed by Browne.

The most noted capes in this country are Cape Verd, so called because the land is always covered with green trees and mossy ground. The Cape of Good Hope was so denominated by the Portuguese, when they first went round it, in 1489, and discovered the passage to Asia. It is the southern extremity of Africa, the country of the Hottentots; and the general rendezvous of ships of every nation who trade to India, being about half-way from Europe. It is, at present, in the possession of the English, who took it from the Dutch in September, 1795. There is but one strait in Africa, which is called Babel-Mandel, and joins the Red Sea with the Indian Ocean.

The situation of Africa for commerce is extremely favourable, standing, as it were, in the centre of the globe, and having a much nearer communication with Europe, Asia, and America, than any of the other quarters has with the rest. That it abounds with gold, we have not only the testimony of the Portuguese, the Dutch, the English, and the French, who have settlements on the coast of Africa, but that of the most authentic historians. It is, however, the misfortune of Africa, that, though it has ten thousand miles of sea-coast, with noble, large,

and deep rivers, it should not have any navigation, nor receive any benefit from them; and that it should be inhabited by a people ignorant of commerce and of each other. At the mouths of these rivers are the most excellent harbours, deep, safe, calm, sheltered from the wind, and capable of being made perfectly secure by fortifications; but quite destitute of shipping, trade, and merchants, even where there is plenty of merchandise. In short, Africa, though stored with an inexhaustible treasure, and capable, under proper improvements, of producing so many things, delightful as well as convenient, within itself, seems to be almost entirely neglected, not only by the natives, who are quite unsolicitous of reaping the benefits which nature has provided for them, but also by the more civilized Europeans who are settled in it, particularly the Portuguese.

The inhabitants of this continent, with respect to religion, may be divided into three sorts, namely Pagans, Mahometans, and Christians. The first are the more numerous, possessing the greater part of the country, from the Tropic of Cancer to the Cape of Good Hope; and these are generally black. The Mahometans, who are of a tawny complexion, possess Egypt, and almost all the northern shores of Africa, or what is called the Barbary Coast. The people of Abyssinia, or Upper Ethiopia, are denominated Christians, but retain many Pagan and Jewish rites. There are also some Jews in the north of Africa, who manage all the little trade which is carried on in that part of the country.

In the central parts, on the south, the population appears to be indigenous and peculiar; these being the native regions of the negroes, whose colour, features, and hair, distinguish them from all the other races of mankind. In the northern parts there have been many successions of inhabitants, the Egyptians being, by some, supposed to have come from Hindoostan, and the Abyssinians being of Arabian extract; while, farther to the west, the Carthaginians passed from Syria; and, according to Sallust, other maritime parts were peopled by the Medes, Persians, and Armenians. The original inhabitants of the northern parts appear to have been, in all ages, distinct from the negro race, from whom they were divided by the great desert of Zahara; and, in the eastern parts, the latter were repelled still farther by the Arabian colony, which settled in Abyssinia. These northern inhabitants sent considerable colonies into Spain; and, from the Roman historian, it appears that they had made some little progress in the arts of life. Herodotus mentions these two distinct races of mankind. The whole of the present population of Africa is supposed to be about twenty-five millions.

The divisions of this continent into kingdoms, states, &c., together with the African Islands, are represented on the following table.—

## CHAPTER I.

## EGYPT.

*Situation, Extent, Divisions, &c.*

THIS extensive and justly celebrated country is situated between thirty and thirty-six degrees of east longitude, and between twenty-one and thirty-one degrees of north latitude; being bounded by the Mediterranean on the north; by the Red Sea and the Isthmus of Suez on the east; by Abyssinia, or Ethiopia, on the south; and by the deserts of Barca and Nubia, on the west. It is about six hundred miles in length, from north to south; and extends from one hundred to two hundred and fifty in breadth, from east to west. It is divided into two parts, called the Upper and Lower Egypt, and is subdivided into eighty provinces.

Upper Egypt, according to M. Savary, is only a long narrow valley, beginning at Sienna, and terminating at Cairo. It is bounded by two chains of mountains, which run from north to south, and take their rise from the last cataract of the Nile. On reaching the latitude of Cairo, they separate to the right and left; one taking the direction of Mount Colzorem, and the other terminating in some sand-banks near Alexandria. Beyond these mountains are deserts, bounded by the Red Sea on the east, and by other parts of Africa on the west, having in the middle a long plain, which, even where widest, is not more than nine leagues over.

Lower Egypt is said to comprehend all the country between Cairo, the Mediterranean, the Isthmus of Suez, and Libya. "This immense plain," says M. Savary, "presents, on the borders of its parching sands, a stripe of land, cultivated along the canals of the Nile; and, in the middle, a triangular island, to which the Greeks gave the name of Delta, from its resemblance to the fourth letter of their alphabet. This great extent of country, from Barca to Gaza, is capable of being overflowed by the Nile, and is, therefore, fertilized to a high degree, though seemingly devoted to eternal sterility, on account of the want of rain and the heat of the climate. According to the concurring testimonies of Mr. Bruce and M. Volney, the coast of Egypt is so extremely low, that it cannot be discovered at sea till the mariners come within a few leagues of it. In ancient times, the sailors pretended to know, when they approached this country, by a kind of black mud brought up by their sounding-lines from the bottom of the sea; but this notion has been proved to be erroneous by Mr. Bruce, who found the mud to arise while the vessel was opposite to the deserts of Barca.

*Climate, Soil, &c.* The climate of Egypt is extremely hot, not only from the height of the sun, which in summer approaches to the zenith, but also from the want of rain, and from the vicinity of those burning and sandy deserts which lie to the south. In the months of July and August, Reaumur's thermometer stands, even in the most temperate apartments, at twenty-four degrees above the freezing point, and in the southern provinces it is said to rise still higher. Hence, says M. Volney, only two seasons should be distinguished in Egypt, the cool and the hot, or spring and summer. The latter continues for the greatest part of the year, viz. from March to November, or even longer; for, by the end of February, the sun is intolerable to an European at nine o'clock in the morning. During the whole of this season, the air seems to be inflamed, the sky sparkles, and every one is thrown into a profuse perspiration, even without the least exercise. This heat, however, is considerably mitigated by the inundations of the Nile, the fall of the nocturnal dews, and the subsequent evaporation; so that the natives frequently complain of the cold in winter. The dew does not fall regularly throughout the summer, the aridity of the country not affording a sufficient quantity of vapour for this purpose. It is first observed about the 24th of June, when the river has begun to swell, and, consequently, a greater quantity of water is raised from it, by the heat of the sun, which, being condensed by the night-air, falls down in copious dews. It might be imagined, that as, for three months in the year, Egypt is in a wet and marshy situation, the excessive evaporation of the stagnating waters would prove very unhealthy. This, however, is by no means the case; for the great dryness of the air makes it absorb all kinds of vapour with the utmost avidity, and the wind carries them off, either to the north or south, without communicating any of their pernicious effects.

By reason of this dryness of the air, Egypt is exempted from the phenomena of rain, hail, snow, thunder, and lightning. Earthquakes are, also, seldom felt in this country, though sometimes they have been very violent and destructive. In the Delta, it never rains in summer, and very seldom at any other time. In the Upper Egypt, rain is still less frequent; but this deficiency is supplied by the inundation of the Nile, and by the dews, the latter of which are more or less copious, according to the direction of the wind.

The soil of Egypt is extremely fruitful, easily cultivated, and certain in its crops. This fertility has been ascribed, by some travellers, to the salt with which it abounds; for so great is the propensity of the Egyptian soil to produce salt, that, even when the gardens are overflowed for the sake of watering them, the surface of the ground, after the absorption of the water, appears glazed over with salt. M. Volney is of opinion, that the fertile mould of Egypt, which is of a black colour, differs essentially from that of the other parts, and is derived from the interior of Ethiopia, along with the waters of the Nile: but there is no reason to suppose this kind of earth of foreign origin, it being always the result of vegetation and cultivation. The cause of decrease in the modern produce of Egypt, compared with the ancient, is thus assigned by M. Savary: "The canals," says he, speaking of the Delta, "which used to convey fertility with their waters, are now filled up. The earth, no longer watered, but exposed to the burning ardour of the sun, is converted into a barren sand. In those places where formerly were seen rich fields and flourishing towns, on the Pelusiatic, the Taretic, and the Mendesian branches, which all strike out from the canal of Damietta, nothing is to be found at present but a few miserable hamlets surrounded with deserts. These once navigable canals are now no more than a vain resemblance of what they were; for they have no communication with the lake Menzall, but what is occasioned by the swelling of the Nile, and during the remainder of the year they are perfectly dry. By deepening them, and by removing the mud deposited by the river since the Turks have been in possession of Egypt, the country they pass through would be again fertilized, and the Delta would recover a third of its ancient greatness."

The periodical return of winds from a certain quarter may be justly reckoned among the most curious phenomena of Egypt. When the sun approaches the tropic of Cancer, they shift from east to north; and, in June, they invariably blow from the north or north-west. They continue northerly during the whole of July, varying only sometimes towards the east and west. In August and September, they blow directly from the north, and are but of a moderate strength, though somewhat weaker in the night than in the day. Toward the end of September, they return to the east, though they do not absolutely fix on that point, but blow more regularly from it than any other. As the sun approaches the southern tropic, they become more variable and tempestuous, blowing most commonly from the north and north-east, which they continue to do throughout December, January, and February; and, during that season, the vapours raised from the Mediterranean condense into mist, or sometimes into rain. Toward the end of February and in March, they more frequently blow from the south than from any other quar-

ter. During part of March and in April, they blow from the south-east and south-west, and sometimes from the east, the latter becoming most prevalent about the end of the month, and continuing during the whole of May.

It is to the long continuance of the north winds, formerly called the Etesian winds, that Egypt is supposed to owe its extreme dryness as well as part of the inundation by which it is annually fertilized. From April to July, there appears to be two strong currents in the atmosphere, the under one blowing from the north, and the upper from the south. By the former, the vapours are raised from the Mediterranean and the southern parts of Europe, whence they are carried over Abyssinia, dissolving there in immense torrents of rain; while, by the latter, the superfluous vapours, or those raised from the soil of Abyssinia itself, are carried in a northerly direction toward the sources of the Euphrates. Here the clouds, coming from the south, dissolve in like manner into rain, and produce an inundation of the Euphrates, similar to that of the Nile, and immediately succeeding it. Mr. Bruce had an opportunity of ascertaining this fact, in the summer of 1768; for at that time, while on a voyage from Sidon to Alexandria, he observed great numbers of thin white clouds moving rapidly from the south, and in direct opposition to the Etesian winds.

Besides the ordinary winds above mentioned, Egypt is infested with the pestilential blasts common to all warm countries which have deserts in their immediate vicinity. The Egyptians call them "winds of fifty days;" because they commonly prevail during the fifty days preceding and following the equinox; though, if they were to blow constantly for only half that time, an universal destruction would be the consequence. They always blow from the south, and are indisputably owing to the motion of the atmosphere over such vast tracts of hot sand, where it cannot be supplied with a sufficient quantity of moisture. When they begin to blow, the sky loses its usual serenity, and assumes a dark and alarming aspect, the sun laying aside his usual splendor, and becoming of a violet colour. This terrific appearance seems not to be occasioned by any real haze or cloud in the atmosphere, but solely by the vast quantity of sand carried along by these winds, and which is so excessively subtile, that it penetrates every where.

The extreme dryness of these winds is such, that water, sprinkled on a floor, evaporates in a few minutes; all the plants are withered and stripped of their leaves; and a fever is instantaneously produced in the human species, by the suppression of perspiration. The danger is greatest when the wind blows in squalls, and to travellers who happen to be exposed to its fury without any shelter. The best method in this case is, to stop the mouth and nostrils with a handkerchief. Camels, by a natural instinct, bury

their noses in the sand, and keep them there till the squall is over.

A blast of this kind once overtook Mr. Bruce in the desert of Nubia; and the pillars of moving sand, which are commonly raised by such winds, were observed on this occasion in all their terrific majesty. Sometimes they appeared to move slowly; but, at other times, with such incredible swiftness, that they could not possibly have been eluded by the fleetest horse. Frequently the tops, when arrived at an immense height, suddenly separated from the bodies, and dispersed themselves in the air; and sometimes the whole column broke off near the middle, as if it had received a cannon-shot; and their size was so enormous, that, at the distance of about three miles, they appeared ten feet in diameter. Next day they seemed of a smaller size, but more numerous, and sometimes approached within two miles of the company. The sun was now obscured by them, and the transmission of his rays gave them a dreadful appearance, resembling pillars of fire. This was said to be a certain sign of the approaching *Simoom*, or hot wind, and the guide directed that, when it came, the travellers should fall upon their faces, and keep their mouths on the sand, to avoid drawing in the pernicious blast with their breath. On his calling out that the *Simoom* was coming, Mr. Bruce turned for a moment to the quarter whence it came, and perceived it like a fog of a purple colour, seemingly about twenty yards in breadth, and about twelve feet high from the ground. It moved with such rapidity, that, before he could turn about and prostrate himself, he felt the vehement heat of its current upon his face; and, even after it had passed over, the air which followed was so extremely hot, as to threaten instant suffocation.

The same phenomenon occurred twice more on our traveller's journey through the desert. The second time it seemed to have a shade of blue mingled with the purple, and its edges were less perfectly defined; resembling a thin smoke, and having about a yard in the middle tinged with blue and purple. The third time, it was preceded by an appearance of sandy pillars, more magnificent than any that had been yet observed; the sun shining through them in such a manner as to give those which were nearest a resemblance of being spangled with stars of gold. The *Simoom* which followed had the same blue and purple appearance as before, and was succeeded by a most suffocating wind, which continued for upwards of two hours.

The danger of travelling in these sandy deserts is finely and energetically described in the following lines:—

- "So where our wide Numidian wastes extend,
- "Sudden the impetuous hurricanes descend,
- "Wheel through the air, in circling eddies play,
- "Tear up the sands, and sweep whole plains away.

## AFRICA.

- "The helpless traveller, with wild surprise,
- "Sees the dry desert all around him rise,
- "And, smother'd in the dusty whirlwind, dies."

Mr. Bruce remarked, that these destructive winds always came from the south-east; while the sandy pillars, which prognosticated their approach, seemed to keep to the westward, and to occupy the vast circular space enclosed by the Nile to the west of their route, going round by Chaigic toward Dongola. The heaps of sand left by them when they fell, or raised by the whirlwinds which carried them up, were about twelve feet high, exactly conical, tapering to a fine point, and their bases well proportioned.

*Inundation of the Nile, Cataracts, Lakes, &c.* The river Nile has always been reckoned one of the greatest wonders of Egypt, and it is chiefly to this that the country owes its abundant fertility; for, as it seldom rains in the inland parts, and the soil is naturally dry and sandy, if the lands were not annually watered by the overflowing of this river, Egypt, instead of the most fruitful, would be one of the most barren regions in the world.

The sources or springs of this famous river were absolutely unknown to the ancients; and the discovery of them, having been repeatedly attempted in vain, was deemed so honourable an enterprise, that Lucan makes *Cæsar* speak to this effect:—

- "Loog has my curious soul, from early youth,
- "Toil'd in the noble search of sacred truth;
- "Yet still no views have urg'd my ardour more,
- "Than Nile's remotest fountain to explore;
- "Theo say what source the famous stream supplies,
- "And bids it at revolving periods rise;
- "Show me that head from whence, since time began,
- "The long succession of his waves has run;
- "This let me know, and all my toils shall cease,
- "The sword be sheath'd, and earth be blest with peace."

Mr. Bruce informs us, that the sources of the Nile are situated in the country of the Agows, in Abyssinia, and that the longitude of the principal fountain is thirty-six degrees, fifty-five minutes, thirty seconds east from Greenwich. The place through which is the passage to the territory of the Agows, is called Abala; a valley, generally about half a mile, and never exceeding one mile, in breadth. The mountains which surround it are at first of an inconsiderable height, and covered to their very summits with trees and herbage, but, as they proceed to the southward, they become more rugged. Those to the west join a mountain called *Asormaska*, where they turn to the south, and enclose the territory of Sacala, which lies at the foot of them; and further to the westward is the small village of Geesh, where the fountains of the Nile are situated.

Having passed several considerable streams, all of which empty themselves into the Nile, Mr. Bruce found himself obliged to ascend a very steep and rugged mountain, where

no path appeared but a very narrow one made by the sheep, and rendered almost impassable by thorny plants, and a number of large stones, which seemed to have remained there ever since the creation. At length, however, he reached the top, and had a sight of the Nile immediately below him; but so diminished in size, that it now appeared only a brook scarce sufficient to turn a mill. The village of Geesh is not within sight of the fountains of this river, though not more than six hundred yards distant from them. The country about that place terminates in a cliff of about three hundred yards high, which reaches down to the plain of Assoa, continuing in the same degree of elevation till it meets the Nile again about seventeen miles to the southward. In the middle of this cliff is a large cave, running straight northward, with several bye-paths, forming a natural labyrinth, which seems capable of containing the inhabitants of the whole village, together with their cattle. Into this cave Mr. Bruce advanced about a hundred yards; but did not choose to go farther, as the candle he carried with him seemed ready to go out, and the people assured him, that there was nothing remarkable to be seen at the end.

From the edge of the cliff of Geesh, above the village, the ground slopes on the northward with a regular descent to a triangular marsh, upwards of eighty-six yards broad; and about the middle of this marsh rises a circular hillock, about twelve feet in diameter, and surrounded by a shallow trench, which collects the water, and sends it off to the eastward. This is firmly built of sod, and kept in repair by the Agows, who worship the river, and perform their religious ceremonies upon this, as an altar. In the midst of it is a circular hole, which is always kept clear of grass and aquatic plants, and the water in it is perfectly pure and limpid, but without any ebullition or visible motion on its surface. The mouth is rather less than three feet diameter, and, at the period of our traveller's first visit, Nov. 5, 1770, the water stood about two inches from the brim, nor did it either increase or diminish during all the time of his residence in the neighbourhood. On putting down the shaft of a lance, he found a feeble resistance, at the depth of six feet four inches, as if from grass and rushes; and, about six inches deeper, he found his lance had entered into soft earth, but met with no obstruction from stones or gravel; and the same was confirmed by using a heavy plummet, with a line besmeared with soap. This is the first fountain of the Nile.

The second fountain is situated about ten feet distant from the former, and is only eleven inches in diameter, but eight feet three inches deep. The third is about twenty feet from the first; the mouth being rather more than two feet in diameter, and five feet eight inches in depth. These fountains are used as altars, and from the foot of each issues a running rill, which, uniting with the water of the

first trench, goes off at the east side in a stream that would fill a pipe of about two inches diameter. The water of these fountains is extremely light and intensely cold, though exposed to the scorching heat of the sun without any shelter. The elevation of the ground must be very great, as the barometer stood only at twenty-two inches; "neither," says Mr. Bruce, "did it vary from that height any of the days I staid at Geesh; and thence I inferred, that, at the sources of the Nile, I was more than two miles above the level of the sea;—a prodigious height to enjoy a sky perpetually clear, as also a hot sun, never overcast with clouds from rising to setting."

The Nile, thus formed by the union of streams from these three fountains, runs eastward through the marsh for thirty yards, with a very little increase of water, but perfectly visible, till it is met by the grassy bank of land declining from Sacala. This turns it round gradually to the north-east, and then due north; and, in the two miles it flows in that direction, the river receives many small contributions from springs, that rise in the banks on each side of it, so that, about this distance from the fountain, it becomes a stream capable of turning a common mill.

From this spot the Nile turns to the westward, and, after running over loose stones occasionally in that direction about four miles farther, a fall commences of about six feet in height, after which it quits the mountainous place of its nativity, and issues into the plains of Goutto. Here it flows so gently, that its motions can scarcely be perceived, but, at the same time, it makes so many sharp unnatural windings, that it differs from any other river our author ever saw; making about twenty sharp angular peninsulas in the course of five miles through a marshy plain of clay, quite destitute of trees, and very unpleasant. After passing this plain, it turns due north; and receives the tribute of several small streams, which descend from the mountains of Aformasha. It now begins to run rapidly, and again receives a number of beautiful rivulets, which have their rise in the heights of Litchambara. Here it becomes a considerable stream, inclining to the north-east, and winding exceedingly till it is joined by the small river Diva. The mere names of places through which it passes cannot be expected to afford any amusement to our readers; suffice it therefore to observe, that, after washing Upper and Lower Egypt, it at last disembogues itself into the Mediterranean.

The inundation of the Nile is now universally allowed to be occasioned by the great rains that fall in Ethiopia during the months of April and May, by which the river is so swelled as to lay that country almost entirely under water, and afterwards Egypt, in its course towards the Mediterranean. Nor is this inundation peculiar to the Nile, but common to it with other rivers that have their rise or course between the tropics, where heavy rains

constantly fall, and they are so much increased, that they are able to break through the adjacent lands, and flow into the sea.

constantly fall at a certain season of the year, which cause them to break through their ordinary bounds, and overflow the adjacent countries in their passage to the sea, particularly in Siam, Bengal, and other parts of the East-Indies.

The Nile begins to swell in the month of May, but its increase is not considerable in the Lower Egypt till about the 20th of June, nor is any public notice taken of it till the 28th of that month, at which time it is usually risen five or six peeks, a Turkish measure, equal to about five and twenty inches. Being come to this height, the public criers proclaim the rise of the river in the city of Cairo, and continue to publish how much it increases every day, till it rises to sixteen peeks, at which time they make great rejoicings; and this usually happens at the latter end of July, or before the 20th of August; but the sooner it happens, they have the greater hopes of a plentiful season. If the Nile do not rise to sixteen peeks, the people pay no tribute that year to the grand Signior; but a still greater height is necessary to cause a general flood, and prepare the lands for cultivation. Eighteen peeks, Dr. Pococke informs us, are reckoned but an indifferent Nile, twenty a middling one, and twenty-two a very good one, beyond which it seldom rises. If it chance to rise higher than twenty-four, the inundation is said to be prejudicial, the waters in that case not retiring soon enough for the people to sow their corn; but we scarcely know any instance of this nature. The Nile is usually at its greatest height about the middle of September.

In order to know exactly the rise of the Nile, there is built, on a pleasant island opposite to Old Cairo, a place called the Makkias, in which is a famous pillar for measuring the elevation of the water. It is fixed in a deep basin, the bottom of which is on a level with the bed of the river, the water passing through it. This pillar, which is placed under a dome, and crowned with a Corinthian capital, is divided into measures; and from the court that leads to the house is a descent to the Nile, by steps, on which the common people believe that Moses was found, after he had been exposed on the banks of the river.

As the river cannot of itself overflow the lands every where in the necessary proportion, a vast number of canals and trenches have been cut from one end of Egypt to the other, so that almost every town and village has its canal, which is opened at the proper time, and conveys the water of the Nile to distant places. It is from these canals, where the banks of the Nile are high, that the lands are overflowed; but it is otherwise where they are low, particularly in the Delta, which is that part of Egypt that lies between the two mouths of the river. Canals are carried along the higher grounds, that the water may have a fall from them to the lower parts; and from the great canals it is drawn out into small channels, and conveyed all over the country. It is likewise observable,

30. VOL. I.

that, as they have dikes or banks to keep the water out of the canals till the river be risen to a proper height to let it in, so in some of them they have contrivances to keep it in after the Nile is fallen, and also preserve it in certain lakes or ponds, from which they can let it out upon their lands at pleasure.

The reader, however, is to understand, that some parts of the country lie too high to be watered by means of the canals, and several gardens and plantations require more refreshment than what they receive from the annual inundation; and on this account they are obliged to raise water from the river, which is lodged in cisterns or reservoirs contrived for that purpose. This is generally done by the Persian wheel, a machine turned by oxen, which carries a rope hung with several vessels, that fill as it goes round, and empty themselves into the reservoir. They have another contrivance, where the bank of the river is high; in which case they make a basin on the side of it, fixing near it an upright pole, and across the top of that another, with an axle, at one end whereof hangs a great stone, and at the other a leathern bucket, which, being drawn down into the water by two men, is raised up again by the weight of the stone, the men directing it, and emptying it into the basin. The former of these machines is chiefly used in the lower parts of Egypt, the latter in the higher; for, as we advance up the river, the difficulty of raising the water increases.

We may judge how much the fertility of Egypt is owing to the inundation of the Nile, when we consider that it leaves behind it a stratum of mud or slime, which, without any other manure, renews all the strength of the soil that the preceding harvest had impaired; nay, it is frequently found necessary to temper it with a little sand, to abate its excessive richness.

With respect to the distribution of the waters of the Nile by means of canals, &c. we shall only add, that there is a great canal, called Khalis, which runs from the river quite through the city of Cairo, and several miles beyond it. Near the mouth of this canal there is a mound or mole, which is every year broken down with great solemnity and rejoicing, when the Nile rises to the height of sixteen peeks; and thereby the water is conveyed into the city, and thence into the gardens and the adjacent country. The bashaw himself, accompanied by all his great officers, and attended by a vast multitude of people, assist at the ceremony of cutting this bank; and on this occasion the trumpets and other music, the repeated shouts of the people, the firing of guns, &c. make an agreeable confusion. In short, bonfires, illuminations, fireworks, several sorts of games and exercises, and whatever can express an universal joy, are continued for three days and nights successively. M. Thevenot, who was twice present at this ceremony, tells us, that, among other diverting sights

exhibited on that occasion, he saw two swimmers, whose performances were very surprising. One of these, with his hands tied behind him, and his feet bound with a chain weighing ten pounds, stood upright in the water, and in that manner went from the opening of the canal quite through Cairo, which is three miles and upwards. The other fellow swam in chains from one end of the canal to the other, with a pipe in his mouth, and a dish of coffee in his hand, without spilling it; and both these swimmers were handsomely rewarded.

Before we leave the Nile it is proper to notice its famous cataracts, which are usually reckoned seven in number, where the river pours itself down high precipices with such a prodigious noise, that it may be heard at the distance of several leagues. De L'Isle represents one of them as falling from a height of two hundred feet, with a noise exceeding that of the loudest thunder; and, it is said, the water, breaking with the fall, raises such thick mists, that at a distance they appear like clouds. It is also reported that the water in its fall forms a kind of arch, under which one may walk without being wetted: and the neighbouring people seem formerly to have made this a diversion, there being several niches and seats cut in the rock, and likewise some grottoes, which are now become inaccessible. Seneca relates a practice of the inhabitants near the cataracts of the Nile, which appears quite incredible, viz.—That two of them used to get into a small boat, the one to guide it, the other to throw out the water, and, directing the little vessel with their hands, they dexterously steered through the narrow channels without touching the rocks, till at last they were hurried down the precipice by the falling river. The affrighted spectators then supposed them inevitably swallowed up and lost, but presently saw them appear again upon the water at a great distance. Some modern travellers seem to confirm this account; but Dr. Pococke, who saw several of the cataracts, takes no notice of any such practice; nor does he represent them as such frightful falls as they are generally supposed to be. The doctor tells us of some rocks that lie across the river in three different places, dividing the stream, and causing several falls of water; but he makes the greatest of them not above seven or eight feet, and others about four or five. He acknowledges, however, that the natives talked of other cataracts besides those he saw, and even reckoned seven of them, which seems to agree with the accounts of the ancients: But, as to the Cataracts, those high cataracts whose noise made the neighbouring inhabitants deaf, he looks upon the whole as fabulous.

We shall finish our account of the Nile by observing, that its waters run through a canal during six months into the lake of Mæris, and during the other six months flow back from the lake into the Nile. This lake is said to

have been dug by a king of Egypt of the same name, in order to correct the irregularities of the Nile, by receiving the superfluous waters when the river rose too high, and by supplying the lands with water when the river failed, which was let out of the lake into the adjacent country by a great number of canals and ditches. Many of these canals are still subsisting, which are equally serviceable to the present inhabitants of Egypt as they were to the ancient, and are attributed, like most other works of public benefit, to the patriarch Joseph, whose name they have given to the great canal by which the lake has a communication with the Nile.

According to the accounts of Herodotus and Diodorus, this lake was no less than three thousand six hundred stadia, or four hundred and fifty miles, in circumference, whereas Pomponius Mela makes it no more than twenty miles; but the critics suppose this to be a mistake in Mela's copy, and have accordingly corrected it by those historians. The truth seems to lie between these two extremes, for travellers of veracity assure us, that the lake of Mæris is at this day between forty and fifty miles in length, and ten or twelve in breadth; though the extent of it varies as the Nile sinks or rises. Its banks are of a blackish soil, between which and the water the ground is slaty, and part of it covered with a deep slimy mud, with a thin cake of salt upon its surface. The water has a muddy taste, is almost as salt as the sea, and consequently very disagreeable; but it is fresher towards the part where the canal enters from the river.

To form this prodigious lake, if it were made by art, a vast quantity of earth must have been dug up, which naturally led Herodotus to enquire what became of it, and the Egyptians told him it was thrown into the Nile, and dispersed by the current of that river. This account, however, seems far from being satisfactory; and, as the inhabitants of the country could give no better answer to the historian's question, it is reasonable to suppose this spacious lake was rather a work of nature than of art, though perhaps king Mæris might enlarge it, by opening or cleansing its communication with the Nile, erecting flood-gates, and even sinking some part of it deeper than it was originally; and this might give rise to the tradition, that he caused the whole cavity to be dug, and formed the lake which retained his name.

The two lakes of Natron, situated to the west of the Delta, are very interesting objects. Their bed is a sort of natural trench, three or four leagues long, by a quarter of a league wide; and the bottom is solid and stony. It is dry for nine months in the year; but, in winter, there oozes from the earth a water of a reddish violet colour, which fills the lake to the height of five or six feet; the return of the great heats causing this to evaporate, there remains a bed of salt, two feet thick and very hard, which

is broken with thirty thousand every year.

Minerals, &c. of the inconceivable which render it respecting the city. These are perdition of the be magicians a ver those treasures their ruins. Some person dare any one willing manner, confident by comparing satisfactory knowledge.

*Minerals, &c.*] Most modern travellers have taken notice of the inconveniences that attend travelling in Egypt, and which render it extremely difficult to speak with accuracy respecting the mineral productions of that celebrated country. These arise principally from the barbarity and superstition of the natives, who imagine all Europeans to be magicians and sorcerers, who come purposely to discover those treasures which the genii have concealed under their ruins. So deeply rooted is this absurd opinion, that no person dares walk alone in the fields, nor can he find any one willing to accompany him; so that he is, in a manner, confined to the banks of the river, and it is only by comparing the accounts of various travellers that any satisfactory knowledge can be acquired.

From comparing his own observations with those of other travellers, M. Volney concludes, that the basis of all Egypt, from Asonan to the Mediterranean, is a continued bed of calcareous stone, of a whitish hue and soft substance, containing the same kind of shells that are met with in the adjacent seas. According to Mr. Bruce, the porphyry mountains and quarries begin at Hamra, in the latitude of nearly twenty-four degrees, and continue along the coast of the Red Sea to about twenty-two degrees thirty minutes; when they are succeeded by the marble mountains, these again by others of alabaster, and these last by basaltic mountains. Some of these mountains appeared to be composed entirely of red, and others of green, marble, and, by their different colours, afforded an extraordinary spectacle. In the vicinity of Cosseir, our author discovered the quarries whence the ancients obtained those prodigious quantities of marble with which they constructed so many wonderful works. The first place where the marks of their operations were plainly discernible, was a very high mountain, where the stone was so hard as to resist the stroke of a hammer; and the evident termination of some channels at this spot, served to prove that water was anciently used in cutting these hard stones.

In four days, during which Mr. Bruce travelled among these mountains, he passed more granite, porphyry, marble, and jasper, than might have sufficed to build Rome, Athens, Corinth, Syracuse, Memphis, Alexandria, and half a dozen such cities. It also appeared, that the passages between the mountains, and what our author calls *degites*, were not natural but artificial openings; where even whole mountains had been cut out, in order to preserve a gradual slope toward the river.

Concerning the mountains in general, our traveller observes, that the porphyry is very beautiful to the eye, and is discovered by a fine purple sand, without any gloss. An unvariegated marble, of a green colour, is generally found

in the same mountain; and where the two meet, the marble becomes soft for a few inches, but the porphyry retains its hardness. The granite has a dirty brown appearance, being covered with sand; but, on removing this, it appears of a grey colour, with a reddish cast all over it, and diversified with black spots. The red marble is next to the granite, though not met with in the same mountain: there is, also, a red kind, with white veins, and a great quantity of the common green serpentine. Some samples of that beautiful marble called *Isabella*, were likewise observed: one of them of that yellowish cast called quaker-colour, and the other of the bluish kind, named dove-colour. The most valuable kind, however, is that called *verde antico*, which is found next to the Nile in the mountains of serpentine marble. It is covered by a bluish stone, somewhat lighter than slate, more beautiful than most kinds of marble, and, when polished, has the appearance of a volcanic lava.

Some travellers have spoken of an emerald-mine in this country; but, from the researches of Mr. Bruce, it does not appear to have any existence. In the Red Sea, indeed, at a small distance from the south-west coast, there is an island, called the Mountain of Emeralds; but it seems that none of those precious stones have ever been found there in modern times. Here, as well as on the continent, there were many pieces of a green pellucid substance; but veined, and much softer than rock-crystal, though somewhat harder than glass. A few yards up the mountain Mr. Bruce found three pits, which are supposed to have been the mines whence the ancients obtained their emeralds; but though many pieces of the green substance above mentioned were met with about these pits, no signs of the true emerald could be perceived.

In the mountains of Cosseir, as well as in some parts of the deserts of Nubia, our author found some rocks, which exactly resembled petrified wood. On the road to Suez are found great numbers of Egyptian flints and pebbles, though the bottom is a hard, calcareous, and sonorous stone. Here, also, M. Volney tells us, that the stones resembling petrified wood are to be met with. These, he says, are in the form of small logs, cut slanting at the ends, and might easily be taken for petrifications, though he was well convinced that they were real minerals.

*Vegetables.*] It is not to be supposed that such a country as Egypt, which is very hot, and annually overflowed, should produce any great variety of plants; and it may be presumed that very few, except those of the aquatic kind, were originally produced in Egypt, but have been transplanted thither from other countries. The celebrated plant called papyrus, or biblus, which formerly grew plentifully on the banks of the Nile, and is, perhaps, a native of Egypt, is now rarely to be met with, the poorer sort of people having almost destroyed it, by digging up the roots

for fuel. This plant was made use of by the ancients to write upon, and thence our paper had its name. It has a large stem, whence some say they took the pith, which they worked into a white paste or glue, and of that made a kind of paper, almost in the same manner as we do with our linen rags; but others say they used the inner rind for that purpose. According to Pliny, the root of this plant is as thick as a man's arm, and ten cubits long, whence arise a great number of triangular stalks, at the extremities of which its flowers are ranged in clusters. Its root is woody and knotty, its leaves long, like those of the bulrush, and its taste and smell resemble those of the cypress, of which some reckon it a species.

The manner of making the Egyptian paper was as follows: they began with lopping off the root and head of the papyrus, as of no use in this manufacture; the remaining stem they slit lengthways into two equal parts, and from each of these they stripped the thin scaly coats or pellicles, whereof it was composed, with the point of a penknife. The innermost of these pellicles were reckoned the best, and those nearest the rind or bark the worst; and accordingly they were kept separate, and constituted different kinds of paper. As the pellicles were taken off, they extended them on a table, and then two of them were laid over each other transversely, so that their fibres made right angles. In this state they were glued together with the muddy water of the Nile, then pressed, dried, and, lastly, flatted and smoothed, by beating them with a mallet; though sometimes, with a hemisphere of glass, they gave them a farther polish.

It is to be observed that, besides paper, the ancients made ropes, sails, mats, blankets, shoes, and several domestic utensils, of the papyrus; but, more useful inventions having set all this aside, the plant is now neglected, and almost extirpated out of Egypt.

The dumez, the sycamore of the ancients, which the Europeans call Pharaoh's fig, is common about the villages near Cairo, and is, likewise, found in some parts of Syria. It is a large spreading tree, with round leaves, and bears a fruit like the common fig, but something smaller, and not much esteemed. It is remarkable that the fruit grows on several short branches, without leaves, that shoot out from the main limbs of the tree; and at the end of the fig there gathers a sort of water, which is let out by cutting the skin, otherwise the fruit will not come to perfection. The tree is propagated by planting its branches, which grow very fast.

The cassia fistula, which we call the pudding-pipe-tree, is not uncommon in Egypt, though it does not seem to be a native of the country. The tree is tall, its bark ash-coloured, its wood very firm, its grain close; and at the centre it is black, but yellowish towards the outside. Its flowers are also yellowish, and produce a fruit in the form

of a long pod, which, when ripe, is full of a black sweetish pulp, divided by small woody cells, and in this pulp are found little hard grains, shaped like hearts, which are the seed of the tree. The Egyptians never use the cassia-pods till they are four months old; for, when young and recent, they are observed to be noxious. They use the pulp extracted from the pod in form of a bolus or potion; and are of opinion that, taken internally, it cools and purifies the blood. The Egyptians likewise use it to alleviate the great and hot pains of the joints, applying it by way of plaister to the part affected. It allays thirst, and is, therefore, good in feverish disorders.

The acacia, or Egyptian thorn, is said to be of considerable use in medicine. From the green pods it bears, a juice is expressed and inspissated, which is brought to use in bladders, containing globular masses, weighing from four to eight ounces, which are externally blackish, but internally of a shining brown colour, hard, brittle, and of an austere taste. This juice is called acacia, and is used for preventing inflammations in the eyes, for curing ulcers in the mouth, and fissures of the lips, for fastening the teeth, and strengthening weak joints.

In Lower Egypt, especially near Rosetta, the lotus grows in great abundance. This plant is a species of the water-lily; its leaves float on the water, and cover its surface, producing many flowers, which were formerly woven into the crowns of conquerors. The ancient Egyptians made bread of the pulp of the lotus dried, which resembles that of a poppy; and they used to eat the root of it, which is round, and as large as an apple. After the flowers follow round green pods, which contain a seed, not unlike that of a cabbage. At present, the Egyptians make a drink of this plant, mixed with sugar, which is good against inward heats; and, in summer, they eat the stalks and heads of it raw, which are sweet, moistening, and cooling.

The culture of the *citrus*, or water-melon, is one of the most general and most prolific in Upper Egypt; the markets are commonly filled with this sort of fruit, and, as they are sold exceedingly cheap, the poor, as well as the opulent, may refresh themselves with their aqueous and saccharine juice. The water-melons of Egypt are round, and grow to a large size; those of the best quality, when thoroughly ripe, have a rind perfectly smooth, and of a blackish green. The divisions are slightly marked; the pulp is white near the rind, and red in the middle; the seeds are flattish, their shell is black, and the inside is of a beautiful white.

The shrub called *schisme* is cultivated in many of the gardens at Rosetta. It bears leguminous flowers, of a deep yellow colour, and oblong leaves terminating in a point. The flowers are succeeded by long pods, bent in the form of a scythe, and contain flat seeds, which are

grey in the middle, and encircled by a brown border. These seeds are considered by the Egyptians as a specific against the ophthalmia, so prevalent in their country: they are pounded and reduced to a yellow powder, which is blown into the eyes, either pure or mixed with pulverized sugar.

The *helbé*, or fenugreek, is properly cultivated for fodder; but M. Somini observes, that the Egyptians themselves eat it with avidity, so that, in Lower Egypt, it may be not inaptly termed the "fodder of men." In the month of November, green *helbé* is carried about in large bundles for sale, and generally purchased at a low price. The natives pretend that it is an excellent stomachic, a specific against worms and dysentery, and a preservative against many disorders.

To this account of the vegetable productions of Egypt we shall add a few particulars relating to their harvests, of which they have two in a year, a spring-harvest from January to May, and a winter-harvest about October. For the latter, before the land is overflowed, they sow rice, Indian wheat, and what they call the corn of Damascus, which produces a large cane, and has an ear like millet. They also plant their sugar-canes at the same time; for all these require a great deal of water, especially rice, the largest crops of which are produced near Damietta and Rosetta, where the lands are low, and more easily overflowed than those higher up the river. Their wheat and barley are sown in November, or somewhat sooner or later, according as the waters of the Nile retire; and what is sown at this time of the year they reap in March and April. At the same season, they sow flax, lentils, lupines, and other vegetables of the like nature, which they gather in the spring; and about November they likewise cultivate their earthamus, or safranoun, as they call it, which grows like succory, and the flower of it, being of use in dyeing, is accordingly brought into Europe. Their wheat is bearded, and their barley has six rows of grain in the ear, but is a coarse sort, and chiefly eaten by horses. They have no oats, but plenty of beans, with which they feed their camels; and the people, likewise, eat them green, both raw and boiled. Neither have they any peas, but a sort of vetch, with one large grain in each pod, which is eaten raw when green, and boiled when dry, and is not much inferior to peas in taste. Here it may not be amiss to observe that, though Egypt produces very good flax, it is not now so remarkable for its fine linen as it was anciently, when it was carried to such a perfection, that the threads could scarcely be discerned by the nicest eye. They had such plenty of it, as not only to clothe their priests and people of condition, and to make shrouds for their dead, but to export considerable quantities of it into other countries. In short, this manufacture was in great request all over the east; and the superfine

31. VOL. I.

sort of it was often dyed in purple, and bore an excessive price.

*Animals.*] Egypt abounds in black cattle; and it is said that the inhabitants employ two hundred thousand oxen in raising water for their grounds. They have a fine large breed of asses, upon which the Christians ride; those people not being suffered by the Turks to ride on any other beast. The Egyptian horses are very fine; they never trot, but walk well, and gallop with great speed, and are extremely tractable. The dogs are large greyhounds, which would be exceedingly handsome, if they were treated with less severity; for the Mahometans have a particular aversion to them: however, their instinct is not destroyed, though they have entirely lost the native elegance of their formation. They are seen passing to and fro, in the most frequented streets, and carefully avoiding the Mahometan passenger, who turns aside his robe at their approach. During the night, they assume a superintendence over the wharfs, boats, and timber, which no person confides to them, and a robber would find it impossible to touch the property, of which they thus become the voluntary guardians. But what seems still more curious is, that these animals form distinct tribes, and have limits, which they never exceed: they never quit the quarter where they first received their existence; and, if a strange dog should presume to enter their confines, his life would most probably answer for his intrusion. The Bedouins, who are much less addicted to superstition than the Turks, keep large greyhounds, for the preservation of their tents and goods; they are particularly careful of them, and bear them so great an affection, that any person who should attempt to kill one of them would undoubtedly fall a sacrifice to the resentment of the owner. Notwithstanding their decided and unjust aversion for dogs, the Turks are extremely fond of cats, inasmuch that, if one of them happen to enter a mosque, it is greatly caressed by the assembled zealots, as the favourite animal of their prophet, there being an old tradition, which affirms, that Mahomet, being once called upon some urgent business, preferred cutting off the sleeve of his robe to disturbing his cat that lay upon it fast asleep.

Among the ancient Egyptians, cats were greatly venerated, and their death was considered as so mournful an event, that their owners shaved their eye-lids, in token of their mourning: the bodies of the animals were likewise embalmed in sacred temples, and from thence carried, solemnly, into Bubastis, a considerable city in Lower Egypt, where they were deposited in the sepulchres of the country. There are cats in all the houses of Egypt: in those of the opulent, they are indulged in the best apartments, and partake of the indolence and effeminacy of their masters, who lavish upon them such caresses as their pride would refuse to beings of superior sense.

Tigers, hyænas, camels, antelopes, apes, with the head like a dog, and the rat called ichneumon, are natives of Egypt. The chameleon, a little animal, something resembling a lizard, which occasionally changes colour, especially when irritated, is found here as well as in other countries. The crocodile was formerly thought peculiar to this country, but there does not seem to be any material difference between it and the alligators of India and America. They are both amphibious animals, in the form of a lizard, grow till they are about twenty feet in length, have four short legs, with large feet armed with claws, and their backs are covered with a kind of impenetrable scales, like armour. The crocodile waits for his prey in the sedge, and other cover, on the sides of the river, and often surprises the unwary traveller with his fore-paws, or beats him down with his tail. The most common method of killing crocodiles is, by shooting them in the belly, where the skin is soft, and not covered with scales like the back. The natives destroy them by making some animals cry at a distance; and, when the crocodile comes out, they thrust a spear, to which a rope is tied, into his body; then letting him retire into the water to exhaust himself, they afterwards draw him out, run a pole into his mouth, and, leaping upon his back, tie his jaws together. The people say, they cannot seize a man in the water, and, therefore, frequently cross the Nile by swimming, both by themselves, and with their cattle, even above the first cataract, where there are a great number of these animals.

They are not fond of salt-water, but love to continue in the rivers. They lay their eggs in the sand, having previously dug a hole with their fore-paws to deposit them in; which they cover up with great care, and then retire. The next day they return again, uncover the place, lay about the same number of eggs, and then retire till the ensuing day, when they repeat the same for the last time, after which the hole is finally closed. As soon as the eggs are hatched by the warmth of the sun, which happens at the end of thirty days, the young ones begin to break the shell. The mother, by instinct, goes at the same time to assist them, by scratching away the sand. The instant they are at liberty, the strongest move towards the water, and the rest mount upon the back of the mother, who carries them safely to it; but the moment they arrive at the water, all natural connection ceases; when the female has introduced her young to their natural element, she and the males become their most formidable enemies, and devour as many of them as they can; the whole brood scatters into different parts at the bottom, and most of them are destroyed. This animal is not only an enemy to its own species, but is at perpetual war with all other living creatures.

The flesh of the crocodile is but indifferent food, though the eggs are deemed great delicacies, and are sought after

very eagerly, not only by man, but by many beasts and birds of prey. The vultures are particularly successful in destroying these eggs, which they effect by the following stratagem:—They hide themselves among the bushes and shrubs, about the banks of those waters where the crocodile inhabits; then watching till she has deposited her eggs, they go to the place, as soon as she retires, scratch away the sand, and feast upon the spoil. At other times, when they have not discovered a crocodile's nest, they are equally destructive to the young ones, while they are running to the river.

Jackals are very numerous in Lower Egypt. They are gregarious. Their howl is very disagreeable, particularly in the night; it is a kind of yelping, that may be compared to the shrill cries of children: they greedily devour dead bodies and filth of every kind. In a word, they are equally cruel and voracious, and are dangerous enemies even to man.

The *thaleb* is an animal which has some resemblance to the jackal, but, at the same time, differs from it in some striking features, and particularly in its habits. And M. Sonnini is of opinion, that all which has been asserted, both by the ancients and moderns, respecting the *fox* of Egypt must be understood to apply to the *thaleb*, who has, in fact, several features similar to those of the fox. The hair of this animal is of a bright fawn colour, deeper on the upper than the under part of the body: the tail is remarkably large, and striped transversely with black and grey; the eyes are literally brightened with the fire of vivacity; and the countenance is expressive of peculiar craft and cunning. While the jackals, merely ferocious, frighten away their prey by their howlings and numbers, and are frequently compelled to appease their hunger with food the most disgusting to their appetite, the more fortunate *thaleb*, surpassing them in address, does not associate with others, but goes alone; in the height of day approaches the habitations of men, establishing near them his subterraneous abode, whence he creeps out with the first favourable opportunity to surprise the poultry, carry off the eggs, &c. One of the handsomest of quadrupeds he would be, perhaps, one of the most amiable, if his tricks and his talents for depredation did not bear too strong an impression of falsehood and knavery.

"Taking one day a contemplative walk in a garden," says our author, "I stopped near a hedge; while a *thaleb*, who heard no noise, was coming toward me through the hedge, and, on his getting out, he found himself close at my feet. On perceiving me, he was so struck with astonishment, that he did not even attempt to escape, but, fixing his eyes upon me, remained motionless for some seconds. His embarrassment was painted in his countenance, in a manner of which I could not have conceived him susceptible, and which indicated a very delicate in-

stinct. For my part, I was afraid to make any motion that might disturb this situation, which afforded me considerable pleasure. At length, after taking a few steps from one side to the other, as if not knowing which way to fly, still keeping his eyes turned toward me, he made off, not running, but stretching himself out, or rather creeping away, placing his feet alternately with singular precaution. He was so much afraid of letting himself be heard in his flight, that he held his large tail almost in a horizontal position, that it might neither drag on the ground, nor brush against the plants. On the other side of the hedge I found the remains of his meal: it was a bird of prey, which he had nearly devoured."

The Jerboa, a gentle animal, takes up its subterranean abode in some parts of Egypt. The singularity peculiar to the construction of this animal is, that the fore-legs are so short, that they scarcely extend beyond the hair: they are white, and have five toes, the inner one of which is short, rounded at the end, and has not any nail; the four other toes are long, and armed with great hooked nails. The heel is very high, and the inside, or sole, of the foot is naked, and of a flesh-colour. Sonnini, who has given a more accurate description of this animal than any traveller who has visited this country, observes, that the fore-feet may be taken for hands, as, in fact, they are of no use in walking, but serve the jerboa only to lay hold of his food, and carry it to his mouth, as also to dig his subterranean habitation.

Hares are tolerably numerous in the desert, although exposed to the pursuit of carnivorous quadrupeds and birds; at least, their tranquillity is seldom interrupted by man; for, except in the plains of the Pyramids, and of Saccara, where the Europeans resident at Cairo sometimes take the amusement of hunting, the inhabitants of Egypt never disturb them; their flesh is forbidden by the Mahometans, as it was by the Jewish law; neither is it eaten by the Copts, who have adopted several of the customs of the Jews. The climate has produced a trifling difference in the quality of the hair of the animals of this species, that inhabit the burning and sandy plains of Africa: they are there nearly grey, which colour changes, and grows darker, in proportion as the temperature becomes less sultry.

Among several sorts of yellow lizards is the worrall, which is said to be affected by music. Dr. Shaw says, he has seen several of them keep exact time and motion with the derives in their circulatory dances, turning when they turned, and stopping when they stopped: but Dr. Pocke, who procured a worrall alive, could not discover that music had any influence upon it. This animal, which is of the lizard kind, is four feet long, eight inches broad, and has a forked tongue, which it puts out like a serpent, but it has no teeth, and is harmless, living on flies and

other insects. It frequents the grottos and caverns, in the mountains on the west of the Nile, and is only found during the hot weather, as it always sleeps during the winter.

There are two species of vipers in Egypt, which are much esteemed in physic; they are of a yellowish colour, like the sand in which they live, one with a kind of horns, which have some resemblance to those of snails, but are of a horny substance; and the others like those in Europe.

Scorpions here grow to a surprising size, and Sonnini was assured that their bite occasioned extreme agony, swoonings, convulsions, and sometimes death.

Of the birds in Egypt, the ostrich deserves the preference: it is called, in Arabic, *ter-gimel*, or the camel-bird, because in its head, neck, and walk, it resembles the camel. This bird is common in the mountains south-west of Alexandria; its fat is sold by the Arabs, and used as an ointment for the rheumatism, palsy, and all cold tumours. They have here a kind of large domestic hawk, of a brown colour, with a very fine eye. These frequent the tops of houses, where they may be seen with pigeons standing close by them; but, though they are not birds of prey, they eat flesh wherever they find it: the natives never kill them, for they, as well as their ancestors, seem to entertain a veneration for these birds. The *ter-chacus*, or messenger-bird, would be thought very beautiful, were it not so common: it is almost as large as a dove, and is not only finely speckled, but has on the top of its head a tuft of feathers, which it spreads, when it alights on the ground.

They have also a beautiful white bird, called, by the Europeans, the field-hen: it resembles a stork, but is not half so large, and is seen about the fields like a tame fowl. They have, likewise, a large white bird, with black wings, shaped like a raven: these last are called Pharaoh's hens, and live in the same manner as the tame hawk.

Great numbers of the birds called ibis were formerly found on the islands in the Nile: these were held in great veneration by the Egyptians, on account of their delivering the country from the multitude of serpents that breed in the ground after the retreat of the Nile. They are of a greyish colour, with the wings and tail black, and resemble the crane.

The stork is held in the highest esteem and veneration by the Mahometans; it being as sacred among them as the ibis was among the Egyptians; and that person would be accounted very profane, who should attempt to kill, or only hurt or molest it. The great regard paid to these birds was, at first, perhaps, less occasioned by the service they render to moist sunny countries, in clearing them of a variety of reptiles and insects, than from the solemn gesticulations they are observed to make whenever they rest upon the ground, or return to their nests; for

they first throw their heads backwards, as it were, in a posture of adoration, then strike, as with a pair of castanets, their upper and lower bill together, and afterwards prostrate their necks in a suppliant manner down to the ground; constantly repeating the same motions three or four times together.

One of the birds most commonly seen in Lower Egypt, at the commencement of the winter, is the hoppoe, or dung-bird. It is by no means wild; but as its flesh is reckoned very indifferent, it is never killed by the inhabitants. The hoppoes are frequently seen in small flocks, and if one of them be separated from its companions, it calls them by a shrill cry, at the same time drawing in its bill close to the breast, and briskly raising its head. The hoppoes, likewise, utter a hoarse disagreeable sound, in one note. These migratory birds are very fat; and their flesh is tender and palatable.

The turtle-doves, which arrive in Egypt after the European autumn, and there spread themselves from the sea as far as Cairo, are of the common species; but those which constantly inhabit the same country form a distinct race.

*Antiquities.*] The Pyramids of Egypt, so highly celebrated and universally admired for ages, have been described by various travellers and antiquaries. But the information here presented to the reader is extracted from the narration of Dr. Pococke; which we have adopted, not only from our own conviction of its superiority, but from the concurrent testimony of Sonnini and other travellers; Denon has, indeed, visited them since the learned doctor; but the hurry with which his researches must have been attended, arising from his being surrounded with enemies, and obliged to accompany an army seeking for conquest in a foreign country, must convince our readers of the propriety of our choice.

"It is singular," says this writer, "that such superb piles are no where to be found but in Egypt; for, in any other country, pyramids are rather puerile and diminutive imitations of those of Egypt, than attempts at appropriate magnificence. The pyramids are situated on a rock, at the foot of the high mountains which bound the Nile, and separate Egypt from Lybia. Unquestionably, they were all intended as places of sepulture; but their architecture, as well externally as internally, is extremely different, whether we regard distribution, materials, or grandeur. Some are open, some close, and others ruinous. Indeed, they have all sustained more or less damage from the lapse of time, as well as from actual demolition. However, considering the astonishing number of ages that must have passed away since their erection, it is rather a matter of surprise that they should be so perfect as they are, than that they should be partially injured. They are certainly works of the remotest antiquity: the very epocha

of their foundations was lost at the time when the first Greek philosophers travelled into Egypt.

"It is not improbable, that the invention of pyramids was antecedent to the discovery of arches and columns. It is, in fact, a mortifying consideration, that the most durable and magnificent works in architecture have originated from ignorance of the arts and sciences. The famous aqueducts of the ancients, whose remains excite the wonder of the present times, were certainly owing to a want of knowledge of the first principles of hydrostatics.

"It is a common tradition in Egypt, that, anciently, there were giants in that country, who raised the pyramids, and the vast palaces and temples, whose remains are scattered about. But this ridiculous opinion is confuted by observing that, had this been the case, the gates and doors of the buildings would have been proportionate to the height of the occupiers; but, as they are of the ordinary dimensions, we may conclude, that they were erected by people of the common size. Indeed, the passages in the pyramids are barely large enough to admit a man of our own times; and the coffin, in the largest and last pyramid, is an incontestible proof of the falsity of such an opinion, since it determines the size of the prince's body, for whom the pyramid was built.

"The principal pyramids are situated about three hours sail up the Nile, near the place where the ancient Memphis stood. The four most remarkable fabrics of this kind are nearly on a diagonal line, and about four hundred paces from each other. The four faces exactly correspond to the four cardinal points. The two most northern are the largest, and their perpendicular height has been calculated at five hundred feet. The bottom of the first is exactly six hundred and ninety-three English feet square, and therefore covers more than eleven acres of land. The inclined plane is equal to the base, and the angles and base form an equilateral triangle. The number of steps have been variously computed; but they are between two hundred and seven and two hundred and twelve: these steps, or layers, are from two and a half to four feet high, and are broad in proportion to their height.

"The most northern of these pyramids is the only one that is open, and with it I shall begin my description. The external part is constructed of great square stones, cut out of the rock which extends along the Nile, where the quarries are still visible from which they have been taken. The size of these stones is unequal, but they have all the figure of a prism, that they may lie close together. It might be imagined, that each range would form an even step round the pyramid; but this is not the case; and hence the reason that different travellers disagree about the number of the courses. It seems that regularity was no farther attended to than was necessary to preserve the

pyramidal form, and for the facility of the work. The external layers have neither mortar, nor cramps; but, in the body of the pyramid, a kind of cement is used, composed of lime, earth, and clay. The only foundation is the surface of the rock, as may be plainly perceived at the four corners.

"The wind has, casually, and in length of time, blown up a ridge of sand, which affords a commodious ascent to the entrance of the pyramid, which is forty-eight feet from the ground. On reaching this entrance, it is usual to discharge a pistol, to frighten away the bats; after which two Arab guides, whom it is necessary to engage, enter and remove the sand, with which the passage is almost stopped up.

"This being done, you strip to the shirt, on account of the excessive heat constantly felt in the pyramids, and in this condition proceed, each with a wax-candle in his hand. Being arrived at the extremity of the gallery, where the passage is forced, you find an opening, barely sufficient to crawl through. Having passed this strait, which is about six feet long, you come to a large apartment, where it is usual to take some refreshment, that you may have more strength and resolution to penetrate into the second gallery.

"Almost all the passages are three feet and a half square, and lined with white marble, highly polished, which, with the acclivity of the way, would render it impassible, were it not for little holes cut for resting the feet in. By observing these holes, you proceed, without danger, to the end of the second passage, where is a resting-place, and, on the right hand, an opening into a kind of well, without any steps, and which is, in fact, a perpendicular pipe, tenanted only by bats. Here a third gallery commences, leading to the inferior chamber, in a horizontal direction. Before the chamber are some stones, which interrupt the way; but, having passed them, you enter the chamber, which has a sharp-pointed vault, and wholly cased with granite, once perfectly polished, but now tarnished with the smoke of the torches used in visiting it.

"Having seen the lower chamber, you return to the resting-place, and ascend the fourth gallery, at the extremity of which is a little platform. Here you must commence climbing again; but, having proceeded a little way, you soon find a new opening, where you may stand upright. At length, by stopping for the last time, you pass the remainder of the fifth gallery, which conducts, in a horizontal line, to the upper chamber. This, like the former, is coated with granite. On the left side is a coffin of the same material, in the figure of a parallelopiped, quite plain. On being struck with a key, it sounds like a bell. Near this coffin is a very deep hole, which probably leads to a cavity underneath. In this chamber, also, are two narrow passages, almost filled up with stones,

31. VOL. I.

which the curious have thrown in, to ascertain their depth. A pistol fired in this room makes a report like thunder.

"When you leave the pyramid, which must be by retracing the same steps, it is necessary to use every precaution to prevent the ill effects that would arise from a sudden transition from an extreme heat to a temperate air. Having provided against this, you ascend the top of the pyramid, to enjoy the prospect of the surrounding country, which is truly delightful. The usual ascent is by the eastern angle; but it is necessary to select the most convenient steps as you advance, for, in the straight line, sometimes one is too high, or another mouldered away. Having reached the top, you are amused with the names of many people, of different nations, who have visited this pyramid, and are ambitious to transmit the memory of the feat to posterity. The entrance of the chambers also bears many marks of the universal passion, the love of fame.

"The second pyramid appears still more lofty than the first, on account of the elevation of its foundation; but, in fact, there is no real difference in this respect. However, this pyramid is so well closed, that not any trace remains of its ever being opened, and its summit is coated in such a manner with polished granite, that the most intrepid would not attempt to scale it. Near this are the ruins of a temple, the stones of which are of a prodigious size, being most of them six feet in breadth and depth, and sixteen or seventeen in length. This structure must have once been singularly superb. The length of its front is one hundred and eighty feet, and its depth one hundred and sixty. By an imperceptible descent, you arrive at the sphinx, whose enormous bulk attracts the admiration of every spectator. It is cut out of the solid rock, and is said to have been the sepulchre of Amasis: the height is twenty-seven feet: the beginning of the breast is thirty-three feet wide, and it is about one hundred and thirteen feet from the forepart of the neck to the tail. The nose is sadly mutilated by wanton aggression. The Egyptians hieroglyphically represented a harlot by a sphinx, having the amiable face of a woman and the rapacious strength of a lion.

The third pyramid is one hundred feet lower than the other two. It is closed like the second, and is destitute of any coating. On the east was also a temple, of great extent, constructed of the same kind of enormous stones as the former. The fourth pyramid is still one hundred feet lower than the third. It is also without coating, and is closed, but there are no vestiges of a temple connected with it. Its chief singularity is, that its summit is terminated by a single large stone, which originally appears to have been a pedestal. These four grand pyramids are surrounded by a number of smaller ones, which have, in

general, been opened, and two of them are so ruinous, that the chamber is no longer distinguishable.

Abdallatiph remarks that, when Al-Malec Al-Aziz Othman Ben Joseph succeeded to his father's throne, his absurd courtiers persuaded him to demolish these pyramids, beginning with the least. Having summoned together, therefore, masons, diggers, and engineers, as well as many grandees of the kingdom, he gave directions for throwing it down. They accordingly pitched their tents around it, and collected great numbers of men and artificers, who were maintained at a vast expence. They continued there about eight months, with an encampment of both horse and foot; but, with their utmost efforts, and the most intense exertion of their strength, they were able to displace but one stone a day, or, at most, but two: some of them at the top protruded the stone by means of wedges and levers, whilst others below pulled it with ropes, and, when it fell, the sound was heard at an immense distance, so that the mountains trembled, and the earth shook. The stone itself was buried in the sand, from which to disentangle it was a work of extreme labour and fatigue. It was then, by wedges, split into pieces; and each piece was removed on a carriage, to be thrown at the bottom of a hill, which was at no great distance. After much time spent in this attempt, their means of subsistence failed; their difficulties were multiplied; their spirits drooped, and their force began to languish. They, at last, relinquished it, exhausted with fatigue, and vanquished by shame; for they had not accomplished their object, nor brought their work to the desired conclusion: on the contrary, the issue of the whole affair was, that they defaced the pyramid, at the same time that they betrayed their own impotence. This happened in the year 593 of the Hegira (A.D. 1197.) Nevertheless, when one contemplates the stones that were carried off, one would think that the whole pyramid must have been crased from its very foundation. But, if we look, on the other hand, at the pyramid itself, we should conclude, that hardly any thing had been detached from it; for only part of one of its sides has been removed. When I saw the trouble which they experienced in throwing down each single stone, addressing myself to the overseer of the workmen, I asked him—"If a thousand pieces of gold were offered you, on condition to replace only one of these stones in its proper situation, could you effect it?" He said, it was beyond their power, even although twice as much were offered them.

Herodotus, the first writer who has given us any information respecting this country, relates, that he was informed that the great pyramid was the tomb of Cheops, whose name it still bears; that the adjoining pyramid was that of his brother, Cephrenes, who succeeded him; that only the former had inner galleries; that one hundred thou-

sand men had been employed twenty years in building in, and that the immense labour which it required had rendered this prince odious to his people.

The pyramids of Saccara are situated about ten miles distant, to the south of those from Meniphis, at the foot of the mountains, but on a sufficient elevation, so as not to be overflowed by the Nile. It appears that the ancient city of Memphis extended nearly to this place.

"One of the most lofty of these piles," says Dr. Pococke, (who was attended by the shiek on his visit to these tombs), "is called the Great Pyramid of the North. A part of this had tumbled down, I was obliged to measure it at a distance, by beginning opposite to the angles; and, proceeding in this manner, I found the north side to be seven hundred and ten feet, and the east six hundred and ninety. The perpendicular height is three hundred and forty-five feet, and it contains one hundred and fifty-six steps, each from two to three feet high.

"This pyramid is built of the same materials as the rest, but was cased with a fine hard stone, part of which still remains. On the north side, about a third part of the height up, is an entrance, three feet and a half wide, and four feet two inches deep. We entered here, and found rest for the feet, but it was with great difficulty we made our way for the last twenty-five feet, on account of the sand. Having, however, effected our passage, we came to a large room, twenty-two feet and a half long, and eleven feet ten inches wide. At the height of ten feet, a tier of stones projected five inches inwards; and, in the same manner, twelve other tiers projected each farther than the other, till they closed at the top. To the west of this is a similar apartment, and at the farther end of both, in the middle of the fifth and sixth tiers, is a door in each, conducting into small rooms, lined with a smooth white stone.

"A mile to the south-east stands the Great Pyramid of the South, as it is called, which is six hundred feet square at the base. It seems to incline with a greater angle from the height of two hundred and eighty feet, than it does below. This appears to have been cased; but the external surface is so worn, or demolished, that it is impossible to ascend its summit.

"On the lower ground, about two miles to the eastward, is another pyramid, constructed of unburnt brick, which seems to have been made of the mud of the Nile. Some of those bricks I found to be thirteen inches and a half long, six and a half broad, and four and three quarters thick. This pile is much crumbled and ruined. Its perpendicular height is one hundred and fifty feet, and at the top it measured forty-three by thirty-five feet: the ascent is very easy. The other pyramids are of stone, and are of different magnitudes, but all much injured by time. They amount to nearly twenty in number. They are called in-

discriminately  
(Giza).

"Having finished my survey of these immense piles, I visited the catacombs, which lie in the same plain, and was first conducted to that of the mummies. The entrance to this is by a kind of funnel, about four feet square, and twenty deep, cut through a slaty rock, but covered with sand, which, frequently shifting, fills up the apertures.

"I descended by means of a rope-ladder, not without being incommoded by the sand falling from the top. Having reached the bottom, I found myself in a passage, five feet wide, and fifty long, almost filled with sand. At the extremity of this I turned down another passage on the left hand, about six feet high, on one side of which were compartments, with benches, about two feet above the floor. On these, I imagine, the mummies were placed. On the other side are narrow cells, just large enough to admit a coffin. At the end of this gallery I entered another on my right, on each side of which were niches, apparently designed for the reception of coffins in an upright posture. From this passage are cut oblong square apartments, filled with the remains of mummies; and, probably, here the inferior persons of a family were deposited, and piled upon one another, while the chief persons were placed in the niches. Each family had, perhaps, originally, its burying-place, and, as the descendants multiplied, they branched out these sepulchral grotts.

"I next visited the catacombs of the birds, which has the same kind of entrance, only deeper. This subterranean receptacle is much more magnificent than the others; being the sepulchre of such birds and animals as were the objects of adoration by the ancient Egyptians, and which they embalmed with the utmost care, and deposited in earthen vases, closely luted over. In one of the irregular apartments, I saw larger jars, which, probably, were intended for dogs and other animals, of which some have been found, but they are now become rare.

"According to Herodotus, there were certain persons employed in the business of embalming, who received a recompence according to the excellence of their workmanship. In the most esteemed method of embalming, they extracted the brains by the nose, with a crooked iron instrument, and then poured in drugs. Afterwards, they opened the body, took out the entrails, and washed the cavity with palm-wine, and, having rubbed into it perfumes, filled it up with myrrh, cassia, and other spices, and then sewed it up. This being done, they washed the body with nitre, and, after an interval of seventy days, having washed it again, they rolled it in swathes of linen, besmearing it with gums. The relations then took the body home, and, inclosing it in a coffin fitted to the shape, placed it in the catacombs.

"Another mode of embalming was, by injecting turpentine of cedar, with a pipe, into the body, and after salting it for seventy days, the pipe was drawn out, which brought the bowels with it. The nitre dried up the flesh, leaving nothing but skin and bones. The third, and least expensive method, was by purifying the inside with salt and water, and salting it for the usual time.

"If we may credit Diodorus, it appears there was a still more perfect mode of embalming than either of those we have mentioned; for he informs us, that the eye-brows, eye-lashes, and the form and appearance of the whole body, was so well preserved, that it might be known the features; and that many of the noble Egyptians kept the remains of their ancestors in houses adorned at a great expense, and had the pleasure of viewing their progenitors long after they were removed from this mortal scene. It does not appear, however, that any bodies have been discovered embalmed in this style.

"I brought a body," continues our author, "with me from Egypt, in a wooden coffin, filled up to the body with linen and fine plaster. Four folds of cloth covered the head, the upper one painted blue. Under these was a composition of gum and cloth, half an inch thick, and next to the skin was a coat of bitumen, about the thickness of a wafer. The hinder part of the head was filled with bitumen, which had been poured in at the nose, and had penetrated even into the bone of the skull.

"The body was swathed in bandages of linen, about three quarters of an inch wide, under which were four folds of cloth, then a swathe, two inches broad, and under that eight different bandages of the same breadth. Under this was a crust of linen, about an inch thick, almost burnt to ashes, but closely adhering, by means of the gums with which it had been smeared. The arms were laid across the breast, the right hand lying over the left. From the hips to the feet were eight bandages, two inches broad; and under these were others, an inch thick, which were consumed by time and the heat of the drags. The coffin was composed of two pieces of wood, hollowed so as to receive the body, which, being put together, were fastened with broad pegs in the top part, let into mortices in the under. It was cut into the shape of a human body, and covered with a thin plaster, and painted."

The famous Labyrinth, which, Herodotus says, was built by the twelve kings of Egypt, when the government was divided into twelve parts, as so many places for them to assemble in, and transact the affairs of state and religion, was situated not far distant from Memphis. It had twelve saloons, or covered courts, with opposite gates; six towards the north, and six towards the south, in continued lines, surrounded with one common wall. Its remains are thus described by Dr. Pococke:—

"The apartments are on two floors the one under

ground, and the other above it; each consisting of fifteen hundred apartments. Those above ground I have seen; but those below, containing the sepulchres of the kings, and the sacred crocodiles, the rulers of the Egyptians are averse to shew. The upper apartments appeared to transcend all human works. The roof of the whole is stone, as well as the walls: the latter are adorned with sculpture. Each saloon has a peristyle of white stones, admirably jointed. Close to the line where the labyrinth terminates, is a pyramid of two hundred and forty feet, on which large animals are engraven. But little now remains of these boasted works of art, except heaps of ruins, broken pillars, shattered walls, and cornices, many of which are of brown marble."

The magnificent ruins of the ancient city of Thebes are situated about twenty-seven miles north of Cnnbis; it is not certain whether this city formerly occupied the two banks of the river: the most celebrated monuments of antiquity, however, are on the eastern side of the Nile. It extended to the south, from the Arab village of Luxor to that of Karnoc, which is about three quarters of a league from it. There are no indications of its extent to the north. The two villages of Luxor and Thonor are erected amidst the ruins of two Egyptian temples, which have a very striking effect, by the vast space they occupy, and the enormous materials employed in their structure.

The city of Thebes, according to some authors, was built by Osiris, and, according to others, by Busiris II., who appointed its circuit, adorned it with magnificent buildings, and rendered it the most opulent city upon earth. It was originally called Diospolis, or the city of Jupiter, and afterwards obtained the name of Thebes. Diodorus Siculus observes, "that not only this king, but many of his successors, improved the city with presents of gold and silver, with ivory, and a multitude of colossal statues; and that no city under the sun was so adorned with obelisks of one entire stone. The buildings erected here by the ancients have remained to modern times; but the gold and silver, the ivory, and precious stones, were carried away by the Persians, when Cambyzes set fire to the temples of Egypt. It is added, that the riches of this country were at that time so great, that, after the plundering and burning, there were taken above three hundred talents of gold, and two thousand three hundred talents of silver, from among the ruins."

There were several temples admirable in beauty and greatness, the most ancient of which, according to Diodorus, was in circuit thirteen stadia, and forty-five cubits in height, with a wall of twenty-four feet broad. The ornaments and offerings within were agreeable to this magnificence, both in value and workmanship. The ruins of the above temple are still to be seen, and it is computed to have been about half a mile in circumference. It has

eight grand entrances, to three of which were avenues of a great length, between sphinxes, two of them having sixty of these statues on each side; beyond these are four grand gates, at a considerable distance behind each other, in a direct line with the temple. They are about thirty-five feet deep, one hundred and fifty in length, and, before the ground was raised, must have been from sixty to sixty-five feet high. These structures lessen every way, like a pyramid, from the bottom to the top: the first is of red granite, finely polished, and beautifully adorned on the outside with hieroglyphics, in four series, from the top downwards, and three on the inside, in each of which are the figures of two men, finely executed, and larger than the life. At a short distance on each side are colossal figures, about fifteen feet high, with hieroglyphics under them; the gates, likewise, are adorned with hieroglyphics.

Dr. Pococke, who viewed these venerable ruins, among which the village of Remock is situated, observes, that on each of the gates there appears to have been colossal statues. On the outside of the first, on one side, is a statue of red granite, and on the other a statue of a species of granite, that seems composed of small pebbles. On measuring the head of one of them, it was found to be five feet six inches in length. The next gate is much dilapidated, and has two stories of colossal figures to the south, and one to the north. The third gate is covered with hieroglyphics and colossal figures of men; and here are the remains of a statue of white marble, the head of which has a serpent on his helmet. This head is four feet and a half from the top to the lower part of the neck. The fourth gate is a heap of ruins; and before the main building is a large pond, that was probably a reservoir of the water of the Nile, for the use of the temple.

There is another superb entrance, about one hundred and fifty paces to the west, with the same kind of avenue of sphinxes. The grand entrance to the west is forty feet broad, the lower part being a solid wall of the same thickness. Within this is a large open court, having on each side, at the first entrance, a terrace of eighty feet broad. In the front of the entrance are two small windows; but the upper story is, in many parts, so much decayed, that, at a distance, it has the appearance of battlements. The walk between the two terraces leads to the inner part of the temple, and is adorned on each side with a grand colonnade of pillars, above forty feet high, and eight feet diameter, with large capital vases, like a base, only worked with some figures in lines. At the farther end of these pillars are two colossal statues, of red granite, on pedestals, four feet wide, and six long; but the heads are broken off, and the statues much disfigured and mutilated.

Our author says that, notwithstanding the wall of the

inner temple is more grandeur than he ever beheld in proportion; and adorned with hieroglyphics, and compartments of hieroglyphics.

There appear rows of pillars, the two middle others eight, which was higher above and had a kind of pillars, with two and without the representations, consisting

inner temple is greatly ruined, it has, in its present state, more grandeur and magnificence than any other building he ever beheld. The door is very high, and yet in a just proportion; and the walls on each side are beautifully adorned with hieroglyphics and figures of men, in six compartments, above nine feet high and twelve wide, every compartment having the figures of three men in it.

There appear, on entering the inner temple, sixteen rows of pillars one way, and eighteen another; those in the two middle rows are eleven feet in diameter, and the others eight, with capitals of square stone. The temple was higher above the middle rows than in any other parts, and had a kind of windows over the space between every two pillars, with twelve lattices of stone in each. Both within and without the temple are hieroglyphics and other representations, consisting of battles and chariots, one of which is drawn by stags, and the whole of which are still visible.

There is, likewise, on each side of the grand entrance into the east end of the temple, an obelisk, upwards of sixty-five feet high, and six square, having only one column of hieroglyphics. Farther to the east are two obelisks, seven feet six inches square, and seventy-three feet high; but one of them is recumbent: they are all of red granite, and these last two have three columns of hieroglyphics. At a little distance from these obelisks are two walls, separated by an entrance in the middle, and on the west side of them are several colossal busts.

At a short distance to the east is a small room of red granite; and on each side of the temple are several apartments, some of which might probably have been appropriated to the use of the priests, and others adapted for the beasts they kept for sacrifice. About one hundred and sixty feet to the east is a large building, which consists of several small apartments on each side of a spacious colonnade, and appears to have been adapted for the use of the officers of the temple. To the north of this are ruins of buildings, with a grand gate before them, which seems originally to have led to the temple.

Here are also the remains of several other temples, whose ruins are scattered several miles round; among these, one of them, from the situation of its fragments, appears to have been round, and in diameter near one hundred and seventy-five feet.

"While examining the whole mass of these ruins," says Denon, "the imagination is fatigued with the mere thought of describing them. The portico of the temple alone contains one hundred columns, the smallest of which are seven feet and a half in diameter, and the largest eleven. The space occupied by its circumvallation contained lakes and mountains. In short, to form a competent idea of so much magnificence, it is necessary that the reader should fancy what is before him to be a dream, for even the spectator cannot believe his eyes."

31. VOL. I.

The remains of a temple at the adjacent village of Luxor, though not so large as that above described, are in a much better state of preservation. The most colossal part consists of fourteen columns, of ten feet in diameter, and of two statues in granite, at the outer gate, buried up to the middle of the arms, and having in front of them the two largest and best preserved obelisks in the whole country. A peculiarity belonging to the temple of Luxor is, that a quay, provided with a demi-bastion, secured the eastern part, which was near the river, from the damages which might have been occasioned by the inundations. There are two obelisks of rose-coloured granite, which are still seventy feet above the ground, and, to judge by the depth to which the figures seem to be covered, it may be conjectured that above thirty feet more is concealed from the eye. Their preservation is perfect, and the hieroglyphics with which they are covered are deeply cut, and shew the bold hand of a master. Two large masses, which form the gate, are covered with sculpture, representing battles between chariots, arranged in lines, drawn by two horses, and containing a single champion. "Nothing," says Denon, "can possibly be more grand than the gate just mentioned, nor any thing more simple than the small number of objects of which this entrance is composed. No city whatever makes so proud a display at its approach as the wretched village of Luxor, the population of which consists of two or three thousand souls, who have taken up their abodes on the roofs and beneath the galleries of the temple, which has, nevertheless, the semblance of being in a state of desolation."

The principal monuments erected upon the western bank of the river Nile, and the only ones which can be reasonably supposed to have depended on Thebes, are the Memnonium, or the palace of Memnon, Medinet-abou, another palace, and the two colossal statues so celebrated for their prodigious height. The Memnonium looks to the east. In one of its courts are the remains of the celebrated statue of red granite. Its height was sixty-four feet, and its ruins are scattered forty feet around it. One of its feet subsists almost entire. Its breadth is four feet and a half, and one of its ears measures thirty-nine inches in length. The excavations are still visible where the wedges were placed which divided the monument when it was thrown down by Cambyzes. At the entrance of the gate, which leads from the second court to the palace, are the remains of a colossal statue of granite, of less proportions: the head is in perfect preservation, and of rose-coloured granite, while the rest is black. It is the most precious monument of the ancient Egyptian sculpture: the execution is admirable. The Memnonium had not been finished, like the greater part of the Egyptian works; but, by the side of objects but roughly hewn, are seen examples of exquisite workmanship.

4 Y

Between the Memnonium and the palace of Medinet-abou are the largest colossal figures which now remain in Egypt: their bases are eleven feet in height: the first appears to represent a man sitting, and the other a woman in the same posture; and they are both fifty feet high from the bases of the pedestals to the top of their heads. The statue to the north has been broken off at the middle, and has been built up with five tiers of stones; but the other is of one single stone: the feet have the toes broken off, and the features are mouldered away by time. The sides of their seats are covered with hieroglyphics; on the pedestal of the statue, which has been broken, is a Greek epigram; and on their insteps and legs are several Greek and Latin inscriptions, some of them in honour of Memnon; but most of them are testimonies of those who have heard the sound; for one of them is supposed to be the famous statue of Memnon, which, at the first and second hour, it is pretended, uttered a sound, occasioned by the rays of the sun striking upon it, like the breaking of the string of a harp, when it was wound up.

The height of them is about fifty-eight feet. Three small female figures accompany each of the colossal statues. They are standing on each side of the chair, and between the legs of the principal figure.

Between the Memnonium and the Medinet-abou, and distant about half a league from each of them, are the remains of a great number of colossal figures, and the traces of buildings, which indicate that these two places communicated with each other by structures that filled up the whole space between them. This mass of edifices appears to have composed, according to Diodorus Siculus, the tomb of Osymandias. This conjecture is somewhat confirmed by the consistency which exists between the monuments in their present state, and the extensive as well as precise descriptions which that writer has left of pictures which are found in both the palaces. These paintings represent the sieges of fortified towns, hostile invasions, and victories obtained by the Egyptians. The barbarians with whom they are engaged, as well as themselves, are represented as making use of cars, but with this difference, that three men are placed in each car. The one holds the reins which guide the horses, the other draws the bow, and the third protects them both with his buckler.

The ruins of Medinet-abou are situated to the south of Memnonium, and are in a fine state of preservation; the most beautiful feature is a peristyle of sixty-five paces long, by fifty-five in breadth. "I remarked," says Denon, who visited this edifice, "that in the second portico Catholicism had erected a church, of which no other remains were left than part of the recess of the choir, and the columns of the nave; but I discovered, from the testimony of a number of little doors decorated with flowered

crosses, that the body of the building, which was two hundred feet long, had, to all appearance, served as a convent for an order of monks of the earlier ages. The sculptures on the wall, where the church had been situated, represent the exploits and the triumph of some hero, who had carried war into foreign countries. I remarked," continues our author, "the figure of a hero, who is mounted on a small chariot, in which there is room only for himself, driving two horses, and holding the reins on a level with his girdle; bucklers and heaps of arms are hung about him, and around his car; his stature is gigantic, and he holds an immense bow, from which he is shooting arrows upon a bearded and long-haired enemy, who have not the least resemblance with the known physiognomy of the Egyptians. At a short distance, he is represented sitting at the back part of his car, the horses of which are held by pages, and one person is counting out before him the hands cut off from the enemy killed in battle, while another is inscribing the number, and a third appears to be proclaiming the amount of them. To the left, on the front of another of these galleries, is a long bas-relief, representing the same hero returning after his conquests; some soldiers in armour attest that the triumph is military, for a little farther nothing is seen but priests, or persons of the initiated cast, without arms, with long habits and transparent tunics. The arms of the hero are covered; he is borne on men's shoulders, in a palanquin, with all the attributes of divinity; before and behind him walk priests, carrying palms and calumets; and he thus arrives at the temple of the great divinity of Thebes, and offers a sacrifice, in which he officiates as priest; farther on the procession re-commences, and is followed by the god, borne by twenty-four priests; the bull Apis, with the attributes of divinity, precedes the hero, together with a long series of persons, each bearing an ensign, on the greater part of which are images of gods. At an altar, a child, with its arms tied behind its back, is about to be sacrificed before the victor, who stops to assist at this horrible immolation: a priest, who breaks the stalk of a flower, and birds, which are flying away, denote death, and the soul departed from the body: what, therefore, Longus and Apuleius, in their romances of Theagenes and the Golden Ass, have told us of human sacrifices among the Egyptians, appears to be true. At another part, the hero himself makes an offering to the god Apis of an ear of wheat; a protecting genius accompanies him constantly; he changes his habit and head-dress during the ceremony, which may mark the different dignities or degrees of initiation; but the same physiognomy is always preserved, by which it is proved to be a portrait; the air is noble, august, and gracious. In another picture, he holds nine figures, chained; incense is offered to him, in honour of one or the other of these victories; and a

priest writes down conquests.

To the north appears to have the same plan which figures of this kind who, with a majesty, as if he earth.

The whole of about half a league ends immediately its base to three hundred of sepulchral surface of the ground the most decorated part of the monument executed; while adjusted proportions belong to the position (representations) trades which were of these grottoes door, opening to twenty feet in a straight line, and entrance in a right columns or pilasters four to ten. At which leads to the deposited. The to sixty feet, and neous passages, rate in a chamber are supported by mummies. There subterraneous cold chambers, &c.

In the upper part painted in fresco, remonies. The monument there offer a detail of the habits of the country; thence we may see the employments of the husbandman, military life. Each is carefully painted.

"The tombs of hundred paces from in a narrow valley. These sepulchres are by the bed of a river

priest writes down and consecrates the memory of his conquests.

To the north of this palace is a small temple, that appears to have been an appendage of it: it is built on the same plan which has been adopted for the several structures of this kind. A picture here represents a priest, who, with a mattock, traces a furrow at the feet of some deity, as if he invited him to favour the tillage of the earth.

The whole of the mountain Lybicus, which begins at about half a league to the west of the Memnonium, and ends immediately opposite Medinet-abou, is pierced from its base to three-fourths of its elevation with a great number of sepulchral grottos. Those which are nearest the surface of the ground are the most spacious, as well as the most decorated; those which are in the most elevated part of the mountain are much more rudely contrived and executed; while such as hold the middle place bear an adjusted proportion of space and ornament. Those which belong to the poor are the most interesting, as they contain representations of arts which flourished, and the trades which were practised by the ancients. The plan of these grottos is, in a great measure, the same. A door, opening towards the east, displays a gallery of about twenty feet in length, which is sometimes formed in a straight line, and, at other times, runs off from the entrance in a right angle: it is indifferently supported by columns or pilasters, of which the number varies from four to ten. At the extremity of the gallery is a well, which leads to the catacombs, where the mummies are deposited. The depth of these wells varies from forty to sixty feet, and they are connected with long subterranean passages, rudely shaped in the rock, which terminate in a chamber of about thirty feet square, whose sides are supported by pilasters, and contain several remains of mummies. There are evident traces of numerous other subterranean communications, which probably lead to other chambers, that are at present concealed.

In the upper gallery are sculptured in bas-relief, or painted in fresco, many subjects relating to funeral ceremonies. The most interesting pictures which are seen there offer a detail of the occupation of the ancient inhabitants of the country, such as the chase and the fishery; thence we may trace the progress of civilization, in the employments of the mechanic, the money-changer, the husbandman, and in the duties and punishments of military life. Each grotto is adorned with a ceiling, fancifully painted.

"The tombs of the kings are about six thousand four hundred paces from the river. They have been formed in a narrow valley, in the centre of the mountain Lybicus. These sepulchres occupy a large ravine, which is flanked by the bed of a torrent. The plan of one of these tombs

will be sufficient to explain the general disposition of the rest. Every grot communicates with the valley by a large gate, which opens to a gallery hollowed in the rock: its breadth and height are generally about twelve feet, and its length is twenty paces to the second gate, which opens to another gallery of the same breadth, and twenty-four feet in length. To the right and left of this gallery are chambers of five feet in breadth, and ten feet long. There are found paintings of arms of every description that were used by the ancients, together with implements of husbandry, vases, and trinkets of every kind. The manner of preparing food is also represented.

"A third gallery succeeds, of the same dimensions as the former, and leads to a chamber above the level of the other apartments, which is eighteen feet square. From this chamber is the entrance to a gallery of thirty-four paces in length: there is also an inclining gallery, whose length is twenty-eight paces. At its extremity is a corridor of sixteen paces, leading to a chamber of eleven paces square, which is connected with another of the same size by a gallery of six paces. A square saloon then succeeds, of about twenty paces wide, supported by eight pillars. Here is the sarcophagus, which contained the mummy of the king. The Romans made some attempts to carry away this sarcophagus from the grotto where it is deposited; they even tried to level the ground, in order to facilitate its removal: but they soon desisted from the impracticable enterprise.

"To the saloon of the sarcophagus another apartment succeeds, of twenty-five paces in breadth, and forty in length. The height of the tomb is seven feet, its length eight, and its breadth six: the total length of the gallery is two hundred and twenty-five paces. The tombs of the kings throughout their whole extent are covered with pictures and hieroglyphics; but the greater part are painted in fresco, and represent the most fantastic subjects that can be conceived.

"One of the most interesting of these grottos contains a sarcophagus, that is still entire and in its place. Its length is sixteen feet, its height twelve, and its breadth six. It still preserves the lid, adorned with the effigy of the king, which is a single block of granite. The astonishment that is felt; on reflecting that this enormous mass was transported to the extremity of a subterranean passage two hundred paces in length, exceeds all bounds, when it is considered that it was worked upon the place where it remains. What difficulties must have been surmounted, in order to transport a weight of many hundred thousands of pounds across the almost impracticable roads of the mountain!

Among the ruins of the ancient city of Dendera, there are the remains of three temples; the largest of which is the best preserved monument in Egypt. None of the

materials which have been employed in it have suffered. The tutelary divinity, Isis, was here worshipped, in the shape of a cat.

The execution of the figures engraved on the exterior and interior walls, at Dendera, is an example of the highest point of perfection which the Egyptians attained. All the minutiae of their dress are finished with a purity and delicacy which it is almost impossible to conceive, when the impracticable nature of the stone is considered.

The great temple of Isis is built nearly on the same plan as that of the ancient Apollonopolis. The figure of the divinity to which it was consecrated is multiplied in every part; in its pictures, in its elegant frieze, even on the four faces of the capitals of the columns which support the portico, and in the saloon which succeeds to it.

The elevation of the temple is seventy-two paces in breadth, and one hundred and forty-five feet in length. A gate, in a very pure taste, opened towards the temple, from which it was separated by a very spacious court. The portico was sixty paces in length, and thirty in breadth. Its most remarkable decoration is the great zodiac, divided into two bands: which enriches the ceiling of the last intercolumniations to the right and left. Indeed, it was under the porticos of temples, that the Egyptians generally represented their astronomical subjects; as if they wished to command, at the same time, a veneration for religion, and a love of the sciences.

The saloon, which succeeds to the portico, is supported by six columns, whose capitals display four figures of Isis, with the ears of a cat. It is a square of twenty-four paces. The second apartment is ten paces long, and twenty-four in breadth; the third is of the same dimensions. The *aditum*, which succeeds, is twenty paces in length, and six in breadth. It is situated between two other apartments, placed on each side. It may be presumed, that a corridor, running behind it, isolates it also in that direction. In the second saloon, to the right and left, are two stair-cases, which lead to the terrace of the temple; they consist of steps, two inches in height, and twenty in length. The compartments of the walls are decorated with pictures, containing a great number of female figures.

There is a small temple on the terrace of the great one, the columns of which resemble those of the portico; they are ten feet in height. This temple forms a square of nine feet; and is the portico of a chapel, of which there are no other traces. In the inner-court of the temple is an apartment, which is adorned with another zodiac; it is circular, and occupies one entire half of the ceiling, the apartment itself appearing to be altogether consecrated to astronomy: it is separated from another astronomical picture by a female figure. It is to be remarked, at Dendera, that all the front figures are perfectly well executed; while

in every other place they are but indifferent, though the profiles are generally full of grace.

Behind the great temple there is another, which appears also to be consecrated to Isis. It is a square structure, and each angle measures seventeen paces on the outside. It is divided into two apartments. The first is fourteen paces in length, and four in breadth. Three gates open into this apartment, and those on the sides lead into the corridors which isolate the *aditum*; their length is ten paces, and their breadth five feet; through their whole extent they are decorated with pictures. The *aditum* is ten paces in length, and six broad. There are more windows in the temples of Dendera than in those which are situated more to the south. There are two spiracles at least in every apartment, and on each of them a disk is sculptured, scattering its rays around.

The Typhonium of Dendera is situated to the right of the gate which leads to the great temple. It is a square of thirty-four paces, and composed of three apartments. The *aditum* is isolated by two corridors, entirely filled up. The subjects of the pictures are nearly the same as at Edfou, and appear to present an history of the birth of Harpoerates, and of the precautions which he employed to save himself from the pursuits of Typhon. In front, and fifty paces to the north of the gate, are the ruins of a temple, which has never been finished. It had four columns in front, and five on each side: the capitals are scarcely made out and seem to have been the trial of a new kind of ornament, attempted by the Egyptians. To the south, and about nine hundred paces from the great temple, are the ruins of a gate, which may have been that of the temple of Athos, the Venus of the Greeks, who is known to have been worshipped at Dendera. The ruins of the city, consisting of vast heaps of burned bricks, of shattered vases, and a great quantity of porphyry fragments occupy a space of one thousand eight hundred paces square.

"All the specimens of architecture," says Depon, "that I had hitherto seen, served but to fix my admiration here. I thought myself in the sanctuary of the arts and sciences. How many periods presented themselves to my imagination, at the sight of such an edifice as the temple! how many ages were requisite to bring a juvenile nation to such a degree of perfection and sublimity in the arts! and how many more of oblivion, to cause these mighty productions to be forgotten, and to reduce the human race to the state of nature in which I now found them on this soil, once so famous! Never was there a place which concentrated in a narrower compass the memorial of a progressive havoc of ages. What continued power, what riches, what abundance, what superfluity of means, must a government possess, which could erect such an edifice, and find within itself artists capable of conceiving and

executing the every thing the

executing the design, of decorating and enriching it with every thing that attracts the eye and understanding!"

Of the city of Antaeopolis nothing remains, except the portico of a considerable temple, the ruins of a quay, and those of a small temple. The portico is composed of eighteen columns, of which six are in front, and three in depth. Its length is forty-five paces, and its breadth eighteen. The capitals represent the head of the palm-tree, but their proportions are much less elegant than that of the capitals of Philœ. The workmanship was not so elegant as that of the two preceding temples, which may rather be attributed to the calcareous stone employed in building it. At ninety paces from the portico to the south, and in a line with the gate, is a chapel, formed of a single stone, being chiselled in a block of seven feet and a half square. As this chapel must have been placed in the aditum, it necessarily gives the length of the temple. At a league to the south-east, and in the Arabian Mountain, is a vast quarry, whence the stone must have been brought, which was employed in the construction of the town. It is four hundred feet in breadth, and six hundred in length. On the upper part of it there are tracings, which explain the manner in which the stone was cut.

To the north of these quarries are the sepulchral grottos of the city, which are formed with greater care than those in the vicinity of Thebes. The Egyptians have imitated their arched roofs, wherever it was in their power. The grottos are vaulted; and an arched door opens into an apartment, on two sides of which are niches, containing figures of Death.

The Lybian chain of mountains, at the foot of which Siout stands, contains such a number of tombs, that this town probably occupies the site of some great city. The rocks are excavated into a vast number of tombs, of different dimensions, and decorated with more or less magnificence.

"I inspected," says Denon, "one of the most considerable of these tombs. A kind of peristyle, which formed the entrance, was cut out, as well as all the rest, from the solid rock, without any masonry; the different parts have been repaired with a facing of stucco, which is still in very good preservation. The first chamber has no other ornament than a torus, which borders a flat arch; but from thence to the bottom of the innermost chamber all the walls are covered with hieroglyphics, and the ceilings with painted and sculptured ornaments: on the smooth surface of the floors are large figures, which are repeated on the solid jambs; there are no traces of hinges, or any other method of closing the entrance; the upper part of the door is larger than the lower; the innermost chamber is beyond the third door, and in it the principal sarcophagus was doubtless situated: the rock is excavated in

32. VOL. I.

every direction: all the inner porches of these grottos are covered with hieroglyphics, which would require months to read them, even if the language were understood; and it would take years to copy them. All the elegancies of ornament, which the Greeks have employed in their architecture, all the undulating lines, the scrolls, and other peculiarities, are here executed with taste and exquisite delicacy. If one of these excavations were a single operation, as the uniform regularity of the plan would seem to indicate, it must have been an immense labour to construct a tomb; but such a one, when finished, would serve for the sepulture of a whole family. I found one of these caves, with a single saloon," continues our author, "in which were an innumerable quantity of graves cut in the rock, in regular order: they had been violated, in order to procure the mummies; and I found several fragments of their contents, such as linen, hands, feet, and loose bones."

Besides these principal grottos, there is such a number of smaller excavations, that the whole rock is cavernous, and causes the step of the traveller to reverberate. Farther to the south are remains of large quarries, the cavities of which are supported by pilasters. Some of these quarries have been the abode of hermits, as appears from several small niches, stucco facings, some red paintings, representing crosses, and some inscriptions, which are still visible in these miserable cells.

The plains that surround Siout are exceedingly remarkable for their abundant fertility. The orchards yield a fine variety of fruit, and the farinaceous plants are to be admired for their rapid growth and surprising produce.

At the foot of the rocks of Mokatam, in a strait between two deserts, are the ruins of Antinœ. This city was built by Adrian, on the site of the ancient Besa, in honour of his favourite Antinous, who sacrificed his own life in this place, to save that of his sovereign. From the Nile there appears one of the city-gates, resembling a triumphal arch: it is decorated with eight pillars, of the Corinthian order, between which are three arches, arising from a buttress, ornamented with pilasters: this groupe of ruins is the most considerable of all that now remains of Antinœ. From this point there was formerly a street, passing in a straight line across the town, to the opposite gate: both sides of this street have been adorned with a colonnade of Doric pillars, for the purpose of affording a shady walk. There are still visible some of the shafts and a few capitals, very much worn, on account of the friable nature of the stone used in their construction.

Near the coast of Alexandria, and towards the eastern extremity of the crescent formed by the new port, are two obelisks, called Cleopatra's Needles: one of them, which still retains its original position, is about fifty-six feet in height; but the other is thrown from its base, and almost

buried in the sand; they are seven feet square at the base, and are hewn out of a single block of granite, and completely covered with hieroglyphics.

To the south-west of the walls of Alexandria, on a gentle eminence, is situated that lofty column called Pompey's Pillar: it is placed on a sur-base, which has been undercut, leaving only a newel of four feet six inches square for its support. This newel, apparently of a silicious substance, is formed of the fragment of an Egyptian monument, and has itself been brought to that place, the hieroglyphics sculptured upon it being reversed. On examining the part cut away below the pedestal, it is easy to discover that an equal pressure has occasioned the column to incline about four feet, and that it is undoubtedly owing to there being a deep rent in the lower part of the column, of about fifteen feet in length. The column is of the Corinthian order, and is divided into four parts; the pedestal, base, shaft, and capital. From there being on the capital a sunk circle, it would appear that there has formerly been a pedestal, on which probably was placed the statue of the hero to whose memory the column was erected.

The pedestal of this column is four feet three lines in height; the base five feet six inches; the shaft sixty-three feet one inch, three lines; the capital nine feet ten inches, six lines. The diameter of the column is eight feet four inches at the lower part, and seven feet two inches, eight lines, near the astragal. All the parts of the column are of granite. Though, on account of its capital, this column may be considered as of the Corinthian order, yet its proportions are not Greek; the shaft approaches nearer to the Ionic. It is also evident, that the different parts of which it consists are productions of different ages. The shaft, which is of an admirable form, and, except on the side of the desert, where it has suffered from the sand, of a fine polish, appears to have been the work of the Greeks, probably under the Ptolemies; the other parts are evidently inferior. The profiles are nearly similar to those of the lower empire of the Romans. The capital is but rudely cut; the pedestal is exceedingly low, and even the colour of its granite is different from that of the granite of the shaft: it is reasonable, therefore, to believe, that the shaft was produced in an age prior to that of the other parts, and that it has been re-erected on some extraordinary occasion. It is probably the largest column of a single block in the world; and it is much to be regretted that the inscription, which was on one side of the pedestal, is not legible.

"Nothing," says an intelligent writer, "can equal the majesty of this monument: seen from a distance, it overtops the town, and serves as a signal for vessels; and, on nearer approach, it produces an astonishment mingled with awe. One can never be tired with admiring the beauty

of the capital, the length of the shaft, and the extraordinary simplicity of the pedestal; although the latter has been rather damaged by the instruments of travellers, who were anxious to possess a relic of this antiquity; and one of the volutes of the column was immaturely brought down, in the year 1781, by a prank of some English captains, which is thus related by Mr. Irwin:—

"These jolly sons of Neptune had been pushing about the can, on board one of the ships in the harbour, until a strange freak entered into one of their heads. The eccentricity of the thought occasioned it immediately to be adopted; and its apparent impossibility was but a spur for the putting it into execution. The boat was ordered, and, with proper implements for the attempt, these enterprising heroes pushed ashore, to drink a bowl of punch on the top of Pompey's Pillar. At the spot they arrived; and many contrivances were proposed to accomplish the desired point; but their labour was vain, and they began to despair of success, when the genius who struck out the frolic happily suggested the means of performing it. A man was dispatched to the city for a paper kite. The inhabitants were by this time apprised of what was going forward, and flocked in crowds to be witnesses of the address and boldness of the English. The governor of Alexandria was told, that these seamen were about to pull down Pompey's Pillar; but, whether he gave them credit for their respect to the Roman warrior, or to the Turkish government, he left them to themselves, and politely answered, that the English were too great patriots to injure the remains of Pompey. The kite was brought, and flown so directly over the pillar, that, when it fell on the other side, the string lodged upon the capital. The chief obstacle was now overcome. A two-inch rope was tied to one end of the string, and drawn over the pillar, by the end to which the kite was affixed. By this rope one of the seamen ascended to the top; and in less than an hour a kind of shroud was constructed, by which the whole company went up, and drank their punch, amid the shouts of the astonished multitude. To the eye below, the capital of the pillar does not appear capable of holding more than one man upon it; but our seamen found it could contain no less than eight persons very conveniently. It is astonishing, however, that no accident befel these madcaps in a situation so elevated, that would have turned a land-man giddy in his sober senses. The only detriment which the pillar received was the loss of the volute before mentioned, which came down with a thundering sound, and was carried to England by one of the captains, as a present to a lady, who commissioned him for a piece of the pillar. The discovery which they made amply compensated for this mischief: as, without their evidence, the world would not have known at this hour that there was originally a statue on this pillar, one foot and ankle of

which are still a gigantic size, at so great a

which are still remaining. The statue must have been of a gigantic size, to have appeared of a man's proportion at so great a height."

There are circumstances in this story which might give it an air of fiction, were it not demonstrated beyond all doubt. Besides the testimonies of many eye-witnesses, the adventurers themselves have left a token of the fact, by the initials of their names, which are very legible in black paint, just beneath the capital.

*Cities, Towns, &c.*] GRAND CAIRO, the capital of Egypt, is situated about a mile from the eastern bank of the river, in thirty degrees fifteen minutes of north latitude, and in thirty-two degrees twelve minutes of east longitude from London. The city of Grand Cairo may be said to consist of three towns, namely, Old Cairo, New Cairo, or Cairo properly so called, and the port of Boulac.

Old Cairo is about half a league distant from Boulac, and is the port for such boats as come down from Upper Egypt. Here, in the midst of Mahometan mosques, are a Catholic church and convent, and a Jew's synagogue: the Copts have likewise a grotto, or low chapel, which, according to tradition, is said to have been inhabited by the Virgin Mary, when she fled with her infant Saviour into Egypt.

Old Cairo is at present reduced to a very small compass, being only about two miles in circumference. It is the port for the boats that come from Upper Egypt, and some of the beys have houses there, to which they retire at the rising of the Nile. The Copts have twelve churches and a convent, chiefly in one quarter of the town, and pretend that the Holy Family once lodged in a cave, in the church dedicated to St. Sergius. Some of these churches are elegantly adorned with columns in front, and the altars are highly decorated.

In this city the Jews have a synagogue, said to have been built, about sixteen hundred years ago, in the same form it now retains. On this very spot they pretend the Prophet Jeremiah usually read the law; and they have a manuscript of the Bible written by Ezra, which is deemed so sacred, that none are allowed to touch it. It is deposited in a niche in the wall, before which a curtain is drawn, and lamps kept continually burning. To the southward of Old Cairo is the great mosque of Atten-Ennaby. For this mosque the Mahometans have a great veneration, from the tradition that their first caliph, Omar, going to the place where it was afterwards founded to his honour, left the print of his foot in a piece of marble.

New Cairo, or Cairo properly so called, lies about a mile from the river Nile, and is about seven miles in circumference. Soncini says, to suppose that Cairo resembles the great cities of Europe, would be to form a very erroneous idea; it is, however, considered by the natives as the most magnificent place under the canopy of

heaven, and is emphatically styled "the matchless city, the mother of the world." He adds, it is but justice to remark, that the extreme narrowness of the streets, which to a stranger must appear contemptible, is indispensably necessary, to shield the inhabitants from the meridian sun.

A large canal, that communicates with the Nile a little above Old Cairo, crosses the middle of the city, from the west to the north-east. Over it are thrown several bridges, and these are embellished on each side with two houses. According to the Arabic historians, the bed of this canal is paved with marble; but it is at present covered with a thick strata of mud.

When the Nile is at its height, many parts of the town resemble lakes, and are covered with handsome boats and barges, filled with persons of the first distinction, who spend their evenings on the water in company with their females. Concerts of music and fire-works enliven the scene; but when the waters retire, this pleasing scene is much altered. Nothing appears at first but mud. But, in a short time, the green corn springs up, and afterwards the harvest waves where, a few months before, the boats were sailing.

The streets are continually crowded with numbers of men of various nations, being inhabited by Turks, Mamelukes, Greeks, Syrians, Arabs, Copts, Moors, Jews, and a few Europeans: the population is estimated at three hundred thousand persons.

The Mamelukes, whose number is estimated at nearly twelve thousand, are military slaves, imported from Circassia and Mingrelia; besides others, who are taken captive in battle, or brought to Egypt by private merchants on speculation: these persons are carefully instructed in every exercise of strength or agility, and usually repay the kindness of their masters with the warmest gratitude and most valiant services. Those who have a genius for literature, are taught to read and write, but the majority of them are deficient in these particulars.

The inferior Mamelukes constantly wear the military dress, which is distinguished from that of other Mahometan citizens by a pair of large crimson drawers, of thick Venetian cloth, attached to their slippers of red leather; and a greenish cap, of a peculiar form, fancifully decorated with a turban. Their usual arms are a pair of pistols, a dagger, and a sabre; but, when engaged in battle, they are furnished with a brace of large horse-pistols and a battle-axe; they also wear an open helmet, and a suit of armour, consisting of interwoven links of steel, under their dress. Their horses are of the finest Arabian breed, and are frequently bought at the rate of one hundred and fifty or two hundred pounds sterling.

The Mamelukes being trained from their infancy to military evolutions, display in them uncommon skill. The javelin, aimed with precision, is never thrown but to

strike the mark." "The well-tempered blade of Damascus," says Sonnini, "was by them wielded with astonishing dexterity, and in their hands proved a most dreadful weapon." He often observed them try these famous sabres in the following manner:—A large cushion, stuffed with feathers, and materials equally soft and flexible, was placed about the height of a man, without any support, and in such a manner that the slightest touch would bring it to the ground, when the sword that divided it by a single stroke gave the requisite proof of its excellence.

The same author observes, "the Mamelukes are a brave and warlike race of men; the ardent ebullition of their youth would have made them a formidable body, had they possessed any knowledge of European tactics, or any idea of engaging in regular ranks. Their cavalry certainly derives a great advantage from the peculiar excellence of their horses, and the extraordinary skill of the riders. All their movements, whether of approach, retreat, or change of disposition, are made with the rapidity of lightning; and, when the velocity of their career seems to have separated them, they are in a moment again collected.

"As the Mamelukes are supplied with provisions by their masters, they have no stipulated pay; yet, from presents, rewards, and extortions, they contrive to raise a sufficient supply of money, either for avarice or debauchery."

The houses of Cairo have a very mean appearance, and are badly constructed; the smaller ones are crowded with a wretched and numerous mixture of inhabitants; those of the opulent are commonly surrounded by a wall, and are generally built of three different materials, brick, wood, and stone; but they have no appearance of regular architecture, nor are they enlivened by any exterior decoration; the interior, however, is not destitute of convenience, nor, indeed, of luxury; they are adorned with handsome marble baths and voluptuous vapour-stoves, with mosaic saloons, in the middle of which are basins and fountains of water; large divans, composed of tufted carpets; raised beds, covered with rich stuffs, and surrounded with magnificent cushions: these divans generally fill three sides of each room. The windows, when there are any, never open; and the day-light which they admit is darkened by coloured glasses and very close lattice-work, as the light generally comes in through a dome in the centre of the ceiling; for the Mussulmen have no great occasion for light, and therefore take very little pains to procure it in their houses, all their customs seeming to invite to repose. The walls, flanked with fine towers, by which the city was formerly surrounded, have been greatly dilapidated by the destructive hand of barbarism; nor is Cairo now defended by any fortifications. Sonnini observed two gates, of the most simple and noble architecture. One

of these is called Babel Nasr, or the Gate of Victory; and the other is denominated Babel Foutouh, or the Gate of Passage, because it was on this side that Sultan Selim entered the city by a breach. The suburbs of Cairo contain many fine buildings towards the east, among which are the mausolea of the ancient Egyptian sultans; but most of them are now falling to decay.

For the reception of wholesale goods there are spacious, clean, and commodious warehouses; and retail dealers are accommodated with extensive buildings, for their various commodities, in every part of the city. Each trade, however, has its particular and allotted division.

The markets of Cairo afford so great a profusion of the necessities of life, that all the delicacies of the table may be there procured at a very reasonable rate.

The mosques in New Cairo are computed at more than three hundred: that called Jamma el Hazer is the most magnificent, being ornamented with marble pillars and Persian carpets. A number of persons, distinguished for their knowledge of literal Arabic, and a profound skill in theology, are supported by its revenues, under a shik, who is an ecclesiastic of the highest order. It is enriched with a large collection of manuscripts, and lectures are read on various subjects. The other mosques that are most celebrated are that of Ghouri el Hassencin, and that of Mohammed Bey Abdhahab. The latter is constructed of the richest materials, and is accounted the chef d'œuvre of eastern magnificence.

The castle of Cairo is seated on a rocky eminence, and is said to have been built by Saladin: but it is so commanded by the hill Tabel Mochatham, to the east, as to be incapable of withstanding an attack, since the invention of cannon. The eastern entrance is called the Gate of the Janissaries, and the western one, the Gate of the Arabs. The castle is about a mile in circumference; but it is an irregular building, and the principal part of it is in a very ruinous condition. At the west end are the remains of very noble apartments, some of which are covered with domes, and adorned with pictures of Mosiac work; but these apartments are now only used for weaving, embroidering, and preparing hangings and coverings, great quantities of which are annually sent to Mecca by the caravan.

The eastern part of this castle stands on much higher ground than the rest, and near a grand saloon, called Joseph's Hall, from which there is a delightful prospect of Cairo, the pyramids, and all the neighbouring country. This was probably a terrace to the saloon, which is open on every side, except to the south, and is adorned with large and beautiful columns of red granite, some of which have capitals of the Corinthian order; some are only marked out in lines, like leaves, and many are only plain stones, that do not much resemble capitals. In the west

part of the castle people say Joseph's Hall is a small garden in large towers on the south side of the castle. These apartments are

beys assemble in the prime minister sits in a room with lattice-windows; an interpreter; and an al-sha's coffee-room for coffee. Here is almost an inch of which, it is said, and are kept as under the basha.

To the south of the city, called Caraff

Gate of Victory; but, on the south, or the Gate of the East, is that Sultan Selim, the founder of the Turkish empire, who was buried at Cairo, among the tombs of the Egyptian sultans; but

there are also several small houses; and retail shops, and other buildings, for the use of the city. Each division is allotted a certain number of inhabitants.

At a profusion of the table, the rate is computed at more than 1000. The houses are built with marble pillars, and a profusion of gold, and small pieces of iron, washed over with silver; which last are of the value of three farthings, and are called medines.

In this castle there is a well, much admired on account of its great depth, which is two hundred and forty-four feet; but it has two shafts that are not perpendicular, above one another; the first is one hundred and forty-eight feet long, and the other one hundred and sixteen feet. It is generally called Joseph's Well, from a grand vizir, who, about seven hundred years ago, had the care of the work under Sultan Mahomet; but the Arabs call it the Snail Well, because it descends in a spiral line. They draw the water up by means of a double wheel and a double range of earthen jars. The oxen employed to turn the wheel go up the first shaft, by a path which is cut in the rock, quite round the well, from top to bottom.

There are grottoes, in many stories, up the side of the rock upon which this castle is built; but several of them are now inaccessible, though there is a path to others by a narrow terrace. These are generally small rooms, eight or ten feet square. Towards the brow of the hill, on the top, are two rooms, with apertures on the top to admit the light; over which is an eminence, to which the great people often go, to enjoy one of the finest prospects in Egypt, since it commands a view of Cairo, and all the country as far as the eye can reach. Over the south cliff is a mosque, the whole inside of which is painted with flowers, on a red ground: here was interred the Sheikh Duise, whose name is given both to the hill and the mosque: several of the sheik's children, and some of the sons of bashas, are likewise buried near it.

To the south of the castle there is a kind of ancient suburb, called Caraffa; at the entrance are several magnificent

tombs, covered with domes, and said to be the grand sepulchres of some Egyptian kings. The people in general suppose that they are the monuments of the caliphs, the relations of Mahomet, who conquered this country; and such is their veneration for them, that they oblige Christians and Jews to alight from their asses and camels, to pay them respect, when they pass this way. On an eminence, adjoining to Caraffa, is the great mosque of El Iman Shafee, anciently one of the four doctors of the law, who is held in great veneration among them, and whose sepulchre is there: it is called Le Salchiah, from a title they gave Saladin, who built it, together with a college and hospital.

The city of Cairo is furnished with several large and sumptuous reservoirs, in different parts, where the water is given to the inhabitants; there are likewise many elegant and convenient baths, which are resorted to by great numbers of people, some of whom visit them on a religious account, to purify themselves; while others go to them as places of refreshment and diversion: the latter are chiefly women, who, once or twice a week, spend most of the day in them, and are glad of such a pretence, to be released from their confinement. People of the first rank have bagnios in their own houses, to prevent intermixing with their inferiors. Coffee-houses are also numerous, where the inhabitants devote the greatest part of the day to smoking and conversation.

In Cairo are likewise many khans, called okelas. These are indifferent buildings round a court, and are commonly appropriated to the use of merchants, of particular countries, for the sale of their respective commodities. There is one for those of Nubia, and the black slaves and goods they bring with them; and another for white slaves from Georgia.

The commerce of Cairo, previous to the discovery of a passage to India by the Cape of Good Hope, was very extensive, but since that period it has gradually declined, and is at present restricted to the following articles, viz. coffee, odours, drugs, and gums, from Yemen; muslins, and various articles of cotton manufacture, from Surat; shawls, from Cassimere; and a portion of spices from Ceylon. It may still, however, be regarded as the metropolis of the trade of Eastern Africa, as Tripoli is of the West. Slaves are brought from Abyssinia, by way of Jidda and Mecca; caravans frequently trade to Sennaar, Dar Fur, and Fezzan; from whence they bring gold-dust, ivory, ostrich-feathers, gums, drugs, &c. and there is another occasional caravan from Morocco, that employs five thousand camels, for the express purpose of merchandise. Part of these pass on to Mecca, and part remain, to await the return of the pilgrims; while the merchants transact their own business. The other caravans are merely for the carriage of goods; and their camels are annually supplied by the Arabs of the Desert.

There is a considerable manufacture of linen cloth, made of the fine Egyptian flax; a second for sal-ammoniac, which is of an excellent quality; and others for glass lamps, saltpetre, gunpowder, and coloured leather, for home-consumption. This last species of merchandise is brought to Cairo by the caravans of Nubia. Two of them sometimes arrive in the course of the year, and the slaves intended for sale may be estimated at between one thousand five hundred and two thousand. During Sonnini's residence at Cairo, their price rose according to the extent of the importation; but the handsomest slave, either male or female, might be purchased for about twelve pounds sterling.

The European merchants generally dedicate their time in the morning to business, and the remainder of the day to such amusements as the place affords. They frequently ride out to the fields and gardens north of the city, where little danger is to be apprehended; they have a relaxation from business both on the Christian and Jewish sabbath, as the Jews transact a great part of their affairs. When the Nile is high, and little business can be done, they generally spend their time in their houses at Old Cairo and Giza.

The caravan, which sets out from Cairo once a year, is one of the most splendid and numerous cavalcades in all the East; and as every Mussulman is under a religious injunction of making, at least once in his life, a pilgrimage to Mecca, the number of those which compose the caravan seldom amounts to less than forty thousand, but it is much greater in times of peace; for it not only consists of pilgrims, but of merchants, who thus unite themselves for defence against the attacks of the wandering Arabs. These caravans join to their devotions a considerable trade, and return home laden with the richest goods from Persia and India, which come to Geddo by the Red Sea, and are thence conveyed to Mecca; and this, united with the richness of the presents carried there, renders it necessary that they should be attended by a sufficient guard. With this view, a draft is always made of the best troops in Egypt to escort them: at the head of which is the Emir Hadji, or the Prince of the Pilgrims, who has the power of life and death over the whole caravan. The ceremony of setting out on this expedition from Cairo is very magnificent: the camels are all ornamented; but those which are made choice of to carry the presents to Mecca are most magnificently adorned, especially that which carries the great pavilion, called Mahmel, or covering of Mahomet and Abraham's tomb, which is made in the shape of a pyramid, with a square base, richly embroidered with gold, on a green and red ground; the view of the house at Mecca being embroidered upon it, with a portico around it. This camel is covered with a rich carpet, that comes down to his feet, so that nothing is

seen of him but his head, neck, and crupper, which are richly ornamented. He is said to be bred for that purpose; and, after he has performed that office, he is esteemed sacred, and never more put to any use.

The pilgrims find but little water in their journey, and that exceeding bad; but what incommodes them most are the hot winds, which frequently suffocate them; and not less than six thousand, belonging to the caravan of Cairo, have been known to perish by one misfortune or another, during their journey; while those who return alive are so altered and emaciated, that their friends scarcely know them; notwithstanding which, there is not a year but many women and children perform this pilgrimage.

Their encampments are so regulated, that the caravan must arrive at Mecca in thirty-eight days; and the departure of it is fixed to the twenty-seventh day of the moon which follows the Mahometan festival called the Ramadan. It is joined at Beddar, six days' journey from Mecca, by the caravan from Damascus; after which they march jointly to Mecca, and are joined in the way by the caravans from other parts, who then proceed together to pay their devotions at Mount Ararat; from whence they march on to Mecca, where the Emir Hadji puts up the new grand pavilion. The stay of the caravan is confined to twelve days, in which time a great and rich traffic is carried on between the pilgrims and their followers from all parts; and then the Emir Hadji gives his signal for departure. On their return to Cairo the greatest festivities are made, and each person is honoured with the title of hadji, or pilgrim, before his own name. Notwithstanding the great numbers which compose the caravans, there have been instances of their being attacked, plundered, and carried into captivity, by the Arabian freebooters.

BOULAC is a port situated about a mile and a half from Grand Cairo, and is the place where all the merchandise coming from Damietta and Alexandria is landed. It contains several grand baths and extensive okals. These okals are square buildings, including a large court, with a portico, over which is a winding gallery. The ground floor is divided into spacious magazines, and the rooms above have neither furniture nor ornaments. Here strangers live, and deposit their wares. The okals may be said to be the only inns in Egypt; but all strangers must provide their own furniture and food, it being impossible to procure a dinner ready dressed on any consideration. Thousands of vessels, of various forms and sizes, may be seen riding at anchor in this port, from the fronts of the houses. The opulent resort to this place, to enjoy the cooling breezes from the Nile, and the delightful prospect of the variegated landscapes which its banks present.

er the Great, after

his return from consulting the oracle of Jupiter Ammon, three hundred years before the birth of Christ. This city is styled, by the Turks, Scanderoon, as, among them, Alexander is called Scander. It was once an opulent and elegant city, seated near the most westerly branch of the Nile, where the sea forms a most spacious haven, resembling a crescent, in thirty-three degrees eleven minutes of north latitude, and in thirty degrees thirty-nine minutes of east longitude.

Travellers inform us, that the port of Alexandria was formed by the Isle of Pharos, which extended across the mouth of the bay, and, towards the west end, was joined to the continent by a causeway and two bridges, ninety paces in length. On a rock, encompassed by the sea, at the east end of the island, was the ancient Pharos, or light-house, so famous in antiquity; and on the place where it stood is a castle, called Pharillon.

The walls round the outside of the old city are beautifully built of hewn stone, strengthened by semicircular towers, twenty feet in diameter, and about one hundred and thirty feet distant from each other. At each of them are steps, to ascend up to the battlements, there being on the top of the walls a walk, built on arches. The inner walls, which appear to be built in the middle ages, are much stronger and higher than the others, and are defended by large towers, which are also very high.

A fourth part of the city was taken up by the palace, with the buildings belonging to it, and within it was the Museum, or academy, and a burial-place of the kings, where the body of Alexander is said to have been deposited in a gold coffin; but, that being taken away, it was put into one of glass.

The street, which extended the whole length of the city, is said to have been one hundred feet wide, and had certainly many magnificent buildings, as appears from the granite columns still remaining in several places. Among these was the Gymnasium, or public school, to which were porticos that extended above half a quarter of a mile.

But the materials of the old city have been carried away to build the new, so that there are at present only a few houses, some mosques, and three convents within the old walls: among the mosques is one called the mosque of one thousand and one pillars. Dr. Pococke observes, that it has four rows of pillars to the south and west, and one row on the other sides. This, it is said, was a church dedicated to St. Mark, at which the patriarch resided, it being near the gate without which the evangelist is said to have suffered martyrdom. There is another great mosque, named St. Athanasius, which was also doubtless a Christian church. The Greeks, Latins, and Copts, have each a monastery in the old city.

The new city, or rather town, of Alexandria, now called

Scanderoon, is chiefly erected on the sea-shore. The houses have terraced roofs; the holes that serve as windows are blocked up, in a great degree, by a wooden lattice, projecting in different forms, and so close that it is hardly possible for the light to enter. It is through this symmetrical, and sometimes not inelegant, arrangement of bars, that the fair sex can see what is passing out of doors without being seen. It is in this kind of everlasting cloister that beauty, far from being paid that homage which nature intended it should receive from every heart of sensibility, experiences nothing but contempt and outrage; it is there, in short, that one portion of mankind, taking advantage of the odious right of the strongest, keeps in a humiliating state of slavery the other portion, whose charms would alone be capable of softening both the rugged nature of the soil, and the ferocity of the possessors.

The houses at present occupy but a small portion of Alexandria, the remainder consisting of extensive gardens and waste grounds, that are entirely covered with ruins. From the former of these the natives are well supplied with fruit and vegetables; and from the latter fragments of sculpture, ancient coins, and pieces of precious marble, are frequently dug by the Egyptian labourers, or discovered to the passenger by successive showers of rain.

The houses of the European consuls and merchants are all erected near each other to the east of the city, and close to the sea-shore, where the inhabitants usually associate with each other, and retain all the customs of Europe, without insult or disturbance; as from Mr. Browne's observation of the natives, he confesses he is led to believe that, when any stranger has experienced uncivil treatment, it was in effect the result of his own imprudence; and, notwithstanding the heavy charges that are commonly brought against the Egyptians by historians, respecting their traffic with the Franks, or Europeans, he ventures to affirm, that the natives are as frequently duped by the European merchants, as the latter by the Egyptian factors, whom they are necessitated to employ. The command of the fort, and the military who are stationed in the city, are committed to the hands of a sardar, who is either a cashef, or an inferior officer of the beys; but the internal government is vested in the citizens.

The present enclosure of Alexandria consists of solid walls, and a hundred vaulted towers, the circumference of which is only six miles, whereas the ancient city, according to the best authorities, was nearly twenty-four miles round. The architecture is evidently in the manner of the Arabs; columns, and other fragments of antique monuments, have been employed in their construction, and several inscriptions on the towers, in Arabic and Kuphic characters, fully substantiate the nature of their origin.

The banks of the canal near Alexandria are, enlivened

by a few trees and shrubs, and in some places they are clothed with occasional patches of verdure, whither a number of small birds usually resort, among which Sonnini remarked the fig-peeker, the sky-lark, and an abundance of sparrows. Those of the former descriptions are only birds of passage at Alexandria; but the sparrows, like those of Europe, are equally remarkable for effrontery, familiarity, and voracity, seemingly determined to partake, at all events, of the dwellings and provisions of the natives. Exclusive of a few fields, where barley is sown, and where artichokes and other vegetables are cultivated, the adjacent country presents nothing to the spectator but rocks, sands, and general sterility. The cultivation was formerly much larger, and might have been still extended with the greatest facility by the Alexandrians; but that ignorant and inactive race, who made no effort to preserve the only water that was potable, could not be expected to make any exertion to procure to themselves either comfort or abundance.

During his residence at Alexandria, Sonnini lodged at the French factory, which he describes as a quadrangular building, situated at the head of the new port, and enclosing a large court-yard, round which are the warehouses, under arcades: the latter are supported by fragments of pillars, taken from the ruins of the ancient city. Several are of granite, and one is of porphyry. In the midst of the yard is a statue of white stone, representing a woman, with a child by her side; the sculpture is tolerably good, and the drapery in particular is well executed; but it has received many injuries from the bales of merchandise that are continually tossing about, and sometimes fall upon it with such force as to mutilate it. The apartments are built over the warehouses; consequently the windows are at a considerable height from the ground. The only avenue to this spacious enclosure is shut up by a single gate, of great solidity; and, in times of tumult, bales of goods are actually piled up against it, as a farther security. If, however, the insurrection be not easily appeased, and the least fear is entertained of the populace breaking in, all the merchants contrive to slip from the windows in the course of the night, and to take refuge on board of some vessel in the harbour.

Sonnini had one day an opportunity of witnessing the extreme terror with which the bare idea of an Alexandrian riot filled the minds of the Gallic merchants. A person happening to say, that an Egyptian was slain by a native of Europe, the gates of the factory were hastily shut, bales of goods ordered to be moved, in order to sustain the expected shock, and all the inmates of the factory were preparing to escape to the harbour, by dropping from the windows, when they were happily informed, that it was one Mahometan who had killed another.

Having heard of a curious antique monument, that was in

a mosque, without the walls of the city, Sonnini expressed a wish to see it; but, on the intimation of his desire, he received the strongest assurances that it was impracticable. He, however, contrived to bribe the iman of the mosque; and, by his connivance, had an opportunity of examining the edifice and its contents at his leisure. The mosque itself is very ancient; the walls are encrusted with marbles of different colours, and some beautiful pieces of mosaic well repaid the trouble of our adventurer to satisfy his curiosity. The tomb, which was the more immediate object of his research, is probably one of the finest pieces of antiquity in Egypt. It is very large, and would be an oblong square, were not one of its sides rounded off in the manner of a bathing-tub. It is formed of one piece of black and spotted marble, elegantly diversified with green, yellow, and red, and is covered with so great a profusion of hieroglyphics, that a month would, in all probability, be too short a space to admit of their being faithfully copied. The sarcophagus is now used by the Mahometans as a reservoir, to contain water for their religious ablutions. Browne relates that, as the sarcophagus is exceedingly rich in hieroglyphics, and has received but little injury from the corroding tooth of time, a person, who had for some time farmed the customs, ventured, on his retiring from Egypt, to negotiate for the sale of this precious relic to an European, who designed to present it to the Emperor of Germany. Previous to its embarkation, however, the secret was divulged, and the citizens insisted so loudly that the property of their mosque was inviolable, that the projected scheme was prudently given up, and the chest permitted to continue in its place, where, since that occurrence, it has been watched with such unremitting vigilance, that it is now extremely difficult for a traveller to obtain a sight of it: consequently Mr. Browne was precluded from presenting the public with so minute a description as would have been congenial with his own desires.

Sonnini observes, that a continual communication with the various nations of Europe had, in some degree, disposed the Alexandrians to more toleration, in some particulars, than the rest of the Egyptians: as, for instance, Europeans are by them permitted, as well as by the inhabitants of Rosetta, to wear their native dresses, while in every other part of Egypt they are forbidden to appear, without being clad in the oriental fashion. This indulgence, however, must by no means be abused; for if the Europeans venture to shew themselves in any number, or with any degree of parade, at a distance from the shipping, they instantly draw upon themselves the insults of the populace.

It is a remarkable fact, that, notwithstanding the stupid barbarism of a people, who have so shamefully neglected, and sometimes destroyed, the most precious relics of an-

tiquity, they are the of the illustrious scattered around; "is, in human valour marble falls is confounded actions will claim an unabated rity. Mr. Browne and acuteness, the Alexandria for that perpet the transit of department is occasionally operated conscious that bated to themselves.

tiquity, they still preserve a solemn respect for the name of the illustrious conqueror, whose superb monuments lie scattered around their habitations. "Thou art an *Alexander*," is, in their opinion, the highest encomium upon human valour; so true it is that, when the sculptured marble falls neglected to the dust, and the statue of bronze is confounded with the common ruins of a city, great actions will survive those perishable monuments, and claim an unabated admiration from the children of posterity. Mr. Browne observes, that as activity, perseverance, and acuteness, are among the leading characteristics of the Alexandrian merchants, they are admirably disposed for that perpetual hurry of business, which is attached to the transit of merchandise; and their attention to every department is so remarkable, that, if various causes occasionally operate to the stagnation of commerce, they are conscious that no portion of blame can be possibly attributed to themselves.

European merchandise is conveyed by water from Alexandria to Cairo, whence it is sent to all the different parts of Arabia, Upper Egypt, and Abyssinia. The small vessels used for this purpose, between Alexandria and Rosetta, are denominated germs; generally of about five or six tons burden. Their construction is tolerable; but, though they draw little water, they are frequently destroyed in a high wind, or swallowed up among the sands, and there perish, together with their crews and cargoes. During the increase of the Nile, these accidents are less frequent; but, when the river has retired to its bed, it is so extremely shallow at the mouth, that the Egyptian mariners never pass it without trembling.

With respect to their political concerns, the Alexandrians are rather disobedient and intractable towards the Mameluke governors, whose public orders are not unfrequently opposed; and the present beys are considered by the citizens as rebels against the authority of the Porte. A mutual jealousy naturally subsists between the parties, as the beys are anxious to subjugate the Alexandrians to the same yoke that is imposed on the rest of the Egyptians, and the citizens are equally zealous to preserve that imperfect autocracy, or independent power, which they have hitherto contrived to maintain by fertility of expedient, or occasional subterfuge.

The Arabic language is in general use at Alexandria; but such of the natives as have any commercial intercourse with Europeans speak Italian, which has considerable currency in all the ports of the Levant. The *Moresco*, or *Lingua Franca*, is also spoken. This is a mixture of bad Italian, Spanish, and Arabic. Sonnini observes, that there is not any place, at which a foreigner can so easily procure servants, who, if not of approved fidelity, have, at least, a facility of making themselves understood by those who are unacquainted with the Arabic.

ROSETTA is esteemed one of the most pleasant cities in Egypt, and, being refreshed by the winds which blow from the sea, is extremely healthy. It is called, by the Egyptians, *Raschid*, and is situated twenty-five miles to the north-west of Alexandria, in thirty-one degrees five minutes of north latitude, and in thirty-one degrees ten minutes of east longitude from London: it stands on the west side of the branch of the Nile, about four miles from its mouth. According to Leo Africanus, Rosetta owes its foundation to a governor of Egypt, under the caliphs. Its old walls announce that it was once larger than at present; and its former foundations may be discovered under the heaps of sand with which they are covered. Like Alexandria, its population is daily decreasing, though it is still considerable. The houses are, in general, better built than those of Alexandria; but they are so slight, that, were it not for the mildness of the climate, which destroys nothing, there would scarcely be a house in Rosetta. Each succeeding story projects farther into the street than that beneath it, so that the two sides finish by almost touching each other. Hence the streets are dark and melancholy. The houses that are built along the Nile have not this inconvenience: these principally belong to foreign merchants. The town is nearly two miles in length, but consists of only two or three long streets. It is defended by two castles, one on each side of the branch of the Nile, by which merchandise is brought hither from Cairo. The fine country of the Delta, on the other side of the Nile, and two beautiful islands a little below the town, afford a delightful prospect; and to the north the country is agreeably improved by pleasant gardens of citrons, oranges, lemons, and almost all kinds of fruits; and is variegated by groves of palm-trees, small lakes, and fields of rice, which latter, when ripe, make a very beautiful appearance.

Here is a castle, about two miles north of the town, on the west side of the river. It is a square building, with round towers at the four corners, having port-holes at the bottom of it, and some pieces of brass cannon. It is built of brick, cased with stone, and is said to have been erected about four hundred years ago. A little lower down, on the opposite side of the river, is a platform of guns; to the east of which are salt-lakes, where great quantities of salt are collected. A little nearer to the sea, from the above castle, is another, whose walls, ordnance, and garrison, are in a poor condition.

Somewhat below this second castle, the Nile is divided into two branches, one turning east, and the other west, and forming what is called a bogaz, or bar, in their mouth, which is known by the name of Canopic. This bar is very dangerous to pass over, especially when the sea is agitated by a northerly wind.

The population of Rosetta consists of natives, Franks, 5 B

and Greeks. The inhabitants have a manufactory of striped linens; but the chief business of the town is the transportation of merchandise between this place and Cairo, all European goods being brought hither from Alexandria, by sea, and sent from hence, in boats, to Cairo. On this account, vice-consuls and factors are stationed here, to transact the business of each commercial nation.

In this town there are a great number of men, called *Psylli*, or serpent-eaters; this singular sect boasts a very ancient origin in Egypt: history mentions that many of them were in Egypt in the time of Cleopatra; for Octavius Cæsar, desirous that the captive queen should grace his triumph, commanded one of these *psylli* to suck the wound the asp had made. His efforts, however, were vain, the poison had pervaded the whole mass of blood, nor could the art of the *psylli* prevent her death. These men are said to possess the power of setting serpents at defiance, of charming them, causing the reptiles to follow them at command, and of curing their bites. This sect is likewise called *Saadis*, from the name of their founder, a saint highly venerated by the Egyptian Mussulmen. This Saadi, they say, had a wealthy uncle in Lybia, who sent him occasionally to fetch some wood from the desert. One day the lad, having cut the faggot, was greatly at a loss for something to tie it, till at length, after a fruitless search, he resolved to knot several serpents together, and accordingly bound up his faggot with this living cord. The uncle, equally surprised and charmed with the boy's acuteness, told him, that he was now adequate to the task of making his way in the world, as his knowledge was superior to that of his elders. The ingenious youth immediately took the hint, and began travelling over the country, charming serpents by his supernatural skill, till at length he had a great number of disciples, to whom he communicated his art. His tomb is in the neighbourhood of Damascus, and is filled with serpents and other venomous animals, among which, the Egyptians believe, a person may repose in perfect safety.

Such is the superstitious origin of this numerous sect in Egypt, each individual of which boldly affirms, that he inherits the skill of the founder. His festival is annually celebrated, in a manner analogous to the institution. The *saadis* march in procession through the streets, each holding a living serpent in his hand, which he bites and swallows piecemeal, with the most horrid contortions. *Sonnini*, who had not an opportunity of witnessing this singular festival, prevailed on one of the sect to indulge him with the exhibition at his own apartments.

On the appointed day, the *saadi* came, accompanied by his priest, who carried a large serpent in his bosom, which he was continually handling. *Sonnini* observed that the reptile's teeth had been drawn; however, it was very lively, and of a greenish copper colour.

The priest, after having recited a prayer, delivered the creature to the *saadi*, who seized it with a muscular hand; but, on its entwining itself round his arm, his countenance changed, his eyes rolled dreadfully, and he uttered the most piercing cries. He then bit the serpent in the head, and tore off a piece, which he instantly chewed and swallowed. At that moment his agitation increased to convulsion, his limbs writhed, his howlings redoubled, and his mouth, distended by the most shocking grimaces, was literally covered with foam, while he occasionally devoured fresh pieces of the animal, with all the marks of confirmed madness. Three men exerted themselves to hold him, but he violently dragged them round the room, throwing out his arms in every direction, and striking furiously against whatever stood in his reach. After some time the priest took the serpent from him, but he still bit his hands, and continued to rage with the fury of a maniac. The priest, however, at length, clasped him in his arms, put his hand gently upon his back, lifted him from the ground, and recited some prayers, when his agitations gradually subsided, and for a few moments he seemed totally exhausted.

"The Turks," says *Sonnini*, "who were present, were fully convinced of the reality of this religious frenzy; and it must be confessed, that, whether reality or imposture, it was impossible to express the transports of madness in a more striking manner, or to exhibit a human being in a more terrific situation." In Egypt, the *saadis* are much respected, but among the Turks who dwell in the other parts of the Ottoman empire, they are objects of derision.

A priest, of this sect, who was of an open disposition, candidly assured our author that, though several individuals of his fraternity had an uncommon power over serpents, he had not the smallest claim to it himself, but, on the contrary, acknowledged that he was extremely afraid of these reptiles: he likewise observed, that the *saadis* always kept serpents in their houses, to be ready upon every occasion; but they previously take the precaution of drawing their teeth. If any person be bitten by a serpent, the *saadi*, to whom he applies, mutters a few words over the wound, scarifies it with a razor, and, having first filled his mouth with lemon-juice, sucks the blood from it repeatedly. These men are likewise said to cure "the serpent's breath," an appellation given, by the Egyptians, to inflammatory pustules, which sometimes break out on persons who sleep uncovered in the open air, and which they suppose are occasioned by the breath of a serpent. The remedy of the *saadis* is a mixture of ceruse, or white lead, and oil of sesamum, with which they rub the pustules, at the same time muttering a few unintelligible words, to impress the superstitious patient with veneration for their superior abilities.

*DAMIETTA* is situated on the eastern shore of the Nile, nearly opposite Rosetta. Its inhabitants are numerous,

and its square pleasantly situated. The re- eruse, or white lead, rub the pustules, at digible words, to in- veneration for their ri shore of the Nile, ants are numerous,

and its squares and okals spacious. The houses are pleasantly situated, and various grand mosques, with lofty minarets, adorn the city. One of them is an ancient famous edifice, said to have been erected on the ruins of a Christian church. It is of a considerable extent, and contains a number of marble columns, one of which is of porphyry, and another of red granite. One, of yellow and white marble, is supposed by the superstitious natives to have the virtue of curing the jaundice, and is frequently scraped by the poorer class, who actually drink the powder, as an infallible restorative. The other mosque is a rich foundation, reputed to maintain near six hundred indigent priests, who are either paralytic or afflicted with blindness. The public baths are elegant and convenient, and produce very salutary effects. The port is filled with vessels, and a considerable trade is carried on here. The finest rice of Egypt is cultivated in the neighbouring plains: and its annual exportation is supposed to be between two and three hundred thousand pounds. There are likewise cloths, sal-ammoniac, and wheat. The law prohibits the exportation of the latter, but it is frequently evaded, the wheat being on these occasions considered as rice.

The harbour of Damietta is very unsafe, for the road where the vessels lie being totally exposed to every gale that rises, mariners are frequently obliged to slip their cables, and take refuge at Cyprus, or keep the open seas. Damietta enjoys a happy temperature of climate, and abounds with the productions common to the country.

The city is supposed to contain about twenty-five thousand inhabitants, without including its suburb on the other side of the Nile. Here are about four hundred Greek families, who are the principal merchants and traders in the city. They have a church, a bishop, and the free liberty of exercising their religion, except the article of ringing the bell. Besides the Greeks, here are many other strangers, of various nations and religions; but they are greatly restrained in the enjoyment of their national privileges, and fearful of being in the streets after dark, on account of the insults to which they are subject from the Turkish soldiery, who have a natural antipathy to all strangers. The people of Damietta have such an aversion to Christians, that they can scarcely escape insult. This rooted dislike seems to have been transmitted from their forefathers, and to originate from the crusades, the chief scene of which, in Egypt, was about Damietta, which was taken by the Christians, and afterwards restored as part of the ransom of Lewis IX. who had fallen into the hands of the infidels. No person must appear here in an European dress; and, as a Christian is known by his mien, strangers dare not be seen in the streets which the soldiery are accustomed to frequent.

*Inventions, Arts, Manufactures, and Commerce.]* Egypt was anciently celebrated for being the seat of learning,

and the nursery of arts and sciences, from which Greece and other nations received them. Geometry is on all hands agreed to have been first discovered in Egypt; and it is said to have owed its rise to the necessity of measuring and laying out the lands, the boundaries of which were almost annually disturbed by the overflowing of the Nile. Astronomy is generally supposed to have been invented by the Egyptians, who, by reason of the constant serenity of the air, and the flatness of their country, might observe the motions of the heavenly bodies earlier, and with more facility, than other people. Herodotus, indeed, gives the honour of this invention to the Babylonians; but Diodorus derives the Babylonians themselves, as well as their sciences, originally from Egypt. The ancient Egyptians were acquainted with the true system of the world, now known by the name of the Copernican system; and from them Pythagoras learned it, and taught it afterwards in Greece.

These sciences were, however, in those early periods, but in their infancy. Geometry does not appear to have extended to all geometrical quantities, and subtle theories, like that of the moderns: perhaps it extended no farther than plain measuring, and such rules as were of use in common life. And this will appear more probable, if it be considered, that Pythagoras, who travelled into Egypt, in order to acquire the learning of that people, after his return home, offered a hecatomb on his discovering that the square of the hypothenuse of a right-angled triangle was equal to the squares formed by the base and perpendicular; and Thales, who also learned geometry in Egypt, sacrificed an ox to the gods, for joy that he had found out a method of inscribing a rectangled triangle in a circle. The professors of astronomy, in those early times, appear to have been unable to make any artificial calculations; since Thales was the first who ventured to foretell an eclipse, and Eudoxes and Ptolemy first reduced the heavenly motions into hypotheses and tables.

Sculpture is generally supposed to have been invented by the Egyptians; and the first monuments recorded of this nature were two colossal statues, the one erected in honour of Mæris, king of Egypt, the other in honour of his queen, both placed upon thrones, supported by two pyramids, which were raised three hundred feet high, in the middle of the lake Mæris; so that, notwithstanding the prodigious circumference of this lake, these two statues were conspicuous from its banks. The invention of painting is also owing to the Egyptians, at least as far as the four principal colours. The knowledge they had of chemistry seems to make this opinion certain; besides, the paintings still to be seen among the old remains of Egyptian buildings, which have so long resisted the injuries of time, and which still retain a fresh and lively colouring, seem to put the matter beyond dispute.

With respect to the ancient state of physic among the Egyptians, Clemens Alexandrinus informs us, that there were forty-two books of Hermes, which contained all the philosophy of the Egyptians, and the last six of which related to medicine, and treated of the construction of the body and its disorders, with the methods of treating them. Herodotus informs us, that the practice of physic was so divided, that one physician had the charge only of one distemper, and might not presume to take upon him the care and inspection of more.

In most parts of Egypt, and even in Cairo itself, the curious mechanical arts are generally in the hands of Christians. Such artificers as jewellers, silversmiths, &c. are fully employed at Cairo, in making ornaments worn by the women, and for the trappings of their horses. The Egyptian pebbles; used for the handles of knives, snuff-boxes, and other toys, are wrought and polished at Cairo to perfection. Their turners are remarkable for making wooden lattices for windows, in a very curious and beautiful manner; and they also make some both of brass and iron, of admirable workmanship, which they place before the windows of their mosques. Upon the whole, however, the preference is given to the artificers of Constantinople, and whatever is brought from thence is much esteemed by the Egyptians.

The inhabitants of Upper Egypt have a very singular art, that deserves to be mentioned. They load a boat with hives of bees, when the honey is all spent, and, falling down the river in the night-time, they stop in the morning at a place they think most proper for the bees to fly abroad, and collect their wax and honey. When night comes on, and the bees are returned to the hives, they proceed on their voyage, casting anchor again in the morning, and resting all day, as before. By this means, it is said, they arrive at Cairo in six weeks or two months, where they are sure of finding a good market for the cargo collected by their industrious little animals.

The method of hatching chickens in ovens is another art, which may be looked upon as peculiar to Egypt. The season for producing fowls after this manner is from January to April, while the weather is temperate, for at other times the heat is too violent. The ovens are built under ground, in two opposite rows, with a gallery or passage between them; and they are raised one above another, with holes at the top, as there are likewise in the passage, which they open or stop, as they would have the heat diminished or augmented. The fuel they use to heat these ovens is dung and chopped straw, which makes a smothering fire, the smoke of which is very offensive. They continue to heat them gently for eight or ten days together, and then bring the eggs from the lower cells, where they had been laid in heaps, and spread them in the upper apartments, so as only to cover the floor, and not

lie one upon another. The business is now to turn them every day, and keep a moderate fire in a channel that runs along near the mouth of the ovens; and indeed the art consists chiefly in giving the ovens a proper degree of heat, neither too much nor too little, for, in either case, the labour would not succeed. Their general rule is, that the eggs be never made hotter than a man can bear them to be applied to his eyelid. Thus, with good management, they begin to hatch in about three weeks, at which time it is very entertaining to take a view of these places, and to observe some of the chickens just putting forth their heads, others half out of the shell, and others quite delivered from their confinement.

Thunder, it is said, sometimes occasions great numbers of eggs to miscarry; and, at the best, it is observed, that many of the chickens want a claw, or have some defect, which, perhaps, they would not have had, if they had been hatched in the natural way. The master of the ovens, according to Mr. Greaves, has one-third of the eggs for his pains and charges, out of which he is to make good to the owners any of their number that may happen to be broken or miscarry. The same gentleman tells us, that the fire in the upper ovens, when the eggs are placed in the lower, is thus proportioned: the first day the greatest fire, the second less than the first, the third day less, the fourth day more than the third, the fifth day less, the sixth day more than the fifth, the seventh day less, the eighth day more, the ninth no fire at all, the tenth a little fire in the morning; the eleventh they close all the holes with flax, &c., making no more fire; for, if they should, the eggs would break. In this manner, seven or eight thousand chickens are hatched in a short time. It has been doubted, whether this method of hatching chickens were practicable in any country besides Egypt, the nature of the climate being supposed particularly favourable to that design; but the same experiment has been made in Italy and other parts of Europe.

Two powerful causes have contributed to render Grand Cairo the seat of an extensive commerce. The first is, that all the commodities consumed in Egypt are collected within the walls of that city; and all the chief persons of property, having made it their residence, draw thither their whole revenue. The second is the situation, which makes this city a centre of circulation; while by the Red Sea it corresponds with India and Arabia; by the Nile, with Abyssinia and the interior parts of Africa; and, by the Mediterranean, with Turkey and Europe.

Every year, a caravan from Abyssinia arrives at Cairo, and brings a large company of black slaves; together with gold-dust, elephants' teeth, gums, parrots, monkeys, and ostrich-feathers; while another caravan, destined for Mecca, leaves the extremities of Morocco, and, receiving pilgrims even from the river of Senegal, coasts along the

Mediterranean to Tripoli, and it proceeds, in order to purchase ravens, gums, fumes, and arrive by another

Cairo does but, besides profits arise from the pilgrims, arrive from the favourab

ck slaves; together  
as, parrots, monkeys,  
aravan, destined for  
occoe, and, receiving  
gal, coasts along the

Mediterranean, collecting those of Algiers, Tunis, and Tripoli, and arrives by the desert of Alexandria. Thence it proceeds to Cairo, where it joins the caravan of Egypt, in order to proceed to Mecca. The lading of these caravans generally consists of Indian stuffs, shawls, perfumes, gums, and coffee: and the same commodities also arrive by another route at Suez.

Cairo does not retain the whole of this merchandise: but, besides what is there consumed, very considerable profits arise from the duties, and the sums expended by the pilgrims. On the other hand, small caravans frequently arrive from Damascus, with silk, oils, fruits, &c. During the favourable season, there are, likewise, vessels in the road of Damietta, unloading hogsheds of tobacco, from Lathia; the consumption of which is very considerable. Others arrive successively at Alexandria, bringing cloths, arms, furs, and wrought silk, from Constantinople; and some vessels come from Leghorn and Venice, with cloths, laces, grocery, paper, lead, and iron. All these articles are first landed at Rosetta, then re-embarked on the Nile, and sent to Cairo.

From this account, it is not surprising that commerce should still continue so flourishing in the capital of Egypt; and we need not doubt the report of the commissioner-general of the customs, who asserted, in 1783, that Cairo had traded to the amount of nearly six millions and a half sterling.

In ancient times, the haven of Alexandria appears to have received the merchandise of the world; and the city became, as Strabo calls it, the greatest emporium on earth. A formidable marine was kept up in the Red Sea and the Mediterranean, to protect the Egyptian merchants; and a rapidly augmenting commerce was cherished and supported by royal patronage; but subsequent troubles and revolutions conspired to humble the pride of Egypt; and, although her commerce is now very considerable, she cannot profit by her situation to rival the Europeans, who have discovered new passages to that quarter of the globe whence she drew her richest commodities. Her ignorant mariners, far from navigating the Indian Ocean, scarcely dare venture over the Red Sea. "Their greatest effort," says M. Savary, "is their annual voyage to Mocha, where their ill-armed saroks, incapable of defence, are laden with the coffee of Ycmen, the muslins and cloths of Beugal, the perfumes of Arabia, and the pearls of the isles of Beharim. The coffee which they buy for four-pence per pound at Mocha, they sell for fifteen-pence at Cairo; and this article alone amounts to half a million sterling.

"Egypt, even in a decline, however, appears respectable, because she contains within herself the true sources of wealth. Her corn, with which she supplies Arabia, Syria, and a part of the Archipelago; her rice, sent over the Mediterranean; her earthenware-flowers, with which the people of

Provence annually load several vessels; her sal ammoniac, transported throughout Egypt; her excellent flax, esteemed by the Italians; and her blue cloths, that clothe, in part, the neighbouring nations, are all objects that make the balance of trade in her favour. The Abyssinians cheerfully exchange their gold-dust, elephants' teeth, and other precious commodities, for her productions; the cloths, laces, arms, and lead, brought from France, do not equal what they receive; even the merchandise imported by the Turks is far below what they take in return, and the difference is always paid in ready money. Except Mocha and Mecca, where the Egyptians leave a great part of their sequins, all who trade with them bring gold and silver; and, indeed, we may form a tolerable idea of the abundance of these metals in Egypt, when we read, that Ali Bey, fleeing to Syria, carried with him three millions and a half sterling; and that Ismael Bey, escaping some years after, loaded fifty camels with sequins, patacas, pearls, and jewels.

"If, destitute of shipping," says our author, "Egypt is still so wealthy, what might she not be, if governed by an enlightened people? What an influx of prosperity would arise from opening her canals, repairing her mounds, and restoring to agriculture a third of the grounds buried under the sands; what wealth from opening her mines of emeralds, famous for almost equaling the diamond in durability! With what advantage might her indigo, carthamus, and other substances, excellent for dying, be employed! These are not chimerical riches; Egypt has possessed them for ages; and a wise administration would restore all the prolific treasures of nature."

*Revenues.* The revenues of Egypt, when compared to the natural riches of the country, and the despotism of its government, are very inconsiderable. It is said that they amount to a million sterling, but that two-thirds of the whole is spent in the country.

*Military Force.* This consists in the Mamelukes, some bodies of whom are cantoned in the villages, to exact tribute, and support authority. The greater part are assembled at Cairo. They amount to about eight thousand, attached to the different beys, whom they enable to contend with each other, and to set the Turks at defiance.

*Constitution and Government.* The government of Egypt is both monarchical and republican. The monarchical is executed by the pasha, and the republican by the Mamelukes or sangiacks. The pasha is appointed by the grand signor as his viceroy. The republican, or rather the aristocratical, part of the government of Egypt consists of a divan, composed of twenty-four sangiacks, beys, or lords. The head of them is called the sheik-bellet, who is chosen by the divan, and confirmed by the pasha. Every one of these sangiacks is arbitrary in his own territory, and exerts sovereign power: the major part of them reside at Cairo. If the grand-signor's pasha acts in oppo-

sition to the sense of the divan, or attempts to violate their privileges, they will not suffer him to continue in his post. They have an extensive grant of privileges, dated in the year 1517, in which the sultan Selim, having conquered Egypt, and overthrown the Circassian Mamelukes, caused their head, Thomam Bey, to be hanged at one of the gates of Cairo. Disgusted at this, they only waited the departure of the Turks to resume their arms, and Selim, perceiving his error, in order to gain the good-will of the Mamelukes, granted them very peculiar privileges, as specified in a treaty signed by him for that purpose. So that, by these means, the Egyptian government partook of monarchy and aristocracy.

For the maintenance of the civil government of Egypt, the divan is held three times a week at the pasha's palace at Cairo. Punishments are in proportion to the offences committed. Murder is punished with death, but inferior crimes with the bastinado or whipping. Bakers, for making their bread deficient in weight, are sometimes put into their own ovens, when hot, and there suffered to perish; and butchers, for selling stinking meat, have one of their ears nailed to their shop-door, with a piece of the flesh in a wire through the nose. In this situation they are obliged to continue four hours.

The Jews under this government are despised and oppressed, so that they are dwindled into a very inconsiderable number, except at Cairo, and reduced to the lowest poverty. The inhabitants of the upper parts of the kingdom are not only oppressed by their rapacious governors, but exposed to the ravages of the Arabian shieks, who take all opportunities of plundering the villagers, by way of reprisal for the hardships they suffer from petty tyrants. From these instances of tyranny, the government of Egypt may be said to be equally oppressive with that under the arbitrary sway of the most despotic prince.

*Religion.*] As to the modern state of religion in Egypt, the Turks, Moors, and Arabs, are Mahometans. The two latter are zealous devotees, and perform the several functions with great precision. They have among them a set of miscreants, called *Santos*, who are most insolent hypocrites, intruding themselves, upon pretence of superior holiness, into the best houses, without the least ceremony, and it would be dangerous to turn them out. The Turks, in general, are deeply tinctured with the doctrine of predestination, which not only inspires them with fortitude in danger, but with magnanimity in distress. Indeed, they behave better in adverse than in prosperous fortune.

As the Ramadan, or feast of the Mussulmen, commenced at the time of year Sonnini was at Rosetta, he was enabled to give the following account of it:—"All the tradesmen assemble," says he, "in companies, and march in procession through the town, by the light of kindled chips of resinous wood, contained in iron pots, carried upon the

end of long sticks. The head of each corporation is mounted upon a fine horse, and clothed in an extraordinary dress. Several also wear masks, which were loudly applauded by the populace; but they were particularly enthusiastic in their expressions of approbation, when the chief nightman appeared in the habit of an European. This fact," adds Sonnini, "may give a just idea of the degree of consideration we enjoy in their country."

During the month set apart for the observance of the Ramadan, eating and drinking are not only forbidden from sun-rise to sun-set, but the use of tobacco is as severely prohibited. The labourer, oppressed by heat, and nearly overcome with fatigue and extreme thirst, is consequently ready to faint; but, in Egypt, as well as in any other country, the man of opulence evades the law that is incompatible with his convenience, and claims a scandalous exemption from the sufferings of the helpless and indigent. If the Ramadan is a period of abstinence very difficult to be endured by the working man, it is an interval of pleasure to the rich, who make of it both a lent and a carnival. Immediately after sun-set, feasting, dancing, shows, and music, occupy the place of every street, and sleep kindly intervenes, to prevent the sons of affluence from perceiving the length of the day.

The superiors in religious matters are the Mufiti, who is the principal, and the doctors of the law: these are judges in all causes of a spiritual nature.

The Copts profess themselves to be Christians of the Greek church, but they embrace transubstantiation; in which, and other points, the Catholics of Cairo think they approach their faith nearer than the Greeks. They have, however, adopted, from the Mahometans, the custom of frequent prostrations during divine service, ablutions, and other ceremonies. In religious, and indeed many civil matters, they are under the jurisdiction of the patriarch of Alexandria, who, by the dint of money, generally purchases a protection at the Ottoman court.

*Language.*] The Coptic is the ancient language of Egypt. This was succeeded by the Greek, about the time of Alexander the Great; and that by the Arabic, upon the commencement of the caliphate, when the Arabs dispossessed the Greeks of Egypt. The Arabic, or Arabesque, as it is called, is the current language; the Coptic, according to Mr. Browne, may be considered as extinct.

*Customs, Manners, &c.*] Amid the numerous revolutions which all nations have experienced, there are few countries that have preserved their original inhabitants pure and unmixed. The same desire which leads individuals to encroach on the property of others, has armed the nations of the earth against each other; and the result of their most obstinate contests has been, to introduce into states a foreign master, who has despoiled his vanquished foes of the domain granted them by nature.

Such has been the case with Egypt: deprived, for three and twenty centuries, of her natural proprietors, her fertile lands have successively become a prey to Persians, Macedonians, Romans, Greeks, Arabs, Georgians, and at length to the race of Tartars distinguished by the name of Ottoman Turks. Several of these nations have left vestiges of their transient possession; but, as they have been blended in succession, they have been so confounded, as to render it extremely difficult to discriminate their respective characters.

The native Egyptians, according to M. Savary, are the Copts; so called from Cophtos, once a famous city in the Thebais. These only appear to be the descendants of the ancient Egyptians, and have preserved many of the customs of their forefathers, together with the ancient vulgar tongue, although, by so long a subjection to foreign powers, their genius and science have almost sunk into oblivion.

The knowledge, transmitted from father to son, of the value and extent of all arable lands, occasioned these people to be chosen clerks to the beys; and, in order to conceal their accounts from their masters, they generally write them in Coptic. They do not, indeed, perfectly understand this language, but as their missals, and various other works they possess, have an Arabic language, it is evident that their ancient language is not lost; and, at some future period, it may, probably, supply the learned with means of dispelling the obscurity of the earliest ages, and of removing the veil from many mysterious hieroglyphics.

The Copts appear to have embraced Christianity at a very early period; and Amrou, having conquered Egypt, indulged them in the free exercise of the Christian religion; since which time they have had churches, priests, bishops, and a patriarch, whose residence is at Grand Cairo. Many superstitious practices are mingled with their worship; but, for the most part, they are mild, humane, and hospitable. Paternal tenderness and filial love constitute their domestic happiness, where every tie of blood is cherished and revered. Inland trade, the art of hatching eggs, and raising bees, constitute almost the whole of their knowledge. They often enrich themselves by the administrations entrusted to their care, but they seldom enjoy tranquilly the fruit of their labours. The bey, who gains intimation of their opulence, often pillages them without mercy, whilst their want of energy keeps them enchained in misery and abject subjection.

After the Copts, the Arabs are the most ancient people of Egypt, where they have twice obtained the supreme authority. Their first dominion was in the remote ages of antiquity; the second began in the seventh, and ended in the twelfth, century. Two-thirds of the present inhabitants are Arabs, whose manners differ according to their mode of life. Those who have not become husbandmen are governed by their foreign masters, and present a

striking example to philosophers of the influence of laws over the human mind. Beneath a tyrannical government, they have lost that good faith which has been said to characterize their nation: villages arm against villages, and towns against towns; and, during the revolutions continually reviving at Grand Cairo, the country presents a frightful scene of carnage and horror. It is these degenerate Arabs who render the navigation of the Nile extremely dangerous, for they frequently attack boats in the dark, massacre passengers, seize their effects, and commit every kind of outrage.

Another division of the Arabs are devoted to the cares of agriculture, and are governed by their own shieks, who possess various principalities in the Thebais. Now, as in ancient times, they are the judge, the pontiff, and the sovereign, of their people; yet governing less like kings than fathers of families. These venerable patriarchs usually take their repasts at the doors of their tents, and, on rising from table, they exclaim, with a loud voice, "Whoever is hungry let him, in the name of God, come and eat." Nor is this a mere form of words enjoined by the precepts of their ancestors, but the invitation is really dictated by unaffected hospitality; and any person is perfectly welcome to sit down and feed on what is set before him. These Arabs are represented as the best of people, ignorant of the vices of more polished nations, and incapable of knavery or disguise. Equally haughty and generous, they repel insult by arms, and never employ treachery; their tents are open to travellers of all descriptions, and utter strangers are always treated with as much respect and affection as their own kindred. "Of their honesty," says Savary, "some idea may be formed by the following fact, to which I was a witness. An Arab shiek had long come annually to the district of the French, where he took up goods, on credit, of a merchant; still coming the following year at the same time, bringing the money, and purchasing fresh merchandise. One year, sickness prevented him from coming at the usual time; but he sent his son with the money, and continued a trade equally honourable to both nations."

A third class of Arabs is comprised under the general name of Bedouins, of whom we have already given some account. They are divided into tribes, and subsist on barley-cakes and the milk of their herds, which they drive into the valleys, where they find water and pasturage. Masters of the deserts, they are the enemies of all caravans, attack them wherever they can find them, and force them either to fight or pay tribute. If the resistance be too powerful, they retreat without fear of pursuit; if they prove victorious, they pillage every one, and divide the spoil; but, it appears, they never put anyone to death, unless to revenge their fallen companions.

Of their disinterested generosity to travellers, many in

stances may be adduced. M. Pages fled over the sands of Arabia Deserta with seven Arabs of this class: he had lost his water and provisions, and, falling from his camel, was in imminent danger of being sacrificed to the resentment of an insulted tribe. One of his companions alighted, and, at the risk of his own life, took him up behind him, till they arrived at a place of safety. The whole provision of the Arabs during this journey was one small barley, cake a day: this they divided into eight portions, and the one they gave the stranger was always twice as large as their own.

Of the misfortunes attending M. de St. Germain, Volney has given a very interesting relation. The caravan he accompanied was composed of English officers and passengers, who had landed from two vessels at Suez, in their way to Europe by Cairo. The Bedouins of Tor, hearing that the travellers were richly laden, resolved to plunder them, and accomplished their purpose about five leagues from Suez. The Europeans, stripped entirely naked, and dispersed by fear, separated into two parties; some returning to Suez, and the remainder pushing forward into the desert, in hopes of reaching Cairo, till hunger, thirst, and extreme fatigue, destroyed them one after another. M. de St. Germain alone survived these accumulated horrors. During three days and two nights he wandered over the bare sands, frozen at night by the bleak north wind, and burnt by the sun during the day, without any other shade but a single bush of thorns, or any other drink but his own urine. On the third day he perceived the water of Berket el Habj, and strove to make toward it; but he had already fallen three times from weakness, when a charitable Arab took him up, carried him to his dwelling, and attended him for three days with unremitting kindness. At the expiration of that time he was conveyed to Cairo, where he arrived in a most deplorable condition, but, through great care and attention, he was eventually restored to health.

An excessive love of liberty induces the Bedouins to prefer a dreary wilderness, where they can live independent, to the fertile plains of Egypt, where they must live under the dominion of foreign masters. The Turkish government has repeatedly offered them lands, which they have constantly refused; and this independent spirit seems to have been inviolably preserved from the time of Ishmael, their progenitor. Sometimes humbled, but never enslaved, they have braved almost every power of the earth, and spurned the fetters in which other nations have alternately been bound.

Except the Copts and Arabs, the Mograbians, or western Mahometans, are the most numerous inhabitants of Egypt: they devote themselves some to trade, and some to arms. Those who become soldiers are, for the most part, adventurers guilty of crimes, and banished from

their country by the dread of avenging justice: these frequently abandon themselves to every excess, and invariably sell their services to that hey who is the highest bidder.

The number of real Turks in this country is not very considerable, exclusive of the Janissaries and Assabs, who frequently pillage both the natives and foreigners, and employ every means to amass riches. Like the Mograbians, they are ill disciplined, and utterly incapable of opposing the military science of Europeans.

The Jews, Greeks, and Syrian Christians, who reside in Egypt, addit themselves principally to commerce, exchange, and mechanic arts. Sometimes their ductile cunning promotes them to be commissioners of the customs, and receivers of the revenue; and in that case they generally employ their power to oppress European merchants, invent new exactions, and shackle their commerce.

Life, in the capital of Egypt, is rather passive than active. Nine months in the year the body is oppressed by excessive heat, and the mind, in a state of apathy, sighs after calm tranquillity. Effeminate indolence is born with the Egyptian, grows with his growth, and descends with him to the grave, after having influenced all his inclinations, and governed all his actions.

The Egyptian rises with the sun, to enjoy the morning air; he purifies himself, and performs his appointed devotion; after which his pipe and coffee are brought in, and he reclines at his ease on a sofa. Slaves, with their arms crossed, remain silent at the farther end of the apartment, with their eyes fixed on him, in order to anticipate his wants. His children, standing in his presence, unless he permits them to be seated, preserve every appearance of tenderness and respect, till he gravely gives them his blessing, and sends them back to the harem. Breakfast ended, he transacts the business of his trade or office; and, as to disputes, they seldom arise in the transactions of these concerns; for here the name of attorney is unknown, and every man is his own pleader.

When visitors come, they are received without many compliments, but in a friendly manner. His equals are seated, cross-legged, beside him; persons of distinction are placed on a raised sofa; and inferiors sit upon their hams. When every person has taken his place, the slaves bring in pipes and coffee, set a perfume-brasier in the middle of the chamber, and afterwards present sweetmeats and sherbet.

About noon the table is prepared, and the viands brought in a large tray of tinned copper; and though in no great variety, yet always in great plenty. In the centre is a mountain of rice, cooked with poultry, and highly seasoned with spice and saffron. Round this are placed hashed meats, pigeons, stuffed cucumbers, and a variety of fruits. The roast meats are cut small, laid over with the fat of the animal, and seasoned with salt. The guests

seat themselves on a carpet round the table; and a slave brings water in one hand, and a basin in the other, to wash. This is an indispensable custom where each person puts his hand in the dish, and where the use of forks is unknown.

When the visit is almost ended, a slave, bearing a plate of burning essences, goes round to the company, and each, in turn, perfumes his beard, and sprinkles rose-water on his head and hands. Thus the ancient custom of perfuming the head and beard, as sung by the Royal Psalmist, "Like the precious ointment upon the head, that ran down upon the beard," is still continued.

After dinner, the Egyptians retire to the harem, where they repose for some hours amidst their wives and children: but the poor, who have neither sofa nor harem, lie down on the mat on which they have dined. In the evening, it is customary to go on the water, or breathe the fresh air on the banks of the Nile, beneath the umbrage of the orange and sycamore-trees. An hour after sun-set, supper is served up, consisting of rice, poultry, vegetables, and fruits, which are equally grateful and salutary during the heat of summer.

Such is the ordinary life of the Egyptians. Public shows, plays, and interludes, are to them unknown; for a monotony, which to an European would be death, is delightful to an Egyptian. Their days are passed in repeating the same thing, and in following the same customs, without a wish or thought beyond. The lower class of people, however, are very fond of attending to the tales and tricks of pretended conjurors.

Among many other diversions, by which the jugglers delude the common people out of their money, is that of leading about dancing camels. These animals are taught to dance, when young, by being brought upon a heated floor, which gives them great pain, and causes them to lift up their legs, as if they were dancing, while a person keeps beating on a drum. This practice is continued for about half a year, after which time, when the camel hears the noise of a drum, he strikes into a dance. The fortune-tellers have, likewise, the art of training up little birds, which, when any person applies to them to have his fortune told, bring him a slip of paper, on which his future destiny is written.

Egypt, as well as Italy, has her improvisatore, called *almal*, or learned, which title they obtain by being better educated than other women; for, to be admitted into this class, it is necessary to possess a fine voice, eloquence, the rules of grammar, and sufficient abilities to compose and sing extempore verses, adapted to any occasion. These *almal* know all new songs by rote; and their memory is stored with the most popular and interesting tales. At festivals they are generally placed in a raised orchestra, where they sing during the banquet, and afterwards amuse

33. VOL. I.

the company with dances, in which they display astonishing suppleness of body and flexibility of features; but their most admired attitudes are equally inconsistent with the female character, and dishonourable to the people by whom they are employed.

These *almal* are frequently introduced into the harems, where they teach the women new airs, recount amorous tales, and instruct them in lascivious dances. It must be observed, however, that they speak their language with purity, have a graceful method of recital, and, habitually addicting themselves to poetry, learn the most winning and sonorous modes of expression. Some of their airs are light and gay; but their excellence appears principally in the pathetic. When they rehearse a tale, in the manner of the ancient tragic ballad, by dwelling upon plaintive tones, they inspire melancholy, which insensibly augments till the auditors burst into tears.

The *almal* are generally present at marriage-ceremonies, and precede the bride, playing on musical instruments. They also accompany funerals, at which they sing solemn dirges, utter groans and lamentations, and imitate every mark of extreme despair. Their charges, however, are very high; and, therefore, they seldom attend any but persons of high rank or known opulence. The common people, indeed, have their *almal*, who are a second order of these women, imitators of the first; but they have neither their elegance, gracefulness, nor knowledge.

The Egyptians never mention their wives in conversation; or, if obliged to speak of them, they say, "the mother of such a person, the mistress of the house, &c." Good manners will not permit a visitor to ask, "How does your wife do, sir?" but, in imitation of their reserve, it is necessary to say, "How does the mother of such a person do?" And even this is deemed an insult, unless asked by a relation or an intimate friend. Subject to the immutable laws by which custom governs the East, the women do not associate with men, not even at table. When a grandee intends to dine with one of his wives, she is previously informed, in order that she may perfume her apartment with precious essences, procure the most delicate viands, and receive her lord with every possible mark of attention and respect. Even among the common people, the women usually stand in one corner of the room, while the husband dines, hold basins for him to wash, and serve him at table. "I once dined," says M. Savary, "with an Italian, who had married an Egyptian woman, and having lived there long, assumed the habits of the natives. His wife and sister-in-law stood in my presence; and it was with difficulty I prevailed on them to sit at table with us, where they were extremely timid and disconcerted."

The Egyptian ladies have much leisure, which they spend among their slaves, making veils, embroidering sashes, tracing designs to decorate their sofas, &c. Cheer-

ful and passionate songs are likewise accompanied by the slaves with the tambour de basque and castanets; and, at the close of the day, an elegant repast is prepared, in which the most exquisite fruits and perfumes are served up with profusion.

Once or twice a week, these women are permitted to go to the bath, or to visit their female friends. To bewail the dead is, likewise, a duty they are allowed to perform; and many of them may be sometimes seen in the environs of Cairo, reciting funeral-hymns over the tombs, which they have previously strewed with odoriferous plants and flowers. They receive each others visits very affectionately: when a lady enters the harem, the mistress rises, presses the visitor's hand to her bosom, kisses her, and makes her sit down by her side; while a slave waits to take her veil, black mantle, &c. Coffee, sherbet, and confectionary, are then served up: a large dish of oranges, pomegranates, bananas, and melons, is placed on the sofa; perfumed water is brought in a silver basin to wash the hands; and glee and good-humour season the repast. At parting, they mutually repeat, "God keep you in health. Heaven preserve your children, the delight and glory of your family," &c.

While a visitor is in the house, the husband must not presume to enter: it is the asylum of hospitality, and cannot be violated without fatal consequences: indeed, the Egyptian women carefully maintain this privilege, as being deeply interested in its preservation; for a lover, disguised in female habiliments, may be introduced into the forbidden place; and it is necessary he should remain undiscovered, to elude the most tragical punishment.

Attended by their eunuchs, the Turkish women sometimes go upon the water, and enjoy the charming prospects of the banks of the Nile. Their boats are handsomely painted, and may be easily known by the blinds over the windows, and the music by which they are accompanied.

It is generally allowed, that facts are better than arguments to show the manners of a people; we shall, therefore, present our readers with the following interesting love-adventure, which happened when M. Savary was at Rosetta.

Hassan, an old jealous Turk, had married a Georgian girl of sixteen, and appointed guards to watch over his new treasure. This wealthy lord had a magnificent garden in the vicinity of Rosetta, whither he permitted the youthful Jemily to go and take the evening air. Slaves of both sexes, however, always attended her; the men to watch the walls, and stand sentinel at the gates; the women to wait within, while their beautiful mistress languidly strayed among the odoriferous bowers. As she was gravely walking, one evening, by the river-side, veiled and surrounded by her slaves, she perceived an European, who had lately arrived at Rosetta: the bloom of youth was

vivid on his cheeks, and instantly excited her attention. She passed slowly, and let her fan fall, that she might have a pretence to stop a moment. The foreigner's eyes met her's, and the look went to her heart: his air, shape, and features, were indelibly imprinted on her mind; and the dread of seeing him no more gave her a painful sense of slavery. Scarcely had she entered her garden, before she took a confidential attendant aside, and said, "Didst thou perceive the young stranger? Didst thou behold his bright eyes, and how he looked upon me? O, my friend, my dear Zetfa! go find him, and tell him to walk among the orange-groves, to-morrow evening, where the wall is lowest. Say, I wish to see and speak to him, only bid him shun the watchful eyes of my pitiless keepers."

This message was punctually delivered, and the European unguardedly promised; but the contemplation of approaching danger made him break his word. The slave went a second time, and demanded why he had not kept the assignation: his excuses were various, and he fixed a more distant time; but reflection again vanquished passion, and he went not to the garden. Zetfa returned once more, and the youth, seduced by her discourse, swore that on the morrow he would be under the arbour an hour after sun-set. The hour of appointment came, and a third time the beautiful Jemily saw herself deceived. Zetfa returned to the European, and reproached him so severely for his ingratitude, that the imprudent youth once more promised; but, left to himself, the dread of an ignominious death made him again violate his engagement. Patience itself has a period: that of Jemily was long; for nine months she solicited a man whom she had seen but an instant. One evening, after shedding tears of bitterness, forgetting herself in the grove, and thinking only of the object of her love, Hassan treated her harshly on her return. The charm was now broken, and she retired furious to her apartment. "Go once more," said she, "to the perfidious European, and bear him these my last words:—I saw you, stranger; I thought you had sensibility, and my heart panted to be yours. Nine months you have deceived me: perjury to you is sport. But beware: your life is in my hands, and I am determined. Hassan will go to-morrow to Faoua, and will not return till late. Either come in the evening and receive your pardon, or a slave shall bring me your head. Jemily swears by the prophet, if longer neglected, to be revenged."

Zetfa faithfully reported this message, and the European hesitated no longer. At the appointed time he came to the wall which separated him from the beautiful Georgian, and, with a palpitating heart, leaped into the garden. Two women, on seeing him, rose and appeared terrified, while he stood motionless. The one was Jemily herself, who held out her hand, and gave him courage

Bitterness, forgetting only of the object of on her return. The hired furious to her she, "to the perils of my last words:—I sensibility, and my care: your life is in the man will go to-morrow. Either come to-morrow, or a slave shall be by the prophet, if

age, and the Egyptian appointed time he came from the beauteous girl, leaped into the rose and appeared. The one was Jenily gave him courage.

He approached, bowed profoundly, and was kindly raised: a signal was given, and the slave disappeared. "Stranger," said Jenily, "why have you deceived me so long? You love me not."—"Forgive me, benutrous Jenily," replied the European; "it was my fear that detained me; but I am now come to repair my wrongs, and throw myself at your feet." She seemed inclined to continue her reproaches; but, taking him by the hand, which trembled in her own, she led him to an orange-grove. This single story is sufficient to show the absurdity of attempting to confine the body where the mind is vitiated, or of imposing shackles on a human creature, whose spirit revolts against the tyranny of her jealous lord. Virtue is the only true guardian of female honour, and mutual confidence is indispensably necessary to conjugal felicity.

With respect to marriages in Egypt, they are, as in most oriental countries, negotiated by female relations, who meet most of the maidens of the city at the public baths, and are thereby enabled to describe them with tolerable accuracy. When a choice is made, the alliance is proposed to the father of the young woman, the portion is agreed on, and presents are interchanged. The procession, which is the commencement of the marriage-ceremony, usually begins in the evening: dancers precede the bride, with their feet fastened to stilts, and carrying balancing poles; numerous slaves display the effects, furniture, and jewels, destined for her use; troops of dancing girls keep time with their instruments; matrons, richly clothed, walk with a grave pace; and the young bride appears under a magnificent canopy, borne by four slaves, supported by her mother and sisters, and covered with a veil, embroidered with gold, pearls, and diamonds. A long file of flambeaux illumine the procession; and the almai, in chorus, occasionally sing verses in praise of the bride and bridegroom.

When arrived at the house of the husband, the women go on the first floor, whence they perceive, through the blinds of a gallery, all that passes below. The men, who are assembled in the hall, do not mix with them, but pass part of the night in banquetting and hearing music. During the ceremony, the bride passes several times before the bridegroom, and always in different dresses, to display her wealth and elegance. The guests having retired, the husband enters the nuptial-chamber, and for the first time beholds the face of the woman to whom he has united himself.

Such are the ceremonies of marriage among the Egyptians, which persons of fortune scrupulously observe. The daughter of a mechanic is, in like manner, conducted to her spouse, the only difference consisting in the surrounding paraphernalia. Instead of flambeaux, they burn fir in braziers, carried on poles; and stilt-dancers and tambours de basque supply the want of almai and musicians. The

poor man's daughter, destitute of attendants and canopies, borrows a handsome veil, and walks in procession to the sound of cymbals, which her followers strike without producing much harmony.

Almost the same ceremonies are observed by the Copts; but they have a custom of betrothing female children only six or seven years old, which is done by putting a ring on the finger; and they often obtain permission to educate such girls till they are of age to consummate the marriage. These schismatic Christians, however, can have but one wife at a time.

The first care of the Egyptian ladies is the education of their children: and a numerous posterity is universally considered as the most important blessing. This is even the prayer of the poor, who earn his bread by the sweat of his brow; and did not adoption alleviate grief when nature proves unkind, a barren woman would be utterly inconsolable. The mother daily suckles her infant, whose innocent smiles and engaging manners fully recompense all the pains and cares it may have created. Milk-diseases, and those maladies which dry up the juices of those young persons who send their offspring to be nurtured by a stranger, are here unknown; for Mahomet has left a positive injunction to this effect:—"Let a mother suckle her children full two years, if the child does not quit the breast; but she shall be permitted to wean it with the consent of her husband." When obliged, by some particular circumstances, to take a nurse, the Egyptians do not treat her as a stranger; on the contrary, she becomes one of the family, and passes her days amidst the children she has suckled, by whom she is cherished and honoured as a second mother.

History places the infancy of human nature in the East: here paternal authority commenced, and here its rights are still preserved. Each family forms a little state, of which the father is sovereign, and the members of it, attached to him by the strong ties of consanguinity, acknowledge and submit to his power. The children are educated in the harem, under the immediate inspection of their mothers and are not permitted to come into the hall, especially when strangers are there. Young people are silent in this hall; if men grown, they are allowed to join in conversation, but when the head of the family speaks, they cease, and attentively listen; if he enter an assembly, all rise, and, in short, upon every occasion, they show him the most profound respect. A numerous posterity frequently resides under the same roof: the children and grand-children come and pay their common father a daily tribute of veneration: the pleasure of being loved and respected, in proportion as age increases, makes him forget he grows old; the content of his heart sparkles in his eyes, and security smooths the wrinkles of his forehead. He is cheerful and jocular; and, while his youthful descendants wear the

most modest garments, he is decked in the gayest colours. Happy in the bosom of his family, when on the borders of the grave, he perceives not the approach of death, and sinks to rest amidst the embraces of his children. Long do they mourn his loss, and each week decorate his tomb with flowers. The Egyptians have lost the art of embalming, but not the feelings which gave it birth.

"Among polished nations," says our author, "the silver-haired sire is often obliged to be silent in the presence of haughty youth, or to assume the manners of a boy, in order to become supportable. In proportion as the burden of life is felt, and its pleasures diminish, he finds himself an incumbrance to those who, but for him, had never been. They refuse him consolation when he needs it most; and the cold hand of age withers his faculties, which the kindly flame of filial love warms not. I was impelled to draw this parallel by the affecting scenes I constantly witnessed in Egypt, where the reverend patriarch, with his beard floating on his breast, smiles in frigid age on his grand-children, who approach him with their caresses. He beholds four generations, all eager to pay him filial duty: his heart expands, and he delights in life to its last moment. These people have, in ignorance, preserved the simplicity of ancient manners: they know not our arts and sciences, but the sweetest sensations of nature they know, enjoy, and revere."

Among the various diseases incident to the human frame, those of the eyes are peculiar to Egypt, where the blind are very numerous; and in the city of Cairo almost every one wears a fillet, a token of an approaching or convalescent ophthalmia. This affliction must not, however, be attributed to the reflected beams of a burning sun; for the Arabs, who live amidst the most arid sands, have generally good eyes and a piercing sight; nor must we suppose that the disease is occasioned by the exhalations of stagnant waters; for, in that case, the French merchants would be all blind; whereas, for upwards of fifty years, not one has lost his sight. The true origin of this disorder seems to have been the Egyptian custom of sleeping in the open air, during summer, on the terraces of their houses, or near their huts. It has also been remarked, that the sea-air contributes very much to injure the organs of sight in this misty atmosphere.

The usual diet of the Egyptians appears, likewise, to be a powerful cause. The cheese, sour milk, honey, confection of grapes, green fruits, and raw vegetables, which constitute the ordinary food of the people, produce a disorder, which physicians have observed to affect the sight. Bodies, thus nourished, abound in corrupted humours, which are constantly seeking a discharge. Diverted from the ordinary channels by habitual perspiration, they fly to the exterior parts, and naturally attack the head, because the Egyptians, by shaving every week, and wearing a very hot head-dress, principally attract the perspiration thither; and

if the head receive even the slightest impression of cold, being uncovered, this perspiration is suppressed, and falls upon the teeth, or still more readily upon the eyes, as being the tenderest part.

Blindness is frequently occasioned by the consequences of the small-pox. This disorder, which is very common in Egypt, is not properly treated: during the three first days, confection of grapes, honey, and sugar, are administered to the patient, and, after the seventh day, he is allowed milk, meat, and even salt-fish, as if he were in perfect health. Inoculation is not unknown to the Egyptians, but it is seldom practised. When they think proper to adopt it, the operation is performed by inserting a thread into the flesh, or by making the patient swallow the powder of some dried pustules.

Several modern authors have asserted that the pestilence is native in Egypt; but M. Saviry was assured by some foreign physicians, who had resided there above twenty years, that this disease was brought thither from Turkey. "A proof," says our author, "that it is not native in Egypt is, that, except in time of great famine, it never breaks out in the inland towns, but always begins at sea-ports, on the arrival of Turkish vessels, and travels to the capital; whence it proceeds as far as Syene. Having come to a period in Grand Cairo, and being again introduced by the people of Upper Egypt, it renews, with augmented fury, and sometimes sweeps off two or three hundred thousand individuals. It always stops, however, in the month of June; and those who catch it at that time may be easily cured. It is also worthy of remark, that excess of heat and cold are equally destructive of this dreadful contagion; winter kills it in Constantinople, and summer in Egypt. It seldom reaches the polar circle, and never passes the tropic. The caravans of Cairo, Damascus, and Ispahan, which are sometimes infected, never propagate it at Mecca; and Yemen is always secure from its baleful influence.

Europeans stand aghast with terror at the calamities which this dreadful distemper produces in Grand Cairo. According to the commissioners of the customs, this city contains nearly nine hundred thousand inhabitants. The streets are very narrow, and always full of people, who crowd and jostle so violently against each other, that a passenger is sometimes obliged to wait several minutes before he can make his way. In such a situation, one person may communicate the plague to a hundred: for its progress is as rapid as that of a conflagration augmented by the wind.

When the disease first breaks out, the French merchants shut up their district, and cut off all communication with the city; Arab servants, who live without, bring them a daily supply of such provisions as they want, and, except bread, which does not communicate the infection, the

the French merchants communication with without, bring them a they want, and, except the infection, the

throw every article, through a hole cut in each door, into a tub of clean water, by which means it is purified, and may be eaten without fear. With these precautions the French enjoy perfect health, while surrounded by all the horrors of death; yet nothing can induce the Turks to adopt similar measures; nor is quarantine performed at a single port throughout the Ottoman empire.

Some traces of the precautions taken by the ancient Egyptians, with respect to the burial of the dead, are still visible in the modern practice. Though the curious art of embalming is entirely forgotten, yet the care with which they arrange the bodies of their deceased relations may be considered as the shadow of that obsolete practice. Immediately after the death of an Egyptian, the body is carefully washed, the beard shaven, and every aperture closely stuffed with cotton. It is then sprinkled with odoriferous waters, and the perfumes of Arabia are admitted into all the pores. After these attentions of respect and cleanliness, it is placed in a coffin, covered with cloth, the colour of which is optional, and carried, with the head foremost, to the tomb, preceded by priests, who recite various passages of the Koran, and female mourners, who are hired to utter the most loud and dismal exclamations of grief. A small stone-pillar, crowned with a turban, is generally erected on the spot where the head of the corpse reposes: and, on Fridays, the women repair to these pillars, to renew their lamentations.

The cemeteries in this country are placed beyond the limits of any habitation. They are large solitary enclosures, well adapted for the reception of visitors, who are led thither by motives of fond regret, or pious affection. The bodies are covered with a thick layer of earth, which preserves them from derangement.

*History.*] The princes of the line of the Pharaohs are supposed to have reigned in Egypt, in an uninterrupted succession, till Cambyzes II., king of Persia, conquered the Egyptians, five hundred and twenty years before the birth of Christ; and, it is conjectured that, in the reign of these princes the pyramids were raised. Egypt continued a part of the Persian empire till Alexander the Great vanquished Darius, when it fell under the dominion of that prince, who soon after built the celebrated city of Alexandria. The conquests of Alexander, who died in the prime of life, being seized upon by his generals, the province of Egypt fell to the share of Ptolemy, by some supposed to have been a half-brother of Alexander, when it again became an independent kingdom, about three hundred years before Christ. His successors, who sometimes extended their dominion over great part of Syria, ever after retained the name of Ptolemies, and in that line Egypt continued between two and three hundred years, till the famous Cleopatra, the wife and sister of Ptolemy Dionysius, the last king, ascended the throne.

33. VOL. I.

After the death of Cleopatra, who had been mistress successively to Julius Caesar and Marc Antony, Egypt became a Roman province, and thus remained till the reign of Omar, the second caliph of the successors of Mahomet, who expelled the Romans after it had been in their hands seven hundred years. The famous library of Alexandria, said to have contained seven hundred thousand volumes, was collected by Ptolemy Philadelphus, son of the first Ptolemy; and the same prince caused the Old Testament to be translated into Greek, which translation is known by the name of the Septuagint.

About the time of the crusades, between the years 1153 and 1193, Egypt was governed by Nouradin, whose son, the famous Saladin, proved so formidable to the Christian adventurers, and retook from them Jerusalem. He instituted the military corps of Mamelukes, who, about the year 1242, advanced one of their own officers to the throne, and ever after chose their prince out of their own body. Egypt for some time flourished under these illustrious usurpers, and made a noble stand against the prevailing power of the Turks till the time of Selim, who, about the year 1517, after giving the Mamelukes several bloody defeats, reduced Egypt to its present state of subjection.

While Selim was settling the government of Egypt, great numbers of the ancient inhabitants withdrew into the deserts and plains, under one Zinganous, from whence they attacked the cities and villages of the Nile, and plundered whatever fell in their way. Selim and his officers, perceiving that it would be very difficult to extirpate these marauders, left them at liberty to quit the country, which they did in great numbers, and their posterity is known all over Europe and Asia by the name of Gypsies.

An attempt was made, a few years since, to deprive the Ottoman Porte of its authority over Egypt, by Ali Bey, whose father was a priest of the Greek church. Ali, having turned Mahometan, and being a man of abilities and address, rendered himself extremely popular in Egypt. A false accusation having been made against him to the Grand Signior, his head was ordered to be sent to Constantinople; but, being apprised of the design, he seized and put to death the messengers who brought this order, and soon found means to put himself at the head of an army. Being also assisted by the dangerous situation to which the Turkish empire was reduced, in consequence of the war with Russia, he boldly mounted the throne of the ancient Sultans of Egypt. But, not content with the kingdom of Egypt, he laid claim to Syria, Palestine, and that part of Arabia which had belonged to the ancient sultans. He marched at the head of his troops to support these pretensions, and actually subdued some of the neighbouring provinces, both of Arabia and Syria. At the same time that he was engaged in these great enterprises, he was

not less attentive to the establishing of a regular form of government, and the introducing of order into a country that had been long the seat of anarchy and confusion. His views were equally extended to commerce; for which purpose he gave great encouragement to the Christian traders, and took off some shameful restraints and indignities to which they were subjected in that barbarous country. He also wrote a letter to the republic of Venice, with the greatest assurance of his friendship, and that their merchants should meet with the utmost protection and safety. His great design was said to be, to make himself master of the Red Sea; to open the port of Suez to all nations, but particularly to the Europeans; and to make Egypt once more the great centre of commerce. The conduct and views of Ali Bey shewed an extent of thought and ability that indicated nothing of the barbarian, and bespoke a mind equal to the founding of an empire. He assumed the titles and state of the ancient sultans of Egypt, and was ably supported by Sheik Daher, and some other Arabian princes, who warmly espoused his interests. He also succeeded in almost all his enterprises against the neighbouring Asiatic governors and bashaws, whom he repeatedly defeated; but he was afterwards deprived of the kingdom of Egypt by the base and ungrateful conduct of his brother-in-law, Mahomet Bey Abudahab; his troops being totally defeated on the 7th of March, 1773. He was also himself wounded and taken prisoner; and, dying of his wounds, was buried honourably at Grand Cairo. Abudahab afterwards governed Egypt, as Sheik Bellet, and marched into Palestine to subdue Sheik Daher. After behaving with great cruelty to the inhabitants of the places he took, he was found dead one morning in Acre, supposed to be strangled. Sheik Daher accepted the Porte's full amnesty, and, trusting to their assurances, embraced the Captain Pacha's invitation to dine on board his ship; when the captain produced his orders, and the brave Daher, Ali Bey's ally, had his head cut off, in the eighty-fifth year of his age.

A civil war now commenced between the adherents of Ali and other beys or princes who rose on his ruins. Of these the principal were Murad and Ibrahim, who, having driven their enemies into banishment, began to quarrel among themselves; till, at length, after having expelled each other from Cairo, they agreed to a kind of compromise, in March 1785.

From this time nothing of importance occurred till the invasion of Egypt by the French, in 1798, when Bonaparte arrived at Alexandria on the 1st of July, having escaped the British squadron, which was sent in pursuit of him, under the command of Admiral Lord Nelson. His good fortune appeared to attend him in his first attempts. The city of Alexandria was taken by assault, on the night of the 5th; and, on the 21st, the French army appeared

before Cairo, which was defended by Murad Bey, with a considerable body of the Mamelukes; but, on the 21st, it was attacked and carried. The beys attempted to rally, and collected a formidable force in the vicinity of Cairo; but the battle of the Pyramids, which was fought on the 26th, rendered the French masters of the greater part of the country.

The conquest of Egypt now appeared to be completed; but, on the 1st of August, 1798, the expedition received a terrible blow in the defeat and destruction of the fleet by Admiral Lord Nelson. The French land-forces, however, remained in possession of Egypt; and, to secure his conquests, Bonaparte advanced into Syria, where, after gaining some advantages, he received a decisive check before St. John d'Acre. The English squadron, under Sir Sydney Smith, intercepted a flotilla, which was bringing Bonaparte's battering artillery and ammunition from Egypt; and Sir Sydney acting in concert with the Turks, the French general was completely repulsed in every assault, and obliged to raise the siege, and retreat back to Egypt with the shattered remains of his army. From Egypt Bonaparte soon after took an opportunity to make his escape to France; and General Kleber, who was left at the head of the army, concluded a treaty with the Grand Vizier, who had been sent against him with a powerful army; by which the French troops were to be permitted to evacuate Egypt without molestation. But the British government having, at the same time, sent orders to the English admirals in the Mediterranean to prevent the return of the French to Europe, General Kleber, having received notice of these orders, immediately attacked the Turks, and defeated them with great slaughter. Kleber was some time after assassinated, and Menou took the command of the French.

In the latter end of the year 1800, a strong force was sent out by the British government, to expel the French from Egypt. Admiral Keith commanded the fleet, and that gallant and experienced officer, Sir Ralph Abercrombie, the land-forces. After many unexpected delays the fleet arrived off Alexandria on the 1st of March, 1801. The troops made good their landing on the 7th and 8th of that month, and on the 13th gained a victory over the French, though with the loss of above two thousand men killed, wounded, and missing. On the 21st, a more decisive battle was fought, which ended in a complete victory on the part of the English, who, however, suffered a loss much to be lamented, in the death of the brave general Abercrombie, who was mortally wounded in this action, and died on the 28th. General Moore was also dangerously wounded. On the part of the enemy, the French general Roize was left dead on the field, and generals Lanusse and Rodet afterwards died of their wounds. mbie, general (now

lord) Hutchinson took the chief command of the British forces. The town and castle of Rosetta were taken by a division of the English army, under Colonel Spencer, aided by a body of the Turks; and early in May a force was detached to reduce Cairo. The French were defeated at Rhamanieh by the Turks, assisted by the British; and, about the middle of June, the city of Cairo was invested on every side by the English forces and those of the Grand Vizier. On the 22d of that month, the garrison of Cairo sent a flag of truce to the English general, and, after a negotiation of several days, a convention was agreed to, by which the French army at Cairo and its dependencies were to be conveyed in ships of the allied powers, and at their expense, together with their baggage, arms, ammunition, and effects, to the nearest French ports in the Mediterranean. The complete conquest of Egypt soon

followed, by General Menou accepting the conditions of the convention of Cairo, for himself and the army under his command.

After the evacuation of Egypt by the French, the English endeavoured to effect a reconciliation between the Mamelukes and the Turks, to restore the former government of the country; but the Turks treacherously assassinating a number of the beys, the remainder fled into Upper Egypt; and the Porte, being unable to subdue them, at length concluded a treaty with them, by which they yielded to them possession of that part of the country. In consequence, however, of the mutinies and intestine contentions among the Turkish troops, the Mamelukes again returned into Lower Egypt, and the country became a scene of confusion and anarchy, alternately ravaged by the different contending parties.

## CHAPTER II.

### STATES OF BARBARY.

UNDER this head are comprised the countries of Morocco and Fez, Algiers, Tunis, and Tripoli, the latter of which includes Barca.

*Extent, Boundaries, &c.]* The empire of Morocco, comprising Fez, is about five hundred miles in length, and four hundred and eighty in breadth, being bounded, on the north and west, by the Mediterranean; on the south, by Tafilet; and, on the east, by Algiers and Segelmissa.

ALGIER extends along the coast of the Mediterranean, about four hundred and eighty miles in length, and between forty and one hundred in breadth. Its boundaries are the Mediterranean on the north, Tunis on the east, Mount Atlas on the south, and Morocco on the west.

TUNIS is about two hundred and twenty miles in length, from north to south, and nearly one hundred and seventy in breadth, from east to west; being bounded by the Mediterranean on the north and east, by Algiers on the west, and by Tripoli and part of Biledulgerid on the south.

TRIPOLI, including Barca, is bounded on the north by the Mediterranean Sea; on the south, by the country of the Berberes; on the west, by the kingdom of Tunis, Biledulgerid, and the territory of the Gadamis; and on the east, by Egypt; extending about eleven hundred miles along the sea-coast: and the breadth is from one to three hundred miles.

Each capital bears the name of the state or kingdom to which it belongs.

The Barbary states form a great political confederacy, however independent each may be as to the existence of its internal polity; nor is there a greater difference than happens in different provinces of the same kingdom, in the customs and manners of the inhabitants.

*Climate, Soil, and Produce.]* The air of Morocco is mild, as is that of Algiers, and indeed all the other states, except in the months of July and August. These states, under the Roman empire, were justly denominated the garden of the world; and to have a residence there was considered as the highest state of luxury. The produce of their soil formed those magazines which furnished all Italy, and great part of the Roman empire, with corn, wine, and oil. Though the lands are now uncultivated, through the oppression and barbarity of their government, yet they are still fertile; not only in the above-mentioned commodities, but in dates, figs, raisins, almonds, apples, pears, cherries, plums, citrons, lemons, oranges, pomegranates, and plenty of esculent roots and herbs in the kitchen gardens. Excellent hemp and flax grow on their plains; and, by the report of the Europeans who have lived there for some time, the country abounds with all that can add to the pleasures of life; for the great people find means to evade the sobriety prescribed by the Mahometan law, and make free with excellent wines and spirits, of their own growth and manufacture. Algiers produces saltpetre, and great quantities of excellent salt: and lead and iron have been found in several places of Barbary.

*Animals.*] Neither the elephant nor the rhinoceros are to be found in the states of Barbary; but the deserts abound with lions, tigers, leopards, hyenas, and monstrous serpents. The Barbary horses were formerly very valuable, and thought equal to the Arabian. Though the breed is now said to have degenerated, yet some very fine ones are occasionally imported into England. Dromedaries, asses, mules, and kumrahs, a most serviceable creature, between an ass and a cow, are their beasts of burden.

But from the services of the camel they derive the greatest advantages. This useful quadruped enables the African to perform his long and toilsome journeys across the continent. He seems to have been created for this very purpose, endued with parts and qualities adapted to the office he is employed to discharge. The driest thistle, and the barest thorn, is all the food this useful animal requires; and even these, to save time, he eats while advancing on his journey, without occasioning a moment of delay. As it is his lot to cross immense deserts, where no water is found, and countries not even moistened by the dew of heaven, he is endued with the power, at one watering-place, to lay in a store with which he supplies himself for thirty days to come. To contain this enormous quantity of fluid, nature has formed large cisterns within him, from which, once filled, he draws at pleasure the quantity he wants, and pours it into his stomach with the same effect as if he then drew it from a spring; and with this, he travels, patiently and vigorously, all day long, carrying a prodigious load upon him, through countries infected with poisonous winds, and glowing with parching sands.

The cows are but small, and barren of milk. The sheep yield indifferent fleeces, but are very large, as are the goats. Bears, porcupines, foxes, apes, hares, rabbits, ferrets, weasels, moles, chanelions, and all kinds of reptiles, are found here. "Besides vermin," says Dr. Shaw, speaking of his travels through Barbary, "the apprehensions we were under, in some parts at least, of this country, of being bitten or stung by the scorpion, the viper, or the venomous spider, rarely failed to interrupt our repose." Partridges, quails, eagles, hawks, and all kinds of wild fowl, are found on this coast; and of the smaller birds, the capsa-sparrow is remarkable for its beauty, and the sweetness of its note, which is thought to exceed that of any other bird; but it cannot live out of its own climate. The seas and bays of Barbary abound with the finest and most delicious fish.

*Antiquities.*] A great number of curiosities of this kind are scattered about these countries, which were once possessed by the ancient Romans, as may be seen in Dr. Shaw's geographical observations on the kingdoms of Algiers and Tunis. Spatha, the ancient Susetula, is one of the most remarkable places in Barbary, for the extent and magnificence of its ruins; amongst which, at a furlong's distance to the eastward, there is a sumptuous triumphal arch, of the

Corinthian order. From this arch, all along to the city, there is a pavement of large black stones, with a parapet-wall on each side, probably intended to make the entry of the triumph more commodious. At a little distance from the end of this pavement stands a beautiful portico, built in the same manner as the triumphal arch, which leads into a spacious court, where are the ruins of three contiguous temples, whose roofs, porticoes, and fore-fronts, are broken down, but all the other walls, with their proper pediments and entablatures, remain perfect and entire. In each of them there is a niche, which fronts the portico; and behind that, in the middle temple, is a small chamber, which, perhaps, served for a vestry.

At a place called Jemme, in the kingdom of Tunis, there are several antiquities; as altars, with defaced inscriptions; a variety of columns, a great many trunks and arms of marble statues, one of which is of the colossal kind in armour, another a naked Venus, like the Medicean, both without heads, but apparently the workmanship of good masters. What this place is most remarkably distinguished by, are the remains of a spacious amphitheatre, consisting originally of sixty-four arches, and four orders of columns. The upper order, which probably might be no more than an Attic, has suffered materially from the barbarity of the Arabs, and four arches have been entirely blown up by a bey of Tunis, in a revolt of the Arabs, who made use of it as a fortress; otherwise, as to the outside at least, nothing can be more entire and beautiful. The platform of the seats and the galleries are still remaining; and, by comparing this with other ancient structures, it seems to have been built about the time of the Antonines, agreeing exactly in proportion and workmanship with the buildings of that age.

Besides some ancient cisterns and common sewers, there are scarcely any tokens left of the magnificence of Carthage, the rival of Rome. "We meet with no triumphal arch," says our author, "nor sumptuous piece of architecture; no pillars of granite, nor curious entablatures; but the broken walls and structures now remaining are either built in the Gothic manner, or according to that of the later inhabitants. Adjoining to the large public cisterns, indeed, which were near the western wall of the city, we see the ruins of an ancient and celebrated aqueduct, which may be traced to the distance of at least fifty miles. This has been a work of extraordinary labour and expense; and that part of it which runs along the peninsula whereon Carthage was built, appears to have been beautifully faced with hewn stone. At Arriana, a little village two leagues to the northward of Tunis, several arches of this aqueduct are entire, which are about seventy feet high, and the pillars that supported them are sixteen feet square. The channel that conveyed the water lies above these arches, being vaulted over, and plastered with a strong cement. A person of an

This has cost and expense; and that the whole of Carthage fully faced with heavy leagueto the north-aqueduct are entire, and the pillars that support. The channel that arches, being vaulted. A person of an

ordinary size may walk upright in it; and there are holes left at certain distances, both for the admission of fresh air, and the convenience of cleansing it when necessary."

Over the fountains that supplied this aqueduct with water there were temples erected, of which there are still some remains. One of them, which, by its ornaments, appears to have been of the Corinthian order, ends very beautifully in a dome, wherein are three niches, probably intended to receive statues of water-nymphs, or other deities, supposed by the ancients to preside over fountains. The aqueduct, however, appears to be of much greater antiquity than the temple, having probably been a work of the Carthaginians; it being difficult to conceive how Carthage could well subsist without such a convenience.

In the kingdom of Algiers, near a town called Shershell, lie the ruins of a large city, which, according to a tradition in that country, was destroyed by an earthquake. We may conceive a tolerable idea of its former magnificence, from the fine pillars, capitals, spacious cisterns, and beautiful mosaic pavements, that are still remaining. It was supplied with water, brought by a large and sumptuous aqueduct, little inferior to that of Carthage, in the height and strength of its arches; several fragments of which, scattered amongst the neighbouring mountains and valleys, continue to be so many incontestible proofs of the grandeur and beauty of the work. There are two other conduits still subsisting, which furnish Shershell with excellent water from the mountains, and may be considered as two indisputable proofs of ancient magnificence.

Among the ruins of Tlemsan, or Tremesen, are found several shafts of pillars, and other fragments of Roman antiquities; and in the walls of an old mosque are a number of altars, dedicated to the *Dii Manes*, but there is only one legible inscription. Most of the walls of Tlemsan have been moulded in frames, and consist of a mortar made up of sand, lime, and small pebbles, which, by being well tempered and wrought together, is become equal to stone in strength and solidity. The several stages and removes of these frames are still discernible, some of them being a hundred yards long, and about six feet in height and thickness.

At a place called Kasbaite, on the site of an old Roman city, there are many fragments of antiquity; and, amongst the rest, there is part of the portico of a small temple, dedicated, perhaps, to one of the Roman empresses, as may be conjectured from a broken inscription. A little to the southward are several sepulchral monuments, most of which have been beautifully carved into a variety of figures in bass relief, who are represented mourning, offering incense, or performing some office to the dead; and below the figures lie the inscriptions.

Along a range of hills, called Auress, lying to the southward of Constantina, are spread a number of ruins, the

most remarkable of which are those of L'Erba or Tez-zoute, near three leagues in circumference. Here are a great variety of antiquities; for, besides the magnificent remains of several of the city-gates, Dr. Shaw observed the seats and upper part of an amphitheatre; the frontispiece of a fine Ionic temple, dedicated to Esculapius; a large oblong chamber, with a great gate on each side, intended, perhaps, for a triumphal arch; and a little beautiful mausoleum, built in form of a dome, supported by Corinthian pillars. These, and other edifices of the like nature, sufficiently demonstrate the once-flourishing state of this city, which appears to have been the Lambesa of the ancients. Our learned author copied several Roman inscriptions found among these ruins.

About Constantina, the ancient Cirta, there are many remains of antiquity, particularly on a neck of land to the south-west, which is entirely covered with broken walls, cisterns, and other ruins. Besides these, there are still remaining, near the centre of the city, a set of cisterns, about twenty in number, making an area of fifty yards square, which probably received the water brought to them by an aqueduct, the fragments of which demonstrate the public spirit of the people of Cirta in erecting a structure that must have required an immense quantity of materials.

Upon the edge of a precipice, to the northward, are the remains of a stately edifice, at present occupied by a Turkish garrison. Four bases of pillars, seven feet in diameter, with their respective pedestals, are still in their places, and seem to have belonged to the portico. They are of a black stone, little inferior to marble, probably hewn out of the range of rocks on which they are founded.

The side-pillars of the principal gate of the city are of a reddish stone, as beautiful as marble, and very neatly moulded and pannelled. An altar of white marble makes part of a neighbouring wall, and on that side which is in view is carved, in relief, a well-shaped simulum, a vessel used by the ancients in their sacrifices. The gate toward the south-east is in the same fashion and design, but much smaller. The bridge appears to have been a master-piece in its kind, having had the gallery and the columns of the arches adorned with cornices, festoons, heads of oxen, and garlands. The key-stones of the arches are also charged with Caducei, and other figures; and between the two principal arches there is a well-executed bass-relief, representing a lady treading upon two elephants, which have their faces turned toward each other, and seem to twist their trunks together. The female figure has a large scollop-shell over her head; appears dressed in a close-bodied garment, like a modern riding-habit; and seems to look scornfully upon the city.

A few miles distant from Tangier, there is a vast hole, like a coal-pit, many fathoms deep, which leads into a great number of subterranean apartments, all lined with marble.

These, from the numerous statues, urns, and old Punic inscriptions, that have been found in them, were undoubtedly repositories for the dead, like the catacombs in Italy and Egypt.

*Cities and Towns.*] Morocco, the capital, is pleasantly situated on an extensive plain, between two rivers, the Nephitis and Agmed, and is watered by a third, named the Tensist. It once contained one hundred thousand houses, and still has twenty-five magnificent gates, and a great number of mosques, palaces, &c.; but its pristine splendour is much decayed. It is situated sixteen miles north of Mount Atlas, in thirty degrees forty minutes north latitude, and seven degrees west longitude. The walls are so strong, both with respect to the stones themselves, and the cement with which they are fastened, that they are impenetrable to the pickaxe, and other instruments. They are flanked with strong towers, bulwarks, bastions, &c. and surrounded with a deep ditch.

The imperial palace stands within a spacious fortress, called Al-Capava, situated on the outside of the city. It is defended by high walls, strong towers, and a deep fosse. The royal apartments, halls of audience, and seraglio, are noble structures, highly embellished, and sumptuously furnished, and the gardens are extensive. The houses, in general, are in an indifferent condition, and many of them gone to decay. The inhabitants are numerous. The Jews, the number of whom is about four thousand, live in a particular quarter of the city; and, though highly taxed, they here, as well as elsewhere, acquire wealth, but artfully pretend to poverty, and, for obvious reasons, make a very mean appearance.

The most modern traveller who has given an account of Morocco is Mr. Lempriere; but no notice is taken in any geographical work of his observations on that part of Africa, though some years have elapsed since he submitted them to the public. Mr. L. was a medical man, and, in his scientific capacity, was called on to visit a favourite sultana, by which he had an opportunity of inspecting the harem, of which he gives the following interesting account.

"The public and usual entrance to the harem is through a very large arched door-way, guarded on the outside by ten body-guards, which leads to a lofty hall, where the captain or alcaide, with a guard of seventeen eunuchs, are posted. No person is admitted into this hall, but those who are known to have business in the harem.

"The emperor's order being delivered on the outside of the door to the alcaide, I was immediately, with my interpreter, conducted into the harem by one of the negro eunuchs. Upon entering the court, into which the women's apartments open, I discovered a motley groupe of concubines, domestics, and negro slaves, who were variously employed. Those of the first description had

formed themselves into circles, seated on the ground in the open court, and were apparently engaged in conversation. The domestics and slaves were partly employed in needle-work, and partly in preparing their coscova. My appearance in the court, however, soon attracted their attention, and a considerable number of them, upon observing me, unacquainted with the means by which I had been admitted into the harem, retreated with the utmost precipitancy into their apartments; while others more courageously approached, and enquired of my black attendant who I was, and by whose orders he had brought me thither.

"The moment it was known that I was of the medical profession, parties of them were detached to inform those who had fled, that I was sent in, by order of the emperor, to attend Lalla Zara, (my intended patient's name,) and requesting of them to come back and look at the Christian. Christian doctor! resounded from one end of the harem to the other; and, in the course of a few minutes, I was completely surrounded by women and children, that I was unable to move a single step.

"Every one of them appeared solicitous to find out some complaint on which she might consult me, and those who had not ingenuity enough to invent one, obliged me to feel their pulse; and were highly displeased if I did not evince my excellence in my profession by the discovery of some ailment or other. All of them seemed so urgent to be attended to at the same time, that while I was feeling the pulse of one, others were behind, pulling my coat, and entreating me to examine their complaints, while a third party were upbraiding me for not paying them the same attention. Their ideas of delicacy did not at all correspond with those of our European ladies, for they exhibited the beauties of their limbs and form with a degree of freedom that in any other country would have been thought indecent; and their conversation was equally unrestrained.

"This apparent laxity of conduct in the Moorish ladies does not proceed from a depravity in principle. As the female sex in this country are not entrusted with the guardianship of their honour, there is no virtue in reserve. A depraved education ever serves to corrupt, instead of restraining them. They are not regarded as rational or moral agents; they are only considered as beings created entirely to be subservient to the pleasure of man. To excite the passions, and to do and say every thing which may inflame a licentious imagination, become, therefore, necessary accomplishments in the female sex, and their manners and conduct naturally assume a cast totally different from those of women in a more refined and more liberal state of society. In those instances to which I refer, they were not conscious of trespassing the bounds of decency; and in others they manifested a singular attention to what they conceived to be decorum. tongues of some of my patients, who complained of feverish symptoms, they refused to comply, considering it as inconsistent with their modesty and virtue: some of them indeed laughed at the singularity of the request, and attributed it either to an impertinent curiosity, or an inclination to impose on their understandings.

"As the number of my patients continued to increase rather than to diminish, there appeared but little prospect of an introduction to the sultana Lalla Zara, whom I was first directed to attend, in any reasonable time. The eunuch, however, wearied out with waiting, exerted all the vigour of authority which his natural effeminacy would admit of, to oblige them to disperse, and which was so far effectual at least, as to allow me room to pass, though this female crowd still followed me, till I had nearly reached the lady's apartment.

"From the first court into which I had been introduced, I passed through two or three similar, till I, at length, arrived at the chamber of my intended patient. I was here detained a little time in the court, till my patient and her apartment were ready to receive me. Upon my entrance, I found the lady sitting cross-legged on a mattress, placed on the floor, and covered with fine linen, with twelve white and negro attendants, seated on the floor also, in different parts of the chamber. A round cushion was placed for me next to the lady, on which I was desired to be seated. I should have remarked, that, contrary to my expectations, I found that none of the emperor's women disguised their faces in the manner which I had experienced in the prince's harem, but I saw them with the same familiarity as if I had been introduced into the house of an European.

"Lalla Zara, who was of Moorish parents, was, about eight years before, remarkable for her beauty and accomplishments; on which account she was then, in every respect, the favourite wife of the late emperor. So dangerous a pre-eminence could not be enjoyed, without exciting the jealousy of those females whose charms were less conspicuous; and who, besides the mortification of having a less share of beauty, experienced also the disgrace of being deserted by their lord.

"Determined to effect her ruin, they contrived to mix some poison in her food, and conducted the detestable plot with so much art and address, that it was not perceived till the deleterious drug had begun its baneful operations. She was seized with most violent spasms, and a continual sickness; and, had she not been possessed of an uncommonly strong constitution, she must immediately have fallen a victim to the machinations of her rivals. After a severe struggle, however, between life and death, the effects of the poison, in some degree, abated; but it left the unhappy lady in a state of dreadful debility and irritation, particularly in the stomach, from which it

was not, perhaps, in the power of medicine to extricate her. Her beauty, too, the fatal cause of her misfortune, was completely destroyed, and her enemies, though disappointed in their aim of destroying her life, yet enjoyed the malignant triumph of seeing those charms, which had excited their uneasiness, reduced below the standard of ordinary women.

"When I saw her, she had such a weakness of digestion, that every species of food which she took, after remaining a few hours on her stomach, was returned perfectly crude and undigested. As she did not receive proper nourishment, her body had wasted away to a shadow, and her frame was in so weak a state as not to allow her to walk without assistance. Her complexion was entirely altered. Her skin, from being naturally clear and fair, as I was informed, was changed to a sickly brown, which, joined to a ruined set of teeth and a ghastly countenance, had effaced every trace of that beauty which she before might have possessed. Upon my first entering her apartment, though, from my profession, accustomed to behold objects of distress and misery, yet I was so forcibly struck with her unhappy situation and wretched appearance, that I was obliged to exert all the fortitude of which I was master, to avoid the discovery of my feelings.

"Lalla Zara was at this time about thirty-six years of age, and, though in so weak a state, had two beautiful young children; the first was in its sixth year, and the youngest, which was then under the care of a wet-nurse, was very little more than a twelvemonth old. I was quite astonished to observe such strong and apparently healthy children the offspring of a mother whose constitution was so dreadfully impaired. It was certainly, however, a very fortunate circumstance for Lalla Zara that she had these children; since, by the Mahometan law, a man cannot divorce his wife, provided she bear him children: so that, though the emperor took very little notice of this poor lady, yet he was, for the above reason, obliged to maintain both herself and her offspring.

"From the wretched situation in which I have described this unfortunate female, it is easy to conceive that her spirits must revive at the most distant prospect of procuring relief in her disagreeable complaint. Such, indeed, was the case. She received me with all that satisfaction which hope, united with some degree of confidence, most naturally inspires.

"Under these circumstances, the predicament in which I felt myself was, I must confess, most truly embarrassing. It was one of those unpleasant situations, in which duty and interest are completely in opposition to each other, or rather where the sympathetic feelings stand opposed to personal safety. Humanity pointed out to me, that it was my duty to relieve her, if possible; on the other hand, self-preservation no less strongly dictated, that it was also

lutely necessary to my safety and happiness to embrace the first opportunity of leaving a country where I existed in the most critical and most disagreeable situation. Both these sentiments for some time pressed equally on my mind, and left me at a loss how to determine. I, at length, however, fixed on a middle plan of conduct, which appeared likely to effect the safety of the lady, without endangering my own. This was, to give a proper course of medicines a fair trial for a fortnight; and then, if the least prospect of amendment should appear in consequence of them, I could leave her more, with such directions as might enable her to use them without medical attendance.

"This plan I conceived it most prudent not to communicate immediately to my patient: I, therefore, without affording her any very flattering hopes of a cure, assured her, that I would practise every means with which I was acquainted for the restoration of her constitution. Contrary to most other Moorish females, I found Lalla Zara in every respect affable and polite; though deprived of her health, she retained her natural vivacity; and, with the ravages of her inveterate malady, she still remained a pleasing and interesting character.

"I was upon the point of taking my leave of Lalla Zara, when a female messenger appeared, to request my attendance upon Lalla Batoom, who, from the priority of her marriage, is called the first wife of the emperor, and is more properly entitled to the denomination of sultana than any of the others.

"The harem forms a part of the palace or seraglio, without any other immediate communication with it than a private door, used only by the emperor himself.

"The apartments, which are all on the ground-floor, are square, very lofty, and four of them enclose a spacious square court, into which they open by means of large folding doors. These, as in other Moorish houses, which, in general, have no windows, serve the purpose of admitting light into the apartments. In the centre of these courts, which are floored with blue and white chequered tiling, is a fountain, supplied by pipes from a large reservoir on the outside of the palace, which serves for the frequent ablutions recommended by the Mahometan religion, as well as for other purposes.

"The whole of the harem consists of about twelve of these square courts, communicating with each other by narrow passages, which afford a free access from one part of it to another, and of which all the women are allowed to avail themselves.

"The apartments are ornamented externally with beautiful carved wood, much superior to any I have ever seen in Europe, as well for the difficulty of the workmanship, as for the taste with which it is finished. In the inside, most of the rooms are hung with rich damask, of various colours; the floors are covered with beautiful carpets,

and there are mattresses disposed at different distances for the purposes of sitting and sleeping.

"Besides these, the apartments are furnished at each extremity with an elegant European mahogany bedstead, hung with damask, having on it several mattresses placed one over the other, which are covered with various coloured silks; but these beds are merely placed there to ornament the room. In all the apartments, without exception, the ceiling is wood, carved and painted. The principal ornaments in some were large and valuable looking-glasses, hung on different parts of the walls. In others, clocks and watches of different sizes, in glass cases, were disposed in the same manner. In some of the apartments I observed a projection from the wall, which reached about half way to the ceiling, on which were placed several mattresses over each other, and each covered with silks of different colours. Above and below this projection the wall was hung with pieces of satin, velvet, and damask, of different colours, ornamented on each edge with a broad stripe of black velvet, which was embroidered in its centre with gold.

"The whole harem was under the management of the principal sultana, Lalla Batoom: that is, in general, she was distinguished by the title of mistress of the harem, without having any particular control over the women. This lady and Lalla Douyaw, the favourite, were indulged with a whole square to themselves; but Lalla Zara, and all the concubines, were only allowed each a single room.

"Each female had a separate daily allowance from the emperor, proportioned to the estimation in which they were held by him. Out of this they were expected to furnish themselves with every article of which they might be in want; the harem is therefore to be considered as a place where so many distinct lodgers have apartments without paying for them, and the principal sultana as mistress of the whole.

"The daily allowance which each woman received from the late emperor for her subsistence is very trifling indeed. Lalla Douyaw, the favourite sultana, had very little more than half-a-crown English per diem, and the others less in proportion. It must be allowed, that the emperor made them occasional presents of money, dress, and trinkets; but this could never be sufficient to support the number of domestics and other expenses they must incur. Their greatest dependence, therefore, was on the presents they received from those Europeans and Moors who visited the court, and who employed their influence in obtaining some particular favour from the emperor. Nor had the monarch sufficient delicacy to discourage this mode of negotiation. He well knew that, if his women had not obtained supplies by other means, they must have had recourse to his purse; and, as he had taken too good precautions to allow any mischief to arise from this custom,

he was always through that chants, indeed the court, pe successful mu tion of this desirous of o emperor, for fully soliciting presents of p quence was, and immediate

man received from very trifling indeed. had very little more and the others less in the emperor made dress, and trinkets; support the number must incur. Their presents they who visited the in obtaining some Nor had the mode of negotiation had not obtained too good price from this custom,

he was always well pleased to have business transacted through that channel. Ambassadors, consuls, and merchants, indeed, who were acquainted with the nature of the court, perfectly knew that this was always the most successful mode that could be adopted. As an illustration of this assertion, when I was at Morocco, a Jew, desirous of obtaining a very advantageous favour from the emperor, for which he had been a long time unsuccessfully soliciting, sent to all the principal ladies of the harem presents of pearls, to a considerable amount: the consequence was, that they all went in a body to the emperor, and immediately obtained the wished-for concession.

"The ladies separately furnish their own rooms, hire their own domestics, and, in fact, do what they please in the harem, but are not permitted to go out without an express order from the emperor, who very seldom grants them that favour, except when they are to be removed from one palace to another. In that case, a party of soldiers is dispatched a little distance before them, to disperse the male passengers in particular, and to prevent the possibility of their being seen. This previous step being taken, a piece of linen-cloth is tied round the lower part of the face, and afterwards these females cover themselves entirely with their haiks, and either mount mules, which they ride like men, or, what is more usual, are put into a square carriage or litter, constructed for this purpose, which, by its lattice work, allows them to see without being perceived. In this manner they set off under the charge of a guard of black eunuchs. This journey, and sometimes a walk within the bounds of the palace, with which they are, however, seldom indulged, is the only exercise they are permitted to take.

"The late emperor's harem consisted of between sixty and a hundred females, besides their domestics and slaves, which were very numerous. The four wives which I have already noticed are by no means to be considered as the first set of which the emperor was possessed, since some died, and others were repudiated. So that it is a difficult matter to determine what was the precise number of the late emperor's wives.

"Many of the concubines were Moorish women, who had been presented to the emperor, as the Moors consider it an honour to have their daughters in the harem; several were European slaves, who had been either made captives or purchased by the emperor; and some were negroes.

"In this groupe, the Europeans, or their descendants, had by far the greatest claim to the character of handsome. There was one in particular, who was a native of Spain, and taken into the harem at about the same age as Lalla Douyaw, who was indeed a perfect beauty. Nor was this lady quite singular in that respect, for many others were almost equally handsome.

"The Moorish women have, in general, an expressive countenance, and a rustic simplicity of manners. Their persons are below the middle stature, of a remarkably fat and square make, with very large hands and feet. Their complexions are either of a clear brown, or, what is more usual, of a sallow cast. Their faces are round, and their eyes, in general, black; the nose and mouth very small, and the latter is usually accompanied with a good set of teeth."

Fez was originally the capital of the kingdom of the same name, and is still a rich and populous place. It consists of two parts, Old and New Fez, and, at present, they form one city. Old Fez is nine miles in circumference, stands between two hills, is surrounded by strong walls, and flanked with magnificent towers. It is beyond the suburbs, contains many excellent gardens, has narrow streets, seven gates, and two castles; the one old, and gone to decay, the other new, and in good condition. The latter is garrisoned with blacks; but neither have any cannon to defend them. The houses are of stone or brick, three stories high, flat-roofed, encompassed with galleries, adorned on the outside with mosaic work, and embellished within with carving, painting, and, in many instances, with elegant furniture. In general, the seraglios are upon the turrets of the houses, from which the women have a fine prospect; but they are never permitted to stir abroad.

The river Fez, in passing through the city, divides itself into six canals, over the various parts of which are two hundred and fifty stone bridges, and three hundred and seventy mills are turned by the several streams. In the city, three hundred and thirty-six ovens are daily employed. The mosques are stated at five hundred, fifty of which are of the first rank; and one, in particular, is a most amazing structure, being a mile and a half in circumference, including the cloister and college belonging to it. This college contains the best library in the empire. There are several hospitals and colleges, which are large, magnificent, and well endowed; six hundred water-conduits, and two hundred spacious inns. The principal magistrate of the city is styled provost of the merchants: besides whom there is a governor, a cadi, and other subordinate officers.

Fez is considered to be the grand magazine and principal mart of Barbary. Merchants and tradesmen are numerous, and the warehouses are filled with great variety of commodities. The articles of exportation are hides, leather, skins, furs, wool, dried fruits, olives, honey, wax, silk, cotton, flax, ostrich-feathers, gold-dust, &c. &c. Those of importation are spices, cochineal, vermilion, iron, brass, steel, arms, ammunition, drugs, watches, quicksilver, opium, alum, aloes, linens, woollens, muslins, calicoes, fustians, &c.

The city of **ALGIERS** is not above a mile and a half in circuit, though it is computed to contain near one hundred and twenty thousand inhabitants, fifteen thousand houses, and one hundred and seven mosques. The public baths are large, and handsomely paved with marble. The prospect of the country and sea from Algiers is extremely beautiful, the city being built on the declivity of a mountain; but, though for several ages it has braved some of the greatest powers in Christendom, it could make but a faint defence against a regular siege; and it is said that three English fifty-gun ships might batter it about the ears of the inhabitants from the harbour. The mole of the harbour is five hundred paces in length, extending from the continent to a small island, where there is a castle and large battery.

**TUNIS**, built near the original site of Carthage, has a wall and fortifications, and is about three miles in circumference. The houses are not magnificent, but neat and commodious; as is the public exchange for merchants and their goods: but, like Algiers, it is distressed for want of fresh water; that of rain, preserved in cisterns, is chiefly used by the inhabitants.

The city of **TRIPOLI** consists of an old and new town, the latter being the most flourishing; but great inconveniences attend its situation, particularly the want of sweet water. The city of **Oran**, lying upon this coast, is about a mile in circumference, and is fortified both by art and nature. It was a place of considerable trade, and the object of many sanguinary disputes between the Spaniards and the Moors. **Constantina** was the ancient **Cirta**, and one of the strongest cities of **Numidia**, being inaccessible on all sides excepting the south-west.

Besides the above towns and cities, many others, formerly of great renown, lie scattered up and down this immense tract of country. **Mequinez** is esteemed the great emporium of all **Barbary**. **Sallee** was formerly famous for the piracies of its inhabitants. **Tangier**, situated about two miles within the straits of **Gibraltar**, was given, by the crown of **Portugal**, as part of the dowry of queen **Catherine**, consort of **Charles II.** of **England**. It was intended to be to the English what **Gibraltar** is now; and it would have been a most noble acquisition, had not the misunderstanding between the king and his parliament occasioned him to blow up its fortifications, and demolish its harbours; so that, from being one of the finest cities in **Africa**, it is now little better than a fishing-town. **Ceuta**, upon the same strait, almost opposite to **Gibraltar**, is still in the hands of the **Spaniards**, but, at present, provisionally occupied by the **English**. **Tetuan**, which lies within twenty miles of **Ceuta**, is now but an ordinary town, containing about eight hundred houses: but the inhabitants are said to be rich, and tolerably civilized in their manners.

*Manufactures and Commerce.*] The lower subjects of these states know but few imaginary wants, and depend partly upon their piracies to be supplied with necessary utensils and manufactures; so that their exports consist principally of leather, fine mats, embroidered handkerchiefs, sword-knots, and carpets, which are cheaper and softer than those of **Tinkey**, though not so good in other respects. As they leave almost all their commercial affairs to the **Jews** and **Christians** settled among them, the latter have established silk and linen works, which supply the higher ranks of their own subjects. They have no ships that, properly speaking, are employed in commerce: so that the **French** and **English** carry on the greatest part of their trade. Their exports, besides those already mentioned, consist of elephants' teeth, ostrich-feathers, copper, tin, wool, hides, honey, wax, dates, raisins, olives, almonds, gum-arabic, and sandarach. The inhabitants of **Morocco** are likewise said to carry on a considerable trade, by caravans, to **Mecca** and **Medina**, and to the interior of **Africa**, whence they bring back great numbers of negroes, who serve in their armies, and are slaves in their houses and fields.

In return for their exports, the Europeans furnish them with timber, artillery, gunpowder, and whatever they want, either in their public or private capacities. The duties paid by the **English** in the ports of **Morocco** are but half of those paid by other Europeans. It is a general observation, that no nation is fond of trading with these states, not only on account of their capricious despotism, but the villany of their individuals, both natives and **Jews**, many of whom take all opportunities of cheating, knowing that punishment rarely follows detection.

*Military and Marine Force.*] The king of **Morocco**, it is said, can bring into the field one hundred thousand men; but the strength of his army consists of cavalry, mounted by his negro slaves. These wretches, brought young to **Morocco**, know no other state but servitude, and no other master but their king, and prove the firmest support of his tyranny. About the year 1727, all the naval force of **Morocco** consisted only of three small ships, which lay at **Sallee**, and, being full of men, sometimes brought in prizes. The **Algerines** maintain about six thousand five hundred infantry, consisting of **Turks** and **cologies**, or the sons of soldiers. Part of them serve as marines on board their vessels. About one thousand of them do garrison-duty, and part are employed in fomenting differences among the neighbouring Arab princes. Besides these, the **Dey** can bring five thousand Moorish horse into the field; but, as they are enemies to the **Turks**, they are little trusted. Those troops are under excellent discipline, and the deys of all the other **Barbary** states maintain a force in proportion to their abilities; so that, a few years ago, they refused to send any tribute to the **Turkish**

emperor, though they were willing to gratify him with the shadow of obedience.

It is remarkable that, though the Carthaginians, who inhabited this very country of Barbary, had greater fleets and more extensive commerce than any other nation, or than all the people upon the face of the earth, when that state flourished, the present inhabitants have scarcely any merchant-ships belonging to them, nor, indeed, any other than what Salée, Algiers, Tunis, and Tripoli, fit out for piracy; which, though increased since the last attack of the Spaniards, are now but few and small, and, some years ago, did not exceed six ships, of from thirty-six to fifty guns. The admiral's ship belongs to the government; the other captains are appointed by private owners, but subject to military law. With such a contemptible fleet, these infidels not only harass the nations of Europe, but oblige them to pay a kind of tribute, by way of presents.

*Constitution and Government.*] In Morocco, government can hardly be said to exist. The emperors have for some ages been parties, judges, and even executioners with their own hands, in all criminal matters: nor is their brutality more incredible than the submission with which their subjects bear it. In the absence of the emperor, every military officer has the power of life and death, and it is seldom that they regard the form of a judicial proceeding. Some vestiges, however, of the caliphate government still continue; for, in places where no military officer resides, the mufti, or high-priest, is the fountain of all justice, and under him the cadis, or civil officers, who act as our justices of the peace. Though the emperor of Morocco is not immediately subject to the Porte, yet he acknowledges the grand-signior to be his superior, and he pays him a distant allegiance, as the chief representative of Mahomet. What has been said of Morocco is applicable to Fez, both kingdoms being now under one emperor.

Though Algiers, Tunis, and Tripoli, have each of them a Turkish pasha or dey, who governs in the name of the grand-signior, yet very little regard is paid by his ferocious subjects to his authority. He cannot even be said to be nominated by the Porte. When a vacancy of the government happens, which it commonly does by assassination, every soldier in the army has a vote in choosing the succeeding dey; and, though the election is often attended with bloodshed, it is no sooner fixed than he is cheerfully recognised and obeyed. It is true, he requires the confirmation of the Porte; but that is seldom refused, as the divan is no stranger to the dispositions of the people. The power of the dey is despotic; and the income of the dey of Algiers amounts to about one hundred and fifty thousand pounds a year, without greatly oppressing his subjects, who are very tenacious of their property. These deys pay slight annual tributes to the Porte. When the grand-signior is at war with a Christian power, he requires their

assistance, as he does that of the emperor of Morocco; but he is obeyed only as they think proper. Subordinate to the deys are military and civil officers; and, in all matters of importance, the dey is expected to take the advice of a common-council, which consists of thirty pashas. These pashas seldom fail of forming parties amongst the soldiers, against the reigning dey, whom they make no scruple of assassinating, even in council; and the strongest candidate then fills the place. Sometimes he is deposed; sometimes, though but very seldom, he resigns his authority to save his life; and it is seldom he dies a natural death upon the throne. The authority of the dey is unlimited; but an unsuccessful expedition, or too pacific a conduct, seldom fails to terminate his life and government.

*Revenues.*] The revenues of Algiers have been mentioned in the preceding article, but they are now said to be exceeded by those of Tunis. They consist of a certain portion of the prizes taken from Christians, a small capitation tax, and the customs paid by the English, French, and other nations, who are suffered to trade with those states. As to the emperor of Morocco, we can form no idea of his revenues, because none of his subjects can be said to possess any property. From the manner of his living, his attendants, and appearance, we may conclude he does not abound in riches. The ransoms of his Christian slaves are his perquisites. He sometimes shares in the vessels of the other states, which entitles him to part of their prizes. He claims a tenth of the goods of his Mahometan subjects, and six crowns a year from every Jew merchant. He derives likewise considerable profits from the Negroland and other caravans, especially the slave-trade towards the south. It is thought that the whole of his ordinary revenue, in money, does not exceed one hundred and sixty-five thousand pounds a year. A detachment of the army of these states is annually sent into each province to collect the tribute from the Moors and Arabs; and the prizes they take at sea sometimes equal the taxes laid upon the natives.

*Religion.*] The inhabitants of these states are Mahometans; but many subjects of Morocco follow the tenets of one Hamed, a modern sectarist, and an enemy to the ancient doctrine of the caliphs. All of them have much respect for idiots; and, in some cases, their protection screens offenders from punishment for the most notorious crimes. The Moors of Barbary, as the inhabitants of these states are now promiscuously called, have, in general, adopted the worst parts of the Mahometan religion, and seem to have retained only as much as countenances their vices. Adultery in the women is punished with death; but though the men are indulged with a plurality of wives and concubines, they commit the most unnatural crimes with impunity. All foreigners are allowed the open profession of their religion.

*Language.*] As the states of Barbary possess those countries that formerly bore the names of Mauritania and Numidia, the ancient African language is still spoken in some of the inland countries, and even by some inhabitants of the city of Morocco. In the sea-port towns, and maritime countries, a bastard kind of Arabic is spoken; and seafaring people are no strangers to that medley of living and dead languages, Italian, French, Spanish, &c. that is so well known, in all the ports of the Mediterranean, by the name of *Lingua Franca*.

*Customs, Manners, &c.*] The natives of Morocco, according to the accounts of travellers, seldom wrangle or quarrel with each other, and murders (those committed by the emperors excepted) are never heard of. They are scrupulously obedient to their parents, pay the most profound respect to their superiors, and are loyal to their sovereigns, even to a most absurd degree of veneration. They are, in general, temperate in eating and drinking, though some of the great men lead abandoned lives; but they use a great quantity of opium. Although in the most civilized nations of Europe vast crowds of natives flock to see public executions with a kind of unfeeling curiosity, yet in Morocco it is quite the reverse; for all ranks of people carefully keep out of the way, and criminals are often executed without any person being present except the officers of justice.

The dress of the people of Morocco consists of a linen shirt, and drawers, over which they tie a silk cloth, or vestment, with a sash; and upon that they wear a loose coat, or rather gown. Their arms and legs are always bare, but they have slippers on their feet, and persons of rank sometimes wear buskins. They shave their heads, and wear a turban made of silk or fine linen. The dress of the women nearly resembles that of the men, except that, instead of a turban, they wear a round cap, made of fine linen. Their drawers are much longer and larger; and when they appear in the streets, their faces are covered with a linen cloth, in the manner of a mask. The women of the higher class not only paint their cheeks and chins with deep red, but make a long black mark on the forehead, another on the tip of the nose, and several on the cheeks.

Their general diet is *cocofu*, consisting of small pieces of paste, about the size of rice, crumbled into an earthen cullender, and cooked by the steam of boiled meat and vegetables, which are all served up together, in an earthen dish, with butter and spices. This stew, in which nothing is lost, even the steam being received by the paste, is the favourite meal of the peasant and the monarch. At meals their slovenliness is disgusting, and they are prohibited from using gold and silver vessels.

Algiers may be said to comprise a mixture of most nations; but the most numerous of its inhabitants are the Moors and Arabians. The Moors are divided into two

orders, viz.—those who live in towns, and follow piracy, or various professions by land or sea, and those who wander about without being possessed of houses or land. The first are the citizens of the kingdom, the latter the bulk of the inhabitants. These Moors are of a swarthy complexion, and robust habit of body. The men are active, the women fruitful, and the children healthy. The Arabians of Algiers are divided into tribes, wander up and down, and profess the same religion, customs, and manners, as those of Arabia.

The Algerines are the most cruel and dangerous pirates of all Africa; base, perfidious, and rapacious to the last degree. No oaths or ties, human or divine, will avail to bind them when their interest interferes. In short, whatever respect they may pretend to pay to their prophet Mahomet, gold is the only idol which they worship.

Those who reside on the coast are very savage to such as unfortunately fall into their hands by shipwreck; so that it appears that the Algerines, in general, are as much strangers to humanity, as they are to an elegant taste or polite behaviour.

The dress of the men is only a long piece of coarse cloth, wrapped round their shoulders, and falling down to their ankles, with a cap of the same. The women wear a piece of woollen-stuff, that covers them from their shoulders to their knees. They braid their hair, and adorn it with glass-beads and fishes' teeth. Their arms and legs they ornament with bracelets of ivory, horn, and even wood, and blacken their cheeks, foreheads, arms, and legs. The children are suffered to go naked till seven or eight years old, when they cover them with a few rags, rather for ornament than decency. The dress of the sheik, or chief, of every tribe, is a shirt and cloak, all of one piece, hanging from the shoulders half way down the leg, and he wears a cap of fine cloth.

The Algerine Turks dress with as much elegance as the inhabitants of Turkey. The free Christians are permitted to dress in the fashions of their respective countries; but the slaves are obliged to wear a coarse grey suit, and a seaman's cap. The sheriffs, or those who pretend to be descended from Mahomet, are distinguished by a green turban; but the common Algerines wear shirts, linen drawers, an open woollen jacket, with a hood behind, and a black cloak, which reaches to their knees, when they go abroad.

The wandering sort are distinguished into various tribes, each forming an itinerant village, and every family living in a portable hut. They live by the produce of the lands, which they farm of those of the first order. They pay their rent to their landlords in corn, herbs, fruit, honey, wax, &c. and a tribute to the dey, according to the number of the family in each moving village, or rather camp. Their tents are mean, their utensils trifling, their circumstances

poor, and their chimneys to earthen pots, v the smoke. T promiscuously being placed o on rice, bread, employ is husb

The women even or eight years of age, rather for ornaments, sheik, or chief, of one piece, hanging from the neck, and he wears a

ch elegance as the Arabians are permitted to wear in these countries; but a grey suit, and a turban who pretend to be distinguished by a green shirt, linen drawers, and a hood behind, and a turban, when they go

into various tribes, every family living in the face of the land, in order. They pay for fruit, honey, wax, to the number of their camp. Their circumstances

poor, and their manner of living filthy. They have no chimneys to these habitations: the fires are made in earthen pots, which are placed near the door, to let out the smoke. The family, and all domestic animals, lie promiscuously in the hut together, dogs excepted, these being placed on the outside as sentinels. They live chiefly on rice, bread, fruit, and plain water: and their principal employ is husbandry, or breeding bees or silk-worms.

When a youth of the class last mentioned is disposed to marry, he drives a number of cattle to the hut where the intended bride resides. The girl and her parents, on viewing the stock, immediately consent. All the young women of the village are then invited to the feast. The bride is afterwards placed on a horse, belonging to the bridegroom, and led home, amidst the acclamations of all present. When she arrives at the door of the bridegroom's hut, a mixture of milk and honey is given her to drink, while a nuptial song is sung. She then alights, and, to shew her willingness to perform any duty he may assign her, drives his flock to water and back again. These previous ceremonies being settled, all the company enter the hut, and the evening concludes with the greatest festivity that these poor people are capable of enjoying. Subsequent to the marriage, the wife is obliged to wear a veil, and never stirs from the hut during a month, and ever after is excluded from all concern in, and knowledge of, public affairs.

Polygamy is allowed among the Algerines who are of the higher order. Marriage-contracts are generally left to the interference of friends. When the marriage is agreed upon, the bridegroom sends a present to the bride, and gratifies her relations with a feast and musical entertainment. The marriage-ceremony is concluded with another entertainment.

In sickness the Algerines are attended by persons of their own sex to nurse them. The physicians are extremely ignorant, and if they find their patients at the point of death, they turn them towards the east. After the departure of life, the corpse, being washed and clad in a shirt, drawers, silk robe and turban, is laid in a kind of square coffin, and carried on men's shoulders, by means of poles, to the place of interment, attended by relations and friends.

Mourning is expressed by the women going veiled for some days, and the men wearing their beards for a month. During three days after the funeral, the nearest relations visit the tomb, distribute alms to the poor, and suffer no fire to be lighted in their houses. The better sort have epitaphs on their tomb-stones.

The greatest part of the Tunisian women would be esteemed beauties, even in England; and their children have the finest complexions of any nation whatever: the boys are so exposed to the sun, that they soon attain the swarthy complexion of the Arabs; but, as the girls keep more

at home, they preserve their beauty till they are thirty, when they are generally past child-bearing. One of these girls is sometimes a mother at eleven, and a grand-mother at two or three and twenty; and, as they generally live as long as the Europeans, they sometimes see their children of many generations.

The merchants, officers, doctors, and scholars, here, appear neatly dressed when they go abroad; and behave with such gravity and good manners, that, though the streets are crowded with people, one may go from one end of the city of Tunis, without fear of being insulted by the Turks, as one is sure to be at Algiers. The taverns kept by the slaves are better regulated, and those slaves are allowed to chastise even a Turk, if he drink too much, or behave insolently, and even to pull off and keep his turban, till he has paid his reckoning. They sell none but white wine, which the country produces in great plenty, and is very cheap and good. It is customary in the taverns at Tunis, when a person calls for a quart of wine, to set before him three or four dishes of meat or fish, with salad and other sauce; and, when he goes away, he pays only for the wine at a common price. Some of the graver people, who have no constant employment, spend the day either in conversing with one another in the barbers' shops, in the bazar, or at the coffee-house; but many of the Turkish and Moorish youths attend their concubines, with wine and music, into the fields, or make merry at one of the public taverns.

As to the Arabs of Tunis, their lives are one continued round of idleness or diversion; for, when they are not called abroad by any pastime, they spend the day in loitering at home, smoking their pipes, and reposing themselves under some neighbouring shade: yet the Arab places his highest satisfaction in his horse, and is seldom in high spirits but when hunting or riding at full speed. Hawking is another of their principal diversions: and those who take delight in fowling, instead of springing the game with dogs, shade themselves with a piece of canvas, stretched upon two reeds, and painted with the figure of a leopard. The fowler, thus concealed, walks through the breaks and avenues, looking through some holes, a little below the top of the screen, to observe what passes before him. On the approach of the canvas, the partridges and some other birds are observed to covey together, though they were before at some distance from each other; and the woodcock, quail, and some other birds, that usually feed in flocks, will, on seeing it, stand still, with a look of astonishment. By this means the sportsman has an opportunity of coming near them, when, resting the screen upon the ground, and directing the muzzle of his piece through one of the holes, he shoots at a whole covey at once.

The Arabs, who live in tents, still retain many of the

customs we read of in sacred and profane history; for, excepting only their religion, they are the same people they were several thousand years ago. Upon meeting each other, they still use the primitive salutation, "Peace be with thee." The inferiors show their respect to their superiors by kissing their feet, knees, or the borders of their garments. In saluting each other, they clap their right hand on their breast; and, at their great solemnities, the wife compliments her husband by kissing his hand. Persons of the highest character, like the ancient patriarchs, and the heroes of antiquity, perform what we term menial offices. The greatest prince, when visited by a stranger, is not ashamed to fetch a lamb from his flock and kill it, while the princess makes haste to prepare her fire and kettle, and then dresses it. The custom of walking either bare-foot, or with sandals, renders the compliment of washing the stranger's feet still necessary: this is done by the master of the family, who first presents himself, and is always the most officious in this act of kindness. When his entertainment is ready, he would think it a shame to sit down with his guests; instead of which he stands all the time, and waits upon them: yet, notwithstanding this respect, there have been instances, in which men have been the next day overtaken and robbed, by the very persons who entertained them with such hospitality the night before.

While the indolent husbands take their repose under some neighbouring shade, and the young men and maidens attend the flocks, the wives are all day employed in grinding at the mill, dressing provisions, or working at the looms; and, to conclude the day, they still, as in ancient times, take a pitcher or goat-skin, and, tying their sucking children to their backs, trudge two or three miles to fetch water. Yet, notwithstanding all this business, they will not lay aside any of their ornaments, neither their nose-jewels, their bracelets for their arms and legs, nor their ear-rings; all of which are very cumbersome; nor will they omit tinging their eyes with lead-ore; so prevalent is custom, and so fond are even the ladies in Barbary of appearing in the fashion.

If a renegado, in Tunis, should turn Christian again, they wrap him up in a cloth, dipped in pitch, and burn him: or else pile stones, mud, mortar, &c. all round him, and, having walled in all but his head; they rub that over with honey, which attracts wasps and other insects, that torment the poor wretch with their stings till he expires, which sometimes does not happen for several days. If a slave be caught in attempting to escape, or if he murder his patron, his limbs are all broken, and then he is fastened to a horse's tail, and dragged through the street till he expires.

*History.*] Under the Roman emperors, the states of Barbary formed the fairest jewels in the imperial diadem. It was not till the seventh century, that, after these states had been by turns in possession of the Vandals and the Greek emperors, the caliphs or Saracens of Bagdad, conquered them, and from thence became masters of almost all Spain, whence their posterity was totally driven, about the year 1492, when the exiles settled among their friends and countrymen on the Barbary coast. This naturally begot a perpetual war between them and the Spaniards, who pressed them so hard, that they called to their assistance the two famous brothers, Barbarossa, who were admirals of the Turkish fleet, and who, after breaking the Spanish yoke, imposed upon the inhabitants of all those states, excepting Morocco, their own. Some attempts were made by the emperor Charles V. to reduce Algiers and Tunis, but they proved unsuccessful; and the inhabitants have, in fact, shaken off the Turkish yoke likewise.

The emperors of Morocco are the successors of those sovereigns of that country whose powers resembled that of the caliphate of the Saracens. They have been, in general, a set of bloody tyrants, though they have had among them some able princes, particularly Muly Muloc, who defeated and killed Don Sebastian, king of Portugal. They have lived in almost a continual state of warfare with the kings of Spain, and other Christian princes, ever since.

### CHAPTER III.

#### ZAARA.

A CONSIDERABLE portion of Africa is pervaded by immense deserts, which comprise nearly one half of the western part. Of these the chief is that called Zaara, or the Great Desert, by way of eminence, extending from the shores of the Atlantic, with few inter-

ruptions, to the confines of Egypt, a space of more than forty-five degrees, or about two thousand five hundred miles, by a breadth of twelve degrees, or seven hundred and twenty miles. "This Great Desert," says Golberry, "may be called a sea of fine and moving sand; and on

this dry expanse one can with difficulty perceive, at great distances, some isolated spots, where vegetation has not been entirely annihilated. It is true, that these isles, which can be but imperfectly compared to the ancient Oases of the Thebaid, are so rare in the Zaara, that they do not form an hundredth part of the surface of this great Desert, whose superficies is one hundred and eighty thousand square leagues.

At present, it appears that there are thirty-two known oases, or habitable countries, in the Zaara, which have been rendered fertile by springs of fresh water. The largest of these oases are inhabited, different tribes of Moors having established themselves, and founded in them a sort of colonies: it is supposed that these colonies of Moors, which overspread the desert of Barbary, are seventeen in number. The other oases, being not so large, only serve as points for the refreshment and rest of the caravans who travel through the Desert, as well as for the Moors, who habitually perform such extensive journeys. The caravans traverse the Great Desert of Zaara in nine different and principal directions, and the Moorish tribes who reside in it pass over it at every point.

The Moors who inhabit the valleys belonging to the western ramification of the Atlas, the Mussulmen, and several other savage tribes, the plundering Moors, the Trarshazians, Brachknazians, and Darmankos, frequently perform journeys from the Senegal, as far as Morocco.

Every year a caravan sets off from Mequinez, proceeds to Tatta, crosses the whole extent of the Desert, and arrives at Jarra, which is situated under the fifteenth northern parallel, sixty leagues to the east of Galani: the journey performed by this caravan is five hundred leagues. There are other travellers and merchants who cross the Desert between Tatta and Tombucto, and this journey is near four hundred leagues.

It is likewise certain, that frequent journeys have been performed between Tombucto, Tripoli, and Cairo; and that a part of the caravan from Morocco proceeds along the Niger to Kassina, Ghana, and Kauga; sometimes stopping at Sennaar, arrives at Gerri, on the right bank of the Nile, and finally reaches Suakim, on the borders of the Red Sea, having performed a route of nearly one thousand three hundred leagues. The vast Desert of Zaara is, therefore, constantly travelled over in several different directions.

The soil of this Desert consists of fine sand, which is nothing but a mass of small and uncombined particles: these particles, however, are not stony, like the elements of sand, but susceptible of petrification: the sands of Zaara, being composed of infinitely diminutive grains, are of a very great depth, and, being agitated by the winds, in a manner similar to the waves of the sea, they are thus formed into mountains, which, from the same cause, are

shortly after dispersed, and raised to a considerable height, till their expansion obscures the rays of the sun.

On this sandy extent there may frequently be seen columns of sand, resembling water-spouts met with at sea: in short, the nature of these sands is adverse from combination, since, in the whole of this vast Desert, there are scarcely any rocks, and fertile countries are seldom discoverable in it.

"From the vast, moving, dry, and arid plains, which border on the north of the Senegal," says our author, "I have seen these sand-spouts arise in the form of columns, sometimes advancing with rapidity; at others, proceeding with a majestic slowness, and affording a grand and magnificent spectacle. Their rapidity is sometimes so great, that they are scarcely perceptible, before they vanish to such a degree as to resemble ribands floating in the air at the pleasure of the wind, but the lower extremity of which always touches the earth; at other times, their upper extremities rise to such an immense height, that they are lost in the clouds: these spouts frequently break at a great elevation, and the immense volume of sand is dispersed through the atmosphere; at other times, they break, to appearance, in the middle, and the report occasioned by this rupture is similar to the explosion of a mine."

At no great distance from the right bank of the Senegal, there are, however, some considerable rocks, of a black colour, containing virgin iron, isolated and dispersed. It is a matter of surprise, that masses containing native and virgin iron should be found isolated in countries where iron-mines are unknown, and is a subject of curiosity and research worthy of the attention of naturalists.

This vast Desert is divided, by the Arabs, into three parts, by the names of Cabel, Zaara, and Asgar, which names are given in affinity to the different soils; the first signifying sandy, the second stony, and the third marshy. Modern geographers have, in general, divided it into the following provinces: Zanhaga, Guenziga, Terga, and Lemta.

ZANHAGA extends from the river Sue, which divides it from Morocco, on the north, to that of Senegal, on the south. It is bounded, on the east, by the territories of Serem, Sunda, and Zuenziga; and, on the west, by the Atlantic Ocean. The inhabitants of this province are of various nations, and among them are some tribes of Arabs, who chiefly live by plunder. The district called Tagazza is remarkable for producing vast quantities of rock-salt. This country is very dangerous to travellers, especially in summer, there not being any water to be found for miles together; so that, if a proper provision be not made, they are liable to perish with thirst.

GUENZIGA is more barren than the former, and both men and beasts frequently perish on their journeys for want of water, particularly in that part of it called Gog-

den, where they travel for ten days together without meeting with any refreshment to quench their thirst, except what may casually happen to fall from the clouds. The inhabitants are a mixture of Africans and Arabs, the latter of whom receive a kind of tribute from their neighbours, for tilling their land; and they have abundance of cattle, with which they wander to various parts of the Desert, in search of pasture. They breed a great number of horses, and are so powerful, that the beys of Barbary take some pains to preserve their alliance and friendship.

TERGA is not so dry or so barren as the two already mentioned; nor is it so sultry and unwholesome. It has many good springs of water, and the land produces several sorts of useful herbs. In some parts are found great quantities of manna, which the inhabitants gather in calabashes, and export for sale: the negroes dissolve it in the water wherein they boil their meat, and attribute to this beverage the health they generally enjoy.

LENTA, the next province, is situated to the north-east of Terga, and is more barren than any other part through the whole Desert of Zaara. It is dangerous for travellers, not only on account of the excessive heat and scarcity of water, but also from the natural ferocity of its inhabitants, who are a wild breed of Moors, that rob and plunder all strangers they meet with; and, if any resistance be made, they murder them without the least remorse. It is the high road for the merchants and caravans that travel from Constantia, and other towns of Algiers, Tunis, &c. into Negroland; and, notwithstanding the great danger of the journey, such is their attachment to commerce, that they hazard their lives with the utmost intrepidity.

All the southern parts of the Zaara, in the vicinity of the Senegal, from the mouth of this river to even far below the cataract of Felow, are either frequented or inhabited by Moors.

Several colonies of savages are dispersed in the oases of this Desert: others have formed kingdoms to the north of the Senegal and the Niger; and there are many hordes and their establishments even near Borniou, in forty degrees thirty minutes east longitude from the Isle of Ferro. These dispersed and expatriated Moors, therefore, extend to the very extremities of the Desert, and between the sixteenth and twenty-sixth degrees of north latitude; an extent of eight hundred and seventy-five leagues from east to west.

These Moors, being dispersed in hordes, tribes, colonies, and even kingdoms, through the immense deserts of Barbary, and along the northern banks of the Niger and the Senegal, present, when observed with attention, a mixture of races, in every respect different from each other.

"We may perceive among them," says our author, "men whose physiognomy is grave, whose look is penetrating, who have high foreheads, aquiline noses, vene-

erable beards, well-formed muscles, a sallow skin, a serious air, a tranquil countenance, and, in short, the whole appearance of an Arabian philosopher. Others, by their superior stature, vigour, activity, and agreeableness, by their firm and noble aspect, by features of a softer cast, by their bright, though languishing, eyes, their courageous and tender looks, and by their yellow, though florid, complexion, remind us of those Saracen heroes of Spain, who were so celebrated for their courage and amours.

"There are, likewise, amongst them men of a large size, whose proportions are fine and muscular, whose features are regular, and whose complexion, though brown, is enlivened by the finest natural carnation, like that of the Turks at Constantinople. But the majority of these people are of a vulgar and savage appearance, and, by their habitual commerce with the Jalof and Foulah negroes, with whom the Moors of Zaara often mix, many of them acquire distinctive characters."

The principal tribes, who reside in the interior of the Desert, are the Wadelims, Labdesseba, Laronsseye, Chelus, Tucanois, Ouadelis, Gedingouma, Jafanon, and Ludamar. The first two are the most formidable, and extend their predatory system as far as the environs of Morocco, whose emperor is in constant alarm at their excesses. They consist of large, strong, and well-made men, have generally stiff hair, a long beard, a furious look, large pendulous ears, and nails like talons: they even convert these into a formidable kind of weapon, in the quarrels which they have with their neighbours. The Wadelims, in particular, are the most arrogant and warlike race, and spread terror wherever they pass; though, like all the other Moors, their courage fails them, unless they have a decided superiority of numbers in their favour.

These people live in tents, which they remove at will: they are usually of a round form, terminating in a cone, and are covered with a thatch, made of camels' hair, so compact that rain never penetrates through it. This covering is made by the women, who also prepare the leather, of which the saddles, bridles, and various other articles, are manufactured.

The furniture of these dwellings consists of two large leather sacks, which hold a few rags and scraps of iron-work; sometimes they have a box or two, which become the object of cupidity amongst a whole horde. Three or four goat-skins, in which they keep their milk and water, several wooden platters, two large stones, for pounding barley, a lesser one for driving in the pickets of the tents, some osier-mats, which serve them for beds and covering, and a small copper-kettle, are the whole of the goods which distinguish the rich from the poor.

It is the business of the women to prepare the provisions, fetch water, and attend to the horses and cattle, which always lodge in the same tent. Those who are in

easy circumstances part of the labour upon their husbands exceed the arduousness of the work.

horses and cattle,  
Those who are in

easy circumstances keep negro-slaves to do the principal part of the labour; but they are always obliged to wait upon their husbands themselves. In short, nothing can exceed the arrogance of a Moor to his wife, nor the humility of the woman in the presence of her husband.

When a horde changes its situation, the women strike the tents, load and unburden the camels; and, when the husband mounts his horse, his wife holds the stirrup: they are not even admitted to eat with the men; but, when dinner is ready, they retire, and wait till they are called on to take what is left: indeed they may be considered, in some degree, as the property of their husbands; for a Moor does not marry till he is able to buy himself a wife. The fathers sell their daughters, and he who has most of them is considered the richest man. The price agreed on is always paid in advance; and the husband may afterwards put away his wife; but what he has given for her is never returned. Nevertheless, a Moor cannot turn away his wife without obtaining permission of the oldest people of the horde, but which they never refuse to give; so that the demand is a simple matter of form.

The Moors, in general, treat their women with the most sovereign contempt: they never take the names of their husbands, nor do the children even bear the names of their fathers. Amongst almost all the hordes, they admit only of four or five different names. The men are distinguished by that of their tribe, and have some kind of surname.

Although these women are so badly used, and though they are very indecent in their manners and gestures, they are faithful to their husbands. An instance to the contrary seldom occurs; but, when it does, the offender is driven from the dwelling of her lord, and his relations generally revenge themselves, by her blood, for the disgrace which she has brought upon their family.

The Moors consider the women as an inferior race of beings, created solely for their pleasure and caprice. Their ideas with respect to female beauty are very singular. An elegant shape, majestic walk, a mild and expressive physiognomy; in short, all the charms which delight European eyes, are to them without attraction. They must have women particularly fat; for, with them, corpulence seems to be every thing. "Hence," says Durant, "those women who only require the assistance of two slaves to help them to walk, can have but moderate pretensions; but those who cannot stir, and who are obliged to be conveyed upon camels, are considered perfect beauties; particularly if they have long teeth projecting out of the mouth."

This taste of the Moors for corpulent beauties, induces the women to take the greatest care to make themselves fat. Every morning they eat an enormous quantity of coscofu, and drink several jugs of camel's milk. The girls are obliged to take this food, whether they have an appetite or not; and, when they refuse, they are beaten till

they comply. This forced diet, however, does not occasion indigestion, or any other disease; on the contrary, it occasions that degree of fatness, which passes for perfection in the eyes of the Moors. The Moorish girls are, in other respects, little attended to, and their education is totally neglected.

The boys are generally taught to read and write the Arabic language; and, as soon as they begin to grow up, they are respected by the Moorish women, and even by their mothers, who no longer cat with them. At an early period they are accustomed to use the poniard adroitly, and to tear out, with their nails, the bowels of their adversaries: they are taught to give a lie the semblance of truth; are, in short, familiarized with wickedness, and are instructed to commit a crime with as much pleasure as they would do a good action.

As a plurality of wives is permitted amongst the Moors, a hut is seldom seen with less than eight or ten children. The women live together under the same tent, without betraying any marks of jealousy.

The tent destined to receive a new-married couple is ornamented with a small white flag, and the bridegroom has a band round his forehead of the same colour.

On the day of the ceremony, the bridegroom causes a camel to be killed, for the purpose of regaling the guests. The bride, with the women and young girls of her acquaintance, dance all day round a kettle-drum, and their motions are of the most indecent kind. They dance singly, and one after the other. She who begins the performance stretches out her neck, and makes the most shocking grimaces, which are repeated by the spectators with astonishing precision. They beat time with their hands, and at length all the company put themselves in motion.

It is difficult to reconcile the sentiments of affection which the Moors seem to possess for their children, by whom, in return, they are tenderly loved, with the obdurate and barbarous conduct which they display in their families. For the slightest fault, the offender is corrected with a revolting degree of severity; and the girls, being indifferent both to the father and to the mother, suffer the greatest punishment.

Nothing can exceed the joy of the parents on the birth of a son. The mother has no assistant, and is most frequently alone. She lays down her infant, takes some milk to refresh herself, and then goes to bed for the night. The mother who gives birth to a son, in order to testify her joy blackens her face for forty days. On the birth of a daughter, she only daubs it half over, and keeps it so no longer than twenty days.

"It is difficult," says our author, "to form an idea of the pride and ignorance of the Moors: they think themselves the finest people in the world, and suppose that the sun rises for them alone. 'Contemplate that planet,'

said a Moor to a Christian slave; 'it is unknown in thy country: during the night you are not enlightened, like us, by that orb, which rules on our days and our fasts, or by those luminaries which fill the celestial arch, and indicate the hours for our prayers;—(he alluded to the stars). You have no trees, nor camels, nor sheep, nor sand, nor goats,' continued he; 'nor are your women made like ours. You do not inhabit the earth, but are born, live, and die in your houses that float on the sea.'

The greatest luxury of a Moor is to see his wives and daughters richly dressed, and on them he exhibits all his opulence, by ornamenting their ears, arms, and legs, with rings of gold and silver.

Their language is a gross kind of Arabic: it seems, however, that its rudeness is rather in consequence of their pronunciation, than of the corruption of the language itself, since several of these Moors speak it in great purity, and make themselves perfectly understood among their own countrymen.

They have very little knowledge of the arts, though they make, in a rude manner, pikes, knives, and even keutles, from the native iron which is furnished to them by the Negroes. Every thing else for which they have occasion comes to them either directly or indirectly from the Europeans.

They are but little acquainted with the cultivation of land. The person who is charged with the labour repairs to a spot which appears most moistened by rain, and scatters indifferently the seeds of millet, barley, and wheat, which he covers by drawing over them a plough harnessed to a camel. This implement, without breaking the ground, makes a simple furrow at its surface. If the subsequent rains promote the growth of the seed, each person takes the portion that belongs to him, and retires to his camp. Sometimes, instead of waiting till the grain comes to maturity, they cut it down, and dry it on hot ashes, by which they deprive themselves of an abundant harvest, as well as of the straw that would feed their horses.

The head and rump of their horses are not so handsome as those of the Arabian kind; but the legs are much finer, and the chest and body more perfect in their proportions. "I have seen some," says Golberry, "whose colour was uncommonly beautiful; many were of the most charming cream tint, others were of a slate colour, and had fine coats and black tails; there were also some of a most beautiful black. These horses are gentle and obedient: the Moors teach them a number of singular actions; they kneel down in order to be mounted, even by children six years old, and, when a child falls from the back of one of these animals, it not only stops in an instant, but caresses him, and solicits him to remount, at the same time giving him every assistance that can possibly be conceived. These animals are taught to bow the head at the will of their

master; they bend their right knee to the ground, afterwards their left, and in this manner they walk at the word of command; they also make rapid evolutions, with their heads turned towards their tails, and their gallop is, at least, equal to that of the finest English racers. When a Moor has ridden his horse for some hours, the animal's mouth and flanks are always covered with blood. These barbarians are, nevertheless, perfect horsemen; they raise their legs like the Cossacks; but they are so active, that we may see them, while at full gallop, adjust and throw behind the sort of lance called sagaye. They throw these lances with so much accuracy, that they never miss their mark; and it is by the strength and rapidity of their horses that they stupify, run down, and overcome, the ostriches, with which their oases are surrounded, and which they thus expel from their desert plains.

In the interior of the Zaara, which is the chief residence of these tribes, the Moors also raise numerous flocks and herds of sheep, goats, and oxen: none of these animals are of the kind which are known in Europe by the name of Barbary sheep; the Zaara species is very strong, and is covered with hair instead of wool; this hair is extremely thick, but not curled: these sheep are generally either black, brown, red, or yellow: when they have been fed for some time they become very fat, and their flesh is excellent.

In their solitary residences, the Moors raise a great number of oxen, amongst which may be distinguished two species; one smaller than the common kind of European oxen, but in other respects exactly similar: these small oxen of the Desert are of the same form and colour as ours, but they are more gentle and active: the other species is large and strong, but has a hunch upon its shoulders, and is, in fact, a degenerate species of the bison. These hunch-backed oxen have a very extensive beard, which reaches almost to the ground; their horns are very fine, and almost come in contact at the points; but the distinctive character of this species is a large fleshy wen, which rises between the shoulders: this mass of flesh forms a projection of nearly a foot in height, and is considered as a great delicacy by epicures. These animals are very strong and docile; and, as their pace is very gentle, the Moors are fond of riding them; but, instead of a bit, they pass a cord of camel's hair through the nostrils; to this substitute for a bit they fix smaller cords, which serve for reins, and which pass and hang over the hunch on the back of the animal: they saddle them in the same manner as a horse; and, without requiring much excitement or irritation, they go at a very quick rate, and travel twelve or fifteen leagues without being fatigued. They are susceptible of an attachment to the person who habitually attends and rides them, and are obedient to his commands: their flesh is good, tender,

and succulent in general.

The Moors of these animals a thousand leagues these journeys whose estates as they conceive are profusely

It is uncommon their numerous Africa. Golberry a herd of upwards of a hundred, formed by the right bank of the left bank: the depth of the water was several fathoms.

"This herd, the south of Africa several days, without the conductors of the number, and without poniards.

"When they caused their oxen to make a great noise, animals from the advanced-guard, charm: from those which were the strongest and chosen to direct the conductors seemed animal which was the horns of each about four feet in a standing position projection on the bodies erect, but supported themselves animal's horns: and clothing.

The Moors pass over Africa with herds of four hundred of these animals at a time, which they sell at upwards of a thousand leagues from their deserts. They perform these journeys under the protection of the negro princes whose estates they travel through, but more particularly, as they conceive, by the favour of their amulets, which are profusely distributed by their Marabouts.

It is uncommonly interesting to see these savages, with their numerous herds, cross over the largest rivers in Africa. Golberry has given an account of the passage of a herd of upwards of four hundred oxen, which was performed by the Moors, between Albreda, situated on the right bank of the Gambia, and the village of Bahio, on the left bank: the river is upwards of three thousand five hundred fathoms wide.

"This herd," he says, "was collected on the shore, to the south of Albreda, where the Moors let them rest for several days, without suffering them to graze. The conductors of this herd were one hundred and twenty in number, and were armed with muskets, sagayes, sabres, and poniards.

"When they had resolved on passing the river, they caused their oxen to be collected together, and suddenly made a great shouting: they then selected about forty animals from the herd, which were destined to form the advanced-guard, and were considered as if they possessed a charm: from this a select number were again chosen of those which were the best swimmers, and, at the same time, the strongest and most docile. Ten Moors were then chosen to direct this advanced-guard, and each of these conductors seemed to pay great attention in selecting the animal which was to convey him across the river. Across the horns of each ox they fixed a cord of camel's hair, about four feet in length; they then mounted their oxen in a standing posture, their feet firmly adhering to the projection on the back of the animal; they kept their bodies erect, but rather inclining backwards, and they supported themselves by means of the cord fixed to the animal's horns: on their heads they carried their arms and clothing.

"When every thing was thus arranged, the advanced-guard was conducted to the banks of the river: the leaders then made loud outcries, which were answered by the cattle of the advanced guard; and the Moors and oxen of the main body also repeated them. Immediately afterwards the advanced-guard entered the river, excited by the voice of their conductors: the eldest of the Moors led the van; his ox made way through the current with great resolution; the other animals followed the chief of their file, being animated by the young Moors, who incessantly excited them by their expressions.

"When they were all immersed, the scene was truly singular; only the heads of the oxen were perceptible, and the upper part of the bodies of their conductors, who, inclining backwards, held firmly by the cords, which served them for support. The chief of the file continued to lead the van, and the others followed exactly in his track: they were three hours in passing the river, during which time the main body of the troop continued on the right bank, close to the river, with their eyes attentively fixed on those who were making the passage.

"When the advanced-guard had arrived at the opposite bank, the conductors suddenly gave three great shouts, which were answered with three bellowings by the oxen, and the noise was distinctly heard by the main body on the opposite bank.

"The signals were repeated by the Moors and oxen of the principal troop, and then one might easily see the impatience of the animals, who stedfastly looked on the advanced-guard, that had safely arrived, and testified by their motions their desire of a junction.

"The principal troop was now collected, and several other oxen were chosen to lead the way; these chiefs of the body were twenty in number, and twenty Moors mounted the predestined animals, in the same manner as their predecessors had mounted the advanced-guard.

"Five Moors placed themselves at the head of the troop, very near to each other, and repeated their shouts; the chiefs entered the river, all the oxen immediately followed, and were at once surrounded by the tide: the interest of this view was greater than the former, on account of the vast number of cattle.

"Several of the young Moors occasionally swam amongst the beasts, supporting themselves by their horns: this second passage lasted upwards of four hours.

"It is thus that the Moors, and their oxen, cross the largest rivers, and are never interrupted or impeded in the direction they are inclined to take."

The ordinary food of the Moors is millet, barley, wheat, milk, honey, locusts, and wild animals. They make no use of poultry or domestic animals, except at the last extremity, or on solemn occasions, such as the visits of princes or distinguished friends, the birth of sons, marriages, or deaths. They pass alternately from abstinence to voracity. Their religion subjects them to frequent and rigorous fasts: in their travels they endure hunger and thirst; but, when they find an opportunity of satisfying their appetite, they eat at a single meal more than three Europeans, and drink in proportion.

These people are almost continually at war; frequently among themselves, but oftener with the Negroes. In battle, those who are mounted on horses are hidden in clouds of dust; but the camel, whose pace is heavy, though it takes long steps, is scarcely less useful than the horse;

for, animated by the shouting of its rider, it dashes amongst the crowd, and produces more carnage by its bites than is effected by the musketry. The Moors never make their attack in order of battle; but as many men as there happens to be, so many separate combats take place; and he who throws his adversary to the ground, seizes on his arms, and retires precipitately with the fruit of his conquest; but, if the person conquered be a negro, he is detained and made a slave.

Such incursions generally ruin one party or the other. Those who possessed a considerable stock of cattle are reduced, in one day, to the most dreadful misery, and despoiled by others, who, the evening before, had no property at all. The weaker tribes are, of course, the most exposed; and, therefore, take care to live at a distance from the others, especially from the Wadelims and Labdessebas.

Their ordinary arms are sabres, sagayes, and arrows, the last two of which they throw with great strength and accuracy. Some of them procure from the Europeans or Negroes muskets or pistols; but they cannot make use of them for any length of time, because those which are brought to them from Europe are of a very bad kind; besides which, the humidity of the climate causes them to be speedily covered with rust, while the heat spoils the temper of the metal: they, therefore, soon become useless, as there are no workmen clever enough to repair them.

The Moors are very hospitable: every stranger, of whatever country or tribe he may be, or whether known to them or not, is kindly received. If several travellers arrive at any place together, the inhabitants defray amongst them the expenses of their reception. They all, without distinction, congratulate him upon his arrival, assist him in taking off his luggage, and convey it to a place of security. He is then conducted behind a bush to pass the night; for it is an invariable custom among these people never to admit a stranger into their tents. When this ceremony is over, the people sit down around him, and enquire the news of the country from which he comes; whether such a horde have evacuated the spot on which they last encamped, whether he have met with others on his passage, and the motives for and extent of his journey. They never put any questions about his health till he has satisfied them on all the other points of their curiosity.

The next day the traveller continues his route, and goes off without taking leave of any one: if he happen to remain longer, it is considered an infringement upon their hospitality, and they let him know it by giving him a smaller allowance, which they continue to diminish as long as he stays, and thus politely force him to depart.

Justice, among the Moors, is prompt and decisive

Civil rights are little respected; but they know the necessity of checking men from committing crimes by the example of punishment. On these occasions, and in ordinary cases, the guilty individuals are conducted before the king of the tribe, who judges them alone, and according to his caprice. When a man is accused of a capital offence, the prince calls in the most ancient people of the horde, and pronounces his judgment according to their opinion, which is instantly carried into execution. Capital punishments, however, are only inflicted upon Negroes: those of the Moors are fines, restitution, and banishment.

The most common diseases of the Moors are intermittent fevers and dysenteries, which are speedily cured by sudorifics, a few simple syrups, and a mild diet. Indeed, the patients often abandon themselves to the sole aid of nature, and quickly recover. The Moors have no physicians, and the old women are employed in taking care of the sick. There may be seen amongst them a great number of old men, who enjoy full health and vigour, though their whole time has been passed in continual exertions; and under all the fatigues and privations inseparable from their mode of life. It has, however, been remarked, that the less they have been connected with Europeans, the less have they been liable to infirmity and disease; because, while they remained in their frugal and simple mode of life, their constitution was not affected by strong drinks or high-seasoned food.

The small-pox makes, from time to time, great ravages amongst the Moors, from whom it passes amongst the southern Negroes: those of the Senegal and the Gambia practise inoculation. Amongst them a death is announced by terrible cries, and the women are employed to make the notification. On this occasion, all those belonging to an encampment repair to the tent of the deceased, where some cry, and others sing his praises. Very often they change parts; so that the women cry, laugh, and sing, alternately. Afterwards the body is washed, dressed, and carried to an elevated spot, where it is placed in a grave, with the face turned towards the east, and the head rather raised. They cover the grave with stones, to secure the corpse from the attacks of carnivorous animals.

Their dress is very simple. The rich wear trowsers and pagnes, or pieces of cotton, which hang down to the ground; the latter forms a sort of great-coat, without buttons, which they pass over the breast, and fasten with a belt; in this belt they place a poniard or large knife, sometimes two; and, as they have no pockets, they put in their bosom whatever they have occasion to carry about them. A handkerchief is attached to the belt, but they use it more for wiping their hands and face than any other purpose: those who are of some respectability

carry two. The common people have their head, legs, and feet, naked; but the others wear Morocco slippers, or, sometimes, half-boots, and always round the head a roll of white linen, which forms a turban. The latter, likewise, wear a woollen cloak, which is of a white colour, very finely made, and is brought to them from Morocco or Tunis: this cloak is very simple, and has at top a pointed cape, with which they cover their heads; at the end of this hood is a long string with a tassel. They never wear sabres, except in the army; and then they either carry them in the hand, or pass them between the belt and their body. When they ride on horseback, the princes wear a sort of jockey-boots, of Morocco, and a mass of arms, which are fastened to the saddle-bow; and they carry a lance or sagaye in their hands. The others ride almost naked, but are always armed either with muskets, bows and arrows, or sagayes.

The kings are dressed in finer stuffs than the other Moors: they have likewise larger tents, and are remarkable for being covered with white linen or cotton.

The head-dress of the Moorish women is composed of a bandeau of white cotton, a part of which is larger than the rest, and serves as a veil for the face when they go in the sun: they often go veiled from head to foot. They have fine and long hair, which they plait, and leave flowing on their shoulders: they wear long trousers, shifts with very wide sleeves, and a girdle under the bosom; and round the neck a piece of linen, generally blue, which hangs down to the heels; they walk with their legs and feet naked; but the princesses, when they pay visits, or on days of ceremonies, use European slippers.

Their religion is Mahometanism; and they are very zealous, but ridiculously superstitious, and cover themselves

with charms: their priests have these articles ready prepared for all circumstances and occasions, and sell them at a very high price.

These charms, or amulets, are various, and contained in little cases of Morocco, made with considerable ingenuity: they have some for the head, others for the eyes, and, in short, for all parts of the body, as well as for all diseases, dangers, and sorceries: they hang these charms in every corner of their tents; they cover their oxen, camels, and horses, with them.

In the Desert, they have no mosques, but they meet in the open air: for the duty which they most scrupulously observe is that of prayer, of which there are several repetitions in a day, and the first of which begins before sun-rise.

The priest is remarkable for his long beard, and is dressed in a piece of woollen cloth, half white and half crimson, which floats loosely about his body. His figure is, in general, emaciated by fasting and the continual wearing a kind of chaplet of an enormous size; and his voice is melancholy and lamentable. He begins his office by ordering the people to come and range themselves under his banner, to hear and sing the praises of the Prophet: they all run towards him with the most holy respect. The priest first inclines himself towards the earth, scatters with his hands that on which his feet have rested, and then, taking a handful of that which has not been sullied by his steps, he, for want of water, rubs it over his face, hands, and arms, in order to purify himself; in which action the people all imitate him.

The commerce of these Moors extends to every object with which they can traffic, and to every thing that holds out a prospect of advantage.

## CHAPTER IV.

## NEGROLAND AND SIERRA-LEONE.

*Situation, Climate, Soil, &c.*  
NEGROLAND is an extensive country of Africa, reaching from eighteen degrees of west to a hundred and fifty degrees of east longitude, and from ten to twenty degrees of north latitude. It is bounded by the Great Desert of Zaara, on the north; by unknown countries, on the east; by Guinea, on the south; and by the Atlantic Ocean, on the west; and is watered by the great river Niger, which runs through it from east to west. The entrance into the Niger or Senegal River is narrow

and difficult; but, after sailing up eight or ten leagues, it is found broad and deep; and, excepting about five leagues on each side above the mouth, which consists of sandy and barren ground, the banks are covered with stately trees, and the country appears tolerably fertile.

To the east and north-east of the island of Snegal, the country, as far as is known, is overrun with woods and marshes; the Senegal, Gambia, and Sherbro, which are regarded as branches of one immense river, passing through it, in their way to the Atlantic Ocean. During the rainy

months, which continue from July to October, they lay the whole country under water; and, indeed, the sudden rise of these waters is incredible to persons who are unacquainted with the violent rains that fall between the tropics. At Galam, nine hundred miles from the mouth of the Senegal, the river rises gradually, during the rainy season, above twenty feet perpendicular over part of that flat coast, which of itself so freshens the water, that ships laying at anchor, at the distance of three leagues from its mouth, generally make use of it, and take in water there for their voyage home. When the rains are at an end, the intense heat of the sun usually dries up those stagnating waters which lie on the higher parts, and the remainder from lakes and marshes, in which are found all sorts of dead animals. At this season the winds blow so hot from the land, that they may be compared to the heat proceeding from the mouth of an oven, and bring with them an intolerable smell. The lions, tigers, and other wild beasts, then resort to the river, and seek a respite from the intolerable heat, by steeping their bodies under water: the birds, also, soar to an immense height, and fly a prodigious way over the sea, where they continue till the wind changes.

SIERRA LEONE is so called from the river of that name, which is said to have derived this appellation from the great number of lions that infest the adjacent mountains.

A British settlement was formed, in the year 1791, on this part of the coast of Africa. The purposes for which it was established were, the introduction of Christianity and civilization among the natives of Africa. This colony is situated in eight degrees twelve minutes north latitude, and about thirteen degrees west longitude from Greenwich, on the south bank of the river Sierra Leone: this river is near two leagues wide at its entrance, and has a safe and deep channel for ships of any burden, at all seasons. About six or seven miles from its mouth it divides into two branches, one of which contains Bance Island, and runs to Rokelle and Port Logo; the other is called Bunch River, in which the island of Gambia is situated.

On the north of Sierra Leone the land is low and champion, producing abundant crops of rice; the cultivation of which, and the making of salt, constitute the chief occupations of the natives. On the south, it rises into hills, which, forming one upon another, become lofty mountains, which are covered with perpetual verdure. The valleys near the sea are inhabited, but the mountainous parts are neglected. The natives cultivate little more rice than is necessary for their own consumption; so that, when a crop fails, they are reduced to the greatest distress.

The distinction of seasons here is into rainy and dry. From December to June may be denominated the dry

season; the other months constitute the rainy and tornado season. The tornados generally commence early in June, and continue the greatest part of July: they begin again some time in October, and last till the end of November. A singular circumstance is, that they always happen at or near the time of high or low water; from which circumstance, it is probable, that they are influenced by the same causes that operate on the flux or reflux of the sea.

Towards the middle of December, the air is raw, moist, and cold, and, giving a dangerous check to the perspiration, renders the skin dry and chapt, and frequently causes fevers and agues. Even the birds and beasts droop under the influence of this ungenial temperature of the air; and the very woods shrink from its effects. These winds, which are denominated the haramatans, are frequent along the African coast, from December to March, generally without fog; and some writers describe them as little less than pestilential. It appears, however, that health may be preserved by care and judicious medical assistance, with little more danger than in the variable climate of England.

*Minerals, Fossils, &c.]* Negroland contains mines of iron, copper, silver, and gold, though we are not certain whether many of them are wrought. Mr. Moore informs us, that the gold which the merchants bring down to the European traders on the river Gambia is of a very good quality, and finer than the sterling gold. They bring it in small bars, thick in the middle, and turned round into rings, from ten to forty shillings value. These merchants are blacks of the Mandingo race. They are very unwilling to say much of the interior countries; and all our author could gather concerning the gold was, that it is not washed out of the sand, but dug out of mines in the mountains.

The same author informs us, that there are several hills of a beautiful marble, of different colours, but chiefly red; and that it would be no difficult matter to bring it to Europe. He also mentions another mountain of red marble, mixed with white veins, which are so bright and shining, that they appear like silver. This marble is so hard, that it is used instead of flints by the natives.

The natural salt, formed at the bottom of certain pools near the sea, is a curiosity mentioned by the same author. He reckons eight of these pools, wherein the salt is naturally formed at the bottom of the water, like a scaly stone; which being broke with long iron crows, the salt rises up to the surface, and the natives skim it off, and dry it in the air. Whatever quantity they take, it does not appear to diminish in the least; but this salt, being very corrosive, is only used to cure raw hides.

*Vegetables.]* The palm-tree, in Negroland, Mr. Moore describes as growing to the height of sixty, seventy, or a hundred feet. From this tree the natives extract a sort of whitish liquor, like whey, called palm-wine, by making an incision at the top of the trunk, and inserting a pipe, made

of leaves, through which the liquor runs into gourd-bottles. "This wine," says our author, "is pleasant to drink as soon as drawn, being exceeding sweet, but it is apt to disorder the bowels. In a day or two, however, it ferments, and grows hard and strong, like Rhenish wine; at which time it may be drank without any dangerous consequences. It is very surprising to see how nimbly the negroes climb up these trees, having nothing to assist them but a piece of bark, made round like a hoop, with which they enclose themselves and the tree, and so, setting their feet against the tree, and their backs against the hoop, they ascend very swiftly; sometimes, however, they fall down, and lose their lives, either by missing their footing, or by the breaking of the hoop."

What is called the *ciboa-tree*, seems to be another species of the palm, growing, like that, to a great height, and yielding a wine in the same manner, but not quite so sweet as the former. The trunk of this tree, as well as the palm, is full of sap when young, but very tough when old; and the leaves that grow on the top are of great service in covering of houses.

There is also a species of palm growing in these parts, which yields an oil, called palm-oil, or oil of Senegal: it is of an orange-colour and fragrant smell, and is obtained from the pulp of the fruit, by adding to it a large quantity of boiling water, and stirring them in a kettle over the fire till they are completely mixed. Then, taking the kettle off the fire, they let the matter stand till its more solid parts subside to the bottom; and, having skimmed off the oil that floats on the surface, they repeat the operation by pouring on it more boiling water. This oil is of the consistence of butter, and used as such by the Africans, who also burn it when old. In Europe it is esteemed a good remedy against cold humours, and is said to strengthen the nerves, give ease in pains of the gout, remove weariness, and relax contracted parts.

Mr. Stibbs has given a description of a tree called *pau de sangue*, or blood-vessel, from a reddish gum which it yields. This tree grows plentifully all up the River Gambia, and is a hard wood, of a beautiful grain, and polishes finely, so that it is very proper for cabinet-work: but, as it does not grow to any great height or bulk, it is not easy to find one that will produce a plank of fifteen or sixteen inches broad. It grows generally in a dry rocky soil, on the sides and tops of hills; and, when the wood is first cut, it has an agreeable smell. Upon wounding this tree, the juice oozes out like drops of blood, which, joined together, and being dried by the sun, congeal into lumps. Mr. Moore has had some as large as pullets' eggs; but he gives no account of the trees growing so plentifully near the river as Mr. Stibbs represents.

The principal commodity on the banks of the River Senegal is gum Senegal, which is used both in medicine and

in many arts and manufactures, particularly by silk weavers, dyers, and painters in water-colours. The tree, from which it is produced, is described by Lebat as a species of acacia; being small, prickly, full of branches, and covered with very narrow leaves, moderately long, and of a perpetual verdure. According to some authors, it bears a white flower, composed of five leaves, which form a kind of cup; but other naturalists represent it as formed of one leaf, in the manner of a funnel, and the flowers are in clusters; the flower is succeeded by a pod, three or four inches long, filled with small, round, hard, and black, grains, which serve to propagate the species. Of this kind of gum-tree there are three forests, all in the desert north of the river, and nearly at equal distances from it. Every year produces two crops of gum; the first in December, and the other in March. The first tears or exudations are the largest, driest, and most pure, with every other advantage required in this drug; and the other more soft, glutinous, and impure. The December crop is gathered after the rains have ceased, and the moisture of the earth has rendered the sap more abundant; but that in March is procured by making incisions in the trees, which have then too little vigour to produce it of themselves. The natives, who feed upon this gum after it is dissolved in milk, sell it by a cubic measure, called a quintal, which holds about two hundred weight; and this they exchange for goods of about two shillings value. The white and smaller tears of this gum are often sold for the true gum Arabic, and indeed their properties and qualities are much the same.

The banana-tree bears a fruit six or seven inches long, covered, when ripe, with a yellow and tender skin. Its leaves are two yards long, and about twelve inches wide; and the fruit grows upon a stalk about six yards high, each stalk bearing only one single cluster or bunch, which perhaps consists of forty or fifty bananas. When the bunch is gathered, they cut off the stalk, otherwise it would bear no more fruit. The pulp of the fruit is as soft as marmalade, of a very pleasant taste, and said to be very nourishing. The fruit of the plantain-tree is not much unlike the banana, either in taste or shape, only it is somewhat longer.

The tree called *agon*, resembles a beech, and is extremely poisonous. Its fruit is of an oblong form, like the pod of a bean; and is distinguished, by its size, into three kinds, all of which have the most malignant qualities. Within the pod are enclosed four or five square beans, each encircled with a hard rind, and containing a yellow kernel, from which the poison is extracted. These are used by the natives in poisoning their arrows, and nothing can more effectually answer that purpose, as the smallest quantity, being infused into a wound, proves fatal.

*Animals.]* This part of Africa abounds with elephants, lions, and other wild beasts. Mr. Stibbs tells us, that one morning, as he was examining a hill in the vicinity of

the Gambia, he found, near the top, a lion's den, and soon after heard the lion roaring at no great distance, which occasioned him to hasten to the bottom of the mountain. The den, he says, was cunningly chosen in a solitary place, about three-quarters up the hill, at the foot of a precipice in the side of a rock. It was difficult of access, but large and commodious, yet undoubtedly formed by nature. The track to it, with the footsteps, excrements, and even some of the hair, of the animal, left him no room to doubt but that it was the residence of a lion. The roaring of these creatures he frequently heard in the night, but he could not say that ever he had seen one in the woods. However, he had once the sight of two or three hundred elephants in a drove, coming down to the river to drink, which raised the dust like the smoke of a glass-house fire; and another time he saw a great number of those animals swim across the river, not above a quarter of a mile a-head of his vessel.

Here are also plenty of guanas, which resemble little alligators. The natives say, that, when a man comes near them unawares, they will sometimes break his legs with their tail; which, however, appears almost impossible, the whole animal being seldom above a yard long. The negroes, and some white men, eat the guana as a great dainty; and affirm that it tastes as well as any rabbit.

Snakes and other venomous reptiles abound here, as in most hot and sandy countries. Mr. Moore tells us, "that the natives are much afraid of the black snakes, which he himself has seen three yards long, and as large as the small of his leg. He shot a green snake about two yards long, but in the thickest part not above three inches in circumference. This kind of snake, he was informed by the natives, is not at all venomous; but they have so many that are so, that they seldom go without a remedy about them, in case they should be bitten by any of these poisonous animals."

In some places, there are said to be toads as large as a plate: these are mortal enemies to the snakes, with which they have frequent engagements. There are likewise many centipedes, whose bite occasions a violent pain for several hours, but is not mortal. Spiders of a monstrous size are also found here, and are said to be very venomous.

Several remarkable insects are found near the river Gambia, and other parts of Negroland. Mr. Moore tells us, that during the time of a very dreadful tornado, a sort of large flies, with long wings, came on board a sloop in the river, in such prodigious numbers, that flying into the flame of the candles, the table was soon covered with those that had burnt their wings; and others, which were not burnt, shed their wings as they walked along the table, and then were nothing but so many large maggots.

The mosquitoes are the greatest plague of any vermin

on the river. They are even worse than the sand-flies, which are so little as hardly to be discerned. These, if any wind be stirring, are notable to bite; but the mosquitoes regard neither wind nor any thing else, giving a person continual disturbance, especially in the night-time. They may be compared to our English gnats, but are much more troublesome; when they bite, the part itches very much, and cannot be scratched without great danger.

In the rainy season, the frogs, of which there are vast numbers, are much larger than those in England, make as much noise in the night as a pack of hounds, and not unlike it at a considerable distance. The noise, together with that of the screech-owls, and the wild-beasts in the woods and mountains, is extremely disagreeable.

*Cities, &c.*] BORNOU, the capital of the kingdom or province which bears the same name, is situated in a level country, near the banks of a small river; it is encircled by a strong wall, of considerable height, and encompassed with a ditch. The city has seven gates, that are regularly shut every evening about sun-set; but the streets are erected in a careless manner, without any regard to order or regularity.

The houses, which, exclusive of their dimensions, are exactly similar, are divided into parallel squares, subdivided into apartments, except the interior space, which is left uncovered; there is likewise a detached square at the back of each house, for the protection of cattle. The rooms in the largest houses are commonly eleven feet in height, and twenty in length and breadth. The walls are composed of alternate layers of clay and stone, plastered with tempered clay, and white-washed. The roofs, which are constructed of branches and brushwood, are water-proof, for about two years; but, at the expiration of that time, they require some repairs, as they cannot longer resist the violence of the frequent storms.

The furniture is extremely simple, comprising merely a skin, or mat, to sleep on, a few articles of pottery, a lamp, a kettle, and some wooden bowls or dishes. The higher class of natives, however, have handsome carpets, leather cushions, brass candlesticks, and copper utensils.

This city is furnished with several mosques and public seminaries, where the children are instructed in the doctrines of the Koran. The palace is surrounded with a high wall, in a corner of the town, and the principal mosque is erected in the centre. A market for provisions is likewise established in the city, at which a camel will generally sell for six or seven pounds; a horse from three pounds to seven pounds ten shillings; a cow or bull, six shillings; an ostrich, six shillings; a sheep, three shillings; and an antelope, one shilling and six-pence, sterling.

The city of KASSINA resembles in appearance that of Bornou, and is the usual residence of the monarch: it is situated at the distance of five days journey from the River

Niger. The cowries, that are south of the River, these shells are shillings and three

The higher the houses, the more carpets, leather cushions, and public squares and public squares are surrounded with a wall, and the principal street for provisions, in which a camel will be carried from three or four cows or bull, six or seven, three shillings, and a few pieces, sterling.

The appearance that of a monarch: it is from the River

Niger. The currency consists of little shells, called cowries, that are also used by the Negro states, on the south of the River Niger: two thousand five hundred of these shells are equivalent to a mitkal of Fezzan, or ten shillings and three halfpence sterling.

*Religion, Government, &c.*] The ruling powers are Mahometans, who usually speak Arabic, and decipher the Bornou language in Arabic characters. Many of the common people still retain the Pagan opinions of their forefathers; but this diversity of religion never affects the intestine peace of the country.

The natives acknowledge the existence of a God, who made and governs all things: but they have no idea of thanking him for benefits, or deprecating his wrath. Their offerings are made to their genii, who are supposed to be the immediate agents of the deity. These genii are small images of clay, in the rude form of a man: they are generally placed at the foot of a tree, and a small shed is erected over them. To these they offer the most insignificant articles, such as bits of cloth, cups, brass-rings, or beads. When they wish to render them propitious, they make small libations of some liquor, and drink the rest themselves, before the altars. Besides these, they have small images of wood, painted black, which may be considered as their lares, or household gods; but they meet with little attention, except on particular emergencies, when their assistance is deemed necessary.

The monarchy of Bornou is elective, though the king assumes the title of Sultan; and hence the felicity of the people is frequently destroyed, while their pride is gratified, by so splendid an acknowledgment of their power. On the demise of a king, three of the chief citizens are nominated, to select, from among the princes, a successor to the government, without any regard to the rights of the first-born. During this deliberation, the members of the royal family are confined in separate apartments, and when the election is made, the new monarch is liberated, and conducted in silence to a spot, where he beholds the lifeless remains of his father. An oration is then pronounced over the corpse, in which the virtues and the vices of the late ruler are faithfully described, and the various measures recited, that tended to immortalize his honour, or tarnish the glory of his reign. This harangue is always closed by these words, which are addressed to the subject of their choice, "The end of your mortal career is before your eyes; the eternal, that must succeed, will be happy or miserable, in the same proportion as your actions shall prove a blessing or a curse to your subjects."

The successor is then conducted to the palace, amidst the joyous acclamations of his people, who invest him with a complete authority over the slaves of his father, and give him two-thirds of the lands and cattle, retaining

the other part as a suitable portion for the other branches of the royal family.

His majesty's brothers are then admitted, who prostrate themselves before the throne, and publicly promise allegiance, by kissing his hand; but, if their sincerity is suspected, they are either doomed to perpetual captivity, or removed by death; sometimes an ambitious or popular prince veils his disloyal intentions with the specious disguise of warm attachment, till he has created a party sufficiently powerful to dethrone the reigning brother, and seize upon the throne: such an example, if successful, immediately raises a similar attempt, and, unless he secures his ill-acquired greatness, by the extirpation of his own family, a just retaliation inevitably descends upon him.

Such of the royal children as are accounted too young to receive the division of their father's wealth, are brought up at the palace, till they arrive at years of discretion, when they are invested with their respective portions. Each of the four lawful wives, belonging to the deceased monarch, has a separate dwelling assigned her, with an establishment suitable to their dignity. The royal concubines are permitted to return to their friends, with all their ornaments and apparel, and are at full liberty to enter into the marriage-state, whenever they think proper.

Governors are appointed by the king over the various parts of the empire, and the execution of criminals is left to the direction of the *cadi*, who generally causes a slave to behead the malefactor. In this instance the humanity of the sovereign appears considerable, when compared with the neighbouring princes, who both act as judges and executioners among a wretched people.

The revenue of the king arises from his hereditary lands, and taxes upon various articles of commerce; besides which, he might procure an immense sum from the salt-lakes; but, though the neighbouring parts and several Negro countries are totally destitute of this valuable article, the provincial traders of Agades are permitted, according to an ancient custom, to load their camels every year, at the lakes of Bornou, and thus monopolize all the profits of the trade. The military force consists chiefly of cavalry, whose arms are lances, sabres, pikes, and shields, composed of hides. If the sovereign finds it necessary to raise an army, he commands his servants to place a date-tree at one of the gates in the capital, for the horsemen to pass over singly, till the tree is worn asunder by the horses' feet, which is then regarded as a signal, that the needful levy is completed.

*Customs, Manners, &c.*] Children, of both sexes, in Negroland, wear no clothes till they are thirteen or fourteen years of age, when those of distinction wear a cotton cloth from the waist downwards, while the poorer sort remain in their primitive nakedness. Women of middle

rank wear girdles of rushes, or palm-leaves, neatly interwoven, and hanging down to their knees. They likewise have copper, brass, or iron, bracelets round their wrists, and large rings upon their legs, to which they hang silver bells. The most common dress is the tony, which is made of woollen cloth, manufactured by themselves. This the females tie round their waists, letting it fall to the knee; but the men, fixing it before, bring it between their legs, and fasten it to a girdle behind. The women endeavour to attract the regard of the men, by drawing a line of white, yellow, or red paint across their forehead, with circles of the same round their arms, legs, and waist. The men wear much the same ornaments, which differ only in the size of the bracelets and rings on their arms, legs, fingers, and toes. The poorest negro is seldom without some of these, and their number is increased in proportion to the wealth or vanity of the wearer.

In general the common people go hare-headed and barefooted. The principal men, in imitation of the Europeans, wear a red cap and sandals, and also ornament their shirts and drawers with worsted embroidery. All the men are provided with a large straight knife, hung in a sheath on the right thigh, by way of defence, and another smaller one, for the purpose of eating. Tattooing is pretty general, which not only distinguishes the different tribes from each other, but likewise marks the condition of the party, as a slave is not allowed to be tattooed in the same manner as a free-man. Some raise the skin in such a manner as to make their bodies appear embossed; others are punctured with a sharp-pointed instrument, dipped in a liquid, which leaves an indelible mark.

The negroes of the interior countries are extremely libidinous; but they are said to be temperate, gentle, and sociable. They have an aversion to the shedding of human blood, and seldom make war but in their own defence. They are united by friendship, and ready to assist and relieve each other. Hence, if a friend be under misfortunes, they will share their clothes, their provisions, and all they have, with him; and, should it be their case to be distressed, they would meet with the same treatment in return.

In Sierra Leone, no notice is taken of a stranger on his arrival till he announces his visit in form, and then he is provided with every necessary apart from the family. When the women meet upon visits, they join their right-hands, and curtsy; but the young and unmarried embrace with the most apparent affection. Mothers never wcan their children till they are able to walk, and carry a calabash of water, which they are instructed to do as soon as possible. Sterility is dreaded, as the greatest reproach. In their domestic arrangements, the head wife, surrounded by her husband's women, is employed in spinning or carding cotton, while one of the company amuses the rest by telling stories.

Both sexes are passionately fond of dancing, and they seldom lose the opportunity of a fine evening for enjoying this diversion. Besides the birth of a child and the arrival of a friend, even the death of a relation, furnish them with a pretext for their favourite amusement. These dances are called cullunjee; the performers in which are dressed in a grotesque style, and in their hands they hold pieces of flat wood, which they clap together, by way of keeping time.

The most favourite musical instrument is the drum, and of this there are various sorts, which give a different sound. They have also two kinds of stringed instruments; one is a sort of guitar; the other is in the form of a Welch harp, but not above two feet long. The strings are made of the fibres of a plant, and the hair of an elephant's tail.

The carpenter, blacksmith, and charn-maker, are the only trades in general estimation among them, and their workmanship is not destitute of neatness and ingenuity. Every family spin and weave their own cloth, and make up their clothes.

The houses are only one story high, and they are either round or an oblong square, the sides being formed of upright posts, wattled, and covered with a stiff clay; the roofs are supported by long poles, and thatched with grass. They have, generally, two doors on opposite sides, which admit an agreeable draught of air in this hot climate. Their doors, however, are not like ours, except amongst those who pique themselves on imitating the Europeans: the others consist of a mat fixed to the roof; and, when this mat is let down, no one must be so rude as to enter without giving notice, though this precaution is unnecessary when the mat is raised. The edges of the roof project seven or eight feet over the wall, and is thus converted into a sort of portico, which secures the wall from rain, and, with certain additions, serves as a place for their stores. The junction of several of these habitations forms a town, which often covers a quantity of ground, and is generally enclosed with a mud-wall. When the people are at war, they have several barriers, which they enclose always at sun-set, and never open them on any occasion whatever till morning: they are guarded all the night by vigilant sentinels.

In the more distant parts of the country, the natives, however, build large houses of bricks, baked in the sun; and these houses may last many years, if care be taken to secure them from the injuries of the weather. No chimneys are constructed in their habitations, though they make a fire in them every evening, to drive away the mosquitoes, and prepare their food.

The common people, slaves, and children, sleep on mats or dried skins, spread upon the ground; but the free negroes, and those in easy circumstances, have a kind of

alcove, formed which are hung men's apartme treasure, which they place the dome looking-glass.

alcove, formed of four stakes driven into the earth, on which are hung mats, in the manner of curtains. In the men's apartments is a box to contain their clothes and treasure, which is covered with a mat or a skin, whereon they place their weapons. The women's chamber contains the domestic utensils, mats, stools, and always a looking-glass.

"Polygamy in these regions is practised," says Durant, "in its utmost latitude. The women are frequently hostages for alliance and peace; and the chiefs of two tribes, who have been at war, cement their treaties by an exchange of their daughters; private individuals do the same; and this circumstance may be the reason why the chiefs, in particular, have such a great number of women.

"A girl is frequently betrothed to a man as soon as she is born; and, on the day agreed on for marriage, the bridegroom places on the road which the bride has to pass several of his people, at different distances, with brandy and other refreshments; for, if these articles be not furnished in abundance, the conductors of the bride will not advance a step farther, though they may have got three parts of the way, on their journey. On approaching the town, they stop, and are joined by the friends of the bridegroom, who testify their joy by shouting, drinking, and firing their guns.

"At this period an old woman takes the girl on her shoulders, and the attendants cover her with a fine veil. Mats are now spread before the old woman, who must not, on any account, touch the ground with her feet. In this manner the bride is conveyed to the house of her husband, followed by the friends of both families, singing, dancing, and firing off their muskets."

These people have the greatest veneration for the dead; and they pay them the last duties with profound and melancholy respect. As in Europe, they bury them either in the morning or evening, as suits their convenience. The place of interment is sacred, and is always a wood beyond the town. One of their dogmas is, that none die without having a presentiment of their death, unless they be victims of magic or poison; or when the charms of an enemy have been more powerful than the talismans which they carry about them.

The body that is to be interred is wrapped in a piece of white linen, and placed on a bier, which is carried on the heads of six boys, or six girls, according to the sex of the deceased: the corpse is preceded by a friend, who holds a green bough in his hand, and asks the body several questions, as to the cause of its death. His principal interrogatories are, "Did you foresee it?—Is it natural?—Is it in consequence of poison or magic?" The bearers interpret the answers of the deceased according to the movements of the body, which they pretend to feel. A simple rotation indicates that the death was natural; in which case the body

is asked, what could induce it to die and leave its friends; whether it was from chagrin, at not being able to procure such good clothes, or such a fine musket, as a certain person; or whether it was through despair, at not having taken vengeance upon one who had offended it?

A movement forwards is a proof of poison or magic, upon which they immediately attempt to discover the guilty individual, by mentioning to the deceased the names of several persons, not even excepting those of his own family. If the body be silent, it is supposed to be irritated at the suspicion against its relatives, and they beg it to tell them who is the guilty person. To ascertain this fact, they invite it to turn the bier towards the person who carries the branch. If the body should then push the bier forwards, and strike the bough with it, the guilty person is thus named, and the spectators are convinced. Three motions forwards indicate magic, and two poison. The criminal is then seized; and, if the accusation be for magic, he is sold without formality. It often happens, when the deceased is a person of distinction, and the one whom he accuses is poor, that they sell his whole family with him; but, if he be accused of poisoning, they reserve him for a subsequent trial, from which, however, he rarely escapes.

After depositing the dead man in his grave, in which, according to their custom, they throw his best clothes, and whatever else they conceive he may want, they return to the accused, who is confined, but in such a manner that he might escape if he please; and he is informed, that the laws which he has transgressed require the privation of his liberty. As soon as night approaches, the criminal makes his escape to the nearest town, where he invokes the protection of the chief, who is supposed to be impartial. He protests his innocence of the crime, and demands the ordeal of red water. This request is generally complied with, and the friends of the deceased are invited to assist at the ceremony.

On the appointed day, they place the criminal on a high seat, strip off his clothes, and leave him nothing but an apron of plantain-leaves round his waist. He then, in presence of the whole town, who assemble on these occasions, eats rue or cola, and drinks poisoned water. If he die, which almost always happens, he is declared guilty; but, should he live twenty-four hours after the ceremony, he is adjudged innocent.

A person once acquitted by this judgment acquires a general confidence, and has a right to bring an action against the parents and friends of the deceased, for defamation and false poisoning. The latter, in such cases, are always condemned, and pay a fine equal to the injury.

When the accusation of magic falls on a person whom they cannot sell, either on account of his age, or the rank of his family, he is conducted to a field out of town, where

he is obliged to dig his own grave; while the people who surround and guard him load him with insults, and say, as a common phrase—"You kill others, and do not wish that death should strike you in return." During these injuries, he continues his doleful work with an apparent insensibility, and merely answers, "It is true, I have killed such-a-one, and many others; and, if I were to live, I should kill many more." From time to time he takes

measure of the grave with his own body; and, when he thinks it deep enough, they place him at one end, with his face towards it: in this position, one of the assistants give him a violent blow on the nape of the neck, which causes him to fall into the grave on his face; they then cover him with mould, and strike a sharp pike several times into his body. The grave is then filled up, and the name of the criminal is condemned to oblivion.

## CHAPTER V.

### GUINEA PROPER.

**T**HIS country extends from twelve degrees of west to eight degrees of east longitude, nearly in the parallel of six degrees north latitude; and is bounded, on the east, by the unknown parts of Africa; by Congo and the Atlantic Ocean, on the south; by the same ocean on the west; and by Negroland, on the north. It is divided into four parts, under the appellations of the Slave Coast, the Gold Coast, the Ivory Coast, and the Grain Coast; each of which, for the sake of perspicuity, will be separately described.

#### SECTION I.

##### THE SLAVE COAST.

Whidah and Ardrah were, for a long series of time, the principal kingdoms on this coast; but, being subdued by the king of Dahomy, they were annexed to his dominions, which are supposed to reach from the sea-coast about one hundred and fifty or two hundred miles inland, though no European has penetrated above half that distance: the capital, Abomey, lies in about eight degrees of north latitude, and about two degrees of east longitude.

*Soil and Productions.*] The soil of this country is a deep rich clay, of a reddish colour, with a little sand on the surface. In some places, it is light and gravelly; but there is not a stone so large as an egg in the whole country, so far, at least, as it has been visited by Europeans. It produces maize and millet, or Guinea-corn, of different sorts, a kind of kidney-beans, called callavances, and also a species of beans called ground-beans. The Dahomans likewise cultivate yams, potatoes of two sorts, the cassada or mauioka: the plantain and the banana, pine-apples, melons, oranges, limes, guavas, and other tropical fruits, also abound in this fertile country. Nor is it destitute of productions adapted for commerce and manufactures;

such as indigo, cotton, sugar-cane, tobacco, and palm-oil, together with a variety of spices, particularly a species of pepper, very similar in flavour, and indeed scarcely distinguishable from the black pepper of the East-Indies. Dahomy abounds with buffaloes, deer, sheep, goats, hogs, both wild and domestic; poultry of various kinds, particularly pintados, or Guinea-hens, and Muscovy-ducks. The elephant, though its flesh be coarse, is made use of as food by the natives, and dogs are reared for the same purpose.

*Religion and Government.*] The religion of the Dahomans, like that of many other countries, consists of a jumble of superstitious nonsense, of which it is impossible to convey any satisfactory idea to the reader. The Portuguese word *feitiço*, or, as the English pronounce it, *fetish*, signifying witchcraft, has been adopted by most of the maritime natives of Africa, as well as by the Europeans who trade thither. The word, at present, is very comprehensive in its signification, meaning either the several objects of worship, whether ideal or corporeal, the act of worship itself, or the various amulets, charms, and superstitious nummery of the priests, or *fetish-men*, who abound in this country. They observe no sabbath, unless their market-days, which are considered as days of recreation, may be so called. Most of the savage nations have some confused notion of a Supreme intellectual Being, the maker of the universe; but this idea not being easily understood among a people not much addicted to metaphysical reasoning, a variety of corporeal beings have been selected as objects of devotion, such as the sun, moon, animals, trees, and other substances. The tiger is the fetish of Dahomy. Among the amulets, or charms, the principal is a scrap of parchment, containing a sentence of the Koran, which the natives purchase from the Moors who visit this country. This they hang up in their

apartments, which are shapen images, of oil, stuck with feathers. The government

is a despotism, the policy of which is a moderate degree of severity, least in the royal palace, obliged to prostrate himself as the meanest of the sovereign, at pleasure. A native of the apartment of the king arrives in the royal palace, and, rubbing his hands, making expressions of respect, the king's command is obeyed, still continuing the person is permitted to be present, except the earth, when they return.

Strangers are received with the most remembrance, whatever state, and a salutation practised in the for European government they sit, covered, till they make a bow, they resume their seats.

White visitors are cordial liquor, filled with which would be of this kind are received so much for the sake of them. On such while the king holds court, he must drink till sometimes does not emptied, especially with the drinker.

In Dahomy a consular army is commanded by several other subordinate themselves in reading, at the command of these troops chiefly in which they are the males pair to the general's marching at the head of the king takes the field, very great emergencies within the walls of the are enumerated not less

ly; and, when he  
one end, with his  
the assistants give  
neck, which causes  
; they then cover  
several times into  
and the name of

apartments, which are likewise decorated with crude mis-  
shapen images, tinged with blood, besmeared with palm-  
oil, stuck with feathers, bedaubed with eggs, &c.

The government of the Dahomans is a perfect despo-  
tism, the policy of the country admitting of no interme-  
diate degree of subordination between king and slave; at  
least in the royal presence, where the prime-minister is  
obliged to prostrate himself, with as much abject submis-  
sion as the meanest subject, all acknowledging the right  
of the sovereign to dispose of their persons and property  
at pleasure. A minister, on his entrance, crawls towards  
the apartment of audience on his hands and knees, till he  
arrives in the royal presence, where he lays himself flat,  
and, rubbing his head in the dust, utters the most humili-  
ating expressions. Being desired to advance, he receives  
the king's commands, or communicates any particular bu-  
siness, still continuing in a recumbent posture; for not any  
person is permitted to sit, even on the floor, in the royal  
presence, except the women; and even they must kiss the  
earth, when they receive or deliver the king's message.

Strangers are received by the king and all his subjects  
with the most remarkable courtesy. Ambassadors, from  
whatever state, salute the sovereign according to the fa-  
shion practised in their own country. Chairs are placed  
for European governors, or masters of ships, upon which  
they sit, covered, till the king makes his appearance, when  
they make a bow, standing and uncovered; after which  
they resume their seats.

White visitors are always honoured with a glass of some  
cordial liquor, filled by the king's own hand; the refusal  
of which would be considered as an affront. Favours of  
this kind are received with avidity by his own subjects, not  
so much for the sake of the liquor as the honour conferred  
on them. On such occasion, the subject lies on his back,  
while the king holds the bottle to his mouth. In this pos-  
ture he must drink till the royal hand be withdrawn; which  
sometimes does not happen before the whole contents be  
emptied, especially when the king is disposed to sport  
with the drinker.

In Dahomy a considerable standing-army is maintained:  
this army is commanded by an agaow, or general, with  
several other subordinate military officers, who must hold  
themselves in readiness to take the field upon all occa-  
sions, at the command of the sovereign. The payment of  
these troops chiefly depends on the success of the expe-  
ditions in which they are engaged. On extraordinary oc-  
casions all the males able to bear arms are obliged to re-  
pair to the general's standard, every caboceer, or chief,  
marching at the head of his own people. Sometimes the  
king takes the field, at the head of his troops; and, on  
very great emergencies, at the head of his women; for  
within the walls of the different royal palaces in Dahomy  
are enumerated not less than three thousand women. See

36. VOL. I.

veral hundreds of these are trained to the use of arms,  
under a female general, and subordinate officers, appointed  
by the king, in the same manner as those under the agaow.  
These warriors are regularly exercised, and go through  
their evolutions with as much expertness as the male sol-  
diers. They have their large umbrellas, their flags, their  
drums, trumpets, flutes, and other musical instruments.  
In short, the singularity of this institution never fails to  
attract the particular attention of the Europeans, when,  
among other exhibitions, they are presented with the un-  
usual spectacle of a review of female troops.

The king of Dahomy has several palaces; each occu-  
pying a piece of ground of nearly a mile square. That  
at Calmina, which is similar to the rest, is surrounded  
with a very substantial clay-wall, of a quadrangular form,  
and about twenty feet high. In the middle of each side  
is a guard-house, with two centinels at the gate, and a  
guard of armed women and eunuchs within. On the  
thatched roofs of these guard-houses are ranged, on small  
wooden stakes, many human skulls. Such of the inner  
apartments as the Europeans have an opportunity of  
seeing, consist of large courts, communicating with each  
other, generally square or oblong, encompassed by clay  
walls. In each of them is a sort of piazza, or shed,  
formed of posts, about seven feet high, planted in the  
ground, at the distance of about twelve or fourteen feet  
from the wall. The intermediate space is covered with a  
slanting thatched roof, supported by bamboo-rafters, rest-  
ing upon the posts, and reaching to the top of the wall,  
which in this part is also about twenty feet, though only  
eight or ten feet on the other sides of the court. The  
areas of these courts are of the common soil of the  
country; but under the sheds the ground is elevated a few  
inches by a bed of elayed mortar, which forms the floor;  
and the wall is in some parts white-washed with a species  
of pipe-clay, which the country produces. In the middle  
of the palace there stands a large building, of two stories,  
and about thirty or forty feet high, so that the top of it  
may be seen from without. This house seems to be in-  
tended more for shew than use; for the king never dwells  
in it. The whole has somewhat the resemblance of an  
assemblage of farm-yards, with long thatched barns, ho-  
vels for cattle and carts, and low mud-walls, to separate  
them from each other. The interior of the palace is  
scarcely ever entered by any but the females, whose apart-  
ments are guarded from intrusion with more than eastern  
jealousy.

The vulgar among the Dahomans affect to believe that  
their king does not eat. Indeed he does not eat in  
public, though he scruples not to drink. He entertains  
the whites who visit him with great hospitality. They  
often dine in his presence; sometimes in the piazzas, or  
sheds before mentioned, and sometimes in the open area

of one of the courts. On such occasions, the table and the guests are screened from the sun by large umbrellas, held up by attendants, clothed in the country dress. There is no want of table apparatus: the table-cloth is commonly a piece of new linen, cut off for the purpose; the dishes are of pewter or earthen-ware, and the knives and forks silver-handled. The white men, on such occasions, are seated on chairs; the caboceers, and heir-apparent, are placed on the ground, near the Europeans. The dishes are few, but excellent: of these black soup is the chief. It is made either of flesh or fish, with a variety of mucilaginous vegetables, well seasoned with pepper and salt, and enriched with palm-oil. This dish is likewise seasoned with an ingredient which is made of the seeds of a tree, called, in the country, wild tamarind, somewhat resembling those of the cucumber. Their bread is of maize or millet, sometimes boiled into a pudding, and sometimes baked, either with or without leaven; they make also a very light, white, and delicate fermented bread of calavai ces, first stripped of the husks, and a kind of paste or flummery of fermented Indian corn.

At the approach of the customs, which are usually celebrated soon after Christmas, the king leaves Calmina, where he generally resides during the rest of the year, and repairs to Abomey, his ancient capital, and the burial-place of the royal family. About this time he despatches his messengers extraordinary, called half-heads, from having the half of their heads shaved, with his gold-headed cane and compliments to the European governors at Grigwee, inviting them to witness the solemnization of this festival.

An annual present, consisting of a piece of rich silk for a dress, together with some brandy and other articles, amounting in the whole to about fifty pounds sterling, is presented to the king by the governors. These articles are received, not as the consideration by which they hold their respective forts, but as a token of friendship and good correspondence: for the king takes care to make them sensible that he does not accept such presents for the sake of their value, as he always returns more than is equivalent; such as a young female slave, which he presents to each, under the denomination of a washer-woman; and one fine cotton cloth, at least, for a counterpane. Besides this, he entertains them during their stay at Dahomy with the greatest liberality and kindness.

The governors, on their arrival at Abomey, are received with a salute of cannon, and lodged, during their stay, in apartments belonging to the master of the ceremonies. They are liberally supplied with mutton, poultry, and other articles, for their own tables, and those of their attendants, which are sent from time to time by the king or his caboceers.

The celebration of the customs usually continues about a month, during which there is some public exhibition

every fourth or market-day, the intermediate days being employed in preparations. The whole would afford a very amusing spectacle, if it were not for the human sacrifices which are annually made for the purpose of watering, according to the country expression, the graves of the deceased royal family.

One of the first days is set apart for singing and dancing. There are professed singers, who perform by the hour before the king. The songs are mostly extemporary, in praise of the monarch and his exploits; and the performers are rewarded upon the spot, according to the merit of their compositions. Their bards likewise, on solemn occasions, rehearse the whole history of their country, sitting at the king's gate. This recital takes up several days; and they are attended by young men of the best memories, who endeavour to qualify themselves to become their successors, when there shall be a necessity for their services.

Another day is allotted for feasting in the market-place, where a large camp is made for the purpose, and several tents pitched for the accommodation of the king, caboceers, white visitors, and ambassadors from foreign states. Here a very large quantity of viands, previously dressed, and carried in procession by the king's women, in their best clothes, is distributed, not only among the more distinguished guests, but even without the camp, where the vulgar partake plentifully. A liquor, brewed by the women of the palace, is likewise dealt out with a liberal hand upon the same occasion; nor is there any want of brandy and other liquors from Europe. In short, the whole resembles what is sometimes seen at a general election, with this difference, that it is more orderly.

This ceremony is generally concluded by the following extraordinary spectacle:

Contiguous to the palace, a large stage, of about one hundred feet by forty, is erected: this is supported by a vast number of piles, ten feet long, driven into the ground, upon which are laid joists, and then branches and straw. The wall of the palace forms the boundary behind; the front and sides are railed. The floor, as well as the railing, is covered with carpets and country cloths; and the front and sides are adorned with a multitude of flags, streamers, and large umbrellas, of various colours, some of which are made of gold and silver tissue. At a little distance, a fence of thorns keeps off the rabble. On this stage are piled a great quantity of cowries, strung in branches of two thousand each, pieces of brocade, and other silks, strings of coral, European and country cloths, Brazil tobacco, pipes, bottled liquors, and a variety of other articles. At an appointed time, the king, with all his caboceers and vassals, repairs to the stage, where the Europeans also are present. Here each officer is allowed to choose a cloth for himself, the prime-minister making

the first election, according to their rank is given to each. cowries, and through the multitude. All the candidates follow his example, a few bunches of the favourite seraglio stand between them, handed to them by the king, prepared for this sport. The girl round the loins, in the expectation of the cowries, parties, in order to get the cloth. Such a competition between the cowries; but as no one is killed by the accidents follow. The king is usually making parties, closed with the deities, together with several other stages, to be made

*Arts and Manufactures.*  
The Dahomians are induced by the Dahomians to be expected tools. Their looms are not so ingenious; yet they are not so common, which are held by the women, and are often counterpanes, at a very well, especially in the night. They likewise make many other things, which they sometimes dye of a colour, which is so common. They likewise make

minister making

the first election, and the rest following his example, according to their rank. Sometimes, also, a string of coral is given to each. After this the king takes up a bunch of cowries, and throws it over the fence, among the multitude. All the caboceers, and Europeans, if they please, follow his example, and toss over all the goods, except a few bunches of cowries, which are reserved for some of the favourite servants, who are permitted to take their stand between the stage and the fence, and which are handed to them by their masters. The rabble come prepared for this sport; being all naked, except a strong bag, girt round the loins, and which hangs before, for the reception of the cowries. Some associate themselves in parties, in order to be able to carry off a piece of silk or cloth. Such a prize becomes frequently the object of competition between two parties, and a violent struggle ensues; but as no kind of weapon is allowed to be carried by the people assembled on this occasion, no fatal accidents follow. The effusion of blood, however, commonly making part of a Dahoman exhibition, this also is closed with the death of, at least, one human victim, who, together with several animals, is thrown, bound, from the stage, to be murdered below.

*Arts and Manufactures.*] The specimens of art produced by the Dahomans discover a degree of perfection little to be expected from the rude simplicity of their tools. Their looms are the most awkward machines imaginable; yet they manufacture very durable cloths of cotton, which are held in very great estimation among themselves, and are often purchased by the Europeans, for counterpanes, at a high price. Their dyes stand washing very well, especially their blues, which are not inferior to any. They likewise weave cloths of the palm-tree leaves, which they sometimes dye, but oftener wear in the natural colour, which is somewhat higher than that of nankeen. They likewise make neat mats of the same substance.

The implements of the forge are very simple. The bellows consists of two bags of rough goat's skin, with a stick of about three feet in length, fixed perpendicularly to each, and also a horizontal tube (an old gun-barrel) to convey the air from the bag, through a little clay party-wall, to the fire. While the smith is at work, a boy holds a stick in each hand, blowing the fire with alternate puffs, so that the air is expelled and drawn in by turns through the two pipes, there being no other communication with the bags. In this way they contrive to make a sufficient heat, and fabricate not only the necessary implements of husbandry, but carpenters' tools, cutlasses, spears, &c.; the hammer which they use is a thick piece of rounded iron, of about a foot in length, which they hold by one end. Besides blacksmiths, there are a sort of braziers or silversmiths, who make bracelets, handles to cutlasses, rings for the fingers, and other trinkets, of brass or silver,

which they melt in crucibles of their own making. Some of them are good potters, having learned that art from the Portuguese. Though their earthen-ware is thin, yet it is very substantial, and equally good for use as any made in Europe.

*Customs, Manners, &c.*] The natives of Dahomy, of both sexes, are generally tall, lusty, and well-proportioned. Their character is marked by a mixture of ferocity and politeness. The former appears in the treatment of their enemies, and in the celebration of those customs which have been sanctioned by the immemorial practice of past ages, under the idea of performing a grateful oblation to the deceased: the latter they possess far above all the African nations with whom Europeans have hitherto had any intercourse; this being the only country, in this part of Africa, where strangers are not exposed to insults, and where it is easy to reside in security and tranquillity. The nature of their government makes them very reserved with regard to every state transaction; but, on occasions where this restraint is unnecessary, they are very affable and communicative.

In Dahomy, the dress of the men consists of a pair of striped or white cotton drawers, of the manufacture of the country, over which they wear a large square cloth, of the same, or European manufacture. This cloth is about the size of a common counterpane, for the middling class, but much larger for the grantees. It is wrapped about the waist, and tied on the left side by two of the corners, the other ends hanging down, and sometimes trailing on the ground. A piece of silk, or velvet, of sixteen or eighteen yards, makes a cloth for a grandee. The head is generally covered with a beaver or felt hat, according to the quality of the wearer. The king, as well as some of his ministers, frequently wears a gold or silver laced hat and feather. The arms and upper part of the body are usually naked; and the feet are always bare, none but the sovereign being permitted to wear sandals.

The dress of the warriors consists of what is commonly called a grass-cloth, made in the country, of the skin of palm-tree leaves, parted into small threads, knotted and wove. This is afterwards tinged with various dyes, and wrapped round the loins. They also wear a cartouch-box, of their own manufacture, a powder-flask or calabash, with many grotesque ornaments, which, together with the uncouth devices painted on their faces and bodies, give them a very fiend-like appearance. Every Dahoman also carries a tobacco-pouch, containing tobacco, a flint, steel, and tinder, together with one or two tobacco-pipes, in a neat wooden case.

The dress of the women, though simple, consists of a greater number of articles than that of the men. They use several cloths and handkerchiefs, which they wrap round the waist, and cover occasionally the breasts and upper

part of the body. They adorn the neck, arms, and ankles with beads and cowries, and wear rings of silver or baser metals on their fingers: girls, before the age of puberty, wear only a string of beads or shells round their loins, and young women usually expose their breasts to view. The children go quite naked till they are ten or twelve years of age, when they wear a cloth fastened round the middle.

Their habitations are composed chiefly of mud, clay, and wood. The dwellings of the better sort are built of the same materials as those of the common people, but are more lofty and spacious. The houses in general have small huts adjoining them, most of which are divided into different apartments, by partitions made of rushes, bound closely together: these apartments are for the accommodation of their wives, each woman having one to herself.

Their furniture is very simple, consisting of a few stools, some earthen pots, to hold water and dress victuals, and a few small wooden cups. The poorer sort have only a mat to lie on, which they spread on the ground, covering themselves with the skins of beasts. The better sort use quilts, made of rushes, on which they lay a fine mat, with a bolster, and by it keep a large kettle, with water, to wash them. They all keep a good fire in their bedroom, to preserve them against the damp of the rainy season, and always sleep with their feet towards it.

Among the amusements which prevail in this, and indeed every part of Guinea, dancing is so universally admired by both sexes, that it is the custom for them to assemble every evening at the market-place for that purpose. On these occasions they dress themselves in their best attire. The women have a number of small bells hanging at their feet and legs, and the men carry small fans in their hands, made of the tails of elephants or horses. Those who compose the dance divide into couples, opposite to each other, and the dance commences by their throwing themselves into many wild ridiculous postures, advancing and retreating, leaping, stamping on the ground, bowing their heads to each other as they pass, and muttering some strange noise. The men then strike each other alternately with their fans, and the women lay large circles of straw on the ground, into which they first jump, and dance round them, then throw them up into the air, and catch them with their hands. Thus they divert themselves for about an hour, when they break up the dance, and return to their respective habitations.

In this country the marriage-ceremonies are very concise. When a man fancies a young woman, he applies to her father, and desires her for his wife, which is seldom refused. He then presents her with a fine pague, or garment, as also necklaces and bracelets; after which he provides a grand entertainment, which concludes the ceremony. If a slave is inclined to marry a girl who is

the slave of another, he asks her of her master, without applying to her parents. The boys of this marriage belong to the master of the wife.

Polygamy is universally prevalent here. It is no uncommon thing for a poor man to have forty or fifty wives; a chief, or grandee, three or four hundred, and a king as many thousands. These wives may be considered only as so many slaves; and, indeed, the principal part of those belonging to the great are, probably, captives, that happen to please their masters, who, therefore, rather choose to keep them than sell them to the Europeans.

The relations and friends on the death of any one immediately assemble, and, surrounding the corpse, express the most hideous lamentations. They then wrap the body in an old cotton cloth, and put it into a coffin, made of the bark of a tree, covering the face over with the skin of a goat. In this manner they expose it in the open air for half a day, the favourite wife sitting by it all the time, and rubbing the face with a wisp of straw. If the deceased be a woman, the husband uses the same ceremonies. During this time, the nearest relations, appointed on the occasion, sing mournfully, and beat their brass basins, till the bearers come to remove the body, and every thing is ready for the procession. In the interim, an old woman goes from house to house, and collects something for the funeral-charges, towards which every person in the town or village is obliged to contribute in proportion to their circumstances. With the money thus collected they purchase a cow or an ox, which they present to the priest for performing the functions of his office. This beast the priest sacrifices, and sprinkles the fetish of the deceased with its blood, which is considered as a propitiatory offering for the dead. The corpse is then laid on a board, and the company sing and dance round it for a short time; after which it is carried to the grave by men, but only women are suffered to attend as mourners. The chief or favourite wife walks immediately after the corpse; and, if the deceased be a woman, the husband only follows it, not any other man being permitted to attend. When they come to the place of interment, the body is immediately laid in the grave, which is generally made about four feet deep. It is inclosed with stakes, and over it they raise a shed or covering, so that neither rain nor beasts can come near it. When the body is deposited, the women creep beneath this shed, and renew their lamentations, by way of a conclusive farewell. They then raise a square heap of earth over the body, on which they lay the principal tools and instruments used by the deceased in his life-time, as also his clothes and weapons.

es along the shore,  
inland, after which

it divides itself like two arms, being in some places thirty or forty miles broad, and in others much more. It is bounded on the east by the kingdom of Ardrati; on the west, by the river Volta; on the north, by the country of Dahomy; and, on the south, by the gulf of Guinea. It is a fine, populous, and fertile country, being watered by two excellent rivers, both of which take their rise in the kingdom of Ardrah. The southernmost of these runs within about a league and a half of the sea, and is called the river of Jakin, from a town of that name in the kingdom of Ardrah: it is only navigable for boats, some parts of it not being more than three feet deep. The other river is called Euphrates: it runs about a league to the south of Xavier, or Sabi, the capital of Whidah, and is much deeper than the former. The water is exceeding good, and the river would be navigable, were it not for the banks and shoals in the channel. The road where the ships ride is at the mouth of this river, but in the months of April, May, and July, the landing is exceeding dangerous, on account of the prodigious swell of the sea at those times.

The soil of this country is so fertile, that, as soon as one harvest is over, the ground is sown with some other grain; so that they have two, and sometimes three, crops in a year. They plough their land in ridges; by which means, the dews falling into the hollows, and the sun heating the sides, whatever is planted soon comes to perfection. The grain consists of rice, millet, and maize, or Turkey corn. The negroes are so industrious that they will not suffer any spot of ground to lie uncultivated; even the enclosures of their houses and villages are planted with melons and other fruits.

The vegetable productions of Whidah are, in general, similar to those of the kingdom of Dahomy: they have, however, one species of pea, of a very peculiar nature, producing small trees, like those that bear the pimento, or red pepper; but they have no flower, and seldom exceed six feet in height: the peas grow in a bag, or membrane, almost as strong as parchment, placed beneath the stem, among the roots which yield nourishment to the plant: the bag contains, in general, about one hundred and fifty peas. When the leaves begin to grow yellow, they pull up the plant with the roots, open the bag, and extract the peas. But if they wish to have them tender, like those of Europe, they pull up the plant while the leaves are green. These peas are sown at the end of the rainy season, and they grow so fast that they are fit to gather in six weeks. They are as well tasted as the peas of Europe, are easy of digestion, and make excellent soup.

As the people in general leave no part of the country uncultivated, they are seldom troubled with wild beasts: but, in the more inland parts, there are elephants,

buffalos, and tigers. There are many deer and hares, the latter of which are much like those of Europe; they have also a greater plenty of all sorts of apes and monkeys than in any other part of Guinea. Their tame beasts are oxen, cows, goats, sheep, and hogs, which are exceeding large, and the flesh as white and sweet as those of England. This, indeed, is little to be wondered at, for the poorer sort of negroes pay much more regard to their hogs than to themselves, and feed them much better. Their tame poultry consists of coeks and hens, geese, ducks, and turkies.

They have great plenty of wild-fowl, as partridges, pheasants, thrushes, pintados, wild ducks, teal, wood-cocks, ortolans, and ring-doves. There are also many parrots, which are chiefly grey, with some red feathers on the head and the tips of their wings and tails. The crown-bird is likewise found here, but is not so beautiful as those of the Gold Coast; however, here are several other sorts of birds, among which the most peculiar are the Kurbalot, the Guinea-hen, and the Numidian Damsel.

The Kurbalot, or fisher, is a small bird, about the size of a sparrow, and its plumage beautifully variegated; the bill, which is as long as the body, is very strong and sharp, and is furnished on the inside with small teeth, not unlike those of a saw. They build in high trees, by the sides of the rivers, and their nests are composed of earth, mixed with feathers and moss: they make their nests at the extremity of the most slender branches, where they hang by a reed, or straw, about a foot long; they are of an oval form, and are entered by a projection at the top, that bends a little; so that the inside is perfectly secure from the weather. These birds are exceeding numerous, and breed so fast, that sometimes a dozen nests are found on the same tree. They not only fly in the air, but skim on the surface of the water with prodigious swiftness.

The pintado, or Guinea-hen, has a round back, with a tail turned downwards, like a partridge, and the feet are furnished with membranes, or webs, like water-fowl. The head is covered with a kind of helmet, and the whole plumage is black, or dark grey, speckled with white spots. It is of the size of a common fowl, and the helmet on the middle of the head is of a horny substance, and a dusky red colour. The feet are of a greenish colour, and covered with large scales before, but behind there is only a rough skin, like shagreen-leather; and the hinder toe is short. They go together in large flocks, and feed their chickens indiscriminately, each attending to those that first come in their way.

The Numidian Damsel is very delicate in its construction. The body is long and taper, as are also the legs. The feathers, on the upper part of the wings and back, are of a light colour; but the tail, which is long and

ragged, is black. The sides of the head are white, and from the top of it, behind, hangs a long tuft, which reaches for several inches down the back of the neck. It is a bird much esteemed among the blacks, the flesh of it being firm and well-tasted.

The swans here are very different in shape to those of Europe. From the head to the shoulder of the wings they are white; but from hence to the tip the colour is a dark brown, as is also the tail. The legs are long and taper, and the back is also long and very thick, but terminates with a sharp point. Their flesh is very coarse, and rather obnoxious than grateful to the palate.

Great plenty of various kinds of fish are found in the rivers, as well as in the road of Whidah, which are caught by the natives with lines, they being strangers to the use of nets. Among the fish caught here is a remarkable one, called by the people the ape or monkey-fish. It is, in general, about ten feet long, and between three and four broad, from the extremity of the neck till within a third of its length, when it diminishes insensibly, ending in a long round tail. The head is round, the eyes small, the chin short, and the upper lip is furnished with hair, like whiskers. The neck is very distinct from the body, and on that part of it next the head is a round excrescence, like a crown. It has four fins, which resemble the beard or whiskers of a whale: the two foremost are so situated that they supply the place of hands, for it can convey any thing with them to the mouth. The hinder fins are placed beneath the middle of the belly, and are less than the former. It has no scales, but a skin spotted with small pimples, like that of the shark. It is of a black colour, and shines when first taken out of the water, but, when dead, it loses its lustre. The flesh is tolerably good, and, in its taste, greatly resembles lean beef. It is a lively fish, and swims very swift. When he appears first on the surface of the water, before he takes the hook, his motions are truly diverting. He comes gently near it, looks at it, tastes it with the edge of his lips, and then quits it; but, after several evolutions, he, at length, swallows it.

There are two sorts of snakes, or serpents, which abound in this country, one of which is black and poisonous, but the other is perfectly harmless, and is worshipped by the natives. The poisonous sorts are about twelve feet long, and three inches in diameter. They have a flat head, with two large crooked teeth, and always creep with their heads erect and their mouths open, and attack their prey with great eagerness.

The fetish-snake has a large round head, with beautiful eyes; the tongue is short, pointed like a dart, and its motion exceeding slow; the tail is slender and sharp, and the skin very beautiful; the ground of it being white, with wavy streaks, or spots of yellow and brown, agree-

ably intermixed. These snakes are so gentle, that they will not hurt any creature, except the venomous serpents, to which they have the greatest enmity, and seem to take pleasure in destroying them. Both negroes and whites handle and play with them without the least danger.

These snakes are held in so sacred a light by the blacks, that should a negro kill one of them, whether on purpose or by accident, his life would probably pay for it. If a white man should happen by chance to kill one of these serpents, the only means to secure him are to go immediately to the king, and satisfy him that it was not done designedly; in which case, by a handsome present made to the priests, he may probably escape the rage of the populace; but even then his situation is dangerous.

Bosman relates that, a hog happening to devour one of these snakes, a proclamation was immediately issued for destroying all the hogs in the country, and abundance of them were slaughtered on the occasion; but, at the instance of some of the rich owners, and some presents made to the king, the severe decree was revoked; but it seems that so many of them were destroyed for this offence, that hogs' flesh became very dear while he was there.

The natives of Whidah are generally tall, lusty, and well-proportioned; but their colour is not so shining as black as those of the Gold Coast. Their dress consists of three or four ells of stuff, called a pagne, which is wrapped round the waist, and then descends to the middle of the leg. The ladies wear a silk garment, with two or three rows of fringes, the bottom of it covering the feet. The better sort of the men are distinguished by their hats, which they purchase of the Europeans: the larger they are the better they like them, and are particularly proud of them, even after they are old and rusty; others have bounnets, made of deer or dog skins. They wear strings of pearl or coral on their necks, and on their arms and wrists they have bracelets of the same materials.

The negroes here, although very illiterate, are more polite and civil than any other people on this part of the coast; and, although they are very industrious, they are extremely addicted to gaming; and, when they have lost their money and other property, they will play for their wives and children; after which they will stake their own liberty, and thus become the property of their countrymen, who sometimes sell them to the European traders.

There is little difference between the religion of the Whidah blacks and those of the other parts of the coast, except that the number of the fetishes of the former is much more considerable. The chief deity is a serpent of a particular species, whose bite is not mortal, and is so well used by his votaries, that he scarcely ever attempts to hurt them. They address themselves to this animal on

the most important preservation of the public welfare, built for the people sacrifice principal snakes miles from the full and lofty towers the largest of the king and great men are very considerable of provisions, but all sorts of European offerings are preferred who adapts the ceremony as to enhance

this animal on

the most important occasions; as for seasonable weather, the preservation of the state, or whatever else concerns the public welfare. The snakes are kept in religious houses, built for that purpose in groves; and to these the people sacrifice hogs, sheep, fowls, goats, &c. The principal snake-house, or cathedral, situated about seven miles from the king's village, is built under a beautiful and lofty tree. It is called the Grand Snake, being the largest of them all, and is chiefly worshipped by the king and great men. The offerings made to this snake are very considerable, consisting not only of various kinds of provisions, but also money, pieces of silk, or stuff, and all sorts of European and African commodities. These offerings are presented to the priest, or grand sacrificer, who adapts the disposal of them to the idol in such a manner as to enhance his own emolument.

An annual pilgrimage is likewise made to the Grand Snake by all the nobility and great men of the kingdom, when the richest offerings and most valuable presents are bestowed. The grand master of the king's household also goes once a year, in the king's name, and offers presents to the snake for the preservation of the government. A solemn procession is also made after the coronation of a new king.

When the natives of Whidah are afflicted with drought or rain, famine, or other public calamities, they generally invoke the snake or serpent, conceiving that the private fetishes have not power to protect them. The common people go daily in large bodies to their snake-house, with drums beating, and trumpets sounding, where they perform their worship, which consists of certain songs and dances, to the honour of their idol, from whom they implore either a propitious journey, fair weather, a good crop, or whatever else they stand most in need of; to obtain which they present their offerings, and then return home.

The next public fetishes are lofty trees: to these they apply in their sickness, or any private misfortune. The sacrifices offered to the trees consist of loaves, millet, maize, or rice, which are placed by the priest at the foot of the tree: if the patient compliments the former with a pecuniary present, he leaves them to be devoured by the beasts and birds; if not, when the patient is gone, he takes them home, and converts them to his own use.

The sea is another fetish, which they firmly believe is able to do as much for them as the snake, or the trees. When the weather is so stormy as to hinder trade, the grand sacrificer is consulted, and, according to his answer, a procession is made to the sea, where an ox or sheep is killed on the shore, letting the blood flow into the water, and, at the same time, throwing a ring into the sea, as far as the strength of the arm will reach. The carcase of the beast sacrificed is the property of the

priest, who disposes of it in such a manner as he thinks proper: sometimes he divides it among the people, but, in general, he converts it to his own use.

Another of their public fetishes, called Agoye, is an image made of black earth, or clay, and, in form, somewhat resembles a negro squatting. It is placed on a kind of pedestal, ornamented with a slip of red cloth, bordered with cowries; the head is crowned with lizards and serpents, intermixed with red feathers; and from the top issues the point of an assagaye, that goes through a larger lizard, beneath which is a silver crescent. This idol is placed on a table, in the house of the grand sacrificer. Before it stand three wooden bowls, or half-calabashes, in one of which is a number of small earthen balls. With this idol the people generally advise before they commence any capital undertaking; for which reason he is called the god of councils.

The office of the priesthood is not vested in the males exclusively; the females also enjoy it in a superior degree, being wholly exempt from the control of their husbands, who treat them with the utmost reverence. Girls are trained to the priesthood, under the inspection of an old priestess, from whom they imbibe many absurd principles and maxims, both as to religious tenets, ceremonies, and practices. The high-priest, or grand sacrificer, presides over the rest, who pay him the greatest homage; even the king himself considers him with equal respect. The priesthood of the grand serpent is peculiar to one family, of which the grand sacrificer is the chief, all the others being subject to, and dependent on, him. The priests, as well as the priestesses, are easily known by the scars and marks on their bodies, made at the time they are initiated into the religious order. In other respects, they differ but little from the laity. They trade like other people, and acquire considerable possessions, by the sale of cattle and slaves; but their greatest gains arise from the credulity of the people, from whom they extort offerings and presents for the great serpent; which their deluded devotees imagine are religiously bestowed.

Whidah, at present, may be considered only as a province, and its king as a tributary prince, though the inhabitants are under the same laws and government, and possess the same indulgences in their religious maxims, as before it was conquered by the Dahomans. The civil and military government is vested in the king, aided by officers appointed to the respective departments in the several districts. Besides these, there are a great number of honorary captains, and another sort, that are entrusted with the care of the markets, slaves, prisons, &c.

The only crimes which are considered as capital are murder and adultery. For the first offence, the criminal is cut open alive, his entrails taken out and burnt, and his body fixed on a pole, erected in the market-place, where

lendour, though, is dependent es abroad, and, er, that few of

his subjects see him. He keeps a great number of women, the principal of whom has the title of queen.

No person whatever eats in company with the king; and, when he drinks, an officer makes a signal, by striking two small rods of iron together, in order that all who are within sight may turn away, and not look at his majesty; for it is a capital offence for any one to see him drink. An instance of this was once seen in an infant, who, being asleep near the king, was awakened by the noise of the rods; and his majesty, observing that the child turned its eyes towards him while the cup was at his mouth, ordered it to be put to death.

So severe, indeed, are the laws of Ardrah, that whoever disobeys the royal command is beheaded, and his wives and children become the king's slaves. Insolvent debtors are left to the mercy of their creditors, who have liberty to pay themselves by selling them for slaves. The same punishment is also inflicted on him who has seduced another man's wife. The punishments for adultery committed by the women, and other crimes, are the same as at Whidah.

Assem, called by the Europeans Great Ardrah, the capital of the kingdom, is situated about sixteen leagues inland to the north-west from Little Ardrah, a spacious road leading from one to the other. The king's palace is a spacious edifice, though greatly inferior to the original building, which was destroyed in the year 1726. Europeans are treated by the king and grantees of Ardrah with the same respect as at Whidah.

### BENIN.

The kingdom of Benin, which lies contiguous to Ardrah extends about six hundred miles from east to west; but its extent from north to south cannot be ascertained. It is bounded, on the east, by the kingdoms of Mujac and Makoko; on the west, by Ardrah and part of the Gulf of Guinea; on the south, by Congo; and, on the north, by part of Gago and Biafara.

This is, in general, a low and woody country; but it is well watered with rivers, the most distinguished of which is that called, by the English and French, the River Benin; but, by the Portuguese, Rio Formosa, or the Beautiful River. Its length and source are not known; but its branches are supposed to extend through most parts of the neighbouring countries. Its banks are exceedingly pleasant, being ornamented with lofty trees, and many small but neat villages.

The noxious vapours, exhaled from the low grounds by the heat of the sun, render the climate of this kingdom rather unwholesome; but the soil is tolerably fertile, and well adapted for the produce of millet and rice: but, as the inhabitants are not partial to those grains, little of them are cultivated. Their principal attention is directed

to the cultivation of yams, which they use instead of bread; and they have also great plenty of potatoes, and other roots. The chief fruits here are oranges, lemons, and bananas; and they have some cotton and pepper-trees; the latter of which produce a tolerable commodity, but not in such quantities, neither are the corns so large as those of the East-Indies.

In this country the wild beasts are tigers, leopards, bears, and monkeys. The tame ones consist of horses, cows, sheep, dogs, and cats; the two latter of which the natives prefer to any other kind of flesh. They have also great plenty of poultry, and the woods abound with game, as hares, turtle-doves, pheasants, partridges, &c.

The state of Benin is divided into four classes; the first of which is composed of three persons, called Great Lords, or great men, who are always near the king's person. Whoever desires to obtain any favour from his majesty, must apply to them, in order to acquaint him with their desires, and return his answer. As there is no intermediate person between these, the king, and those who solicit favours, they act on these occasions in such a manner as best suits their own interests; so that, in reality, the whole government is entirely in their hands.

The second rank, or class, is composed of those called Ores-de-Roes, or Road Chiefs, who are of four sorts: the meanest preside over slaves; those a degree higher: over the rabble; the third inspect the conduct of those concerned in husbandry and agriculture; and the fourth, or superior order, superintend the military. The latter are very numerous, and from them are chosen the viceroys and governors of those countries subject to the king. They are all under the command of the three great men, and are responsible to them on all occasions. They obtain their posts by the recommendation of the three lords; and the king, as an ensign of their honour, presents each of them with a string of coral, which they are obliged continually to wear about their necks; and, if any one should lose his badge of honour, whether by accident or otherwise, the consequence would be not only degradation, but the loss of his life.

The Fiadors, or brokers, are the third class: they are appointed by the government to treat with the Europeans, on behalf of the traders of Benin; and their business is to see that all matters of commerce are fairly transacted between the respective parties.

The commonalty form the last class. The generality of these are very indolent, nor will they go to work but when necessity obliges them. The laborious part of their business is executed by their wives; such as tilling the ground, spinning of cotton, weaving of cloth, and other handicrafts. The principal artificers among them are smiths, carpenters, and leather-dressers.

The negroes here, particularly the better sort, dress in

a white calico, or cotton cloth, fastened round the waist, and neatly plaited in the middle; but the upper and lower parts of the body are entirely naked. The dress of the meaner sort is of the same form, and only differs in the quality of the stuff with which it is made.

Calico pagnes are worn by the wives of the grantees: these pagnes, which are wove in this country, are very fine, and beautifully variegated with different colours. They are fastened round the waist, the upper part of the body being covered with a piece of cloth, about a yard long, which serves instead of a veil. They wear necklaces of coral, agreeably disposed; and their arms, legs, wrists, and fingers, are ornamented with copper and iron rings.

The buildings are, in general, spacious and lofty, but they are indifferently constructed, some of them being square, and others oblong. The doors are made high and narrow; the windows are few in number, and small. They are all made with a flat roof, on the top of which is a covering, raised several feet, to keep off the heat of the sun. Here they frequently regale themselves, when they pay a visit to each other.

The diet of the better sort consists chiefly of beef, mutton, or chickens. Instead of bread, they use yams, which, after being boiled, are beaten fine, and made into cakes. Their common beverage is water, with which they sometimes mix brandy. The poorer sort live on dried fish, yams, bananas, and pulse.

Polygamy is allowed here, with the same latitude as on the coast of Guinea; and the marriage-ceremonies consist only in the consent of the parents, a present to the bride, and an entertainment to the guests on both sides. The men are very jealous, for which reason the wives of the poorer class enjoy a pleasure to which those of the better sort are strangers; for, while the former have their liberty, the wives of the great are closely confined. Though jealous of each other, they are not so, of Europeans; as they think it impossible that the taste of the women can be so depraved as to grant any liberties to a white man.

All the boys born in this country are presented to the king as his property; for which reason all the males of this country are called the king's slaves; but the females are the property of the father, who has liberty to dispose of them at his own discretion.

If a woman happen to be delivered of two children at a birth, immediate information is given to the king, who orders public rejoicings to be made on the occasion. Such circumstances are considered as happy omens, in all the territories of Benin, except at a place called Arebo, where they are productive of the most horrid cruelties; for the people there generally sacrifice both women and children to a certain demon, which, they say, inhabits a wood near the town. Sometimes they will spare the wife,

by the husband's offering a female slave in her stead; but the children are condemned without redemption.

The thoughts of death are not so alarming to the negroes of Benin as to their neighbours on the coast of Guinea. When a person falls sick, he immediately applies to the priest, who also acts in the capacity of physician, and furnishes him with medicines; but, if these prove ineffectual, he has recourse to sacrifices.

On the demise of a person, the corpse is kept only one day before interment, except it happen at a distance from the general place of residence: then, in order to preserve it for conveyance, it is dried over a gentle fire till the moisture is extracted, when it is put into a coffin, and publicly exposed; after which it is carried on men's shoulders to the place of interment. When the funeral is over, the nearest relations bewail their loss by cries and lamentations. The shew of mourning consists only in shaving their heads, some half-way and others all over; and the men shave off their beards. At the funeral of a grantee several slaves are usually sacrificed.

Various kinds of idols are worshipped in Benin, some of which are made of elephants' teeth, claws, dead men's heads, skeletons, &c. Each person is his own priest, and addresses himself to such of his idols as he likes best; to which they make daily offerings, consisting of a few yams, mixed with oil. Sometimes they offer a fowl; but they only sprinkle the blood of it on the idol, for the flesh they convert to their own use. The great men make annual sacrifices, which are very expensive, and celebrated with great pomp. They kill multitudes of cows, sheep, and other kinds of cattle; and they provide an elegant entertainment for their friends, that lasts several days.

Two annual festivals are observed, besides those held on the sabbaths. The first of these is in commemoration of their ancestors, when they not only sacrifice a great number of beasts, but also human beings; but the latter are generally malefactors sentenced to death, and reserved for these solemnities. If it happens that there are not so many criminals as are requisite on these occasions, the king orders his officers to patrol the streets, and seize indifferently such persons as they meet not carrying lights. If the persons so seized are wealthy, they are permitted to purchase their redemption; but, if poor, they are sacrificed on the day appointed. The slaves of great men so seized may be also ransomed, on condition that the masters find others to supply the place.

But the most considerable is their second annual festival, which is called the coral-feast. It is celebrated in the month of May; and the king appears in public the day on which it is held. At this time the king bestows the strings of coral on those whom he advances to any preferment, or post of honour, which he never does but on this festival, unless a particular urgency of state require it.

cond annual fest- t is celebrated in ars in public the king bestows the ces to any prefer- does but on this ate require it.

Though the will of the monarch in this kingdom is an absolute law, the chief direction of government is vested in the three great lords. Their laws are, in general, very mild. When a person of property dies, the right of inheritance devolves to the eldest son; but he is obliged to present a slave to the king, and another to the three great lords, with a petition that he may succeed his father in the same quality. He is not compelled to make any allowance to his younger brother, that being wholly left to his own discretion; but, if his mother be living, he must allow her a maintenance suitable to her rank. If the deceased leave no children, the brother inherits the effects; and, in case of deficiency of such heir, the next of kin; but, if no lawful heir appears, the whole becomes the property of the king.

Criminals are punished in proportion to the nature of their offence; but, from the particular respect which they pay to foreigners, the injuring of any European is considered as a capital crime, and the punishment for such offence is thus executed: they take the offender, tie his hands behind his back, and blindfold him. After this, the judge raises him up, so that his head hangs towards the ground, which the executioner cuts off with a hatchet, and, separating the body into four quarters, leaves it for the wild beasts and birds to devour.

Murder is punished with death, except the offence be committed by the king's son, or a grandee; in which case the offender is banished to the most distant part of the kingdom, and never permitted to return.

If a person kill another by accident, he may purchase his life, by first burying the deceased, and afterwards producing a slave to suffer in his stead. When this slave is sacrificed, the offender must bend his body, and touch the slave's knees with his forehead; after which he must pay a fine to the three great lords, when he obtains his freedom; and the relations of the deceased think a sufficient atonement has been made for the offence.

The punishment for adultery is in proportion to the circumstances of the parties. If a common person surprise his wife in the fact, he is entitled to all the effects of the person that has injured him; and the woman, after being severely chastised by her husband, is totally discarded, being left to provide for herself the remainder of her life.

Other crimes are punished by fine, which is proportioned to the nature of the offence; and, if the culprit be not able to pay the fine levied, he is subject to corporal punishment. Part of the fine is paid to the person injured, after which the governor has his share, and the remainder of it goes to the three great lords.

The principal city of this kingdom is Benin, which is the usual residence of the king: it is a large town, being at least nine miles in circumference, and pleasantly situ-

ated on the banks of the river, about forty miles from its mouth. It contains a great number of streets, most of which are spacious, and the houses uniformly built. The principal street is broad, and, at least, three miles in length: it is intersected by many cross streets and lanes, all of which are straight, and of considerable extent. The houses of the grandees are much higher than those of the commonalty, and are ascended by steps. At the entrance of each is a vestibule, or porch, which is spread with mats of straw. The inner chamber is square, with an opening in the centre for the admission of light. The king's palace is very extensive, superb, and magnificent. It consists of several large squares, surrounded with galleries, each of which has a portico or gate, guarded by soldiers.

This city is entirely inhabited by the natives, no foreigner being permitted to reside in it. Some of them are wealthy, and spend their whole lives at court, leaving trade and agriculture to be conducted by their wives and servants. These go to the adjacent villages, and either trade in merchandise, or serve for daily wages; the greatest part of which they give to their masters, otherwise they would be sold for slaves.

There is a daily market in the principal part of the city, for the sale of provisions and merchandise. The former consists of dogs, of which the natives are very fond, roasted baboons, and monkeys, bats, and large rats, parrots, hens, lizards, dried in the sun, fruits, and palm-wine. Their merchandise consists of cotton, elephants' teeth, wooden platters, cups, and other household articles; also cotton-cloth, lances, darts, &c.

## SECTION II.

### THE GOLD COAST.

*Situation, Boundaries, &c.*] The Gold Coast, which is situated within the fifth degree of north latitude, is bounded, on the north, by Negroland; on the east, by the Slave Coast; on the south, by the ocean; and, on the west, by the Ivory Coast. It is about one hundred and eighty miles in length, and contains eleven districts, some of which contain two or more towns or villages, lying on the sea-shore, either under or between the European forts and castles. These villages, however, are only for the convenience of trade and fishing, for the principal towns lie in the interior, and are very populous. Some of these districts are independent republics, under the direction of their own magistrates; and seven of them are kingdoms, governed by their respective chiefs.

*Climate, &c.*] The heat is excessive from October to March; but the other six months it is tolerably temperate. The coast is very unhealthy, owing to the extreme heat of the day and the coolness of the nights; to which may be

added the damp sulphureous mists that arise every morning from the mountains. Tornados are also frequent here, particularly in the months of April, May, and June. These are violent storms of wind, rising suddenly from the east and south-east, and sometimes from the north, with a few points to the west. They are generally attended with repeated claps of thunder and dreadful lightning, with prodigious showers of rain, falling like a flood, and an uncommon darkness. They sometimes last an hour, or more; but, as soon as they are over, the weather immediately becomes clear and fine. If they happen in the summer-season, which is sometimes the case, they are not so violent as in the winter, but they are more incommotions, both to land and sea-faring people, being usually followed by cold rains for several days together.

The rains that fall then are of so pernicious a quality, that, if a person sleep in his wet clothes, he is sure to contract a dangerous disease; and it has been found that clothes laid by wet have, in a short time, been so rotten as to fall to pieces with the most gentle touch.

*Minerals.*] The inland districts abound with mines. Gold is also gathered on the sea-shore by the following method:—In the morning succeeding a rainy night, numbers of the natives go to the sea-shore, each being furnished with two calabashes, one of which they fill with earth and sand. This they wash with many waters, by turning the calabash round; the water, with the lightest of the mud, washing over the brim, while the gold, if there be any, sinks, by its own weight, to the bottom. Thus they continue till two or three spoonful are only left, and then they put into the other calabash; then fill the other again, and continue washing till about noon, when the calabash that receives the settlings, being pretty well filled, is taken home, and minutely searched. They sometimes find as much gold as is worth half-a-guinea, sometimes the value of a shilling, and sometimes none at all.

*Vegetables.*] This coast abounds with a variety of trees. One of the most remarkable, and which grows in great abundance, is the papay-tree. The fruit, at first, is produced at the top of the trunk, without any branches; but, as the tree grows older, it shoots out branches, towards the top, which resemble young stocks, whereon likewise fruit grows. The inland countries on the coast of Guinea are, in general, fertile, and produce several sorts of grain, particularly maize and millet, which grow in great abundance. They have also several kinds of vegetables and roots. Palm-trees grow here in abundance, and are of infinite service to the natives, not only from the wine that flows from the trunk, but the oils which they extract from their nuts. They have also plenty of various kinds of fruits, as plums, pears, oranges, citrons, cocoa-nuts, and figs, to which may be added ananas, water-melons, and the

corn-martin apple. The last fruit is more peculiar to this country than any other: it is about the size of a walnut, and has a green husk; but the outer rind is of a yellowish cast, somewhat inclined to red. In the core are four large flat kernels, separated by the pulp, which is red and white, of a sweetish sharp taste, but most inclining to the latter. It is a very agreeable and refreshing fruit, and of infinite service to those afflicted with the bloody-flux; for it is very astringent, and, when boiled with wine and sugar, is not only more useful, but more pleasant, than tamarinds.

*Animals.*] The tame quadrupeds of this country are bulls, oxen, cows, sheep, goats, and hogs; but the pasture is so indifferent, that they are, in general, exceeding poor and small. The cows yield but little milk; and one of the best, when full grown, is so light, that it will not weight above two hundred and fifty pounds. The sheep are not above half the size of those in Europe; and, instead of wool, their bodies are covered with long shaggy hair. The goats are very plentiful, but small in proportion to those of Europe. The flesh, however, is very fat and sweet, and greatly preferred to that of sheep.

The chief domestic animals are dogs and cats. The negroes frequently eat the former, and prefer their flesh to any other. The dogs here are much like our foxes, and have long upright ears. Their tails are long, but taper, and without hair: the skin is also naked; and they never bark, but only howl. They are very disagreeable to the night, but more so to the touch. The blacks call them *cabra de matto*, which signifies a wild goat; and so universally are they admired in this country, that, in some places, they breed them for sale, and carry them to the markets, where they fetch a much better price than the sheep. Cats are also greatly esteemed by the negroes, but they do not eat them unless out of necessity.

The wild beasts, both on the coast and in the interior parts, are of various sorts. Among these none are more distinguished than the elephants; for though in other parts these animals are rendered docile and useful, yet here they are never tamed.

On this coast there are various sorts of apes and monkeys, some of which are called bearded monkeys, from their having long white beards: the hair on their backs is of a light brown, that on the belly white, and the rest of the body is covered with spots. There are others, called white noses, from that part of them being only of a white colour. These animals, though of various sorts, are all very cunning, and ready to imitate what they see. They are fond of their young, always in action, and greatly resemble the human form; so that the negroes call them cursed men, and say they could speak if they would.

There are also several sorts of wild cats on this coast, some of which are spotted like tigers, and are extremely fierce and mischievous. Among these is the civet-cat,

called by the negroes *zeze* them, before the more the nation, the better the civet consists, glands that lie better from which the civet

on this coast, are extremely the civet-cat,

called by the negroes *kankan*. They generally vex and tease them, before they take out the musk from the bag; for the more the animal is enraged previous to this operation, the better will be the civet. The bag which contains the civet is largest in the male. The liquor of which the civet consists, appears to be excreted from certain glands that lie between the coats that compose the bag from which the civet is taken.

Here are some porcupines, which are, in general, about two feet in height, and their teeth are remarkably sharp. They are very daring, inasmuch that they will attack the largest and most dangerous snakes. When irritated, they shoot their quills at the enemy, and with such violence that they oftentimes prove fatal. The negroes esteem their flesh as a great delicacy.

The sloth, which is called by the natives *potto*, is found in this part of Guinea. This animal is said to be the most ugly creature in the universe; and it is so slow in its motion, that it cannot travel above twenty yards in a day. The head is strangely disproportioned, and the fore-feet greatly resemble hands. The hair of the young ones is of a pale mouse-colour, but that of the old is red, and looks more like wool than hair. The female, when big with young, climbs the trunk of some old tree, in which there is an hollow, from some accidental decay, at a distance from the ground. Here she deposits her young, which are generally two in number. During the time she suckles her young, she continues in the same hole, and, though that period is very short, before it is expired she becomes almost emaciated. When the young ones are able to crawl after her, she leads them to the nearest branches of the tree, where they devour the leaves first of one and then another. When the tree is quite stripped, they are obliged to seek a new place of abode. The journey, however, to the next tree, takes up no small time in performing; and though the creature is fat at the time he leaves his former habitation, yet, before he has reached his new one, he becomes as poor and lean as possible; and, if the tree be high, or at any distance, and he meets with nothing on his journey, he inevitably dies with hunger. While he is thus travelling slowly on the ground, any beast may kill and devour him; for he is entirely defenceless, and, when attacked, only makes a noise like the crying of a kitten. The characteristics of this animal are its slow pace, and its having the fore-feet longer than those behind, with three claws on each foot.

The crown-bird, which is found on this coast, is more beautiful than those in the other parts of Guinea. They are about the size of a stork, and receive their name from a large tuft that grows on their heads; some of which are red, others blue, and some of a shining gold. Their bodies are chiefly covered with black feathers; the sides of their heads are beautified with purple spots; and the fea-

thers of their wings and tails are of different colours, as red, yellow, white, and black. Their tails are very long, and the negroes pluck their feathers to ornament their heads.

Several species of large and venomous snakes abound on this coast, as also large scorpions, some of which are as big as small lobsters, having a bladder full of poison at the end of their tails, which they discharge at their enemies at pleasure. Locusts are very numerous here, and sometimes make great destruction among the corn and vegetables. The millepedes, or hog-lice, are very numerous; and, though their sting is not so dangerous as that of the scorpions, yet it occasions a very sharp pain for some time.

The most remarkable insects on this coast are the large ants, which are different from those in other parts of the world. These are of various sorts and colours: some are white, others black, and some red. They are very rapacious, and will sometimes attack a living sheep, which, in a night's time, they will reduce to a perfect skeleton, leaving not the least thing except the bones. Fowls and chickens frequently share the same fate; and even rats, though such active animals, are not able to escape.

The gnats on this coast are very troublesome, especially near woods and marshy grounds. Their sting is very sharp, and raises prodigious swellings, attended with violent pain. They are most troublesome in the night, and frequently oblige the inhabitants to desert their habitations.

[*Religion, Government, &c.*] The negroes on the Gold Coast are, in general, idolaters. Every one has a fetish, or charm, to which they pay the greatest reverence. These fetishes are formed of different things, according to each person's fancy; some have the tooth of a dog, tiger, elephant, or civet-cat; others have an egg, the bone of some bird, the head of a fowl, ox, or goat; and others, again, the bone of a fish, the end of a ram's horn, or a bunch of cords, made of the bark of trees: their regard for them is so great, that whatever they promise them they perform in the strictest manner, and that in every instance of abstinence and mortification.

Each kingdom has its particular fetish: this is generally some large mountain, or remarkable tree, which, if any person should be so indiscreet as to cut or disfigure, he would be put to the most cruel death. Each village has also its guardian fetish, dressed at the common expence, to which they pray for general benefits; and for this patron they erect, in the most public place, a kind of altar, made with reeds, and covered with a roof of palm-leaves. In short, they are, in general, from the highest to the lowest class, most inviolably and unreservedly attached to the particular objects of their adoration.

The negroes on this coast tremble at the idea of the  
5 P

devil, to whom they ascribe all their misfortunes, and are even terrified at his name. Such are their notions of the injuries they receive from this fiend, that they have an annual custom of banishing him from every town and village throughout the respective district.

They have generally two days of worship in the week, one of which is dedicated to their fetishes, and the other is called their bossum-day, being that on which they were born. On the latter day, they clothe themselves in white, and besmear themselves with earth of the same colour, as emblems of innocence; but the fetish-day is observed with the greatest devotion.

There are five degrees, or classes, among the natives on this coast. The first are their kings; the second their nobility; the third may be called civil magistrates, their province being only to take care of the welfare of the city or village, and to appease such tumults as may arise among the inhabitants; the fourth are the common people, employed in agriculture, fishing, &c.; and the fifth and last are the slaves, who are either taken in war, or become so by poverty.

The different kingdoms are governed either in the form of monarchies or republics. The kings are, in general, hereditary, but some few of them elective. Their chief justices, or judges, as well in kingdoms as republics, are commonly chosen from among the most wealthy, and particularly the governors of towns and villages. These take cognizance of all civil and criminal cases; but their decision is not absolutely ultimate, as the parties can appeal to the king.

The crime of adultery, on this part of the coast, is punished only by fine; for which reason many women, by consent of their husbands, bestow their favours, merely to take advantage of those who have been captivated by their charms. The inland negroes, however, are more rigid in exacting the penalty than those of the coast. Nothing less, in general, than life will satisfy the party offended, though the punishment is sometimes mitigated by virtue of an enormous pecuniary consideration; in which case, the negroes are responsible not only for their children, but also their relations, who, in such cases, help one another by a mutual contribution, each giving something towards the fine, according to his circumstances: otherwise the offender would be condemned either to slavery or death. In like manner, every man is obliged to make good the injury done by his slave; for whatever crime he commits, his master must pay the fine imposed. In general, the fine is proportioned to the circumstances of the criminal.

When any contention breaks out among the different princes on this coast, war is formally declared, and the kings, by their governors, appoint a day for their subjects to assemble in arms. This being done, a herald is sent to

announce it to the enemy, at the same time fixing the day, place, and hour, of battle. The grandees, or nobles, then repair to court, and, after complimenting the king, proceed to the place of battle, taking with them their wives and families; and, if the motives of the quarrel be great, before they set out, they destroy their houses and towns, that the enemy, if victorious, may gain the less advantage of their conquest.

The kings have a great number of guards, who constantly attend their persons, either at home or in the field. These are well furnished with arms, and make a most formidable appearance. They are very dexterous in the use of their warlike implements, which consist of muskets, sabres, lances, shields, and bows and arrows.

In battle, each commander has his men close together in a crowd, without the least attention to order, himself being hid in the midst of them. In case a few are killed the rest immediately run away, unless surrounded by the enemy; and so natural is cowardice to them, that, when one officer sees another enthralled, instead of advancing to assist him, he consults only his own safety by a speedy flight. They do not stand upright in battle, but stoop, that the bullets may fly over their heads: as soon as they have discharged their guns, they immediately run back to load them, and then return and resume the fire. The victorious party make as many prisoners as they can. Those who cannot raise their ransom are either kept or sold as slaves; if a person of rank is taken, he is well secured, and his ransom is fixed very high; but if the person who occasioned the war fall into their hands, he is immediately put to death.

The contending princes, when a treaty of peace is agreed on, engage to meet each other on a certain day, to proclaim their determinations. The place is generally a large open plain, and each party appears as if armed for battle, bringing with them their fetishes. The priests, who are the principal people in these ceremonies, make the chiefs swear reciprocally to cease hostilities, to forget what has passed, and, as a security for their promises, to give mutual hostages. As soon as these oaths are taken, the parties throw down their arms, and embrace each other with the greatest cordiality; after which they pass the remainder of the day in singing and dancing, and commerce is renewed as if no dispute had happened.

### SECTION III.

#### THE IVORY COAST.

The Ivory Coast derives its name from the great number of elephants' teeth purchased here by the Europeans, the principal part of which is found on this coast and in its vicinity. It is bounded, on the east, by the Gold Coast,

on the west, by the Atlantic Ocean; and, on the north, by the whole coast, which is called, by the Apollonia, is abundant, and is called, by the word quaqu, in the

the great num- the Europeans, coast and in its e Gold Coast,

on the west, by the Grain Coast; on the north, by Negroland; and, on the south, by the Atlantic Ocean. The whole coast, which extends from Cape Palmas to Cape Apollonia, is about two hundred and fifty miles in length, and is called, by the natives, the Quaqua Coast; the word quaqua, in their language, signifying a tooth.

*Soil and Productions.*] The country is pleasant to the view, and fertile in soil, producing grain and vegetables in abundance. The natives are not sensible of the value of sugar-canes, and therefore only apply them to the purpose of feeding elephants, which are here very numerous. Indigo and cotton are said to grow without cultivation, and tobacco, under proper care, would prove a profitable and useful article.

Oxen, goats, hogs, sheep, &c. abound here. A good ox is seldom sold for more than a few dozen of knives, and inferior ones in proportion. They have also great plenty of poultry, and variety of fish. Among the latter are frequently found three remarkable creatures, namely, the sea-ox, the zingana, or hammer-fish, and the sea-devil.

The sea-ox, or horned fish, is very long and thick. The skin is hard, rough, and without scales, and of variegated colours. The head resembles that of a hog, and it has a trunk like that of an elephant, which in the same manner receives its food. It has many peculiarities in its form; but the most singular is the extreme part of the tail, which is composed of a strong thick fin, which serves as a defence. It has also other fins, which subserve the same purpose. The zingana, or hammer-fish, is a voracious creature, and is armed with fins, which greatly facilitate the seizure of its prey.

The sea-devil, so called from the ugliness of its form, surpasses all other creatures found in the seas; it is about twenty-five feet in length, and eighteen in breadth: on each side of it is an angular substance, as hard as horn, and very sharp. The tail is long and taper, and terminates with a dangerous point: the back is covered with small lumps, about two inches high, and sharp at the ends: the head is large, but there is no appearance of any neck, and the mouth is furnished with a great number of sharp-pointed teeth: two of the eyes are near the throat, and are round and large, but the other two are placed above them, and much smaller: on each side of the throat are three horns, of an equal length, the middlemost of which is three feet long, and an inch and a half in diameter, but they are flexible, and therefore can do but little harm; the flesh of this creature is hard and ill-tasted, but the negroes catch them for the sake of the liver, from which they extract large quantities of oil.

The places most worthy of description on the Ivory Coast are the following:—Cape la Hou, or Laho, which produces elephants' teeth, of the largest size, and in the greatest abundance. The town is extensive, the soil fer-

tile, and the natives are tolerably civil. Between two villages, called Cape-la-Hou and Corbi-la-Hou, is a track of the sea, called by some the Bottomless Pit, many efforts having been made in vain by the natives to fathom it. At length the bottom was found by the Europeans, and the depth appeared to be no more than sixteen fathoms. Near Cape Apollonia, at the eastern extremity of the coast, are three villages, inhabited by some negro natives, who carry on an occasional traffic with the Europeans.

*Customs, Manners, &c.*] The Quaqua blacks, or natives of the Ivory Coast, are tall, lusty, and well featured, and very honest in their dealings, particularly with the Europeans that visit this coast. When they go to trade with any ship, they take some water in their hands, and let a few drops of it fall into their eyes: this is a kind of oath, by which they intimate, that they would rather lose their eye-sight than cheat those they trade with. They are no less averse to drunkenness than fraud; and, though their country produces a prodigious number of palm-trees, yet they will not drink any palm-wine, but only a certain liquor, called bordon, or tombo-wine, which is much weaker, and rendered still more so by being mixed with water.

Their dress is much the same as the inhabitants of the coasts in general. They file their teeth very sharp, but they are, in general, irregularly placed, and very crooked. They are fond of having long nails, and take particular pride in the length of their hair, which they plait and twist in different forms, and grease it with palm-oil mixed with red earth. With this composition they every day anoint their bodies, and continually chew betel, the juice of which they rub about their mouths and chins. They ornament their legs with a great number of iron rings, and in these consists their chief dignity, for the greater a man's quality is, the more rings he wears.

Their language is altogether unintelligible to a European, and they speak hastily and by starts. When they meet each other, they use the word *quaqua*, at the same time each laying one hand on the other's shoulder, and taking hold of the fore-finger, pull it till it snaps, when they again, in a low voice, repeat the word quaqua, which closes the salutation.

In religion they are all idolaters; and though there are several petty princes in different parts of the coast, yet the whole are subject to a king, called Soccoo, whom they not only respect but dread; and imagine that, if he would only make use of his fetishes or enchantments, he would cause all his enemies to die.

By the fundamental laws of this country every one is obliged to continue all his life in the condition in which he was born; so that, for instance, one whose father was a fisherman can never become any thing else but a fisherman; and so of all other trades and professions.

In some parts of the coast, particularly Laho, they manufacture a pretty sort of cotton-stuffs, striped blue and white, about three-quarters broad, and three or four ells long. These are much valued, and sell for a good price in most parts of Guinea. The natives are very fond of trade; but they are cautious in going on board European ships, lest they should be trepanned. In negotiation, all is done by signs and gestures of the hands or fingers, and by setting a quantity of goods against the teeth they offer to dispose of.

Besides the articles of ivory, gold, and slaves, the negroes here carry on a great trade in salt, which they sell to their neighbours, who carry it further into the inland countries, and dispose of it to great advantage, it being in those parts exceeding scarce. The inland parts of this coast produce the largest and best elephants' teeth to be found in the universe. The country is so full of elephants, that the inhabitants of the hilly parts are obliged to dig their houses in the backs of the mountains, and to make their doors and windows narrow and low, and are forced to use all kinds of artifices to drive them from their plantations, or lay snares for them, and kill them. The reason of ivory being so plentiful here is, because the elephants cast their teeth every three years; so that they find more loose teeth in the forests than they get from those they kill.

#### SECTION IV. THE GRAIN COAST.

*Climate and Productions.*] Though the climate of the Grain Coast is very unhealthy, owing to the periodical rains and winds, the soil is tolerably good, and, besides pepper, produces plenty of vegetables and roots, as also various kinds of fruits, particularly, oranges, lemons, cocoa-nuts, bananas, and dates. Their cattle consists of cows, sheep, hogs, and goats; and they have a few horses, but they are very small, and of little use. There are also several kinds of wild beasts, as elephants, buffaloes, tigers, apes of various sorts, and great plenty of hares and deer. Their poultry consists of geese, turkeys, and ducks, with plenty of cocks and hens, the latter of which are esteemed as good in quality as those of Europe.

*Inhabitants.*] The natives of this coast, in person, are, in general, tall and well featured, and are said to be more liberal and honest in disposition than those of the adjacent coasts. Their dress, in point of distinction and form, is much the same, and they are equally fond of trinkets, and all sorts of ornaments. They are mostly abstemious in their diet; intemperance, in drinking especially, being severely punished by royal mandate.

Here are some of a mixed breed, called Mulattoes, who are an abandoned set of people, and have proceeded from the intermixture of negroes and Europeans. These are of a tawny complexion, and profess themselves Christians, notwithstanding which they retain many of the most superstitious notions of the Pagans. They imitate the Portuguese in their dress, but exceed both them and the negroes in their vices. The men are drunkards, lewd, thievish, and treacherous; and the women are the most abandoned prostitutes, sacrificing themselves at all times, and to all sorts of men, without the least degree of restraint.

Their sovereign is despotic, and he is never seen abroad, unless on particular occasions, and then he appears with the greatest pomp and magnificence.

*Manufactures, Trade, &c.*] Their chief employment is husbandry; but there are some tolerable artificers among them. They purchase fire-arms, gunpowder, and bullets, of the Europeans; but darts, arrows, lances, and broad-swords, they make themselves. The carpenters make canoes, of various sizes, with great neatness; and they also build their houses or huts, which are made of wood and clay, and thatched with reeds, or branches of the palmetto-tree.

As the Europeans have no settlement on this part of Guinea, the trade here is carried on by signals from the ships, on the appearance of which the natives immediately go in their canoes, carrying with them their pepper, ivory, &c.

Large ships go up the river Sherbro for about seven leagues from its mouth; but farther up it grows shallow, and is only navigable for canoes. The country round is very mountainous, and the river has many turnings and windings, but the stream is not rapid, except at two or three cataracts or water-falls, one of which is exceeding large, and makes a prodigious noise, the water falling from the rocks upwards of twenty feet perpendicular. The negroes that sail up this river, before they reach the cataract, are obliged to go ashore, and land their goods, which, with their canoes, they drag along the mountains, till they have passed the cataract. The other two water-falls are trifling; notwithstanding which, they frequently have their canoes overset, especially when they are heavily laden: but as the camwood, with which they are generally loaded, is very heavy, it sinks, and in the dry season they go and take it up, there being at that time hardly any water in the river. Their times of going up the river are in the latter end of the rainy seasons, which generally continue five months out of the twelve, when they cut the camwood, and search for elephants' teeth.

THIS extends to the equinoctial line; and extends from north to south, Benin, on the north-east; Matamoras, on the west. Loango, Congo, described under

*Climate, and Soil.* It is situated almost on the equator, its climate is by no means salubrious, and is capable of improvement, the indolence of the natives, and the sorts of peas and beans, all which the ground produces, have fruits of various kinds, pumpkins, coconuts, &c.

*Animals.*] The country is full of leopards, elephants, &c. The only tame animal is the dog, which is so plentiful, that it is almost impossible to count the number. Among the birds, there is a bird larger than a pigeon, its feathers are black, and it sits on the breast. It belongs to this class, transparent, with

## CHAPTER VI.

## LOWER GUINEA.

**T**HIS extensive tract of country is situated between the equinoctial line and eighteen degrees of south latitude; and extends upwards of seventeen hundred miles from north to south. Its boundaries are, the kingdom of Benin, on the north; the interior parts of Africa, on the east; Mataman, on the south; and the Atlantic Ocean, on the west. It is divided into four kingdoms, viz.—Loango, Congo, Angola, and Benguela; which will be described under their respective heads.

## SECTION I.

## LOANGO.

*Extent, Boundaries, &c.]* This kingdom extends along the African coast from two to five degrees of south latitude, and is four hundred and ten miles in length, and three hundred in breadth. It is bounded, on the north, by the kingdom of Benin; on the south, by Congo; on the east, by Makoko; and, on the west, by the Atlantic Ocean. This country, as well as Angola, was formerly a part of the kingdom of Congo; but has long been dismembered from it. It is watered by several small rivers, and divided into four provinces, called Loangiri, Loango-mongo, Chylongo, and Piri:

*Climate, and Vegetable Productions.]* Though Loango is situated almost in the middle of the torrid zone, the climate is by no means unwholesome, and the soil is capable of improvement, though greatly neglected, through the indolence of the natives: they have, however, several sorts of peas and beans, with large and small millet, of all which the ground yields annually three crops. They have fruits of various kinds, as oranges, lemons, bananas, pumpions, cocoa-nuts, and the kola.

*Animals.]* The wild animals of this country are tigers, leopards, elephants, civet-cats, and a variety of monkeys. The only tame animals are goats and hogs; and poultry is so plentiful, that sixpenny-worth of beads will purchase twenty good fowls.

Among the birds, the most remarkable is the pelican, a bird larger than a swan, in shape resembling a heron. Its feathers are black and white, and it has a bare place on the breast. But the most remarkable circumstance belonging to this bird is the bones, which appear to be transparent, with many fibres and veins running up and

down throughout their whole length. To this may also be added another singularity, which is, that near the middle of the stomach the windpipe is divided into two branches, a circumstance not to be met with in any other bird whatever.

*Chief City.]* Loango, the capital of the kingdom, is situated in four degrees and a half of south latitude, and is about four miles from the sea-coast. It is a large and populous city, and the streets are long and spacious. Near the centre of the city is a spacious square, surrounded with lofty trees, where a daily market is held for the sale of all kinds of provisions, also palm-cloths, of various sorts, and great quantities of elephants' teeth.

The royal palace consists of a number of detached buildings. The king's apartments are in front; behind are those belonging to his women. The whole is surrounded with lofty palm-trees, and is at least a mile and a half in circumference.

The articles sold here by the natives consist of ivory, tin, lead, copper, iron, red-wood, and several sorts of cloths, the manufacture of the country; in exchange for which they purchase of the Europeans, salt, Silesia ticking, cutlasses, looking-glasses, beads, and other articles.

*Power and State of the King.]* The king of Loango is a very powerful prince, and able to bring into the field a considerable army, for all his subjects are obliged to equip themselves with arms, and immediately attend at his command. His dress is elegant and sumptuous, and both he and his nobles wear, on their left arm, the skin of a wild cat, sewed together, with one end stuffed. The king shuts the door of his apartment, and continues, by himself during the whole time he is at dinner: for should any person happen to see him either eat or drink, he would be immediately put to death. So punctually is this law observed, that even animals are subject to the same fate, which happened to a fine dog presented the king by a Portuguese. The creature not being very well fed by those who had the care of him, smelling the viands one day when the king went to dinner, followed the scent, and his majesty not fastening the door properly, the dog, while he was at dinner, thrust it open with his feet, and entered the room, when the king immediately quitted the apartment, and ordered him to be killed.

Every day after dinner the king goes in state, accompanied by his nobles, and a great crowd of people, to

the banquetting-house, in order to refresh himself by drinking palm-wine. As soon as he arrives there, he seats himself on the throne, and on each side of him is a cup-bearer. He on the right-hand reaches him the eup when he is inclined to drink, but at the same time turns his head, notice of which is given to the company by him on the left, who strikes two iron rods, pointed at the ends, one against the other. At this signal the people turn their backs to the king, and bend their faces to the ground, in which posture they remain so long as the irons continue ringing; after which they rise, turn their faces to the king, and wish him health by clapping their hands.

At sun-set he goes a second time to the apartments adapted for eating, where his provisions are prepared for him as before, after which he again visits the banquetting-house, where he remains till nine or ten o'clock, when he returns, and retires to rest. The king seldom appears abroad, except on the before-mentioned occasions, or when an ambassador arrives, or some strange accident has happened; such as when a leopard is taken in the country, or else lodged near the city ready for the chase, or, lastly, when his land is to be tilled, and his chief nobility bring him tribute.

His majesty appears in public at the commencement of the seed-time, which is always on the first of January. He takes his seat at three o'clock in the afternoon, when the women who till the ground appear before him with their instruments of husbandry, and the men walk backwards and forwards, armed and clothed in their military habits. The king generally stays about an hour, when he returns to his palace, amidst the acclamations of the people, who spend the rest of the day in mirth and festivity.

When any of the inhabitants have discovered a leopard in the woods adjoining to the capital, intimation of it is given to the king, who immediately appears in public, and a trumpet is sounded, to give notice to the people to attend him at the sport. If the place where the leopard lies be too far for the king to walk, he is carried on men's shoulders, in a kind of chair, made of wicker, and curiously ornamented. As soon as they arrive at the spot where the leopard is secreted, the people surround it, armed with bows and arrows, lances, and darts, leaving only a small place open, that the king may have a convenient opportunity of seeing the sport. Before this opening, nets are spread, that, if the leopard should happen to take his course that way, he might be caught alive. When every thing is ready, the beast is roused by the people making an universal shouting, with the blowing of horns and beating of drums. As soon as he finds himself surrounded, he endeavours to make his escape, but is impeded by the volleys of darts and arrows that are discharged at him by the multitude, who follow him close,

and, if he happens not to take the net, overpower and despatch him. When the leopard is killed, the king retreats to his palace, before which the hunters bring the carcass, and exult over it by dancing, singing, and exhibiting various kinds of diversions. The king then orders the beast to be flayed, and the skin is brought to him; after which the body is buried very deep in the earth, except the gall, which is taken out and thrown into the river.

When the king dies, the succession of the crown does not devolve to his children, but to his eldest brother; but, for want of such kindred, it falls to his sister's children. Those who have pretensions to the crown are five in number, and reside in towns or villages at some distance from the court: they preserve their titles agreeably to the names of the respective villages in which they live. The next heir to the crown is called Mani-Kay, who resides at a large town of that name, situated about five miles from Loango. When the king dies, Mani-Kay succeeds him; and thus, by a regular rotation, they succeed to each other's villages, and afterwards to the crown.

On the decease of the king the Mani-Kay enters immediately upon the government, but he does not go to court till the funeral of the late king is over; the ceremonies attending which are as follow: They first make two vaults under ground, adjoining to each other, in one of which they lay the royal corpse, richly dressed, on a stool, and by it pots, kettles, pans, cloths, and garments. They then place round it little images of wood and red earth, representing the household servants of the deceased. After this, they leave the royal corpse, and go to the other vault, where they place the bodies of several slaves, who have been sacrificed, to serve the king in the other world, and to make attestation in what manner he behaved during the course of his life. The two vaults are then closed, and over each is erected a covering, to preserve it from the weather.

*Revenues.*] The king of Loango's revenues principally arise from elephants' teeth, copper, and slaves. The greatest part of the copper is brought, by stealth, from an inland country, the inhabitants of which are always at variance with the king of Loango.

*Laws.*] By the laws of this kingdom, theft is never punished with death, unless it be committed on the king: in common cases, where the theft is detected, either he or his friends must restore the goods stolen, or atone for the want of them by an adequate compensation; besides which, the thief is tied to a post, in the middle of the street, where he continues an hour, as an object of ridicule and contempt to the spectators. If he is unable either to restore the goods or pay the value of them, his relations must work for the party robbed, till such time as he thinks himself sufficiently satisfied for the loss he has sustained.

When any person is suspected of a crime, and it can

not be clearly proved against him, he is sworn by drinking a certain quantity of a liquor, called *imbonda*. It is made from the root of a small tree or shrub, which is about six inches long, and resembles a carrot. The root is scraped into water, which is boiled in gourds. The liquor is as bitter as gall, and so strong that one root would serve to try a hundred people. When the person drinks the liquor, if it be too much infused, it strikes up into the head, inebriating to such a degree, that he falls down as if dead, in which case he is pronounced guilty, and is accordingly executed; but if he can stand upright, he is deemed innocent. The determination of this matter rests entirely in the person appointed to administer the potion; for however innocent he may be that is suspected, yet, if the *imbonda*-giver has any dislike to him, or his accuser is a person of importance, the liquor is so strongly infused, that its operation proves fatal.

*Religion.* With respect to the religion of these people, they are all idolaters, though an attempt was once made to bring them to a knowledge of Christianity. They have some notion of a Supreme Being, whom they call Sam-bian Pogo, but their ideas are very imperfect. Their idols, which they call *mokissos*, are of various forms; some of them are made to resemble the human species; others consist of a piece of wood, about a yard long, with small bits of iron on the top, or else the figure of some animal carved at the end of it. The heads of their greater idols are ornamented with the feathers of hens or pheasants, and their bodies decorated with various kinds of trinkets. All acts of devotion are performed to these idols, of which they have great numbers. Each has a peculiar name, according to its office or jurisdiction.

All circumstances that happen to them, whether good or evil, they suppose to arise from the power of the *mokisso*. If a man preserves a good constitution by chastity and temperance, he ascribes his health to the *mokisso*, and not to those virtues. If a sick man recovers, they never impute it either to the force of nature, or the application of medicines, but the *mokisso* has the credit of the cure which is performed; and, if the patient happens to die with old age, or by any accident, they believe he was killed by sorcery, for having violated the injunctions laid on him by the *mokisso*.

Besides their private *mokissos*, they have many public ones, that are kept in temples or huts, to which they daily repair to their devotions. One of these is at a village called *Thiriko*, and in figure resembles a man. The *ganga*, or high-priest, who is lord of the village, performs the service every morning, in the following manner: As soon as the people are assembled, he sits down upon a mat, and with a leathern bag strikes his knee several times, having small iron bells fastened to his fingers. After this he strikes the bag several times on his breast, and

then uses many strange motions and postures of his body, hands, head, and eyes; sometimes he raises his voice, and then depresses it, frequently repeating the word, *Marionena*; to which the assembly answer, *Ka*. When this has continued for some time, the *ganga* appears as if distracted, and his rage becomes so violent, that he is obliged to be held; but, by virtue of a sour liquor, drawn from cane, with which they sprinkle him, he recovers, and then declares what he has received from the *mokisso*, and what must be done in cases of sickness. After this he recommends to the *mokisso* the health of the king, the welfare of the country, flourishing of the seed, success to the merchants, and full nets to the fishermen. At the mention of the king's name, the whole company clap their hands, in token of affection, and then the ceremony is concluded.

*Customs, Manners, &c.* The inhabitants of Loango, who are called *Bramas*, are tall, well shaped, and of a shining black colour. In disposition they are civil, but jealous, and much addicted to drinking. It is affirmed, by several writers, that the children of the natives are born of much the same colour as those of Europeans, but in two days become as black as their parents.

Another circumstance here, relative to the birth of children, is very remarkable. Though both parties are negroes, yet sometimes it happens that the offspring is very different in colour to that of its parents. These *lusus-naturæ* at a distance greatly resemble Europeans: they have grey eyes, and red or yellow hair; but, when you are close to them, their colour is like the corpse of an European, and their eyes appear, as it were, fixed in their heads. Their sight is very imperfect in the day, but at night they see clearly, especially if it be moon-light.

The children of this description are called *Dondos*, by the negroes, and *Albinos*, or whites, by the Portuguese. They are always presented to the king a few days after they are born, are brought up in the court to attend his person, and are held in such high esteem by him, that no person dare offend them: if they go to the markets, they have the liberty of taking such articles as they think proper, without control.

On the death of any person, the relations immediately make it known, by running about the town or village, and shrieking in the most hideous manner; after which they bring the corpse into the street, and wash and clean it. When the grave is dug, they carry several of their household goods and lay by it, as also the most valuable things used by the deceased in his life-time. They then take up the corpse, and carry it with all expedition to the grave, in which it is immediately deposited, some of the goods being thrown into it; and, after they have shewed their lamentations by howling and the most strange gesticulations, it is filled up with earth. The remaining goods are

set over the grave on poles, being first cut, to prevent their being stolen. The relations of the deceased bewail his loss by attending the grave morning and evening, for six successive weeks.

No foreigner is permitted to be buried in Loango. When it happens that an European dies here, his body is carried in a boat two miles from the shore, and thrown into the sea. This custom took its rise from a Portuguese being buried here some years ago, soon after which the country was afflicted with a famine. The priests attributed the cause of the general calamity to the interment of the foreigner, whose body, in consequence of their opinion, was taken up, and thrown into the sea: and, from this circumstance, they have never since permitted a stranger to be interred in their country.

## SECTION II.

### CONGO.

Congo is situated between the second and eleventh degree of south latitude, and between the thirty-second and forty-first degree of east longitude, extending in length, from north to south, five hundred and forty miles, and in breadth, from east to west, about four hundred and twenty miles.

*Climate.*] The climate is less sultry than might be expected from its situation, it being so near the equator. The winter months are April, May, June, July, and August; during which they have almost continual rains, by which the rivers are so swelled as to overflow the principal part of the country. The winds in winter blow from north to west, and from north to north-east. These winds drive the clouds towards the mountains, where, being gathered and compressed, they, at length, condense into water. In the summer, the winds blow from the south to the south-east, and, as they clear the southern skies, so they drive the rain into the northern regions. These winds are of infinite service in cooling the air, the heat of which would otherwise be insupportable.

*Soil and Vegetable Productions.*] The soil of this country is fertile, and produces several sorts of grain, particularly rice and maize. They have also great plenty of a grain called lukó, which, in its form, resembles mustard-seed, but, when ground, produces flour, little inferior to that from wheat. The manioc-root is likewise cultivated here, and much admired by the Portuguese, who, instead of making it into bread, bruise it very small, and either eat it raw, or else boil it in broth. Various sorts of vegetables are cultivated with very little labour. Among these are turnips, cabbages, potatoes, radishes, cauliflowers, carrots, and spinage, besides others not known in Europe. They have also several useful herbs, as hyssop, thyme, sweet marjoram, balm, sage, mint, &c.

Among the fruits are oranges, lemons, citrons, ananas, bananas, pumpions, melons, dates, and the kola fruit. The last of these is about the size of a pine-apple, and the fruit, which is enclosed within a thin husk, tastes much like chestnuts. It is not only valued for being pleasant to eat, but for its great efficacy in removing any disorder that particularly affects the liver. There are several sorts of trees here that are distinguished for having medicinal qualities; among these is one called angaria, the root of which, boiled in water, is an infallible remedy for violent pains in the sides.

The khisekka is another tree of a medicinal virtue, any part of which, being reduced to powder, and mixed with water, is good against fevers; and, in cases of fainting, if applied either to the forehead or temples, is equally efficacious as hartshorn.

The jakassa-tree grows very tall, is of a red colour, and has the virtue of curing the tooth-ach and sore gums; but it is very pernicious to birds; for, if they once settle on its boughs, they fall lifeless to the ground.

In the kingdom of Congo are every year two harvests; for they begin to sow in January, and reap in April; the second time is in September; and they reap what is then sown in December. In the cultivation of the earth, they use neither plough nor spade; for the clouds no sooner begin to afford the least moisture, than the women set fire to the herbs and roots; and, after the first heavy shower has fallen, proceed to turn up the ground with a slight hoe, fixed to a handle about two spans long, cutting into the earth with one hand, while, with the other, they scatter the seed, which they carry in a bag by their sides. While thus employed, they have generally one or more children upon their backs, to prevent their being hurt by the insects, which, upon this occasion, come out of the earth in great numbers.

*Fossils and Minerals.*] In many places in the mountains of Congo are quarries of excellent stone, of various kinds; whence whole columns of a prodigious size, with their capitals and bases, may be dug entire. There are even said to be whole mountains of jasper, porphyry, and marble, of various colours, resembling the marbles of Ethiopia, Numidia, and Africa. There is also a stone, speckled with grains and streaks, some of which contain beautiful hyacinths; for the streaks, which are disposed like veins through the body of the marble, may be picked out like the kernels of a pomegranate, when they fall into grains and little pieces of perfect hyacinths. Beautiful columns may be formed of the whole mass, which is very sparkling. There are other stones, seemingly inlaid with copper and other metals, which likewise appear very beautiful, and take a fine polish.

The mountains of Congo are likewise said to abound with gold; but this is denied by some writers: it is, how-

ever, allowed that copper, and also the usefulness of the means of agriculture, well known to the ancients, and fossils of the count.

*Animals.*] The animals are leopards, buffaloes, lions, apes, wild cows, sheep, goats, and great plenty of rabbits.

Poultry is very common, and ducks, turkeys, partridges, pheasants, &c. There are also many other birds, and there is one species of sparrows, and the most admired birds of music: but they greatly differ in colour, some are all red, and some black; some are white, these last have the cages, by the better of their song.

The reptiles are snakes, and serpents, species amazingly from its being children.

The seas and rivers in the former are plentiful, and the latter are plentiful, &c. They produce oysters, muscles, and generally found at the St. Salvadore, upon a very high hill, which is a plant, and commands a most beautiful shade of palm, tamarinds, &c. The air is also excellent, and the mines, which are of fabricate it into vessels. From these and other minerals have made the king's palace is a

ever, allowed that there are mines of silver and excellent copper, and also some of iron, which are wrought: the usefulness of that metal in making knives, arms, instruments of agriculture, and other kinds of utensils, being well known to the inhabitants. Of the other minerals and fossils of this country, we have no satisfactory account.

*Animals.*] The wild animals are elephants, lions, tigers, leopards, buffaloes, bears, wolves, large wild cats, chameleons, apes, monkeys, &c. The tame animals are oxen, cows, sheep, goats, and hogs; besides which, they have great plenty of stags, fallow-deer, roebucks, hares, and rabbits.

Poultry is very plentiful, particularly cocks, hens, geese, and ducks. They have also abundance of wild fowls, as partridges, pheasants, woodcocks, pigeons, doves, &c. &c. There are great numbers of parrots, most of which are very large, and either of a grey or green colour; but there is one species exceeding small, not being larger than sparrows, and their feathers are beautifully variegated. The most admired among the small birds are those called birds of music: they are about the size of a canary-bird, but they greatly differ in the colour of their feathers; some are all red, and others green, with their feet and bills only black; some again are all white, grey, dim, or black. These last have the most agreeable note, and are kept in cages, by the better sort of people, merely for the sake of their song.

The reptiles here are scorpions, millipedes, vipers, snakes, and serpents. Among the snakes there is one species amazingly large: it is called the great water-adder, from its being chiefly found in the rivers.

The seas and rivers abound with great variety of fish: in the former are prodigious quantities of anchovies; and in the latter are plenty of sturgeons, soles, barbel, trout, tench, &c. They have also several kinds of shell-fish, as oysters, muscles, cockles, and large crabs, which are generally found at the mouths of the rivers.

St. Salvadore, the capital of this kingdom, is situated upon a very high hill, mostly of solid rock, on the top of which is a plain, about ten miles in circumference, which commands a most extensive and delightful prospect, and is beautifully shaded with a great variety of fruit-trees, as palm, tamarinds, plantain, kola, lemon, and orange-trees. The air is also exceeding salubrious. The hill has some iron-mines, which are of singular use to the inhabitants, who fabricate it into weapons and instruments of agriculture. From these and other conveniences, the Congoese monarchs have made this spot their usual place of residence. The king's palace is a very spacious and beautiful structure.

The most considerable buildings in the city, exclusive of the palace, are twelve churches, of which one is the

cathedral; and the Portuguese fort, which is a strong and spacious edifice. The churches, and other public buildings have stone foundations; but the roofs are mean, being covered only with straw; and they are indifferently provided with utensils for the celebration of divine service.

The city is well supplied with fresh water by two excellent fountains. The one is in a place called St. James's Street, and the other within the walls of the court. Besides these, there is, on the east side, near the foot of the hill, a spring of excellent water, called the Vese, which falls into the river Lelundo, and serves to water the adjacent country. Before the great church is a spacious square, on one side of which a large market is kept every day for the sale of provisions. The rest of the square is surrounded with elegant houses, chiefly inhabited by noblemen. The city is very populous, the number of inhabitants being computed at forty thousand.

The Portuguese principally reside at St. Salvadore, where they carry on a considerable traffic with most other parts of the kingdom. The goods they sell to the natives are various sorts of grain, fruits, plants, and other provisions, which they bring from Brazil. The articles from Europe are English cloth, and stuffs, copper and brass vessels, several kinds of earthen-ware, rings, and other ornaments; tobacco, wine, brandy, and other spirituous liquors; light stuffs, made of cotton, linen, and woollen; with a great variety of tools and utensils. In return for these, they receive from the natives elephants' teeth, furs, and other commodities of the country: but the chief article is slaves, prodigious numbers of which are annually exported to the plantations in America. The best and most serviceable of these are brought from Angola, the country of the Jaggas, and other adjacent parts, where they are naturally very robust and strong; whereas those in the provinces of Congo, being for the most part brought up in sloth and indolence, either die in their passage, through misery and sickness, or soon after their arrival, through the change of climate, or the severe treatment they receive from those to whom they are sold.

*Religion.*] The Portuguese have taken great pains to introduce and establish their religion in this country. The Romish faith was introduced in the reign of Don John the Fourth, by means of a naval commander of rank, called Diego Cam, who, desirous of discovering the coast of Africa, in the course of his voyage came to anchor in the mouth of the River Zaire. Pleased with his reception by the natives, he took five of them home with him, and presented them to his majesty, at the court of Lisbon. Having acquired some knowledge of the Portuguese language during the voyage, they ingratiated themselves so far with the king, by the pertinent answers they made to the questions he put to them, that he ordered Cam to take them back to their own country, and to

use his utmost endeavours to make a convert of the African king to the Romish church. The attempt succeeded: the king became a convert, erected a magnificent church, and was himself baptized in the most public manner, as were his queen and court soon after. But, notwithstanding the great pains taken by the Portuguese to establish their religion in this country, few of them seriously profess it, and even those appear to do it more from policy than being affected by religious sentiments.

*Government, Dignity of the King, &c.]* The authority of the king of Congo is absolute, the lives and property of his subjects being entirely at his disposal. They approach him, on all occasions, in the most submissive manner; and whoever neglects paying proper respect and obedience to him, is punished with perpetual slavery. He has a council, consisting of twelve persons, who are his favourites, with whom he advises in all matters relative to the affairs of state. All orders of a public nature are made known by them, to which the people are obliged to pay the same obedience as if issued by the king himself. He is always attended by a number of the nobility, who dwell in and about the palace, besides his domestics and other officers of his household. He has also a strong guard, which he keeps not only for the dignity of his court, but for the security of his person. He gives public audience twice a week; but no one is permitted to speak to him except his favourite nobles. His dress is very rich, being for the most part a cloth of gold or silver, with a long velvet mantle. He generally wears a white cap on his head, as do all his favourites; but, if any of the latter come under the displeasure of the king, he orders the cap to be taken off, which is the highest mark of indignity they can receive; this cap being considered here as a badge of nobility, and of no less honour than the star or garter in England.

When the king goes abroad, he is attended by a numerous retinue; for not only his nobles accompany him, but likewise all the principal men of the city, some of whom go before and others behind. He is also attended by a numerous guard, armed with sabres, lances, or bows and arrows. When he goes to the cathedral, the Portuguese, both temporal and spiritual, as well as the grandees, must wait on him, and return with him to the palace: but the Portuguese are not obliged to attend him on any other occasion. At these times the king is dressed in his richest robes, which consist of a long mantle or cloak of silk or velvet, ornamented in the most sumptuous manner. On his head he wears a bordered cap, and round his neck are chains of gold, intermixed with the finest coral. He has a sort of half-boots on his legs, and his arms and wrists are decorated with bracelets of gold. There are other times also when his majesty's pomp and grandeur are particularly displayed. One of these is,

when he gives public audience to his nobles, or any foreign envoys, which is generally after dark. The courtiers pass through a long gallery, between two ranks of negroes, bearing waxen flambeaux. His majesty is seated in a chair of state, under a superb canopy. He is elegantly habited in a robe of tissue, ornamented with brilliants of the first lustre. On his right-hand stands an officer, waving a handkerchief at a little distance, to cause an agreeable breeze. At his left stands another, bearing in his right-hand a sceptre, and in his left a bow. He is surrounded by attendants, each holding a flambeau in his hand.

The king has one lawful wife, who is called Mani-Mombada, that is, queen; besides whom he keeps a great number of concubines. The queen is maintained at the expense of the public, an annual tax, called pintelo, being gathered for that purpose from every house in the kingdom. The tax is collected on the king's wedding-day, when the proper officers of each province go to the respective houses, and measure the length and breadth of every bed, the owner of which is taxed according to its breadth, viz. for every span, he gives either a slave or the value of one; which is the reason that most of the common people lie on the ground, and those who do not, have their beds very small.

The queen lives with great splendour, having apartments in the palace peculiarly appropriated to her use: she has a great number of women, who attend on her alternately both day and night, and the king's concubines are obliged to pay her the greatest homage; for, should they behave to her with the least disrespect, they would be punished with perpetual slavery.

With respect to the succession to the crown of Congo, no order is observed, neither legitimacy or seniority taking place, farther than the ruling nobles think proper, who esteem all alike honourable, and choose him among the king's sons for whom they have the greatest respect, or whom they think the most proper to govern. Sometimes they set aside all the children, and give the crown to a brother, nephew, or some other distant relation. The king does not stir from his palace for eight days after his coronation: in which time all the nobility, and the Portuguese, come to visit him, and wish him success. The blacks do him homage on both knees, by clapping their hands, and kissing the king's right-hand: the Portuguese and clergy do homage only on one knee.

After the expiration of the eight days, the king appears in the market, attended by his nobles, where he makes a speech to the people, declaring his resolution to perform what was proposed to him at his coronation; and assuring them that it shall be his constant study to promote the welfare of his kingdoms, and the propagation of the Romish religion.

*Revenue.*] The king's revenue consists chiefly in the tribute that is paid to him by several vassal princes, and which the mani, or governors of the six chief provinces, are obliged to gather for him. There are others that make him a kind of free-will offerings, some of cattle, others of grain, wine, palm-oil, and the like, as acknowledgments for the lands they hold under him. He is also proprietor of all the zirbis, or cockle-shells, (the current coin of this and the neighbouring kingdoms,) which bring him in exchange slaves, elephants' teeth, stuffs, cattle, millet, and other commodities. Fines and confiscations likewise bring him a considerable income. To which may be added his power in levying taxes on his subjects as often as he pleases; but this he seldom does, except in cases of necessity; the poverty of his subjects being so great, that, if he were to repeat such impositions often, it might induce them to revolt, and produce disagreeable consequences.

*Military Force.*] The king's forces are not very numerous, nor are they either well-clothed or disciplined. The best of them are the musketeers, who, having been taught the use of fire-arms by the Portuguese, retain the art of handling them with surprising dexterity. All the king's subjects may be said to be soldiers; for, whenever there is occasion, and he thinks proper to command, they must all attend.

These soldiers are taught to fall on the foe with a dauntless bravery, or rather fury; but, as their arms are of little use in such violent and irregular onsets, for want of better discipline, they are sometimes put to the rout; and, when that happens, are seldom able to rally; so that the breaking of the very first body is mostly attended with the loss of the battle. The flight of one army generally animates the other to an obstinate pursuit, the consequences attending which are dreadful, and the carnage always great. When the conquerors relinquish the pursuit, they return and plunder the enemy's camp, seize all the men, women, and children, they meet with, and sell them to the Europeans for slaves. Few of those wounded in battle survive, their arrows and darts being infected with so deadly a poison that, if they draw blood, and the person is not provided with some extraordinary antidote, they are sure to cause a speedy and unavoidable death.

After a conquest, terms of peace are generally proposed by the victor, which, though favourable on his own part, are generally accepted by the vanquished ; but they are no longer attended to by the latter than while he becomes sufficiently formidable to renew the war.

*Laws, &c.]* For the better administration of justice, a judge is appointed by the king in every particular province, to hear and determine all causes, whether of a civil or criminal nature. These are called Royal Judges; from whom an appeal may be made to the king, who, for

Treason and murder are the only offences which are deemed capital; in both which cases the punishment is solely vested in the king, who generally condemns them to the loss of their heads and estates, the latter of which are confiscated to his use. In trifling matters the offenders are punished various ways. If they are poor, they are either bastinadoed or whipped; if rich, they are punished by having fines levied on them, at the discretion of the judge.

In this kingdom the poorer sort are subject to many instances of cruelty and oppression from their superiors, among which are the following:—If a poor man happens to contract a debt with a rich one, he is not only liable to be stripped of all he possesses, (not excepting his wife and family, who, in such cases, are often sold for slaves,) but to be also bastinadoed, dragged to a jail, and there inhumanly treated, in order to oblige some of his friends to procure him his liberty at an exorbitant rate. Another proceeding, not less cruel and oppressive, is, that if an insolvent debtor secretes himself from his tyrannic creditor, or flies into some other country, either to avoid a jail, or being sold for a slave, the creditor makes no hesitation to seize on some wealthy relation of his, and imprison him in his stead, till he has extorted, by the most cruel usage, a sufficient sum from his other friends to satisfy him for the debt. This arbitrary power extends even so far as to the debts contracted by gaming, a vice to which the people of Congo are greatly addicted.

*Customs, Manners, &c.]* The complexion of the original natives of Congo is generally black, but, since they have intermixed with the Portuguese, many of them are of an olive-colour. They likewise differ in their persons, according to the respective provinces in which they are born; some of them are very tall and robust, but the generality are of a middling stature. They have all black curling hair, but their noses are not so flat, neither are their lips so thick, as those of the negroes in general. In their dispositions they are proud and haughty among themselves, but to strangers they are very affable and courteous. They have a natural propensity to theft, and whatever they get, either by stealing or otherwise, they spend in liquors, of which they are very fond, and frequently drink to the greatest excess. They have naturally a ready turn of wit, and, when sober, will converse with great circumspection. They are very revengful, and, whenever they think themselves offended, nothing will satisfy them but destroying the object of their resentment, which they generally effect by poison.

The dress of the common people consists only of a loose garment, which reaches from the waist to the middle of the ankles, and some have the bottom ornamented with a

fringe. It is fastened round the waist with a kind of string, made of leaves. Some use girdles, made of bulrushes or palm-leaves, which they plait together. They have a cap on their heads, made to sit close, and generally carry some weapon in their hands. The upper part of the body is bare in both sexes, and their arms and legs are ornamented with brass, copper, or iron, bracelets. The dress of the better sort is made of cloth, or serge, under which they have a white shirt. The garments of the women are much shorter than those of the men, and some of the ladies have a velvet-cap, richly ornamented with jewels, over which they wear a veil.

Their towns, or villages, consist of several houses, erected in the midst of an inclosure. These buildings are made of wood, and covered with the branches of trees; each house is divided into several apartments, the innermost of which is adapted for the women: they are all on the ground-floor, and without windows, the only light they have being admitted at the door, which is so small that they are obliged to stoop when they pass it. The inclosures of the houses are formed by trees, which grow so close together, that they not only serve as a fence, but also keep off the violent heat of the sun.

Their houses are very thinly stocked with furniture, the whole of which consists of only a few necessary utensils, such as pots, kettles, calabashes to hold provisions, a mill to grind their corn, a hatchet to fell timber, and some instruments of agriculture. Some of them, however, have beds, made of coarse cloth, stuffed with straw, or the leaves of trees; but the generality lie upon loose straw, spread on the ground.

The food of the common people consists principally of rice, fish, potatoes, and other roots; but the better sort live chiefly on flesh and fowl. Their common drink is water, but they sometimes regale themselves with palm-wine, or brandy mixed with water.

The natives who reside near towns live chiefly by trade; but in the country parts they are principally employed in agriculture and keeping cattle. About the River Zaire, some of them subsist by fishing, some by drawing palm-wine, and others by weaving.

Persons of rank, when they travel, are carried in hammocks, made either of net-work or strong stuffs; the hammock is fastened to a long pole, about a foot from each end; and, when the person has got into the hammock, two men, one before and the other behind, take up the pole, and lay it on their shoulders, carrying the person in this manner a considerable way without resting. When they go long journeys, they have four men, who relieve each other, in doing which they are so expert, that they never stop, but shift as they walk, at the same time keeping their usual pace. This is a very easy method of travelling, the person sitting or laying in the hammock at

pleasure; and they have sometimes a piece of calico thrown over the pole, to shelter them from the heat of the sun.

Sometimes, instead of a hammock, they fasten two ropes to the pole, one of which is much shorter than the other; they are each tied in two parts, and hang like swings: in the former the person sits, and at the bottom of the latter is a square piece of board, on which he rests his feet. The person carried generally holds an umbrella in his hand, to shelter him from the heat of the sun, or the inclemency of the weather. The reason of their travelling in this manner is from their want of horses, there not being any of those animals in the whole country.

The inhabitants of Congo are very fond of festivity and diversion, and, in most villages, the people assemble every evening at some open place, where they form a ring, in the centre of which is placed a wooden platter, full of provisions. The eldest of the company, who is called Makuluntu, gives to each his portion, which he divides with such exactness, that not any person has the least reason to complain. They do not make use either of cups or glasses, but only a large flask, which, when any one wants to drink, the makuluntu holds to the person's mouth; and when he thinks he has drank enough he takes the flask away. If any strangers happen to come by at the time of these festivities, they are equally welcome to participate with the rest of the guests.

They have also feasts on several particular occasions, such as gaining a law-suit, a marriage, the birth of a child, or any singular advancement in life. At these feasts they dance, and sing love-songs, which are attended with a variety of musical instruments, consisting of flutes, pipes, ivory-trumpets, and drums, the latter of which are made of thin wood, and covered with the skin of a beast. One of their most ingenious instruments, and the most common in use, is called the miramba. It consists of sixteen calabashes, of several sizes, placed uniformly between two boards, joined together, on a long frame, which is hung about a man's neck with a thong. Over the mouths of the calabashes are thin slips of red-wood, which, being struck with two small sticks, produce an agreeable sound, somewhat resembling that of an organ.

The marriages of those who have been converted by the Portuguese to the Romish religion, are celebrated according to the rites of that church; but the generality of the natives of Congo preserve their ancient idolatrous maxims, being married by their own priests, and having a number of wives, each taking as many as he thinks himself able to maintain.

In Congo the pagan priests lay certain injunctions on young people, such as obliging them to abstain from eating either some sorts of poultry, the flesh of certain beasts, fruits of different kinds, roots, either raw or boiled after

this or that manner, which they call *tabo*. They are kept as they are, fast till they perceive that the feast has been forbidden the least trespasser die in a very short time. this or that manner, with the like ridiculous obligations, which they call *kejilla*. These rules are as inviolably kept as they are strictly enjoined. They would sooner fast till they perished, than taste the least morsel of what has been forbidden; for they think that, if they commit the least trespass against the *kejilla*, they shall certainly die in a very short time. An instance illustrative of the prepossession of their minds in this respect is related by Merolla, in his voyage to Congo. "A young black, upon his journey, who had received the *kejilla*, conning to a friend's house at night, his host next morning had for breakfast a wild fowl, which is much better than a tame one. The guest demanded if it was a wild hen, and being answered in the negative, he sat down and ate very heartily. Four years after, these two meeting together again, the country black asked his friend, who was not yet married, if he would eat a wild hen? The young man answering that he had received the *kejilla*, and therefore could not, the other laughed, and asked why he refused it now, when he had eaten it at his table so many years before? On hearing this the other began to tremble, and, by the effects of imagination, died in less than twenty-four hours."

Previous to the interment of any great personage, they strew the way with leaves and branches of trees. On these occasions several slaves were formerly sacrificed, to serve their master in the other world; but since the Portuguese have introduced Christianity into Congo, that practice has been laid aside, and only preserved by a few, who still adhere to their original pagan maxims; but these are obliged to do it by stealth; for, should it be known, they would not only be rebuked, but severely punished by those of superior power, who are, in general, strong advocates for the Romish religion.

### SECTION III.

#### ANGOLA.

This kingdom was originally called, by the natives, Dongo, but the Portuguese afterwards gave it the name of Angola, in compliment to a prince of that name, who first usurped it from the king of Congo. The country is, in general, mountainous, and watered by several rivers, the chief of which are the Danda and Coanza. These rivers are stored with most kinds of fish, but it is dangerous to catch them, on account of the crocodiles. The Portuguese have a fort, at a place called Cambamba, upon the River Coanza. Angola is composed of several provinces, the principal of which are Chissama, Sumbi, Rimba, Sietta, Bembea, Temba, Oacco, Cambezzo, Lubolo, Loando, Benga, Danda, Illamba, Moseche, Oarii, and Membacca.

The province of Chissama is divided into three parts, each of which is under the direction of a governor, deputed by the king. The country is mountainous, and poorly cultivated: it is famous for producing a peculiar salt, made, by the natives, from a briny kind of water, which they dig for, and, being formed into a mass, they make cakes of it, which they exchange with the Portuguese for meal, oil, and other commodities. The merchants derive considerable advantages from exporting this salt to most parts of Ethiopia, as it is not only excellent for food, but also in physic, being a very pleasant diuretic.

Sumbi is, for the most part, flat. The natives, though tall and strong, are, in general, indolent, and, of course, neglect the cultivation of the land, which, wherever industry prevails, proves fruitful, and produces several sorts of excellent grain.

The province of Rimba is divided into twenty-eight lordships, or districts, under as many governors. The land is fertile, and the rivers abound with fish. The inhabitants are idolaters, but of a tractable and industrious disposition.

Sietta is one of the most rocky and mountainous provinces in all the kingdom, particularly on one side of it, where a ridge of perpendicular rocks covers a spot of thirty miles in length, without interruption. The surface of these rocks, which is well inhabited and cultivated, enjoys a serene and wholesome air, and is plentifully supplied with fresh water. The low-lands are well watered, and produce excellent pasture for cattle, great numbers of which are bred by the inhabitants; but they often sustain considerable loss from the number of wild beasts that infest this part of the country. The torrents that flow from the hills bring with them great quantities of iron-ore, which the inhabitants gather carefully, by laying straw and other materials across the streams to receive it. In this country are also found great quantities of a kind of transparent ore, which the natives call *tare*, and, when wrought, it is, in appearance, much superior to iron.

The province of Bembea extends itself on one side along the sea, and on the other divides the kingdom of Angola from other nations on the south. The great river Sucano, or San Francisco, waters most part of this province; but it is of little other use; for though it abounds with fish, yet the inhabitants dare not venture to catch them, owing to its being infested with great numbers of sea-horses, and monstrous serpents, which not only destroy great quantities of fish, but also do considerable mischief to the adjacent grounds. The country is very extensive and populous, and abounds with small cattle, the hides of which the inhabitants convert into garments, and anoint their heads and bodies with the fat. These people are much more savage than their neighbours, being almost all idolaters, and having a language peculiar to themselves.

The province of Temba is in general flat and low, and is well watered by a number of small rivers. The Rio Longo, or Long River, is the most remarkable: it springs out of a rock, on the top of which the Portuguese have a fortress, that defends the whole district. This province is divided into twelve lordships, whose chiefs, though under the protection of the Portuguese, live free and independent, being only obliged to furnish them with a certain number of militia, in cases of emergency. The whole country abounds with wild cows and mules, which the inhabitants hunt and kill for food. Some of the inhabitants have been converted to the Roman Catholic religion, which they strictly adhere to; but most of them are idolaters.

Oacco is bounded, on the south-west, by Lubolo; and, on the north-east, by the river Coanza. It is beautifully variegated with hills and plains, and so well watered with rivers and springs, that it is one of the most delightful provinces in the kingdom. But these advantages are of little use to the natives, as they are restrained by their lords from cultivating any more of the land than what is absolutely necessary to produce provisions for their families. The chief governor of this province has twenty others under him, whose principal business is to discipline and exercise the militia, for which reason this is one of the most formidable provinces in the kingdom.

There is a distemper which the natives of this province are subject to, and peculiar to the climate of this part of the country; it generally begins with a violent headache and vertigo, and is followed by convulsions, which soon reduce the patient to a mere skeleton. The medicine for this disease is made from a plant, something like our hyssop, which they pulverize, and drink the infusion: they also extract an oil from it, with which they anoint the parts convulsed. They are, likewise, subject to a kind of swelling, that begins at the mouth, and spreads itself all over the neck, which often swells to the size of the head, causes excessive pain, and is frequently attended with suffocation. This disease is generally cured by anointing the parts with the oil extracted from the above-mentioned plant.

A very singular insect, resembling the dragon-fly, is found in this province: its sting is so dangerous, that, if a quantity of blood be not immediately drawn from the part affected, the person is thrown into a violent fever, attended with excessive tortures, that commonly end in a total delirium, and, if not speedily relieved, in convulsive death. The most remarkable circumstance attending this is, that, when the person is cured, he seldom fails of a relapse, owing merely to the bare remembrance of what he felt during the time he was affected: and some persons undergo such excessive torture, that they close their miseries by putting an end to their existence.

When the inhabitants happen to be stung by these insects, they have recourse to their priests, who seek out for an insect of the same kind, which having found, they dig a hole in the earth to put it in, adding sundry fumigations, exorcisms, and superstitions, known only to themselves; after which they fill the hole with water, and replenish it as that sinks, stirring it, and letting the earth settle again several times; at length, without staying till it is quite clear and divested of its disagreeable earthy taste, they give the patient plenty of it to drink: this occasions a violent vomiting, by which so great a part of the poison is thrown out, that the natural strength of the patient enables him to throw off what is left behind. Many, however, who are cured by this strange method, are some time after seized with pains and convulsions in their nerves, which frequently end in a settled lameness, and sometimes in a dead palsy. Though this method is altogether superstitious, yet, from its being sometimes effectual, the Europeans, unable to bear the excessive pain arising from the sting, have recourse to it.

The province of Cambezzo is very populous and fertile, producing not only abundance of cattle, but also most kinds of provisions. In one part is a high hill, called the Iron Mountain, from its yielding great quantities of that metal, which the Portuguese have taught the natives to purify, and work into various kinds of instruments. In this province are many large and lofty trees, particularly palm and cocoon-trees. There is one sort that resembles our apple-trees, the bark of which, being cut with a knife, yields an odoriferous juice, which is very useful in medicine, and is of the colour and consistence of honey. The Portuguese have taken great pains to propagate the Roman Catholic religion in this province, and not without success, as there are less idolaters in it than in any other in the kingdom.

Lubolo is situated on the southern bank of the river Coanza. Its climate is wholesome, and its soil remarkably fertile, producing great plenty of all sorts of provisions; but it is chiefly noted for its excellent palm-trees, which produce better wine, oil, and timber, than is to be met with in all the other parts of the kingdom. The greater part of the people of this province are of the Romish religion, and tributary to the Portuguese.

The province of Loanda is one of the most considerable places belonging to the Portuguese settlements on this side of Africa, and is remarkable for having in it the capital of the whole kingdom of Angola. It is a large city, pleasantly situated on the declivity of a hill, near the sea-coast. It is strongly defended by a spacious fortress, in which is a church, dedicated to St. Amaro, and a convent of Cisterrians, besides several bulwarks that serve to guard the entrance of the port. This city is called, by the Portuguese, San Paulo de Loanda, and was

f Angola. It is a  
declivity of a hill,  
nded by a spacious  
d to St. Amaro, and  
eral bulwarks that  
port. This city is  
e Loanda, and was

built by them in the year one thousand five hundred and  
seventy-eight, under the direction of Paulo dias de Novais,  
the first governor of this part of Angola. It is very pop-  
ulous, and greatly resorted to; not only on account of  
its being the residence of the Portuguese governor, but  
also for its containing the chief courts of judicature for  
the whole kingdom.

The churches and other public buildings are sumptuous,  
as are also the houses of the merchants and officers, both  
spiritual and temporal. The streets are straight, wide,  
and regular, and always kept exceedingly clean. The  
houses belonging to the Portuguese are built of stone,  
and most of them elegantly furnished; but those of the  
natives are very mean, being built only of earth, and  
thatched with straw. In the centre of the city is a large  
convent, belonging to the Jesuits, who are here held in the  
highest esteem. It is a stately edifice, and endowed with  
a considerable revenue. On one side of it is an hospital,  
called the Misericordia, which has twenty-four wards or  
rooms for patients, besides convenient apartments for the  
attendants. On the other side of the convent is a church,  
belonging to the fraternity of St. John the Baptist. At  
a small distance from these three buildings is the cathed-  
ral, which is a large stately structure, dedicated to Our  
Lady of the Conception, under which is another, dedi-  
cated to the Holy Sacrament. Here are also, besides the  
parochial churches, many monasteries and chapels, belong-  
ing to the capuchins, carmelites, and friars.

Prodigious numbers of slaves are kept in this city, who  
are employed in tilling the ground, carrying burdens, and  
fetching water from springs in an adjacent island, called  
Loanda. On the north side of the city, at a small distance  
from it, is a lofty hill, on which the original city stood. It  
still bears the name of San Paulo, and upon it are some  
fine houses, together with the ruins of a monastery, which  
formerly belonged to the Jesuits. The present city suf-  
fered much by the Dutch, who took it from the Portu-  
guese, in the year 1641; but the latter, soon after retaking  
it, restored it to its primitive grandeur. Notwithstanding  
the want of water, the country round is very fertile, well  
cultivated, and beautifully diversified with a variety of  
fruit-trees, gardens, and villas.

About half a mile from the city is situated the island  
of Loanda, which is very disproportionate in its form.  
being fifteen miles long, and only one broad. The  
Portuguese have many houses on it, as also a great num-  
ber of gardens, which they keep well stocked with most  
sorts of fruit-trees and vegetables. They have also on this  
island several handsome churches; besides which there is  
a spacious convent, belonging to the Jesuits, who have, at  
least, two thousand slaves in this place. In the neigh-  
bourhood of the capital (which is called by the name of  
the island) are many elegant seats and villas belonging to

the Portuguese, most of which are richly furnished, and  
adorned with gardens, orchards, and other embellishments;  
in some of them are also very handsome chapels, in which  
service is performed by priests, who are allowed a suffi-  
cient salary for that purpose. The city, which contains  
about three thousand houses, is built of stone, and covered  
with tiles.

Small payments are made here either in zimbis (the  
shells of a small fish) or else beads, the latter of which  
are of various sizes, colours, and fashions, and are worn,  
by some of the natives, as ornaments to their arms, necks,  
and wrists. Larger payments are made with pieces of  
cloth, of their own manufacture, of a stated length and  
breadth; and goods are usually paid for in slaves, where  
the sum is considerable.

Benga is divided into many districts, the chiefs of which  
are natives, though tributary to the Portuguese. It is si-  
tuated on a river of the same name; and is bounded, on  
the west, by the sea, and, on the east, by the province of  
Moseche. Here are eight churches, three of which are  
called parochial; and one of them belongs to the Jesuits,  
who celebrate their festivals in it with the greatest pomp  
and magnificence. The country is fertile, and produces  
great plenty of maize and millet, as also a prodigious num-  
ber of banana and bacoa-trees.

The province of Danda is situated to the north of Ben-  
go, on the south side of the river of that name, which  
separates the kingdom of Angola from that of Congo. As  
this country is well watered, it is very fertile, and pro-  
duces plenty of grain, with various kinds of fruits; but it  
is greatly infested with crocodiles and large serpents, which  
harbour in the River Bengo. As the inhabitants are, for  
the most part, Christians, here are several churches, regu-  
larly served by secular priests. The chief of these is  
situated at the mouth of the Danda: and at some distance  
from it is another, as also several churches and chapels,  
all of which belong to the Jesuits.

The province of Ilanba is divided into two parts, dis-  
tinguished by the names of higher and lower. They are  
both very fertile; and the natives, who are chiefly Chris-  
tians, pay a tribute to the Portuguese. The Higher Il-  
lamba has mines of excellent iron, and is almost covered  
with small hills. In the centre of it is a large mountain,  
from the summit and sides of which flow a prodigious  
number of springs and rivulets of clear and wholesome  
water, which is of infinite service in contributing to ferti-  
lize that part of the country. This province pays a con-  
siderable tribute to the king of Portugal, and the governor  
of it is obliged to maintain a numerous militia for his  
service.

Moseche is situated on the northern banks of the River  
Coanza. The soil is very fertile, and, besides grain, is  
remarkable for producing the manioc-root, which is so

plentiful that large quantities of it are annually sent to the city of Loanda. In this province are mines of several metals. It is remarkable that each mine tinges the complexion of the inhabitants who live in the territory; for, though they are all naturally black, yet those near the silver mines differ in their complexion from those that live near the mines of gold and lead, which cannot be otherwise accounted for than from the effluvia that exhales from the different metals.

Oarii is situated on the northern bank of the River Coanza, and adjoins to the province of Moseche. It is watered by a great number of small rivers, that fall into the Coanza, but which, in the time of the great rains, becomes large, rapid, and dangerous. In this province are two fortresses, belonging to the Portuguese, at each of which they keep a strong garrison. One of these is built at Quitongo, an island of great importance on the River Coanza, and the other at a place called Maopongo.

This last-mentioned fortress is situated on the top of a number of large rocks, and appears, at a distance, like a considerable city, surrounded with high walls, and diversified with steeples, turrets, pyramids, obelisks, triumphal arches, and other eminent structures: on a nearer approach, however, it shews itself to be no more than a heap of gigantic rocks, parted from each other by intervals of a vast depth, and several fathoms wide; and the summit of it, exclusive of a small part round the fortress, is a large, barren, and uncultivated plain. Though this place is near one hundred leagues from the sea, yet it abounds with a variety of springs of brackish water, very proper for making salt, and which, rising and falling with the tide, mount up at high water, in large streams, above the level of the plain. A circumstance still more singular than this, is, that these springs are intermixed with an equal number of fresh ones, the waters from which are both clear and well-tasted. The sepulchres of the ancient monarchs of Angola, called, by the Portuguese, Las Pubuillas de Cobazzo, are still to be seen about six miles from this place.

The province of Membacca is situated on the north side of the River Lucala, and between that and the Higher Illamba. It is wholly subject to the Portuguese; for though the lord who governs it assumes a claim to a kind of independency, it is granted him only on condition that he shall maintain, at his own expense, a numerous militia for their service. These troops, though idolaters, are stout, warlike, and well-disciplined, and never betray any fear of death when they engage an enemy; for which reason the Portuguese value them above all the rest in the kingdom.

The purchase of slaves constitutes the chief trade carried on in this kingdom by the Portuguese and other Europeans. The commodities brought in exchange are

broad-cloths, crimson and other silks, velvets, cambrics, gold and silver lace, broad and narrow striped tickings, black serges, Turkey carpets, threads, and silks of all sorts, Canary and other wines, brandy and other spirituous liquors, oil, spices of all sorts, loaf-sugar, knives, fishing-hooks, pins, needles, small bells, variety of other trinkets and baubles, glass-beads of all sizes and colours, rings of the same or other materials, fire-arms, swords, cutlasses, and other weapons.

The kingdom of Angola was formerly subject to Congo, but it does not, at present, acknowledge any dependence; and the king, from the protection he receives from the Portuguese, preserves an absolute authority. When his troops engage an enemy, they divide themselves into three bodies, at certain distances from each other. In the centre one is the general, who directs all their motions by the sound of several warlike instruments. They then move forwards, retire, or wheel-about, as these direct; and fall on the enemy with great fury, making at the same time a most hideous noise. If they find themselves likely to be disconcerted, they take to flight, nor is it possible for their general to rally them; so that the fate of a battle depends on the success of the first onset.

The dress of the military officers is very grand, their caps being ornamented with a variety of ostrich, peacock, and other feathers. About their necks they wear several links of iron chain, to which are fastened great quantities of rings, that jingle at every motion. For the same purpose, also, they hang a great number of bells about their middle, the noise of which, they suppose, animates the soldiers to fight with more ardour, and, at the same time, gives them a greater air of pomp and grandeur. They wear buskins on their legs, after the manner of the Portuguese. Their weapons are the bow, sword, target, and dagger. Those, however, who carry the bow, are not allowed to wear the target, but only the sword and dagger. The common soldiers, who go naked from their waists upwards, fight with bows and daggers, and in their girdles they wear large crooked knives.

The language of the people of Angola and Congo is radically the same; but the dialects of the different provinces differ so essentially in pronunciation, that it is difficult for those born in places remote from each other to converse together.

38. VOL. I.

Europeans who reside here are striking spectacles of mortality.

The chief rivers of Benguela are the Longo, the Nica, the Saint Francisco, which runs through the middle of it, and the great River Cuneni, which runs from east to west.

Benguela, the capital, lies in ten degrees thirty-five minutes of south latitude, and gives its name to a province that extends about thirty miles along the coast. In this city the Portuguese have built a fort, encompassed with pallisadoes and a ditch: the whole is surrounded with houses, and shaded with orange, lemon, banana, and other trees. The bay of Benguela, which lies to the south of the town, is about two leagues broad at the entrance, and deep enough for ships of burthen to anchor in.

At a village, called Manikicongo, about twenty miles from the mouth of the bay, the Portuguese have a store-house for divers articles, which they sell to the natives: the chief of these are linens, cottons, fire-arms, and gun-powder.

To the northward of a river called Caton-helle is another bay, which, from its convenience for anchorage, the Dutch call the Good Bay. The land here is low and fertile, and the natives breed great numbers of black cattle and hogs.

The inland parts abound in wild beasts, as lions, tigers, elephants, rhinoceroses, and wild mules. The greatest curiosity here is a remarkable animal, peculiar to the country, called, by the natives, Abada. It is of the size of a half-grown calf, very shy, and swift of foot. It has two horns, one on the forehead, the other on the nape of the neck. When the animal is young, the front horn is straight; but, as it advances in age, the horn bends gradually up, like the tusk of an elephant. The natives hunt it for the sake of the front horn, which they esteem as an excellent antidote against poison. They look on the virtue of it to be greater or less, according to the age of the animal when killed. The Portuguese, in order to know the goodness of it, make use of the following expedient:—They set the horn upright on the ground, and suspend a naked sword over it, point to point. If the horn be good and hard, the point of the sword will not penetrate it, whereas, when the horn is soft and young, the sword immediately sinks into it, which shews that it is not arrived at its full perfection, and, of course, lessens its value. They also make a poultice of pulverised bones of this creature, mixed with water, which, they say, is a sovereign remedy against all pains of the body, by drawing away the peccant humours not only from the part affected, but from the whole mass of blood.

## CHAPTER VII.

### UPPER ETHIOPIA.

THIS extensive tract of country comprises the kingdoms of Nubia, or Sennaar, Abyssinia, and the coast of Abex; each of which shall be separately described.

#### SECTION I.

##### NUBIA, or SENNAAR.

*Situation, Climate, &c.*] The kingdom of Nubia, or Sennaar, is bounded, on the north, by Egypt; on the east, by the Red Sea and part of Abyssinia; on the south, by some unknown parts of Africa; and, on the west, by Gaoga and the desert of Gerham. The soil and climate of this country are extremely unfavourable, both to man and beast. The men, though remarkable for bodily strength, are generally short-lived; and there is such a mortality among the children, that, were it not for a constant importation of slaves, the metropolis would soon be

depopulated. No horse, mule, nor ass, will live in the city of Sennaar, or for many miles round it. The case is the same with bullocks, sheep, dogs, and poultry; all of which must be sent to the sands, at least twice a year. It is difficult to account for this mortality; though Mr. Bruce assures us it is the case every where about the metropolis of this country, where the soil is a fat earth, during the first season of the rains. Several of the kings of Sennaar have endeavoured to keep lions; but it was always found impossible to preserve them alive after the wet season; though they will live, as well as other quadrupeds, in the sands, at no great distance from the capital. No species of tree, except the lemon, will blossom in the vicinage of this city; and even the cultivation of the rose has been frequently attempted without success. In some places, however, the soil is very fertile, and produces exuberant crop of doura, or millet, which is the principal food of the common people. In some parts, the earth is so strongly

impregnated with salt, that a sufficient quantity to serve the inhabitants is extracted from it.

"Nothing," says Mr. Bruce, "is more pleasant than the country around Sennaar in the end of August and beginning of September. The grain, being now sprung up, makes the whole of the immense plain appear a level green land, interspersed with great lakes of water, and ornamented at certain intervals with groupes of villages; the conical tops of the houses presenting, at a distance, the appearance of small encampments. Through this extensive plain winds the Nile, which is here about a mile broad, full to the very brim, but never overflowing. Its banks, about Sennaar, resemble the pleasantest part of Holland in the summer-season; but, when the rains cease, and the sun exerts its utmost influence, the doura begins to ripen, the leaves to turn yellow and to rot, the lakes to putrify and become full of vermin, and all beauty suddenly disappears; bare scorched Nubia returns, with all its terrors of poisonous winds and moving sands, glowing and ventilated with sultry blasts, which are followed by a troop of terrible attendants; epilepsies, apoplexies, violent fevers, obstinate agues, and lingering painful dysenteries, still more obstinate and mortal."

With regard to the climate of the country round Sennaar, our author has several curious observations. The thermometer rises, in the shade, to a hundred and nineteen degrees; but the degree indicated by this instrument does not at all correspond with the sensations occasioned by it; nor with the colour of the people who live under it. "Nations of blacks," says Mr. Bruce, "live within latitude thirteen and fourteen degrees; about ten degrees south of them, nearly under the line, all the people are white, as we had an opportunity of observing daily in the Galla Sennaar. Cold and hot are terms merely relative, not determined by the latitude, but elevation, of the place. When, therefore, we say *hot*, some other explanation is necessary concerning the place where we are, in order to give an adequate idea of the sensations of that heat upon the body, and the effects of it upon the lungs. The degree of the thermometer conveys this but very imperfectly; ninety degrees is excessively hot at Loheia, in Arabia Felix, and yet the latitude of Loheia is but fifteen degrees; whereas ninety degrees at Sennaar is only warm, as to sense, though Sennaar is in latitude thirteen degrees.

"At Sennaar, then, I call it *cold*, when one, fully clothed and at rest, feels himself in want of fire. I call it *cool*, when one, fully clothed and at rest, feels he could bear more covering all over, or in part, than he has at that time. I call it *temperate*, when a man, so clothed and at rest, feels no such want, and can take moderate exercise, such as walking about a room, without sweating. I call it *warm*, when a man, so clothed, does not perspire when at rest; but, upon taking moderate exercise, sweats

and again cools. I call it *hot*, when a man at rest, or with moderate exercise, sweats profusely. I call it *very hot*, when a man, with thin or little clothing, perspires much, though at rest. I call it *excessive hot*, when a man, in his shirt and at rest, sweats excessively, when all motion is painful, and the knees feel feeble, as if after a fever. I call it *extremely hot*, when the strength fails, a disposition to faint comes on, and a straitness is found in the temples, as if a small cord were drawn tight about the head; when the voice is impaired, the skin dry, and the head seems more than ordinarily large and tight. This, I apprehend, denotes death at hand; but this is rarely or never effected by the sun alone, without the addition of that poisonous wind which pursued us through Atbara, where it has, no doubt, contributed to the total extinction of every thing that hath the breath of life. A thermometer, graduated upon this scale, would exhibit a figure very different from the common one; for I am convinced, by experiment, that a web of the finest muslin, wrapped round the body at Sennaar will occasion, at mid-day, a greater sensation of heat in the body than a rise of five degrees in the thermometer of Fahrenheit.

"At Sennaar, from seventy to seventy-eight degrees of Fahrenheit's thermometer is cool; from seventy-nine to ninety-two temperate; at ninety-two degrees begins warmth. Although the degree of the thermometer marks a greater heat than is felt by strangers, it seems to me that the sensations of the natives bear still a less proportion to that degree than ours."

*Vegetables.*] Nubia produces some very fine fruits, as also plenty of sugar-canes; but the natives are unacquainted with the method of making good sugar. They have also a great variety of medicinal plants, roots, and drugs, with others that are extremely obnoxious; particularly a most dreadful poison, so quick and fatal in its operations, that a single seed, taken inwardly, causes instant death. These seeds grow on the top of a plant that resembles our nettles; and it is said that considerable quantities of it are exported to the neighbouring countries. Nubia also affords gold, ivory, sanders and other medicinal woods, and drugs.

*Animals.*] This country abounds with various kinds of wild beasts, as lions, tigers, leopards, crocodiles, vipers, and several kinds of serpents, particularly one of a colour which so nearly resembles that of the dust or sand, in which it lurks, that it is not easily avoided, and its bite is commonly attended with almost immediate death, and that of the most painful nature. Here are likewise great numbers of camels, dromedaries, and horses, of which the breed of the latter is the chief boast of this country.

These animals are generally about sixteen hands high; and, by Mr. Bruce, who has given the most accurate ac-

count of them, introduced into the preserved u represents this a horse. "What make in point being so entirely if beautiful sym the most agile, endurance of fat attachment to m animal, can prou is above all comp

teen hands high;  
most accurate ac-

ment of them, they are said to be the breed which was introduced into Nubia at the Saracen conquest, and has been preserved unmingled to the present time. Our author represents this as a much finer animal than the Arabian horse. "What figure," says he, "the Nubian horse would make in point of fleetness is very doubtful, his make being so entirely different from that of the Arabian; but if beautiful symmetry of parts, great size and strength, the most agile, nervous, and elastic movements, great endurance of fatigue, docility of temper, and seeming attachment to men beyond that of any other domestic animal, can promise any thing for a stallion, the Nubian is above all comparison the most eligible in the world."

The Nubians are very jealous in keeping up the pedigree of their horses, which are black or white; but a vast proportion of the former to the latter. Our author observes, that he never saw the colour which we call grey; but he has seen some bright bays, and a few inclining to sorrel.

All noble horses in Nubia are said to be descended from one of the five upon which Mahomet and his four immediate successors fled from Mecca to Medina, on the night of the Hegira. No European, however, can be expected to pay much regard to this legendary tale, or to believe that the strength and beauty of this breed of horses is owing to any virtue communicated to the first of them by the Arabian impostor and his deluded associates. Mr. Bruce accounts for the excellence of these animals upon rational principles. He observes, that the best horses of this breed are found in the tribes of Mowelli and Amcey, which lie in about thirty-six degrees of north latitude; and Dongala, which is situated in twenty degrees latitude, seems to be the centre of excellence for this noble animal. Hence he infers, that the bounds in which the horse is in the greatest perfection, are between the twentieth and thirty-sixth degrees of latitude, and between thirty degrees of longitude east from Greenwich, and the banks of the Euphrates. If, to the effects of climate, we add the manner of feeding the Nubian horses, we shall, probably, have the true cause of their superiority over all others. They are kept fat upon doura, and suffered to eat nothing green, but the short roots of grass that are to be found by the side of the Nile, after the blades have been withered by the sun.

*Chief City.* SENNAAR, the capital of Nubia, is situated in latitude thirteen degrees thirty-four minutes thirty-six seconds north, and in longitude thirty-three degrees thirty minutes thirty seconds east from the meridian of Greenwich. It is on the west side of the Nile, and close upon the banks of it. The ground on which it stands rises just enough to prevent the river from entering the town, even in the height of the inundation, when it comes to be even with the street.

The town of Seninaar is very populous, there being in it many good houses, after the fashion of the country. Poncet says, in his time, they were all of one story high, but now the great officers have all houses of two stories. They have parapet roofs, which is a singular construction; for in other places the roofs are all conical. The houses are all built of clay, with very little straw mixed with it, which sufficiently shews the rains here must be less violent than to the southward, probably from the distance of the mountains.

*Language.* The language of the Nubians is peculiar to themselves, but bears some kind of affinity to the Arabic: it is not, however, universally spoken throughout the whole kingdom; for in the desolate parts, which are inhabited by a different kind of people, they speak a language that does not border either upon the one or the other; so that these and the inhabitants of the more civilized parts of the country can scarcely converse together at all.

*Religion.* The inhabitants in general, according to Mr. Bruce, pay adoration to the moon; which worship, he says, is performed every night that she shines, with great pleasure and satisfaction. Coming out from the darkness of their huts, they say a few words upon seeing her brightness, and testify great joy, by motions of their feet and hands, at the first appearance of the new moon; but he never saw them pay any attention to the sun. Their priests seem to have great influence over them, but through fear only, and not from affection. They are distinguished by thick copper-bracelets about their wrists, as also sometimes one or more about their ankles. There are some, however, who profess Mahometanism, but they are by no means strict adherents to its injunctions.

*Government, &c.* The government of Nubia is monarchy in the most absolute sense, the king having uncontrollable sway over the lives and property of the people.

The king and his officers administer justice in all cases, whether civil or criminal, and that with the utmost expedition. On the person found guilty, sentence is no sooner passed than executed. For trifling matters they are punished with the bastinado; but in cases of murder and treason they are put to death; the manner of doing which is by laying the criminal on his back, and beating him on the breast with a stick till he expires, which, from the severity of the strokes, is generally effected in a very short time.

*Customs, Manners, &c.* The inhabitants of Nubia are swarthy, and small of stature. Those of superior rank, in the interior of the country, are clothed in a vest, without sleeves, but the common people only wrap a piece of linen-cloth about them, and the children go quite naked. Persons of quality, however, wear fine long robes of

silk or cotton; and those of the women reach to the ground; the last also adorn their hair with rings and other ornaments of gold, silver, and brass, but have nothing on their legs or feet, except sandals.

Both men and women anoint themselves, at least once a day, with camel's grease, mixed with civet, which they imagine softens their skins, and preserves them from cutaneous eruptions; of which they are so fearful, that they confine themselves to the house if they observe the smallest pimple on their faces. With the same view of preserving their skins, though the better sort have a clean cotton shirt every day, they sleep in a greased one at night, having no other covering. Their bed is a tanned bull's hide, which this constant greasing softens very much; it is also very cool, though it gives a disagreeable smell to their bodies, from which they cannot be freed by any washing.

The poorer class of people live upon the flour of millet; but the rich make this into puddings, toasting the flour before a fire, and putting milk and butter into it; besides which they use beef, partly roasted and partly raw. They have very fine horned cattle; but the meat commonly exposed to sale is camels' flesh; and it appears that the liver and spare-rib of the camel are invariably eaten raw. Hogs' flesh is not sold in the market; the common people, however, eat it openly, and those in office, who pretend to pay an implicit obedience to the precepts of Mahomet, do the same in secret.

The generality of the inhabitants are said to have neither modesty, civility, nor religion. Mr. Norden, who proceeded up the Nile a considerable way into Nubia, found them base, treacherous, mean, and avaricious, especially some of the great, who scruple neither threats nor intreaties to obtain the treasures they dare not plunder by open violence. They fight to greater advantage on horseback than on foot, for they are very expert horsemen; but, as they poison their weapons, the Turks seldom venture to attack them.

A French physician, named Poncet, who passed through this country in his way to Abyssinia, says, they are subject to a prince, who wears a long robe, embroidered with gold and silver, fastened with a girdle of the finest cotton. On his head he has a turban of the same; but never appears in public without having his face veiled with silk gauze, of various colours. Those strangers who are admitted to pay their homage to him, are obliged to pull off their shoes, and, kneeling, to kiss the ground two or three times.

One of the most remarkable customs of this country is, that the king ascends the throne with an expectation of being murdered whenever the general council of the nation thinks proper. The dreadful office of executioner belongs to a person called the *Sid el Coom*, and who is always a relation of the monarch himself. The *Sid el*

*Coom* in office at the time Mr. Bruce visited this country was named Achmet, and was one of his best friends. He had murdered the late king, with three of his sons, one of whom was an infant at its mother's breast; and he was, also, in daily expectation of performing the same office to the reigning sovereign. This man was by no means reserved concerning the nature of his office, but readily answered every interrogation. When asked by our author, why he murdered the king's young son in his father's presence? he replied, that he did it from a principle of duty to the king himself, who had a right to see his son killed in a lawful and regular manner, (which was by cutting his throat with a sword,) and not in a more painful or ignominious way, which the malice of his enemies might possibly have inflicted.

The same man observed, that the king was very little affected at the sight of his son's death, but he was so unwilling to die himself, that he frequently pressed the executioner to let him escape, but, finding all his entreaties ineffectual, he submitted, at last, without resistance. On being asked, whether he was not afraid of coming into the king's presence, considering the office he might possibly have to perform? he answered, that he was not in the least afraid on this account; that it was his duty to be with the king every morning, and very late in the evening; that the king knew he would have no hand in promoting his death; but that, when the matter was absolutely determined, the rest was only an affair of decency; and it would undoubtedly be his own choice rather to fall by the hand of a relation in private, than by that of a hired assassin in the sight of the populace. Baady, the king's father, having the misfortune to be taken prisoner, was sent to Acbara, to Welled Hassan, the governor of that province, to be put to death there. But the king, who was a strong man, and well armed, kept so much upon his guard, that Welled could find no opportunity of killing him, but by running him through the back with a lance, as he was washing his hands. For this, Welled was afterwards executed, not on account of the murder itself, but because, in the first place, he, who was not the proper executioner, had presumed to put the king to death; and, in the next, because he had done it with a lance, whereas the only lawful instrument was a sword.

On the death of any of the sovereigns of this country, the eldest son ascends the throne; and as many of his brothers as can be found are apprehended, and murdered by the *Sid el Coom* in the manner already related. The princesses are excluded from the sovereignty, and are worse off than those of Abyssinia; having no settled income, nor being treated, in any degree, better than the daughters of private persons. The king is obliged, once in his life-time, to plough and sow a piece of ground; whence he is named *Baady*, "the countryman or pea-

ant;" a title as common among the monarchs of Sennaar as Cæsar was among the Romans.

The royal family were originally negroes; but, as the kings frequently marry with Arab women, the white colour of the mother is communicated to her children. This is said to be invariably the case when a negro man of Sennaar marries an Arab woman; and it holds equally good, when an Arab man marries a negro woman.

Mr. Bruce gives a very curious description of the queens and ladies at the court of Sennaar. He had access to them as a physician, and was permitted to pay his visit alone. He was first shown into a large square apartment, where there were about fifty black women, all in a state of nudity, excepting a narrow piece of cotton-cloth about their waists. As he was musing whether these were all queens, one of them took him by the hand, and led him into another apartment, much better lighted than the former. Here he saw three women, sitting upon a bench, covered with blue Surat cloth; themselves being clothed from the neck to the feet with cotton-shirts of the same colour. These were three of the king's wives: his favourite, who was one of the number, appeared to be about six feet high, and so extremely corpulent, that our author imagined her to be the largest creature he had seen next to the elephant and rhinoceros. Her features perfectly resembled those of a negro: a ring of gold passed through her under lip, and weighed it down till it almost covered her chin, leaving her teeth bare, which were small and very fine. The inside of her lip was blackened with antimony. Her ears reached down to her shoulders, and had the appearance of wings: there was a gold ring in each of them, about five inches in diameter, and somewhat smaller than a man's little finger; the weight of which had drawn down the hole where her ear was pierced so much, that three fingers might easily pass above the ring. Her neck was adorned with a gold necklace, of several rows, one below another, to which were hung rows of perforated sequins; and upon her ankles were two manacles of gold, larger than those used for chaining felons. The other ladies were dressed much in the same manner; only one of them had chains coming from her ears to the outside of each nostril, where they were fastened. A ring was, also, put through the gristle of her nose, and hung down to the opening of her mouth; having altogether something of the appearance of a horse's bridle.

## SECTION II.

### ABYSSINIA.

*Extent and Boundaries.*] Abyssinia is about nine hundred miles in length, and eight hundred in breadth. It is bounded, on the north, by the kingdom of Nubia; on

the south, by Alaba; on the east, by the Red Sea; and, on the west, by the River Maley.

*Climate.*] The climate of Abyssinia is, in general, very sultry; but the extreme heat is only felt in the valleys or low lands, for the ridges of mountains, most of which are of a prodigious height, enjoy a degree of coolness; inso-much that there are some parts where the summers are less sultry than in Portugal, and others where the inhabitants are more afraid of cold than heat. This difference of climate is frequently productive of violent storms of thunder and lightning, which are sometimes so terrible as to prove destructive both to man and beast. These storms are also generally attended with excessive rains, which are frequently so violent, that their streams carry away with them trees, houses, and even hills, whilst all the rivers overflow, and inundate the country: after the water retires, the lanes and roads are so covered with a thick slimy mud, that they become for some time entirely impassible. But the greatest inconvenience that attends these rains is, that they infect the air with a dangerous malignancy; for, falling on the ground, that has been parched up for a considerable time, they raise such quantities of unwholesome vapours as seldom fail of producing violent distempers.

The seasons are, properly speaking, three; namely, the spring, which begins at the latter end of September; the summer, which commences on the twenty-fifth of December; and the winter, which begins on the twenty-fifth of June. The summer is divided into two parts, of three months each; the first is the most sultry and disagreeable; the other is much more moderate and pleasant.

The winds differ as much as the climate: some, especially on the high lands and lofty mountains, are very refreshing and pleasant; whilst others, on the low lands, where the air is less agitated, are hot and insalubrious. One of these, which is rather a hurricane, is called Sengo, or the Serpent. This is sometimes so violent, that it overturns houses, tears up trees by the roots, and is frequently very prejudicial to the shipping. Notwithstanding these inconveniences, this wind has some good tendency, as it clears the air of the lower grounds, which would otherwise stagnate, and prove infectious.

The whole country is intersected with prodigious high mountains, between which are such dreadful precipices as must naturally excite terror in the beholder. Some of them have very large plains on the top, covered with trees and other verdure, and afford springs of excellent water; and in some parts they are so well cultivated as to produce most of the principal necessities of life.

These stupendous hills appear, at some distance, in a delightful variety of shapes. Some of them resemble pyramids, others towers of various shapes. Some are of an exact square, others perfectly round. Some, again, so deceive the eye, that, when the traveller arrives at what

he supposed to be the top, he discovers it to be only the foot of another eminence, equally high and difficult of ascent.

That the reader may form a proper idea of one of these hills, and the great danger and difficulty there is in ascending them, we shall present an account of that called Guza, situated in the province of Tigré, which travellers, who come from the Red Sea, are obliged to cross in going to Dambea. "When you have gained the top, it presents a spacious plain, in the midst of which stands another mountain of equal height. The ascent takes up about half a day's journey, and goes winding all the way up. The paths are very narrow, and cut into the side of the solid rock: the passage presents to the view a most deep and dreadful precipice, the bottom of which cannot be reached by the naked eye, but only offers a gulf, which at once turns the head, and fills the heart with terror. Should any of the caravans that go up and down these steep and narrow roads chance to meet another in its way, both men and beasts are in the greatest danger of being thrown down the precipice, and dashed in a thousand pieces before they reach the bottom, unless they take the utmost care in passing by one another. The mules are by far the best for those that ride, because they are the surest footed; but they will always close to the edge of the precipice, and cannot, without great risk, be turned to the other side of the road, or be kept to it when they are there. What adds still more to the horror of the journey, whether it be up or down the steep declivity, is, that, at the bottom of the valley below, there commonly runs a swift torrent of water, with a most hideous roar, which, being echoed by the adjacent rocks, and often heightened by loud winds, as well as by the continual trampling of the men and beasts upon the rock, increases the horrid din to such a degree, as precludes the possibility of hearing or being heard. But the wished-for summit once attained, the traveller is amply gratified by the beautiful prospect presented to the view, which is not that of rugged and intersected peaks above, and deep gaping valleys beneath, as might be expected, but of a small delightful plain, about two miles in compass, and a musket-shot in breadth, and terminated, at one end, by a new, flat, and upright rock, like the back of a chair, of which this little plain is the seat: so that, take the whole mountain together, that of Guza seems to be a kind of pedestal to this; and the latter, which the natives call Lamalmon, represents, in some measure, a chair without arms, the back of which is the upright rock at the end of the plain, which is as perpendicular as if it had been hewn out with a chisel. Along what we may call the seat of this wonderful chair is pleasantly situated a town of the same name, whose inhabitants obtain a livelihood by helping the caravans to load and unload the beasts of burthen during a great part of the way of the craggy ascent."

There are other mountains in this country that resemble the above, particularly one situated between the provinces of Anihara and Oleca. But the most considerable amongst them is that called, by the natives, Thabat Mariam, whose summit greatly exceeds all the rest, and is, at the same time, very spacious. This remarkable mountain, whose bottom is watered by two large rivers descending from it, has seven handsome churches on its summit, one of which, dedicated to St. John, is very beautiful, having been formerly the burial-place of the Abyssinian emperors. Within it are five monuments, erected to the memory of these monarchs: they are covered with tapestry, on which are represented the arms of Portugal.

There is a remarkable hollow high rock situated in the province of Gojam, directly opposite to which, at a small distance, is another, much of the same height and bulk, so exactly placed by nature, that it echoes back a word faintly whispered in the former with amazing force; and the united voices of three or four persons speaking together produce a sound not inferior to that arising from the shouts of a numerous army.

*Vegetables.* Among the vegetable productions of Abyssinia is the *balm*, or balsam, which appears to have been highly valued in the early ages. We know from scripture, that the Ishmaelites, or Arabian carriers and merchants, trafficking, with the Indian commodities, into Egypt, brought with them balm, as a part of the cargo. The *ense* is an herbaceous plant, which grows to great perfection at Gondar; but it mostly abounds in that part of Maitsha and Goutta west of the Nile, where there are large plantations of it, and it is there, almost exclusive of every thing else, the food of the Gallas inhabiting that province. When soft, like the turnip well boiled, if eaten with milk and butter, it is the best of food, wholesome, nourishing, and easily digested. The *teff* is a grain commonly sown all over Abyssinia, where it seems to thrive equally on all sorts of ground: from it is made the bread which is commonly used throughout this country. The Abyssinians have plenty of wheat, and some of it of an excellent quality. They likewise make as fine wheaten bread as any in the world, both for colour and taste; but the use of this is chiefly confined to people of the first rank. The acacia-tree is very common in Abyssinia, as are several other curious productions of the vegetable world.

This country produces great variety of fruits; but those most cultivated are the black grape, peaches, pomegranates, almonds, citrons, and oranges. They have also great plenty of roots and herbs, which, notwithstanding the heat of the country, grow naturally. Sugar-canes are, likewise, very plentiful; and they have prodigious quantities of honey, which is here very excellent, and of many different sorts.

Abyssinia produces a great quantity of cotton, and India. There is much abundance of such animals as are domesticated with the people of these parts, as horses, mules, camels, and oxen, and also many wild animals, as lions, tigers, and leopards, and many other beasts.

*Animals.* The Abyssinians have various and numerous animals, as mules, camels, goats, and oxen. The oxen are their principal beasts of burden, and are used in various occupations, as in ploughing, and in carrying goods. They are also used in war. The beasts of burden are also used in carrying goods, and in ploughing. The Abyssinians have also many wild animals, as lions, tigers, and leopards, and many other beasts.

The wild quadrupeds of Abyssinia are, the hyenas, leopards, and other beasts. The hyenas are very fierce, and mischievous, and kill many of the people. The leopards are also very fierce, and kill many of the people. The Abyssinians have also many other wild animals, as tigers, and lions, and many other beasts.

The elephants are also found in Abyssinia, and are very large and fierce. They are used in war, and in carrying goods. The Abyssinians have also many other animals, as horses, mules, and camels, and many other beasts.

nd of many dif-

Abyssinia produces great quantities of senna, and abundance of cotton, which grows on shrubs, the same as in India. There are also various sorts of flowers, that grow in such abundance, that the banks of the rivers are ornamented with them the principal part of the year. Many of these are peculiar to the country; but the generality are those natural to Europe, particularly jessamines, lilies, jonquils, and roses: among the latter is one that grows on trees, and is much more odoriferous than those produced from shrubs.

*Animals.*] The quadrupeds of this country are both various and numerous. Those of the tame kind are horses, mules, camels, dromedaries, oxen, cows, sheep, and goats. The oxen, in particular, are of a prodigious size; their horns are so large, that the inhabitants make them into various necessary utensils. The horses are, in general, fleet and docile, but seldom used, except in times of war. The beasts of carriage are mules, camels, and dromedaries, all which they train up to an easy, yet quick, pace. They use the mules when they travel over the craggy mountains, those beasts being not only very gentle, but also sure-footed; and the camels and dromedaries when they travel through hot and sandy deserts.

The natives prefer riding on mules to horses, not only on account of those beasts being more gentle and sure-footed, but also out of respect to their own pedigree; for, as they boast themselves to be descended from the Jews, whose princes and grandees are recorded to have chiefly ridden upon mules, they esteem it an honour to do the same here, and to have the horses led by the bridle, till some martial engagement obliges them to mount.

The wild quadrupeds of this country are lions, tigers, hyenas, leopards, various kinds of apes, wolves, foxes, and other beasts of prey; all of which are very numerous, fierce, and mischievous. Lions are numerous, and of several sorts and sizes, but the most remarkable are those of the kingly or royal breed. As these do considerable mischief among the larger cattle, the inhabitants are very assiduous in endeavouring to destroy them, and will even encounter them with no other weapons than their lances and daggers.

The elephants in Abyssinia generally go in large droves, and frequently make havoc among the corn and other grain. They also make great destruction among the forests, by rooting up large trees, and breaking down small ones, to feed on their leaves.

The number of birds in Abyssinia exceeds that of other animals, the high and low countries being equally stored with them. Many species of the eagle and hawk, and many more of the vulture kind, as it were, over-stock all parts of the country. That species of glede called *hadaya* comes very punctually into Ethiopia, at the return of the sun, after the tropical rains. The *nissar*, or golden

eagle, is not only the largest of the eagle kind, but one of the largest birds that flies. From wing to wing he is about six feet four inches. The most distinguished bird in this country is the *maroe*, or honey-bird: it receives its name from having a particular instinct in discovering the hidden treasure of the industrious bees, of which they have prodigious numbers, and of various sorts; some of them are domestic, and kept in hives; others are wild, and lay up their honey in hollow trees; and a third sort hide it in small holes and caverns in the ground, which they take surprising care to cleanse for their use, and afterwards to stop them so close and artfully, that it is almost impossible to find them out, though they chiefly lie along the most public highways. This last is the sort that the *maroe* discovers to the inhabitants, by an unusual noise and fluttering of its wings, which, when perceived by the passenger, he has nothing to do but to follow him to the place, where the feathered guide begins a more pleasing note, which he continues till the man has taken possession of the hidden store; in the plundering of which he takes care to leave a small quantity behind for his songster, it being the chief food on which he exists.

There is no great plenty of water-fowl in Abyssinia, especially of the web-footed kind. Vast variety of storks cover the plains in May, when the rains become constant. All the deep and grassy bogs have snipes in them; and there are swallows of many kinds unknown in Europe: those that are common in Europe appear in passage at the very season when they take their flight from thence. There are few owls in Abyssinia; but those few are of an immense size and beauty. There are no geese, wild or tame, excepting what is called the Golden Goose, or Goose of the Nile, common in all the south of Africa: these build their nests upon trees, and, when not in water, generally sit upon them. There are ducks, turkeys, and hens, with a variety of uncommon birds, peculiar to this country.

*Towns, Cities, &c.*] GONDAR, the metropolis of Abyssinia, is situated upon a hill of considerable height, the top of it nearly plain, on which the town is placed. The houses are chiefly of clay, the roofs thatched in the form of cones, which is always the construction within the tropical rains. On the west of the town is the king's house, formerly a structure of considerable consequence. It was a square building, flanked with square towers. It was formerly four stories high, and from the top of it had a magnificent view of all the country southward to the lake *Tzana*. Great part of this house is now in ruins, having been burned at different times; but there is still ample lodging in the two lowest floors of it, the audience-chamber being above one hundred and twenty feet long.

The palace and all its contiguous buildings are sur-

rounded by a substantial stone-wall, thirty feet high, with battlements upon the outer wall, and a parapet roof between the outer and inner, by which you can go along the whole, and look into the street. There appear to have been never any embrasures for cannon, and the four sides of the walls are above an English mile and a half in length.

DIXAN, the first town in Abyssinia, on the side of Taranta, is built on the top of a hill perfectly in form of a sugar-loaf; a deep valley surrounds it every where, like a trench, and the road winds spirally up the hill till it terminates among the houses. The inhabitants consist of Moors and Christians, yet the only trade of either of these sects is that of selling children. The Christians bring such as they have stolen in Abyssinia to Dixan, as to a sure deposit; and the Moors receive them there, and carry them to a certain market at Masuah, whence they are sent over to Arabia or India. The priests of the province of Tigré, especially those near the rock Daino, are openly concerned in this infamous practice.

AXUM is supposed to have been once the capital of Abyssinia, and its ruins are now very extensive; but, like the cities of ancient times, consist altogether of public buildings. In one square, which seems to have been the centre of the town, there are forty obelisks, none of which have any hieroglyphics upon them. They are all of one piece of granite, and, on the top of that which is standing, there is a *patera*, exceedingly well carved, in the Greek taste. There are several manufactures of coarse cotton-cloth; and here too the best parchment is made of goats' skins, which is the ordinary employment of the monks. Axum is watered by a small stream, which flows all the year from a fountain in the narrow valley where stand the rows of obelisks. The spring is received into a magnificent basin, one hundred and fifty feet square, and thence it is carried at pleasure to water the neighbouring gardens.

SIRÉ is situated on the brink of a very steep narrow valley, and through this the road lies, which is almost impassable. In the midst of this valley runs a brook, bordered with palm-trees. The town is built in form of a half-moon, fronting the plain, but its greatest breadth is at the west end; all the houses are of clay, and thatched; the roofs are in form of cones; as, indeed, are all in Abyssinia. Siré is famous for a manufacture of coarse cotton cloths, which pass for current money through all the province of Tigré. Besides these, beads, needles, cohol, and incense, at times, are considered as money.

ADOWA is situated on the declivity of a hill, on the west side of a small plain, surrounded every where by mountains. This plain is watered by three rivulets, which are never dry, even in the midst of summer. The town consists of about three hundred houses, and occupies a

much larger space than would be thought necessary for these to stand on, by reason that each house has an inclosure round it of hedges and trees. The mansion-house of the governor of Tigré, which stands here, is not distinguished from any of the others in the town, unless by its size: it is situated upon the top of the hill, and resembles a prison rather than a palace; for there are about it more than three hundred persons in irons, some of whom have been there for twenty years, mostly with a view to extort money from them; and, even when they have paid the sum of money which the tyrant asks, they do not always obtain their deliverance; but are kept in cages, like wild beasts, and treated in the same manner.

The houses in Adowa are all of rough stone, cemented with mud instead of mortar. The roofs are in the form of cones, and thatched with a reedy sort of grass, something thicker than wheat-straw. Excepting a few spots, this is the only part of Tigré where there is soil sufficient to yield corn; the whole of the province besides being one entire rock.

*Trade.*] There is a considerable trade carried on at Masuah, narrow and confined as the island is, and violent and unjust as is the government. But it is all done in a slovenly manner, and for articles in which a small capital is invested. Property here is too precious to risk a venture in valuable commodities, where the hand of power enters into every transaction.

Gondar, and all the neighbouring country, depend for the necessities of life, cattle, honey, butter, wheat, hides, wax, and a number of such articles, upon the Agows, who inhabit a province in which the sources of the Nile are found, and which province is no where sixty miles in length, nor half that in breadth. These Agows come constantly in succession, a thousand or fifteen hundred at a time, loaded with their commodities, to the capital.

*Language.*] A variety of languages are spoken in this country. The Jews speak a dialect of the Hebrew; the Moors, an impure Arabic; the Gallas have likewise a language of their own. The dialect of the court is that of Amhara; that of Tigré, however, approaches nearest to the old Ethiopic, which has a considerable affinity to the Arabic, and is called the learned language; and is still used, not only in all their literary and religious books, but also in their public instruments and records.

*Government.*] The monarchs of Abyssinia claim descent from Menelik, the son of Solomon, as they pretend, by the queen of Sheba. The crown is hereditary in this family, but elective as to the person. A peculiar custom formerly prevailed of confining all the princes of the blood royal in a palace on a high mountain, during their lives, or till they were called to the throne; but this practice, it appears, has now fallen into disuse.

being poured upon the crown of his head, he rubs into his long hair with both his hands. The crown is a kind of helmet, in the shape of a priest's mitre, covering the forehead, cheeks, and neck. The outside is a mixture of gold and silver, enriched with beautiful filigree-work; and it is lined with blue taffety.

The king goes to church regularly, his guards taking possession of every door and avenue through which he is to pass; and no persons are allowed to enter with him, excepting two officers of his bed-chamber, who support him. He kisses the threshold and side-posts of the church-door, and the steps before the altar, and then returns home: sometimes there is service in the church, sometimes there is not; but he takes no notice of the difference. He rides up stairs into the presence-chamber on his mule, and lights immediately on the carpet before the throne.

It is customary for the Abyssinian monarchs to allow themselves a plurality of wives; and not only to imitate their progenitor in that respect, but in taking those of different religions, even Mahometans and Pagans; and some have carried this privilege so far as to allow their heathen wives to have their own temples and idols; so that on one side might be seen the church of God, and on the other a Pagan temple. Others, however, have had so much regard to their religion, as to cause those Pagan or Mahometan ladies to be instructed and baptized before they married them.

The kings of Abyssinia are above all laws. They are supreme in all cases, ecclesiastical and civil: the land and persons of their subjects are equally their property, and every inhabitant of their kingdom is born their slave.

When the king sits to consult upon civil matters of importance, he is shut up in a kind of box, opposite to the head of the council-table. The persons who deliberate sit at the table, and give their opinions according to their rank, the youngest or lowest officer always speaking first. The first that give their votes are the shalaka, or colonels of the household troops. The second are the great butlers, men that have the charge of the king's drink. The third is the badjerund, or the keeper of that apartment in the palace called the lion's house; and after these the keeper of the banquetting-house. The next is called lika magwass, an officer that always goes before the king, to hinder the pressure of the crowd. After the lika magwass comes the palambaras; after him the fit-auraris; then the gera kasmati, and the kanya kasmati; after them the dakakin billetana geeta, or the under-chamberlain; then the secretary for the king's commands; after him the right and left azages or generals; then the rak massery and basha; and after these the kasmatis of Damont, Samen, Amhara, and Tigré, the last of whom is called nibrit, as being governor of Axum, or keeper of the book of the law supposed to be there.

30. VOL. I.

After the governor of Tigré comes the acab saat, or guardian of the fire and the chief ecclesiastical officer of the king's household. After him comes the first master of the household; then the ras; and last of all the king gives his sentence, which is final, and sends it to the table, from the balcony where he is then sitting, by the officer called kal-hatzé.

It is a constant practice in Abyssinia to beset the king's doors and windows within his hearing, and there, from morning till night, to cry aloud for justice, in a complaining tone, and in all the different languages they are masters of, in order to their being admitted to have their supposed grievances heard. In a country so ill governed as Abyssinia, and so perpetually involved in war, it may be easily supposed there is no want of people who have real injuries to complain of. But if it were not so, this is so much the constant usage, that when, in the rainy season, few persons can approach the capital, a set of vagrants are maintained and paid for the sole purpose of crying and lamenting, as if they had really been much injured; and this they affirm is for the king's pleasure, that he may not be lonely by the palace being too quiet. This, of all their absurd customs, was the most intolerable to Mr. Bruce. Sometimes, while busied in his apartment in the rainy season, he was entertained with a concert of sighs, groans, and complaints, so artfully performed, that no ear could distinguish but that it proceeded from real distress. Our author was often so surprised as to send the soldiers at the door to bring in one of the performers; and upon asking what misfortune had befallen him, he would answer very composedly, that nothing was the matter, but hearing from the soldiers that Mr. Bruce was retired to his apartment, he and his companions had come to make a noise under his window, to do him honour before the people, lest he should be melancholy by being alone; and therefore hoped he would order them something to drink, that they might continue with a little more spirit. The violent anger he fell into did not fail to be punctually reported to the king, at which he would laugh heartily; and sometimes he himself was concealed not far off, for the sake of being a spectator of the European's displeasure.

No man is condemned by the king in person to die for the first fault, unless the crime be of a horrid nature, such as parricide or sacrilege; and, in general, the life and merits of the prisoner are weighed against his immediate guilt; so that if his former behaviour appear to have had more merit towards the state than his present delinquency is thought to have injured it, the one is placed against the other; and when the sovereign judges alone, the accused is generally absolved. Six judges always attend the king of Abyssinia to the camp, and, before them, rebels taken on the field are tried and punished on the spot.

When a prisoner is condemned in capital cases, he is not again remitted to prison, which is thought cruel, but he is immediately carried away, and the sentence executed upon him. The capital punishments are crucifixion and lapidation, or stoning to death, which is chiefly inflicted upon strangers, called Franks, for religious causes.

To these may be added the plucking out of eyes, which is generally inflicted upon rebels. Mr. Bruce informs us that, after the slaughter of the battle of Faggitta, twelve chiefs of the Gallas, taken prisoners by Ras Michael, had their eyes torn out, and were afterwards abandoned to starve in the valleys below the town. Several rebel noblemen of Tigré underwent the same misfortune; and it appears that not one of them died in consequence of the operation, though it was performed in the most brutal manner, with an iron forceps or pincers.

The bodies of criminals, who have been put to death for treason, murder, or violence on the highways, are seldom buried in Abyssinia. The streets of Gondar are strewn with their limbs, which bring the wild beasts into the city in such numbers, as soon as it is dark, that it is almost impossible to walk from one house to another in safety.

*Revenue.* The royal revenues are derived from four branches; the first of which is the tribute paid by the governors of such provinces and kingdoms as contain gold-mines, particularly those of Narea and Gojam, from which he annually receives a certain weight of that metal; the second arises from the sale of all the great places in the empire; the third consists in a tenth levied every third year upon all the cattle in the empire. By this last, which, it appears, was unknown till about the middle of the third century, every man that has cows is obliged to pay him one out of ten every third year; and the country breeding great numbers, renders this the most considerable branch of the three. It is called the burning or branding tax, because the emperor's officers brand those animals which they set aside for his use with a particular mark. The fourth arises from a duty laid on every loom of cotton-cloth. If it belong to a Christian, he pays one piece of cloth; if to a Mahometan a piece of eight, per annum. The kingdom of Dambea and adjacent parts yield a duty of about one thousand pieces, and that of Gojam three thousand.

*Military Force.* Notwithstanding the great exaggerations that have been used, it does not appear that any king of Abyssinia ever commanded forty thousand effective men at any time, or upon any cause whatever, exclusive of his household troops. Their standards are large staves, surmounted at the top with a hollow ball: below this is a tube, in which the staff is fixed; and immediately under the ball a narrow stripe of silk, made forked, or swallow-tailed, like a vane, and seldom much broader. The standards of the infantry have their flags painted two colours,

crossways, yellow, white, red, or green. The cavalry have upon their flag, some a red, some a green, and some a white, lion. The black cavalry have a yellow lion, and over it a white star upon a red flag.

The king's household troops consist of about eight thousand infantry, of whom two thousand carry firelocks, and supply the place of archers, bows having been laid aside for nearly one thousand years. These troops are divided into four companies, each under an officer called shalaka, who answers in rank to our colonel. Every twenty men have an officer, every fifty a second, and every hundred a third; that is, every twenty have one officer who commands them, but is commanded likewise by an officer who commands the fifty; so that there are three officers who command fifty men, six command a hundred, and thirty command five hundred, over whom is the shalaka; and this body they call Bet, which signifies a house or apartment, because each of them goes by the name of one of the king's apartments. There is, for example, an apartment called Ambasa Bet, or the lion's house, and a regiment bearing that name has the charge of it; and their duty is at that apartment, or that part of the palace where it is; there is another called Jan Bet, or the elephant's house, that gives the name to a regiment; another called Werk Sacala, or the gold house, which gives its name to another corps, and so on.

There are four regiments that seldom, if ever, amount to one thousand six hundred men, which depend alone upon the king, and are all foreigners, at least the officers: these have the charge of his person while in the field. Sometimes, when the king's minority has elapsed, they amount to four or five thousand, and then oppress the country, as they have great privileges. When the king is a minor, they are kept incomplete, out of fear and jealousy.

With respect to the cavalry, about one thousand five hundred of them are properly mounted; but the rest are indifferently armed and accoutred, having no other arms but spears and a buckler. The spears are of two sorts; the one like half-pikes, and the other resembling a halbert. The staves of the former are slender, and the iron narrow, like our pike; but the iron of the other is broad and thin: the first is darted at the enemy, and the last used in close fight, with one hand, while the other holds a buckler, made of a buffalo's hide, which is usually very thick and strong.

The infantry have each of them two spears, and those of a higher rank have likewise swords, which they seldom use in battle, but rather wear them as a mark of distinction, and, in time of peace, commonly hold them in their hands when in conversation; but, if they walk, their servants carry them. They have the hilt of gold, or silver gilt, and the scabbard of velvet, or rich damask, which is commonly red: these weapons are chiefly worn by way of

ornament. Their girdle, and their heavy wood, which they commonly use by way of a close engagement.

These soldiers are poorly furnished, and not more than action, who are fire above once these they seldom of the higher rank cavalry are said to be armed much like horses extremely disciplined.

In time of battle their armies with in most cases, turning their backs common to run in as any disgrace; troops, nor indeed entirely owing to naturally hardy, tigue; and, as the of the year, they excessive heat, tarius, with very little cure by their labour to those in his taking their wives generally so numerous men always consious, all of whom lands assigned for vast number of persons in the paviments with great and instrumental drums and kettle-sound, than ours; other instruments.

ornament. They likewise wear a kind of dagger under their girdle, and some also carry a club, made of hard heavy wood, with a dagger in it. This weapon they commonly use by darting at the enemy, when they come to a close engagement.

These soldiers are but little acquainted with fire-arms, and poorly furnished with powder and ball. There are not more than three or four hundred musketeers in any action, who are generally so ill-trained, that they never fire above once, principally for want of powder and ball: these they seldom have at their exercises, except a few of the higher rank, who use a rest to their muskets. Their cavalry are said to be very good horsemen, and are all armed much like the infantry: they mount and sit their horses extremely well; but, in other respects, are very ill-disciplined.

In time of battle, the Abyssinians generally draw up their armies with little regularity, so that the first shock, in most cases, begins and ends the battle, the one side turning their back, and the other pursuing; for it is so common to run from the enemy, that it is not considered as any disgrace; and they never endeavour to rally their troops, nor indeed know how to go about it. This is entirely owing to their want of discipline; for they are naturally hardy, and inured to hunger, thirst, and fatigue; and, as they continue in the field the greatest part of the year, they are equally capable of bearing the most excessive heat, the sharpest cold, and the most violent rains, with very little sustenance; and even this they procure by their labour, from the lands the emperor allows to those in his service. Another disadvantage is, their taking their wives and children with them, who are generally so numerous, that a camp of thirty thousand men always consists of above one hundred thousand persons, all of whom are obliged to live on the produce of lands assigned for their maintenance. They have also a vast number of priests, who not only perform the divine service in the pavilions, but escort and attend the sacred utensils with great pomp and ceremony, and with vocal and instrumental music. The army is also attended by drums and kettle-drums, larger, and producing a louder sound, than ours; besides trumpets, hautboys, flutes, and other instruments.

[Religion.] The religion of the Abyssinians is a mixture of Christianity, Judaism, Mahometanism, and Paganism; but the former is by far the most prevalent, and, as it were, the established one of the country. Their first bishop, Frumentius, being ordained about the year 333, and instructed in the religion of the Greeks, of the church of Alexandria, by St. Athanasius, then sitting in the chair of St. Mark, it follows, that the true religion of the Abyssinians, which they received on their conversion to Christianity, is that of the Greek church; and every rite or

ceremony in the Abyssinian church may be traced to its origin in that church, when both of them were orthodox.

Frumentius preserved Abyssinia untainted with heresy till the day of his death; but, after that event, the monks of Egypt introduced the detestable doctrines of Arius, and other heretics, by which the church soon became infected.

It was settled by the first general council, that one baptism only was necessary for the listing man under the banner of Christ. The Jesuits, however, affirmed, that in Abyssinia all adults were re-baptized every year; and the following narration is extracted from the travels of Mr. Bruce, who was an eye-witness of the ceremony here introduced to the notice of our readers.

"The small river running between the church of Adowa and the Nile had been dammed up for several days; the stream was scanty, so that it scarcely overflowed. It was in places three feet deep, in some, perhaps, about four. Three large tents were pitched here the morning before the feast of the Epiphany. About midnight, the monks and priests assembled, and began their prayers and psalms at the water-side, one party relieving another; and at dawn of day the governor, Welleta Michael, came thither with some soldiers.

"As soon as the sun began to appear, three large crosses of wood were carried by three priests, dressed in their sacerdotal robes; each of whom, on coming to the side of the river, dipped his cross into the water, whilst a confused firing, skimmishing, and praying, went on together. The priests with the crosses then returned, one of their number carrying somewhat less than an English quart of water in a silver chalice. On approaching Welleta Michael, one of the priests took as much water as he could hold in his hands, and sprinkled it upon his head, holding the cup at the same time to the governor's mouth, and saying, at the same time, 'May God bless you.' The three crosses were then brought forward to Welleta Michael, and he kissed them. The ceremony of sprinkling the water was afterwards repeated to all the great men in the tent. Some of them, not contented with aspersion, received the water in the palms of their hands, and eagerly drank it; and after the whole of the governor's company had been sprinkled, the crosses returned to the river, their bearers singing hallelujahs, and the skimmishing and firing still continuing."

Our author observed that, soon after the governor had been sprinkled, two horses and two mules, belonging to the Ras Michael and Ozoro Esther, came and were washed. Afterwards the soldiers went in, and bathed their horses and guns; and heaps of plates and vessels, that had been used by Jews or Mahometans, were brought to be purified. From Mr. Bruce's account, however, this ceremony seems rather intended for a solemn lustration or purification, than for the rite of baptism, properly so called.

The Abyssinians receive the sacrament in both kinds, in unleavened bread and in the grape, bruised with the husk together as it grows; so that it is a kind of marmalade, and is given in a flat spoon. Whatever the priests may pretend, some mixture seems necessary to keep it from fermentation in the state that it is in, unless the dried cluster be bruised just before it is used; for it is little more fluid than common marmalade; but is perfectly the grape as it grew, bruised stones and skin together.

It is a mistake that there is no wine in Abyssinia; for a quantity of excellent wine is made at Dreedda, about thirty miles from Gondar, which might supply a greater quantity than could be necessary for the celebration of the eucharist in all Abyssinia twenty times over. The people themselves are not very fond of wine, and plant vines in one place only; but a small black grape, of an excellent flavour, grows plentifully in every wood in Tigré.

Large pieces of bread are given to the communicants, in proportion to their quality; and our author asserts that, he has seen some great men, who, from the respect the priest bore them, had such a large portion of the loaf put into their mouths, that water actually ran from their eyes, from their incapacity of chewing it. After receiving the sacrament in both kinds, a pitcher of water is brought, of which the communicant drinks a large draught. He then retires from the steps of the inner division, where the administering priest stands, and, turning his face to the wall of the church, repeats a private prayer, with seeming decency and attention.

Before we dismiss this subject, it may be proper to present our readers with an anecdote, which was related to Mr. Bruce by the priest of Adowa, on the very day of the Epiphany.

"The Sunday before Ras Michael's departure from Adowa, he went to church in great pomp, and there received the sacrament. There happened to be such a crowd to see him, that the consecrated wine was thrown down, and spilt upon the steps where the communicants stood at receiving. Some hay was instantly gathered and sprinkled upon it, to cover it; and the communicants continued the service till the end, treading that hay under foot.

"This giving great offence to some of the priests, it was told Michael, who, without explaining himself, said only, 'As to the fact of throwing the hay, they are a parcel of hogs, and know no better.' These few words had galled the priest of Adowa, who, with great secrecy, begged Mr. Bruce would inform him what was his opinion of the circumstance, and what would have been done, in such a case, in England. Our author told him, that the answer to his question depended upon two things, which being known, his difficulties would be very easily solved. 'If,' said he, 'you believe that the wine spilt

upon the steps, and afterwards trodden under foot, was really the blood of Jesus Christ, then you was guilty of a most horrid crime, and you should cry upon the mountains to cover you; as ages of atonement are not sufficient to expiate it. But if, on the contrary, you believe, as many Christian churches do, that the wine, notwithstanding consecration, remained in the cup nothing more than wine, but was only the symbol of Christ's blood of the New Testament; then the spilling it upon the steps, and the treading upon it afterwards, having been merely accidental and out of your power to prevent, you are to humble yourself, and sincerely regret that so irreverent an accident happened in your hands, and in your time; but, as you did not intend it, and could not prevent it, the consequence of an accident, where inattention is very culpable, will be imputed to you, and nothing further."

The priest declared to Mr. Bruce, with the greatest earnestness, that he never did believe that the elements in the eucharist were converted, by consecration, into the real body and blood of Christ. He said, however, that he believed this to be the Roman-catholic faith; but, for his own part, he conceived that bread was bread, and wine was wine, even after consecration. From this example, which occurred accidentally, and was not the fruit of interrogation, it appears that some, at least, among the Abyssinians do not believe the real presence in the eucharist; but the majority may probably hold a contrary opinion.

The Abyssinians are not at all agreed about the state of souls before the resurrection of the body. The general opinion is, that there is no third state; but that the souls of pious men enjoy the beatific vision immediately after the separation from the body. This doctrine, however, is contradicted by the practice; for, when any person dies, alms are given, and prayers are offered for the departed soul, which must certainly be useless, if it were supposed to be already in the presence of God, and in possession of eternal felicity.

The ceremony called incision is an usage frequent, and still retained, among the Jews, though positively prohibited by their law. As soon as a near relation dies in Abyssinia, such as a brother, parent, or cousin-german, every woman in that relation lacerates the skin of both her temples with the nail of her little finger, which is suffered to grow to a considerable length for this purpose: hence it appears that either a wound or a scar may be seen in almost every fair face in Abyssinia; and in the dry season, when the troops are engaged in war, these wounds seldom have liberty to heal, till peace and the armies return.

Their churches appear to have been formerly large and elegant structures; but they are now so decayed, that it is impossible to form a proper idea of their ori-

ginal magnificence. St. Emanuel, George, Goly, and Lalibela, it is, that the rock, by dint of them bears the ons of having men from Eg, ing carried on four years: a and the state being proportion pillars, arches, are many more gain two chap women; but he order the first

ginal magnificence. The most distinguished are those of St. Esmatmel, St. Saviour, St. Mary, the Holy Cross, St. George, Golgotha, Bethlehem, the Martyrs, Marcocos, and Lalibela. Incredible as it may appear, yet certain it is, that these ten churches were all cut out of a solid rock, by dint of the hammer and chisel. The last of them bears the name of their founder, who, being desirous of having them finished, sent for a number of workmen from Egypt, and so expeditiously was the undertaking carried on, that the whole were completed in twenty-four years: a short time, considering the number of them, and the stately manner in which they are constructed, being proportionable in all their parts, as gates, windows, pillars, arches, chancels, &c. Besides the churches, there are many monasteries in Abyssinia, most of which contain two chapels, one for the men and the other for the women; but how they came to be introduced, and of what order the first founders of them were, is not known.

*Customs, Manners, &c.*] The inhabitants of this country may be classed in the following order:—Christians of the Abyssinian church, and those whom the Roman missionaries brought over to their communion. Jews, settled here from time immemorial. Mahometans, dispersed throughout the empire, and forming one third of the inhabitants; and Pagans, inhabiting several parts, who are chiefly descendants of the Gallas. The Abyssinians are in general well made, and of a lively tractable disposition; some of them are black, but the principal part are of a brown, or olive complexion; they are very tall, and their features well proportioned: their eyes are large, and of a sparkling black, their noses rather high than flat, and their teeth white and uniform.

Among them the olive is reckoned the finest complexion, and next to that the jet black; but the reddish, and particularly the yellowish, brown is esteemed the most disagreeable. They have regular and agreeable features, and their eyes are black, brisk, and lively: their noses are not flat, nor their lips protuberant, as among the natives of Guinea. In their form they are stout and strong, active and healthy; and their labour, together with the temperance they use in eating, prolongs their lives to a good old age. Most of them are so nimble and active, as to climb up the tallest trees, or steepest rocks, with surprising ease and agility. The women greatly exceed those of Europe and Asia in strength and sprightliness; they breed easy, are delivered without help, and can take care both of the child and themselves, without the assistance of a nurse. Indeed, except where they are weakened by a sedentary life, this strength of constitution is common to all the women in these hot climates.

The common people wear a kind of scarf, which hangs loose from the shoulders to the waist, from whence they have a pair of cotton drawers, that reach to the ankles.

The superior classes wear a long vest, made either of silk or cotton, and tied about the waist with a stiff girdle. The women of the higher class dress in the best silks and brocades, and ornament their heads various ways; their necks are decorated with chains, jewels, and other embellishments, and in their ears they wear the richest pendants. The habit of the women is indeed always as fine and genteel as their circumstances will admit; for they are far from being kept in so recluse a manner as those among the more eastern nations. Their upper garments are wide and full, not unlike surplices. Both sexes take particular pains with their hair, which is the only ornament they have on their heads, none but the emperor being permitted to wear either cap or any other covering.

The greater part of the Abyssinians reside in tents, or camps, and remove from one place to another, as suits their convenience. The houses, or rather huts, that form their camps, are made only of lath and clay, and covered with straw: the furniture is equally miserable with their houses, consisting only of a large table, to sit round at their meals, and a few trifling utensils. The more wealthy lie upon couches, and cover themselves with their upper garments, but the poorer sort lie on mats on the ground, and wrap themselves up in the skin of some beast.

The natives of Abyssinia are not only very temperate in their eating, but far from being particular in the choice of their food; for none can be coarser, or more disgusting, than theirs, even that which is eaten by the superior classes. It generally consists of a piece of flesh, which is sometimes par-boiled, but for the most part quite raw: this is served up on apas, or cakes of bread, ground and made by the women, of wheat, peas, millet, teff, and other sorts of grain, according to their circumstances; so that this apas serves them not only instead of a dish or plate, but likewise a napkin, or table-cloth, neither of which they ever use at their tables. The sauces they use to their meat are no less disagreeable than the flesh itself, being chiefly butter turned into oil, mixed with some ingredients, the smell and taste of which are so disgusting, that a stranger could not eat with them, not even a Spaniard or a Portuguese.

They eat no wild or water-fowl, not even the goose, which was a great delicacy in Egypt. The reason of this is, that upon their conversion to Judaism, they were forced to relinquish their ancient customs, as far as they were contrary to the Mosaic law; and the animals of their country not corresponding in form, kind, or name, with those mentioned in the Septuagint, or original Hebrew, it has followed, that there are many of each class that know not whether they are clean or not; and a ludicrous confusion and uncertainty have taken place, through ignorance or mistake, the people being unwilling to vio-

late the law in any instance, through not understanding it.

The highest dainty is a piece of raw beef, brought in reeking warm from the beast; and, if they invite company to eat with them, the whole quarter is served up at once, with plenty of salt and pepper; and some add an ingredient-called malta, which is made of what they draw out of the paunch of the ox or cow. This they stew some time on the fire, with pepper, salt, and sliced onion, before they bring it to table, which, when covered with such a large piece of warm raw beef, is esteemed by them a most delicious repast. This dish, however, can only be purchased by the rich, on account of the pepper, which is very expensive.

In confirmation of the predilection of these people for raw beef in particular, the following circumstances are stated in Mr. Bruce's travels in Abyssinia. He relates that, in his journey from Masuah to Axum, he overtook three travellers, who appeared to be soldiers, driving a cow before them. The cow did not seem to be fatted for killing, and it occurred to Mr. Bruce and his attendants that it had been stolen: he observed that the attendants attached themselves in a particular manner to the three soldiers who were driving the cow, and held a short conversation with them. Soon after, the drivers suddenly tripped up the cow, and gave the poor animal a very hard fall upon the ground, which was but the beginning of her sufferings. One of them sat across her neck, holding down her head by the horns, the other twisted the halter about her fore-feet, while the third, who had a knife in his hand, got astride upon her belly, before her hind-legs, and gave her a very deep wound in the upper-part of her buttock. When Mr. Bruce saw them throw the beast upon the ground, he rejoiced, thinking that, when three people were killing a cow, they must have agreed to sell part of her to them; and he was much disappointed upon hearing that they were not then to kill her, that she was not wholly theirs, and they could not sell her. This excited our traveller's curiosity: he let his people go forward, and staid himself, till he saw, with the utmost astonishment, two pieces, thicker and longer than our ordinary beef-steaks, cut out of the higher part of the buttock of the beast; after which they drove her gently on as before.

The same author gives the following description of an Abyssinian festival:

"Consistent with the plan of this work, which is to describe the manners of the several nations through which I passed, good and bad, as I observed them, I cannot avoid giving some account of this Polyphemus banquet, as far as decency will permit: it is part of the history of a barbarous people; whatever I might wish, I cannot decline it.

"In the capital, where one is safe from surprise at all times, or in the country or villages, when the rains have become so constant that the valleys will not bear a horse to pass them, or that men cannot venture far from home, through fear of being surrounded and swept away by temporary torrents, occasioned by sudden showers on the mountains; in a word, when a man can say he is safe at home, and the spear and shield are hung up in the hall, a number of people, of the best fashion in the villages, of both sexes, courtiers in the palace, or citizens in the town, meet together to dine, between twelve and one o'clock.

"A long table is set in the middle of a large room, and benches beside it, for a number of guests, who are invited. Tables and benches the Portuguese introduced amongst them; but bull-hides, spread upon the ground, served them before, as they do in the camp and country now. A cow or a bull, one or more, as the company is numerous, is brought close to the door, and its feet strongly tied. The skin that hangs down under the chin and throat, which I think we call the dew-lap, in England, is cut only so deep as to arrive at the fat, of which it totally consists, and by the separation of a few small blood-vessels, six or seven drops of blood only fall upon the ground. They have no stone, bench, or altar, upon which the cruel assassin lays the animal's head in this operation. I should beg his pardon, indeed, for calling him an assassin, as he is not so merciful as to aim at the life, but, on the contrary, to keep the beast alive till it be totally eaten up. Having satisfied the Mosaic law, according to his conception, by pouring these six or seven drops upon the ground, two or more men fall to work: on the back of the beast, and on each side of the spine, they cut skin-deep; then, putting their fingers between the flesh and the skin, they begin to strip the hide of the animal half-way down the ribs, and so on to the buttock, cutting the skin wherever it hinders them commodiously to strip the poor animal bare. All the flesh on the buttocks is then cut off, and in solid square pieces, without bones, or much effusion of blood; and the prodigious noise the animal makes is a signal for the company to sit down to table.

"There are then laid before every guest, instead of plates, round cakes, if I may so call them, about twice as big as a pan-cake, and somewhat thicker and tougher. It is unleavened bread, of a sourish taste, far from being disagreeable, and very easily digested, made of a grain called teff. It is of different colours, from black to the colour of the whitest wheaten-bread. Three or four of these cakes are generally put uppermost, for the food of the person opposite to whose seat they are placed. Beneath these are four or five of ordinary bread, and of a blackish kind: these serve the master to wipe his fingers upon, and, afterwards, the servant for bread to his dinner.

"Two or three pieces of beef in a tef, placed like any thing else, have knives in the crooked ones, when the time of war, such as the worst sold for a penny.

"The company, between two women, thin piece, which England, while you perfectly distinct, and amina, of any fashion his own meat. The length-ways, like a finger, then cross smaller than dice: bread, strongly peppered and fossil-salt: the like a cartridge.

"In the mean time, with each hand resting, stooping, his head very like an idiot, ready, who stuffs the so full that he is in. This is a mark of seem to be, the larger the more noise he makes is thought to be. says—Beggars and out making a noise.

he does very expeditiously forth another cartridge on till he is satisfied eating; and, before that fed him, he makes kind and form; each at the same time, when into their mouths large handsome horns and then all drink to joke goes round, very money or ill-humour.

"All this time the bleeding indeed, but cut off the flesh from the thighs, or the part last they fall upon the animal, bleeding to cannibals, who have

"Two or three servants then come, each with a square piece of beef in their bare hands, laying it upon the cakes of teff, placed like dishes down the table, without cloth or any thing else beneath them. By this time all the guests have knives in their hands, and the men have the large crooked ones, which they put to all sorts of uses during the time of war. The women have small clasped knives, such as the worst of the kind made at Birmingham, and sold for a penny each.

"The company are so ranged, that one man sits between two women; the man with his long knife cuts a thin piece, which would be thought a good beef-steak in England, while you see the motion of the fibres yet perfectly distinct, and alive in the flesh. No man in Abyssinia, of any fashion whatever, feeds himself, or touches his own meat. The women take the steak, and cut it length-ways, like strings, about the thickness of your little finger, then cross-ways, into square pieces, something smaller than dice: this they lay upon a piece of the teff-bread, strongly powdered with black or Cayenne pepper, and fossil-salt: they then wrap it up in the teff-bread, like a cartridge.

"In the mean time the man, having put up his knife, with each hand resting upon his neighbour's knee, his body stooping, his head low and forward, and his mouth open, very like an idiot, turns to the one whose cartridge is first ready, who stuffs the whole of it into his mouth, which is so full that he is in constant danger of being choaked. This is a mark of grandeur. The greater a man would seem to be, the larger piece he takes in his mouth; and the more noise he makes in chewing it, the more polite he is thought to be. They have, indeed, a proverb, that says—Beggars and thieves only eat small pieces, or without making a noise. Having despatched this morsel, which he does very expeditiously, his next female neighbour holds forth another cartridge, which goes the same way, and so on till he is satisfied. He never drinks till he has finished eating; and, before he begins, in gratitude to the fair ones that fed him, he makes up two small rolls of the same kind and form; each of his neighbours open their mouths at the same time, while with each hand he puts their portion into their mouths. He then falls to drinking, out of a large handsome horn: the ladies eat till they are satisfied, and then all drink together. A great deal of mirth and joke goes round, very seldom with any mixture of acrimony or ill-humour.

"All this time the unfortunate victim at the door is bleeding indeed, but bleeding little. As long as they can cut off the flesh from his bones, they do not meddle with the thighs, or the parts where the great arteries are. At last they fall upon the thighs likewise; and soon after the animal, bleeding to death, becomes so tough, that the cannibals, who have the rest of it to eat, find very hard

work to separate the flesh from the bones with their teeth, like dogs.

"In the mean time, those within are much elevated; and every thing is permitted with absolute freedom: there is no coyness, no need of appointment or retirement, to gratify their wishes; there are no rooms but one; but in this they sacrifice both to Bacchus and Venus. When a couple leave their seats, the two men nearest the vacuum which they have made on the bench, hold their upper garments, like a screen, before them; and, when they resume their place at the table, their health is drank by the company; but not a licentious word is uttered, nor the most distant joke upon the transaction."

Although the Jesuits have written a great deal about marriage and polygamy, yet there is nothing which may be asserted more truly, than that there is no such thing as marriage in Abyssinia, unless that which is contracted by mutual consent, subsisting only till dissolved by dissent of one or other, and to be renewed as often as it is agreeable to both parties. Mr. Bruce tells us, that he was once, at Hoseani, in presence of the *iteghé*, where, in the circle, there were seven men who had all been the husbands of a woman of great quality, but none of them was the happy spouse at that time.

Upon separation, they divide the children. The eldest son falls to the mother's first choice, and the eldest daughter to the father. If there be but one son, he is the right of the mother; and, if the numbers are unequal after the first election, the rest are divided by lot. There is no such distinction as legitimate and illegitimate children, from the monarch to the humblest peasant; for supposing any one of their marriages valid, all the issue of the rest must be adulterous bastards.

In computing their time, the Abyssinians have continued the use of the solar year. Diodorus Siculus says, "they do not reckon their time by the moon, but according to the sun; thirty days constitute their month, to which they add five days and the fourth part of a day, and this completes their year. Whence they derive the name of their months cannot be possibly ascertained, as they have no signification in any of the languages of Abyssinia."

One method of describing time among these people is peculiar to themselves. They read the whole of the four evangelists every year, in their churches, beginning with St. Matthew, proceeding to Mark, Luke, and John, in order. When speaking of any particular event, therefore, they say, "it happened in the days of Matthew," that is, in the first quarter of the year, whilst the gospel of St. Matthew was yet reading in the churches. The time of the day is computed in a very arbitrary irregular manner. The twilight is very short, almost imperceptible, and was still more so, when the court was situated farther to the southward in Shoa. As soon as the sun falls below the hori-

zon, night comes on, and all the stars appear. This term, the twilight, they have chosen for the beginning of their day, and call it *naggé*, which is the very time the twilight of the morning lasts. The same is observed at night, and *meset* is meant to signify the instant of beginning twilight, between the sun's falling below the horizon and the stars appearing. Mid-day is called *kater*, a very old word, signifying culmination, or a thing being arrived at the highest part of an arch. All the rest of times they describe, in conversation, by pointing out the place in the heavens where the sun was when such and such circumstances happened.

Mr. Bruce observes, that nothing can be more inaccurate than Abyssinian calculations; for, besides their ignorance of arithmetic, their aversion to study, and a number of fanciful combinations, by which every particular scribe or monk distinguishes himself, there are obvious reasons why there should be a variation between their chronology and ours. Our years begin on the first of January, and theirs on the first day of September, so that there are eight months difference between us. And in the reigns of their monarchs they seldom mention either month or day beyond an even number of years. Supposing, then, it be known that the reign of ten kings extended from such to such a period, where all the months and days are comprehended, when we come to assign to each of these an equal number of years, without the correspondent months and days, it is plain that, when all the separate reigns are added together, the one sum total cannot correspond with the other, but will be more or less than the just time which each prince swayed the sceptre.

Their funeral-ceremonies are few. As soon as the person has expired, and the body is washed, they perfume it with incense, sprinkle it with holy water, and, wrapping it in a sheet, place it on a bier. The bearers then take it, and hurry it away with such swiftness, that those who attend can hardly keep pace with them. When they come to the church or church-yard, (for they bury in either,) they again incense it, and throw plenty of holy water upon it. After the priest has read the first fourteen verses of the gospel of St. John, they shoot the corpse into the ground, instead of letting it down gently, the priest repeating the service, and the grave is immediately filled up. The relations mourn for their dead many days; and their lamentations begin early in the morning, and continue till the evening. The parents, relations, and friends, meet at the grave, together with women-mourners, hired to accompany the solemnity with their outcries, all clapping their hands, beating their breasts, and uttering the most affecting expressions.

The funerals of the kings and grandees are performed with great pomp and magnificence, and are accompanied with all the insignia of their dignity, and with the

most solemn and doleful music, which is in a manner drowned by the loud cries and lamentations of the retinue. But they use neither torches or any other lights, either in the procession or in the church.

The Agows, in whose country Mr. Bruce discovered the sources of the Nile, are, in point of number, one of the most considerable nations in Abyssinia: when their whole force is raised, they can bring into the field four thousand horse and a great number of foot: they were formerly much more powerful; but the frequent inroads of the Gallas have considerably diminished their strength. Their riches, however, are still greater than their power; for, although their province is no where sixty miles in length, nor half so much in breadth, yet Gondar and all the neighbouring country depend for cattle, honey, butter, wheat, hides, wax, and other useful articles, upon the Agows; who come constantly in succession, a thousand or fifteen hundred at a time, loaded with these commodities to the capital.

It is natural to suppose, that in a long carriage, such as that of a hundred miles, in a hot climate, butter must melt and be in a state of fusion, consequently very near putrefaction: this, however, is prevented by the root of a herb, called *mocmoco*, which nearly resembles the shape and colour of a carrot: this they bruise and mix with their butter; and a very small quantity preserves it fresh for a considerable time.

Besides the market of Gondar, the neighbouring Shangalla purchase the greatest part of these commodities from the Agows; and give, in exchange, elephants' teeth, rhinoceros' horns, gold, in small pellets, and a quantity of very fine cotton.

The clothing of the Agows consists entirely of hides, which they soften and manufacture in a method peculiar to themselves; and this they wear in the rainy season when the weather is cold, for here the wet seasons are very violent and of long duration. Their dress is like a shirt, reaching down to their feet, and girded with a belt about their waist: below the girdle it resembles a large double petticoat, one part of which they turn back over their shoulders, fastening it with a broach, or skewer, across their breast before. The women are generally thin, and, like the men, below the middle stature. There is no such thing as barrenness among them: they begin to bear children before they are eleven years of age, and generally leave off before they are thirty.

Besides what they sell, and what they pay to the governor of Damot, the Agows have a particular tribute, which they present to the king: one thousand *dabra* of honey, each *dabra* being a large earthen vessel, containing about sixty pounds weight. They also pay fifteen hundred *oxen*, and one thousand ounces of gold. The officer who keeps the accounts and sees the rents paid, is called *Agow*

Miziker: his post by this it may be collected.

The Agows are said that there is between any two content happened than till the next year.

Once a year, in the shum, or pries at the principal for a black heifer, that of it into this four hide, so as no more divided in half, and when thus prepared first fountain, and the elders carry water from the fountains; they then of St. Michael, which corresponding to the receives, as its privy eaten the carcase of the Nile water, to pile up the bones, and

Having finished head, closely wrapped they say, reaches the common light, with which they perform their work known to many, but of the night they could not learn who burnt. The Abyssinian devil appears upon the Agows eat the head, conditions of his senses and cattle.

It is certain that spirit supposed to reside "Light of the World Universe." The priests made no scruple of receiving for plenty of grass, a large kind of serpent: theologically; and ascribed river, which Mr. Bruce out an interpreter.

Our author asked he had purposely insinuated the river had been seen very frequently; and, evening of the 3d, he

Miziker: his post is worth a thousand ounces of gold, and by this it may be judged with what economy the revenue is collected.

The Agows are divided into clans, or tribes; and it is said that there never was a feud or hereditary animosity between any two of these clans; or if the seeds of discontent happened to be sown, they did not vegetate longer than till the next general convocation of all the tribes.

Once a year, upon the first appearance of the dog-star, the shum, or priest, assembles all the heads of the clans at the principal fountain of the Nile. Having sacrificed a black heifer, that never bore a calf, they plunge the head of it into this fountain; and then wrap it up in its own hide, so as no more to be seen. The carcase is next divided in half, and cleaned with extraordinary care; and, when thus prepared, it is laid upon the hillock over the first fountain, and washed all over with its water, while the elders carry water in their hands from the two other fountains; they then assemble upon a small hill to the west of St. Michael, where they cut the carcase into pieces, corresponding to the number of the tribes, and each tribe receives, as its privilege, a particular part. After having eaten the carcase raw, according to their custom, and drank the Nile water, to the exclusion of all other liquor, they pile up the bones, and burn them to ashes.

Having finished their banquet, they carry the heifer's head, closely wrapped from sight, into a cavern, which, they say, reaches below the fountains; and there, by a common light, without torches or a number of candles, they perform their worship, which appears to be a secret known to many, but revealed to none. At a certain time of the night they return from the cave; but our author could not learn whether the head was buried, eaten, or burnt. The Abyssinians have an absurd story, that the devil appears upon this occasion, and that with him the Agows eat the head, swearing obedience to him, upon the conditions of his sending rain, and a good season for their bees and cattle.

It is certain that the Agows pay divine honours to a spirit supposed to reside in the river, whom they call the "Light of the World, God of Peace, and Father of the Universe." The priest with whom Mr. Bruce resided, made no scruple of reciting his prayers for seasonable rain, for plenty of grass, and for the preservation of a particular kind of serpent: he also deprecated thunder very pathetically; and ascribed several titles of divinity to the river, which Mr. Bruce could perfectly comprehend without an interpreter.

Our author asked the priest, into whose good graces he had purposely insinuated himself, if ever the spirit of the river had been seen by him? He answered, "Yes, very frequently; and, in particular, about sun-set on the evening of the 3d, he had seen him under a tree, where

he told him of the death of a son, and also that a party from Fasil's army was approaching; that, being afraid, he (the priest) consulted his serpent, who ate readily and heartily, from which he knew that no evil would befall him from his visitors." He said, "the spirit was of a very graceful figure and appearance; he thought rather older than middle age, but he seldom chose to look at his face; he had a long white beard, and his clothes were not of leather, but like silk, of the fashion of the country." Mr. Bruce asked him, how he was certain it was not a man? at which he laughed, or rather sneered, shaking his head and saying, "No, no, it is no man, but a spirit." Our author then desired to know why he prayed against thunder. He said, "Because it was hurtful to the bees, and their greatest revenue consisted in honey and wax." And, on being asked, why he prayed for serpents, he replied, "Because they taught him the coming of good or evil." It seems, indeed, that all the Agows have several of these creatures in the neighbourhood; and the richer sort keep them in their houses. When they undertake a journey, or any affair of consequence, they take a serpent from his hole, and put butter and milk before him, of which he is extravagantly fond. If he devour it greedily, it is regarded as an auspicious omen; but, if he refuse to eat, misfortune is supposed to be near at hand.

### SECTION III.

#### ABEX, OR HABESH.

This coast formerly constituted a part of the kingdom of Abyssinia; but at the commencement of the last century it fell into the hands of the Turks, who, at the same time, made themselves masters of all the bays and ports belonging to it; so that ever since the Abyssinians have been cut off from all communication with the Red Sea.

The climate of this coast being very sultry, and the soil, in general, sandy and barren, the productions must, of course, be scanty. Here are many animals, tame and wild; and they have some deer and sheep; but grain of every kind is brought from other parts. The country labours under a dearth of water.

Abex is divided into two parts, the northern and the southern. The towns of the northern are Suakin and Arkeko. The former is the residence of the governor, and is tolerably large and populous. The latter has a castle; but it is small, and thinly inhabited. The southern reaches to the end of the coast, and includes the province of Dancali, of which Abex is the capital. Of this part little can be said worthy of notice, but that its chief produce is salt. Here is a sea-port, called Balyur, at which the Portuguese missionaries first landed: and, as their reception and treatment from the king were rather singular,

the relation of them may not prove unacceptable to the reader.

"As soon as the king heard of their arrival, he sent to invite the patriarch or principal missionary and his retinue to his court, which was about three or four days' journey from Balyur, and despatched his own son to meet them in the way, and conduct them to the royal palace, or rather camp, which they found to consist only of half a dozen tents, with about twenty huts, fenced in with a thorn-hedge, and shaded by some wild kind of trees.

"The hall of audience, where they were received by the king, was a large tent or hut, about a musket-shot from the rest. At the upper end was a kind of throne, about two feet from the ground, made of stone and clay, and covered with a carpet and two velvet cushions. At the other end, opposite to the throne, was the king's horse, with the saddle and other accoutrements suspended on one side. Round the hall were about fifty young men, sitting cross-legged on the ground; and, when the Portuguese missionaries were admitted, they were made to sit down in the same posture.

"In a short time the king entered the hall, preceded by some of his domestics, one of whom carried an earthen pitcher, full of hydromel, or wine made of honey; another a drinking-cup, made of porcelain; a third carried a cocoanut shell, filled with tobacco; and a fourth a silver tobacco-pipe and some fire. Next to them came the king, dressed in a light silk-stuff, with a turban on his head, from the edges of which hung a parcel of rings, that dangled before his forehead. Instead of a sceptre, he held in his hand a short kind of javelin. He was followed by all the chief officers of his court and household; and among them were his lord high-steward, the superintendant of his finances, and the captain of his guard. The respect paid him at his coming in was by standing on their feet, and squatting down again twice; after which they went towards the throne to kiss his hand. The audience was short, but full of the most bombastic professions of love and esteem on his side, and of respect and gratitude on theirs: but this behaviour soon altered; for when, on the next morning, they came to make their presents to him, instead of

the king's accepting them, the patriarch, who was the person that brought them to him, met with a severe reprimand for daring to affront a monarch like him with such trifling presents, and was ordered to take them out of his sight. The patriarch readily obeyed, without betraying either fear or any other emotion than that of disdain, after having given him to understand, that they were of more value than he ought to have expected from religious persons, who had renounced the world, and forsaken their native country, for the sake of carrying their religion into Abyssinia; and told him, at parting, that, since he did not think them worth his acceptance, the next he sent for from them should be much less valuable.

"This spirited behaviour of the patriarch greatly surprised the king, who suffered him to depart with the presents; but, being unwilling to lose them, sent one of his officers to fetch them back, with orders to insist upon some addition being made to them: but he was glad to take them as they were; the patriarch, on his side, insisting upon retrenching them; so that, when they were brought again, the covetous monarch received them with visible signs of dissatisfaction and resentment.

"The disgust in which he held the missionaries on this account was very soon evinced; for he not only detained them, upon some pretence or other, longer at his court than was necessary for getting things ready for their departure, but privately forbid his subjects to sell them any kinds of provisions at any price; so that they must have been obliged either to satiate his avarice by larger presents, or have been in danger of starving, had not the spirited patriarch expostulated with him on the impropriety of his conduct. Notwithstanding this, he not only postponed their departure from day to day, but suffered them to be insulted by his subjects, in hopes of finding some pretences for extorting from them farther presents for their dismission. To avoid this, the only expedient they could find was, to bribe one of his favourite ministers with a valuable gift, who soon after obtained their audience of leave, and such supplies of carriages, provisions, &c. as were necessary to proceed on their embassy to the court of Abyssinia."

ZANGUEBAR.]

THIS country is called Zangue, in the word Zangue, in the inhabitants being of the east, by the Indian name on the north, by the name of Cuma, which separates it from the sea, and is disproportionate in extent, being about a hundred miles in length and fifty in the breadth. The coast is very fertile, has many rivers and is best known to Europeans here by the Portuguese name of Zangue, large, barren, and unproductive, and intersected by rivers and marshy grounds. The principal river being the descendant from their own country to the sect of Ali, the sect of the professors.

The principal river is the Zangue, which name was given to a fort and town so called.

The continental part of the kingdom, Mosambique, is divided into several districts, each of which is a small kingdom, the climate is sultry and unproductive, producing plenty of rice, and also abundance of wild beasts, particularly lions, the latter of which are so numerous that they are obliged to kindle fires from devouring the night without carrying frighten them away.

The inhabitants are of the same race as the latter, have short curled hair, and are very crafty. Their towns are small, low and despicable. They have elephants, with broad

## SECTION I.

## ZANGUEBAR.

THIS country received its name from the Arabs, the word Zangue, in their language, signifying black, all the inhabitants being of that colour. It is bounded, on the east, by the Indian Ocean; on the west, by Monoemugi; on the north, by Anian; and, on the south, by the River Cuama, which separates it from Monomotapa. It is very disproportionate in its extent, being one thousand four hundred miles in length, and not more than three hundred and fifty in the broadest part.

The coast is very extensive, and, in the course of it, has many rivers and islands. This part of the country is best known to Europeans, owing to the conquests made here by the Portuguese. The inland parts consist of a large, barren, and unhealthy tract; the lands lying low, and intersected by rivers, lakes, thick woods, forests, and marshy grounds. Most of the inhabitants are Arabs, being the descendants of those who were banished here from their own country, on account of their adherence to the sect of Ali, of which they are still zealous professors.

The principal river of this country is that called Quilmanzi, which name was given it by the Portuguese, from a fort and town so called, built by them at the mouth of it.

The continental part of Zanguebar is divided into two kingdoms, Mosambique and Melinda.

Mosambique is divided into several provinces and lordships, each of which has a dialect peculiar to itself. The climate is sultry and unwholesome; but the soil is fertile, producing plenty of millet, rice, and several sorts of pulse; as also abundance of orange and lemon-trees. It abounds with wild beasts, particularly bears and elephants, the latter of which are so numerous, that the inhabitants are obliged to kindle fires round the fields, to prevent them from devouring the corn, nor dare they go abroad at night without carrying lighted torches in their hands, to frighten them away.

The inhabitants are of low stature, very black, and have short curled hair. They are naturally cruel and deceitful. Their towns are very small, and the buildings low and despicable. Their common food is the flesh of elephants, with bread made of millet and rice; from the

latter of which they also make a kind of beer. The chief wealth of these people consists in gold, ebony, ivory, and slaves, all of which they sell to the Portuguese only; for they will not suffer any other foreigners to enter their country.

With respect to their religion, some of them are Christians, and others Mahometans; but the principal part are idolaters, and use all those superstitious and ridiculous customs practised in other idolatrous countries.

There are two small districts adjoining to the kingdom of Mosambique, called Mongalo and Angos: the former is situated near the mouth of the River Cuama, and is chiefly inhabited by Arabs; the other is also situated on a bank of the same river, about one hundred and sixty miles from the former. Both these places are fruitful, producing abundance of rice and millet; as also great quantities of cattle. The inhabitants are chiefly Mahometans, but intermixed with negroes, who are idolaters, and remarkable for the lowness of their stature. They have no covering to the upper part of their bodies, but round their waists they wrap pieces of cotton or silk. Some of the better sort wear a turban on their heads. The people of both these places carry on a commerce with the inhabitants of Monomotapa in gold, gums, elephants' teeth, &c.

Melinda is situated partly under the equinoctial line, and partly on both sides of it; for its southern boundaries lie under the second degree and thirtieth minute south latitude, and its northern extremity extends to the river Quilmanzi. As this kingdom is well watered by rivers, the soil is in general fertile, and produces great abundance of the principal necessities of life. It abounds also with a variety of fruit-trees, particularly orange, palm, and citron, the latter of which constantly perfume the air with an odoriferous scent.

The inhabitants of this kingdom differ greatly in their complexions, some of them being quite black, some of an olive-colour, and others almost white, particularly the women. The common people wear only a loose piece of cloth about their waists, but the better sort have a garment made of cotton or silk, which reaches from the waist to the knees, and on their heads they wear a turban. The women of rank appear in silk, and ornament their necks and arms, the former with strings of gold, and the latter with bracelets, made of the same metal.

The city of Melinda, the capital of the kingdom, is situated on a very agreeable plain, and contains a great number of houses, most of which are well built of freestone. It is the residence of the king, and in it are a great number of rich merchants, who trade with the Indians of Camboja in gold, ivory, copper, quicksilver, and all sorts of stuffs. The Portuguese are so numerous in this city, that they have built several handsome churches and chapels in it; and before one of the churches they have erected a stately cross of gilt marble.

The king's palace is a spacious edifice, built of stone, and neatly ornamented. Whenever the king goes abroad, he is carried in a sedan, on the shoulders of four of the greatest men in his kingdom, and incense and other perfumes are burned before him as he passes along the streets. At every town he enters, he is always met by a number of beautiful women, some of whom present him with flowers, and others go before him, scattering various kinds of perfumes.

The laws of the country are but few, and those wholly vested in the power of the king. If any one is found guilty of murder, he is immediately punished with death; but thefts and trifling offences are punished only by fine. If any of the king's grandees are detected in having imposed falsities on him, they are either sentenced to pay a fine, or to receive a number of blows, from the king's own hand, more or less, according to the greatness of the offence.

In the latter case, the method of inflicting the punishment is thus:—they strip the criminal naked, and lay him on the ground, in the apartment of the palace assigned for that purpose. The king then gives him a number of blows on his back and breech, with a kind of whip, made with two long pieces of leather, fastened to a stick. As soon as the king thinks he has sufficiently scourged him, he desists, when the criminal rises, puts on his clothes, kisses the king's feet, and thanks him in the most respectful and submissive manner.

The weapons used by the people of this kingdom are bows, arrows, darts, and shields. Some of them are Mahometans, but the principal part are idolaters. The Portuguese have made but few proselytes in this kingdom, the inhabitants being obstinate in preserving their own religious principles.

The country of Ajan is the boundary of Zanguebar towards the north. It lies between latitude two degrees and twelve degrees north, extending from the river Magadoxo to Cape Gardafui. All the eastern coast of Ajan is sandy and barren, but to the north the country is more fertile. The kings of Ajan are frequently at war with the emperor of Abyssinia, and sell the prisoners which they take: they trade likewise in ivory, gold, and horses of an excellent breed.

## SECTION II. MONOMOTAPA.

Monomotapa is an extensive country, bounded, on the east, by the kingdom of Sofala; on the west, by the mountains of Caffraria; on the north, by the River Cuama, which separates it from Monoemugi; and, on the south, by the river del Spiritu Sancto. It is situated between the fourteenth and twenty-fifth degrees of south latitude, and between the forty-first and fifty-sixth of east longitude, being nine hundred and sixty miles in length, from east to west; and six hundred and sixty in breadth, from north to south.

This country is divided into six provinces, or petty kingdoms, the governors of which are vassals to the king of Monomotapa. The names of these provinces are, Monomotapa Proper, Quiteve, Manica, Inhambana, Inhambior, and Sabia.

Monomotapa Proper is the most considerable of the whole, and particularly distinguished for containing the capital city of the empire. It is situated in eleven degrees twenty-seven minutes south latitude, and thirty-one degrees ten minutes east longitude. It is large and populous, and the streets are very long and spacious. The houses are built with timber and earth, and the greatest ornament of the city is the imperial palace, which is a large spacious fabric, well flanked with towers, having four avenues, or stately gates, constantly kept by a numerous guard. The other towns in this province are all very insignificant, except one, called Tete, which is large and populous, and was formerly remarkable for being the residence of the Portuguese jesuits.

Quiteve lies to the south of Monomotapa Proper, and is bounded on the east by Sabia, on the west by Caffraria, and on the south by Manica. The capital city is called Lambave, and is situated about one hundred and twenty miles from Monomotapa Proper. It is large and populous, and the place where the king or governor of the province usually resides.

The province of Manica is bounded on the east by Sabia, on the west by Caffraria, on the north by Quiteve, and on the south by the river del Spiritu Sancto. The capital town is called after the name of the province. It is a small place, and poorly inhabited.

Inhambana lies southward from the above province, under the tropic of Capricorn, so that the air is exceedingly sultry. The capital town is called Tongue, which, though small, is populous, owing to the number of Portuguese that reside there.

The province of Inhambior is very extensive, but contains not any thing that merits particular notice. Its chief town, of the same name, is the constant residence of the king or governor of the province.

Sabia is also very fertile, and has several excellent rivers, one of which is called the Arac. On the coast are the Cape of Agulhas, and the Cape of Agulhas.

The climate of Monomotapa is more temperate than many other parts of the continent, so that it produces a great variety of fruits, and is the source of many sorts of life. It abounds in all sorts of beasts, and is bred prodigious numbers of oxen and cows.

The chief grains are wheat, and there is plenty of various kinds of fruits, and forests are great stores of elephants, the latter of which are killed for their flesh, but the natives use them with food, and considerable advantage.

The rivers of this country are situated on the banks of most of the rivers, with out any other kind of excellent fish, and the water is swept away from the more inland parts.

The natives are very healthy: they are very fond of which they ornament their houses, and are of a very sprightly disposition, standing which they prefer that employment are brought up to collect the sand on ponds, and lakes, from which is intermixed with it, and exchange for cotton and chandise.

Their common food is bread made of thin cakes; and their better sort use starchy, rice, and several other grains, and esteem palm-wine, which is greatly used at court.

Polygamy is allowed in Africa, every man being allowed as he can maintain; but the children inherit the property of the father.

They pay a religious regard to preserving the bones of their ancestors in their family. These they hang up, and they belonged, by fixing them on the seventh day the relation of the white, which is the spread a table before them.

Sabia is also very large, and well watered by two excellent rivers, one of which is called Sabia, and the other Aré. On the coast of this kingdom are the island of Boccia, and the Capes of St. Sebastian and St. Catherine.

The climate of Monomotapa is much more wholesome than many other parts of Africa, and the soil is so fertile, that it produces great plenty of the principal necessaries of life. It abounds with pasture-grounds, on which are bred prodigious quantities of cattle, especially oxen and cows.

The chief grains are rice and millet, and they have plenty of various kinds of tropical fruits. In the woods and forests are great numbers of wild beasts, particularly elephants, the latter of which the natives kill not only for their flesh, but also for their teeth: the former furnishes them with food, and of the latter they make considerable advantage, by selling them to the Portuguese.

The rivers of this country are very numerous, and on the banks of most of them grow many fine-trees and sugar-canes, without any culture. They abound with a variety of excellent fish, and in some of them is found gold, that is swept away from the mines through which they run in the more inland parts of the country.

The natives are in general tall, well shaped, strong, and healthy: they are quite black, and have woolly hair, which they ornament with a great variety of trinkets. They are of a very sprightly and docile disposition, notwithstanding which they are fond of being engaged in war, and prefer that employment to any other. The poorer sort are brought up to diving, and their chief business is to collect the sand or mud from the bottom of the rivers, ponds, and lakes, from which they separate the gold that is intermixed with it, and sell it to the Portuguese, in exchange for cotton and various other articles of merchandise.

Their common food is the flesh of oxen and elephants, with bread made of rice or millet, which is baked into thin cakes; and their drink is either sour milk or water. The better sort use strong liquors, made from honey, millet, rice, and several sorts of fruits; but they mostly esteem palm-wine, which is reckoned a royal liquor, and greatly used at court.

Polygamy is allowed here, as in most other parts of Africa, every man being permitted to take as many wives as he can maintain; but the first wife is the principal, and her children inherit the father's estate.

They pay a religious worship to the dead, every one preserving the bones of the most distinguished of his family. These they hang up in a court, and know to whom they belonged, by fixing certain marks on them. Every seventh day the relations visit them, being all dressed in white, which is the mourning of the country. They spread a table before them with provisions, then pray to

the deceased for the king's prosperity, and afterwards sit down and regale themselves, which they look upon as the greatest honour that can be paid to the defunct. Some of the inhabitants here profess the Roman Catholic religion, to which they have been converted by the Portuguese; but the principal part of them are idolaters, and practise the most superstitious rites. They hold a festival on the day of every new moon, and on the anniversary of the emperor's birth. They shew a singular veneration for a certain virgin, whom they call Al Firoo, and have temples erected in honour of her: they have also many nunneries, in which some of them confine their daughters to perpetual celibacy.

The king has a prodigious number of wives, the principal of whom are the daughters of some of his vassal princes; but the first only is called queen. The princess and females of the highest rank always attend upon him: they discharge this business in their turns, and think it the highest honour to be so employed. He is waited on by a great number of officers, who keep most profound silence, except when he drinks, or happens to sneeze or cough, at which time one of them cries aloud, "Pray for the health and prosperity of the king:" as soon as the words are repeated, they all kneel, then rise, and testify their joy by the loudest acclamations.

He takes great pains to preserve the respect of his subjects: he exacts no taxes or tribute from them, instead of which he is satisfied with a trifling present when they apply to him for any particular favour. This is an universal custom from an inferior to a superior of every rank and denomination, and esteemed the highest mark of respect that can be shewn. If at any time he orders his subjects to labour either at the gold-mines or any other service, (as is sometimes the case,) he always sends them cows and other provisions, so that, instead of attending with reluctance, they obey his commands with the greatest cheerfulness.

His ministers and officers, both civil and military, as well as his soldiery, who subsist by his pay, are obliged, instead of taxes, to pay him a kind of service of seven days in every month, either in cultivating his grounds, or any other work he thinks proper to employ them in; the lords and nobles are also bound to the same service when required, unless exempted from it by some particular privilege granted to their family or office.

The king maintains a numerous army of foot, (for he has no cavalry,) there being but very few horses, and those not fit for the purpose, throughout his dominions. Wherever the king encamps, they erect a large wooden house, in which a fire must be kept constantly burning. Neither he nor any of his soldiers are permitted to wash their hands or face while the war continues: when it is over, and they have gained a complete victory, the spoil

is divided, the sovereign reserving one part to himself, and distributing the rest in proportionable shares to his officers and men. This equitable distribution has an excellent effect, as it animates the men, and makes them fight with distinguished intrepidity.

The laws of this country are very few; and so little occasion is there for the confinement of criminals, that there is not a single prison throughout the whole country. Those found guilty of murder are punished with death; but, in trifling matters, they only inflict corporal punishment, which is done by giving the party a certain number of strokes with a knotted cord, according to the nature of the crime.

There are gold-mines in the inland parts, which have produced very considerable advantages to the Portuguese. There are other mines, in different parts of the country, that produce excellent metal, particularly those near Batua, a small place bordering on the province of Manica, and extending itself from the Mountains of the Moon to the River Magnico, whose governor is a vassal to the king.

There are several considerable places between the mines and the sea-coast, where fairs and markets are held for the sale of gold, particularly at those towns which lie on the River Zezebe, and Cuama, where the Portuguese have built fortresses to keep the natives in awe, who come to those markets to exchange their gold for European and other commodities. In each of these markets they have an officer of their own, who decides all contests and differences that arise about their traffic: they have, likewise, in most of these towns, churches and monasteries, of the Dominican order.

The king of Monomotapa first permitted the Portuguese to build their forts here, in gratitude for the service they had done in contributing to reduce some revolted vassals to return to their obedience, as well as to enable them, on all such exigencies, to be near at hand to assist him. This was about the year 1640, since which time they have been on good terms with the sovereigns of the country.

The commodities which they bring the natives are chiefly cloths of various sorts, glass beads of different sizes and colours, and other trifling trinkets; in exchange for which, besides gold, they receive great quantities of ivory, furs of sundry wild and tame beasts, and other valuable articles, which make their commerce very advantageous.

### SECTION III.

#### MONOEMUGI.

Monomugi, being an inland country, is very little frequented by the Europeans. It is bounded on the east by part of Zanguebar, on the west by Matamba, on the north by Abyssinia, and on the south by Monomotapa.

The account we have of this country is chiefly founded on the authority of the negroes, who carry on a commerce with it, European travellers not daring to venture into it, not only by reason of the unhealthiness of the climate, but also for fear of the inhuman Jaggas, who infect the more interior parts of it, and massacre all that happen to fall in their way.

The extent of this country cannot be ascertained, but that it is very great appears from the distance of its confines. The emperor is a powerful and rich prince, and has subdued most of the petty kingdoms about him to obedience.

Monomugi is divided into five kingdoms, or provinces, all of which are governed by petty princes, subject to the emperor. The names of these are as follow, viz. Mejaco, Gingiro, Cambate, Alaba, and Monomugi Proper.

Mujaco is bounded on the east by Abyssinia, on the west by Congo, on the north by Nubia, and on the south by Makoko. It is a large kingdom, but very poorly inhabited; neither does it contain any thing that deserves particular notice.

Gingiro, which is also a large kingdom, lies between Narea, the most southern kingdom of Abyssinia, and Makoko and Cambate. A writer, who travelled through this kingdom, says, the king preserves an extraordinary dignity, and that he contends with the sun; for which reason he never goes abroad, or gives audience, but before the sun rises, alledging that two suns cannot appear at once. His palace is no better than a cottage, which, when he dies, is always burnt, and his successor has a new one built for him, which is dedicated with the blood of two or three men, of a certain family, killed at the door, and on that account the said family is free from all other duties, which are so heavy, that they render this cruel composition acceptable; for, when the king buys any thing of foreign merchants, he pays them in slaves, and these are the sons and daughters of any family, which he takes at pleasure, without any opposition.

Cambate joins to the above kingdom on the west, and is bounded on the east by Alaba, on the north by Abyssinia, and on the south by Makoko. It is a poor country, and badly inhabited.

Alaba is a large kingdom, and situated on the coast of Cambate. It reaches to the coast of Zanguebar, and is inhabited by a cruel people, called Gallas. The prince is a Mahometan, but many of his subjects are idolaters, and of the worst sort, for they offer human sacrifices.

Monomugi Proper is bounded on the east by Congo, on the west by Tranquebar, on the north by Monomotapa, and on the south by Makoko. This is the largest division of the whole, but not otherwise remarkable, except from its being the residence of the emperor.

The natives dress in silks and cottons, which they buy of strangers, and wear collars of transparent beads, brought from Camboya. These beads serve also instead of money, gold and silver being so common that it is considered by them as of no value. They are most of them idolaters, and in their dispositions refractory and cruel.

### SECTION IV.

#### SOFALA.

Sofala is an extensive kingdom; and, like Monomotapa, remarkable for containing many excellent mines of gold. It is bounded, on the east, by the Indian Sea; on the west, by the province of Manica; on the north, by the empire of Monomotapa; and, on the south, by the kingdom of Sabia. It is, properly speaking, a continued coast, extending itself from the River Cuama, on the north, to that of Magnico, or Del Spiritu Sancto, on the south. The inland parts are not extensive, being confined, on the west, by the empire of Monomotapa; notwithstanding which, the whole kingdom is computed to be, at least, two thousand two hundred and fifty miles in compass.

The most considerable rivers of this country are the Cuama and the Del Spiritu Sancto, both of which are supposed to take their rise from the Lake Goyama. The former received its name from the Portuguese; but it is generally called, by the natives, Zambeze. This river washes down great quantities of gold, which the negroes collect when the waters are low, by diving to the bottom of such parts of it as, from practice, they know contain the greatest abundance. They bring up the mud in buckets, which, being properly levigated, easily discovers the metal.

On the coast are several capes, the principal of which are called Corientes, St. Catharine, and Sebastian. The former is situated under the twenty-third degree of south latitude: it is noted for the many rocks, sands, and shelves, that lie between it and the island of St. Laurence or Madagascar, and cause frequent shipwrecks along that channel.

The climate of Sofala is very unwholesome, occasioned by the vast number of marshes, which, being in summer dried up by the scorching heat of the sun, infect the air with pestilential steams. The soil, in general, is very uneven, barren, and desert. The inland parts abound with various sorts of wild beasts, particularly elephants, great numbers of which are annually killed by the natives, not only for the sake of their flesh, which is the chief part of their food, but also for their teeth, which they sell to great

advantage to the Europeans. The number of these animals destroyed here by the natives is said, one year with another, to amount to near four thousand.

The inhabitants of this kingdom are, in general, well shaped, and have short curled hair: they cover themselves only from the waist to the knees, with a garment made of silk or cotton; but they adorn their arms, wrists, legs, and ankles, with rings of gold, amber, or coloured beads; the better sort wear turbans on their heads, and have swords by their sides, the handles of which are made of ivory, curiously inlaid with precious stones.

Their food consists of the flesh of elephants, large and small cattle, and fish, with which the rivers abound; instead of bread, they use rice and millet. The drink of the common people is water; but the better sort have a kind of beer, which is made of rice and millet: they have also some strong liquors, made from honey, palm, and various fruits.

The king and his court, with a great number of the principal people, are descendants of the Arabs, and not only speak that language, but also strictly profess the Mahometan religion: the original natives are permitted to retain their ancient customs, and their religious maxims, the latter of which are much the same as those observed in the principal parts of Africa.

Sofala, the metropolis, and the only place of any note, is pleasantly situated on a small island, at the mouth of the River Cuama. The Portuguese have built a strong fortress, which is of infinite service to them, as it secures their ships in the harbour, when they stop here in their passage to and from India. The articles they purchase of the natives are gold, ambergris, slaves, and elephants' teeth, in exchange for which they supply them with silks, stuffs, cotton, glass-beads, and other trinkets. Both the fortress and island are tributary to the king of Portugal.

The king keeps a great number of soldiers, who are all paid in gold-dust, each according to his rank. Their original weapons are bows and arrows, with the scymetar, javelin, dagger, and hatchet; but, since the arrival of the Portuguese, they have been taught the use of fire-arms, of which they are very fond, and exercise them with great dexterity.

The inhabitants of Quiloa, Mombaza, and Melinda, come to this country in small boats, called tambues, with stuffs of blue and white cotton, silk stuffs, yellow and red ambergris, which they exchange with the people here for gold and ivory. These again sell them to the inhabitants of Monomotapa, who give them gold in return, without weighing it; so that the profit of the exchange is very considerable. This is the reason that, when the Monomotapans come to purchase these articles, as soon as the Sofalans perceive their vessels at sea, they signify their joy, and bid them welcome, by lighting fires on the shore.

It is said that the gold-mines of this kingdom yield above two millions of metigals per annum, each metigal amounting to fourteen livres; that the ships from Ziden and Mecen carry off about two millions a year in time of peace; and that the governor of Mosambique, whose office lasts but three years, has above three hundred thousand crowns revenue, without including the soldiers' pay and the tribute annually paid to the king of Portugal. Hence many learned men are of opinion, that this is the Ophir to which Solomon sent ships every three years from Eziongeber to fetch gold, Eziongeber being thought to be Suez, a sea-port on the Red Sea. This conjecture

is supported by the remains of several stately edifices, which are found in the different parts where the gold-mines are situated, and are supposed to have been originally palaces or castles, built by the king of Israel. It may also be confirmed by the authority of the Septuagint, who translate the word Ophir (1 Kings ix. 28) into Sophira, which has some resemblance to its present name of Sofala. As a farther confirmation of these conjectures, Lopez, in his voyage to India, says, the inhabitants of this country boast, that they have books which prove that, in the time of Solomon, the Israelites sailed every third year toward these parts, to procure gold.

## CHAPTER IX.

### INTERIOR COUNTRIES OF AFRICA;

FEZZAN, BORNOU, CASHNA, TOMBUCTOO, HOUSSA, DAR-FUR, &c.

**C**OMPLAINTS having long existed, that Europeans knew very little, if any thing, of the *interior* of Africa, a number of learned and opulent individuals formed themselves into a society for the purpose of exploring that tract of country. The association was formed on the 9th of June, in the year 1788; and on the same day a committee of its members, viz. Lord Rawdon, the Bishop of Landaff, Sir Joseph Banks, Mr. Beaufoy, and Mr. Stuart, were invested with the direction of its funds, the management of the correspondence, and the choice of the persons to whom the geographical mission was to be assigned. Convinced of the importance of the object which the association had in view, the committee lost no time in executing the plan which it had formed. Two gentlemen were recommended to them, and, appearing to be eminently qualified for making the projected researches, they were chosen. One was Mr. Ledyard, and the other Mr. Lucas.

Mr. Ledyard undertook, at his own desire, the difficult and perilous task of traversing, from east to west, in the latitude attributed to the Niger, the widest part of the African continent. On this bold adventure he left London, June 30, 1788, and arrived at Cairo on the 19th of August.

Hence he transmitted such accounts to his employers as manifest him to have been a traveller who observed, reflected, and compared; and such was the information which he collected here from the travelling slave-mer-

chants, and from others, respecting the interior districts of Africa, that he was impatient to explore them. He wrote to the committee, that his next communication would be from Sennaar, six hundred miles to the south of Cairo: but death arrested him at the commencement of his researches, and disappointed the hopes which were entertained of his projected journey.

Mr. Lucas embarked for Tripoli, October 18, 1788, with instructions to proceed over the desert of Zaara to Fezzan, to collect, and to transmit, by way of Tripoli, whatever intelligence the people of Fezzan, or the traders thither, might be able to afford respecting the interior of the continent; and to return by way of Gambia, or the coast of Guinea.

Mr. Lucas, however, was only able to execute a part of this plan. He set out, indeed, mounted on a handsome mule, presented to him by the bey, the pasha's eldest son, in company with sherefs, for the kingdom of Fezzan, intending to penetrate from Tripoli to Gambia: but his peregrinations, which began February 1, 1798, terminated at Mesurata on the 7th of the same month.

Deprived of visiting Fezzan, and the other inland districts of Africa, he solicited the information of his fellow-travellers, and transmitted to the society the result of his conferences with a sheref, Imhammed, who described the kingdom of Fezzan to be a small circular domain, placed in a vast wilderness, as an island in the midst of the ocean, containing near a hundred towns and

villages, of which Mesurata is the capital. This kingdom are some rich mines, some numerous smoking lakes, called founa.

The narrative of Mourzook, at the district, is a sandy desert, to the north are the mountains of Fezzan, tributary to Fezzan. Fezzan is said to be abundant with corn, and camels. The tribute of Fezzan is twenty camels.

For a more circumstantial account, see the account of Mourzook, indebted to the researches of Mourzook.

On the 6th of September, Mourzook, from Cairo with the intention of making discoveries in the interior, proceeded by Umm el-Kaywan, but few inhabitants, only twenty hours' journey from Siwah, the caravan known to Herodotus, from the city of the interior of Fezzan; thence to Mourzook, and thence to Mourzook on the 17th of November.

The cultivated part of the country is bounded by the mountains of Harutsch, and by the desert of the country of the Tiber. The wandering Tuaricks; a climate is, at no season of the year, the heat is from the south, it is natives. The winter is a bleak and penetrating rain, but seldom, and the winds are frequent. The natural and staple produce is likewise grown in the soil and are adapted for the indolence of the people, agriculture, and the op-

ately edifices,

villages, of which Mourzook is the capital, distant south from Mesurata about three hundred and ninety miles. In this kingdom are some venerable remains of ancient magnificence, some remarkably fertile districts, and numerous smoking lakes, producing a species of fossil-alkali, called trona.

The narrative proceeds to state, that, south-east of Mourzook, at the distance of one hundred and fifty miles, is a sandy desert, two hundred miles wide, beyond which are the mountains of Tibesti, inhabited by ferocious savages, tributary to Fezzan. The valleys between the mountains are said to be fertilized by innumerable springs, to abound with corn, and to be celebrated for their breed of camels. The tribute of the Tibestins to the king of Fezzan is twenty camel-loads of senna.

For a more circumstantial account of this country we are indebted to the researches of Mr. Horneman.

On the 6th of September, 1798, this gentleman set out from Cairo with the Fezzan caravan, for the purpose of making discoveries in the interior of Africa. The caravan proceeded by Umme-sogier, a small village, containing but few inhabitants, to the Oasis of Siwah, which is only twenty hours' journey from Umme-sogier. Hence from Siwah the caravan proceeded by Augila, a town known to Herodotus, who places it at ten days' journey from the city of the Ammonians, to Temissa, in the territory of Fezzan; thence to Zuila, in the same territory; and thence to Mourzook, the capital, where it arrived on the 17th of November.

The cultivated part of the kingdom of Fezzan, according to Mr. Horneman, is about three hundred English miles in length from north to south, and two hundred miles from east to west; but the mountainous regions of Harutschi, to the east, and other districts to the south and west, are comprised within its territory. The borderers on the north are Arabs, dependent, though rather nominally than really, on Tripoli. To the east, the country is bounded by the mountains called the Black and White Harutsch, and by deserts; to the south and south-east is the country of the Tibboes; to the south-west, that of the wandering Tuaricks; and, to the west, the Arabs. The climate is, at no season, temperate or agreeable. During the summer, the heat is intense; and, when the wind blows from the south, it is scarcely supportable, even by the natives. The winter would be moderate, were it not that a bleak and penetrating north wind frequently prevails. It rains but seldom, and then but little in quantity; but violent winds are frequent. Dates may be considered as the natural and staple produce of the country; some senna is likewise grown in the western parts; and the climate and soil are adapted for wheat and barley; but, from the indolence of the people, their ignorance of the art of agriculture, and the oppressions of the government, there

is not sufficient corn grown for the consumption of the inhabitants, who rely for subsistence on importations from the Arab countries from the north. There are but few horses or cattle in Fezzan; the principal domestic animal is the goat. Camels are extremely dear, and only kept by the principal persons and more wealthy merchants.

The population of the country is estimated by Mr. Horneman at seventy or seventy-five thousand souls. He says, it contains a hundred and one towns and villages, the names of the principal of which, next in order to Mourzook, the capital, and royal residence, are Sockna, Sibba, Hun, and Wadon, to the north; Gaken, to the south; Yerma, to the west; and Zuila, to the east.

"The complexion of the Fezzaners," says our author, "is a deep brown; their hair is black and short; their form of face such as may be termed regular, and their nose less flattened than that of the negro. They are but of an ordinary stature, and their limbs are by no means muscular. Their mien, walk, and every motion and gesture, denote a want of energy, either of mind or body. Their dress consists of a shirt or frock, made of a coarse linen or cotton cloth, brought from Cairo, and coarse woollen cloth of their own manufacture, called abbe. The middling classes wear frocks, made at Souda, of dyed blue cloth. The richer people and the Mamclukes of the sultan are clothed in the Tripolitan habit, over which they wear a Soudan shirt of variegated pattern and colours, and likewise the abbe. The ornamental distinctions of dress are chiefly confined to the head-dress, and to rings on the arms and legs. The women of distinction divide their hair into curls or tresses, to which they fix pieces of coral and amber, and little silver bells. They also fasten to the top of the head silver cords, on which are strung a number of silver rings, which hang on each side pendent to the shoulder. The meaner women wear merely a string of glass beads, and curl their hair above the forehead into large ringlets, into which severally is stuffed a paste, made of lavender, caraway-seeds, cloves, pepper, mastich, and laurel-leaves, mixed up with oil. The women of Fezzan generally have a great fondness for dancing, and the wanton manners and public freedoms which are permitted among them, astonish the Mahometan traveller. The men are much addicted to drunkenness. Their beverage is the fresh juice of the date-tree, called lugibi, or a drink called busa, which is prepared from dates, and is very intoxicating.

"The commerce of Fezzan is considerable, but consists merely of foreign merchandise. From October to February, Mourzook is the great market and place of resort for various caravans, from Cairo, Tripoli, Soudan, and companies of Tibboe and Arab traders. The caravans from the south and west bring to Mourzook slaves of both sexes ostrich-feathers, tiger-skins, and gold,

partly in dust, and partly in native grains, to be manufactured into rings and other ornaments, for the people of Interior Africa. From Bornou, copper is imported in great quantities; from Cairo, silks and woollen cloths; and from Tripoli, fire-arms, sabres, knives, &c.

"Fezzan is governed by a sultan, descended from the family of the sherefa. His power over his own dominions is unlimited; but he holds them tributary to the pasha of Tripoli. The tribute was formerly six thousand dollars, but it is now reduced to four thousand; and an officer from Tripoli comes annually to Mourzook, to receive this sum, or its value in gold, senna, or slaves. The throne is hereditary; but the crown does not, in all cases, descend directly from father to son; the eldest prince of the royal family succeeds, perhaps a nephew, in preference to a son who is younger. This custom frequently occasions contest and bloodshed. The sultan's palace is situate within the castle or fortress of Mourzook, where he lives retired, with no other inmates but the eunuchs who wait on him. His harem, consisting of a sultana and about forty slaves, is contiguous: he never enters it; but the female whom he at any time wishes to see is conducted to his apartment. The apparel of the sultan, on days of state and ceremony, consists of a large white frock or shirt, made in the Soudan manner, of stuff, and brocaded with silver and gold, or of satin interwoven with silver. Under this frock he wears the ordinary dress of the Tripolitans: but the most remarkable appearance is that of his turban, which, from the fore to the hinder part, extends a full yard, and is not less than two-thirds of a yard in breadth. The revenues of the sultan are produced from a tax on cultivated lands, from duties on foreign trade, paid by the caravans, from royal domains, and predatory expeditions.

"The religion of the Fezzaners is Mahometanism. Justice is administered by an officer called a *cadi*, who is here, at the same time, the head of the clergy, and possesses great influence and authority with the people.

"The title of the present sultan of Fezzan is, 'Sultan Mohammed ben Sultan Mansur;' but, when he writes to the pasha of Tripoli, he only styles himself sheref.

"This kingdom is inconsiderable, when compared with the two great empires of Bornou and Cashna, which lie south of Fezzan, occupying that vast region which extends from the river of the Antelopes for twelve hundred miles westward, and including a great part of the Niger's course. Cashna is said to contain a thousand towns and villages; and in Bornou, which is still more considerable, thirty languages are spoken. The latter is represented as a fertile and beautiful country, its capital being situated within a day's journey of the River *Wed-el-Gazel*, which is lost in the sandy wastes of the desert of Bilma, and is inhabited by herdsmen, dwelling, like the old patriarchs,

in tents, and whose wealth consists in their cattle. Though they cultivate various sorts of grain, the use of the plough is unknown; and the hoe is the only instrument of husbandry. Here grapes, apricots, pomegranates, limes, lemons, and water and musk melons, are produced in great abundance; but one of the most valuable vegetables is a tree called *kedeyna*, which in form and height resembles the olive, is like the lemon in its leaf, and bears a nut, of which the kernel and the shell are both in great estimation, the first as a fruit, the last on account of the oil which it furnishes when bruised, and which supplies the lamps of the people of Bornou with a substitute for oil. Bees are so numerous, that the wax is often thrown away, as an article of no value in the market. The population is described by the expression, a *countless multitude*."

We shall pass over the nature of their religion, which is Mahometan; of their government, which is an elective monarchy; and the singular mode of their electing a new king from among the children of the deceased sovereign: but the account of the present sultan, his wives, and his children, is too curious not to be transcribed.

"The present sultan, whose name is Ali, is a man of an unostentatious plain appearance; for he seldom wears any other dress than the common blue shirt of cotton or silk, and the silk or muslin turban, which form the usual dress of the country. Such, however, is the magnificence of his seraglio, that the ladies who inhabit it are said to be five hundred in number, and he himself is described as the reputed father of three hundred and fifty children, of whom three hundred are males; a disproportion of which naturally suggests the idea, that the mother, preferring to the gratification of natural affection the joy of seeing herself the supposed parent of a future candidate for the empire, sometimes exchanges her female child for the male offspring of a stranger.

"South-east from Bornou lies the extensive kingdom of Begarmee; and beyond this are said to be several tribes of negroes, idolaters, and cannibals. These are annually invaded by the Begarmese; and, when they have taken as many prisoners as their purpose may require, they drive the captives, like cattle, to Begarmee.

"The empire of Cashna bears a great resemblance to that of Bornou."

Under the patronage of the same society for making discoveries in the interior of Africa, Mr. Mungo Park performed a journey eastward, from the mouth of the Gambia to Silla, on the River Niger, above a thousand miles from the Atlantic; and, to use the words of Major Rennell, brought to our knowledge more important facts respecting the geography of Western Africa, both moral and physical, than have been collected by any former traveller.

From an enqui

Mr. Park set out from Pisanía, a British factory, on the banks of the Gambia, on the 2d of December, 1795, and took his route through the kingdoms of Woolli, Bondou, Kayaaga, Kasson, and Kaarta.

The dominions of the king of Woolli are bounded, on the east, by the Simbani Wilderness; on the west, by Walli; on the north-east, by Bondou; and, on the north, by the Gambia.

The towns are mostly seated in valleys, surrounded by some cultivated spots, whose produce yields an equivalent to the wants of the natives; supplying them with vegetables, tobacco, cotton, &c., while the circumjacent country is universally covered with thick woods and extensive forests.

The natives of Medina, the capital, who are Mandingoes, are divided into two religious sects: the one profess obedience to Mahomet, and the other retains the pagan ceremonies, and are denominated Bushreens, or Kafirs. Those who endure this term of reproach are, nevertheless, the rulers of the nation, and far exceed the Mahometans in their number. The converts to the Koran are, indeed, consulted on any business of public consequence; but the executive power is vested exclusively in the hands of their king or mausa, with the great officers of his appointment, who retain the ancient rites of their ancestors.

On the demise of the sovereign, the crown descends to his eldest son, unless a minor; but if there is no male issue, or if the prince has not attained to the years of maturity, either the brother of the deceased monarch, or his other nearest relative, is established, by consent of a council, with full powers to guide the political helm. The expences attendant upon this government are cleared by the taxes which are paid for all goods conveyed through the country, and likewise by a tribute, which is occasionally exacted from the inhabitants. When travellers proceed from the Gambia to the interior, the customs are claimed in various European articles; but, on their return, none will suffice, which must, however, be paid in every town they enter.

Medina in its extent is considerable, and may probably contain near a thousand houses. The fortifications are in the African style, consisting of a high clay-wall, and an exterior defence of sharp stakes and thorny bushes; but the wall is evidently falling to decay, through the negligence of the people; and the outwork has suffered materially from the industry of the females, who frequently remove the stakes to their own habitations, to supply the want of other fuel.

Mr. Park, in the course of his travels, arrived at a village called Konjour, where, having purchased a sheep, the negro who had killed the animal demanded the horns as his perquisite.

From an enquiry of the interpreter, who attended Mr.

Park, concerning the value of those things, he understood they were highly prized, as being easily appropriated to the purpose of cases or sheaths, to contain the saphies, which the people superstitiously fasten to some part of their apparel. These saphies, which are commonly detached sentences from the Koran, written on small bits of paper by the priests of Mahomet, are supposed, by the natives, to include some peculiar virtues, and therefore they wear them as amulets or charms, to defend them from the poison of serpents, the attack of alligators, the weapons of their foes, and the natural diseases of the human body.

They have likewise the weakness to imagine that hunger and thirst may be prevented by the possession of these wondrous papers, and the protection of superior intelligences thereby conciliated. Indeed, the art of writing is, on this part of the continent, considered in itself as a species of magic, and upon that idea they rest their opinions with much greater confidence than on the doctrines of the prophet.

The country of Bondou, like that of Woolli, is generally covered with woods; but its native fertility, in the opinion of our traveller, is not surpassed by any part of Africa. The name of the capital of this country is Fat-tecenda. The inhabitants are of the tribe of the Foulahs, who are in general of a tawny complexion, with small features, and soft silky hair. The Foulahs of Bondou are naturally of a mild and gentle disposition; but they evidently consider all the negro natives as their inferiors; and, when talking of different nations, always rank themselves among the white people.

In Kayaaga, the next kingdom, the air and climate are more pure and salubrious than at any of the settlements towards the coast; the face of the country is every where interspersed with a pleasing variety of hills and valleys; and the windings of the Senegal river, which descends from the rocky hills of the interior, make the scenery on its banks very picturesque and beautiful. The inhabitants are called Serawoolies, or, as the French write it, Sera-colets. Their complexion is a jet black; their government is a despotic monarchy; and they are habitually a trading people.

In the kingdom of Kasson, of which Kooniakary is the capital, from the top of a high hill, Mr. Park had an enchanting prospect of the country. The number of towns and villages, and the extensive cultivation around them, surpassed every thing he had yet seen in Africa. A gross calculation may be formed of the number of inhabitants in this delightful plain, from the fact, that the king of Kasson can raise four thousand fighting men by the sound of his war-drum.

At Kemmo, the capital of Kaarta, Mr. Park had an audience of the king, who advised him to return to Kasson;

telling him, it was not in his power at present to afford him much assistance, for that all kind of communication between Kuarta and Bambarra had been interrupted for some time past, in consequence of a war between the two kingdoms. Our traveller, however, resolved to continue his journey, and proceeded to Jarra, a town in the kingdom of Ludamar, whence he sent presents to Ali, the sovereign, then encamped at Benown, requesting permission to pass through his territories. Several days afterwards, one of Ali's slaves arrived with instructions, as he pretended, to conduct him as far as Goomba, on the farther frontier; but, before he arrived there, he was seized by a party of Moors, who conveyed him to Ali, at Benown, who detained him a prisoner more than three months. He, however, at length found means to make his escape, in the confusion which ensued in consequence of the success of the army of the king of Kuarta, who had invaded the country. His joy at his escape, he tells us, it is impossible to describe; but he soon found that his real situation was distressful in the extreme. He was in the midst of a barren wilderness; and, after travelling a long time, exposed to the burning heat of the sun, reflected with double violence from the hot sand, his suffering from thirst became so intolerable that he fainted on the sand, and expected the immediate approach of death. Nature, however, at length resumed its functions, and, on recovering his senses, he found the sun just sinking behind the trees, and the evening become somewhat cool. It soon after rained plentifully for more than an hour, and he quenched his thirst by wringing and sucking his clothes, by which he was sufficiently relieved to enable him to pursue his journey; and, after travelling several days more, he at length came in sight of one of the principal objects pointed out for his research—the river Niger. "I saw," says he, "with infinite pleasure, the great object of my mission—the long-sought-for majestic Niger, glittering to the morning sun, as broad as the Thames at Westminster, and flowing slowly to the eastward. I hastened to the brink, and, having drunk of the water, lifted up my fervent thanks in prayer to the Great Ruler of all things, for having thus far crowned my endeavours with success."

Mr. Park had now reached Sego, the capital of Bambarra, which is thus described:—

Sego, properly speaking, includes four separate towns, two of which are seated on the southern banks of the river, and bear the names of Sego See Korro and Sego Soo Korro; and two are built on the opposite side, which are Sego Korro and Sego Boo, and each of these is surrounded by a high mud-wall. The houses are generally square, with flat roofs, some of them two stories high, built of clay, and occasionally white-washed. Mosques are also frequent in every division of the capital. The streets are tolerably broad, considering that wheel-car-

riages are unknown, and the population is estimated at thirty thousand inhabitants.

Sego See Korro is the residence of the monarch, who derives a considerable part of his revenue from passengers crossing the Niger, under the care of his slaves, who convey them over in a sort of canoe, formed of two large trees, hollowed out and united at the end, by which uncommon junction they appear of a disproportionable length; they are also destitute of decks and masts, but are sufficiently roomy to contain four horses and several people with ease.

While our traveller stood waiting on the banks, for an accommodation in one of these vessels, the king was informed that a white man intended to visit him; but, on this intelligence, a messenger was despatched to tell the stranger, that his majesty could not possibly admit him to his presence till he understood the cause of his arrival, and also to warn him not to cross the river without the royal permission. This message was accordingly delivered by one of the chief natives, who advised Mr. Park to seek a lodging in an adjacent village, and promised to give him some requisite instructions in the morning.

Our author immediately complied with this counsel; but, on his entering the village, he had the mortification to find every door indiscriminately closed against him. He was, therefore, obliged to remain all the day without food, beneath the shade of a tree, till about sun-set, when, as he was turning his horse loose to graze, and expected to pass the night in this lonely situation, a woman stopped to gaze at him, as she returned from her employment in the field; and, observing his dejected looks, enquired from what cause they proceeded; which, on hearing explained, she immediately took up his saddle, and desired him to follow her to her residence, where, after lighting a lamp, she presented him with some broiled fish, spread a mat for him to lie upon, and gave him permission to continue beneath her roof till morning. Having performed this beneficent action, she summoned her female companions to their spinning, which occupied the chief part of the night, while their labour was beguiled by a variety of songs, one of which was observed by our author to be an extemporaneous effusion, occasioned by his own adventure. The air was remarkably sweet and plaintive, and the words were literally the following:

"The winds roared, and the rain fell. The poor white man, faint and weary, came and sat under our tree.—He has no mother to bring him milk; no wife to grind his corn.

"Chorus—Let us pity the white man; no mother has he."

To which we subjoin the following imitation, from the pen of the Rev. Thomas Smith:

Grateful for  
on quitting his  
benevolent hos

Loud roar'd the wind, while sheets of rain  
 Descending, delug'd all the plain,  
 Nor left the mountains free;  
 When, faint and wearied with the storm,  
 The while man threw his languid form  
 Beneath our spreading tree.  
 Unhappy man! how hard his lot,  
 Far from his friends, perchance forgot,  
 As thus he sits forlorn!  
 He boasts no mother to prepare  
 The fresh-drawn milk, with leader care;  
 No wife to grind his corn.

CHORUS.

With glad consent let ev'ry breast  
 Relieve and pity the distressed!  
 To him let each a parent be,  
 For parent none, alas! has he.

Grateful for the kindness he had received, Mr. Park, on quitting his bed, made a small acknowledgment to his benevolent hostess, and remained all day at the village, to oblige the natives, who anxiously crowded to survey him.

A messenger now arrived from the sovereign, to enquire whether any present was prepared for him; which, being answered in the negative, a second person was despatched from the court, who informed our author, that it was his majesty's desire he should immediately depart from Sego; but, anxious to relieve a white man in distress, he had graciously sent him five thousand cowries, and had given orders for his departure, which our traveller immediately obeyed.

Mr. Park observes, that the view of this extensive city, the numerous canoes upon the river, the crowded population, and the cultivated state of the surrounding country, formed altogether a prospect of civilization and magnificence, which he little expected to find in the bosom of Africa. Sego is situate, as nearly as can be ascertained, in fourteen degrees ten minutes of north latitude, and two degrees twenty-six minutes of west longitude.

From Sego, Mr. Park continued his journey along the banks of the Niger to Silla, a large town, about eighty miles to the east of Sego; and here, the tropical rains being set in, his finances expended, and various other difficulties concurring to render his farther progress extremely dangerous, if not impracticable, he terminated his travels to the eastward, at a point somewhat more than sixteen degrees east of Cape Verd, and precisely in the same parallel. The line of distance arising from this difference of longitude is about nine hundred and forty-one geographical, or one thousand and ninety British, miles, within the western extremity of Africa, a point which, although short by two hundred miles of the desired station, Tombucto, the attainment of which would unquestionably have been attended with great eclat, was yet far beyond what any other European, whose travels

have been communicated to the European world, had ever reached.

Mr. Park gives the following account of Tombucto and Houssa, from the information he was able to collect concerning those cities, at Sego, and in the course of his journey:

"To the north-east of Masina (a kingdom on the northern bank of the Niger, at a short distance from Silla) is situated the kingdom of Tombucto, the great object of European research; the capital of this kingdom being one of the principal marts for that extensive commerce which the Moors carry on with the negroes. The hopes of acquiring wealth in this pursuit, and zeal for propagating their religion, have filled this extensive city with Moors and Mahometan converts; the king himself, and all the chief officers of state, are Moors; and they are said to be more severe and intolerant in their principles than any other of the Moorish tribes in this part of Africa. I was informed by a venerable old negro, that, when he first visited Tombucto, he took up his lodging at a sort of public inn, the landlord of which, when he conducted him to his hut, spread a mat on the floor, and laid a rope upon it, saying, 'If you are a Mussulman, you are my friend; sit down: but, if you are a Kafir, (infidel,) you are my slave, and with this rope I will lead you to market.' The present king of Tombucto is named Abu Abrahima. He is reported to possess immense riches. His wives and concubines are said to be clothed in silk; and the chief officers of state live in considerable splendour. The whole expence of government is defrayed, as I was told, by a tax upon merchandise, which is collected at the gates of the city.

"The city of Houssa (the capital of a large kingdom to the eastward of Tombucto) is another great mart for Moorish commerce. I conversed with many merchants who had visited that city; and they all agreed that it is larger and more populous than Tombucto. The trade, police, and government, are nearly the same in both; but in Houssa the negroes are in greater proportion to the Moors, and have some share in the government."

Mr. Park was likewise told by a sheref, who resided at Walet, the capital of the kingdom of Beeroo, to the northward of Sego, and who had visited Houssa, and lived some years at Tombucto, that Houssa was the largest town he had ever seen; that Walet was larger than Tombucto; but, being remote from the Niger, and its trade consisting chiefly of salt, it was not so much resorted to by strangers: that between Benown and Walet was ten days' journey; but the road did not lead through any remarkable towns, and travellers supported themselves by purchasing milk from the Arabs, who keep their herds by the watering places: two of the days' journey was over a sandy country, without water. From Walet to

Tombucto was eleven days more: but water was more plentiful, and the journey was usually performed upon bullocks. He said, there were many Jews at Tombucto; but they all speak Arabic, and use the same prayers as the Moors.

We shall here add a short account of the country of Dar-Fur, another kingdom of the interior of Africa, lately visited by Mr. Browne. "Dar-Fur, or the country of Fúr, is situated to the south of Egypt and Nubia, and to the west of Abyssinia. Cobbe, its capital, stands, according to Mr. Browne, in fourteen degrees eleven minutes of north latitude, and twenty-eight degrees eight minutes of east longitude. In Dar-Fur wood is found in great quantity, except where the rocky nature of the soil absolutely impedes vegetation; nor are the natives assiduous completely to clear the ground, even where it is designed for the cultivation of grain. The perennial rains, which fall here from the middle of June till the middle of September, in greater or less quantity, but generally both frequent and violent, suddenly invest the face of the country, till then dry and sterile, with a delightful verdure. The tame animals in Dar-Fur are camels, sheep, oxen, and dogs; the wild ones, lions, leopards, hyænas, wolves, jackals, and elephants, which, in the places they frequent, go, according to report, in large herds of four or five hundred; it is even said that two thousand are sometimes found together. The antelope and ostrich are also extremely common. The population of the country Mr.

Browne estimates at two hundred thousand souls: Cobbe, the capital, he thinks, does not contain more than six thousand inhabitants. This town is more than two miles in length, but very narrow; and the houses, each of which occupies within its inclosure a large portion of ground, are divided by considerable spaces. The walls of the houses are of clay, and the people of higher rank cover them with a kind of plaster, and colour them white, red, and black. The disposition of the natives of Dar-Fur is more cheerful than that of the Egyptians. Dancing is practised by the men as well as the women, and they often dance promiscuously. But the vices of thieving, lying, and cheating, are here almost universal. No property, whether considerable or trifling, is safe out of the sight of the owner. Their religion is the Mahometan; but they allow polygamy without limitation; and they are little addicted to jealousy. To the women are assigned the most laborious employments: they till the ground, gather in the corn, make the bread, and even build the houses. The government is despotic; though the monarch can do nothing contrary to the koran. He speaks of the soil and productions as his personal property, and of the people as his slaves. His revenues arise from the tenth of all merchandise imported; the tribute of the Arabs who breed oxen, horses, camels, and sheep; and some other duties: the sultan is, besides, the chief merchant in the country, and despatches with every caravan to Egypt a great quantity of his own merchandise.

## CHAPTER X.

### TERRA DE NATAL, CAFFRARIA, CAPE OF GOOD HOPE, AND COUNTRY OF THE HOTTENTOTS.

#### SECTION I.

##### TERRA DE NATAL.

**T**HIS country, called Terra de Natal, from its being discovered by the Portuguese on Christmas-day, comprehends about three degrees of latitude from north to south. The River Dellagoa, which bounds the country on the north, is navigable, and has been frequented by European ships, for the purposes of trade. There is plenty of water here. The woods produce good timber, and the fields are covered with grass. They have a variety of beasts and birds. But, though the sea and rivers abound with fish, the natives seldom take any but tortoises, and that chiefly when they come ashore to lay.

The natives of this country are of a middle stature, and tolerably well proportioned; the colour of their skins is black, and their hair crisped: they are oval-visaged; their noses neither flat nor high; their teeth are white, and their aspect altogether graceful. Their chief employment is agriculture. Their cattle are numerous, and carefully attended. The men and women have their respective occupations, and their apparel is light, but mean. Their ordinary subsistence is Guinea-corn, beef, fish, milk, eggs, &c. They are of a facetious and social disposition. They live in small villages, under the government of the oldest man; and those who live in one village are all related; and, as an amiable characteristic, they are just and civil to strangers.

## SECTION II. CAFFRARIA.

This part of Africa was visited by those eminent botanists Sparrman and Thunberg, in the years 1771 and 1772, and by Mr. Barrow, eminent for his skill in astronomy, mathematics, and mechanics, in 1797 and 1798. The latter, from long residence and personal researches, has been enabled to ascertain the geography, state, and produce, of the country, with greater precision than any who have preceded him. To him, therefore, we are principally indebted for the following particulars.

*Soil, Climate, and Produce.*] The soil of Caffraria is a blackish loamy ground, and so extremely fertile, that every vegetable substance, whether sown or planted, grows here with great luxuriance. The bread-tree, which is a species of palm, rises to no great height, but is very thick, and from the pith the natives contrive to make their bread. They, however, bury it first in the earth for the space of two months; and, when it is sufficiently decayed, they knead it into cakes, which they bake in the embers. There are great variations in the climate. It seldom rains, except in the summer-season, when it is accompanied with thunder and lightning. The country is extremely well supplied with water, not only from the high land towards the north, which furnishes abundance throughout the year, but from many fountains of excellent water, found in the woods, which produce a variety of arboreous plants, and some of a considerable size. Among the animals are elephants, buffaloes, &c. There are also varieties of beautiful birds, but they are so shy, that they are procured with the greatest difficulty.

*Customs, Manners, &c.*] The male Caffres are tall, robust, and muscular, distinguished by a peculiar firmness of carriage, and a fine ingenuous countenance; some of them are six feet ten inches high, and so elegantly proportioned, that, Mr. Barrow affirms, they would not have disgraced the pedestal of Hercules in the Farnese palace. Their colour is a jet black. Their skins and short curling hair are rubbed with a solution of red ochre, that gives them the romantic appearance of bronze figures. They are, in general, destitute of raiment, except a few, who are covered with cloaks of skins.

The features of the Caffre women are agreeable: they have a well-formed contour, an agreeable nose, with sparkling and expressive eyes; so that, setting aside our prejudice with regard to colour, there are many among them who might be thought handsome by the side of an European female.

The men are more particular in decorations than the women, being very fond of beads and brass-rings. They are seldom seen without bracelets on their legs and arms, made of the tusks of an elephant, which they saw to a

convenient thickness, and then polish and round. As these rings cannot be opened, it is necessary to make them large enough to pass the hand through, so that they fall or rise, according to the motion of the arm: sometimes they place small rings on the arms of their children, whose growth soon fills up the space, and fixes the ornament.

They likewise make necklaces of the bones of animals, which they polish and whiten in the most perfect manner. Some content themselves with the leg-bone of a sheep hanging on the breast. In the warm season only the Caffres wear their ornaments; when the weather is cold they make use of krosses, made of the skins of calves or oxen, which reach to the feet. The Caffre women care little for ornaments. Their aprons are bordered with small rows of beads: but this is the only finery they exhibit.

The skin that the female Hottentot ties about the loins, the Caffre woman wears as high as her shoulders, tying it over the bosom, which it covers. They have, like the men, a kross, or cloak, of calf or ox skin, divested of the hair; but it is only in the cold or rainy season that either sex wear it.

The huts of the Caffres form perfect hemispheres, and are composed of wooden work, very strong and compact, covered, both within and without, with a mixture of earth, clay, and cow-dung. The opening, or door-way, is so low, that, to enter the dwelling, it is necessary to crawl on the hands and knees; which makes it easier to defend themselves against animals, or the sudden attacks of an enemy. The hearth, or fire-place, is in the centre, surrounded by a circular rim, which rises two or three inches.

Industry is a leading trait in the character of this people. The women are employed in the care of their gardens and corn; and cultivate several vegetables, which are not indigenous to their country; such as tobacco, water-melons, a sort of kidney-beans, and hemp. They also make baskets, and the mats which they sleep on. The men have great pride in their cattle; they cut their horns in such a way as to be able to turn them into any shape they please; and they teach them to answer a whistle. When they wish them to return home, they go a little way from the house, and blow a small instrument, which is made of ivory or bone, and so constructed as to be heard at a great distance, and in this manner bring all their cattle home without any difficulty.

The government is vested in a chief or king, whose power is very limited. He receives no tax, and has no troops at his command; but, being the father of a free people, is respected and beloved, though poorer than many of his subjects. Being permitted to take as many wives as he pleases, it is necessary that he should have a larger portion of land to cultivate, and a greater number of cattle to tend and feed; and, as these are his only resources for the

maintenance of his numerous family, he is frequently in danger of being ruined. His cabin is neither larger nor better decorated than the rest; his whole family and *se-raglio* live round him, composing a groupe of a dozen or fifteen huts: the adjoining lands are generally of his own cultivation.

The sovereignty is hereditary, and, in default of male heirs, the eldest nephew succeeds; and, in case the king should have neither children nor nephews, the chiefs of the different hordes elect a king. Upon these occasions a spirit of party sometimes prevails, which gives rise to factions and intrigues, which generally end in bloodshed.

The following account, for which we are indebted to Mr. Browne, will give an idea of the nature of royalty in this country, in the year 1797.

On the arrival of the travellers at a village that was honoured by the residence of the king, they were kindly received by the queen and his majesty's mother, who informed them, that the monarch was at his grazing village, about ten miles distant, to which a messenger was instantly despatched, while the travellers were entertained by the conversation and vivacity of the royal females.

Gaika, the sovereign, came galloping to the village upon an ox, with several attendants, and received the strangers under the shade of a spreading tree. After a short conversation, which reflected the highest honour on the sense and prudence of the young monarch, he received a present, consisting of sheets of copper, brass-wire, knives, beads, looking-glasses, and tobacco, and assured them of his favour and protection.

The monarch, who was at this time under twenty years of age, was about five feet ten inches high, of an elegant form, and graceful deportment; his eyes were brown and animated, his teeth white as unsullied ivory, and his countenance strongly marked with the habit of reflection. Vigorous in his mental, and amiable in his personal, qualities, Gaika was at once the friend and ruler of a happy people, who universally pronounced his name with transport, and blessed his abode as the seat of felicity.

His dress consisted of a cloak, faced with the skin of a leopard, large ivory bracelets, a necklace of beads, and a fanciful chaplet, adorned on the left side with a brass-chain; but these ornaments are only worn occasionally, as the king is usually destitute of apparel, like the generality of his subjects.

The queen, who was very young, and agreeably featured, was merely distinguished from the other females by a cloak, with three rows of brass-buttons, that extended from the hood to the extremity of the skirt. Mr. Browne observed, that the skin-caps of the women were covered with a profusion of buttons, shells, or beads, variously placed, according to the suggestions of their own fancy.

They acknowledge a Supreme Being, and believe in a future state, where the good will be rewarded, and the wicked punished; but have no idea of the creation, thinking the world had no beginning, and will ever continue in its present state. They have no sacred ceremonies. They instruct their own children, having no priests; but, instead of them, a kind of sorcerers or conjurers, whom they greatly distinguish and revere.

Circumcision, which is generally practised among them, proves that they either owe their religion to an ancient people, or have simply imitated the inhabitants of some neighbouring country, of whom they have no longer any remembrance.

It is a custom among the Caffres for each to gather his own grain, which they grind between two stones; for which reason, the families living separately, each surrounded by his own plantation of corn, occasions a small horde sometimes to occupy a square league of ground. The distance of the different hordes make it necessary that they should have chiefs, who are appointed by the king. When there is any thing to communicate, he sends for and gives them orders, or rather information, which the chiefs bear to their several hordes.

The principal weapon of the Caffres is the lance, or assaygay; which shews his disposition to be at once intrepid and noble; despising, as below his courage, the envenomed dart, so much in use among his neighbours, seeking his enemy face to face, and never throwing his lance but openly. In war, he carries a shield, of about three feet in height, made of the thickest part of the hide of a buffalo; this defends him from the arrow, or assaygay, but it is not proof against a musket-ball. The Caffre also manages with great skill a club of about two feet and a half long, made of a solid piece of wood, three or four inches thick in the largest part, and gradually diminishing towards one of the ends. In a close engagement, they strike with this weapon, and frequently throw it to the distance of fifteen or twenty paces.

Polygamy is allowed to all, but chiefly confined to the chiefs, who generally purchase their wives from a neighbouring nation. The other inhabitants are seldom able to purchase more than one; and, as the females of this country regard themselves as the absolute property of their parents, any suitor, who is able to advance the sum demanded, may rest assured of success.

In cases of infidelity, which seldom occur, the punishment is a fine, with the dismissal of the wife, at her husband's option; but, if he receives ocular demonstration of his dishonour, he is permitted to sacrifice both the parties to his indignation. A murderer is instantly put to death, unless the fact was accidental, when he must pay a certain fine to the relatives of the deceased, as a compensation for their loss. Imprisonment is totally unknown

The Caffres seldom attempt to sing, and when they do, the performance is miserable. Equally destitute of grace are their dances; in which a Caffre woman appears to the greatest disadvantage, as her features are overspread with an unusual gravity, her eyes fixed on the earth, and her body apparently distorted by the most convulsive motions.

Tattooing is extremely prevalent among the women, who frequently devote their leisure hours to this strange amusement, and exercise their ingenuity chiefly upon the stomach and the arms.

Of fishery they are so totally ignorant, that the whole extent of their coast, though washed by the sea, and intersected by several considerable rivers, does not produce a single boat or floating vessel of any construction; probably some peculiar superstition may prohibit the use of fish, or otherwise they are unwilling, from a natural timidity, to trust themselves in a frail bark upon the waters.

The pronunciation of their language is fluent, soft, and harmonious, though not the smallest vestige of a written character is to be found among them. Of astronomy, they only know that, in about thirty days, the moon will have gone through all its various appearances, and that twelve moons will bring a revolution of the seasons. Their chronology, which is kept by the moon, and registered by notches in a piece of timber, seldom extends beyond one generation, when the old series is cancelled, and the death of a favourite chief, or some remarkable conquest, serves for the commencement of a new era.

Their manner of disposing of the dead is extremely singular, and essentially different from the practice of the surrounding nations. Their chiefs are usually buried very deep under the places that are appointed for the repose of the oxen; and their children are commonly deposited in excavated ant-hills; but all other persons are exposed, on their decease, to the wolves; and are instantly dragged away to the dens of those ferocious animals, which are, therefore, held sacred by the Caffres, and permitted to ravage the country without molestation.

### SECTION III.

#### CAPE OF GOOD HOPE.

*Situation, Climate, Soil, &c.*] The Cape of Good Hope, which is the southernmost extremity of Africa, is situate in thirty-four degrees twenty-nine minutes of south latitude, and eighty-one degrees twenty-three minutes of east longitude. The climate, in the summer, would be intolerable, if the heat were not mitigated by the winds which blow from the southern ocean. Violent storms frequently arise, which, though they render the coast very dangerous, are absolutely necessary to the health of the inhabitants

41. VOL. I.

The division of the year may be said to consist of four parts, as in the countries of Europe. The spring, which commences at the beginning of September, and continues till the entrance of December, is indisputably the most agreeable season. The summer, from December to March, is rather sultry. The autumn, from March to June, is distinguished by a variety of weather, though generally pleasant towards the end; and the winter, from June, to September, is usually rainy, cold, and stormy.

The south-east and north-west are the most powerful winds; the former of which blows with extreme violence, when a cloud rests upon the Table Mountain, and generally predominates from the end of August till the middle of May. The other commences about the end of May, and blows occasionally, till the termination of August.

The approach of winter is generally observed by the subsidence of the winds, and the disappearance of the fleecy cloud. These tokens are succeeded by heavy dews, thick fogs, and cold north-westerly winds, accompanied by violent storms of thunder, lightning, and rain. At the expiration of three days, however, the atmosphere begins to brighten, and the mountains on the continent appear, with their summits buried in snow.

According to some meteorological observations, made by Dr. Sparrman, at the Cape, it appears that the winters are generally far from severe. The first half of May, the fluctuation of a good thermometer was from fifty-three to sixty-three degrees, and during the latter half between fifty and fifty-eight. In June, the thermometer stood between fifty-four and sixty, though there was either a fall of rain or snow on several days.

To the northward of the Cape the soil is sandy, barren, and desolate; but the traveller, who proceeds in an easterly direction, will meet with some rich and picturesque scenes, to reward his toil.

*Mountains.*] The stupendous mountains of this country are thus described by Mr. Barrow:—"The *Irregular Belt* encloses a fertile tract of land, from twenty to sixty miles in width, pleasantly intersected with a variety of streams, luxuriant in fruit and forest trees, refreshed with frequent showers, and blest with an equable temperature.

"The *Zevarte Berg*, or Black Mountain, is superior in height to the first, and frequently consists of double ranges; the district enclosed between this and the first chain is about forty miles in width, presenting to the spectator a varied scene of barren acclivities, fruitful meads, and naked plains. Its general surface is considerably higher than that of the *Irregular Belt*, its temperament more uncertain, and its intrinsic value much inferior. The third mountainous range is called the *Nienweldt's Gebergte*, which, together with the second, encloses the Great Karroo, or Parched Desert, and is utterly destitute of any human habitation.

6D

What is called the Table Mountain is a stupendous mass of naked rock, which imposes an involuntary attention upon the most indifferent observer of nature, and more peculiarly engages the contemplation of the mineralogist. It received its name from mariners, who usually affix the epithet of Table Land to every considerable acclivity, whose summit appears to the spectator in a parallel line with the horizon.

The northern front of this mountain is a horizontal line, about two miles in length, which directly faces the town. The bold front, that rises at right angles to meet this line, is sustained by several projecting buttresses, which, rising from the plain, close in with the front, a little higher than midway from the base. These, with the division of the front into three parts, a curtain, flanked by two bastions, the first retiring and the others projecting, render its appearance similar to the ruined walls of some stupendous fortress.

The height of these walls is three thousand five hundred and eighty-two feet above the level of Table Bay; the eastern side is still bolder, and has one point considerably higher: to the west, the rock is rent into various deep chasms, and worn away into numerous pointed masses; and, about four miles toward the south, the mountain descends in successive terraces to the chain which extends completely along the peninsula. The wings of the front, denominated the Lion's Head, and the Devil's Mountain, are, in fact, but disunited fragments of the Table Mountain.

The height of the former is about two thousand one hundred and sixty feet, and that of the latter three thousand three hundred and fifteen. The upper part of the Lion's Head is a circular mass of stone, which, from some points of view, exactly resembles the dome of St. Paul's cathedral, erected upon a lofty cone-shaped eminence; but the Devil's Hill is broken into a variety of irregular points. The exact horizontal position of these three mountains, which are composed of multitudinous tabular masses, clearly demonstrate their origin to be Neptunian, and that no convulsion of the earth has ever happened in this part of Africa, since their formation, sufficient to disturb the nice arrangement of their parts.

The substratum of the plain on which the town is built, and the shores of Table Bay, compose a bed of blue compact schistus, generally running in parallel ridges towards the south-east and north-west, but occasionally interrupted by considerable masses of a flinty rock, of the same colour. From an island, in the mouth of Table Bay, fine blue flags, diversified with white streaks, are procured, and appropriated to the purpose of paving the terraces before the houses.

A body of strong clay, tinged with iron, and abounding with brown foliated mica, lies upon the schistus; immense

blocks of granite are imbedded in the clay, and many coarser blocks, of a similar class, afford shelter to runaway slaves, among the African mountains.

The first horizontal stratum of the Table Mountain commences above five hundred feet above the level of the sea, and rests upon the clay and granite already mentioned. Upon a rough sand-stone, of a dingy yellow colour, is a deep brown sand-stone, containing veins of hematite and calciform ores of iron. This is succeeded by a mass of shining granular quartz, about a thousand feet in height, which, by exposure to the weather, is, in many places, changing into sand-stone. On the summit of the mountain such a transition has entirely taken place, and myriads of pebbles, of semi-transparent quartz, surround the skeletons of rocks in which they were formerly imbedded.

The ascent to the summit of the Table Mountain lies through a deep chasin, about three quarters of a mile in length, which divides the curtain from the left bastion. The perpendicular checks at the foot are above a thousand feet high, and the angle of ascent is equal to forty-five degrees.

After quitting the romantic scenery of the chasm, and passing the portal, which forms two lines of natural perspective upon the summit, the adventurer feels a momentary disgust at the tame and insipid plain, which spreads its dreary extent before his eyes: this, however, must infallibly subside, when he reflects on the great command obtained by the elevation over surrounding objects.

All the objects on the adjacent plain are diminished to insignificance in the eye of the spectator; the houses of Cape Town appear like childish fabrics composed of cards; the shrubbery on the sandy isthmus is merely visible; and the farms, with their enclosures, resemble a small picture held up at a distance.

*Vegetable Productions.*] Plantations of stone-pine and white poplar, with avenues of oak-trees, are sometimes found near the country-houses in the vicinity of Cape Town; but the timber which they produce is seldom equivalent to the rapidity of their growth. The sides of the hills are abundantly clothed with the silver tree; the con-carpa, and various others, which are collected for the purpose of fuel, and spread over the country in wild luxuriance.

The dwarf tree, called cripple-wood, has very crooked knotty branches, with broad, rough, and thick, leaves, shaped like those of the apple-tree; and the fruit resembles the pine-apple. The bark, which is thick and wrinkled, is not only used by tanners, but the physicians pulycrize it, and administer it with success in dysenteries.

There are here four sorts of camphire-trees; one transplanted to the Cape from the island of Borneo, which is esteemed much the best; the other three sorts were brought

from Japan, China, and Sumatra: they all grow very quick, and to the size of a walnut-tree. The inside of the leaves is of an ash-colour, and the outside of a grass-green; and, on rubbing them with the fingers, they send forth a strong odour, like that of camphire. These trees are so soft and tender, that their branches are frequently stripped off by the wind, and sometimes nothing is left standing but the trunk.

The Indian gold-tree, at the Cape, grows about six feet high, and has small leaves, nearly of the colour of gold, speckled with red, and are very beautiful. They have particularly a fine effect, when ranged in gardens among other trees. Yet the blossoms are very small, and of a greenish colour, without the least scent.

The stinkwood-tree grows to the size of an oak, and its leaves are three fingers in breadth. It received its name from its filthy scent; for, while it is under the tool, it exhales so nauseous a stench, that the workmen can scarcely endure it; but, after some time, this goes entirely off. The wood being beautifully clouded, the Cape Europeans have tables, presses, and several other useful and ornamental pieces of furniture, made of it.

Among the exotics, which, in the opinion of Mr. Barrow, might be successfully introduced, are different species of the cactus, the varieties of the cotton-plant, and two sorts of indigo, which are, at present, found in several parts of the colony.

Sugar-canes seem to flourish, as likewise the tea and coffee-plants, the latter of which was brought from the island of Bourbon. Two sorts of the wax-plant are abundant on the sandy flats. The dwarf-mulberry, the palma christi, and the aloe, are also extremely plentiful.

Many of the tropical, and most of the European, fruits are successfully cultivated; by which means the table may be constantly supplied with a good variety of fruit, either green or dry; as China and Mandarin oranges, grapes, figs, pears, apricots, peaches, pomegranates, apples, quinces, and medlars; likewise strawberries, walnuts, almonds, chestnuts, and mulberries, all of an excellent quality, and very plentiful. The vineyards, fruiteries, and gardens, are commonly divided into squares, and defended from the parching influence of the south-east winds by hedges of quince-trees, oaks, or myrtles.

The vines are here planted in the same manner as gooseberry-bushes in England, and so abundant is their produce, that one acre will bear five thousand stocks of vines, which will generally yield a pipe of one hundred and fifty-four gallons of wine. The retail price of such a quantity at the Cape is from ten to thirty pounds sterling. That sort which is denominated "Cape Madeira," sells at twelve pounds a pipe, as does, likewise, a tart pleasant wine, called the Steen wine. A great variety of sweet rich wines are also produced in the colony.

Some few persons, who have attended to the distillation of spirits, have produced brandy of an excellent quality. In general, however, this article is extremely bad, as the materials which are thrown into the still are of the coarsest kind, the apparatus is indifferent, and the process is usually committed to the hands of a slave, who, either through drowsiness or inattention, suffers the fire to go out, and then contaminates the flavour of the spirit, by a rapid blaze, which is used to supply the loss of time.

M. Thunberg informs us, that the wheat which grows in this country is much heavier and more productive than that of Europe; and barley is raised upon open grounds with good success.

We shall close this article with the description of a plant, which M. le Vaillant asserts to have been the most beautiful and magnificent he ever saw in the whole course of his travels through the interior of Africa. It was a lily, seven feet high, which waved majestically on its flexible stem, and literally impregnated the passing gales with its exquisite fragrance. The stem was six inches in circumference, and furnished with leaves that were three feet long, and three feet and a half wide. On the upper part were displayed, in beautiful order, thirty-nine corollas, or flowers; of which eighteen were in full bloom, six half-blown, and fifteen just ready to open. The greatest number formed a calyx, one-third larger than that of European lilies; their petals, of a charming flaxen grey on the outside, and as white within as unsullied snow, were finely bordered with crimson, and set off by a pistil and stamens, whose colours were equal to the finest carmine. "In short," says our author, "this plant, produced in solitude, and pure as the sun which had fostered it, had been respected by all the animals of the district, and seemed sufficiently defended even by its own beauty."

Having caused this charming lily to be cautiously dug up, M. le Vaillant found that its bulb measured thirteen inches in depth, and twenty-seven in circumference. In shape and colour it nearly resembled the bulb of a tulip; but, instead of being composed of several coats, it was pulpy, full, and weighty. Having been properly arranged in a basket, it was carried to our author's tent, where he enjoyed the pleasure of seeing all the flowers open in regular succession, and of inhaling its reviving perfume, till its odour was, at length, exhausted, and its strength completely decayed.

[*Animals.*] Among the wild animals of this country are the elephant, the rhinoceros, and the buffalo, all of which are very numerous. The latter are larger than those of Europe, and are of a brown red, whereas the European buffaloes are black. Those of the Cape are well-proportioned, hold their heads aloft, and have their foreheads covered with hard frizzled hair; their horns, however, are short, and bend inwards, so that their points almost meet.

Their skin is hard and tough, so that it is difficult to kill them without very good fire-arms; but their flesh is neither so fat nor so tender as that of the common ox. These animals are enraged at the sight of red cloth, and at the discharge of a gun near them; in both which cases they roar, stamp, tear up the ground, and run so furiously at the offending party, as to beat down all opposition. A considerable body of Europeans at the Cape once chased a buffalo, and, having driven him to the water-place, as it is called, near the harbour, the beast turned, and ran furiously at one of his pursuers, who was in a red waistcoat, and who, nimbly skipping aside, ran towards the water, where the buffalo pursuing him, obliged him to plunge in to save his life. He swam well, and as quick as possible; but the buffalo, leaping in after him, pursued him so closely, that he could only save himself by diving. The buffalo, thus losing sight of him, swam towards the opposite shore, which was at three miles distance; and our author observes, that he would undoubtedly have reached it, had he not received a shot from one of the ships in the harbour.

The elk of the Cape is generally five feet high; and its head, which resembles that of the hart, is small in proportion to its body. The horns, which are only about a foot long, run up twisting; but the ends are straight, smooth, and pointed: the neck is slender and beautiful, and the legs also slender, and of a great length; the hair of the body, which is of an ash-colour, is smooth and soft, and the tail about a foot long. The flesh tastes agreeably, either boiled or roasted, and bears a near resemblance to that of good beef. These stately animals are generally to be found on high mountains, where there are good pasture-grounds, and near some springs. They climb the highest rocks, and pass the most difficult ways with surprising despatch and security; yet sometimes visit the valleys, and frequently attempt to enter the gardens; whence the inhabitants place traps before those that are most exposed to their incursions. These gardens being usually encompassed with a ditch, over which is a bridge at the entrance, they fix in the ground, at one corner of the bridge, a strong, pliant, taper pole, fixing to the small end of it a long rope, by which that end of the pole is pulled down to the other corner of the bridge, where it is fastened so slightly, that by a small touch it is freed, and flies up with great force. When the small end of the pole is thus properly fixed, the remainder of the rope is formed into several nooses and coils, and laid under the arch of the pole. An elk coming to one of these gardens, and finding no communication but by the bridge before the door, steps upon it through the arch; and, hampering his legs in the coils of the rope, shakes the pole, on which the small end flying up, and fastening him in one of the nooses, he is drawn up, and unable to escape. If, by struggling,

he breaks the pole, he is almost sure to fall into the ditch; and, if he escapes that, he drags a piece of the pole after him, which so embarrasses him in his march, that he may be easily taken.

The blue goats of the Cape are shaped like those of Europe, but are as large as a hart. Their hair, which is very short, is of a fine blue; though, when they are killed, it changes to a bluish grey; their beards are long; and their horns, which are short and very neat, are annulated till within a little of the point, which is straight and smooth.

Spotted goats are sometimes seen in herds of above a thousand in number; and are covered with red, white, and brown spots; they are rather larger than the blue goats; and their beards, which are of a brown red, are very long. Their legs are well-proportioned to their bodies; and the joints about their fetlocks are of a dark brown; their horns, which are about a foot long, incline backwards, running up twisting to the middle, from whence to the end they are very straight and smooth. The young ones are easily taken, and rendered so tame, as to run with flocks of sheep; and their flesh is very agreeable food.

There is another sort of goat, which has a very beautiful head, adorned with two smooth, bending, pointed horns, three feet long. A white streak runs from the forehead along the ridge of his back to his tail, and is crossed by three streaks, one over his shoulders; another is on the middle of the back, running down both sides to his belly; the third crosses it above his buttocks, and runs down them. On all the other parts of his body the hair is greyish, with little touches of red; only the belly approaches to white. His beard is grey, and pretty long, as are also his legs. The female, which is less than the male, is without horns; and the flavour of the flesh is also very agreeable.

The Cape rock-goat is seldom bigger than an European kid of a quarter-old, and his horns are about half a foot long: as he frequently enters the vineyards and gardens, where he does great mischief, he is narrowly watched, and often taken; and his flesh is esteemed a great dainty.

The diving-goat is almost as large as an ordinary tame one, and is nearly of the same colour; but he no sooner sees any person or thing, from which he apprehends danger, than he squats down in the grass; and seeing nothing but grass about him, perhaps imagines himself unseen; for thus he lies, giving now and then a peep out, and drawing his head suddenly down again, till either the danger is past, or he is shot or knocked on the head.

In this country are two sorts of wolves, one like those of Europe, and the other called tiger-wolves. The latter are of the size of a shepherd's dog, or somewhat larger; and the head broad, like that of an English bulldog. Their jaws, nose, and eyes, are also large, and

their hair is frizzled; their feet are large, and draw in like a dog's; they remain in the ground, seeking the most dismal dogs who keep an enemy, and draw a fold, they get heated heartily upon their dens.

There are here a great havock and of hounds; and when they encounter them by their number, part of the day is spent in the place of rendezvous. Both European dogs on the elvans, and take have killed, when The Hottentots what the European dogs, however, in one flock.

their hair is frizzled, and spotted like that of tigers. Their feet are large, and armed with strong talons, which they draw in like a cat, but their tails are short. All day they remain in the clefts of the rocks, or holes in the ground, seeking their prey only in the night, and howling most dismally while out upon the prowl, which rouses the dogs who keep the flocks: these join together against the enemy, and drive them away; but, if they get safely into a fold, they generally kill two or three sheep, and, having fed heartily upon the spot, carry some carcases away to their dens.

There are here, also, wild dogs, which sometimes make great havoc among the cattle. They seem to be a species of hounds; and packs of thirty, and sometimes forty, of them encounter lions, tigers, and other animals; which, by their numbers, they conquer. They spend the greatest part of the day in the chase, and drag what they kill to a place of rendezvous, where they share it among them. Both Europeans and Hottentots, when they discover these dogs on the chase, follow them to the place of rendezvous, and take what they think proper of what the dogs have killed, which they permit them to do very quietly. The Hottentots eat what they take from the dogs; and what the Europeans take they salt for their slaves. These dogs, however, sometimes destroy seventy or eighty sheep in one flock.

In this country is a little creature, called a rattle-mouse, though it is larger than an European squirrel, and has a head shaped like that of a bear. The hair on the back is of a liver-colour, but that on the sides is almost black. With its tail, which is neither very long nor very hairy, it, from time to time, makes a rattling noise, and has thence obtained its name. It feeds on acorns, nuts, &c.; purs like a cat; and is mostly seen in trees, leaping from one to another, after the manner of the squirrel. It is so nimble, and bites so sharply, that it is seldom taken alive.

One of the most extraordinary animals of this country is called by the Dutch stinkbingsen, or stinkbox; its noise being the grand defence this creature has received from nature against all its enemies. It is of the shape of a ferret; but as large as a middle-sized dog. When its pursuer, whether man or beast, comes pretty near, it pours from its tail so horrid a stench, that it is impossible to endure it; a man being almost struck down by it before he can get away; and a dog, or other animal, is so strangely confounded, that he is obliged every minute to stop to rub his nose in the grass, or against a tree. The animal, having thus stopped his pursuer, gets a great way a-head before the chase can be renewed; and, if he comes up with him a second time, repeats the same expedient, and by this means escapes again. Thus he proceeds till his pursuer, overpowered by the stink, is obliged to desist. This animal, however, is sometimes shot by

42. VOL. I.

the Europeans, but they are obliged to suffer it to lie till it rots; for it is no sooner dead than its whole body contracts so nauseous a smell, that, if any one does but touch it with his fingers, they retain a stench that can neither be endured, nor easily got off by washing.

Among the feathered tribes, the most remarkable are eagles, vultures, kites, and cranes, that constantly hover round the summit of the Table Mountain, and assist the wolves in removing many nuisances. Snipes, teal, ducks, and geese, are frequently seen in the winter, in the vicinity of ponds and periodical lakes; and the gardens near the towns are much frequented by thrushes, fiscal-birds, and turtle-doves.

The following curious particulars, relative to a species of the cuckoo, was communicated in a letter from a member of the Royal Academy in Stockholm to a Fellow of the Royal Society in London.

"The Dutch settlers, at the place where this bird is found, have given it the name of Konig-wiser, or Honey-guide, from its discovering wild honey to travellers. It has nothing remarkable, either in colour or size, but the instinct which prompts it to seek its food is truly admirable. Not only the Dutch and Hottentots, but likewise a species of quadruped, which the Dutch call a Ratel, are frequently conducted to wild bee-hives by this bird, which, as it were, pilots them to the very spot. The honey being its favourite food, its own interest prompts it to be instrumental in robbing the hives, as some scraps are commonly left for its support. The morning and evening are its times of feeding, when it is heard calling, in a shrill tone, *Cherr Cherr*, to which the honey-hunters carefully attend, as the summons to the chase. From time to time they answer it with a soft whistle, which the bird hearing, always continues its note. As soon as they are in sight of each other, the bird gradually flutters towards the place where the hive is situated, continually repeating its former call of *Cherr Cherr*. At last, the bird is observed to hover for a short time over a certain spot, and then silently retiring to an adjoining bush, or other resting-place, the hunters are sure of finding the bees' nest in that very spot. While the hunters are busy in taking the honey, the bird is seen looking on attentively, and waiting for its share of the spoil. The bee-hunters never fail to leave a small portion for their conductor, but commonly take care not to leave as much as would satisfy its hunger. The bird's appetite being only whetted by this parsimony, it is obliged to make another discovery, in hopes of a better reward. It is further to be observed, that the nearer the bird approaches the hidden hive, the more frequently it repeats its call, and seems more impatient."

Among the various sorts of fish, with which the market is constantly supplied, are a rose-coloured perch; red and white stone-breams; the cabellan; the Hottentot's fish;

the silver perch, of a rose-coloured tinge, with five silver bands on each side; the stonipneus, with six transverse bands of black and white spots, one back-fin, and tail bifid; the harder, the klip, or rock-fish; the elst, the scomber, springer, speering, and atherina. Besides these, soles, muscles, crabs, and oysters, are found in abundance; dolphins are frequently caught in the bay after a strong gale. A species of the asterias, or star-fish, is sometimes sent to enrich the cabinets of Europeans, together with the paper nautilus.

Among the insects which infest the Cape are large black spiders, venomous snakes, scorpions, and scolopendras. Land-turtles, chameleons, and other lizards, are frequently perceived by the traveller; a species of locust is exceedingly injurious to the gardens in the hot months; and persons, who have occasion to traverse the sandy isthmus, are greatly tormented by sand and flies, which are so small as scarcely to be visible: the mosquitoes are less troublesome than in most warm climates.

*Principal Town.* Cape Town, the principal European settlement here, is situated in thirty-four degrees fifteen minutes south latitude, and sixteen degrees five minutes of east longitude. It is large, commodious, and populous; the streets are spacious, and regularly laid out; and the houses are tolerably handsome, but very low. As well within as without the town are excellent gardens, which produce many culinary vegetables and much fruit; among these is that extensive and beautiful garden belonging to the company. Building, as well as tillage, is greatly encouraged at the Cape, and land given for either purpose to those who choose to accept of it; but the government claims an annual tenth of the value of the former, and produce of the latter, and a tithe of all purchase-money when estates are sold.

Cape Town is embellished with four spacious squares, a Calvinist and a Lutheran church, a castle that affords barracks to a thousand men, and a regular well-designed building, originally intended for an hospital, but now appropriated for the accommodation of the military.

There is a regular guard-house, at which the burghersenate transacts all business relative to the police of the town, a spacious building appropriated for the reception of government slaves, and a court of judicature, where a final decision is passed in all civil and criminal causes. The weeskammer, or chamber for the administration of the affairs of orphans, is within the walls of the castle, as is the Lombard Bank, whose capital is about six hundred thousand rix-dollars, lent by the old government, in paper money, to the subjects, on mortgage of their property, at an interest of five per cent. Among a number of handsome houses, with which the plain is spotted between Table Mountain and the town, the government-house attracts the attention of the traveller. It is erected on a

fertile soil, and surrounded by about forty acres of excellent land; which are divided into a variety of squares, by oak-hedges; the public walks run up the middle, between two charming rows of myrtles, and are effectually shaded by avenues of spreading oaks.

*Customs, Manners, &c.* The inhabitants of Cape Town, though, in their persons, large, stout, and athletic, have not the characteristic phlegm of Dutchmen; a circumstance which may probably have resulted from the physical influence of climate. The ladies are universally noticed by travellers, on account of their beauty, good humour, and vivacity; and, from their peculiar gay turn, they are said to admit of liberties which would be deemed reprehensible in England; though, perhaps, they as seldom overleap the bounds of virtue as the women of other countries.

Children are not here subject to the caprice of their parents; since the family-property must be equally divided between the offspring, whether male or female; and no person is permitted to disinherit his child, without assigning, on absolute proof, at the least one reason out of the fourteen, which are enumerated in the Justinian code.

The education of youth is, in general, much neglected: it is, however, but justice to remark, that many of the young females have attained several accomplishments, which, to all appearance, the limited means of instruction must render extremely tedious and painful. Most of the young ladies, in respectable families, are conversant with the French and English languages, proficient in all kinds of tambour, lace, and knotting work, and are applauded for a tolerable degree of execution upon the piano-forte, or other musical instruments.

On the marriage of two persons, a community of all property, real and personal, is supposed, by the law of the colony, to take place, unless a solemn contract have been made to the contrary, previous to the celebration of the nuptials.

Occasional balls are the only public amusements at the Cape, and family parties, who assemble for the purpose of dancing or card-playing, are the only proofs of social intercourse between the inhabitants.

Money and merchandise are the universal topics of conversation, though none of the natives are in very affluent circumstances; many, however, enjoy a decent competency, while the objects of public charity are but few; and mendicants are unknown in the colony.

The carriages for pleasure, which are here maintained at a very trifling expense, are open, and capable of containing four or six persons: these, however, are only used for short excursions; as journeys are usually performed in a machine, similar to a light waggon, that is sufficiently spacious to accommodate a whole family, with provisions,

apparel, &c. varying of said mixed breed, extremely do turn abruptly nues, with ei

apparel, &c., and is sheltered from the weather by a covering of sail-cloth. The drivers, who are usually of a mixed breed, between a Hottentot and an European, are extremely dexterous in their avocation, and will either turn abruptly, or gallop through the most dangerous avenues, with eight in hand, with the greatest facility.

An indolent sedentary life, excessive gluttony, and an immoderate use of raw spirits, tobacco, &c. are the distinguishing characteristics of a native of the Cape; by which means, a schirrous liver, or an apoplexy, is brought forward: the former usually drags the slave of intemperance to an early grave, and the latter, though seldom attended with sudden dissolution, terminates in a dropsy, and thus proves equally fatal with the other. Few of the inhabitants, indeed, attain to longevity, seldom surviving a period of sixty years.

### SECTION III.

#### COUNTRY OF THE HOTTENTOTS.

This tract of country extends towards the north of the tropic of Capricorn, and, on all other parts, is bounded by the Southern Ocean. It is occupied by several distinct nations; but, as it would be superfluous to enumerate the whole, we shall only advert to the following, as the principal, and, therefore, most worthy of notice; viz. the Houteniquas, the Damaquas, the Sonquas, the Houzouannas, the Hensequas, the Chirigriqas, the Namaquas, the Gonaquas, and the Boshiesmen.

The Houteniquas' land is a woody tract, which extends a considerable way along the coast. It, however, contains some fertile vales, and streams of sweet water; so that some farmers have established themselves here. Agloa Bay is one of its boundaries, a station seldom visited by ships, though it is well calculated to supply wood and water. Indeed, between this place and the Cape, the navigation appears to be neglected; nor is any constant and frequent communication kept up between the centre colony and the more distant dependencies, so that trade circulates in a very slow and sluggish manner, to the great detriment of the community.

The people called Damaquas occupy a district which abounds with cattle, game, hemp, and water-melons. Wood is very scarce, and salt-pits are at once numerous and useless; for the Hottentots never eat any salt; and the pits are too far from the coast to be of any service to the Europeans. Those who travel through this territory are much obstructed by the serpentine river Palamites, which meanders through the whole country, and is passed upon floats, or in canoes, as the people have no idea of building a bridge.

The Sonquas are but few in number, and inhabit a very

steril rocky country; from the nature of which, and the manner in which they pick up a subsistence, they may be termed the Swiss of the Cape. Cattle is so scarce among them, that they never kill any but upon certain solemn occasions; their food being either the game which they take in hunting, or such roots, plants, and herbs, as their country affords.

The Houzouannas may be considered as one of the richest and most polished of the Hottentot nations; that is, they have the greatest quantity of cattle, the only criterion of riches, and are the most luxurious in their living, the sole mark of refinement in this country. Their kraals or villages are larger and better built; their oxen for carriage stronger and more handsome; and their country is better inhabited than any other about the Cape. They have abundance of game, and, indeed, every thing that is necessary to convenience and pleasure in that tropical situation. Some of these people article themselves as servants to the Dutch for a certain number of years, and generally conduct themselves with propriety during the stipulated time.

The Hensequas differ from the other Hottentots, in applying themselves to agriculture, as well as the breeding of cattle. They cultivate a singular root, called *dakha*, the juice of which is sharp and spirituous. The substantial part serves them for food, and the fluid is an inebriating liquor, of which they are very fond. These people catch lions by traps, and are said to possess the art of taming them, so as to render them perfectly domestic.

The Chirigriqas are a strong, active, and bold people, inhabiting a tract of country bordering on the Bay of St. Helen's. The territory is watered by an excellent stream, called the Elephants' River, on account of the great number of elephants which frequent its banks. This district abounds in mountains, which are flat on the top; and the summits of some of them have all the verdure of the finest meadows. The valleys are enamelled with the most beautiful flowers; but it is dangerous to enjoy their fragrancy, on account of the prodigious number of snakes with which they abound; that called *cerastes* being particularly venomous. The Chirigriqas are very numerous, and are celebrated for being the most dexterous of any of the Hottentots in throwing the assagay, or half-pike, which they do with the most critical exactness. This weapon is made of a taper stick, about four feet long, armed at one end with an iron-plate, sharp at the edge, and tapering to a point: the blade is always kept bright and clean, and, when used in war, is dipped in poison.

The people called Namaquas are divided into two nations; the Greater Namaquas, who inhabit the coast; and the Lesser Namaquas, whose territory extends more to the eastward.

The language of the Namaquas considerably varies from the other tribes of Southern Africa, though they universally retain that clapping of the tongue, by which the Hottentots are peculiarly distinguished. Their stature is commonly higher, and they are less robust, than the generality of the eastern tribes. Among the females, some were observed whose figures were truly elegant, and their vivacity pleasing. Like the Hottentots of the east, they bestow an abundance of pains upon their little leather aprons, which are fancifully adorned with a profusion of beads, shells, &c.

Their huts are likewise different from those which are erected by the Hottentots of the colony, or the natives of Caffraria; they are framed of semicircular sticks, and covered with a kind of matting, made of sedges; they are about twelve feet in diameter, and so commodious, that the peasantry of the adjacent nations frequently model their own habitations by those simple dwellings of these Namaquas.

Like the Caffres, they are very attentive to their cattle, and give an artificial direction to the horns of the oxen, after the manner of that nation. The herds that were seen in the possession of both Dutchmen and Hottentots were bony, large, and equal, in every respect, to those which are reared at Sneeuwberg.

Though the Namaquas have relinquished their ancient weapons, which, from the decrease of wild beasts, and a dread of the savage Boshiesmen, are accounted useless, they are evidently acquainted with poisonous substances, with which the points of their arrows were probably rubbed, when the adjacent parts abounded with a variety of game, and beasts of prey.

The Gonaqua Hottentots are a tribe nearly resembling the Caffres. Both sexes wear ornaments of brass-rings, on which they set great value. These people use the initiatory rite of the Jews. The women are less decent in their attire than the Hottentots in general, but their manners are equally modest.

The Gonaquas are very importunate beggars, particularly for tobacco. All of them, Sparman says, were armed with the assagay, or javelin, and the kirris. They did not, however, appear to be dexterous marksmen; for they could not hit a handkerchief at twenty paces, till after many trials.

The savage race of Boshiesmen inhabit the Sneeuwberg, or Snowy Mountains. Mr. Barrow, in the course of his travels, proceeded, with his party, to a kraal or village, that was situated in the mouth of a defile, where the inhabitants were at first alarmed at the appearance of so large a party of Europeans; but, on the reception of a few trifling presents, their terrors subsided, and they contentedly associated with the strangers for several days. The horde contained about twenty-five huts, constructed

of small grass mats, fastened upon two semicircular sticks, open before and closed behind. They were about a yard high, and four feet wide, with a hollow place in the middle of the ground, that resembled the nest of an ostrich. In this hollow a little grass was placed, to serve the purpose of a bed, where the inmates lay coiled round, in the manner of some quadrupeds. All the men were entirely naked, and rendered still more disgusting by a porcupine's quill, or a piece of wood, that was passed through the cartilage of the nose. The females wore a small belt, of springbok's skin, cut into long fringes, while their heads were fancifully adorned with leather caps, in the form of helmets.

In their persons they are very diminutive, seldom exceeding four feet nine inches in height; the tallest woman seen in the kraal measured four feet four inches, and another, who was merely three feet nine inches high, was mother of several children. From their complexion, hair, and turn of countenance, Mr. Barrow was inclined to pronounce them of the same origin with the Hottentot race in general; though, in personal appearance, the difference is exceedingly great. The Boshiesmen are peculiarly distinguished by the depression of their noses, the height of their cheek-bones, the prominence of their chins, and the formation of their eyes, the rounded lids of which are nearly similar to those of the Chinese. Their bellies are likewise protuberant, and their backs hollow; though their limbs are commonly well-turned; and their agility is such, that they will leap the precipices of the mountains, like the klip-springing antelope, and outstrip the fleetest horse, on rough ground, with the greatest facility.

The disposition of these people is widely different from that of the Hottentots who reside in the colony. Cheerful, active, and vivacious, they earn a precarious subsistence with much danger and fatigue, and usually satisfy the cravings of an empty stomach with the larvae of locusts, or a few granineous roots, that are pungent and ungrateful to the palate; yet, when the surrounding farmers have retired to their habitations, and the moon breaks forth in unsullied brightness upon the landscape, they apparently forget their perils and their wants, and usually devote the hours to dancing, till the orient clouds are gilded with the beams of the rising sun. They are, likewise, extremely joyful at the approach of the first thunder-storm after the winter, which they consider as a harbinger of the summer's commencement, and express their delight by rending their skin-coverings, throwing them in the air, and dancing for several successive nights.

When their various plans of entrapping game rendered abortive, and the chase proves unsuccessful, they proceed to the colony, in quest of plunder, though the undertaking is toilsome, and extremely hazardous. They use poisoned arrows, and are so dexterous in their use,

that they will hit a mark at the distance of a hundred yards. The poison being of the most virulent kind, whatever animal is wounded, in a few minutes languishes and expires. Their arrows are about eighteen inches long, and made of a reed, tipped with polished bone.

If they are unexpectedly surrounded by the farmers, they will throw themselves in the midst of their enemies, that, by creating a general confusion, their countrymen may take an advantageous aim from the adjacent concealments, while their wives and children may escape unperceived. If they are pursued, when retreating with a booty, they always divide into two parties, one of which is employed in driving off the cattle, and the other in engaging their pursuers; if, however, the colonists are likely to prove victorious, they instantly stab or maim the whole herd with poisoned weapons.

The most perfect equality prevails within this horde. Hunger or satiety is alike experienced by all, and they are all equally destitute of management or economy with respect to provisions. If their different exertions prove unsuccessful, the horde must contentedly suffer the pangs of a temporary famine; but, if a herd of cattle is brought in from the colony, the kraal is soon covered with a mass of putrefaction, and the circumambient air is tainted with the noxious effluvia.

Their constitutions are much stronger than those of the Hottentots in general, and their lives are usually of longer duration. In every kind of sickness, they cut off the extremities of the fingers, beginning with the little finger on the left-hand, as the least important. This ridiculous operation is performed under the idea that the effusion of blood will carry off the disease.

The capture of slaves from among this race of men is effected in the following manner:—Several farmers, that are in want of servants, join together, and take a journey to that part of the country where the Boshiesmen live. They themselves, with their attendants, who are Boshiesmen that have been caught before, and trained up to fidelity in their service, endeavour to spy out the haunts of that wild race. This is best done by the smoke of their fires. They are found in societies, from ten to fifteen, and sometimes a hundred. Notwithstanding this, the farmers will venture, on a dark night, to attack them with six or eight people, which they contrive to do by previously stationing themselves at a distance round about the spot. They then give the alarm by firing a musket. By this means such a consternation is spread among the savages, that it is only the most bold and intelligent among them that have courage to break through the circle, and steal off. The rest allow themselves to be taken, and carried into bondage. They are, at first, treated by gentle means; that is, the captors intermix the fairest promises with their threats, and endeavour, if possible, to shoot some of the

larger kinds of game for their prisoners, such as buffaloes, sea-cows, and the like. Such agreeable baits, together with a little tobacco, soon induce them to go to the place of abode of the colonists. Then this luxurious living is exchanged for more moderate portions, consisting mostly of butter-milk, hasty-puddings, &c., but this diet fattens the Boshiesmen in a few weeks. Their good living is embittered by the taunts of master and mistress, to which are sometimes added blows, for neglect, remissness, or idleness; so that, by nature and custom, detesting all manner of labour, from greater corpulency becoming still more slothful, and having, besides, been used to a wandering life, subject to no control, they most sensibly feel the want of liberty. They accordingly seldom fail of making their escape, when an opportunity offers; but, when any individual of this nation runs from his servitude, he never takes with him any thing that does not belong to him. This is an instance of moderation in the savages towards their tyrants, which is universally asserted, and, at the same time, praised and admired by the colonists themselves. It is necessary to observe, that some of these Boshiesmen live in small societies, peaceably and quietly, in desert tracts, where the colonists cannot easily come at them, and are sometimes in the possession of a few cows.

The generality of these people have no idea of the existence of a Supreme Being; for some of them, who spoke Dutch, being questioned upon the subject, by a traveller, answered him to this effect:—"We are poor stupid creatures, and have never heard, neither are we able to understand, any thing of the matter." Many of the colonists declared, that the Boshies, of both sexes, used, in stormy weather, to abuse the thunder with reproachful expressions; and, at the same time, in a furious manner, with their shoes, or any thing else that was at hand, threaten and bid defiance to the flashes of lightning and peals of thunder. Nay, they most obstinately persisted in declaring that rain was always an evil, and that it would be a happy circumstance were it never to rain.

They seem to have some idea of spirits, and of a future state; as they accost their friends, as soon as they are dead, with reproaches for leaving them so soon, at the same time admonishing them henceforth to demean themselves properly: by which they mean, that their deceased friends should not come back again to haunt them, nor allow themselves to be made use of by wizards, to bring any mischief on those that survive them.

Of the Hottentots in general it may be said that there is something peculiar in their features, which, in a certain degree, separates them from the generality of mankind. The cheek-bones are exceedingly prominent; so that the face being very broad in that part, and the jaw-bones,

on the contrary, extremely narrow, the visage continues decreasing, even to the point of the chin. This configuration makes the head appear very disproportioned, and too small for a full and plump body. The nose rises scarcely half an inch at its greatest elevation; and the nostrils, which are excessively wide, often exceed in height the ridge of the nose. The mouth is large, and furnished with small teeth, well enamelled, and perfectly white; the eyes, very beautiful and open, incline a little towards the nose, like those of the Chinese; and, to the sight and touch, the hair has the resemblance of wool; it is very short, curls naturally, and in colour is as black as ebony. The male Hottentots have very little hair, yet they employ no small care to pull out by the roots part of what they have. Though they have no beard, but upon the upper-lip, below the nose, and at the extremity of the chin, they never fail to pluck it out as soon as it appears. This occasions an effeminate look, which destroys that commanding fierceness usual among savages. The women, with more delicacy of features, exhibit the same characteristic marks in their figure: they are equally well made: their hands are small, and their feet exceedingly well shaped, though they never wear sandals. The sound of their voice is soft; and their idiom, passing through the throat, is not destitute of harmony. When they speak, they employ a great variety of gestures, some of which are tolerably graceful.

The Hottentots, in general, paint themselves; and the two colours for which they show the greatest fondness are red and black. The first is composed of a kind of ochery earth, which is found in several places of the country, and which they mix and dilute with grease: this earth has a great resemblance to brick-dust. Their black is nothing else than soot, or the charcoal of tender wood. Some women are contented with painting only the prominence of the cheeks; but in general they daub over their whole body, in compartments, varied with a certain degree of symmetry. The men never paint their faces; but they use a preparation, made of both colours, mixed, to paint the upper lip, as far as the nostrils.

The Hottentots are naturally timid: their phlegmatic coolness, and their serious looks, give them an air of reserve, which they never lay aside, even at the most joyful moments; while, on the contrary, all other black or tawney nations give themselves up to pleasure, with the liveliest joy, and without any restraint. A profound indifference to the affairs of life inclines them to indolence: the keeping of their flocks, and the care of procuring a subsistence, are the only objects that occupy their thoughts. They never follow hunting as sportsmen, but like people oppressed and tormented by hunger. In short, forgetting the past, and being under no uneasiness for the future, they are occupied only by the present; and it

is that which alone engages their attention. They are, however, kind and hospitable. Whoever travels among them may be assured of finding food and lodging; and though they will receive presents, yet they never ask for any thing. If a traveller has a long journey to accomplish, and if they learn, from the information he requires, that there are no hopes of his soon meeting with other hordes, that which he is going to quit supplies him with provisions, and other necessities, as far as their circumstances will allow.

Their clothing is very slight, and seldom more than modesty requires. The females, however, cover themselves more scrupulously than the men. They are seldom content with one covering, but frequently wear two, and often three. These garbs are composed of well-greased skins, fastened round their bodies with a thong; the outermost is always the largest, and is sometimes rendered very showy, by ornaments of glass-beads.

The covering for the body, when any is used, is of sheep-skin, with the woolly side turned inwards. This pelisse, or else a cloak, made of some smaller fur, is tied forwards, over the breast. The Hottentots do not burthen themselves with a great many changes of these krosses, as they are called, but generally content themselves with one, which serves both for clothing and bedding. The kross used by the women has a hood, or pouch, with the hairy side turned inwards, in which they carry their infants at their backs.

In general, neither men nor women wear any covering for their heads, though sometimes the former have a cap, made of a greased skin, and sometimes an European slouched hat, and the latter occasionally cover their heads with a cap, in the form of a truncated cone, made out of some animal's stomach. This article of dress is ornamented, according to the taste of the wearer, with rows of small shells, and other decorations. The necks of the men are bare; but the women wear a string of shells, on a leather thong, which is considered as an ornament of a superior kind.

The lower part of the body is principally regarded, by both sexes, as entitled to decoration. Strings of beads adorn their waists, and their aprons, or girdles, are frequently studded with these ornaments, in a very tasteful style. But the rings on their legs and arms are the most singular embellishments of this people, and distinguish them from all other. These rings are made of thick leather straps, cut in a circular shape, and appear to be universally used. The males have several of these rings on their arms, but seldom any on their legs: the females, especially those of higher rank, have often their legs and arms covered with them.

The Hottentots seldom wear any shoes; when they do, they are generally of the same kind as are in use among

A rectangular piece, somewhat broader and longer than the foot, is doubled up at the extremities, and drawn together with thongs, till it fits the wearer, and sits as close as a stocking. These kind of shoes are very convenient, and attended with little expense.

The Hottentots, who reside within the boundaries of the Dutch colonies, seldom use any weapons, unless for their personal defence, or attack against the wild beasts.

The dwellings of the Hottentots are extremely simple, and well adapted to their pastoral roving life. In a kraal they are all uniform, and this contributes to keep envy from insinuating itself under their roofs. The fire-place is in the middle; and the door, small as it is, admits all the light they want, and serves as an aperture to let out the smoke. The whole fabric consists of rods, bent into a proper form, and bound with withies. Over this a mat is thrown, which serves to keep out the rain.

The position of these huts, in a kraal, is, for the most part, circular, with the doors inwards. By this means a kind of area is formed, in which the cattle are lodged at night. The milk is no sooner taken from the cow, than it is put into a leathern sack, with the hairy side inwards, and is never drank while it is sweet; as it is considered more wholesome and nutritious, when fermented or curdled.

When a Hottentot is disposed to take his house down, and remove his dwelling, he lays all the materials on the backs of his cattle, and, by that means, conveys them to the spot he has fixed upon for removal. The furniture simply consists of two or three earthen pots for culinary purposes.

In the colony of Drakenstein, Dr. Sparrman visited the warm baths, called Hottentots' Holland Bath, from the district in which it lies; and here a tolerably large and commodious brick house has been built, by the government, for the accommodation of company resorting thither. From a list, kept by the overseer of the bath for several years, it appears that from one hundred and fifty to two hundred persons use the bath annually.

The bathing-house is situated about a hundred paces from the dwelling-house. This last, at each end, has a cistern or pit, a fathom and a half square, and two feet deep. The warm water is conducted a little way under ground from its source, till it reaches the house, when it runs through an open channel into the cistern, in a stream of an inch diameter.

When the patient is to receive the benefit of the bath, he sits down in the cistern, till the water rises to his chin. It then feels extremely warm, and a kind of pulsation is perceived from the internal to the external parts of the

body. The quickness of the pulse is increased; and, in a short time, a deliquium is felt coming on. It is, therefore, necessary to have an attendant; as instances have occurred of persons fainting, and being drowned in the bath. When the patient gets out of the water, he lays himself down at the other end of the room, to sweat, in clothes provided on purpose. When this is over, he washes himself in the water of the bath; and this process is repeated two or three times, without any considerable interval. In general, however, the bath is used only twice a day.

There are several springs of a similar nature in the vicinity, but these are little used, except by the slaves and Hottentots. Some of them, however, seem to be possessed of more powerful virtues than that which is used by the better sort of people. Dr. Sparrman made several chemical experiments on the water; from which he concluded, that the predominant mineral in it was vitriol, with some portion of steel.

The Hottentots sometimes make an intoxicating liquor, composed of honey and a certain root, which they suffer to ferment in a sufficient quantity of water. This liquor, however, is not their usual beverage, nor do they ever keep a stock of it by them. Whatever they have, they drink all at once, and frequently regale themselves in this manner at certain periods. They smoke the leaves of a plant, which they call *dagha*, which seems to be the hemp of Europe. There are some of the savages who prefer these leaves to tobacco; but the greatest part of them are fond of mixing both together. They set less value on the pipes brought from Europe than on those which they fabricate themselves.

Though they rear abundance of sheep and oxen, they seldom kill the latter, unless some accident happens to them, or old age has rendered them unfit for service.

Those oxen which they intend for carrying burdens must be broke and trained very early to the service, otherwise they would become absolutely untractable. Some Hottentots were observed by Sparrman riding on their oxen, which they drove with great boldness over hills and dales. These animals have a hole bored through the gristle of the nose, sufficiently large to hold a wooden pin, at both extremities of which they fasten the rope that serves both for bit and bridle. The saddle is made of a sheep's skin, folded up, and fastened by a rope round the fore-part of the body of the ox.

These oxen are called pack-oxen, as they are likewise used for carrying packs and burdens. By an order of government, no Hottentot is allowed to have a horse in his possession; and, therefore, they break in their oxen, when young, and bring them to supply the place of that animal.

Of their sheep and kine, each village has one common

herd, every inhabitant taking it in his turn to act as herdsman. This charge requires many precautions, as beasts of prey are both numerous and fierce in the southern parts of Africa. Lions, indeed, are not very common; but there are elephants, rhinoceroses, leopards, tigers, hyænas, and several kinds of wolves, together with other furious animals, that abound in the forests, and occasionally make excursions towards the Cape, and destroy the tame cattle. To prevent these misfortunes, it is the business of the herdsman to go or send every day round his district, in order to discover if any beast of prey be lurking in that quarter. If an animal of this kind be discovered, the herdsman assembles the whole village, and makes his report; when a party of the stoutest among them arm themselves with javelins and poisoned arrows, and proceed to the cave or covert where the beast is lodged. Here they arrange themselves in two lines, till the animal is provoked to come out, when he is inevitably destroyed.

They are remarkably fond of hunting, and in this exercise they display great dexterity. Besides gins and snares, which they place at convenient spots to catch large animals, they lie in wait for them also, attack them as soon as they appear, and kill them with their poisoned arrows or their assagays.

The Hottentots measure the year by the seasons of drought and rainy weather. This division is common to all the inhabitants of the tropical regions, and it is subdivided into moons; but they never count the days, if they exceed ten, that is to say, the number of their fingers. Beyond that, they mark the day or the time by some remarkable occurrence: for example, an extraordinary storm, an elephant killed, an infectious disorder among the cattle, an emigration, &c. The different parts of the day they distinguish by the course of the sun; and they will tell you, pointing with their finger, He was there when I departed, and here when I arrived.

The Hottentots have frequent festive meetings, which generally conclude with music, singing, and dancing. Their musical instruments are the greater and lesser gongom and the drum. The gongom is a bow of olive-wood, strung with sheep-sinews. At one end of the bow a quill is placed upon the string, and a cocoa-shell fastened to it by two holes. The mouth is applied to the quill, and the player blows and modulates his breath, as if playing on a Jew's harp. The drum is made of earthen-ware, and covered with sheep-skin, braced on with sinews. Their vocal music is confined to a few songs, and a frequent repetition of the monosyllable "ho," by way of chorus. When they are to have a dance, the men squat down in a circle; then several couple present themselves; but only two couple enter the ring at the same time, performing face to face. Sometimes they dance back to back, but never take hands.

In their country-dances they display very little agility or art. While their feet are employed in a kind of stamping and moderately slow movement, each of them, at intervals, make several gentle motions with a little stick. Their music is equally simple; yet it is calculated to inspire a certain degree of joy and hilarity. They have also dances of another kind, in which they join hands, and move in a circle round some of the party, who are placed in the centre of the ring.

It has been said that these people play at cards. Dr. Sparrman saw the peculiar game, which has absurdly received this name, played by four Hottentots. The chimney-corner was the scene of their sport, and the ash-hole might be considered as their card-table, as it often happened that, in the midst of their ardour for the sport, they struck their hands into the midst of it, and raised the ashes in clouds of dust, that floated all over the apartment. Their sport seemed to consist in an incessant motion of the arms upwards, downwards, and across those of each other, without ever seeming to touch one another. It is probable, however, they observe certain rules, and, in certain circumstances, mutually get the advantage; as each of them, at times, would hold a little peg between his fore-finger and thumb, and burst out into laughter. After some hours play, if play it can be called, one of the party grew tired, and lay down to sleep; but the rest continued their diversion till day-break.

The wealth of a Hottentot consists in the number of his flocks; and commerce is carried on entirely by barter. The articles of the natives are cattle, skins, elephants' teeth, ostrich' eggs, &c.; in return for which they receive from the Europeans, brandy, wine, tobacco, coral, beads, brass, copper, and iron. But a Hottentot will not sell his arms upon any consideration. They are very just and upright in their dealings. From proofs of their dexterity in some handicraft professions, it appears they would be expert in most, were they not prevented by their prevailing indolence from the prosecution of them.

Every Hottentot tribe is governed by a national chief, called the Konquer, whose office is to command the army, conduct negotiations of peace, and preside in the councils. His installation is attended with great pomp and solemnity. Next to the Konquer is the Kraal Captain. Every village has one of these, who attends to the preservation of peace, the administration of justice, and, in war, holds command under the national chief. He is bound, by solemn engagement to the people, not to alter or deviate from the ancient laws or customs of his kraal. He hears and decides all disputes of right and property, and tries and punishes for crimes within his jurisdiction.

Justice is dispensed among these people with a laudable impartiality: for, if the captain of the kraal have

Hottentot marriages nearest relations. The killed, to feast the com the service of Europe mony or regularity. It

committed a crime, he is seized as rudely, persecuted as severely, and punished as ignominiously as the meanest individual. The charge against a culprit is pronounced by the prosecutor, whose witnesses are heard by the court. The culprit makes his defence, and has his witnesses heard with the greatest indulgence. After some debates on the evidence, the captain collects the voices, the majority of which acquits or condemns. If the latter, and the crime be death, sentence is pronounced, and execution takes place on the spot, without a moment's delay. The captain having pronounced the fatal word, the court rises, but the criminal does not stir. After a profound silence for a minute or two, the captain flies at him, as in a rage, and, with one blow on the head with the kirrstick, fells him to the ground, when the rest fall on, and complete the execution, by beating him to a mummy, and breaking several of his limbs. He is then buried; but his family and relations suffer nothing in name, privilege, or property. No one is reproached with the memory of his crime or punishment.

M. Thunberg was present at the execution of a slave, who had murdered his master. The delinquent being tied to a cross, his arms and legs were first burnt, in eight different parts, with red-hot jagged tongs; afterwards his arms and legs were broken on the wheel, and, lastly, his head was struck off, and fixed on a pole. This execution was conducted with much solemnity, in the presence of the judge and a circle of attendants.

The Hottentots have very little notion of military discipline. The causes of war are chiefly three; trespassing on each others districts, stealing the cattle, or running away with the wives of their neighbours. Disputes are decided between two nations by fighting one battle, the success of which determines the whole affair. It is worthy of remark, that they never plunder the dead, but suffer their friends to bury them, and dispose of their arms as they think proper.

The pronunciation of the Hottentot language is equally difficult and singular. Almost every word is to be spoken with a clacking of the tongue against the roof of the mouth. In different nations, however, a different dialect and mode of articulation are used. Notwithstanding the apparent difficulty of learning this language, the children of Europeans, in families where there are Hottentot servants, acquire it with as much facility as their mother-tongue. Dr. Sparrman met several children at the Cape, who could speak two or three different languages with equal facility.

Hottentot marriages are negotiated by the parents or nearest relations. The day after the nuptials, an ox is killed, to feast the company. The Hottentots who are in the service of Europeans intermarry without any ceremony or regularity. If a married Hottentot at any time

undertakes a journey, his wife may marry another in his absence; a circumstance that happened to our traveller's driver, who, on his return home, with all that he had earned in his expedition, found himself a widower.

Dr. Sparrman was very assiduous in his enquiries how far it was true that these people secluded from society, and abandoned to their fate, such as were old and helpless. That such an inhuman practice is sometimes followed, well-authenticated instances seem to testify; but they are not very numerous. Another custom, no less horrid, is that of burying sucking children alive, who have the misfortune to lose their mother.

Those Hottentots who live in their natural manner are seldom afflicted with diseases, to which those who reside among the Europeans are liable. Their practitioners are equally skilled in medicine and surgery. They perform surprising cures by their botanical knowledge. In bleeding they are only provided with a common clasp-knife and a strap. When they have taken away as much blood as is thought necessary, the orifice is closed, and rubbed with mutton-fat, and the leaf of some herb is bound over it. With all their skill they are very superstitious, and fond of divination. In order to know the fate of a sick person, they slay a sheep alive: if the poor animal, in this condition, is able to get up, and run away, the omen is esteemed favourable; but, on the contrary, if it die with the excruciating pain, it is deemed fatal to the patient.

When a Hottentot dies, he is buried in his worst dress, and the limbs are disposed in such a manner, that the whole body is covered. The relations then carry the corpse to a certain distance from the horde, and, disposing it in a shallow pit, dug for this purpose, cover it with earth, and then with stones, if any are to be found in the neighbourhood. Such a mausoleum, however, proves but a weak defence against the attacks of the jackal and the hyæna; and the body is soon dug up and devoured.

The generality of the Hottentots have neither temples, idols, nor any peculiar place of worship. They celebrate nocturnal dances, with singing, at the new and full moon; but these are rather pastimes than any thing relative to religious worship. Of late years, however, the glorious doctrines of the gospel have been introduced among them with surprising success; and we may confidently anticipate, that, both in respect of religion and civilization, this part of Africa will soon discover most important improvements.

Mr. Barrow, in his travels, took up his lodging at a place where a small number of Moravian missionaries had been several years established, for the express purpose of teaching the unenlightened Hottentots the truths of the Christian religion. After a night of undisturbed repose, he was awakened early by the most melodious

sounds, which proceeded from a groupe of female Hottentots, who were neatly dressed in printed cotton gowns, and assembled to chaunt their morning-hymn.

The ministers were three in number, of modest manners, humble deportment, and unfeigned piety; lively and intelligent in conversation, they freely answered every question that was asked them, and cheerfully welcomed the traveller to their habitations, which were equally remarkable for cleanliness and simplicity. Their church was a plain neat building; their mill superior to any in the colony, and their gardens abundantly stocked with an excellent variety of useful vegetables.

"Through the unremitting exertions of these men," says our traveller, "six hundred Hottentots have been united in one society, who have been instructed in different trades, and live comfortably in little huts that are sprinkled over the valley, whence they hire themselves out occasionally to the neighbouring peasants, or employ themselves at home in such avocations as are most congenial to their own inclinations, and best adapted for the subsistence of themselves and their families.

"On Sundays, they regularly attend their public devotions, when their apparel is extremely clean, and their behaviour truly devout. At the time of my visit, about three hundred composed the congregation, to whom an excellent and pathetic discourse was delivered by one of the fathers. The voices of the females were, in general, harmonious; and their style of singing was extremely sweet and plaintive."

We shall close this article with the following extracts from the last report of the London Missionary Society.

"During the past year, the communications from Africa have been peculiarly interesting. Mr. Campbell, agreeably to the proposed object of his mission, has visited the various missionary stations in distant parts of South Africa, has suggested many excellent regulations for their improvement, and has fixed upon several new places, in which missionary settlements may probably be established.

"After a careful examination of official papers relating to the missionaries, and obtaining passports from his excellency the governor, Sir John Cradock, to the landrosts of the districts through which he was to pass, he left Cape Town on the 31st of February, 1813, accompanied by Mr. Hammea, his son, Mr. Bartlett, a catechist, and several Christian Hottentots, and others belonging to Bethelsdorp. In a fortnight he reached the Drosdy of George, the inhabitants of which are desirous of having a missionary settled among them. Mr. Campbell promised that Mr. Pacalt should be sent to them for a time, to be succeeded by Mr. Wimmer.

"Mr. Campbell reached Bethelsdorp on the 20th of March, and was received by Mr. Read and all the mis-

sionary brethren with the most cordial affection, and, by the Hottentots, with the liveliest expressions of joy.

"He witnessed a greater degree of civilization than he was led to expect, from the reports in circulation, on his arrival in South Africa. He found at Bethelsdorp natives exercising the businesses of smiths, carpenters, sawyers, basket-makers, turners, &c. He saw cultivated fields extending two miles in length, on both sides of a river; their cattle had increased from two hundred and eighteen to two thousand two hundred and six; from three hundred to four hundred calves were produced in a year, not more than fifty of which were in that space of time allowed to be slaughtered. The blessed effects of religion were displayed in benevolent institutions formed among them: they had a fund for the support of the poor and sick, which amounted to two hundred and fifty six-dollars; they proposed to build a house for the reception of part of their poor. They had also a common fund for the purpose of improving the settlement, amounting to one hundred and thirty dollars, and about thirty head of cattle; and they contributed, during the last twelve months, seventy six-dollars in aid of this society.

"Such are the fruits of the seed sown among them by Dr. Van der Kemp, Messrs. Read, Ulbricht, Wimmer, and other faithful missionaries! Such are the powerful effects of divine truth among the most degraded of our species, in their civilization, as well as in the more important concerns of religion. Thus we see a Christian church, cultivated fields and gardens, useful manufactories, an hospital, and an auxiliary missionary society, among Hottentots!

"From Bethelsdorp, Mr. Campbell proceeded through a wild country, almost uninhabited, on the borders of Caffraria, in order to fix upon two spots, eligible for missionary settlements, in Zureveld, near the Great Fish River, the government having kindly promised to give sufficient portions of land for that purpose. Two suitable places were accordingly fixed upon, where, the land being good, a part of the people now at Bethelsdorp might settle, and to which some of the cattle might occasionally be sent for the sake of better pasture. Here it was agreed that Mr. Ulbricht, aided by Mr. Bartlett, should assist in forming a settlement.

"Mr. Campbell next travelled, in a north-westerly direction, to Graaf Reinet, where Mr. Kichrer resides, and had the pleasure of witnessing the happy effects of his labours; here also he met with John, Mary, and Martha, the Hottentots who visited England in the year 1803.

"Here Mr. C. continued about a week, and was favoured with an interview with a Mr. Burchel, a botanical traveller in South Africa, who had just returned from an excursion very far north, and who was the first European who had penetrated to that part of Africa from Graaf Reinet.

After receiving cautions, and his guide, he about the 10th accompanying of the colony to the boors heard of a C whereby to de country until velling about eastward, he describes the Bridge.

from Great Britain.

After receiving from him the most valuable directions and cautions, and accompanied by the native who had been his guide, he commenced his journey to the Orange River, about the 10th of May; Mr. Kicherer and other friends accompanying him a week's journey, as far as the limits of the colony; preaching, wherever they had opportunity, to the heathen, some of whom had never heard of a God, nor had they a word in their language whereby to denote him. He crossed the wild Boshiesmen's country until he reached the Orange River, and, after travelling about one hundred miles along its banks to the eastward, he found a ford, which he safely crossed: he describes the river as wider than the Thames at London-Bridge.

"On the next day he reached Klara Water, the missionary settlement, which has long been under the care of Messrs. Anderson, Kramer, and Janz. Here he remained but a few days, and left it, accompanied by Messrs. Anderson, Kok, and Hendrick, in order to explore a large and populous city which had been described to him.

"After travelling ten days in the direction of north-north-east, they arrived at the city of Latakkoo, which contains about one thousand five hundred houses, neatly built, and about eight thousand inhabitants. After waiting ten days for the King, Mateebee, who was absent on a jackal-hunt, Mr. Campbell was introduced to him at sunset; when he requested leave to send missionaries to his people, to acquaint them with the religion of Jesus Christ.

"After starting several objections to that measure, which Mr. C. was enabled to answer to his complete satisfaction, the king gave him this laconic answer: 'Send them, and I will be a father to them.' This conference was repeated publicly, at the request of the king, on the next day, in the presence of his subjects, and the same liberty to send missionaries was openly granted.

"Here Mr. Campbell obtained the important information, that there were twenty tribes of people north of Latakkoo, who all speak the same language, and who are reported to be still more civilized.

"From Latakkoo Mr. Campbell travelled eastward, and in five days reached a large Coranna-town, called Malapeetze, where he understood that no white man had been seen before; to this place also he obtained leave from the chief and the majority of the inhabitants to send missionaries.

"Travelling southward from thence, he went in search of the Malalaren River, and discovered a kraal, situated in a most beautiful valley, where Makoon, the chief of all the Boshiesmen in that part of Africa, resided: he appeared to be a man of talents, and, though he had never before seen a European, he consented to Mr. Campbell's proposal of sending missions there also.

"From thence Mr. C. travelled along the Malalaren River to its junction with the Great Orange River, which he discovered was composed of four smaller rivers, the Malalaren, the Yellow River, and two others, which he named, in compliment to his respected friends, the governor and the secretary at the Cape, the Craddock and the Alexander. This geographical discovery has since afforded great pleasure to gentlemen of science at the Cape.

"Mr. Campbell and his friends then returned to Klara Water, after a circular tour of six weeks; and Mr. C. continued about a fortnight there, to arrange the affairs of that settlement.

"He then proceeded on a route entirely new, directly across the continent of Africa, westward, pursuing nearly the course of the Great Orange River; and, on the 13th of September, reached Little Namaqualand, on the western coast, where he had the pleasure of meeting the missionaries, Albrecht, Schmelen, and Ebner, labouring in their usual manner.

"From hence Mr. Campbell despatched Mr. Schmelen towards the mouth of the Great River, distant about ten days' journey, to ascertain, if possible, whether supplies could be obtained by sea from the Cape. Should this be found practicable, it will prove of inestimable advantage to all the settlers on the banks of that great river, and save the great labour and heavy expence of long journeys by land to and from Cape Town.

"Mr. Schmelen was desired, after exploring the country, especially the coast of Great Namaqualand, to penetrate, if possible, into the Damara country, to obtain information concerning its inhabitants, and the regions beyond them, known to Europeans only by name.

"One circumstance, among the many difficulties and deliverances which Mr. Campbell experienced, must not be omitted. In the midst of that desolate wilderness through which he passed, an attack was one night made on his company by a party of wild Boshiesmen, who killed one of the Hottentots, and carried off all their oxen, which were more than one hundred. This left the missionaries in a situation, the peril and horror of which we can scarcely conceive; for had not their oxen been recovered, their total destruction seemed inevitable: In their trouble they called upon God, put themselves into the best posture of defence they could, and sent a party of Hottentots in pursuit of the plunderers: most happily they overtook them; the Boshiesmen fled, and the cattle were brought back before morning.

"After a journey of nine months, replete with dangers, discoveries, and mercies, Mr. C. returned to the Cape, in better health than when he set out; and, on the 7th of May, 1814, he arrived in London, and gave the society a full account of his successful mission."

## CHAPTER XI.

## AFRICAN ISLANDS.

## SECTION I.

## STRAITS OF BABELMANDEL, AND ADJACENT ISLANDS.

**BABELMANDEL** is situated towards the entrance of the Red Sea, in the very middle of the straits, about four miles from the Arabian, and the same distance from the Abyssinian, coasts. Hence it forms two channels, one on each side of it, and, from its situation, might, if properly fortified, command both.

This strait was formerly the only passage through which the commodities of India found their way to Europe; but, since the discovery of the Cape of Good Hope, the trade by the Red Sea is comparatively of little consequence.

This island is a barren sandy spot of earth, not more than five miles in circumference, and contains only a few inhabitants, for whom it just supplies a subsistence.

**DAHLAK** is situated near the coast of Abex, about twenty leagues eastward from the continent, and about the same distance south of Masua. It is the largest and most considerable island on this coast, being near ninety miles in circumference. The air is temperate and salubrious, the land well watered and verdant, and the inhabitants tolerably numerous.

Great numbers of camels, oxen, goats, &c. feed in the pastures; the sea and rivers yield plenty of fish; and the natives are profusely supplied from the continent with honey and grain; but the chief wealth of the place arises from pearl-fishing, as the pearls found here are some of the finest in the universe. Besides pearls, this island produces many emeralds, some of which are of the green colour, in all its different shades, from very dark to extreme pale.

The goats' hair is very fine and long, so that it is manufactured into camblets. Here is a small insect, which feeds on a kind of gum, that distils from a tree which has some similitude to a cherry-tree; and from this insect gum-lac, used in varnishing, &c. is extracted.

Those inhabitants of Dahlak who do not concern themselves in fishing, are, in general, notorious pirates, and plunder all the ships that come in their way. They behave with asperity to all, but particularly to the Turks, when any of them are so unfortunate as to fall into their hands; and, when they return home, they take a peculiar

pleasure in boasting of their piratical exploits to their wives, children, and relations.

The king of Dahlak is sovereign of this and many other islands, and his subjects consist chiefly of Christians of the Abyssinian church.

The people of Dahlak are black and ill-favoured, but strong, robust, daring, and loyal to their sovereign. They are sagacious and crafty, pleasant companions, and admirably skilled in story-telling. Their clothing is a large piece of silk, or cotton, according to their respective ranks, tied round the middle, and hanging down to the feet; but from the middle upwards both sexes go naked. Their language is Arabic, with a mixture of some Ethiopian words.

The capital city, which goes by the same name as the island itself, is situated on a point of land to the westward of it; but it is of no great consideration, as the king resides, the greatest part of the year, at the little island of Masua.

**MASUA** is only half a mile in length, and somewhat less in breadth. It is very flat, and lies near the main land, on the north-west side. It has a good harbour, secure in all weathers, the depth of the water being about eight or nine fathoms, and the ground oozy. The entrance of this port is on the north-east side, towards the middle of the channel, for from the east-north-east point of the island there runs a shoal towards another point; so that ships must take care to keep the middle of the channel, which is very narrow, and consequently dangerous.

The inhabitants resemble those of Dahlak, in their customs and manners. The men are of two classes, those who follow traffic, or the pearl-fishery, and those who live by piracy.

Masua, with all the opposite coast, was formerly subject to the king of Abyssinia; but, within the last century, it was seized by the king of Dahlak, who resides here chiefly for the convenience of carrying on a trade with the continent; from whence he receives abundance of gold and ivory.

**MARATE** is a low barren island, about three leagues from the continent, and sixty-six from Masua, but in compass it does not exceed five miles. On the south-west side, facing the coast, there is a good haven, formed by two very long points, which extend north by west, and south by east, inclosing a spacious harbour, narrow

at the mouth, where there lies a long flat island, with some sand-banks and shoals, so that no sea can get in. This port has two entrances, both very near the points. The channel, on the east side, lies north by west. The depth is three fathoms in the shallowest place, and increases advancing in the port, where, near the shore, it is four or five fathoms, and the bottom is rather muddy.

The people who inhabit this island differ in nothing with respect to customs, manners, &c. from those who reside in Masua and Dahlak.

## SECTION II.

### ZOCOTRA.

This island is situated in ten degrees twelve minutes north latitude, and fifty-three degrees sixteen minutes east longitude, about thirty leagues to the eastward of Cape Guardafui, on the most easterly point of the continent of Africa. It is about eighty miles in length, and fifty-four in breadth, and has two good harbours.

The climate is sultry, owing to the short continuance of the rains, which seldom last more than two or three weeks in the season; but this defect is remedied by heavy dews, occasioned by the lofty mountains, whose tops are generally covered with snow, so high as to condense the clouds, and afterwards dissolve them in a kind of heavy mist or fog, which thoroughly waters the earth. In some parts are rivers, which rise from springs, and are never dry; but other parts are totally destitute of water, except in the rainy season. This island is populous; and the inhabitants are under the government of a prince, or sultan, who was once subject to the Sherifs of Arabia, but is now tributary to the Porte.

The country abounds in cattle and fruit, with which, and some other commodities, the natives trade to Goa, where they are better received than the Arabs, who are not permitted to enter that town without passports. The other productions of the island are aloes, frankincense, dragons' blood, rice, dates, coral, and ambergris.

Of coral there are various kinds, some of which resemble small trees without leaves: and others are in the form of a net. The inside of the branches seems to be of the nature of horn; for it has the same scent when put into the fire; but the bark is of a stony nature, and contains much salt. Coral, properly so called, is of a stony nature, and placed in the animal kingdom, because it produces marine insects. Some of these are red, others white, and others of various colours. The red, of the colour of vermilion, is best, and is supposed to be of the male kind; and that which is palish, of the female. The white coral is the next in value. It is always covered with bark, and is stony, solid, and very hard. even

in the water; though the branches are a little flexible, they soon grow hard in the air. The bark of the coral is a mixture of tartar, and a fluid of a glutinous nature; and though it is a little rough, it admits of a very fine polish. Some think the black coral to be a sea-plant of a different nature. Red coral is particularly esteemed in Arabia, where it is used for making several sorts of articles, such as spoons, heads of canes, knife-handles, and beads.

Besides the natives, there are great numbers of Arabs on this island; the latter of whom call the former by the name of Bedouins. These last are divided into two sorts, namely, the natives of the coast, who intermarry with the Arabs, and are called Half-Bedouins; and those of the interior parts, who religiously adhere to their own customs, and account it a heinous crime to intermarry with foreigners. These last are the true Bedouins, or original inhabitants of the country. They are much fairer than the Indians, and are in general tall and well-proportioned, but in their dispositions they are deceitful, indolent, and cowardly. Their food consists of milk, butter, rice, dates, and the flesh of their cattle; and their common beverage is water.

The other inhabitants of this island are of a low stature, disagreeable complexion, and hideous features; but they are hardy, strong, and active. They feed on fish, flesh, milk, butter, and vegetables. Their common dish is a composition of all these boiled together, with which bread or rice is eaten.

The native Bedouins go almost naked, having nothing more than a small piece of cloth fastened round the waist, and a cap made of goats' skin. The women go bare-headed, and have a short gown or cloak, with a shift made of goats' hair. But the most general dress of these islanders consists of a long cloak, which reaches from the waist to the ankles: it hangs down in a train behind, and is not unbecoming, though extremely inconvenient, on account of the heat of the climate. When they are at work, they gather it up, and fasten it round the waist with a girdle.

These people have several very strange and uncommon customs. They practise polygamy, and divorce their wives at pleasure, either for a certain time, or for ever. A man may even be the father of children, without being obliged to maintain either them or the mother, provided the latter, during her pregnancy, consents that the father shall give away the child, when it sees the light. On these occasions the father kindles a fire before the door of his hut, and then makes proclamation that he will give away the infant of which his wife is on the point of being delivered. After this he fixes upon some particular person for its adopted father, to whom the infant is conveyed immediately after its birth. Here it meets with that tenderness and kindness which are denied it by the un-

natural father, and is ordered to be fed with goats' milk. These children are called *The sons or daughters of smoke*; and it frequently happens that a humane and liberal man has the honour of rearing a dozen children, upon whom he bestows all the affection of a real parent.

Another custom, not less strange and singular than the above, is that of burying their sick before they have breathed their last, esteeming it a duty to put them out of pain as soon as possible. When the father of a family apprehends that his dissolution is near, he assembles his children around him, whether natural or adopted, with his wives, servants, and all his acquaintance, whom he strongly exhorts to a compliance with the following articles of his last will: Never to admit any alteration in the doctrine or customs of their ancestors, never to intermarry with foreigners; never to permit an affront done to them or their predecessors to go unpunished; and, lastly, never to suffer a friend to lie in pain, when they can relieve him by death. Such are the extraordinary requests of the dying man; after which he makes the signal to have the last of them performed upon himself.

Justice is administered by the chief magistrates, who are next in rank to the sultan they are called *hodamos*, and sit at certain times to judge and determine in all causes, political or ecclesiastical, civil or criminal. They hold their office only for a year, during which they preserve the most distinguished power and dignity. There is no appeal from this tribunal, nor can the successors reverse any decree passed before their coming into office.

The punishment for murder is decapitation or impaling the criminal alive. In cases of theft, if the robber escape with his booty, and take sanctuary in a temple, he is protected; but if he be caught by the person robbed before he reaches the temple, he is delivered up to justice, and the punishment for the crime is the loss of his right-hand. More trifling offences are punished by fines, one half of which goes to the sultan, and the other half is equally divided among the magistrates.

With respect to the religion of the inhabitants of this island, the Arabs amongst them are Mahometans, but all the rest are Pagans, and practise the most superstitious rites.

In seasons of great drought they assemble in a solemn manner, and offer up their petitions to the moon. They make a public sacrifice to her towards the beginning of lent, and offer up numbers of goats in honour of her. They enter into their temples whenever the moon rises or sets, and practise several other religious ceremonies, which prove them to be the zealous votaries of this inconstant deity.

An English traveller says, "At the rising and setting of the moon, or at the new and full moon, they make solemn processions round their temples and burying places, strik-

ing against each other two pieces of odoriferous wood, about a yard long, which each man holds in his hands. This ceremony they perform three times in the day, and as often at night; after which, putting a large cauldron, suspended by three chains, over a great fire, they dip into it splinters of wood, with which they light their altars, and the porch of the temple. They then put up their prayers to the moon, that she will enlighten them with her countenance, shed upon them her benign influence, and never permit foreigners to intermix with them.

These particulars, relative to the religion of the inhabitants of this island, are confirmed by Sir Thomas Roe, who, during his stay here, took great pains to preserve, in his journal, a minute account of the manners and customs of the natives. This writer says, that he found the inhabitants of the island to consist of four different sorts of men, viz. of Arabs, whom the king of Caxem had sent to keep the island in subjection to him; of slaves to the prince, who are employed in preparing aloes, and other offices of drudgery; of Bedouins, the primitive inhabitants of the island, who were banished to the mountains till they submitted to the yoke, and agreed to breed up their children in the Mahometan religion; and, lastly, of savages, with long hair, who live naked in the woods, and refuse all society.

### SECTION III.

#### COMORO ISLANDS.

The Comoro Islands derive their name from Comoro, the largest of them. They are five in number; and the other four are distinguished by the names of Mohilla, Angazeja, Hinzuan, or Joanna, and Mayotta. They lie opposite the shore of Zanguebar, and north of Madagascar.

COMORO, the largest, is not frequented by Europeans, as it has no safe harbour, and the natives are averse to commerce with strangers. The reason originated from the cruelties exercised on them by the Portuguese, when they first visited these seas; for they not only robbed them of their property, and committed the most dreadful outrages, but also made them captives, and frequently divested them of every earthly enjoyment, by forcing them on board their ships, and then selling them for slaves. It is, therefore, little to be wondered at, that the descendants of these unhappy people should look with detestation on those who had proved themselves such strangers to humanity.

This island is fertile, and abounds with cattle, sheep, hogs, and fowls of various sorts. It also produces sweet and sour oranges, great and small citrons, cocoa-nuts, bananas, honey, betel, sugar-canes, rice, and ginger.

HINZUAN, or JOANNA, one of the principal of the Comoro Islands, is situated between the north end of

principal of the  
the north end of

Madagascar and the continent of Africa, and is said to possess many natural advantages. The appearance of the island from the bay is thus described by Sir William Jones. "We were at anchor in a bay, and before us was a vast amphitheatre, of which you may form a general notion by picturing in your mind a multitude of hills, infinitely varied in size and figure, and then supposing them to be thrown together, with a kind of artless symmetry, in all imaginable positions. The back ground was a series of mountains, one of which is pointed, near half a mile perpendicularly high from the level of the sea, and little more than three miles from the shore; all of them richly clothed with wood, chiefly fruit-trees, of an exquisite verdure. I had seen many mountains of a stupendous height in Wales and Switzerland; but never saw one before, round whose bosom the clouds were almost continually rolling, while its green summit rose flourishing above them, and received from them an additional brightness.

"Next to this distant range of hills was another tier, part of which appeared charmingly verdant, and part rather barren; but the contrast of colours transformed even this nakedness into beauty. Nearer still were innumerable mountains, or rather cliffs, which brought down their verdure and fertility quite to the beach; so that every shade of green, the sweetest of colours, was displayed at one view, by land and by water. But nothing conduced more to the variety of this charming prospect than the many rows of palm-trees, especially the tall and graceful arcacs, on the shores, in the valleys, and on the ridges of hills, where one might almost suppose them to have been planted regularly by design. A more beautiful appearance can scarcely be conceived than such a number of elegant palms in such a situation, with luxuriant tops, like verdant plumes, placed at just intervals, and showing between them part of the remoter landscape, while they left the rest to be supplied by the beholder's imagination. Neither the territory of Nice, with its olives, date-trees, and cy-presses, nor the isles of Hieres, with their delightful orange-groves, appeared so charming to me as the view from the road of Hinzuân."

To these remarks we shall append the following account of an excursion by two English travellers, the second day after they landed on the island :

"As we set out early in the morning, we advanced about five miles into the country before the sun began to be troublesome; and this was no small stretch, considering the mountainous tract we had to go. We had fowling-pieces with us, and a view of excellent sport in shooting, could we have reached the places where the game lay; but we could not gain the summit of the hills, though we endeavoured to scramble up them on our hands and knees. We were obliged, therefore, to rest satisfied with what small birds presented themselves in the valleys, and

on the hills that were passable. We made our breakfast on pine-apples and the milk of cocoa-nuts. About noon, coming to a beautiful piece of water, we seated ourselves in the shade, by the banks of it, to make a second meal, as well as to enjoy the tinkling of several little springs and natural cascades, that fell from the rocks, and, according to their distance, seemed to sound a gradation of notes, so as to form a kind of agreeable soothing water-music.

“The orange and lime-trees, which stood in great numbers about that spot of ground, bending under the weight of their fruit, diffused a most fragrant odour. There were also pine-apples, which grew wild, of eleven and thirteen inches in circumference, of a much richer flavour than those we afterwards met with in India. Our guides pointed out to us a number of guava, and especially plum-trees, the size of whose fruit is about that of a damascene, and leaves a pleasing flavour on the palate for some minutes after it is eaten. All these growing promiscuously, and without the least arrangement of order, combined with the falls of water, and the stupendous height of the surrounding hills, covered with trees and verdure, and, in their various breaks and projections, exhibiting the boldest strokes of nature, altogether composed what might, without exaggeration, be called a terrestrial paradise, compared to which, the finest gardens in Europe, with their statues, artificial cascades, compartments, and all the refinements of human invention, would appear poor indeed. Here it was impossible for art to add any thing but what would rather spoil than adorn the scenery. It was not without regret that we quitted so charming a spot, after having feasted our eyes with the beauties of it; to which it may be mentioned, as no inconsiderable addition, that there was no fear of wild beasts or venomous creatures, to interrupt our pleasures.”

In the interior of this island is a sacred lake, half a mile in circumference. The adjacent hills, covered with lofty trees, and the unfrequented solitude of the place, seem more calculated to inspire religious awe in those who visit this sequestered spot, than any sanctity in a flock of wild ducks inhabiting it, which are deified and worshipped by the original natives, who occasionally offer sacrifices to them, and consult them as their oracles upon all important occasions. Being extremely averse to conduct strangers to the lake, they always stipulate that all fire-arms shall be left at the distance of five miles. The worship paid to the birds ensures their safety and tranquillity, and renders them so perfectly tame, that they fearlessly approach any one who goes to see them.

The chief cattle of this island are oxen, sheep, and hogs. The oxen are, in general, of a middling size, and, like those in the East-Indies, are remarkable for having a large fleshy excrescence between their neck and back.

Their flesh is very sweet, and the excrescence, when kept for some time in pickle, tastes like marrow, and is generally preferred either to tongue or udder.

In the woods are great numbers of monkeys, of different kinds and sizes, and an animal called mongooz. This animal is about the size of a small cat, and has a head shaped like a fox, with black eyes, and orange-coloured circles round the pupil. The hair about the eyes is black, and hangs downwards in a point towards the nose, which is also black; but there is a space between the eyes and nose entirely white, which is continued to the sides of the face, as far as the ears. The upper parts of the head, neck, back, tail, and limbs, are of a dark-brown ash-colour, and the hair is somewhat woolly; the under side of the body is white, and the paws are like human hands, with flat nails, except a sharp-pointed claw on the second toe of the hinder feet. The tail is long, and the hair thick and soft. Its actions are like those of a monkey. It feeds on fruits, herbs, and almost every thing else, not excepting even live fish. There are several sorts of these animals, which differ only in colour; and they are all very harmless and inoffensive.

The maucauco is an animal about the size of a cat, with a head nearly resembling that of a fox. It has a lively piercing eye, its coat is woolly, and generally of a mouse-colour, and its tail, which is about three feet long, is variegated with circles of black, within an inch of each other, quite to the end. When taken young, it soon grows tame. The country abounds with large squirrels, but they are neither of good shape or colour. They have fowls and ducks here, and great variety of game; but the inhabitants are so inexperienced in the use both of nets and guns, that very few of them are caught.

The sea here abounds with several sorts of excellent fish, which the natives are very expert in catching, particularly thornbacks, mullets, and a flat fish, greatly resembling the turbot. But the most remarkable species is the parrot-fish, so called from its mouth, which is made like the bill of a parrot. It is about a foot long, and the colour is greenish, variegated near the head with yellow. The fins are blue, as are also the eyes, which are very sprightly, and have a yellow iris: the scales are very large, and there are two rows of strong teeth in the mouth, with which it breaks open muscles and oysters. The flesh of this fish is very firm, and well-tasted.

The town of Joanna is the royal residence, and contains about two hundred houses, which are enclosed either with high stone-walls, or palings made with a kind of reed; and the streets are little narrow alleys, extremely intricate, and forming a perfect labyrinth. The better kind of houses, which are built of stone, within a courtyard, have a portico to shield them from the sun, and one long lofty room where they receive guests, the other apart-

ments being sacred to the women. The sides of their rooms are covered with a number of small mirrors, bits of china-ware, and other ornaments, that they procure from ships which come here to refresh: the most superb of them are furnished with cane-sofas, covered with chintz and satin mattresses.

The original natives of Hinzuani occupy the hilly parts of the country, and are frequently at war with the Arabian interlopers, who, being greatly superior in point of numbers, have established themselves on the sea-coast by conquest. Though this is not the largest of the Comora Islands, it claims sovereignty over, and exacts tribute from, all the others. Here also are a regular form of government, and a public exercise of the Mahometan religion, both being introduced by the Arabians.

The colour of the two races of inhabitants is very different: the Arabs have not so deep a tinge as the others, being of a copper complexion, with regular features, and a tolerably animated countenance. They consider a black streak under the eye as particularly ornamental; and this they make every day with a painting-brush. The custom of chewing betel-nut prevails greatly here, as in most parts of the African continent. No one is without a purse or bag of betel; and it is looked upon as an indispensable piece of civility to offer it to a friend, on meeting him or taking leave.

Their religion licenses a plurality of wives and concubines; and of these they are so jealous, that they totally exclude them from the sight of all other men: female strangers, however, are admitted into the harem; and some English women, whose curiosity has led them thither, make favourable reports of their beauty, and the richness of their apparel, which is displayed in a profusion of ornaments of gold, silver, and beads, in form of necklaces, bracelets, and ear-rings.

The men seem not to look with an eye of indifference on our fair countrywomen, notwithstanding they are of so different a complexion. One of the first rank among them, being deeply enamoured of an English young lady, wished to make a purchase of her at the price of five thousand dollars; but, on being informed that the lady would fetch at least twenty times that sum in India, he lamented that her value was so much above what he could afford to give.

Most of these people speak a little English: they profess a particular regard for our nation: repeat that "Joanna-man and Englishman all brothers;" and never fail to ask "How king George do?" They are very temperate and abstemious, wine being forbidden them by the laws of Mahomet. They attend their mosques three or four times every day; and, in prayer, they prostrate themselves on the ground, frequently kissing it, and expressing very fervent devotion. The superstitious adoration paid by

some of the we have already mentioned, is held of the island practice of of blood. In well-disposed there are among some vicious the lower class very exemplar delinquent. like the inhabit indolent, and with which na

some of the original inhabitants to a flock of ducks, which we have already mentioned in a preceding part of this section, is held in the utmost detestation by the Arabian part of the islanders; but it seems impossible to abolish the practice of it without occasioning a prodigious effusion of blood. In general, they appear to be a courteous and well-disposed people, and very honest in their dealings; there are amongst them, however, as in all other nations, some viciously inclined: and theft is much practised by the lower class, notwithstanding the punishment of it is very exemplary, being amputation of both the hands of the delinquent. It must also be observed that these people, like the inhabitants of most tropical countries, are very indolent, and neglect to improve the richness of that soil with which nature has blessed them.

Mr. Grose, who was a considerable time on this island, has furnished us with a very curious account of the means by which the sovereignty of it was first acquired.

"The grandfather of the present king," says our author, "was an Arab, or Moorish trader to Mosambique, where, in a quarrel with a Portuguese fidalgo, or gentleman, with whom he was dealing for slaves on that coast, he had the misfortune to kill his adversary, and was obliged instantly to fly, and put to sea in the first boat he could seize on the shore; when the first land he made was Jo-anna, where he took refuge. Here, meeting with an hospitable reception, he remained some years in obscurity, till an Arabian vessel, being driven in there by stress of weather, he made himself known to his countrymen, for whom he procured all the relief the place afforded.

"In the mean time, he had so perfectly acquainted himself with the language and manners of the inhabitants, and was so captivated with the fertility and pleasantness of the island, that he not only relinquished every thought of returning to his own country, but laid a scheme to obtain for himself the sovereignty of this, in which he was greatly countenanced and assisted by the Arabs, his countrymen, who came into his views, from the advantage they expected to receive from his success.

"He proceeded not on a plan of violence, but of insinuation, in making himself necessary to the natives, whom he instructed in the use of arms, before unknown to them, especially in the assagay, or lance, which those of any consideration among them now handle with dexterity. This, with other methods of war, which he taught them, entirely new to these simple people, proving of singular service to them against the inhabitants of the neighbouring islands, especially of Mohilla, with whom they had constant bickerings, sometimes invading, and sometimes invaded, acquired him such consideration and authority, that he soon availed himself thereof, and procured himself to be elected their chief, and was invested with regal power. Yet this was not obtained but by

43. VOL. I.

degrees, and by great art; themselves, too, being divided among one another. As soon as he had carried his point, he made them repent of their credulity and confidence; for, not only strengthening himself, by calling in some of his countrymen, with their families, but choosing for his guards the most bold and determined of the natives, he was soon in a condition to establish an arbitrary government. Such as endeavoured to oppose him in his pretensions and innovations, he forced from their families, and sold them to the Arabs for slaves; who, on this alteration, increased their resort there for trade, which they still continue. In short, he succeeded so entirely, as to overcome all opposition, and to bequeath the peaceable sovereignty to his son, who was about forty-three years of age when his father died, and who had no further contention with his subjects, until also dying, a few years ago, he left two sons, of whom the eldest was king of the island when I was there."

The king seldom misses going on board the European vessels, where the captains regale him in the best manner, and compliment him, both on his arrival and departure, with a discharge of five guns. Every captain is obliged to have a licence from the king before he can trade with the natives; but this licence is easily acquired, nothing more being wanting than to compliment him with a few trifling articles of European manufacture.

As soon as a ship anchors in the road, it is immediately surrounded by a number of canoes, hurrying on board with refreshments of all sorts, the produce of the island; and it is diverting enough to observe the confusion and strife among the rowers, who shall get first to the ship to dispose of their commodities. They are sometimes over-set, when the sea is high, but without any danger to their persons, as they are excellent swimmers, and lose only their little cargoes. Their canoes are most of them balanced on each side with outlanders, composed of two poles each, with one across, to prevent their over-setting. They use paddles, instead of oars, and make no distinction of head or stern. Their larger boats, called panguays, are raised some feet from the sides with reeds and branches of trees, well bound together with a small cord, and afterwards made water-proof with a kind of bitumen, or resinous substance. The mast carries a sail or two, which is made either of cocoa-leaves or steer-grass, matted together; and in these boats they will venture out to sea for trips of three or four weeks, and sometimes longer.

## SECTION II.

### MADAGASCAR.

*Extent, Climate, Soil, &c.]* Madagascar is the largest of all the African Islands; being about eight hundred

miles in length, and, in some parts, above two hundred in breadth. It is every where watered by rivers and rivulets, which rise from a long chain of mountains that runs through its whole extent from east to west. These mountains are said to contain a variety of minerals and fossils. They are also covered with precipices, the summits of which are crowned with monstrous trees, that seem coeval with the world, and interspersed with great cascades, the approach to which is generally inaccessible. To these views, so sublimely picturesque, rural scenes succeed; little hills, gentle rising grounds, and extensive plains, the vegetation of which is never repressed by the intemperance or the vicissitudes of the seasons. The climate is uncommonly fine, and the soil so extremely fertile, that lands sown in the most careless manner produce a hundred fold.

In the vicinity of Amboule, a large town of Madagascar, there is a fountain of hot water, within twenty feet of a small river, whose sand is almost burning. The water of the fountain is said to boil an egg hard in two hours; and the inhabitants affirm it to be a sovereign remedy against the gout.

*Minerals.*] Many of the most valuable minerals are found here, among which are beds of pure rock-crystal, often used for optical purposes, and by some called Brazil pebbles, as also topazes, sapphires, emeralds, and spotted jaspers, commonly termed blood-stones.

*Vegetables.*] Of esculent plants, there are rice, bananas, yams, several kinds of kidney-beans, gourds, water-melons, and cocoa-nuts. The fruits are the pine-apple, tamarinds, oranges, and pomegranates. The spices are pepper, ginger, turmeric, cinnamon, &c. The Indian fig grows here, as does the ebony, the bamboo, the cotton, and indigo.

The fruit rabinsara, which abounds in the woods of Madagascar, is very valuable; and, according to the account of M. de Pagés, it unites in itself the qualities of cloves, cinnamon, and nutmeg, and, when gathered a little before it is ripe, is capable of supplying the place of those spices. The sugar-canes of this island are much larger and finer than any in the West-Indies, being as thick as a man's wrist, and so full of juice, that a single foot of them will weigh two pounds, and one of them will support a traveller for two or three days. Here are also abundance of tamarinds, and such prodigious quantities of limes and oranges, that very large casks may be filled with their juices at a trifling expence.

*Animals.*] The oxen of Madagascar are remarkably large and fat, and have invariably a protuberance of fat between the shoulders, weighing about twenty pounds. Their flesh is highly esteemed by Europeans trading to India, and ships are frequently sent out on purpose to kill and salt them in the island.

The sheep of this island differ but little from the goats, being equally hairy; only their heads are somewhat larger, their necks resemble that of a calf, and their tails are so extremely large as to weigh nine or ten pounds.

The bats of Madagascar are of an extraordinary size, and prove very troublesome to strangers. This species, called the vampire, has large canine teeth, a sharp black nose, large naked ears, a pointed tongue, terminated by sharp aculeated papillæ, strong compressed talons, and no tail. The head is of a dark ferruginous colour; on the neck, shoulders, and belly, of a lighter red; on the back and the membranes of the wings, dusky.

These odious creatures fly in flocks, and sometimes obscure the air with their prodigious numbers; they begin their flight from one island to another immediately after sun-set, and return in clouds from the first dawn of light till sun-rise. They commonly feed on fruits; and are so fond of the juice of the palm-tree, that they will intoxicate themselves with it till they fall senseless on the ground.

Vast quantities of locusts rise here from the low lands, in thick clouds, which frequently extend to an incredible length and breadth. The natives eat these insects, and even prefer them to their finest fish: their method of cooking them is, to strip off their legs and wings, and fry them in oil. Crocodiles, chameleons, &c., may also be reckoned among the most numerous animals of Madagascar.

*Towns, &c.*] The French settlement of Fort Dauphin is situated in the south-east extremity of the island. Almost all the towns and villages are built upon eminences, and surrounded by two rows of strong palisades, within which there is a parapet of earth, four feet in height, and sometimes there is likewise a ditch, ten feet in breadth, and six feet in depth. Their household furniture consists only of rush mats, which are either of a yellow or red colour. The floors on which they lie are covered with these mats, without bed, bolster, quilt, or any sort of covering, and the pillow is only a log of wood. Their kitchen-furniture consists of earthen pots, called villangues, wooden dishes and spoons, dried gourds, or calabashes, to hold water, knives, gridirons, mortars to pound rice, troughs, and winnowing-fans, with large vessels for honey-wine. The leaves of dates, twelve feet long, and four broad, are used instead of napkins, and small portions of them serve as plates. These are spread upon mats on the ground, for neither tables nor chairs are used.

*Customs, Manners, Religion, and Government.*] The natives of Madagascar, called Madecasses, are in person above the middle size of Europeans. The colour of the skin varies considerably in different tribes: among some it is of a deep black, among others tawney: some of the natives are of a copper-colour; but the complexion of

by far the greater part of the black have worn in Africa; but they have hair equal to their features, dispositions, and the attitude of genius in the use and without the principle and system.

They wear the same kind of an umbrella and the beard.

The women of the middle size, and called ugly, handsome or plain, apron round the waist, which barely covers the ornaments about the body, divided into a middle and a lower part, according to the fashion.

The men are inclined to look on the women in the fields, or in the cassava, or in the commerce.

Their common fish: they consume their usual bread of sugar-cane, fermented.

Though the religion of religious worship, as the patron of after death, and of good actions, really performed day of their age, the day of their much joy and satisfaction.

They believe this article of the saret, or magic, to control the machine of thousands of Indians, indeed, of his enchantments, who always in every country his fraud and in Amulets of a

e complexion of

by far the greatest number is olive. All those who are black have woolly hair, like the negroes on the coast of Africa; but those who resemble Indians and Mulattoes have hair equally straight with that of Europeans, and their features are very regular and agreeable. In their dispositions they are lively and obliging; but wholly destitute of genius; vain, whimsical, and interested. Prompt in the use and application of their bodily faculties; but without the powers of ratiocination, or any thing like principle and system.

They wear an apron at their girdle, and something of the same kind on their shoulders, with a bonnet in form of an umbrella. Their hair is combed into small tresses, and the beard is suffered to grow only on the chin.

The women have expressive faces, and are generally of the middle size, or rather under it; and though few can be called ugly, scarcely any can be ranked among the handsome or pretty part of the sex. They tie a long apron round their waist, with a kind of under-waistcoat, which barely covers the breasts. They are fond of silver ornaments about the neck and arms. Their hair is divided into a multitude of little tresses, variously disposed, according to the particular fancy or taste of the individual.

The men are little addicted to agriculture, and are more inclined to look after their cattle, which roam in the woods. On the women is chiefly devolved the care of cultivating the fields, of raising rice, corn, and fruits, particularly the cassava, or Madagascar bread-tree.

Their common food consists of rice, bananas, and dried fish: they consume very little fresh meat, or fresh fish. Their usual beverage is rice-water, or the juice of the sugar-cane, fermented with mustard and pimento.

Though the natives of this island have no regular form of religious worship, yet they adore one Supreme Being, as the patron of justice and goodness, who will judge men after death, and reward or punish them for their demerits or good actions. The initiatory rite of the Jews is generally performed upon males between the seventh and eighth day of their age; but sometimes at a later period; and the day of circumcision is solemnized in all families with much joy and festivity.

They believe also in a devil, or evil being; and upon this article of their creed is founded the craft of the pansaret, or magician, who, being supposed to defeat or control the machinations of the invisible enemy, practises a thousand tricks on the credulity of the multitude. Few Indians, indeed, of good sense, give credit to the virtue of his enchantments; but the more ignorant and superstitious, who always compose the great mass of the people in every country, suffer themselves to be sadly duped by his fraud and imposition.

Amulets of a species of wood, suspended round the

neck, or preserved in a little bag, are supposed to secure the possessor against wounds, or the disasters of war. A shrimp, or toad, applied with words of magical power to the head of a patient, is expected to restore him to his wonted health. Exposing the sick in a hut of a certain elevation, with an eastern aspect, from which is let fly an assemblage of party-coloured threads, is deemed a sovereign remedy in the most desperate cases. A cure is sometimes expected from painting the posts of the patient's house with different colours. Perfumes mix in abundance in all the arts and enchantments of the magician; and though the greatest part of this, no doubt, is imposture, the effects of effluvia are not unknown to the physician or the philosopher.

Madagascar presents a traveller with many other absurd observances, of which it may be difficult to trace the origin; but which, for the most part, seem to be the barbarous vestiges of religious notions, indistinctly transmitted to the people from their Asiatic neighbours.

They are accustomed to hunt the whale all along the coast; and, having been fortunate enough to strike him with the harpoon, they wait till his strength is nearly exhausted, when they haul him towards the shore. The women, watching their success, having by this time assembled on the beach, begin songs of praise in honour of him who had the merit of giving the first wound. The singers having withdrawn, the whale is dragged as near as possible to land, and surrounded by all the principal men of the village, when the public orator advances, and having pronounced a long oration on the pre-eminence and excellent qualities of the fish, it is cut up, and affords an immediate repast to the assembly.

All matters of dispute receive a formal discussion in the palaver, or council of the tribe. Here, too, all public business is solemnly and deliberately discussed; and much time is taken in weighing the arguments of different speakers. With all this affectation of gravity, however, the inhabitants of Madagascar have a weak intellect, and are far from being qualified, by a sound understanding, to avail themselves of maxims drawn from experience, in considering the contingencies of futurity.

Besides, as the country is divided into many small and independent states, the interest of any individual community becomes very much involved, inasmuch that it is difficult to determine what line of conduct is most eligible. But their chief misfortune, as politicians and men of business, originates in the versatility of their own minds, which can never be fixed on one precise object.

Property in this island consists in cattle, grain, and slaves. Every person who has had the misfortune to be made a prisoner of war, is reduced to slavery, and from that moment is regarded by his own kindred as an object of contempt.

Their arms consist of a shield and a kind of lance, which they have the art of throwing with peculiar address. They are also tolerably well provided with muskets, which they have purchased of the French, and in the use of which they are not unskilful. A few of the petty princes have procured swivel-guns from the same quarter; and, it is said that, one of them is in a condition to bring cannon into the field.

On the eve of war, the women, children, and cattle, retreat to the woods, and remain in concealment till the issue of the campaign. The village is then occupied only by the men, who, previously to an act of hostility, sacrifice an ox. An Indian, distinguished for his eloquence, then rises and makes a long harangue on the arrogance and injustice of the enemy; his countrymen meanwhile dipping their lances in the blood of the victim. The carcase is then cut in pieces with the skin, and distributed among the by-standers, who instantly devour each man his portion with the most horrid voracity; a ceremony sufficiently descriptive of those ferocious sentiments with which they proceed to vindicate their rights, or avenge their wrongs. Their operations in the field are of a very desultory nature, consisting chiefly in harassing the enemy, or in attempting to surprise him when disadvantageously posted, or in the night.

If they have reason to imagine that an enemy is off his guard, or little prepared for the defence of his fort, they form a blockade round it, and endeavour, by a coup-de-main, to make the chief a prisoner of war. Should they have the good fortune to succeed, they plunder his village, drive off his cattle, and enslave his vassals; but seldom or never come to any thing like a regular engagement.

These people are susceptible of very violent enmities; and sometimes execute on their devoted subjects the most deliberate cruelties. M. de Pagès saw a chief dressed in a necklace, formed of the teeth of a rival, whom he had slain in battle. A man of the first quality, having captured a daughter and a cousin of an obnoxious neighbour, ordered them into his presence, and, in cold blood, with a single stroke of his lance, killed the former, and dismissed her companion to carry home the dismal news to the parent.

The customary use of presents is the same here as in India. It is the business of the inferior to make the first advance, as well as the first present; but he is sure of a return. This custom of giving and receiving presents, forms the bond of union between strangers and the oriental nations; and where the protection of a chief is not only necessary to security, but subsistence, we ought not too hastily to condemn a practice different from our own. Here presents are publicly given; with us the same effect is often produced by the less honourable means of private gratuities and solicitations.

The natives of Madagascar indulge in all the offices of hospitality; a virtue which is rather the result of a natural impulse of the heart, than the practice of any fixed and defined precept, such as founds the exercise of it in the nations of Asia. When some travellers tell us, however, that in Madagascar the offices of hospitality are carried to such a pitch of extravagance, as to make it customary for parents to prostitute their children to the embraces of strangers, they speak either from ignorance, or from a desire of exciting wonder in their readers. From a closer inspection of their manners, it will be found, that the little regard shown to chastity among that people may be resolved into a covetous principle, and a long acquaintance with the propensities of dissolute men.

Besides the article of presents, the chief, by means of his daughters, who act as spies on the sentiments and conduct of the paramour, obtains such intelligence as is sometimes conducive to his safety and independence. Thus the young ladies of Madagascar, habituated to intrigue, prompted by the political and mercenary views of their parents, and captivated by the charm of some new personal ornament, are easily won by the vows of their admirers.

In the language of this island, which is by no means harsh or disagreeable, M. de Pagès observed some of the same inflections of voice which occur in that of the Philippine Isles. It seems to be a compound of different dialects, and contains many words borrowed from the Arabic and Portuguese.

The province of Anossi, in Madagascar, is inhabited by three different sorts of whites, and four classes of negroes. The whites are distinguished by the names of Rohandrians, Anacandrians, and Ondzatsi; and the former of these claim a pre-eminence over all the others; for when they proceed to the election of a sovereign, he is always chosen from the Rohandrian race, and the members of his tribe hold the rank of princes, and are honoured as such by all the rest of his subjects. The Anacandrians are accounted the bastards of the princes, as having descended from Rohandrian men and inferior white or black women. These are likewise called by the name of *Ontem-pasemaca*, or "people from the sandy parts of Mecca," from whence, they say, came the Rohandrians. The Ondzatsi, or lowest class of whites, are descended from the illegitimate sons of the Anacandrians. These are all fishermen, and are allowed to kill no land-animal, except a chicken.

The four classes of negroes are named Voadziri, Lavohits, Ontsoa, and Andeves. The Voadziri, the richest and most powerful class, are masters of several villages, and descended from the original lords of the country. They enjoy the privilege of killing beasts, when at a distance from the whites, and no Rohandrian or Anacandrian

in the village. The Lohavohits are descendants from the Voadziri, and also lords; but with this difference, that the one commands a whole district, and the jurisdiction of the others extends only to their own family and village. They are also permitted to kill those beasts they intend to eat, when at a distance from the whites. The Ontsoa are next to the Lohavohits, and are their near relations; and the Andeves are the lowest of all, being originally slaves by father and mother.

The Voadziri, Lohavohits, and Ontsoa, enjoy the privilege of submitting themselves, on the death of their sovereign, to any chief they please; but, by the present which the new lord makes on this occasion, he becomes the heir to all their possessions. Hence the lower classes, both of whites and blacks, are generally under the greatest anguish of mind when death approaches, knowing that their lords will not fail to deprive their children of every thing they possess. The Andeves have no choice in the election of a ruler; but in times of famine their chiefs are obliged to supply them with necessities, or, in failure thereof, the people may throw off their allegiance.

Of the government of the island now under consideration we have the following account, in the second volume of Count Benyowsky's Memoirs:—"The Madagascar people have always acknowledged the line of Ramini as that to which the right of *Ampanasacabe*, or sovereign, belongs. They have considered this line as extinct since the death of Dian Ramiri Larizon, which happened many years ago, and whose body was buried upon a mountain, out of which flows the river Manangourou; but, having acknowledged the heir of this line on the female side, they re-established the title in 1776. The right of the Ampanasacabe consists in nominating the Rohandrians to assist in the cabars, at which all those who are cited are bound to appear, and the judgment of the sovereign in his cabar is decisive. Another prerogative is, that each Rohandrian is obliged to leave him, by will, a certain proportion of his property, which the successors usually purchase by a small tribute. Thirdly, the Ampanasacabe is entitled to exact from each Rohandrian one-tenth of the produce of his land, together with a certain number of slaves and horned cattle."

At the time of our author's visit to Madagascar, it appeared that there were thirty-eight Rohandrians actually reigning, and two hundred and eighty-seven Voadziri. "These orders," continues he, "preserve a regular gradation, of which it would be extremely difficult to give a detailed account. They live in the manner of the ancient patriarchs. Every father of a family is priest and judge in his own house, though he depends on the Lohavohit, who superintends his conduct: this last is also answerable to his Voadziri, and the Voadziri to the Rohandrian."

M. Roehon, from a dissertation of M. Commerson

43. VOL. I.

has given the following account of a nation of dwarfs, called Kimos, who inhabit the interior parts of this island:—

"The distinguishing characteristics of these small people are, that they are whiter, or at least paler, in colour than all the negroes hitherto known; that their arms are so long, that they can stretch their hands below their knees without stooping; and that the women have scarcely any breasts, except when they suckle; and even then, we are assured, the greater part of them are obliged to make use of cows' milk, in order to nourish their young. With regard to intellectual faculties, these Kimos are not inferior to the other inhabitants of Madagascar, who are known to be very lively and ingenious, though they abandon themselves to the utmost indolence; but, we are told that, the Kimos, as they are much more active, are also much more warlike; so that their courage being, if we may use the expression, in the double ratio of their stature, they have never yet been overcome by their neighbours, who have often made attempts for that purpose. Though attacked with superior strength and weapons, (for they are not acquainted with the use of gunpowder and fire-arms, like their enemies,) they have always fought with courage, and retained liberty amidst their rocks, which, as they are extremely difficult of access, certainly contribute very much to their safety. They live there upon rice, various kinds of fruits, roots, and vegetables; and rear a great number of oxen and sheep, which form also a part of their subsistence. They hold no communication with the different casts by whom they are surrounded, either for the sake of commerce, or on any account whatever, as they procure all their necessities from the lands which they possess. As the object of all the petty wars between them and the other inhabitants of the island is to carry away on either side a few cattle or slaves, the diminutive size of the Kimos saves them from the latter injury. With regard to the former, they are so fond of peace, that they resolve to endure it to a certain degree; that is to say, till they see from the tops of their mountains a formidable body advancing, with every hostile preparation, in the plains below. They then carry the superfluity of their flocks to the entrance of the defiles, where they leave them, and, as they say themselves, make a voluntary sacrifice of them to the indigence of their elder brethren; but at the same time threaten, in the severest terms, to attack them without mercy, should they endeavour to penetrate farther into their territories: a proof that it is neither from weakness nor cowardice that they purchase tranquillity by presents. Their weapons are assagays and darts, which they use with the utmost dexterity. It is pretended, if they could, according to their ardent wishes, hold any intercourse with Europeans, and procure from them fire-arms and ammunition, they would act on the offensive, as well as the defensive, against their neigh-

hours, who would then, perhaps, think themselves very happy to preserve peace.

"At the distance of two or three days' journey from Fort Dauphin, the inhabitants of that part of the country shew a number of small barrows, or earthen hillocks, in the form of graves, which, as is said, owe their origin to a great massacre of the Kimos, who were defeated in the field by their ancestors. However this may be, a tradition generally believed in that district, as well as in the whole island of Madagascar, of the actual existence of the Kimos, leaves us no room to doubt, that a part, at least, of what we are told respecting this people, is true. It is astonishing, that every thing which we know of this nation is collected from their neighbours; that no one has yet made observations on the spot where they reside; and that neither the governor of the Isles of France and Bourbon, nor the commanders at the different settlements which the French possessed on the coast of Madagascar, ever attempted to penetrate into the interior parts of the country, with a view of adding this discovery to many others, which they might have made at the same time.

"To return to the Kimos, I can declare, as being an eyewitness, that, in the voyage which I made to Fort Dauphin, about the end of the year 1770, the Count de Modave, the last governor, who had already communicated to me part of his observations, at length afforded me the satisfaction of seeing among his slaves a Kimos woman, aged about thirty, and three feet seven inches in height. Her complexion was, indeed, the fairest I had seen among the inhabitants of the island; and I remarked that she was well-limbed, though so low of stature, and far from being ill-proportioned; that her arms were exceedingly long, and could reach, without bending her body, as far as the knee; that her hair was short and woolly; that her features, which were agreeable, approached nearer to those of an European than to an inhabitant of Madagascar; and that she had naturally a pleasant look, and was good-humoured, sensible, and obliging, as far as could be judged from her behaviour. With regard to breasts, I saw no appearance of them, except the nipples: but this single observation is not at all sufficient to establish a variation from the common laws of nature.

"A little before our departure from Madagascar, a desire of recovering her liberty, as much as a dread of being carried away from her native country, induced this little slave to make her escape into the woods."

#### SECTION V.

#### MAURITIUS, OR THE ISLE OF FRANCE.

*Situation, Extent, &c.*] This island is situated in eighteen degrees thirty minutes of south latitude, and fifty-six degrees eight minutes of east longitude, and is about one

hundred and fifty miles in circumference. The form is oval, and from many of the mountains torrents of water rush down with great impetuosity, and form various rapid rivers and rivulets, which are foul near where they fall, particularly in the rainy season, but grow clearer as they turn farther from the mountains, and are perfectly transparent before they disembogue themselves into the sea. Mauritius is watered by above sixty rivulets, some of which deserve the name of rivers, but others do not contain any water in the dry season. The whole have their sources principally in the mountains.

*Soil.*] The soil is almost invariably of a reddish colour, and mixed with veins of iron, which are frequently found near the surface in pieces about the size of a pea. In some parts, the ground resembles pipe-clay, and, to make trenches in it, they cut it with axes. There is no real sand in the soil; but the ground is every where rocky, except where artificial means have been used to make it otherwise.

*Chief Towns.*] This island contains two ports, the principal of which is to the south-east, where the Dutch settlement formerly was; the remains of the building belonging to which are still seen. This port may be entered with ease before the wind; but it is difficult to get out of it, as the gales generally blow to the south-east. The other port, named Port Louis, is situated to the north-west, and is smaller than the former; but the town belonging to it is deemed the capital of the island, though it is situated in a most disagreeable spot. This town, denominated the Camp, is built at the bottom of the port, and towards the opening of the valley. The valley is encircled by a chain of mountains, whose summits are rocky, without trees or bushes, but covered with a dingy herb.

The town itself is built with tolerable regularity; the houses are of wood, and only one story high: they stand separate from each other, and are all surrounded by palisades. The streets are not paved or planted with trees, nor are there any fortifications, except towards the sea, where the place is defended by the fort called Fort Blanc, and a battery on the little island of Tormellieres.

*Vegetables.*] On the Island of Mauritius is a turf, which grows in beds near the sea-shore: it is very thick and elastic, and its leaf is small and sharp-pointed. The cattle will not touch this herb, but browse upon a kind of dogs' grass, which grows in many parts, and jets out little hard branches from the joints. The best herb is one that grows on the windward side of the island: it has large blades, or rather leaves, and is green and tender all the year. Here are a prickly sort of asparagus; a mallow, with small leaves; a thistle, with yellow flowers, which yields seeds that are poisonous; a kind of sweet-scented lily, and sweet basil, which is of a healing quality.

The plants called raquettes, which bear yellow flowers,

are used, on the hedges. The able at a distance are very nauseous very bears a nut, the in many disorders kind of potatoes latter serves for cially, and like

are used, on account of their sharp prickles, in making hedges. The velantier is a plant whose odour is agreeable at a distance, less so as approached, and perfectly nauseous very near. There is a kind of bramble that bears a nut, the kernel of which is bitter, but efficacious in many disorders of the body. Balm-shrubs, and a bastard kind of potatoe, are common, as is pannier-grass, which latter serves for physic and clothing; for it is used medicinally, and likewise to make thread.

The Europeans seem to have been particularly attentive to the improvement of the vegetable system in this island, and that in all its variety. By means of culture, it produces, in great abundance, the different articles which serve either to please the eye, or to gratify the palate.

*Animals.*] The only quadrupeds natural to this island are monkeys and rats. The latter are very destructive to the corn and fruit. As the Europeans have transplanted a variety of articles in the vegetable system into this island, so have they, by importation, propagated numbers of useful animals, among which are horses, oxen, sheep, and hogs.

The birds called corbeaux are deemed the best game on this island, but they are very difficult to catch. There are parrots, paroquets, two sorts of tropic birds, pigeons, and blackbirds, which are much admired by the natives. They have various kinds of poultry; but the most common are ducks and fowls, the former of which were brought from Manilla, and the latter from Europe. The wild fowl are pintadoes, Chinese pheasants, pigeons, and three sorts of partridges.

The most generally esteemed fish for eating here is a kind of turbot, called the water-pullet, the fat of which is green, and exceedingly delicious. The hog-fish has a head which greatly resembles a pike; and upon its back are seven points, as large as its body, united by a membrane, streaked with brown stripes, and resembling the wing of a bat.

Whales are frequently seen to the windward of this island; but they are not so large as those in the northern seas. Some of the fish near this island are poisonous, and others delicate and nutritious.

The eels are of the conger kind: they are, in general, eight feet long, as thick as a man's leg, and exceedingly voracious. There are numbers of lobsters, cray-fish, and crabs: the two former are of a fine blue colour, marbled with black: the latter are principally grey.

There are great numbers of insects in this island: the most destructive are the grasshoppers. Ants are also numerous, and very troublesome in the houses, as it is difficult to secure the provisions from being destroyed by them. Here are wasps, spiders, various kinds of flies, centipedes, and lizards. Moths, or small butterflies, so infest the houses after dark, that the inhabitants are obliged to put their candles into glass cylinders.

There is an insect here, called formicaleo, which is particularly destructive to the ants; and another named cancrelas, of which there are three sorts; the most common are about the size of a cockchafer, of a reddish brown; another sort is flat, and of a grey colour. The houses are pestered with them, especially in wet weather, and they are very destructive to books and furniture.

The temperature of the climate is so favourable to the propagation of insects, that in a short time the fruits would be eaten up by them, and the island itself become uninhabitable, but most of the fruits of the meridional countries are clothed with a thick rind, and afterwards with a skin, a very hard shell, and an aromatic bark, insomuch that the flies can introduce their eggs but into very few of them. Many of these noxious animals are at perpetual war with each other. The formicaleos lay snares for the ant; the green fly pierces the cancrelas; the lizard hunts the butterfly; the spiders spread nets for every insect that flies; and the hurricane, which rages once a year, annihilates, at once, a great part both of the devourers and their prey.

*Customs, Manners, &c.*] The male inhabitants of this island are of the ordinary size, and tolerably proportioned. The women are pale, but well made, and, in general, handsome. They have great vivacity, and seem to possess minds capable of improvement. The most usual dress is muslin, trimmed with rose-coloured taffety. They are extravagantly fond of their children; yet, being ignorant themselves, they wholly neglect their education.

The first French settlers were simple, industrious, and hospitable; but, when the importance of the island was known, others came from France, from the same motives, and with the same views, as induce Europeans, in general, to repair to foreign settlements. The leading principle of the emigrators was avarice, to which they sacrificed both humanity and justice; and the same principle is still predominant among those who may be deemed the European inhabitants of the island.

Their houses are mere cabins of wood, which may be easily removed from one place to another upon rollers. The windows have neither glass nor curtains, and the furniture consists of but few articles, and those very plain.

In proportion to the number of people, few here are married. The people, in general, are immoderately fond of dancing; and the women in the plantations seldom come to town but at Easter, to confess, or when a ball is announced.

The mode of travelling, particularly for women and children, is in palanquins, carried by slaves; for the badness of the roads, and the unevenness of the streets, will not admit of the use of wheel-carriages.

The black inhabitants of the island are either Indians or negroes. The Indians are Malabars, or Malayans, who come from Pondicherry, to article themselves as servants

for a certain number of years. These occupy a spot called the Camp of the Blacks. In general, they work at trades, and are sober and frugal. They are dressed in long muslin gowns, wear a turban on their heads, have gold rings in their ears, and silver bracelets on their wrists. Some few serve the principal people as running-foemen. These being equipped with a handsome cane, and a poniard at the girdle, affect great state, and deliver the most trivial messages with an air of importance.

The negroes, or slaves, are brought from Madagascar. These are neither so black, nor so badly featured, as the natives of Guinea, but resemble the Europeans in feature, and, in complexion, incline to a copper-colour. They are, for the most part, active, ingenious, grateful, and faithful; and have a keener sense of an insult done to any one they love, than of any personal injury to themselves.

## SECTION VI.

### BOURBON.

This island is situated in twenty-one degrees south latitude, and fifty-four degrees east longitude, and is upwards of one hundred miles in circumference. It was first discovered, in the year 1545, by a Portuguese, of the house of Mascariñas, who gave it the name of Mascariñ, which it retained till the year 1654, when M. de Flacourt took possession of it in the name of the king of France, and gave it the name of Bourbon, which it still retains. He left there a few of his people and slaves, who, not liking their situation, were afterwards brought away by an English ship. The French, however, again formed a settlement there in 1674.

According to the latest accounts of this island, it abounds in all kinds of refreshments; and the air is particularly excellent. The roads are good for shipping; but there is not an harbour in the whole island. Here is plenty of wood and water; and the face of the country is beautifully diversified with hills and dales, pastures and woods, and watered by excellent springs and rivulets. In one of the mountains there is a small volcano, which discharges fire, and fills the neighbourhood with a bituminous matter; and the flames are perceived, in the night-time, at the distance of twenty-five leagues.

Some of the trees are fit for building vessels. The Isle of Bourbon likewise produces the shrub that bears coffee, the tamarisk, cocoa, cotton, aloe, and ebony tree. The black ebony is less esteemed than the yellow; and the wild coffee, which is very plentiful, is exceeding good. Many of the trees and plants produce odoriferous gums; and there are plenty of oranges, lemons, tobacco, palms, white pepper, &c.

Vines are successfully planted here, and considerable quantities of different kinds of grapes are annually produced.

But the greatest inconveniences arise from the terrible hurricanes and storms, which are not only violent, but very frequent; hence shipwrecks are common, and the most horrid devastations become familiar to the eye.

This island abounds with black cattle, hogs, goats, and boars, the flesh of which is admirable, on account of their feeding on tortoises; many kinds of fowls, pigeons, turtle-doves, parrots, &c. The surrounding seas, and intersecting rivers and rivulets, supply the inhabitants with abundance of fish; and on the shore are found great quantities of ambergris, corals, and beautiful shells.

A French writer, in speaking of this island, says, "The best animal found here, whether for taste or wholesomeness, is the land-tortoise; and the most agreeable fruit is the anana. This tortoise is of the same figure with those in Europe, but of very different size.

"The bat of this island is very singular, and might be called the flying-fox: it resembles this animal in size, hair, head, ears, and even teeth. The female has two teats, and under each wing a bag, to carry her young in. The length of the wing is about four feet from one extremity to the other. The flesh is so delicious, that the natives hunt for them with the same eagerness that we shoot partridges."

A French officer, who visited both this island and Mauritius, relates the following anecdote, concerning one of the pirates who used to infest this island. "The viceroy of Goa came one day to anchor in the road of St. Denis, and was to dine with the governor. He had scarcely set his foot on shore before a pirate ship, of fifty guns, anchored along-side his vessel, and took her. The captain landed, and demanded to dine at the governor's. He seated himself at table between him and the Portuguese viceroy, to the latter of whom he declared that he was his prisoner. Wine and good cheer having put the seaman in good humour, M. Desforges, the governor, asked him at how much he rated the viceroy's ransom? 'I must have,' said the pirate, 'a thousand pistoles.' 'That's too little,' said M. Desforges, 'for a brave fellow, like you, to have for a great lord, like him: ask enough, or ask not any thing.' 'Well, then, I ask not any thing,' replied the corsair, 'let him be free.' The viceroy instantly re-embarked and set sail, happy at having escaped on such good terms. The pirate settled on the island, and was hanged, a considerable time after an amnesty had been published in favour of his companions, and in which he had failed to have himself included. This injustice was the work of a counsellor, or judge, who was desirous of appropriating the spoils of the pirate to his own use."

The same writer has also given us the following description of the original inhabitants of this island, with observations on their present state

"The manner of life is very simple; and the people even live upon rice door. They do not made to sh Europe; content want. They j ever attempt it, their proceeding inhabitants cam ferred him their

"The manners of the first inhabitants of Bourbon were very simple; and the greater number of the houses were not made to shut, so that a lock was a curiosity. Some people even put their money in a tortoise-shell over their door. They dressed in blue cloth, went bare-footed, and lived upon rice and coffee. They imported but little from Europe; contented without luxury, they lived without want. They joined to this moderation the virtues that ever attend it, good faith in commerce, and generosity in their proceedings. As soon as a stranger appeared, the inhabitants came to him, and, as a mark of hospitality, offered him their houses.

"The wars in the Indies, however, have made a change in their manners. The volunteers of Bourbon distinguished themselves by their bravery; but the manufactures of Asia, and the military distinctions of France, thereby got footing in the island. The children, richer than their parents, require to be treated with more respect. They now seek pleasures and honours in Europe, in exchange for domestic happiness and the quiet of a country life. The attention of the fathers being chiefly fixed upon their sons, they send them to France, whence they seldom return; hence it is that, in this island, there are, in general, more than five hundred girls marriageable, who have very little prospect of obtaining husbands."

The whites who inhabit this island are estimated at five thousand, and the blacks at six thousand. The principal traffic is with France, to which they export the various commodities of the country. The chief town is St. Denis, the residence of the governor and council. It is a small place, and does not contain any thing remarkable, except a redoubt, built of stone, and a drawbridge.

## SECTION VII.

### ISLAND OF ST. HELENA.

This island is situated in five degrees forty-nine minutes of west longitude, and in fifteen degrees fifty-five minutes of south latitude, being one thousand two hundred miles west of the continent of Africa, and one thousand eight hundred east of South America. The island is a rock, about twenty-one miles in circumference, very high and steep, and only accessible at the landing-place, which is defended by batteries of guns, planted level with the water.

This island is said to have been first discovered and settled by the Portuguese on the festival of the Empress Helena, mother of the Emperor Constantine, for which reason the Portuguese gave it her name, which it still bears. But, it being afterwards deserted by them, it lay waste, till the Dutch settled it again. But they afterwards relinquished it for a more convenient situation at the Cape of Good Hope. The English East-India Com-

pany then settled their servants there, and began to fortify it; but, being yet weak, the Dutch, about the year 1672, retook it, and kept it in their possession. This news being reported in England, an officer was sent to take it again, who, by the advice and conduct of one that had formerly lived there, landed a party of armed men in the night, in a small cove, unknown to the Dutch then in garrison, and, climbing the rocks, got up into the island, and reached, in the morning, to the hills hanging over the fort, which stands by the sea, in a valley. From thence firing into the fort, they soon made them surrender. This island has continued ever since in the hands of the English East-India Company, and has been greatly strengthened both with men and guns, so that at present it is secure from the invasion of an enemy. The common landing-place is a small bay, like a half-moon, scarcely five hundred paces wide, between the two points. Close by the sea-side are guns, planted at equal distances, lying along from one end of the bay to the other; besides a small fort, a little farther in from the sea, near the midst of the bay; all which renders the bay so strong, that it is impossible to force it.

St. Helena is situated in the most serene climate, and is delightfully temperate. The English plantations here afford potatoes and yams, with figs, plantains, bananas, grapes, kidney-beans, &c. The flour used here is almost wholly imported from England, and in times of scarcity they generally eat yams and potatoes, instead of bread. They have also a tolerably good supply of rice, which the East-India Company's ships bring from Bengal. Though the island appears, on every side, a hard barren rock, yet it is agreeably diversified with hills and plains, adorned with plantations of fruit-trees and garden-stuff. They have great plenty of hogs, bullocks, poultry, ducks, geese, and turkeys, with which they supply the sailors, taking in exchange shirts, drawers, or any light cloths, pieces of calico, silks, muslin, arrack, sugar, &c.

There is a small English town within the great bay, standing in a little valley, between two high mountains; and containing about twenty or thirty houses, whose walls are built with rough stones. The furniture is very mean. The governor has a decent house by the fort, where he commonly lives, having a few soldiers to attend him, and to guard the fort. But most of the houses in the town stand empty, excepting when vessels arrive, as the owners have all plantations farther in the island, where they constantly employ themselves. But, when ships arrive, they all flock to the town, where they live during the time the vessels remain here; for then is their fair or market, to buy such necessaries as they want, and to sell off the productions of their plantations.

Every house is let out in lodgings, which are very dear. Their profits must be great, particularly when it is considered they raise all their own stock, enjoy it with their

lodgers, and make them, likewise, pay most extravagantly dear for it.

The company's affairs are managed by a governor, deputy-governor, and store-house-keeper, who have standing salaries allowed them, besides a public table well furnished, to which all commanders, masters of ships, and respectable passengers, are welcome. The natives sometimes call the result of their consultations severe impositions: and, though relief may be had from the company in England, the unavoidable delays in returning a redress at that distance, sometimes subject the addressers to hardships; so that, were not the situation of this island very serviceable to our East-India ships homeward-bound, the constant trouble and expence would induce the company to abandon the island; for, though it is furnished with the conveniences of life, yet it has few commodities of any profit to merchants.

There are about two hundred families in the island, most of them descended from English parents. The white inhabitants are subjects of the king of Great Britain: these employ negroes, who transport goods of all kinds from place to place on their heads. There are a small number of horses at St. Helena; but they are never employed in draught, there being no such thing as a waggon or a cart on the island, though in many places the land is not so steep, but that such carriages might easily be drawn.

### SECTION VIII.

#### ISLAND OF ASCENSION.

This island is situate in seven degrees fifty-seven minutes of south latitude, and thirteen degrees fifty-nine minutes of west longitude, six hundred miles north-west of St. Helena. It received its name from its being discovered by the Portuguese on Ascension-day, and is a mountainous barren island, about twenty miles round, and uninhabited; but it has a safe convenient harbour, where the East-India ships generally touch, to furnish themselves with turtle, which are plentiful here, and very large, some of them weighing above one hundred pounds each.

For the following particulars we are indebted to the pen of Mr. Forster:—

"We sent several parties on shore, who passed the night on the watch for turtles, which came to lay their eggs on the sand. The dreariness of the place surpassed all the horrors of Easter Island and Terra del Fuego, even without the assistance of snow. It was, in fact, a ruinous heap of rocks, which seemed to be totally changed by the fire of a volcano. Nearly in the centre of the island rises a broad mountain, of great height, which, from the circumstance of its being partly covered with verdure has obtained the name of the Green Mountain

"We landed early in the morning among some rocks, the surf being always immensely high on the great beach, which consists of minute shell-sand, chiefly of a snowy white, very dry, and intolerable to the eyes, when the sun shines. We ascended among heaps of black cavernous stone, which exactly resembles the most common lavas of Vesuvius, and of which the broken parts looked as if they had been accumulated by art. The lava currents, cooling very suddenly, may easily be imagined to produce such an effect. Having ascended about fifteen yards perpendicularly, we found ourselves on a level plain of six or eight miles in circuit; in the different corners of which we observed a large hill, of a conical shape and reddish colour, standing perfectly insulated. Part of the plain between these conical hills was covered with smaller hills, consisting of the same wild and ragged lava as that near the sea, and ringing like glass, when two pieces are knocked together. The ground between the heaps of lava was covered with a black earth, on which we walked very firmly; but, when these heaps did not appear, the whole was a red earth, so extremely loose, and in such dry minute particles, that the wind raised clouds of dust upon it.

"The conical hills consisted of a very different sort of lava, which was red, soft, and crumbling into earth. One of these hills stands directly in front of the bay, and has a wooden cross on its summit, from whence the bay is said to derive its name. Its sides are remarkably steep, but a path, near three-quarters of a mile long, winds round it to the summit.

"After examining this remarkable country for some time, we concluded, that the plain on which we stood was once the seat of a volcano, by the accumulation of whose cinders and pumice-stones the conical hills had been gradually formed: and that the currents of lava, which we now saw divided into many heaps, had been gradually buried in fresh cinders and ashes; and the waters, coming down from the interior mountain in the rainy season, had smothered every thing in their way, and filled up by degrees the cavity of the water.

"We landed a second time, and, crossing a plain, arrived at a prodigious lava-current, intersected by many channels, from six to eight yards deep, which bore strong marks of having been worn by vast torrents of water, but were at present perfectly dry, the sun being in the northern hemisphere. In these gulleys we found a small quantity of soil, consisting of a black volcanic earth, mixed with some whitish particles, and very gritty to the touch.

"Having, with great fatigue, climbed over this extensive and tremendous current of lava, we approached the foot of the Green Mountain, which, even from our vessel in the bay, we had plainly distinguished to be of a different nature from all the rest of the country. Those parts

of the lava which surrounded it were covered with a prodigious quantity of purslane, and a kind of new fern, where several flocks of wild goats were feeding. The great mountain is divided in its extremities, by various clefts, into several bodies; but in the centre they all run together, and form one broad mass of considerable height. The whole appears to consist of a gritty lime-stone, which has never been attacked by the volcano, but probably existed prior to its eruption. The sides of the mountain are clothed with a kind of grass, peculiar to the island; and the master of the New York sloop informed us, that there is a spring of water on one part of the mountain, which falls down a great precipice, and is afterwards absorbed in the sand."

Our author is of opinion that, with proper exertions, Ascension Island might shortly be rendered fit for the habitation of men. "The introduction of furze," says he, "and of a few other plants, which thrive best in a parched soil, would soon have the same effect as at St. Helena. The moisture attracted from the atmosphere by the high mountains in the centre of the island, would then no longer be evaporated by the violent action of the sun, but collect into rivulets, and gradually supply the whole country. A sod of grasses would every where cover the surface of the ground, and annually increase the stratum of mould, till it could be planted with more useful vegetables." Mr. Forster and his companions returned gradually to Cross Bay, in the heat of noon; having a space of more than five miles to traverse, where the sun blistered their faces and necks, and heated the soil to such a violent degree, that their feet were likewise extremely sore. About three o'clock they arrived at the water's side, and, after bathing in a small cove among the rocks, went on board their vessel. Next morning, they made another small excursion toward the Green Mountain; but they were all so much fatigued that they could not reach it."

#### SECTION IX.

#### THE CAPE DE VERD ISLANDS.

These islands are so called from a cape of that name on the African coast, near the River Gambia, over against which they lie, at the distance of three hundred miles, between twenty-three and twenty-six degrees of west longitude, and fourteen and eighteen degrees of north latitude. They were first discovered in the year 1460, by the Portuguese, and are about twenty in number; but several of them, being only barren uninhabited rocks, are not worth notice. St. Jago, Fuego, Mayo, Bonavista, Sal, St. Nicholas, St. Lucia, St. Vincent, Santa Cruz, and St. Antonio, are the most considerable.

The climate of these islands is exceedingly hot, and, in some parts, unwholesome. The soil differs with the cli-

mate; for though several of them are very stony and barren, yet the principal part are fertile, and produce various sorts of grain and fruits, particularly rice, maize, or Indian wheat, bananas, lemons, oranges, citrons, pomegranates, cocoa-nuts, figs, and melons. They have also a sort of pulse, like French beans, and great quantities of pumpkins, which form the common food of the inhabitants.

These islands produce two other kinds of fruit, of a remarkable nature, viz. the custard-apple and the papaw. The former of these is as large as a pomegranate, and much of the same colour. The outside husk, or rind, is in substance and thickness between the shell of a pomegranate and the peel of a Seville orange, softer than the former, yet more brittle than the latter. The coat, or rind, is also remarkable for being covered with small regular knobs or risings; and the inside of the fruit is full of a white soft pulp, which, in its form, colour, and taste, greatly resembles a custard, whence it received its name, which was, probably, first given it by the Europeans. It has in the middle a few small black stones, but no core, for the whole of it is entire pulp. The tree that bears this fruit is about the size of a quince-tree, and has long slender branches that spread a considerable way from the trunk. The fruit grows at the extremity of these branches, upon a stalk about nine or ten inches long.

The papaw is a fruit about the size of a musk-melon, and resembles it in shape and colour, both within and without; only in the middle, instead of flat kernels, which the melons have, these have a quantity of small blackish seeds, about the size of pepper-corns, the taste of which is much the same as that spice. The fruit itself, when ripe, is sweet, soft, and luscious.

In addition to the vegetable productions of these islands, may be added the following, as described by Dr. Gillan, who attended Earl Macartney and his suite, on the embassy to China, when they touched at the island of St. Jago.

"The *asclepias gigantina*, noticed for its milky but corrosive juice, was rich in flower. The *jatropha curcas*, or physic nut-tree, called, by the French West-Indians, *bois immortel*, was also flourishing; and, in shady vales, some indigo-plants, and a few cotton-shrubs, were successfully cultivated. The mimosa, or sensitive plant, common about the country, growing to the size of trees, did not appear to languish, and, in some parts, the annona, or sugar-apple, was in perfect verdure.

"A tree, which, for size, may be called a phenomenon in vegetation, was discovered in a healthy state, in a vale about a mile and a half from the town of Praya, called, by botanists, *Adansonia*; in English, monkey bread-tree. The natives of St. Jago call it *kabifera*; others, baobab. The circumference, or girth of the base, was fifty-six feet,

which soon divided into two vast branches, the one in a perpendicular direction, whose periphery was forty-two feet, the other about twenty-six. Another of the same species stood near it, whose single trunk, girthing only thirty-eight feet, was scarcely noticed."

"This tree," says Golberry, "is the most monstrous of all productions of the vegetable kingdom. It is the most admirable, because, by its nature, it longest resists the action of time; because, by its organisation, and the vigour of its constitution, it attains an unmeasurable size; because, with the faculty of existing for thirty centuries, the heart of its wood is still light and tender; and because, the baobab is a pithy tree, and the pith occupies so considerable a part of the interior of this prodigious vegetable, that, when a sort of mouldiness takes place, to which its centre is subject, there are formed, within these colossal caverns of twenty feet in height, and as many in diameter. This astonishing vegetable production, which holds the same rank amongst vegetables as the elephant does amongst quadrupeds, or the whale amongst fish, undoubtedly deserves to be spoken of in detail; and will be found worthy of the attention of the curious reader, who wishes to acquire information.

"This tree, which belongs to the genus of *malva*, delights only in the hottest countries, attains an enormous circumference in humid and sandy soils, and it is highly probable that such soils are most congenial to its nature, though the rule is not without exception.

"I saw the greatest number of baobabs on the isthmus of the peninsula of Cape Verd, between the bay of Jof and that of Dakar. This space, which comprises nearly two square leagues, contained, in 1786, at least sixty baobabs, all separated from each other. This country, as well as all the country of Cape Verd, is sandy, and the baobab may be said to be the principal vegetable produced on its soil.

"I have, however, seen several of these trees in a very fat soil, and one enormous baobab, which contained a cavern twenty-two feet high, and upwards of twenty in diameter: this tree existed in a green and flourishing antiquity, completely surrounded with the finest and most beautiful vegetation that can possibly be conceived.

"The young baobabs of the isles of la Madeline, near Goree, which have been observed by others as well as myself, and of which M. Adanson has carefully collected all the facts which can tend to elucidate the character of such a prodigious vegetable, have existed for a number of centuries, and have not yet attained a middling size, on a soil the same as that of the island of Goree, the bottom of which is covered with sand, and appears to contain nothing but the lava of a volcanic rock.

"The colour of the bark of the baobab is a clear brown, interspersed with small grey spots; but the colour of the

trunk of the tree is deeper than that of the principal branches; and the ramifications proceeding from these branches are of a dark grey colour, inclining to green. The bark is very thick, compact, and almost as hard as the wood, and both are nearly similar in substance to lignum vitæ. The leaves are from six to eight inches long, by upwards of three wide, and are fixed to the number of three, five, or seven, on a single stalk, like the leaves of the India chesnut-tree, to which they are in many respects extremely similar.

"In the old baobabs it is not the mother-branches which take a horizontal direction, nor is it the large shoots that proceed from them, that bear a number of leaves; they have some, it is true, but they are scarce; it is from the scions of two or three inches in diameter that issue a vast number of ramifications, which rise perpendicularly, and are covered with foliage in incredible profusion, while the mother-branches and large shoots bear leaves only at their extremities: but, as in the old baobabs, that have retained their full vigour, notwithstanding this prodigious age, the number of vertical sprigs is extremely great, the beautiful and venerable head of these patriarchs of vegetation forms an immense dome, of a very rich and elegant verdure."

M. Adanson observed that the roots of this tree extend to an extraordinary distance in a horizontal direction, and almost on the surface of the ground, or at a very little depth from the superficies of the soil.

"These roots frequently exceed sixty feet in length, and the large ones, whose direction is always horizontal, are stronger and thicker than the mother-branches of the tree, with which they rather accurately correspond in number and direction, issuing like ridges from the trunk.

"Below these ridges the trunk of the tree is protracted, and forms a root, the direction of which is perfectly vertical, and the figure that of a large cone: this root penetrates to a great depth; it is the pivot of the tree, is a solid piece, and of thickness proportionate to the colossus which it attaches to the earth, and of which it is the prolongation: it is by means of this pivot, this profound and enormous root, that the baobab derives the greatest part of its nutriment; it is to this, also, that it is indebted, in a great degree, for its solidity and stability. But the bonds which attach such an enormous vegetable to the earth must necessarily possess a power and solidity proportionate to the mass they sustain.

"In the countries of Cape Verd, for example, which are not only very high, but form a point that advances into the sea upwards of thirty leagues, and are subject to all the violence of the land and sea winds, the baobabs, which are separated at a considerable distance from each other, could not resist the impetuosity and force of the winds, if their roots had not been of a very considerable thickness and depth, and if their solidity and resistance had not

been in equilibrium with the winds on the other side.

"The flowers, when expanded, are six inches in diameter, and approach of night, the blackness of the night."

"The blacks, who are possessed by the flowers, sleep, and at sunrise round the tree, observing its expansion, at sunrise, the baobab, which they particularly like, by the hot water, by the

been in equilibrio with the power and efforts exercised by the winds on the surfaces of such enormous vegetables.

"The flowers of this tree are white, and very large; when expanded, they are four inches long, and nearly six inches in diameter: they contract and close at the approach of night, and expand in the morning.

"The blacks of Africa incessantly admire this faculty possessed by the flower of the baobab: they say, that this flower sleeps, and they take pleasure in assembling before sun-rise round the baobabs in blossom, for the purpose of observing its expansion. These negroes also adopt the custom, at sun-rise, of collecting the young leaves of the baobab, which they employ for different purposes; but they particularly use them for giving a fine flavour to their hot water, by the steam of which they cook their food.

"The fruit of the baobab is of a very oblong form, terminating in a point: it is eighteen inches long by rather more than eighteen in circumference at the middle; its form approaches to that of the cucumber, but it is thinner at the two ends; its axis is perfectly straight, and its figure tolerably regular, for it produces two cones, almost equal to each other, when separated in the middle. The rind of this fruit is hard and liguous, of a very dark brown colour, and marked by furrows, which divide its surface into thirteen segments, in a longitudinal direction. The outer surface of the fruit is covered with a very fine and thin down, of a greenish colour; but, when it is at its perfect maturity, this down disappears, and leaves the black bark perfectly exposed, which, being compact and of a brilliant polish, causes the whole to resemble a black cocoa-nut, deprived of its outer rind. This fruit contains a white, spongy, and pulpy substance, extremely light when the fruit is dried, but at the period of its maturity is quite soaked with an acidulated, though sweetish, juice, very agreeable to the palate.

"This pulp is divided by filamentary partitions into thirteen compartments, which take a longitudinal direction: in these compartments are contained the grains or seed, in the form of beans, about six lines wide, and as many long, so that they are nearly globular.

"Each fruit contains several hundred grains. The Africans assert, that the pulp of the fruit possesses several virtues: they reduce it to powder, diluted with milk, or even with pure water, and use it with considerable success in spittings of blood. When mixed in a thin decoction of tamarinds, they consider it an infallible remedy for the bilious bloody flux; and the women, who are subject to hæmorrhages, compose pills with the powder of this pulp and gum, in which they place the greatest confidence."

The Cape de Verd Islands abound with several sorts of poultry, particularly curlews, Guinea-hens, and flamingos, the latter of which are very numerous. The flamingo

is a large bird, much like a heron in shape, but bigger and of a reddish colour. They go in flocks; but are so shy, that it is very difficult to catch them. They build their nests in shallow ponds, where there is much mud which they scrape together, making little hillocks, like small islands, that appear about a foot and a half above the surface of the water. They make the foundations of these hillocks broad, bringing them up taper to the top, where they leave a small hollow pit to lay their eggs in. They never lay more than two eggs, and seldom less. The young ones cannot fly till they are almost full-grown; but they run with prodigious swiftness. Their flesh is lean, and of a dingy colour, but it neither tastes fishy nor unpleasant. Their tongues are broad and long, having a large lump of fat at the root, which is delicious in its taste, and so greatly admired, that a dish of them will produce a considerable sum of money.

There are many wild animals in these islands, particularly lions and tigers, monkeys, baboons, and civet-cats. The tame animals are camels, horses, asses, sheep, mules, cows, goats, hogs, &c.

The sea is plentifully stocked with fish of various sorts, and there is such plenty of turtle here, that several foreign ships come annually to catch them. In the wet season, the turtles go ashore to lay their eggs in the sand, which they leave to be hatched by the heat of the sun. The inhabitants go out in the night, and catch the turtles by turning them on their backs with poles, for they are so large that they cannot do it with their hands.

The Europeans settled in these islands profess the Roman Catholic religion. The natives are all negroes, and being subject to the Portuguese, have their religion and language. Both men and women are stout, and well-proportioned; and they are, in general, of a civil and quiet disposition. Their dress is very trifling, consisting only of a piece of cotton-cloth wound round the waist. The women sometimes throw it over their heads, and the men across the shoulders. Neither sex wear shoes or stockings, except on particular festivals.

The population of the Cape de Verd Islands is estimated at forty-two thousand inhabitants. Of these, St. Jago is said to contain twelve thousand; Bonavista, eight thousand; the Isle of Mayo, seven thousand; St. Nicholas, six thousand; Antonio, four thousand; Fuego, four thousand; Bravo, five hundred; and those not specified till fewer.

The English missionaries touched at St. Jago in 1796, and represent it as the most fruitful and best inhabited of all the Cape de Verd Islands. They acknowledge that they were treated by the governor with the greatest hospitality. The town of Port Praya consists of about a hundred small huts, one story high, built of wood, thinly scattered. It has a fort, or battery, almost in ruins. The

jail is the best building, and next to that the church, at which officiated a mulatto priest. The governor resides in a small wooden barrack, at the extremity of the plain, commanding a view of the bay and shipping. Earl Macartney, on his embassy, was received by him with due honour and respect; but, as he had shared in the general wretchedness occasioned by the long drought and arid winds, which at that time prevailed, he had neither wine nor any other refreshment to offer.

### SECTION X.

#### ISLAND OF GOREE.

This island is situated near Cape de Verd, in fourteen degrees forty-three minutes north latitude, and seventeen degrees twenty minutes west longitude, being the only European settlement between the rivers Gambia and Senegal. It forms an excellent road for shipping, and is surrounded by rocks, every where inaccessible, except at a little creek, one hundred and twenty fathoms broad, and sixty fathoms long, enclosed between two points of land: one of which is pretty high, and called the Point of the Burying-ground; the other is lower, and before it lies a sand-bank, over which the sea beats with great fury. All round this island there is good anchoring, and particularly in the before-mentioned creek, between which and the land ships may ride in perfect security from the most dangerous surges.

From the dark and basaltic colour of the rock which forms the island, from the substance of this rock, and the heaps of prismatic rubbish with which some parts of its base are covered, there can be no doubt that Goree has been detached from Cape Verd by a volcanic revolution. A substance which combines many of the qualities of pozzolane, and which is found in several parts amongst the rubbish at the foot of the rock, also gives weight to this opinion, which seems no longer doubtful, on observing all the corresponding devastations on the coast: and though the isles of Cape Verd are one hundred leagues distant from the point of this cape, the same traces of devastations, the same characteristics of volcanos, existing and exhausted, which are found in those isles, authorize us to think, that at this part the ancient Atlantis must have been united to Africa.

In order to give an exact idea of the Island of Goree, it should be divided into three parts: first, what is properly called the rock, which forms a great and naked mass, rising nearly three hundred feet above the level of the sea, and occupying a surface of upwards of two hundred and twenty-five fathoms in length, by a breadth of one hundred and fifteen fathoms. The plain at the top of this rock is one hundred and thirty fathoms long, by a reduced width

of seventy fathoms, which gives a surface of nine thousand four hundred and fifty square fathoms.

Secondly, the town, which begins at the foot of the high rock, and occupies almost the whole of the low part of the island. This part is two hundred and fifty fathoms long, by an average breadth of one hundred and sixty fathoms, and its soil is a firm sand, mixed with a small quantity of vegetable earth, that the inhabitants have, at different times, conveyed from the continent.

Thirdly, the north point, which forms a sort of natural mole, one hundred and twenty fathoms long by thirty broad; the base of this mole is a mass of rocks, covered with sand.

It has been said, that the rock was crowned by a plain surface of nine thousand four hundred and fifty fathoms in extent: its western part is terminated by a perpendicular scarpement of the whole height of the rock; and this is the only part which is physically inaccessible. The east and south sides have a very steep declivity, the bottoms of which are defended by rocks that project into the sea, but do not prevent access to such a degree, as to impede boats from disembarking a body of men. An industrious engineer might, however, render these two sides as secure as that on the west.

The north part is the most accessible, and here a mound has been formed, fifteen feet in width, and with a proper slope for conveying heavy artillery up to the plain. If a well were dug in the rock, to the depth of about fifty feet, and filled with powder, its explosion would detach the rock from the side next to the town, the communication might be made by means of a bridge, and the upper part of the rock, if strengthened by some lines of defence on its north front, would give it a degree of power and independence, and would, perhaps, ensure it advantages even more infallible than those of Gibraltar.

The town of Goree occupies, in the lower part of the island, the space contained between the rock and the mole. According to a census taken in 1785, its population amounted to one hundred and sixteen landed proprietors, including free negroes and mulattoes: by supposing only three children to belong to each house, the number of free indigenous negroes, of all ages and both sexes, in which are comprised the free resident negroes who are not proprietors, would amount to five hundred and twenty-two individuals. The number of cottage-slaves amounted to one thousand and forty-four persons; the total indigenous population, therefore, consisted of one thousand five hundred and sixty-six individuals: to this number there were at that time to be added two hundred slaves, who circulated like so many articles of commerce, and from seventy to eighty soldiers, officers, and clerks, which made the customary population of the Island of Goree amount to one thousand eight hundred and forty indi-

duals, i. a space long, by a reduced width.

The Canary Isl the Fortunate Isl near the continen seven degrees thir

quals, i. e. a space of two hundred and thirty-five fathoms long, by a reduced width of one hundred and forty fathoms.

A large powder-magazine is situated on the platform of St. Michael: it is partly dug in the rock, and very well vaulted; but, as it was badly aired, it was deemed necessary to make apertures for the circulation of the air, and to dig a small fosse in the rock, for the purpose of isolating the magazine, and a wall to surround it, and defend it from attack.

The military hospital is situated in an advantageous position. The air of Goree, more pure, and always fresher, than that of the town of St. Louis, renders the former island more healthy, and to its hospital are transmitted all the convalescent individuals from the Senegal, who soon afterwards recover their health. This hospital, situated in the highest part of the town, and in a position favourable for the sick, was, in 1786, composed of a building seventy-four feet in length, by twenty feet wide. In the time of siege, the island of Goree might be reduced to a very precarious state of subsistence, as its only supply of water is derived from a very small spring, situated at the foot of the rock, on the east side, which affords but twelve pints of water per day; while the two little reservoirs in Fort François, contain, together, not more than sixty.

Though of so much importance to the African trade, Goree is only a small island, extending about three-quarters of a mile in length. It is of a triangular form, without wood, and has no water but what the inhabitants catch in cisterns and reservoirs.

Goree was yielded to the Dutch, in 1617, by the king of Cape Verd, and they built a strong fort upon the north-west part of it; but that fort not being sufficient to prevent an enemy's landing in the creek, they erected another to secure the warehouses. It was taken by the English in 1663; and retaken by the Dutch soon after. The latter, however, did not keep it long; for the French conquered it in 1677; after which they thought proper to fortify and maintain it as a place of consequence. It was taken from them in the glorious year 1759, together with Fort Senegal; but it was restored to the French at the treaty of peace in 1763. It was retaken by the English, given up again by the peace of 1783, and, at an early period of the last war, it was taken, in a very gallant manner, by a *ruse de guerre*, with little loss on our side.

### SECTION XI.

#### THE CANARY ISLANDS.

The Canary Islands, or, as they were anciently called, the Fortunate Islands, are situate in the Atlantic Ocean, near the continent of Africa, and extend from twenty-seven degrees thirty minutes to twenty-nine degrees thirty

minutes of north latitude, and from twelve to twenty-one degrees of west longitude.

These islands were first discovered and planted by the Carthaginians; but the Romans, destroying that state, put a stop to the navigation on the west coast of Africa, and the Canaries lay concealed from the rest of the world till the year 1405, when they were discovered by John de Bataucourt, a Frenchman in the service of Spain.

The Canaries include the following islands, viz. Grand Canaria, Teneriffe, Palma, Ferro, Gomera, Furteventura, and Lancerota.

*Climate, Soil, &c.*] The Canaries enjoy a pure and temperate air; and such is the nature of the soil, that it frequently yields two crops in a year. They abound in the most delicious grapes, which produce those rich wines known by the name of Canary, and of which it is said that, in times of peace, ten thousand hogsheads are annually exported to England.

In Teneriffe the climate is remarkably healthful, and particularly adapted to afford relief in phthisical complaints. By residing at different heights in the island, such a temperature may be procured as is best suited to the constitution. Persons may continue where the air is mild and salubrious, or they may ascend till the cold becomes intolerable; but no person can live comfortably within a mile of the perpendicular height of the Peak after the month of August.

*Vegetables.*] Great variety of fruits are produced in these islands, besides grapes, figs, mulberries, musk-melons, &c. La Figuera de India, called, in English, the prickly pear-tree, bears a fruit, which is held there in great estimation; but it is neither easily plucked nor eaten. A late traveller gathered one by enveloping the fruit with a tuft of grass, to guard his fingers from the prickles; he warily took off the rind, and the pulp, being exposed to view, proved delicious to the taste, uniting the flavour of a fig, the winter Burgundy pear, and the water-melon. The pumpkins, potatoes, and onions, which grow here, are excellent. Indian corn is produced at Teneriffe, and sold at about three shillings and sixpence per bushel. The fruits and vegetables are, in general, very cheap. The lower hills produce great quantities of the *Euphorbia Canariensis*. The people on the spot imagine its juice to be so caustic as to corrode the skin; but a British botanist convinced them to the contrary, by thrusting his finger into a plant full of it.

There is a shrub common here, agreeing exactly with the description given by Linnæus of the tea-shrub, as growing in China and Japan. It is considered as a weed, and large quantities of it are rooted out of the vineyards every year. The Spaniards who inhabit the island sometimes make use of it, and ascribe to it all the qualities of the tea imported from China. Another botanical curiosity

s called the *impregnated lemon*. It is a distinct and perfect lemon enclosed within another. There is also a certain grape growing here, which is deemed an excellent remedy in phlithical complaints.

The fountain-trees are very extraordinary vegetables, growing in one of the Canary Islands, and likewise said to exist in some other places. Of these very remarkable trees we have the following account in Glasse's history of the Canary Islands: "There are only three fountains of water in the whole island, where the fountain-tree grows. The great cattle are watered at those fountains, and at a place where water distils from the leaves of a tree. Many writers have made mention of this famous tree, some in such a manner as to make it appear miraculous; others, again, positively deny its existence; among whom is Feyjoo, a modern Spanish critic. But he and those who agree with him in this matter, are as much mistaken as those who would make it appear miraculous.

"The author of the 'History of the Discovery and Conquest of the Canaries,' has given a particular account of this remarkable vegetable, which I shall here insert at large:—The district in which this tree stands, is called *Tigulahe*; near to which, and in the steep rocky ascent that surrounds the whole island, there is a narrow gutter, commencing at the sea, and continuing to the summit of the cliff, where it is joined with a valley that is terminated by the steep front of a rock. On the top of this rock grows a tree, called, in the language of the ancient inhabitants, *gurse*, or 'sacred tree,' which for many years has been preserved sound, fresh, and entire. Its leaves constantly distil such a quantity of water as is sufficient to furnish drink to every living creature in Ferro; nature having provided this remedy for the drought of the island. Nobody knows of what species this tree is, only that it is called *till*, and stands by itself at the distance of a league and a half from the sea. The circumference is about twelve spans, the diameter four, and its height, from the ground to the top of the highest branch, forty spans. The branches are thick and extended; the lowest commence about an ell from the ground; and the circumference of the whole of them is about a hundred and twenty feet. The fruit resembles an acorn, and tastes somewhat like the kernel of a pine-apple, but is softer and more aromatic. The leaves appear like those of the laurel, but are larger, wider, and more curved: they come forth in a perpetual succession, so that the tree always remains green.

"On the north side of this tree are two large tanks, or cisterns, of rough stone; or rather one cistern divided, each half being twenty feet square, and sixteen spans in breadth. One of these contains water for the drinking of the inhabitants; and the other that which they use for their cattle, and domestic purposes.

"Every morning, near this part of the island, a cloud or mist rises from the sea, which the south and east winds force against the above-mentioned steep cliff; so that the cloud, having no vent but by the gutter, gradually ascends it, and from thence advances slowly to the extremity of the valley, where it is checked by the front of the rock, which terminates the valley. It then rests upon the thick leaves and wide spreading branches of the tree, from which it distils in drops during the remainder of the day, until it is at length exhausted, in the same manner that we see water drip from the leaves of trees after a heavy shower of rain. This distillation is not peculiar to the till; for some bresos, which grow near it, also drop water; but their leaves being few and narrow, the quantity is so trifling, that though the natives catch some of it, yet they make little account of any but what distils from the till, which, together with the water of some fountains, and what is saved in the winter-season, is sufficient to serve them and their flocks. The tree yields most water in those years when the easterly winds have prevailed for a continuance; for by these winds only the clouds or mists are drawn hither from the sea.

"A person lives on the spot near which this curious tree grows, who is appointed to take care of it and its water, and is allowed a house to live in, together with a certain salary. He every day distributes to each family in the district seven pots of water, besides what he gives to the principal people of the island.

"Whether the tree which yields water at the present time be the same as that mentioned in the above description, I cannot determine; but it is probable there has been a succession of them: for Pliny, describing the Fortunate Islands, says, 'In the mountains of Ambrion are trees, resembling the plant *ferula*, from which water may be procured by pressure. What comes from the black kind is bitter, but that which the white yields is sweet and potable.'

*Animals.*] The oxen on the Canary Islands are small, lean, and bony. Sheep, goats, hogs, and poultry, may be had on reasonable terms. Of birds there are hawks and sparrows, natives of the island; as also the sea-swallow, sea-gulls, partridges, swallows, canary-birds, and blackbirds. The inhabitants are but indifferently supplied with fish by the adjoining seas: they are engaged in a considerable fishery on the coast of Barbary, and the produce of it sells at a very moderate price. There are also lizards, locusts, and three or four sorts of dragonflies.

*Mountains, &c.*] The Peak of Teneriffe is an ascent in the form of a sugar-loaf, containing a volcano, which sometimes throws out such quantities of sulphur and melted ore, as to convert the richest lands into barren deserts.

The height of this mountain has been described by Dr. Heberden to be fifteen thousand three hundred and ninety-six feet, which is but one hundred and forty-eight yards less than three miles, reckoning the mile at one thousand seven hundred and sixty yards. Its appearance at sun-set was very striking; when the sun was below the horizon, and the rest of the island appeared of a deep black, the mountain still reflected its rays, and glowed with a warmth of colour which no painting can express. There is no eruption of visible fire from it; but a heat issues from the clinks near the top, too strong to be borne by the hand, when held near them.

The following account of this mountain, given by several English merchants and others, who had the curiosity to climb to the top of it, is extracted from the Philosophical Transactions.

The travellers set out from Oratava, a sea-port on the west side of the island, and passed over several bare mountains and sandy places, till they came to the foot of the Peak, where lie a vast number of huge stones, that seem to have fallen down from above. After they had ascended about a mile on horseback, they were obliged to alight, and climb the hill on foot; and, having traversed a steep black rock about a mile higher, they found the top of it as flat as a pavement. Here the air was very cold after sun-set, and they were forced to keep great fires all night. Next morning they proceeded to that part of the mountain called the Sugar-loaf, which being steep, and the soil a deep white sand, it was very difficult travelling, though they were provided with shoes that had soles a finger broader than the upper-leather, to facilitate the passage. When they came near the summit, they found a strong wind, and a continual breathing of a hot sulphureous vapour issued from the hill, which scorched their faces, and made them sore. On the top there was a large basin or pit, shaped like an inverted cone, which is of considerable depth, and about a musket-shot over. The inside of this cavity is covered with small loose stones, mixed with sand and sulphur, from whence issued a hot suffocating steam; and the footing being so bad, they did not descend into the pit above four or five yards, though some have ventured to the bottom. The brim of this pit, on which they stood, was not above a yard broad; and from hence they could clearly see Grand Canaria, Palma, Gomera, and even Ferro, which is twenty leagues distant. As soon as the sun appears, the shadow of the Peak seems to cover not only this and the Great Canary Island, but even the sea to the very horizon, where it looks as if, being limited, it turned up into the air.

The same gentlemen relate, that there was a great deal of snow and ice about two-thirds of the way up, but at the top there was none at all; which, doubtless, is owing to the hot steam proceeding from the caldron and the

upper parts of the mountain. They mention a remarkable cave, ten yards deep, and fifteen broad, in shape like an oven or cupola, with a hole at the top, near eight yards over, through which their servants let them down by a rope, till they came to a bank of snow. At the bottom of the cave there is a round well of water, exactly underneath the opening above, the surface-whereof is about a yard lower than the snow, and its depth about six fathoms. This is not supposed to be a spring, but only snow blown in and dissolved, or water that drops from the rocks, and is there collected. About the sides and roof of this grotto there were isles hanging down to the snow. They met with no trees or shrubs in their passage but pines, and, among the white sands, a bushy plant like broom.

A physician, who lived upon the island of Teneriffe twenty years, gives it as his opinion, that the whole island, being impregnated with brimstone, formerly took fire, by the violence of which great part of it was blown up, there appearing about the island several mountains of large calcined stones, that must have had their origin from such subterraneous commotions. He further supposes, that the greatest quantity of sulphur lying about the centre of the island, the shock was there the most violent, and occasioned the rising of the Peak to its present prodigious height; and this appears from the vast number of calcined rocks that lie at the bottom of it for three or four miles round. From the Peak to the south-west, as far almost as the shore, are still to be seen the tracks of the rivers of brimstone and melted ore which ran that way, and have so ruined the soil where they flowed, that broom is now its only production. The doctor adds, that in the south-west part of the island there are high mountains of a bluish earth, and stones with a rust on them like that of copper and vitriol, and that there are several springs of vitriolic water.

In the year 1704, there happened a most dreadful earthquake in the island of Teneriffe, which began the 24th of December, and increased till the 31st, when the earth opened, and two volcanos were formed, which cast up so many burning stones as made two considerable mountains; and the combustible matter thrown up by these new volcanos kindled above fifty fires in the neighbouring places. On the 5th of January, the air was darkened with ashes and smoke, the terror increased, and, towards the evening, the country was all in a flame for above a league in extent. This was the effect of another volcano, which had broke out towards Oratava, with at least thirty mouths within the circumference of a quarter of a league. In a word, whole towns were swallowed up or overturned, many thousands of people lost their lives, and the torrents of sulphur and metallic matter thrown out by these volcanoes converted a great part of a fruitful country into a barren desert.

In addition to the above particulars, we shall transcribe an account of the crater of this extinguished volcano, and of some experiments made on its brink by M. Mongey, on the 24th of August, 1785, which may not prove unacceptable to the reader.

"The crater of the Peak of Teneriffe," says this gentleman, "is a true sulphur-pit, similar to those of Italy. It is about fifty fathoms long, and forty broad, rising abruptly from east to west. At the edges of the crater, particularly on the under side, are many spiracles, or natural chimneys, from which there exhale aqueous vapours and sulphureous acids, which are so hot as to make the thermometer rise from nine to thirty degrees of Reaumur. The inside of the crater is covered with yellow, red, and white, argillaceous earth, and blocks of lava partly decomposed. Under these blocks are found eight-sided rhomboidal crystals of sulphur, which are, probably, the finest that have ever been found. The water that exhales from the spiracles is perfectly pure, and not in the least acid, as appeared from several experiments.

"The great elevation of the Peak above the level of the sea induced me to make several chemical experiments, in order to compare the phenomena with those that occur in our laboratories. I shall here confine myself merely to the results.

"The volatilization and cooling of liquors were here very considerable; for half a minute was sufficient for the dissipation of a pretty strong dose of ether. The action of acids on metals, earths, and alkalis, was slow; and the bubbles which escaped during the effervescence were much larger than ordinary. The production of vitriols was attended with very singular phenomena: that of iron assumed, all at once, a beautiful violet colour; and that of copper was suddenly precipitated of a very bright blue colour. I examined the moisture of the air by means of the hygrometer of pure alkali and of vitriolic acid; and I thence concluded, as well as from the direction of the aqueous vapours, that the air was very dry; for, at the end of three hours, the vitriolic acid had suffered hardly any change either in colour or weight; the fixed alkali remained dry, except at the edge of the vessel that contained it, where it was a little moist; and Saussure's hygrometer pointed to sixty-four degrees, as nearly as the impetuous wind which then blew would enable us to judge.

"Liquors appeared to have lost nothing of their smell or strength at this height; a circumstance which contradicts all the tales that have been hitherto related on this head: volatile alkali, ether, and spirit of wine, retained all their strength; the smoking spirit of Boyle was the only one that seemed to have lost any sensible portion of its energy. Its evaporation, however, was not the less quick; for in thirty seconds a quantity which I had poured into a cup was entirely volatilized, and nothing remained

but the sulphur, which tinged the rim and the bottom. When I poured the vitriolic acid on this liquor, there happened a violent detonation, and the vapours that arose had a very sensible degree of heat. I tried to form volatile alkali, by decomposing sal-ammoniac with the fixed alkali; but the production was slow and hardly sensible, while at the level of the sea, this process, made with the same substances, succeeded very readily and in abundance.

"As I was curious to investigate the nature of the vapours that exhale from the crater, and to ascertain whether they contained inflammable air, fixed air, and marine acid, I made the following experiments: I exposed on the edge of one of the spiracles a nitrous solution of silver in a cup: it remained upwards of an hour in the midst of the vapours which were continually exhaling, but without any sensible alteration; which sufficiently proved that no vapours of marine acid exhaled from the crater. I then poured into it some drops of marine acid, when a precipitation of lunea cornea immediately ensued; but, instead of being white, as it generally is, it was of a dark violet colour, which soon became grey, and assumed the form of small sealy crystals. I think myself justifiable in attributing this alteration of colour to the vapours of inflammable air, according to some experiments that I have made on the precipitation of lunea cornea in such air. Lime-water, exposed for three hours on the margin of the crater, and near a spiracle, was not covered with any calcareous pellicle, nor even hardly with any filmy appearance; which seems to prove, not only that no vapours of fixed air exhale from the crater, but that the atmospheric air which rests upon it contains very little of that air; and that the inflammable vapours and sulphureous acids alone are sensible and considerable. The electricity of the atmosphere was pretty considerable; for Saussure's electrometer, when held in the hand at the distance of about five feet, indicated three degrees; while, on the ground, it pointed only to one and a half."

The ship appointed, in 1792, to convey Earl Macartney and his suite on the embassy to the emperor of China, touched at Teneriffe, in the month of October, and a party of them attempted the ascent, the result of which was as follows:

The party set off, accompanied by two muleteers as guides. They passed through a pleasant vale, covered with vines, and ascending an eminence, the sloping sides of which were entirely covered with a grove of chestnut-trees, they arrived at the summit of the first, called the Green Mountain. They had now to attain the top of a second mountain, whose sides were craggy and sterile, and its ascending path on the brink of precipices. A few pines were thinly scattered on its sides. By means of a barometer, they found they had ascended nearly six thousand feet above the town. The mountain upon which they

m and the bottom. In this liquor, there were vapours that arose, tried to form volcanic matter with the fixed and hardly sensible, made with the acids, and in abundance.

The nature of the volcanic matter was to ascertain whether it was of a marine acid, and marine vapours: I exposed on a solution of silicic acid of an hour in the solution, but usually exhaling, but sufficiently proved the nature of the volcanic acid, when a solution ensued; but, in fact, it was of a dark colour, and assumed the appearance of myself justifiable to the vapours of the experiments that I made on the sea cornea in such vapours on the margins of the hills, not covered with any filmy appearance, but that no vapours arose, and that the atmosphere was very little of that nature, and sulphureous vapours. The electricity was considerable; for Saunders and at the distance of several miles; while, on the other hand, it was very little.

They Earl Macartney, Emperor of China, in the month of October, and a result of which

two muleteers as a guide, covered with the sloping sides of the mountain, of chestnut-trees, called the Green Hill, the top of a second mountain, sterile, and its appearance. A few pines were seen, by means of a barometer, nearly six thousand feet upon which they

mood was now overcast with clouds; and various and impetuous gusts of wind, combating each other, seemed to threaten any further approach.

Excavations, resembling distinct craters of volcanic matter, were discovered in every part of this mountain; and night setting in, and the path being difficult, the guides not only proposed to halt, but, in contempt of threats, were unwilling to proceed. The travellers wanted much to reach that part known by the name of La Estancia dos Ingleses, the resting-place of the English. It then began to rain, and blow with violence, and the guides, anticipating, from experience, an approaching tempest, declared the unsheltered traveller must inevitably perish, and insisted on stopping under the brow of a projecting rock.

They had furnished themselves with provisions at Oratava: they kindled a fire with the branches of the cyprus; and the leafy boughs of the Spanish broom served them as a couch to sleep upon. The thermometer was now at forty-five degrees; the air keen, the wind tempestuous, and they had no shelter against the rain.

At day-break they arose; but the weather was exceedingly boisterous, driving, with violence, heavy drops of rain. They saw the point of the upper cone, but the conical frustum, by which it was supported, was concealed by thick clouds; these rolled in succession along its sides, and, being thence rapidly hurled into the valleys, between the hills, against which they were forcibly driven, quickly condensed into rain. Some of the party then gave up the project, and, by the assistance of one of the guides, returned to Oratava.

Those who pursued the ascent were attended by another guide, one of the few remaining of the descendants of the Guanches. They had attained the summit of the mountain, whence arises the great cone, which, being frequently covered with snow, occasioned the ancients to give the whole island the name of Nivaria. The plain on the top of the mountain presented a dreary waste, loaded with black lava, without verdure or vegetation, except a solitary cyprus, which, peeping through the fissures of a rock, discovered its feeble withering branches.

The cold was piercing and intolerable; the fall of sleet tormented the hands, and incapacitated them from holding the reins. At length the tempest raged with increased violence, and the drops of rain fell half congealed; the difficulties they had to encounter were insurmountable, and the only choice left was that of returning.

Excursions to the Peak, at proper seasons of the year, are attended with less difficulties. Mr. Johnstone, a native of Great Britain, and at that time a merchant in Madeira, visited this place in the summer-time. He and his party provided themselves with tents, and slept, the night before they got to the Peak, nearly upon the same spot which finished the labours of those just mentioned.

There they encamped on ground covered with pumice-stone; a stream of lava on each side; in front, a barren plain; the island of Grand Canaria bearing south-east, as if rising out of an immense field of ice, formed by the clouds below them. About four o'clock next morning, the first of August, the moon shining bright and the weather clear, they began to ascend a kind of path, along the first great frustum, leading to the smaller and higher Sugar-loaf. The passage was steep and disagreeable, being covered with pumice-stone, which gave way at every step. In about an hour they got to the Alta Vista, where it was necessary to climb over the lava, leaping from one large stone to another, till their arrival at the foot of the Sugar-loaf. Here they rested about five minutes. They then began to ascend the Sugar-loaf. This was by much the most fatiguing part; it being exceedingly steep, and wholly consisting of small pumice-stones; so that the foot, at every step, sinks and slides back. They were obliged to take breath repeatedly. It was little more than six o'clock when they got upon the summit of the Sugar-loaf. At this time the clouds had gathered about a mile and a half perpendicular below. They were thick, and had a very striking effect, appearing like an immense extent of frozen sea, covered with innumerable hillocks of snow, above which the islands of Grand Canaria, Palma, Gomera, and Ferro, raised their heads. On the sun's getting a little higher, the clouds disappeared, and opened to the view the coast around. The colours, hoisted on the Peak, were distinctly seen in Oratava, through a telescope.

The prospect from the Peak is romantic and extensive, no other hill being of a height to intercept the view. The coast is perceived all round, and a distinct idea of the island may be formed. The north-west coast appears to be well cultivated; but the south-east seems dreary and barren. Within the summit of the Peak is an excavation; not less than eighty feet in depth, into which the travellers descended, and gathered some sulphur, with which the surface is mostly covered. In many parts the foot cannot rest upon the same spot above a minute, the heat penetrating quickly through the shoe. Smoke issues frequently from the earth. Just under the surface is a soft reddish clay, so hot, that the hand introduced into it must instantly be withdrawn. In the caldron, the sulphureous odour is very offensive; but on the ridge it may be easily endured.

From this place they saw the town of Santa Cruz, and the shipping in the road, which is a distance, in a direct line, of about twenty-five miles. They continued two hours and a half upon the summit of the Peak, without feeling any inconvenience from heat or cold. Soon after sun-rise the thermometer, in the shade, was at fifty-one degrees. They descended the Sugar-loaf in a few minutes, running the whole way, which was found to be the best

mode. At the foot of the Peak there were several caverns in the midst of lava, some filled with fine water, extremely cold, and frozen at the edges of the caverns. Others, in the winter, are filled with snow, over which the sun never shines; and thus a portion of snow continues in them throughout the year.

On the north-east part of the island of Palma is a lofty and spacious mountain, called the Caldron, from having a hollow in it. The descent within the caldron, which proceeds gradually from the summit, contains a space of about thirty acres, and on the declivity of the inside are several springs, which form a stream that issues out from the extremity of the mountain near the sea-shore. On the south side of the island is a medicinal well of hot water; and at a village called Uguar is a cave, at the extremity of which is a curious grotto, with the roof studded with large flakes of slate-stones, from between which constantly issues a flow of clear and wholesome water.

*Sepulchral Caves.*] The ancient inhabitants of these islands were called, by the Spaniards, Guanches; and their sepulchral caves are particularly worthy of notice:— They had an uncommon veneration for the bodies of their ancestors, which were deposited in caves formed by nature in the rocks. They were preserved in goats' skins, bound round by belts of the same, so exactly and uniformly enclosing the body, as to excite admiration, each round being exactly proportioned to the part; and this method preserved the bodies. The eyes, which are closed, the hair, ears, nose, teeth, lips, and beard, are found entire. They are placed on wooden couches, which the natives had the art of rendering so hard, that they are impenetrable to iron. Some of the caves contained two or three hundred bodies. We shall conclude the account of these sepulchres in the words of a learned European, who resided several years on the island. "Being one day hunting, a ferret, having a bell about his neck, ran after a rabbit into a hole, where the sound of the bell was lost. The owner being afraid he should lose his ferret, in seeking about the rocks and shrubs, found the mouth of a cave, and entering in, was so affrighted, that he cried out. His fright arose from one of these corpses, very tall and large, lying with the head on a great stone, the feet supported by a little wall of stone, and the body itself resting on a bed of wood. The man, being now a little recovered from his fright, went nearer, and cut off a piece of the skin that lay on the breast of the body, which was more flexible and pliant than any kid-leather glove, yet not in the least rotten. These bodies are very light, as if made of straw; and in some that were broken might be observed the nerves and tendons, as also the veins and arteries, like strings, very distinctly. By the relation of the oldest inhabitants, there was a particular tribe who had this art only among themselves, which they kept as

a thing sacred, and not to be communicated to the vulgar. The people of this class were likewise priests, and did not marry out of their own tribe. But when the Spaniards conquered the place, most of them were destroyed, and the art perished with them. Their ancient people say that they have above twenty caves of their kings and great personages, with their whole families, yet unknown to any but themselves, and which they will never discover."

*Population.*] The population of Grand Canaria is estimated at forty thousand inhabitants; Palma, thirty thousand; Fuerteventura, ten thousand; Lancerota, eight thousand; Gomera, seven thousand; and Ferro, one thousand five hundred.

*Manufactures and Commerce.*] The principal manufactures of these islands are silk-hose and garters, which are knit; quilts, taffeties, blankets, coarse cloths, &c. In the large towns the men are weavers and tailors; but, in the villages, women only perform these operations; and the exportation of raw silk is prohibited, in order to encourage the manufactories.

The commerce of the Canaries may be considered under five heads, viz. the domestic trade with each other, and from island to island, the trade to Europe, the Spanish West-Indies, America, and the coast of Barbary. The centre of trade is Teneriffe. The principal commerce is carried on in foreign bottoms. The various imports are woollen goods, hardware, hats, red-herrings, pilehards, wheat, &c. from Great Britain; butter, candles, pickled pork, pickled herrings, &c. from Ireland; gun-powder, cordage, coarse flax, &c. from Holland and Hamburgh; bar-iron, from Biscay; dried cod, rice, beef, pork, hams, bees-wax, deal boards, staves, wheat, flour, maize, &c. from the American colonies; and silks, velvets, oils, cordage, &c. from Barcelona, Seville, Majorea, Italy, and Cadiz.

*Customs, Manners, &c.*] The inhabitants of these islands are, in general, small of stature, but well made, and have good features. Their complexions are very swarthy, their eyes full of fire, and their countenance expressive. They are fond of calling themselves Spaniards, and speak the Castilian language; the better sort of people with a good grace, but the vulgar very unintelligibly.

The higher classes wear, in common, a camblet cloak, of a dark red or black colour; a linen night-cap, bordered with lace, and a broad slouched hat. When they pay visits, a coat, sword, and white peruke, are added; which latter forms a striking contrast with their dark countenances; and what is still more singular, they keep their heavy slouched hats upon their heads always in the house, but when they are out of doors they carry them under their arm. The common people wear their own black bushy hair, and tuck some of it behind the right ear. Their principal garment is a white loose coat, made in the

manner of a French loose coat, with a friar's cape, and girded about the middle with a sash.

The women wear on their heads a piece of gauze, which falls down the shoulders, and covers the neck and breasts. One part of their dress is a broad-brimmed hat: but they use this with more propriety than the men; for they wear it in the open air, to shield their faces from the scorching beams of the sun. Over the shoulders a mantle is thrown, its quality being in proportion to the condition of the wearer. Jackets are worn instead of stays; but all are very fond of a great number of petticoats. The principal ladies of Canaria and Teneriffe dress after the fashions of France and England, and pay visits in chariots: but none walk the streets without being veiled; though some are so careless in the use of their veils, that they take care to let their faces and necks be seen. Some ladies have their hair curiously plaited, and fastened to the crown of the head with a gold comb. Their mantles are very rich, and they wear a profusion of jewels; but clumsiness of dress, and awkwardness of gait, are almost general.

Both sexes go every morning to hear mass, and generally before they take any refreshment. Their breakfast is usually chocolate. They dine at noon, and shut up the doors till three o'clock. People in good circumstances have four courses brought to table: the first is soup, the second roast meat, the third an olio, and the fourth the dessert. They cease drinking as soon as the cloth is removed, and after dinner all the company wash their hands in one large utensil, and then go to sleep for about an hour. In winter evenings, they regale themselves with chocolate and sweetmeats; but, in summer, spring-water is substituted instead of chocolate.

The people in general sleep on mattresses, spread on mats, and placed on the floor. The sheets, pillows, quilt, &c. are fringed or pinked; but no curtains are used, as they are considered harbours for fleas and bugs. The women sit upon cushions, on a raised part of the floor, either when they receive or when they pay visits. The children are instructed in convents, and usually make a rapid progress, as they have a quick genius, particularly for poetry. The common amusements are singing, dancing, playing on the guitar, cards, wrestling, quoits, throwing a ball through a ring at a distance, &c.

Each of the Canary Islands, as well as each town and family, has its peculiar titular saint; and the festivals of these saints are kept with great solemnity.

The employment of a butcher, taylor, miller, or porter, is held in the utmost contempt by the generality of the people; as they consider that a butcher is barbarous, a taylor is effeminate, a miller is a thief, and a porter is a human beast of burthen.

The gentry, in general, though proud, are polite; the lower class, though poor, are decorous; and even beggars

ask charity with a good grace, and, if refused, never behave with impertinence. Private pilfering is very common here, but highway or street robberies seldom occur. The only consequence of robbery is a severe beating, or a short imprisonment. Duels are never heard of, but private murders are very common.

The inhabitants of the Canary Islands are, in general, temperate; for nothing can be a greater disgrace than to be seen intoxicated; and a man who can be proved a drunkard is not admitted to take his oath in any court of judicature. Hence those who are fond of liquor inebriate themselves in their chambers, and then lie down, in order to sleep themselves sober. If a man fall in love with a young woman, and her parents refuse to consent to the union, she has liberty to complain to the curate of the parish, who takes her away, and places her in a convent, where she must remain till they consent to her marriage.

Religion here, as in every part of the Spanish dominions, engrosses much of the leisure time of the inhabitants. Even ladies of rank seldom go out hut to mass, matins, or vespers. The unmarried live in convents, and are often enticed to take the veil. The residence of the bishop of the isles, whose revenue is ten thousand pounds a year, is at Canaria. The revenue accruing to the crown from all the Canaries, after deducting the ordinary expences of administration, does not exceed sixty thousand pounds a year. The duty on tobacco and snuff is so enormous, that the temptation to smuggle is irresistible.

According to the account of the first discoverers, the original inhabitants of Grand Canaria amounted to upwards of fourteen thousand men capable of bearing arms, exclusive of women, children, aged persons, &c., which must have rendered the island extremely populous. The natives, in general, were tall of stature, active, cheerful, and of dark complexions. They were humane and warlike, faithful to their promises, and fearless of danger. They frequently climbed up very steep precipices, and, by means of long heavy poles, leaped from rock to rock. Their dress was a close short coat, reaching only to the knees, and girded round the middle with a leather belt. The coat itself was made of rush, which they beat till it became soft, like flax, and then spun and wove into a garment. Their outward covering was a goat-skin cloak; the hairy side of which they wore inward in the winter, and outward in the summer. Their caps were made of the skins of goats' heads, so contrived, that part of the beard hung down by each ear, and was sometimes tied under the chin.

The external distinction of the noble or superior rank of Canarians from those of the vulgar or lower class, was by the cut of their hair or beards.

The Canarians originally used only stones, clubs, and sharp-pointed poles; but, after having been invaded by

the Europeans, they learnt of their invaders the art of making shields and swords. In all their wars, however, they preserved humanity and decency; for they never molested women or children, nor did the least damage to the temples or sacred places belonging to their enemies. They had, in times of peace, amphitheatres for public combats; when a challenge being given in form, the challenger and challenged both repaired to the grand council of the island, which consisted of twelve principal nobles: here they petitioned for permission to fight; which being granted, they went to the fray, or principal officer, to confirm that permission. This being done, and all things prepared, they went to the amphitheatre, where the exhibition was begun by the two combatants mounting on two large stones at some distance, and pelting each other with smaller stones, which were supplied them for that purpose: the principal skill consisting in avoiding being struck by these, by mere dexterity of body. This ludi- cation being performed, they engaged with a cudgel in the right hand, and a flint-stone in the left, with which they gave each other a severe beating; then retiring for some refreshments, they afterwards returned, and fought again, till the grand council ordered them to desist. These combats were generally fought on public festivals; and the cure, if either of the combatants were wounded, was of a singular nature; for a skilful person, who acted as surgeon, pounded a rush, till it became of the consistency of tow, and then, dipping it in goat's tallow, he applied it warm to the place affected.

The houses of the native Canarians were built of stone, but not cemented together: they were, however, fastened with such exactness, that their appearance was not uncouth. The floors were sunk beneath the level of the ground, and the walls were very low. The roofs were formed of wooden beams, covered with earth. Beds made of goat-skins, mats of rushes, and baskets formed of palm-leaves, were the whole of their furniture.

The women, in the proper season, gathered flowers, herbs, and shrubs, from which they extracted a variety of colours; and, when that season was over, they employed themselves in dying, staining, and painting, their houses, furniture, and dresses. Their thread was made of nerves or tendons, their needles of bone, their fish-hooks of horn, and their domestic utensils of clay dried in the sun. The common food of the Canarians was barley-meal, milk, butter, &c. They ground their barley with a hand-mill, and ploughed their ground with a wooden machine, which in some measure resembled a hoe, with a spur at the end of it. When the land was too dry, they had a method of sluicing it, by the means of channels cut in parallel lines, with others intersecting them at right angles. The corn, when ripe, was always reaped, threshed, and winnowed, by the women.

The richer sort of the people resided chiefly in the interior parts of the island, and the poorer class inhabited the sea-coast, where they subsisted principally by fishing. They had a peculiar method of catching a small but exquisite fish, of the pilchard kind, which was this: when they perceived a shoal near the shore, a number of persons swam off, surrounded the fish, and drove them into nets, which were purposely laid for their reception. The prize was then divided between all present with great equity; but pregnant women had always the allowance of two persons; and those who had children, besides their own share, received a share for each child.

Among the original Canarians was an order of nuns, who were distinguished from the other women by a peculiar sort of long white garments. They had many superstitious traditional notions among them; and the places where they resided were deemed places of refuge for criminals, and had privileges very nearly resembling European sanctuaries. In all crimes, but those punishable by death, the laws of retaliation were used, and justice, in general, impartially administered.

In times of public danger, or when they looked upon themselves to be afflicted by any general calamity, the Canarians went in processions to the rocks and mountains, preceded by the religious women, and carrying with them branches of palm, and vessels filled with milk, which latter they poured upon the rocks, as religious oblations, and then danced in mournful measure, and sung melancholy songs, to deprecate the wrath of their supposed deities. When any of the Canarians died, if capital people, they were buried in sepulchral caves; if of the vulgar class, in holes in the ground, which were afterwards covered with stones.

## SECTION XII.

### THE MADEIRA ISLANDS.

The Madeira Islands are three in number; namely, Madeira, properly so called; the Island of Puerto Santa, or Porto Santo; and Isla Deserta, or the Desolate Isle. The whole are situated in the Atlantic Ocean, between thirty-two and thirty-three degrees of north latitude, and between seventeen and eighteen degrees of west longitude.

The largest of these islands, from which the rest derive the general name of Madeira, is about seventy-five miles in length, and upwards of thirty-six, in some places, in breadth. It is composed of one continued hill, of a considerable height, extending from east to west; the declivity of which, on the south side, is cultivated and interspersed with vineyards. The seasons here may be said to be only two, spring and summer; as no degree of heat or cold has been found unpleasant.

A distant view of the Island of Madeira represents it as

a rocky, barren approach, its picturesque and ward of the island at the top is perpendicular, and able only to pe-

number; namely, of Puerto Santa, the Desolate Island, Ocean, between north latitude, and of west longitude. which the rest of about seventy-five, in some places, continued hill, of a distance to west; the desolate and uncultivated and in some here may be said as no degree of Madeira represents it as

a rocky, barren, and uncultivated spot; but, on a nearer approach, its beauties open to view, and form a scene picturesque and enchanting. From Funchal, to the eastward of the island, the road is steep and craggy up hills: at the top is a narrow path, on one side of which is a perpendicular rock; on the other a dreadful precipice, passable only to pedestrians, or to some well-trained mules.

Many parts of Madeira, being mountainous and rugged, and others nearly destitute of soil, are incapable of culture. Small patches, indeed, of cultivated ground appear in the narrow valleys, in which, also, there are some villages. But, though the cultivators are lazy, they have shown instances of industry, by breaking, on the sides of hills thinly covered with soil, such pieces of scattered rock as contain vegetable matter into smaller parts; and the rills from the heights being made to flow over, the fragments combine, and become a fertile mould.

The highest mountains of Madeira have hardly any volcanic appearance. The clouds frequently envelope their tops, and from them descend all the streams and rivulets of the island. Their antiquity is marked by the deep chasms they have formed in their descent between the ridges of the rocks, during the long lapse of time they have continued to flow. In the beds of these rivulets are found pebbles of various sizes, and large round masses of siles, such as are usually found in the beds of many similar torrents in the Alps. The soil also of the fields and pasturage-grounds appears exactly the same as those of the Continent, where no volcanic fire has ever been supposed to have existed.

No lava of a glassy nature has been discovered in Madeira, nor any perfect pumice-stone; circumstances which both indicate, that not the highest degree of heat had been suffered here; but it is probable, that the bay or beach of Funchal is a segment of a large crater, the exterior part of which has sunk into the sea; for the shining blue stones upon the beach are all of compact lava; and tempestuous weather throws always upon the shore larger masses of the same blue stone, and also a quantity of cellular lava, approaching to pumice-stone in texture, but much heavier, and not fibrous. It may also be observed, that the Loo-Rock, and the landing-place opposite to it, to the westward of Funchal Bay, as well as that upon which Fort St. Jago is constructed, are evidently perpendicular fragments of the edges of the crater, which have hitherto resisted the action of the sea, by having been better supported, or having more closely adhered together, though much worn by the violence of the surge.

The inhabitants are well supplied with delicious fruits and vegetable esculents, of various kinds. But the grape, chiefly white, is the staple production of the island. Twenty-five thousand pipes, each of a hundred and twenty gallons, are said to be made annually: of this quantity

one half is exported to England, North America, and the West-Indies, and the residue is consumed by the inhabitants.

Other kinds of grapes are native in Madeira; one whose juice has a deeper colour than the former, the wine of which is called Tinto; another, called Bastardo, has a red skin, but produces a white juice; and, lastly, on some few soils, a third species is raised, whose juice is remarkably sweet and rich, from which is made that celebrated wine called Malmsey. The wine is made by pressing the juice out in a square wooden vessel. The persons employed, having taken off their shoes and jackets, get into it, and, with their elbows and feet, press out as much of the juice as they can. In like manner the stalks, being tied together, are pressed under a square piece of wood, by a lever, with a stone fastened to the end of it.

The inhabitants of this island make the best sweetmeats in the world, and succeed wonderfully in preserving citrons and oranges, and in making marmalade and perfumed pastes, which exceed those of Genoa. The sugar they make is excellent, and smells naturally of violets.

The food most relished at Madeira is pork. The hogs, when young, are marked by their owners, and suffered to range wild among the mountains, and, at last, are hunted and caught by dogs.

No serpents, nor any noxious animals, have been known to exist at Madeira; neither are there hares or foxes. Fish of several kinds are caught on the coast, but herrings and oysters are never found. Salted cod, in abundance, is imported from America; and, being the principal diet of the poor, occasions frequent scorbutic eruptions.

Mr. Spilsbury, surgeon of his majesty's sloop Favourite, who was there in 1805, has furnished us with the following account of Funchal:

"The town is large, but the streets are narrow; the lower floors are all warehouses, and are far from being in a clean condition. We got excellent fruit here, at very reasonable prices. Most of the shops are filled with articles of English growth and manufacture. The better sort of people dress like the English, but the costume of the country people is rather grotesque, especially of the women. This consists of a blue conical cloth cap, with a small bit of red rag on each side; under this, a white linen handkerchief, which flows over the shoulders; a straight cloth cloak, blue or brown, edged with red; a close-bodied jacket, and a striped petticoat: they go bare-legged. The men likewise wear a cap, and their coat thrown over their shoulders; their waistcoats and drawers fit close, the latter reaching below the knee.

"The countrymen, in general, carry a long pole on their shoulders, over which is oftentimes thrown their coat. The women, according to the Moorish custom, squat on their hams. On Sunday, they bring various productions from

the country for sale. They are very hospitable and inoffensive. A draughtsman, whom we met with here, informed us, he had travelled over the island, and was always well treated: he described the views as the most grand and romantic imaginable.

"The cathedral is well worth seeing; it is very richly decorated with gold and silver ornaments. In the body of this edifice, while I was viewing it, the corpse of a female child was brought, without a coffin, dressed with flowers, and its hands clasped together: a hole was dug, into which they laid it; the earth was then thrown over it, and trampled down before its mother, who appeared very little concerned. We afterwards learned, that parents rejoice at their children dying so young; as, having no sin, they are sure to go to heaven."

The merchants of the British factory attach themselves to the cultivators of the vine, and supply them, in advance, with whatever can contribute to their necessities. They are remarkable for their hospitality to strangers, as their houses are open, on the slightest recommendation, for the reception of passengers, who stop there for refreshments on their way to Asia or America.

The clergy are very numerous, and generally rich; but none who are descended from Moors or Jews are admitted to take orders. In marriages, affection is seldom thought of; the principal enquiries are into family, descent, and circumstances. The women are prohibited from marrying Englishmen, unless they consent to change their religion, and turn Roman Catholics.

Murders are very frequent, on account of the great number of places deemed sanctuaries, and the ease with which an assassin can screen himself from justice. But, if the criminal be taken before he reach a sanctuary, the punishment is only banishment or confinement, either of which may be evaded by a pecuniary compensation.

The military establishment of the island consists of three hundred regular troops, half infantry, the rest artillery, and two thousand militia, who are embodied occasionally; the latter, making two battalions, are obliged to provide themselves with a uniform. There are also ten thousand irregular militia, who are not so clothed, nor called out to exercise; and, being at no expence on that account, are compelled to perform garrison-duty, to take charge of signals, and repair the highways.

The churches are made repositories for the dead. The corpse is curiously dressed and adorned; yet, in the interment, a quantity of lime is used, in order to consume

the body with all imaginable despatch, which usually happens in a fortnight, so that there is then room for another corpse. The bodies of protestants are not allowed to be buried, but must be thrown into the sea, unless a large sum of money be paid to the clergy.

### SECTION XIII.

#### THE AZORES.

These islands are situated in the latitude of between thirty-seven and forty degrees north, about five hundred and forty geographical miles to the north-west of Madeira. They are nine in number, and are named Santa Maria, St. Michael, Terceira, St. George, Graciosa, Fayal, Pico, Flores, and Corvo. They were discovered in the middle of the fifteenth century, by Joshua Vander Berg, a merchant of Bruges, in Flanders, who, in a voyage to Lisbon, was, by stress of weather, driven to these islands, which he found destitute of inhabitants, and called them the Flemish Islands. On his arrival at Lisbon, he boasted of this discovery, on which the Portuguese immediately hastened to take possession of them. They were called, in general, the Azores, from the great number of hawks and falcons found among them. All these islands enjoy a clear and serene sky, with a salubrious air; but they have frequently suffered by violent earthquakes, and also by inundations of the surrounding waves. They are, however, extremely fertile in corn, wine, and a variety of fruits, also cattle, fowl, and fish.

Terceira is the most important of these islands, on account of its harbour, which is spacious, and has good anchorage, but it is exposed to the south-east winds. Its capital town, Angra, contains a cathedral and five churches, and is the residence of the governor and the bishop.

St. Michael, which is near one hundred miles in circumference, and contains fifty thousand inhabitants, was twice invaded and plundered by the English, in the reign of Queen Elizabeth.

Pico contains a mountain of remarkable height, by some reported to equal that of Teneriffe, and which might with propriety be assumed as the first meridian of longitude, instead of the various and confused distinctions which have been adopted.

The rest of these islands do not contain any thing remarkable, nor do they vary from those described in any of their productions.

## CHAPTER I.

### DISCOVERY, &c.

**N**OTHING can be more appropriate than the division of this vast continent into two parts, called North and South America; for Nature herself seems to have pointed out such a distinction by the narrow isthmus with which she has separated that extensive region.

It is clearly ascertained, that the southern limits of America are from the Straits of Magellan; but the precise northern boundary will probably long remain unknown. This limit may extend to eighty degrees; but, at present, we are only justified in estimating the length of the American continent from the seventy-second degree of north latitude to the fifty-fourth degree of south latitude, or the Straits of Magellan: and thus it is known to contain a space of one hundred and twenty-six degrees, or seven thousand five hundred and sixty geographical miles. The greatest breadth of South America is two thousand two hundred and eighty geographical miles, or forty-eight degrees, and runs from Cape St. Roque, in the east, to Cape Blanco, in the west. In North America, however, the extreme breadth is upwards of a third greater: it may be taken from the most eastern point of Labrador, or even of Greenland, to the promontory of Alaska, which gives about three thousand eight hundred and forty geographical, or four thousand four hundred British, miles. The total length of America may be computed at eight thousand eight hundred British miles.

As it is now admitted that Greenland forms a part of America, the credit of the first discovery of that continent has of late been taken from Columbus, and given to the Norwegians, who visited Greenland in the year 982; and this discovery was succeeded, in 1003, by that of Finland,

which was probably a part of Newfoundland, or Labrador. The former colony flourished for a length of time, and was, at last, impeded only by the increase of the shoals of ice, which put a stop to its maritime intercourse; but that of Finland was soon destroyed by the commotions which took place among its settlers. But the Danes afterwards settled on the western coast, and called their establishment New Greenland, in opposition to the original colony on the eastern shores. Greenland, however, was long well known, and was probably visited by many of the numerous English ships which sailed to Iceland in the fourteenth and fifteenth centuries.

The Welch imagine that, in 1170, their country contributed to people the New World, by the adventure of Madoc, son of Owen Gwynedd, who, on the death of his father, sailed there, and colonized part of the country.

The glory of discovering the important parts of America, however, is due to Christopher Columbus; for Behaim, who was the most complete geographer of his time, has proved that no previous discovery was made in the route adopted by that celebrated navigator.

It seems that the Canary Islands were faintly known to the Spaniards about the middle of the fourteenth century; and the Normans had made piratical excursions as far as these isles, which were, at length, completely conquered in the year 1402, by a Norman gentleman, named Jean de Bethencourt, who obtained the consent of the Spanish court to assume the title of King of the Canaries. Madeira is said to have been discovered by the English in 1344; but the Cape de Verd Islands appear not to have been known till 1446, nor the Azores till 1449. The

King of Portugal, in 1466, gave these last isles to his sister, the Duchess of Burgundy; and, a famine then prevailing in Flanders, many people emigrated to them, among whom was Job de Huerter, lord of Moirkirchen in Flanders, who afterwards resided in Fayal, and appears to have had a grant of the Azores from the Duchess of Burgundy. Behaim, the celebrated geographer already mentioned, married the daughter of Huerter; and, by his account, as inscribed on his globe, the Azores were discovered in 1431, and received their name from the numerous goshawks found upon them. The discovery of these isles, so far to the west, proved a strong incentive to Columbus to extend his researches.

Towards the close of the fifteenth century, Venice and Genoa were the only powers in Europe who owed their support to commerce. An interference of interests occasioned a mutual rivalry; but Venice was much superior in traffic, as she engrossed the whole commerce of India. In this state of affairs, Columbus, who was a native of Genoa, conceived a project of sailing to the Indies by a new and unknown route. But his proposal was rejected by the Genoese as chimerical, and the principles on which it was founded were considered absurd. Irritated by disappointment, Columbus retired from his country, and laid his scheme before the court of France; but there his reception was still more mortifying. He next applied to Henry VII. of England; but the cautious politics of that prince were the most opposite imaginable to so important a speculation.

In Portugal, where the spirit of adventure and discovery about this time began to operate, he had reason to expect better success. But the Portuguese contented themselves with proceeding along the coast of Africa, and discovering one cape after another; without attempting to venture into the open sea. Notwithstanding his disappointments, however, Columbus still remained firm: he became the more intent on his design, the more difficulty he found in accomplishing it, and was inspired with that enthusiasm which always animates an adventurous and original genius. Spain was now his only resource; and there, after an attendance of eight years, he succeeded, chiefly through the interest of Queen Isabella; for such was the prejudice of Ferdinand, her husband, against Columbus, that he refused to take any part in the enterprise as king of Arragon. As the whole expence of the expedition was, therefore, to be defrayed by the crown of Castile, Isabella reserved for her subjects of that kingdom an exclusive right to all the benefits which might result from its success. The chief articles of the capitulation entered into with Columbus were as follow:—

First, Ferdinand and Isabella, as sovereigns of the ocean, constituted him their high-admiral in all the seas, islands, and continents, which should be discovered by his

industry; and stipulated, that he and his heirs for ever should enjoy this office, with the same powers and prerogatives as belonged to the high-admiral of Castile, within the limits of his jurisdiction. Secondly, They appointed Columbus their viceroy in all the islands and continents which he should discover; but if, for the better administration of affairs, it should hereafter be necessary to establish a separate governor in any of those countries, they authorised him to name three persons, of whom they would choose one for that office; and the dignity of viceroy, with all its immunities, was likewise to be hereditary in the family of Columbus. Thirdly, They granted to him and his heirs for ever the tenth of the free profits accruing from the productions and commerce of the countries which he should discover. Fourthly, They declared that, if any controversy or law-suit should arise, with respect to any mercantile transaction in the countries which should be discovered, it should be determined by the sole authority of Columbus, or of the judges to be appointed by him. Fifthly, They permitted him to advance one-eighth part of what should be expended in preparing for the expedition, and in carrying on commerce with the countries which he should discover, and entitled him, in return, to an eighth part of the profit.

Accordingly, on the 3d of August, 1492, Columbus sailed from Spain in quest of a new world. But the armament was not suitable, either to the dignity of the nation by which it was equipped, or to the importance of the service for which it was destined. It consisted only of three vessels. The largest, a ship of no considerable burthen, was commanded by Columbus, as admiral, who gave it the name of *Santa Maria*, in honor of the Blessed Virgin. The second, called the *Pinta*, was commanded by Martin Pinçon, a man of much wealth and experience, and his brother Francis was pilot. The third, named the *Nigna*, was under the command of Vincent Vanez Pinçon. These two were light vessels, hardly superior in burthen or force to large boats; and the *squadron*, if it merit that name, was victualled for twelve months. It had on board ninety men, mostly sailors, together with a few adventurers, who followed the fortune of Columbus, and some gentlemen of Isabella's court, whom she appointed to accompany him. Though the expence of the undertaking was one of the circumstances which chiefly alarmed the court of Spain, and retarded so long the negotiation with Columbus, the sum employed in fitting out this squadron did not exceed four thousand pounds.

As the art of ship-building in the fifteenth century was extremely rude, and the bulk of vessels was accommodated to the short and easy voyages along the coast, which they were accustomed to perform, it is a proof of the courage and enterprising genius of Columbus, that he ventured, with a fleet so ill adapted for a distant naviga-

tion, to explore un-

tion, to explore unknown seas, where he had no chart to guide him, no knowledge of the tides and currents, and no experience of the dangers to which he might be exposed. His eagerness to accomplish the great design which had so long engrossed his thoughts, made him disregard every circumstance that would have intimidated a less adventurous mind. He facilitated the preparations with such ardour, and was seconded so effectually by the persons to whom Isabella committed the superintendence of the business, that every thing was soon in readiness for the voyage.

On the 1st of October, Columbus found himself seven hundred and seventy leagues west of the Canaries. At this period his crew, despairing of the success of their enterprise, began to mutiny; and he was obliged to promise them, that, if land did not appear in three days, he would return. They, however, soon observed some fortunate presages, such as land-birds, a cane newly cut, a carved piece of wood, and the branch of a tree, with fresh red berries. At the same time, a brisk gale arose, and carried them forward: several birds were seen hovering about the ship, and directing their flight towards the west, so that the desponding crew resumed some degree of spirit.

About ten o'clock at night, Columbus, standing on the fore-castle, observed a light at a distance, and privately pointed it out to Pedro Gutierrez, a page of the queen's wardrobe. Gutierrez perceived it, and, calling to Salcedo, comptroller of the fleet, all three saw it in motion, as if it were carried from place to place; and, a little after midnight, the joyful sound of *land, land*, was heard from the Pinta, which kept always a-head of the other ships. As soon as morning dawned, on Friday, October 12, all doubts were dispelled:—from every ship an island was seen about two leagues to the north, whose flat and verdant fields, well stored with wood, and watered with many rivulets, presented the aspect of a delightful country. The crew of the Pinta instantly began singing the *Te Deum*, and were joined by those of the other ships, with tears of joy. This office of gratitude to Heaven was followed by an act of justice to their commander. They threw themselves at the feet of Columbus, with feelings of self-condemnation, mingled with reverence. They implored him to pardon their ignorance, incredulity, and insolence; and passing, in the warmth of their admiration, from one extreme to another, they now pronounced the man, whom they had lately reviled and threatened, to be a person inspired by Heaven with sagacity and fortitude more than human.

At sun-rise, all their boats were manned and armed. They rowed towards the island, with their colours displayed, with warlike music, and other martial pomp. The coast was covered with a multitude of people, whom the

novelty of the spectacle had drawn together, whose attitudes and gestures expressed astonishment at the strange objects which presented themselves. Columbus was the first European who set foot in the New World which he had discovered. He landed in a rich dress, and with a drawn sword in his hand: his men followed, and, kneeling down, they all kissed the ground. They next erected a crucifix, and, prostrating themselves before it, returned thanks to God for conducting their voyage to such a happy issue. They then took solemn possession of the country for the crown of Castile and Leon, with the usual formalities.

The natives, in the mean time, gazed in silent admiration upon actions which they could not comprehend. The dress of the Spaniards, the whiteness of their skins, their beards, and their arms, appeared surprising. The vast machines in which they had traversed the ocean, that seemed to move upon the waters with wings, and uttered a dreadful sound resembling thunder, accompanied with lightning and smoke, struck them with such terror, that they began to consider their new guests as a superior order of beings, and concluded that they were children of the sun, who had descended to visit the earth.

The Europeans were hardly less amazed at the scene now before them. Every herb, shrub, and tree, was different from those which flourished in Europe. The soil seemed to be naturally fertile, but bore few marks of cultivation. The climate, though warm, appeared extremely delightful, and the inhabitants were entirely naked. Their black hair, long and uncurled, floated upon their shoulders, or was bound in tresses around their heads. They had no beards, and every part of their bodies was perfectly smooth. Their complexion was of a dusky copper-colour, their features singular, rather than disagreeable, their aspect gentle and timid. Though not tall, they were well-shaped and active. Their faces, and several parts of their bodies, were fantastically painted with glaring colours. For some time they appeared timid; but, at length, they became familiar with the Spaniards, and joyfully received from them hawks'-bells, glass-beads, or other baubles; in return for which they gave such provisions as they had, and some cotton-yarn, the only commodity of value that they could produce. Towards evening, Columbus returned to his ships, accompanied by many of the islanders in their canoes, which, though rudely formed out of the trunk of a single tree, they rowed with surprising dexterity. Thus, in the first interview between the inhabitants of the old and new worlds, every thing was conducted amicably. The former, enlightened and ambitious, formed already vast ideas of the advantages which they might derive from the regions that began to open to their view. The latter, simple and undiscerning, had no conception of their impending calamities.

Columbus, who now assumed the title and authority of admiral and viceroy, called the island which he had discovered San Salvador. It is one of that large cluster called the Bahama Isles, situated above three thousand miles to the west of Gomera, from which the squadron took its departure, and only four degrees to the south of it; so little had Columbus deviated from the westerly course which he had chosen as the most proper. He employed the next day in visiting the coasts of the island; and, from the apparent poverty of the inhabitants, he perceived that this was not the rich country for which he sought. But, conformably to his theory concerning the discovery of those regions of Asia which stretched towards the east, he concluded that San Salvador was one of the isles which geographers had described as situated in the great ocean adjacent to India. Having observed that most of the people whom he had seen wore small plates of gold, by way of ornament, in their nostrils, he eagerly enquired where they obtained that precious metal. They pointed towards the south, and made him comprehend, by signs, that gold abounded in countries situated in that quarter. Thither he immediately determined to direct his course. He took along with him seven of the natives of San Salvador, that, by acquiring the Spanish language, they might serve as guides and interpreters; and those innocent people considered themselves highly honoured by being selected to accompany him.

He saw several islands, and touched at three of the largest, on which he bestowed the names of St. Mary of the Conception, Fernandina, and Isabella. But, as their soil, productions, and inhabitants, nearly resembled those of San Salvador, he made no stay in any of them. He enquired every where for gold, and the signs that were uniformly made by way of answer, confirmed him in the opinion that it was brought from the south. He followed that course, and soon discovered a country which appeared very extensive, not perfectly level, like those he had already visited, but so diversified with rising grounds, hills, rivers, woods, and plains, that he was uncertain whether it might prove an island, or part of the continent. The natives of San Salvador, whom he had on board, called it Cuba, but he gave it the name of Juanna. He entered the mouth of a large river with his squadron, and all the inhabitants fled to the mountains as he approached the shore. But as he resolved to careen his ships in that place, he sent some Spaniards, together with one of the natives of San Salvador, to view the interior of the country; and they, having advanced above sixty miles from the shore, reported that the soil was richer and more cultivated than any they had hitherto discovered; that, besides many scattered cottages, they had found one village, containing above a thousand inhabitants; that the people, though naked, seemed to be more intelligent than those of San

Salvador, but had treated them with the same respectful attention, kissing their feet, and honouring them as sacred beings; that they had given them to eat a root, the taste of which resembled roasted chesnuts, and likewise a singular species of corn, called maize, which, either when roasted whole or ground into meal, was very palatable; that there seemed to be no quadrupeds in the country, but a species of dogs, which could not bark, and a creature resembling a rabbit, but of a much smaller size; and they added, that they had observed some ornaments of gold among the people.

Some of the natives, who had been persuaded to accompany the messengers, informed Columbus, that the gold of which they made their ornaments was found in Cubanacan. By this word they meant the middle or inland part of Cuba; but Columbus, being ignorant of their language, as well as unaccustomed to their pronunciation, and his thoughts running continually upon his own theory concerning the discovery of the East-Indies, he was led, by the resemblance of the sound, to suppose that they spoke of the Great Khan, and imagined that the opulent kingdom of Cathay, described by Marco Polo, was not very remote. This induced him to employ some time in viewing the country. He visited almost every harbour, from Porto del Principe, on the north coast of Cuba, to the eastern extremity of the island; but, though amazed at the fertility of the soil, which, from its novelty, made a most lively impression upon his imagination, he did not find gold in any quantity. The people of the country, as much astonished at his eagerness in quest of gold, as the Europeans were at their ignorance and simplicity, pointed towards the east, where an island, which they called Hayti, since known by the name of St. Domingo, was situated, in which that metal was more abundant than among them. Columbus ordered his squadron to bend its course thither; but Martin Alonso Pinçon, impatient to be the first who should take possession of the treasures which this country was supposed to contain, quitted his companions, regardless of all the admiral's signals to slacken sail until they should come up with him. Columbus did not reach Hayti till the sixth of December. He called the port where he first touched St. Nicholas, and the island itself, Hispaniola, in honour of the kingdom by which he was employed. As he could neither meet with the Pinta, nor have any intercourse with the inhabitants, who fled in great consternation to the woods, he soon quitted St. Nicholas, and, sailing along the northern coast of the island, he entered another harbour, which he called the Conception. Here his people overtook a woman, who was running from them, and, after treating her with great gentleness, dismissed her with a present of toys. The description which she gave to her countrymen of the humanity and wonderful qualities of the strangers, their admiration

of the trinkets, eagerness to part of them to repeat which they bestowed upon their wishes. They were naked, like to be equally most necessary credulous, and to acquire an excessive admiration of the people of the other spirits described possessed gold in it for bells, beads, considered themselves sited by a prince with all the pomp carried in a sort of men, and attended him with great stately very res Columbus and gave the admiration of curious work small value.

Still anxious Columbus continued whom he had a They concurred which they called and farther towards which appeared by which Marco distinguished themselves with respect to discovered, to the expectation of so the object of his the east. He called St. Thomas the government havi, who, as his sovereigns among He immediately his name, delivered fashioned, with and invited him harbour now called the east. a of the humanity  
e, their admiration

of the trinkets, which she exultingly displayed, and their eagerness to participate of the same favours, induced many of them to repair to the harbour. The strange objects which they beheld, and the baubles which Columbus bestowed upon them, amply gratified their curiosity and their wishes. They nearly resembled the people of Cuba. They were naked, like them, ignorant, and simple; and seemed to be equally unacquainted with all the arts which appear most necessary in polished societies; but they were gentle, credulous, and timid, to a degree, which rendered it easy to acquire an ascendancy over them, especially as their excessive admiration led them into the same error with the people of the other islands, in supposing the Spaniards to be spirits descended immediately from heaven. They possessed gold in some abundance, and readily exchanged it for bells, beads, or pins; and in this traffic both parties considered themselves gainers. Here Columbus was visited by a prince or *cacique* of the country. He appeared with all the pomp known among a simple people, being carried in a sort of palanquin, upon the shoulders of four men, and attended by many of his subjects, who served him with great respect. His deportment was grave and stately very reserved towards his own people, but with Columbus and the Spaniards extremely courteous. He gave the admiral some thin plates of gold, and a girle of curious workmanship, receiving, in return, presents of small value.

Still anxious to discover the mines which yielded gold, Columbus continued to interrogate all the natives, with whom he had any intercourse, concerning their situation. They concurred in pointing out a mountainous country, which they called Cibao, at some distance from the sea, and farther towards the east. Struck with this sound, which appeared to him the same with *Cipango*, the name by which Marco Polo, and other travellers to the east, distinguished the islands of Japan, he no longer doubted with respect to the vicinity of the countries which he had discovered, to the remote parts of Asia; and, in full expectation of soon reaching those regions which had been the object of his voyage, he directed his course towards the east. He put into a commodious harbour, which he called St. Thomas, and found that district to be under the government of a powerful *cacique*, named Guacanahari, who, as he afterwards learned, was one of the five sovereigns among whom the whole island was divided. He immediately sent messengers to Columbus, who, in his name, delivered to him a present of a mask, curiously fashioned, with the ears, nose, and mouth, of beaten gold, and invited him to the place of his residence, near the harbour now called Cape François, some leagues towards the east. Columbus despatched some of his officers to visit this prince, and they returned with such favourable accounts, both of the country and of the people, as made

Columbus impatient for that interview with Guacanahari to which he had been invited.

With this view he sailed from St. Thomas, on the 24th of December, with a fair wind; and, as he had had no rest for two days, he retired at midnight to repose, having committed the helm to the pilot, with strict injunctions not to quit it for a moment. The pilot, however, carelessly left it to a cabin-boy, and the ship, carried away by a current, was dashed against a rock. The violence of the shock awakened Columbus; who ran up to the deck, and was the only person who retained presence of mind. He ordered some of the sailors to take a boat, and carry out an anchor astern; but, instead of obeying, they made off towards the Nigua, which was about half a league distant: the vessel soon afterwards opened near the keel, and filled so fast with water, that its loss was inevitable. The smoothness of the sea, and the assistance of the boats from the Nigua, enabled the crew to save their lives, and as soon as the islanders heard of this disaster, they crowded to the shore, with their prince at their head; lamenting the misfortune with tears of condolence, putting to sea a number of canoes, and, under the direction of the Spaniards, assisting in saving whatever could be got out of the wreck. As fast as the goods were landed, Guacanahari in person took charge of them; by his orders they were deposited in one place, and armed sentinels kept the multitude at a distance. Next morning this prince visited Columbus, who was now on board the Nigua, and endeavoured to console him for his loss, by offering all that he possessed to repair it.

Of the humanity and orderly behaviour of the natives on this occasion, Columbus gave the following account, in a letter to Ferdinand and Isabella. "The king, having been informed of our misfortune, expressed great grief for our loss, and immediately sent aboard all the people in the place in many large canoes: we soon unloaded the ship of every thing that was upon deck, as the king gave us great assistance: he himself, with his brothers and relations, took all possible care that every thing should be properly done both aboard and on shore. And, from time to time, he sent some of his relations, weeping, to beg of me not to be dejected, for he would give me all that he had. I can assure your highnesses, that so much care would not have been taken in securing our effects in any port of Spain, as all our property was put together in one place near his palace, until the houses which he wanted to prepare for the custody of it were emptied. He immediately placed a guard of armed men, who watched during the whole night, and those on shore lamented as if they had been much interested in our loss. The people are so affectionate, so tractable, and so peaceable, that I swear to your highnesses, that there is not a better race of men, nor a better country, in the world. They love their neigh-

bour as themselves; their conversation is the sweetest and mildest in the world, cheerful, and always accompanied with a smile. And although it is true that they go naked, yet your highnesses may be assured that they have many very commendable customs: the king is served with great state, and his behaviour is so decent, that it is pleasant to see him, as it is likewise to observe the wonderful memory which these people have, and their desire of knowing every thing, which leads them to enquire into its causes and effects."

Columbus had hitherto procured no intelligence of the Pinta, and no longer doubted that his treacherous associate had sailed for Europe, in order to have the merit of carrying the first tidings of the extraordinary discoveries which had been made, and to pre-occupy so far the ear of their sovereign, as to rob him of the glory and reward to which he was justly entitled. There remained but one vessel, and that the smallest and most crazy of the squadron, to traverse such a vast ocean, and carry so many men back to Europe. Each of those circumstances was alarming, and filled the mind of our adventurer with the utmost solicitude. The desire of overtaking Pinçon, and of effacing the unfavourable impressions which his misrepresentations might make in Spain, made it necessary to return thither without delay. The difficulty of taking such a number of persons aboard the *Nigna*, confirmed him in an opinion, which the fertility of the country, and the gentle temper of the people, had already induced him to form. He resolved to leave part of his crew in the island, that, by residing there, they might learn the language of the natives, study their disposition, examine the nature of the country, and search for mines. When he mentioned this to his men, all approved of the design, and many offered voluntarily to remain.

Nothing was now wanting towards the execution of this scheme, but to obtain the consent of Guacanahari; and his unsuspecting simplicity soon presented to the admiral a favourable opportunity of proposing it. Columbus having expressed some curiosity to know the cause which had induced the islanders to fly with such precipitation upon the approach of his ships, the cazique informed him that the country was much infested by the incursions of certain people, whom he called Carribeans, who inhabited several islands to the south-east. These he described as a fierce and warlike race, who delighted in blood, and devoured the flesh of the prisoners who fell into their hands; and as the Spaniards, at their first appearance, were supposed to be Carribeans, whom the natives, however numerous, durst not face in battle, they had recourse to their usual method of securing their safety, by retiring into the thickest and most impenetrable woods. Guacanahari, while speaking of those dreadful invaders, discovered such symptoms of terror, as well as

such consciousness of the inability of his own people to resist them, as led Columbus to conclude that he would not be alarmed at the proposition of any scheme which afforded him the prospect of an additional security against their attacks. He instantly offered him the assistance of the Spaniards to repel his enemies: he engaged to take him and his people under the protection of the powerful monarch whom he served, and offered to leave in the island such a number of his men as should be sufficient, not only to defend the inhabitants from future incursions, but to avenge their past wrongs.

The credulous prince was charmed with this proposal, and thought himself already safe under the patronage of beings superior to mortals. The ground was marked out for a small fort; the ramparts were fortified with palisades, and the great guns, saved out of the admiral's ship, were planted upon them. In ten days the work was finished; that simple race of men labouring with inconsiderate assiduity in erecting this first monument of their own servitude. During this time, Columbus, by his caresses and liberality, laboured to increase the high opinion which the natives entertained of the Spaniards; but, while he endeavoured to inspire them with confidence in their disposition to do good, he wished likewise to give them some idea of their power to punish and destroy such as were the objects of their indignation. With this view, in presence of a vast assembly, he drew up his men in order of battle, and made an ostentatious display of the sharpness of the Spanish swords, of the force of their spears, and the operation of their cross-bows. These people, strangers to the use of iron, and unacquainted with any hostile weapons, but arrows of reeds, pointed with the bones of fishes, wooden swords, and javelins, hardened in the fire, wondered and trembled. Before their surprise or fears had time to abate, he ordered the great guns to be fired. The sudden explosion struck them with such terror, that they fell flat to the ground, covering their faces with their hands; and, when they beheld the astonishing effects of the bullets among the trees, towards which the cannon had been pointed, they concluded that it was impossible to resist men who had the command of such destructive instruments, and who came armed with thunder and lightning against their enemies.

After giving such impressions both of the beneficence and power of the Spaniards, as might have rendered it easy to preserve an ascendancy over the minds of the natives, Columbus appointed thirty-eight of his people to remain in the island. He entrusted the command of these to Diego de Arada, a gentleman of Cordova, investing him with the same powers which he himself had received from Ferdinand and Isabella; furnished him with every thing requisite for the subsistence or defence of this infant colony; and having thus taken every precaution for

the security of his

the security of his people, he sailed on the 4th of January, 1493, and, steering towards the east, discovered, and gave names to, most of the harbours on the northern coast of the island. On the 6th, he descried the *Pinta*, and soon came up with her, after a separation of more than six weeks. From the condition of his ships, and the temper of his men, Columbus now found it necessary to hasten his return to Europe. The former, having suffered much during a voyage of such an unusual length, were extremely leaky; and the latter expressed the utmost impatience to revisit their native country. Accordingly, on the 16th of January, he directed his course towards the north-east, and soon lost sight of land. He had on board some of the natives, whom he had taken from the different islands which he discovered; and, besides the gold, which was the chief object of research, he had collected specimens of all the productions which were likely to become subjects of commerce in the several countries, as well as many unknown birds, and other natural curiosities, which might attract the attention of the learned, or excite the wonder of the populace. The voyage was prosperous till the 14th of February, and he had advanced near five hundred leagues across the Atlantic Ocean, when the wind began to rise, and continued to blow with an increasing rage, which terminated in a furious hurricane; but, after sustaining the greatest dangers, Providence at length interposed, to save a life reserved for other services. The wind abated, and, on the evening of the 15th, Columbus and his companions discovered land; and, though uncertain what it was, they made towards it. They soon knew it to be St. Mary, one of the Azores, subject to the crown of Portugal. One circumstance, however, greatly disquieted Columbus: the *Pinta*, of which he had lost sight on the first day of the hurricane, did not appear; he dreaded for some time that she had foundered at sea, and that all her crew had perished; afterwards, his former suspicions recurred, and he became apprehensive that Pinçon had bore away for Spain, that he might reach it before him, and, by giving the first account of his discoveries, might rob him of some share of his well-earned fame.

To prevent this, he left the Azores on the 24th of February; but, when near the end of his voyage, and seemingly beyond the reach of disaster, another storm arose, and, after driving before it during two days and two nights, he was forced to take shelter in the River Tagus. Upon application to the king of Portugal, he was allowed to come up to Lisbon; and, notwithstanding the envy which it was natural for the Portuguese to feel, when they beheld another nation entering upon that province of discovery which they had hitherto deemed peculiarly their own, Columbus was received with all the respect due to a man who had performed things so extraordinary and unexpected.

Columbus remained only five days in Lisbon; and, on the 15th of March, he arrived in the port of Palos, seven months and eleven days from the time when he set out thence upon his voyage. As soon as his ship approached the port, all the inhabitants ran to the shore, to welcome their relations, and to hear tidings of their voyage. When the prosperous issue of it was known, when they beheld the strange people, the unknown animals, and singular productions brought from the countries which had been discovered, the effusion of joy was general and unbounded. The bells were rung, and the cannon fired; Columbus was received, at landing, with royal honours, and all the people, in solemn procession, accompanied him and his crew to the church, where they returned thanks to the Divine Being, who had so wonderfully conducted and crowned with success this important voyage. On the evening of the same day, he had the satisfaction of seeing the *Pinta*, which the violence of the tempest had driven far to the north, enter the harbour.

Ferdinand and Isabella, on being apprised of the success and safe return of Columbus, desired him, in terms the most respectful and flattering, to repair immediately to Barcelona, where they then held their court; that from his own mouth they might receive a full detail of his services and discoveries. During his journey, the people crowded from the adjacent country, following him every where with admiration and applause. His entrance into the city was conducted, by order of their majesties, with pomp suitable to the great event. The people whom he brought along with him from the countries which he had discovered, marched first, and, by their singular complexion, the wild peculiarity of their features, and uncouth finery, appeared like men of another species. Next to them were carried the ornaments of gold, fashioned by the rude art of the natives, the grains of gold found in the mountains, and dust of the same metal gathered in the rivers. After these, appeared the various commodities of the newly-discovered countries, together with their curious productions. Columbus himself closed the procession, and attracted the eyes of all the spectators. Ferdinand and Isabella received him, arrayed in their royal robes, and seated upon a throne, under a magnificent canopy. When he approached, they stood up, and, raising him as he kneeled to kiss their hands, commanded him to be seated upon a chair prepared for him, and to give a circumstantial account of his voyage; and, when he had finished his narrative, the king and queen, kneeling down, offered up solemn thanks to God for the discovery of those new regions, from which they expected so many advantages. Every mark of honour that gratitude or ambition could suggest was conferred upon Columbus. Letters patent were issued, confirming to him and to his heirs all the privileges contained in the capitulation concluded at Santa

Fé: his family was ennobled; and the king and queen, and, after their example, the courtiers, treated him, on every occasion, with all the ceremonious respect paid to persons of the highest rank. But what pleased him most, as it gratified his active mind, bent continually upon great objects, was an order to equip, without delay, an armament of such force as might enable him not only to take possession of the countries which he had already discovered, but to go in search of those more opulent regions, which he still confidently believed to exist.

While preparations were making for this expedition, the fame of Columbus's successful voyage spread over Europe, and excited general attention. Men of science, capable of comprehending the nature, and of discerning the effects, of this great discovery, received the account of it with admiration and joy. They spoke of the voyage with rapture, and congratulated one another upon their felicity, in having lived in the period when, by this extraordinary event, the boundaries of human knowledge were so much extended, and such a new field of enquiry and observation opened, as would lead mankind to a perfect acquaintance with the structure and productions of the habitable globe; and not only the Spaniards, but the other nations of Europe, seem to have adopted the opinion of Columbus:—the countries which he had discovered were considered as a part of India. In consequence of this notion, the name of Indies was given to them by Ferdinand and Isabella, in a ratification of their former agreement, which was granted to Columbus upon his return. Even after the error which gave rise to this opinion was detected, and the true position of the New World was ascertained, the name has remained, and the appellation of *West-Indies* is given by all the people of Europe to the country, and that of *Indians* to its inhabitants.

In consequence of this success, preparations for a second expedition were carried on with a rapidity unusual in Spain, and to an extent that would be deemed not inconsiderable in the present age. The fleet consisted of seventeen ships, some of which were of good burthen. It had on board fifteen hundred persons, among whom were many of noble families, who had served in honourable stations. The greater part of these being destined to remain in the country, were furnished with every thing requisite for conquest or settlement, with all kinds of European domestic animals, with such seeds and plants as were most likely to thrive in the climate of the West-Indies, with utensils and instruments of every sort, and with such artificers as might be most useful in an infant colony.

But, formidable and well provided as this fleet was, Ferdinand and Isabella did not rest their title to the possession of the newly-discovered countries upon its operations alone. The example of the Portuguese, as well as

the superstition of the age, made it necessary to obtain from the Roman pontiff a grant of those territories which they wished to occupy; because the Pope, as the vicar and representative of Jesus Christ, was supposed to have a right of dominion over all the kingdoms of the earth. Alexander VI., a pontiff infamous for every crime which disgraces humanity, filled the papal throne at that period. As he was Ferdinand's subject by birth, and very solicitous to secure the protection of Spain, in order to facilitate the execution of his ambitious schemes in favour of his own family, he was extremely willing to gratify the Spanish monarchs. By an act of liberality, which cost him nothing, and that served to establish the jurisdiction and pretensions of the papal see, he granted in full right to Ferdinand and Isabella all the countries inhabited by infidels, which they had discovered, or should discover; and, by virtue of that power which he pretended to derive from Christ, he conferred on the crown of Castile vast regions, to the possession of which he himself was so far from having any title, that he was unacquainted with their situation, and ignorant even of their existence. As it was necessary to prevent this grant from interfering with that formerly made to the crown of Portugal, he appointed that a line, supposed to be drawn from pole to pole, a hundred leagues to the westward of the Azores, should serve as the limit between them; and, in the plenitude of his power, bestowed all to the east of this imaginary line upon the Portuguese, and all to the west of it upon the Spaniards.

A zealous desire of propagating the Christian faith was the consideration employed by Ferdinand in soliciting this bull, and was mentioned by Alexander as his chief motive for issuing it. In order to manifest some concern for this laudable object, several friars, under the direction of Father Boyl, a Catalonian monk of great reputation, as apostolical vicar, were appointed to accompany Columbus, and to devote themselves to the instruction of the natives. The Indians, whom Columbus had brought along with him, having received some tincture of Christian knowledge, were baptized with much solemnity, the king, the prince his son, and the chief persons of his court, standing as their godfathers.

Ferdinand and Isabella having thus acquired a title, which was then deemed completely valid, to extend their discoveries, and to establish their dominion over such a considerable portion of the globe, Columbus was impatient to revisit the colony which he had left, and to pursue that career of glory upon which he had entered. He set sail from Cadiz on the 25th of September, 1493, and, touching again at the island of Gomera, he steered farther towards the south than in his former voyage. By holding this course, he enjoyed more steadily the benefit of the regular winds, which blow within the tropics, and

was carried towards considerably to the e discovered. was carried towards a large cluster of islands, situated considerably to the east of those which he had already discovered. On November 2, the twenty-sixth day after his departure from Gomera, he made land. It was one of the Caribbee Islands, to which he gave the name of Desenda, on account of the impatience of his crew to discover some part of the New World. He then visited successively Dominica, Marigalante, Antigua, San Juan de Puerto Rico, and several other islands, as he advanced towards the north-west. All these he found to be inhabited by that fierce race of people whom Guacanalari had painted in such frightful colours. His descriptions appeared not to have been exaggerated; for the Spaniards never attempted to land without meeting with such a reception, as discovered the daring spirit of the natives; while in their habitations were found relics of those horrid feasts which they had made upon the bodies of their enemies taken in war.

Columbus afterwards paid a visit to his new colony at Hispaniola, or St. Domingo, and did not return from this second voyage till the year 1496. It is impossible to determine, whether the genius of this great man, in first conceiving the idea of these discoveries, or his sagacity in the execution of the plan, most deserves our admiration. Instead of hurrying from sea to sea, and from one island to another, which was naturally to be expected, Columbus, with such a field before him, unable to turn on either side without finding new objects of his curiosity and his pride, determined rather to turn to the advantage of the court of Spain the discoveries he had already made, than to acquire for himself the unavailing applause of visiting a number of unknown countries, from which he reaped no other benefit but the pleasure of seeing them. With this view, when he made for Hispaniola, he examined the colony, and erected forts in the most advantageous spots, for securing the dependence of the natives. Having spent a considerable time in this employment, and laboured to benefit the colony, with as much zeal and assiduity as if his views had extended no farther, he next proceeded to ascertain the importance of his other discoveries, and to examine what advantages were most likely to be derived from them. He had already touched at Cuba, which, from some specimens, seemed a rich discovery; but whether it were an island, or a part of some great continent, he was altogether uncertain. To ascertain this point was the present object of his attention. In coasting along the southern shore of Cuba, he got among a multitude of islands, of which he reckoned one hundred and sixty in one day. In the same voyage, Jamaica was discovered. But to so many difficulties was Columbus exposed, on an unknown sea, among rocks, shelves, and sands, that he returned to Hispaniola without learning any thing more certain with regard to Cuba, the main object of this enterprise.

By the first success of Columbus the public diffidence was converted into admiration; but, by a continuance of the same success, admiration degenerated into envy. His enemies in Spain set every spring in motion against him; and there is no difficulty in finding specious grounds of accusation against such as are employed in the execution of an extensive and complicated plan. An officer of equivocal character was despatched from Spain, to act the part of a spy and informer, and whose presence plainly demonstrated to Columbus the necessity of returning to Europe, in order to render abortive the machinations of his enemies.

It was not without great difficulty that he was enabled to set out on a third expedition, still more famous than any he had hitherto undertaken. He designed to stand to the southward of the Canaries, until he came under the equinoctial line, and then to proceed directly westward, that he might discover what opening that course might afford to India, or what new islands or continent might reward his labour. In this navigation, after being long enveloped in a thick fog, and suffering numberless inconveniences from the excessive heats and rains between the tropics, he was, at length, favoured with a brisk gale, and went before it seventeen days to the westward. At the end of this time, a seaman saw land, which was the island now called Trinidad.

Having passed this island and two others, the admiral was surprised with an appearance he had never seen before: this was the frightful tumult of the waves, occasioned by a conflict between the tide of the sea and the rapid current of the immense river Oroonoko, which, though a river only of the third or fourth magnitude in the New World, far surpasses any of the streams in our hemisphere. It rolls towards the ocean such a vast body of water, and rushes into it with such impetuous force, that, when it meets the tide, which on that coast rises to an uncommon height, their collision occasions a swell and agitation of the waves truly formidable. In this conflict, the irresistible torrent of the river so far prevails, that it freshens the ocean many leagues with its flood. Columbus, before he could perceive the danger, was entangled among those adverse currents and tempestuous waves, and it was with difficulty that he escaped through a narrow strait, which appeared so tremendous, that he called it La Boca del Drago. As soon as the consternation which this occasioned permitted him to reflect upon the nature of an appearance so extraordinary, he discerned in it a source of comfort and hope. He concluded, that such a vast body of water as this river contained could not be supplied by any island, but must flow through a country of immense extent, and, consequently, that he was now arrived at that continent which had long been the object of his anxious research. Charmed with this idea, he

stood to the west, along the coast of those provinces which are now known by the names of Paria and Cumana. He landed in several places, and had some intercourse with the people, who resembled those of Hispaniola in their appearance and manner of life. They wore, as ornaments, small plates of gold, and pearls of considerable value, which they willingly exchanged for European toys; and they seemed to possess a better understanding, and greater courage, than the inhabitants of the islands. The country produced quadrupeds of several kinds, as well as great variety of fowls and fruits. The admiral was so much delighted with its beauty and fertility, that, with the enthusiasm of a discoverer, he compared it to the garden of Paradise. Thus Columbus had the glory not only of discovering the existence of a New World, but he made considerable progress towards a perfect knowledge of it, and was the first man who conducted the Spaniards to that vast continent, which has been the chief seat of their empire, and the source of their treasures in this quarter of the globe. The shattered condition of his ships, the scarcity of his provisions, and his personal infirmities, together with the impatience of his crew, prevented him from pursuing his discoveries any farther, and made it necessary to hear again for Hispaniola. In his way thither, he discovered the islands of Cubagua and Margarita, which afterwards became remarkable for their pearl-fishery. When he arrived at Hispaniola, on the 30th of August, he was greatly indisposed; but the affairs of the colony afforded him no prospect of enjoying even a temporary repose. Many revolutions had happened during his absence, in consequence of the cabals of those whom he had left in power; and their ringleader was Francis Roldan, whom Columbus had appointed to a principal situation. This ingrate accused his patron and his two brothers of injustice, and pretended that they aimed at independent dominion; in consequence of which, and unfortunately for the honour of Spain, that great man was disgraced; for, in October, 1500, he was sent back to Spain in *chains*!!

In the year 1499, Ojeda, an officer who had accompanied Columbus in his second voyage, sailed to America with four vessels, but met with little more than Columbus had previously found. One of the adventurers was Amerigo Vespucci, an inhabitant of Florence, eminently skilled in navigation. On his return, he published the first description that had then appeared of any part of the new continent; and fame has assigned to him the honour of impressing his name upon this vast portion of the earth.

Though deprived of the honour of giving name to the New World, Columbus enjoyed the glory of rendering the one hemisphere known to the other; a glory much the more precious, as it was untainted by cruelty or plunder,

which disfigured all the exploits of those who came after him. He fully vindicated himself at court, and was restored to favour, and undertook a fourth voyage, in 1502, in which he discovered a considerable part of the American continent. He then returned to Spain, and died at Valladolid, on the 20th of May, 1506, in the fifty-ninth year of his age.

The succeeding governor of Cuba and Hispaniola endeavoured to purchase the same advantages by the blood of the natives, which Columbus had obtained by his good sense and humanity. These islands contain mines of gold; the Indians only knew where they were situated; and the extreme avarice of the Spaniards, too furious to work by the gentle means of persuasion, hurried them to acts of the most shocking violence and cruelty against those unhappy men, who, they believed, concealed from them part of their treasure. The slaughter now began, they set no bounds to their fury; and, in a few years, they depopulated Hispaniola, which contained three millions of inhabitants; and Cuba, that had about six hundred thousand. Bartholomew de las Casas, a witness of those barbarous depopulations, says, that the Spaniards went out with their dogs to hunt after men. The unhappy savages, almost naked and unarmed, were pursued like deer into the forests, devoured by dogs, killed with gun-shot, or surprised and burnt in their habitations.

In 1515, the continent was explored as far as Río de la Plata; but, even in 1518, little was known concerning its western parts; and twenty-six years had elapsed since the first voyage of Columbus, before the existence of Mexico and Peru was even guessed at. Hispaniola and Cuba continued to be the chief seats of the Spanish power; but, in 1519, Cortez proceeded to the conquest of Mexico, which was accomplished in 1531. Magellan, at the same time, having explored the Pacific Ocean, the discovery of the western coast of Africa became the consequence of his exertions. After many reports concerning the riches of Peru, that country was, at length, visited, in 1526, by Pizarro, in a vessel from Panama. In 1530, he began the conquest of Peru; in ten years that empire was divided among his followers; and, in 1543, Peru became the seat of a Spanish viceroy.

Having stated the different periods of the discovery of America and its dependent islands, it may now be proper to revert to the manner in which the Spaniards effected the conquest of Mexico and Peru. From what they saw or learned by report, they conjectured that this part of the new world would afford a still more valuable conquest than had yet been achieved. Fernando Cortez was dispatched from Cuba with six hundred men, eighteen horses, and a small number of field-pieces; and, with this inconsiderable force, he proposed to subdue the rich and powerful empire of Mexico, inhabited by millions of Indians,

passionately fond of war, and then headed by Monte-  
zuma, whose fame in arms struck terror into the neigh-  
bouring nations. This empire had subsisted for ages;  
and its inhabitants were in all respects a polished and  
intelligent people. They knew, like the ancient Egyp-  
tians, whose wisdom is still admired in this particular,  
that the year consisted nearly of three hundred and sixty-  
five days. Their superiority in military affairs was the  
object of admiration and terror over all the American con-  
tinent; and their government, founded on the basis of laws  
combined with religion, seemed to bid defiance to time  
itself. Mexico, the capital of the empire, situated in  
the middle of a spacious lake, was the noblest monument  
of American industry. It communicated with the conti-  
nent by immense causeways, which were carried through  
the lake. The city was much admired for its buildings,  
all of stone, its squares and market-places, the shops,  
which glittered with gold and silver, and the sumptuous  
palaces of Montezuma, some of which were erected on  
columns of jasper, and contained whatever was most rare,  
curious, or useful.

Not all the grandeur of this empire, however, could  
defend it against the Spaniards. Cortez, in his march,  
met with a feeble opposition from the nations along the  
coast of Mexico, who were terrified at the first appear-  
ance of their invaders. The warlike animals on which  
the Spanish officers were mounted, the artificial thunder  
which issued from their hands, and the wooden castles  
which had wafted them over the ocean, struck a panic  
into the natives, from which they did not recover until it  
was too late. Wherever the Spaniards marched, they  
spared neither age nor sex, nothing sacred or profane. At  
last, the inhabitants of Tlascala, and some other states  
upon the coast, despairing of being able to oppose them,  
entered into their alliance, and joined arms with those ter-  
rible, and, as they believed, invincible, conquerors. Cortez,  
thus reinforced, marched onwards to Mexico, and, in his  
progress, discovered a mine of sulphur and saltpetre,  
whence he could supply himself with powder. Monte-  
zuma heard of his progress without venturing to oppose  
it. This sovereign is reported, by the Spaniards, to have  
commanded thirty vassals, of whom each could appear at  
the head of a hundred thousand combatants, armed with  
bows and arrows; and yet he dared not resist a small body  
of Spaniards, aided by a few Americans, whose allegiance  
would have been shaken by the first reverse of fortune.  
Such was the difference between the inhabitants of the  
two worlds, and the fame of the Spanish victories, which  
always preceded them.

Montezuma, by sending a rich present of gold, which  
only excited the Spanish avarice, hastened the approach  
of the enemy. No opposition was made to their entry  
into his capital, and a palace was set apart for Cortez and

his companions, who were already treated as the masters  
of the new world. Soon, however, he had reason to dis-  
trust the affected politeness of this emperor, under which  
he suspected some plot to be concealed; but he had no  
pretence for violence: Montezuma loaded him with kind-  
ness, and with gold in greater quantities than he demand-  
ed; and his palace was surrounded with artillery, the most  
terrible of all engines to the Americans. At last a cir-  
cumstance took place, which afforded Cortez a pretext  
for commencing hostilities: In order to secure a commu-  
nication by sea, to receive the necessary reinforcements,  
he erected a fort, and left a small garrison behind him, at  
Vera Cruz, which has since become an emporium of  
commerce between Europe and America. He understood  
that the Americans in the neighbourhood had attacked this  
garrison in his absence, and that a Spaniard was killed in  
the action: he also learned that Montezuma himself was  
privy to this violence, and had issued orders that the head  
of the slain Spaniard should be carried through his pro-  
vinces, to convince his subjects that the Europeans were  
not immortal.

On receiving this intelligence, Cortez went in person  
to the emperor, attended by a few of his most experienced  
officers. Montezuma pleaded ignorance, and Cortez  
seemed ready to believe him, though, at the same time,  
he alleged that the Spaniards, in general, would never  
be persuaded of it, unless he returned with them to their  
residence, which would remove all jealousy between the  
two nations. The success of this interview demonstrated  
the superiority of European artifice. A powerful mo-  
narch, in the middle of his own palace, and surrounded  
by his guards, gave himself up to be disposed of accord-  
ing to the inclination of a few strangers, who came to  
demand him. Cortez had now got into his hands an en-  
gine by which every thing might be accomplished. The  
Americans had the highest respect, or rather the most  
superstitious veneration, for their emperor, and hence  
Cortez, by keeping him in his power, allowing him to  
enjoy every mark of royalty but his freedom, and, at the  
same time, from a thorough knowledge of his character,  
being able to flatter all his tastes and passions, maintained  
the easy sovereignty of Mexico by governing its prince.  
If the Mexicans, grown familiar with the Spaniards, be-  
gan to abate their respect, Montezuma was the first to  
teach them more politeness. If a tumult were excited  
through the cruelty or avarice of the Spaniards, Monte-  
zuma ascended the battlements of his prison, and haran-  
gued his Mexicans into submission. This farce continued  
a long time; but on one of these occasions, when Mon-  
tezuma was shamefully disgracing his character, by justi-  
fying the enemies of his country, a stone from an unknown  
hand struck him on the temple, which, in a few days, oc-  
casioned his death. The Mexicans, now delivered from

this emperor, who co-operated so strongly with the Spaniards, elected a new prince, the famous Guatimozin, who, from the beginning, had discovered an implacable animosity against the Spaniards. Under his conduct, the unhappy Mexicans rushed against those very men whom a little before they had offered to worship: the Spaniards, however, by the dexterous management of Cortez, were too firmly established in Mexico to be driven from that situation.

The tribute which the grandees of this empire had agreed to pay to the crown of Spain amounted to six hundred thousand marks of pure gold, besides an immense quantity of precious stones; a fifth part of which, distributed among the soldiers, stimulated their avarice and their courage, and made them willing to perish rather than abandon so precious a booty. The Mexicans, however, made no small efforts for independence; but all their valour, and despair itself, gave way before what they called the Spanish thunder. Guatimozin and the empress were taken prisoners, and it is recorded as a fact, that this prince, when he lay stretched on burning coals, by order of one of the receivers of the king of Spain's exchequer, who inflicted the torture to make him discover in what part of the lake he had thrown his riches, said to the high-priest, condemned to the same punishment, who loudly expressed his sense of the pains that he endured, "Do you imagine that I lie on a bed of roses?" The high-priest remained silent, and died in an act of obedience to his sovereign. Cortez, by getting a second emperor into his hands, made a complete conquest of Mexico; with which Darien, and other provinces, fell into the hands of the Spaniards.

Whilst Cortez and his soldiers were employed in reducing Mexico, they obtained intelligence of another great empire, situated towards the equinoctial line and the tropic of Capricorn, which was said to abound in gold, silver, and precious stones, and to be governed by a prince more magnificent than Montezuma. This was the empire of Peru, which extended in length nearly thirty degrees; and, singular as it may appear, this country, more important than Mexico itself, was reduced by the endeavours and at the expence of three private persons. The names of these were, Francis Pizarro, Almagro, and Lucques, a priest, but a man of considerable fortune. The first two were natives of Pahama, of doubtful birth. Pizarro, the soul of the enterprise, could neither read nor write. Having sailed over into Spain, and obtained a grant of what they should conquer, Pizarro set out for the conquest of Peru, with two hundred and fifty foot, sixty horse, and twelve small pieces of cannon, drawn by slaves from the conquered countries. If we reflect that the Peruvians naturally entertained the same prejudices as the Mexicans, in favour of the Spanish nation, and were, besides, of a character still more soft and unwarlike, it need not

surprise us, after what has been said of the conquest of Mexico, that, with this inconsiderable force, Pizarro should make a deep impression on the Peruvian empire. There were particular circumstances, likewise, which conspired to assist him, and which deserve to be narrated, as they discover something of the history, religion, and state of the human mind, on this continent.

The Peruvian empire was founded by Mango Copac. He was one of those uncommon men, who, calm and dispassionate themselves, can observe the passions of their fellow-creatures, and turn them to their own profit or glory. He perceived that the people of Peru were naturally superstitious, and had a particular veneration for the sun: he pretended, therefore, to have descended from that luminary, whose worship he was sent to establish, and whose authority he was entitled to bear. By this romantic story, he easily deceived a credulous people, and brought a large extent of territory under his jurisdiction. He united and civilized these dispersed barbarous people: he subjected them to laws, and trained them to arms; and he softened them by the institution of religious duties. In short, there was no part of America where agriculture and the arts were so assiduously cultivated, and where the manners of the people were so mild and ingenuous. A race of princes succeeded Mango, distinguished by the title of Yncas, and revered by the people as descendants from the sun. The twelfth of these, named Atabalipa, was now on the throne. His father, Guiana Capac, had conquered the province of Quito, and, to secure himself in the possession, he had married the daughter of the natural prince of that country, from which marriage sprung Atabalipa. His elder brother, named Huescar, by a different mother, had claimed the succession to the whole of his father's dominions, not excepting Quito, which devolved on the younger by a double connexion. A civil war had been kindled on this account, which, after various turns of fortune, terminated in favour of Atabalipa, who detained Huescar, as a prisoner, in the tower of Cusco, the capital of the Peruvian empire.

In this feeble and disunited state was Peru when Pizarro advanced to attack it. The ominous predictions of superstition, too, as in most other cases, joined their force to human calamities. Prophecies were recorded, and dreams were recollected, which foretold the subjection of the empire by unknown persons, whose description exactly corresponded with the appearance of the Spaniards; and, under these circumstances, Atabalipa, instead of opposing the Spaniards, sought to conciliate their favour. Pizarro, however, whose temper partook of the meanness of his education, had no conception of dealing gently with those whom he considered as barbarians. While he was engaged in conference, therefore, with Atabalipa, his men, as they had been previously instructed, furiously attacked

the guards of that prince, and, having butchered five thousand of them, as they were pressing forward, without regard to their particular safety, to defend the sacred person of their monarch, seized Atabalipa himself, whom they carried off to the Spanish quarters. Pizarro, with the sovereign in his hands, might already be deemed the master of Peru; for the inhabitants of this country were as strongly attached to their emperor as were the Mexicans; and Atabalipa was not long in their hands before he began to treat for his ransom. On this occasion the ancient ornaments, amassed by a long line of magnificent kings, the hallowed treasures of the most sumptuous temples, were brought out to save him who was the support of the kingdom and of the religion. While Pizarro was engaged in this negotiation, by which he proposed, without releasing the emperor, to get into his possession an immense quantity of gold, the arrival of Almagro caused some embarrassment in his affairs. The friendship, or rather the external show of friendship, between these men, was solely founded on the principle of avarice, and a bold enterprising spirit, to which nothing appeared too dangerous that might gratify their ruling passion. When their interests, therefore, happened to interfere, it was not to be supposed that any measures could be kept between them. Pizarro expected to enjoy the most considerable share of the treasure arising from the emperor's ransom, because he had the chief hand in acquiring it. Almagro insisted on being upon an equal footing: and, at length, lest the common cause should suffer by any rupture between them, this disposition was agreed to. The ransom was paid without delay: it proved a sum exceeding their conception, but not capable of gratifying their avarice. It amounted to one million five hundred thousand pounds sterling, which, considering the value of money at that time, was prodigious: on the dividend, after deducting a fifth for the king of Spain; and the shares of the chief commanders and other officers, each private soldier had above two thousand pounds, English money. With such fortunes, it was not to be expected that a mercenary army would incline to the rigours of military discipline. They insisted on being disbanded, that they might enjoy the fruits of their labour. Pizarro complied with this demand, sensible that avarice would still detain a number in his army, and that those who returned with such magnificent fortunes would induce new adventurers to pursue the same plan for acquiring gold. These wise reflections were abundantly verified: it was impossible to send out better recruiting officers than those who had themselves met with such brilliant success: new soldiers constantly arrived, and the American armies never wanted reinforcements.

But this immense ransom was only a further reason for detaining Atabalipa in confinement, until they discovered

whether he had any other treasure to gratify their avarice. But, whether they believed he had no more to give, and were unwilling to employ their troops in guarding a prince from whom they expected no farther advantage, or that Pizarro had conceived an aversion against the Peruvian emperor, on account of some instances of craft and duplicity which he observed in his character, and which he conceived might prove dangerous to his affairs, it is certain that, by his command, Atabalipa was put to death. To justify this cruel proceeding, a pretended charge was exhibited against the unhappy prince, in which he was accused of idolatry, of having many concubines, and other circumstances of a similar nature. The only just ground of accusation against him was, that his brother, Huescar, had been put to death by his command; and even this was considerably palliated, because Huescar had been plotting his destruction, that he might establish himself on the throne. Upon the death of the Ynca, a number of candidates appeared for the throne. The principal nobility set up the brother of Huescar; Pizarro set up a son of Atabalipa; and two generals of the Peruvians endeavoured to establish themselves by the assistance of the army. These distractions, which, in another empire, would have been extremely hurtful, were, at present, rather advantageous to the Peruvian affairs. The candidates fought against one another: their battles accustomed these harmless people to blood; and, in the course of those quarrels among themselves, the inhabitants of Peru assumed some courage against the Spaniards, whom they regarded as the ultimate cause of all their calamities. The losses which the Spaniards met with in these quarrels, though inconsiderable in themselves, were rendered dangerous, by lessening the opinion of their invincibility, which they were careful to preserve among the inhabitants of the new world. This consideration engaged Pizarro to conclude a truce; and the interval he employed in laying the foundations of the famous city of Lima, and in settling the Spaniards in the country. But, as soon as a favourable opportunity offered, he renewed the war against the Indians, and, after many difficulties, made himself master of Cusco, the capital of the empire. While he was engaged in these conquests, new grants and supplies arrived from Spain. Pizarro obtained two hundred leagues along the sea-coast, to the southward of what had been before granted; and Almagro, two hundred leagues to the southward of Pizarro's government. This division occasioned a warm dispute between them, each reckoning Cusco within his own district; but the dexterity of Pizarro brought about a reconciliation. He persuaded his rival, that the country which really belonged to him lay to the southward of Cusco, and that it was no way inferior in riches, and might be as easily conquered as Peru: he even offered him his assistance in the expedition.

Ambitious of subduing a kingdom for himself, Almagro listened to this advice; and, joining as many of Pizarro's troops to his own as he judged necessary, he penetrated, with great danger and difficulty, into Chili; losing many of his men as he passed over mountains of an immense height, and always covered with snow. He reduced, however, a very considerable part of this country. But the Peruvians were now become too much acquainted with war, not to take advantage of the division of the Spanish troops. They made an effort for regaining their capital, in which, Pizarro being indisposed, and Almagro at a distance, they were very nearly successful. The latter, however, no sooner obtained intelligence of the siege of Cusco, than, relinquishing all idea of distant conquests, he returned to secure the grand objects of their former labours. He raised the siege, with infinite slaughter of the assailants; but, having obtained possession of the city, he was unwilling to give it up to Pizarro, who now approached with an army, and knew of no other enemy but the Peruvians. This dispute occasioned a long and sanguinary struggle between them, in which the turns of fortune were various, and the resentment fierce on both sides, because the fate of the vanquished was certain death. This was the lot of Almagro, who, at an advanced age, fell a victim to the security of a rival, in whose dangers and triumphs he had long shared, and with whom, from the beginning of the enterprise, he had been intimately connected. During the course of this war, many Peruvians served in the Spanish armies, and learned, from the practice of the Europeans, to butcher one another. That blinded nation, however, at length opened their eyes, and took a very remarkable resolution. They saw the ferocity of the Spaniards, their unextinguishable resentment and avarice, and they conjectured that these passions would never permit their contests to subside. "Let us retire," said they, "from among them; let us fly to our mountains; they will speedily destroy one another, and then we may return in peace to our former habitations." This resolution was instantly put in practice; the Peruvians dispersed, and left the Spaniards in their capital. Had the force on each side been exactly equal, this singular policy of the natives of Peru might have been attended with success; but the victory of Pizarro put an end to Almagro's life, and to the hopes of the Peruvians, who have never since ventured to make head against the Spaniards.

Pizarro, though now sole master of the field, and of the richest empire in the world, was still instigated by his boundless ambition to undertake new enterprises. The southern countries of America, into which he had some time before despatched Almagro, offered the richest conquest. Towards this quarter, the mountains of Potosi, composed of entire silver, had been discovered, the mere shell of which only remains at present. He, therefore,

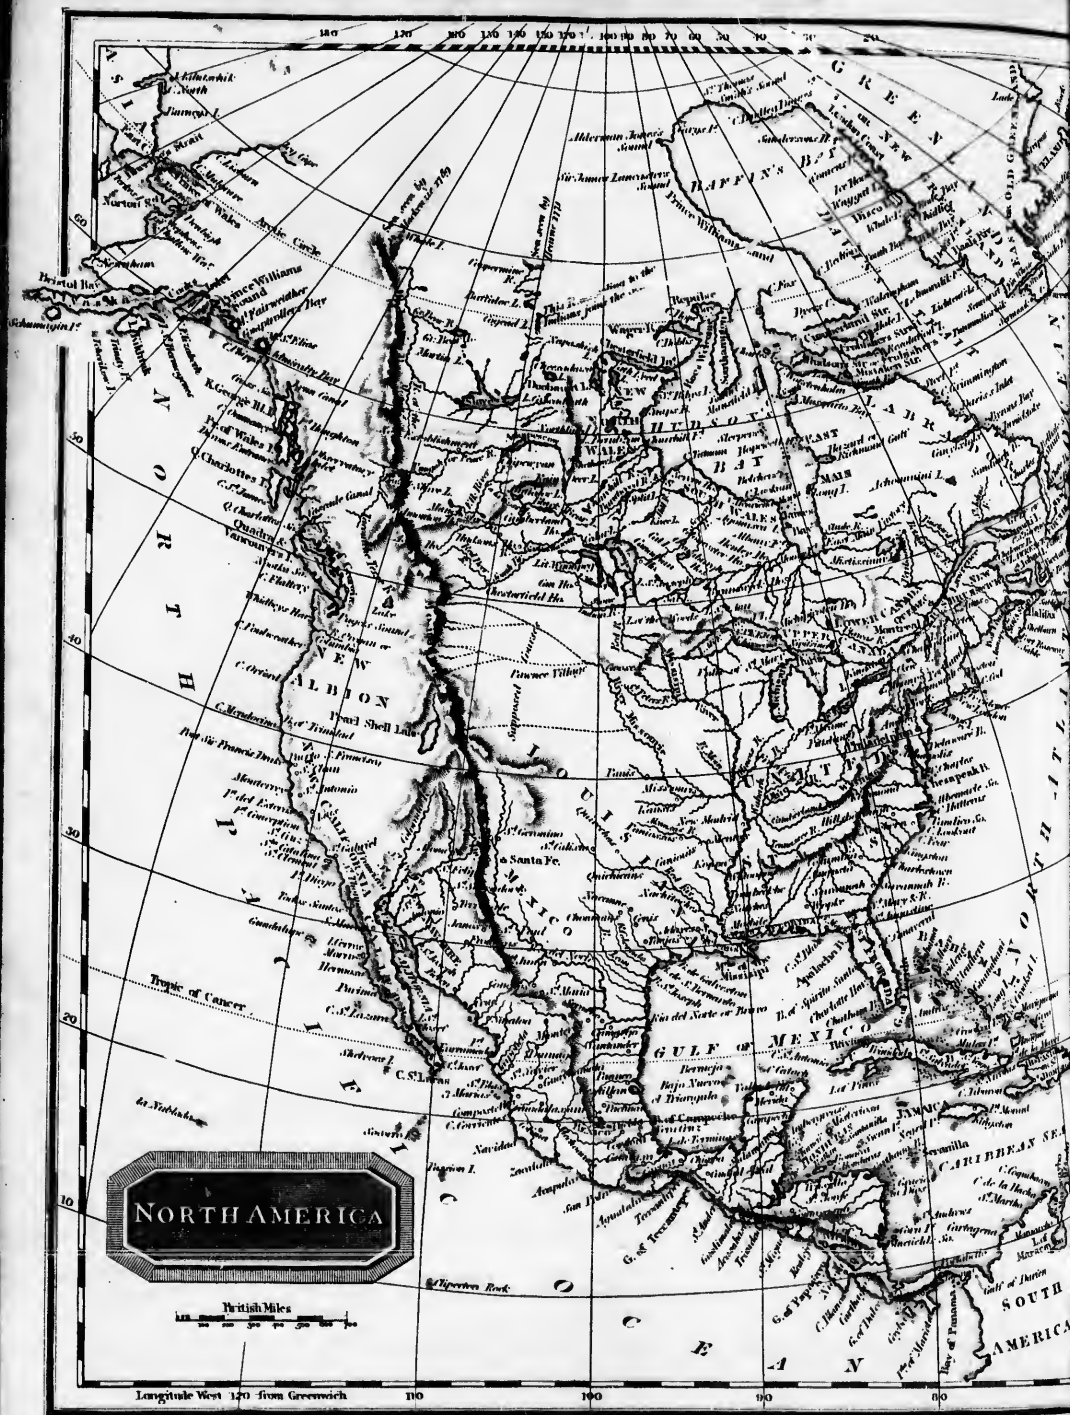

followed the track of Almagro into Chili, and reduced another part of that country. Orellana, one of his commanders, passed the Andes, and sailed down to the mouth of the River Amazon, an immense navigation, which discovered a rich and delightful country; but, as it is mostly flat, and, therefore, not abounding in minerals, the Spaniards neglected it. Pizarro, meeting with repeated success, and having no superior to control, nor any rival to keep him within bounds, now gave loose to the natural ferocity of his temper, and behaved with the basest tyranny and cruelty against all who had not concurred in his designs. This conduct raised a conspiracy against him, to which he fell a sacrifice in his own palace, in the city of Lima, which he himself had founded. The partisans of Almagro now declared his son, of the same name, their viceroy; but the greater part of the nation, though satisfied with the fate of Pizarro, did not concur with this declaration. They waited the orders of the emperor Charles V., then King of Spain, who sent over Vaca di Castro to be their governor. This man, by his integrity and wisdom, was admirably calculated to heal the wounds of the colony, and to place every thing on the most advantageous footing, both for it and for the mother-country. By his prudent management, the mines of la Plata and Potosi, which were formerly private plunder, became an object of public utility to the court of Spain. The parties were silenced or crushed; young Almagro, who would hearken to no terms of accommodation, was put to death; and tranquillity was restored to Peru. It seems, however, that Castro had not been sufficiently skilled in gaining the favour of the Spanish ministry, by proper bribes or promises, which a ministry would always expect from the governor of so rich a country. By their advice, a council was sent over to control him, and the colony was again unsettled. The party-spirit, but just extinguished, again broke out, and Gonzalo, the brother of Pizarro, set himself at the head of his brother's partisans, with whom many new malcontents had united. It was now no longer a dispute between governors about the bounds of their jurisdiction. Gonzalo Pizarro only paid a nominal submission to the king. He strengthened himself daily, and even went so far as to behead a governor who was sent over to curb him. He also gained the confidence of the admiral of the Spanish fleet in the South Seas, by whose means he proposed to prevent the landing of any troops from Spain; and he had a view of uniting the inhabitants of Mexico in his revolt.

Such was the situation of affairs, when the court of Spain, sensible of their mistake in not sending into America men whose character and virtue pleaded in their behalf, despatched, with unlimited powers, Peter de la Gasca, a man differing from Castro only by being of a more mild and insinuating behaviour, but with the same

rather than submit to any officer of Spain. With those of his partisans, therefore, who still continued to adhere to his interest, he determined to venture a battle, in which he was conquered, and taken prisoner. His execution followed soon after; and thus the brother of the man who conquered Peru for the crown of Spain fell a sacrifice for the security of the Spanish dominion over that country.

*Climate.*] The climate of North America is various; but, generally speaking, the heat of summer, and the cold of winter, are more intense than in most parts of the ancient continent. In the vicinity of Hudson's Bay, Fahrenheit's thermometer has risen in July to eighty-five degrees, and sunk in January to forty-five degrees below the freezing point; but the mercury begins to congeal at forty degrees, while spirits of wine will shew forty-six. The predominant winds blow from the west; and the severest cold is from the north-west. In the middle provinces the weather is remarkable for its transitions from heat to cold. In Virginia snow falls plentifully, but seldom remains above a day or two on the ground; yet, after a mild, or even warm, day, James River, where it is two or three miles in breadth, has in one night been covered with ice, so as to be passed by travellers. These alterations apparently proceed from the sudden change of the wind to the north-west. The provinces of South Carolina and Florida are subject to violent heats, furious hurricanes, and tremen-

dous storms of thunder and lightning; and the sudden changes of the weather are highly injurious to the human constitution.

There have yet occurred but few opportunities for obtaining accurate accounts of the climate, in the western parts of North America. That of California seems to be, in general, moderate and pleasant, though somewhat incommoded by the heat of summer. According to Perouse, in latitude fifty-nine degrees, the land has a barren and wintry appearance, even in June: the gloom is increased by frequent fogs, and the glaciers seem perpetual.

*Inland Seas.*] Among the inland seas, or great bays of North America, may be mentioned the gulfs of Mexico, California, and St. Laurence; with Hudson's Bay, and what is called Davis's Straits, which is probably a sea of communication between the Atlantic and the Arctic Oceans. There are several lakes in this part of America, of so great a size, that they ought to be distinguished by the name of seas, particularly Lake Superior, Michigan,

and Huron, which are three hundred and thirty miles in length, and twenty miles in breadth, and are upwards of one thousand fathoms deep. The Gulf of Mexico, above mentioned, presenting at its entrance a singular current called the Gulf Stream, and is a collection of waters distinguished from others by its eight or ten degrees of heat, and its sparks in the night produces thick fog in the Bay of Honduras. English commerce in the Gulf of St. Lawrence, a river of the same name, is carried on from November to April. Newfoundland, and one called the Great Bank, is more than four hundred and forty miles in length, and two to fifty fathoms deep. The fishery begins on the end of September, and is taken by a single fisherman, but the average is so small, that it is sold to Mr. Pennant, and weighed forty-five hundred pounds. Hudson's Bay measures a distance of about three hundred miles. The shores are generally almost perpetually covered with ice.

The extensive trade in the property of the principal profits of the fur trade has been repeatedly exposed hitherto, without success, to the strait, stretching to the face of lake of fresh water, by what may be called being level, rich in fish. The lakes Superior, Michigan, and Huron, which are large inland seas, where the French charts called Lake Superior five hundred miles in length, and the coast seems

and Huron, which constitute one piece of water, about three hundred and fifty miles in length; and the great Slave Lake in the north is supposed to be about two hundred and twenty British miles in length. Lake Superior is upwards of one hundred miles in breadth.

The Gulf of Mexico is the most celebrated of those above mentioned, as lying in a favourable climate, and presenting at its entrance that grand archipelago of North American islands called the West-Indies. From this gulf a singular current sets towards the north-east, which is called the Gulf Stream: it passes to the banks of Newfoundland, and is supposed to proceed from the accumulation of waters by the trade-winds. It is often distinguished from other parts of the ocean by the gulf-weed, is eight or ten degrees warmer, of an indigo blue, never sparkles in the night; and when it arrives in cool latitudes, produces thick fogs. To the south of the Gulf of Mexico is the Bay of Honduras, well known in the annals of English commerce.

The Gulf of St. Laurence is the well-known estuary of a river of the same name, generally frozen from December to April. This gulf is closed by the island of Newfoundland, and by numerous sand-banks, particularly one called the Great Bank. This celebrated fishing station is more than four hundred miles in length, by about one hundred and forty in breadth; the water being from twenty-two to fifty fathoms deep, with a great swell. The chief fishery begins on the 10th of May, and continues till the end of September. The greatest number of cod-fish, taken by a single fisherman, has been twelve thousand; but the average is seven thousand: the largest fish, according to Mr. Pennant, was four feet three inches in length, and weighed forty-six pounds.

Hudson's Bay may be considered as extending from the entrance of Hudson's Strait to its western extremity, a distance of about one thousand and fifty British miles. The shores are generally steep and rocky, and the climate is almost perpetually cold.

The extensive tract of territory on the south of this sea is the property of the Hudson's Bay Company, whose principal profits are derived from furs. This sea has been repeatedly explored for a north-west passage; but, hitherto, without success. Chesterfield Inlet is a singular strait, stretching to the west, but terminating in a magnificent lake of fresh water, communicating with this sea by what may be called a broad river; the adjacent land being level, rich in pasture, and abounding with deer.

The lakes Superior, Huron, and Michigan, form one large inland sea, which may be called the Sea of Canada. The French charts state that part of this sea, which is called Lake Superior, to be not less than one thousand five hundred miles in circumference; and the greater part of the coast seems to consist of rocks and uneven ground,

like those of the sea of Baikal. The water is pure and transparent; and the bottom generally consists of large rocks. More than thirty rivers fall into this lake, some of them of a considerable size. The banks of a river on the north-west abound with native copper. The chief fish are sturgeon and trout; the latter being caught at all seasons, and said to weigh from twelve to fifty pounds. This part of the Sea of Canada opens into the Lake Huron, by the Straits of St. Mary, about forty miles in length, and, in some places, only one or two miles in breadth; with a rapid current, towards the north-west extremity, which may, however, be descended by canoes. The circumference of that part called Lake Huron is said to be about one thousand miles; and on the northern side are some islands, called Manitulan, a name implying the residence of spirits. Another short strait leads into the third lake, called Michigan, which is also navigable for vessels of any burthen.

With respect to the smaller lakes, there are about two hundred of a considerable size in North America; a singularity which distinguishes it from every other portion of the globe.

*Rivers.]* The Mississippi is the most distinguished among the rivers of North America; and is thus described in a recent system of American geography, the author of which appears to have possessed the most accurate information.

"The Mississippi receives the waters of the Ohio and Illinois, and their numerous branches, from the east; and of the Missouri, and other rivers, from the west. These mighty streams, united, are borne down with increasing majesty, through vast forests and meadows, and discharged into the Gulf of Mexico. The great length and uncommon depth of this river, and the excessive muddiness and salubrious quality of its waters, after its junction with the Missouri, are very singular. The direction of the channel is so crooked, that, from New Orleans to the mouth of the Ohio, the distance, which does not exceed four hundred and sixty miles in a straight line, is above eight hundred and fifty-six by water. It may be shortened at least two hundred and fifty miles, by cutting across eight or ten necks of land, some of which are not thirty yards wide. Charlevoix relates that, in the year 1722, at Point Coupée, the river made a great turn; and some Canadians, by deepening the channel of a small brook, diverted the waters of the river into it. The impetuosity of the stream was so violent, and the soil of so rich and loose a quality, that, in a short time, the point was entirely cut through, and travellers saved fourteen leagues of their voyage. The old bed has no water in it, the times of the periodical overflows only excepted. The new channel has been since sounded with a line of thirty fathoms, without finding bottom. Several other points of great extent have, in

like manner, been cut off, and the river diverted into new channels.

"In the spring-floods the Mississippi is very high, and the current so strong, that it is with difficulty it can be ascended; but this disadvantage is remedied in some measure by eddies, or counter currents, which are generally found in the bends close to the banks of the river, and assist the ascending boats. The current at this season descends at the rate of about five miles an hour. In autumn, when the waters are low, it does not run faster than two miles; but it is rapid in such parts of the river as have clusters of islands, shoals, and sand-banks. The circumference of many of these shoals being several miles, the voyage is longer, and in some parts more dangerous, than in the spring. The merchandise necessary for the commerce of the upper settlements, on or near the Mississippi, is conveyed, in the spring and autumn, in batteaux, rowed by eighteen or twenty men, and carrying about forty tons. From New Orleans to the Illinois the voyage is commonly performed in eight or ten weeks. A prodigious number of islands, some of which are of great extent, intersperse that mighty river. Its water, after overflowing its banks below the river Ibberville on the east, and the river Rouge on the west, never return within them again, there being many outlets or streams by which they are conducted into the Bay of Mexico, more especially on the west side of the Mississippi, dividing the country into numerous islands. These singularities distinguish it from every other known river in the world. Below the Ibberville the land begins to be very low on both sides of the river, across the country; and gradually declines as it approaches nearer to the sea. The island of New Orleans, and the lands opposite, are to all appearance of modern date, for in digging ever so little below the surface you find water, and great quantities of trees. The many beaches and breakers, as well as inlets, which have arisen out of the channel, within the last half century, at the several mouths of the river, are convincing proofs that this peninsula was wholly formed in the same manner. And it is certain that, when La Salle sailed down the Mississippi to the sea, the opening of that river was very different from what it is at present.

“The nearer you approach the sea, this truth becomes more striking. The bars that cross most of these small channels, opened by the current, have been multiplied by means of the trees carried down with the streams; one of which, stopped by its roots or branches in a shallow part, is sufficient to obstruct the passage of thousands more, and to fix them at the same place. Astonishing collections of trees are daily seen in passing through the Balize and the Missouri. No human force is sufficient to remove them, and the mud carried down by the river serves to bind and cement them together. They are gradually co-

vered, and every inundation not only extends their length and breadth, but adds another layer to their height. In less than ten years' time, canes, shrubs, and aquatic timber, grow on them, and form points and islands which forcibly shift the bed of the river."

Nothing can be asserted with accuracy respecting the length of this river ; nor has its source been explored, but it is supposed to be upwards of three thousand miles from the sea. We only know that, from St. Anthony's falls, in latitude forty-five degrees, it glides with a pleasant clear current, and receives many extensive tributary streams, before its junction with the Missouri, without greatly increasing the breadth of the Mississippi. The muddy waters of the Missouri discolour the lower part of the river, till it disembogues into the Bay of Mexico. The Missouri is longer, broader, and deeper, than the Mississippi, and affords a more extensive navigation : it is, in fact, the principal river, contributing more to the common stream than the Mississippi. It has been ascended by French traders, about twelve or thirteen hundred miles ; and, from the depth of the water and breadth of the river, at that distance, it appeared to be navigable many miles farther.

From the Missouri River to nearly opposite the Ohio, the western bank of the Mississippi is, some few places excepted, higher than the eastern. From Mue au Fer, to the Iberville, the eastern bank is higher than the western, on which there is not a single eminence for the distance of seven hundred and fifty miles. From the Iberville to the sea there are no acclivities on either side, though the eastern bank appears rather the highest of the two, as far as the English turn. Thence the banks gradually diminish in height to the mouths of the river, where they are but a few feet higher than the common surface of the water.

The slime which the annual floods of the Mississippi leave on the surface of the adjacent shores, may be compared with that of the Nile, which for many centuries past has ensured the fertility of Egypt. When its banks shall have been cultivated, as the excellency of its soil and temperature of the climate deserve, its population will probably equal that of any other part of the world. This river also resembles the Nile in the number of its mouths, all issuing into a sea that may be compared to the Mediterranean, which is bounded on the north and south by the two continents of Europe and Africa, as the Mexican bry is by North and South America. The smaller mouths of this river might be easily stopped up by means of those floating trees, with which the river is always covered during the floods. The whole force of the channel being united, the only opening then left would probably grow deep, and the bar be removed.

The falls of St. Anthony, in about latitude forty-five degrees, received their name from Lewis Hennepin, a

Lewis Hennepin, a

French missionary, who travelled in these parts about the year 1680, and was the first European ever seen by the natives. The whole river, which is more than two hundred and fifty yards wide, falls perpendicularly about thirty feet, and forms a most pleasing cataract. The rapids below, in the space of nine hundred feet, render the descent considerably greater, so that, when viewed at a distance, they appear to be much higher than they really are. In the middle of the falls is a small island, about forty feet broad, and somewhat longer, on which grow a few hemlock and spruce trees; and about half-way between this island and the eastern shore is a rock, lying at the very edge of the fall, in an oblique position, five or six feet broad, and thirty or forty feet long. These falls are peculiarly situated, as they are approachable without the least obstruction from any intervening hill or precipice, which cannot be said of any other considerable fall, perhaps, in the world. The circumjacent country, composed of many gentle ascents, which in the spring and summer are covered with verdure, and interspersed with little groves, is extremely beautiful.

A little distance below the falls is a small island, of about an acre and a half, on which grow a great number of oak-trees, the principal branches of which arc, in the proper season of the year, loaded with eagles' nests. The instinctive wisdom of these birds has taught them to choose this place, as it is perfectly secure, on account of the rapids above, from the attack of either man or beast.

From the best accounts that can be obtained from the Indians, we learn that the four most capital rivers on the continent of North America, viz. the St. Laurence, the Mississippi, the River Bourbon, and the Oregon, or the River of the West, have their sources in the same neighbourhood. The waters of the three former are said to be within thirty miles of each other; the latter is rather farther west.

This shews that these parts are the highest lands in North America; and it is an instance not to be paralleled in the other quarters of the globe, that four rivers of such magnitude should take their rise together, and each, after running separate courses, discharge their waters into different oceans, at the distance of more than two thousand miles from their sources. For, in their passage from this spot to the Bay of St. Laurence, east; to the Bay of Mexico, south; to Hudson's Bay, north; and to the bay, at the Straits of Anian, west, where the River Oregon is supposed to disembogue, each of them traverses upwards of two thousand miles.

The Ohio is a most beautiful river, presenting a gentle current, and a surface smooth and unbroken by rocks and rapids, a single instance only excepted. It is one quarter of a mile wide at Fort Pitt; five hundred yards at the mouth of the Great Kanaway; one thousand two hun-

dred yards at Louisville; and the rapids half a mile in some few places below Louisville; but its general breadth does not exceed six hundred yards. In some places its width is not four hundred; and in one place, far below the rapids, it is less than three hundred. Its breadth in no one place exceeds twelve hundred yards; and, at its junction with the Mississippi, neither river is more than nine hundred yards wide.

Dr. Morse states the precise measurement of the length of the Ohio, with all its windings, from Fort Pitt to its junction with the Mississippi, to amount to one thousand one hundred and eighty-eight miles. A vessel, drawing twelve feet water, might safely navigate from Pittsburgh to the sea. Two great rivers unite to form the Ohio, namely, the Monongahela and the Allegany, both of which are navigable.

From the preceding description, it appears that the Missouri must be regarded as the chief river which forms what is called the Mississippi. If measured on the same comparative scale which has been adopted to give a general idea of the length of the rivers in Europe and Asia, the Missouri or Mississippi will be about two thousand miles in length. The great river of St. Laurence is far inferior, being chiefly remarkable for its breadth.

The noble river of St. Laurence is allowed to be the second in North America; it being about ninety miles wide at its mouth, and navigable for ships of the line as far as Quebec, a distance of four hundred miles. Near that place it is five miles in breadth; and at Montreal, from two to four. Though there are some rapids, yet this river may be considered as navigable to Kingston and the Lake Ontario, which is seven hundred and forty-three miles from the sea. It is difficult to define the precise source of the St. Laurence, though that name be generally confined to the river issuing from Lake Ontario; while the Niagara, which flows from the Lake Erie, is regarded as a distinct stream. The length of the St. Laurence may, therefore, be about seven hundred British miles, the breadth being the grand characteristic.

The other chief rivers in North America are the Saskatchewan, the Athabasca, the Unjiga, or Mackenzie's River; the Rio Bravo, which flows into the Gulf of Mexico; and the Albany, which joins Hudson's Bay; Nelson River, and Churchill River, are also considerable streams, which flow into that sea; but their geography is but imperfectly known. The same may be said of the Oregon, or great western river, which, confined by a chain of mountains, runs southerly, till, by a western course, it joins the Pacific.

*Mountains.* The mountains of North America are far from equalling the Andes, in the south. The isthmus contains many irregular ranges; but it is only theoretical to consider them as connected with the Andes, as they

have neither the same character nor direction. In the isthmus there are also several volcanos.

The centre of North America may be described as a vast fertile plain, watered by the Missouri and its auxiliary streams. On the west, as far as discovered, a range of mountains proceeds from New Mexico in a northern direction, and joins the ridge called the Stony Mountains, which extends to the vicinity of the Arctic Ocean. From most of the accounts of navigators who have visited this coast, it seems to resemble that of Norway, being a wide hilly country, of considerable extent; while the shore, like that of Norway, presents innumerable creeks and islands. This tract, from the Stony Mountains and Mackenzie's River westward, to the source of the Oregon and Beering's Strait, probably contains the highest mountains in North America. On the north-east, Greenland, Labrador, and the countries around Hudson's Sea, present irregular masses, continually covered with snow, and having black naked peaks, resembling in form the spires of the Alps, but of very inferior height.

The most celebrated mountains in North America are those called the Apalachian, which pass through the territory of the United States from south-west to north-east. They commence to the north of Georgia, where they give rise to many rivers, running south to the Gulf of Mexico; and running north to the Tennessee, and others. There are several collateral ridges, as the Iron or Bald Mountains, the White Oak Mountains, &c.; the exterior skirt on the north-west being the Cumberland Mountains. The Apalachian chain thence extends through the western territory of Virginia, accompanied with its collateral ridges, the breadth of the whole being often seventy miles; it proceeds through Pennsylvania, then passes Hudson's River; and afterwards rises to a greater height, but seems to terminate in the country of New Brunswick. The chief summits appear to be in the province of New Hampshire, where the White Mountains are reported to be nine thousand feet above the sea; though some writers are of opinion that their altitude does not exceed six thousand feet.

The extent of the Apalachian chain appears to be about nine hundred geographical miles, a length greater than that of any chain of European mountains, except the Norwegian alps. The collateral ridges are very distinct; the central is granitic, the next schistous, and the exterior strata calcareous. The granite seems to consist of white felspar, bluish pellucid quartz, and black mica. The schistous band, generally metalliferous in other regions, here presents copper-ore; and, in Canada, lead and silver are said to have been discovered in them. The lime-stone contains, as usual, many petrifactions, particularly a small scallop-shell, and several sorts of corals. The height of the chief summits has not been precisely ascertained, but probably does not exceed three thousand feet above

the sea; and they are often covered with forests. Mr. Weld conjectures that the peaks of Otter, the highest of what are called the Blue Mountains, are little more than two thousand feet in height.

The Count de la Rochefoucault has communicated some valuable information concerning the ores of this part of the world. The primitive calcareous rock is mingled, in veins or banks, with the granitic, and is evidently contemporary. Near Philadelphia, large pieces of talc appear, instead of mica. There are also veins of quartz and marble, in the position of metallic veins. A remarkable circumstance in the mineralogy is, that the granitic mountains approach nearest to the sea, while at a greater distance the rocks are calcareous; and the primitive lime-stone is sometimes covered with breccia and argillaceous schistus. The lakes of Upper Canada are surrounded with calcareous rocks; while in Lower Canada, from Montreal to the sea, the granite is predominant. The rock of Quebec is said to consist of grey granite, mingled with schorl, and was formerly called the Rock of Diamonds, because quartz crystals were found in the sand-bank of Newfoundland is supposed to be a mass of granite, covered with sand.

On the coast of New York and Boston, the rocks are of a soft granite, interspersed with lime-stone and schistus; but, towards Carolina and Florida, the granitic mountains are at a considerable distance from the sea, which seems gradually to have retired.

*Mineral and Vegetable Productions.*] America produces most of the metals, minerals, plants, fruits, trees, and timber, which are found in the other parts of the world, and many of them in greater quantities and higher perfection. The gold and silver of America have supplied Europe with such immense quantities of those valuable metals, that they are become much more common than formerly. And to these may be added diamonds, pearls, emeralds, amethysts, and other precious stones, which have been brought into Europe in considerable quantities. Other commodities, though of less price, are of much greater utility, and many of them make the ornament and wealth of the British empire in this part of the world. Of these are the plentiful supplies of cochineal, indigo, anatto, logwood, brazil, fustic, lignum-vitæ, rice, ginger, pimento, cocoa, or the chocolate-nut, sugar, cotton, tobacco, banillas, red-wood, the balsams of Tolu, Peru, and Chili; the Jesuits' bark, mechoacan, sassafras, sarsaparella, cassia, tamarinds, hides, furs, ambergris, &c.

This continent has also a variety of excellent fruits, which here grow wild in great perfection; as pine-apples, pomegranates, citrons, lemons, oranges, cherries, pears, apples, figs, and grapes; with great quantities of culinary and medicinal herbs, roots, and plants

[PART III.

with forests. Moreover, the highest mountains are little more than

## CHAPTER III.

## BRITISH AMERICA.

**U**NDER the general name of British America is comprised the vast extent of country situate between forty-two and seventy degrees of north latitude, and between fifty and ninety-six degrees of west longitude. It is bounded, on the south, by the United States of America and the Atlantic Ocean; on the east, by the same ocean and Davis's Straits, which divide it from Greenland; on the north, by the northern limits of the Hudson's Bay charter; and, on the west, by unknown parts.

British America is divided into New Britain, Canada, and Nova Scotia; to which are to be added the islands of Cape Breton and Newfoundland.

## SECTION I.

## NEW BRITAIN.

*Situation, Extent, and Boundaries.*] New Britain is situate between fifty and seventy degrees of north latitude, and between fifty and one hundred degrees of west longitude; extending eight hundred and fifty miles in length, and seven hundred and fifty miles in breadth, and is said to contain three hundred and eighteen thousand seven hundred and fifty square miles. It is bounded by unknown lands and frozen seas, about the pole, on the north; by the Atlantic Ocean, on the east; by the Bay of Canada and River St. Laurence, on the south; and by unknown lands, on the west.

*Climate, Soil, &c.*] The climate of New Britain is intensely cold, and the air is seldom, if ever, clear. In the spring and fall, they have heavy wet fogs; and, in the winter, the air is full of an infinite number of icy spiculæ, that are visible to the naked eye; for as there arises, at this time of the year, a very thick vapour, called frost-smoke, this vapour, freezing, is driven by the wind in the form of spiculæ.

Mock suns, and red circles about the noon and sun, very luminous, and beautifully tinged with all the various colours of the rainbow, are common in these regions. Captain Ellis saw six of these mock suns at one time. The true sun rises and sets with a large cone of yellow light perpendicular to it; and no sooner does it disappear, than the Aurora Borealis spreads a thousand different colours over the whole concave of the sky, with so resplendent a beauty, that even the full moon does not efface their lustre; but, if the moon does not shine, these lights

are much more apparent. The stars seem to burn with a fiery redness, especially those near the horizon, which strongly resemble a fire, or a ship's light, at a distance. Thunder and lightning are not very frequent in summer, though that season, for about six weeks or two months, is extremely warm. The soil is universally barren; and, to the northward of Hudson's Bay, even the hardy pine-tree is seen no longer. Every kind of European seed hitherto committed to the earth in this inhospitable climate has perished.

*Animals.*] In this country there are moose-deer, stags, rein-deer, bears, buffaloes, wolves, foxes, beavers, otters, lynxes, martins, squirrels, ermines, wild cats, hares, and beavers. The singular animal called the musk-ox is thus described by Mr. Hearne:—"The musk-ox, when full grown, is about the ordinary size of English black cattle; but the legs are shorter and thicker. The tail is short, and always bent inwards, so that it is entirely hid in the long hair of the rump and hind quarters. The hunch on the shoulders is not very prominent; the hair, on some parts, is very long, particularly under the throat, where it appears like a horse's mane inverted, and gives the animal a very formidable appearance

"The flesh of the musk-ox resembles that of the moose, or elk; the fat is a clear white, slightly tinged with azure. The calves and young heifers are good eating; but the flesh of the bulls smells and tastes so strong of musk, that it is almost intolerable. Even the knife that cuts the flesh of an old bull will smell so strong, that nothing but scowering it can remove the scent. The Indians killed several of them; but, as the flesh was very lean, they only stripped the bulls for the sake of their hides.

"In the high latitudes, many herds of these animals may be seen in the course of a day's walk. The number of bulls is very small, in proportion to that of cows; so that there is every reason to believe they kill each other in contending for the females. They delight in the most mountainous parts of the barren ground. Though of considerable magnitude, and apparently little adapted for agility, they climb the rocks with the facility of goats."

As the skins of the beavers form the principal article of commerce in New Britain, it may be proper to give a particular description of these curious animals.

A large beaver is about twenty-eight inches in length, from the hind part of the head to the root of the tail, and

weighs sixty or seventy pounds; but the colour varies: in some places, they are black, in some white, and, in others, almost of the colour of the deer. They are amphibious animals; and the females generally bring forth four young ones at a time. Their jaws are furnished with two cutters and eight grinders: the upper cutter is two inches and a half in length, and the lower something longer. The upper jaw projects over the lower one. The head is shaped like that of a rat, and the tail like the blade of a paddle. It is about fourteen inches in length, and about an inch thick. It is covered with a scaly skin; the scales being a quarter of an inch long, and folding over each other, like those of a fish.

The industry, foresight, and good management, of these animals, are extremely surprising, and scarcely credible to those who never saw them. When they want to form a settlement, three or four of them assemble together, and first pitch upon a place where they may have provisions, such as the bark of trees, roots, or grass, with every thing necessary for erecting their edifices, which must be surrounded by water: and, if there be neither a convenient lake or pond, they make one, by stopping the course of some brook or river. For this purpose, they cut down trees, above the place where they are resolved to build, and take their measures so well, as always to make the tree fall towards the water, that they may have the less distance to roll it, when they have cut off the branches. This done, they float it to the appointed place, and these pieces they cut bigger or less, to suit their convenience. Sometimes, they use the trunks of large trees, which they lay flat in the water. At others, they fasten stakes in the bottom of the channel, and then, interweaving small branches, fill up the vacancies with clay, mud, and moss, in such a manner as renders the dam very tight and secure. In these works, their tails serve them for carts and trowels, and their teeth for saws and axes. Their paws supply the place of hands, and their feet serve instead of oars.

The construction of their houses is no less admirable: they are generally built upon piles, at some distance from the shore, but sometimes close to the banks of the rivers. They first make holes at the bottom of the water for planting six posts, upon which each of their edifices is built, in a most curious manner. Their form is circular, with a flat roof. The walls are two feet thick, and sometimes more: they are formed of the same materials as the dams just mentioned: and every part is so well finished, that no air can possibly enter. About two-thirds of the edifice is raised above the water: in this they lodge, and are careful to keep it clean. They have generally three or four different avenues to each house, which they enter under water. To provide provisions against the winter, they draw the sticks they cut from the trees, and, thrusting one end into the mud, let them lie under the water, to pre-

serve the bark green and tender for their winter provision.

The Indians sometimes roast these animals, in the same manner as we do pigs, first burning off their fur. Besides the fur, the beaver produces the true castor, the value of which is well known.

"It is worthy of observation," says a respectable geographer, "that all the quadrupeds of this new world are less than those of the old; even such as are carried from hence to breed there are often found to degenerate, but are never seen to improve. If, with respect to size, we should compare the animals of the new and the old world, we shall find the one bear no manner of proportion to the other. The Asiatic elephant, for instance, often grows to the height of fifteen feet, while the tapurette, which is the largest native of America, is not bigger than a calf of a year old. The lama, which some also call the American camel, is still less. Their beasts of prey are quite divested of that courage which is so often fatal to man in Africa or Asia. They have no lions, nor, properly speaking, either leopard or tiger. Travellers, however, have affixed those names to such ravenous animals as are there found most to resemble those of the ancient continent. The congar, the taquar, and the taquaretti, are despicable, in comparison of the tiger, the leopard, and the panther, of Asia. The tiger of Bengal has been known to measure six feet in length, without including the tail; while the congar, or American tiger, as some affect to call it, seldom exceeds three. All the animals, therefore, in America are different from those of the ancient continent; nor does there appear to be any common to both, but those which, being able to bear the cold of the north, have travelled from one continent to the other. The bear, the wolf, the rein-deer, the stag, and the beaver, are known as well in New Britain and Canada as in Russia. But, if the quadrupeds of America be smaller than those of the ancient continent, they are in much greater abundance; for it is a rule that obtains through nature, and evidently points out the wisdom of the Author of it, that the smallest animals multiply in the greatest proportion. The wisdom of Providence in making formidable animals unprolific is obvious: had the elephant, the rhinoceros, and the lion, the same degree of fecundity with the rabbit or the rat, all the arts of man would soon prove unavailing, and we should soon perceive them become the tyrants of those who call themselves the masters of the creation."

Among the birds of New Britain there are geese, bustards, ducks, partridges, and all kinds of wild-fowl. There are such quantities of partridges in this country, that ninety thousand have been taken, in one season, at Port Nelson. The seas abound with whales, seals, cod, and a white fish, preferable to herrings; and the rivers and fresh waters with pike, perch, carp, and tench.

*Minerals.*] New Britain contains an abundance of minerals of different sorts; iron, lead, and copper: there are, likewise, a great variety of marble, talcs, spars, and rock-crystals, of different colours. In the northern parts there is a substance that burns, and resembles coal. The asbestos, or stone-flax, is common here, and a stone, of a black, smooth, and shining surface, that separates easily into thin transparent leaves, resembling the Muscovy talc, which the natives use as looking glasses.

*Customs, Manners, &c.*] The natives of this country are of a middle size, and copper-colour, with black eyes, and long black hair. In their shapes and faces, they do not resemble the Americans who live to the southward. In general, the women here are far from being objects of attraction, according to European ideas of beauty; though there are a few, when young, that are not quite destitute of personal charms. Hard labour, however, hard fare, and a rigorous climate, soon render them wrinkled; and they have all the marks of decrepitude before they are thirty. These Indians, in general, are of a cheerful and friendly disposition, good-natured, and honest in their dealings.

The clothing of the men, in summer, is a loose coat, made of a blanket, which they buy either of the French or English colonists; a pair of leather stockings, which come so high as to serve them for breeches, and shoes of the same materials. The ordinary apparel of the women is made of the skin of deer, otters, or beavers, with the hair or fur on; the sleeves of their upper habit are frequently separate from the body of it, and taken off at pleasure, being only tied with strings at the shoulders; so that the arms, even in the depth of winter, are exposed to the cold, which they conceive contributes to health. Their diseases, indeed, are but few, and these chiefly, arise from colds taken after drinking spirituous liquors, which they buy from the English.

They reside in tents, covered with moose and deer-skins sewed together. These are all circular, and are formed of poles, which are extended at the bottom, and at the top incline to the centre, where an opening is left to admit the light, and let out the smoke. They strew the floor with the tops of pine-trees, and lie with their feet to the fire, and their heads to the sides of the tent. The entrance is generally on the south-west side, and they go in by lifting up one of the skins.

They have no dependence for subsistence on the fruits of the earth, but live entirely on the animals which they take in hunting, or catch in traps. They every season make a prodigious slaughter among the deer, from an absurd notion, that the more they destroy the greater plenty will succeed; hence they sometimes leave three or four hundred dead on the plains, taking out only their tongues, and leaving their carcases either to rot, or to be devoured

by wild beasts. At other times, they attack them in the water, and bring great numbers on floats to the factories. They also live upon birds, and even feed on eagles, hawks, crows, and owls, as well as on partridges, wild geese, and ducks. They generally boil their flesh, and drink the water in which it is boiled, which they esteem very wholesome.

The chiefs in every family or tribe (who are generally chosen from among the most ancient of the people, for their skill in hunting, and experience in trade, or valour in war,) direct those who reside with them in their different employments of hunting, fishing, fowling, &c.; yet their advice is followed rather through deference than obligation; for, in point of exemption from power, they may be truly called a free people.

Their method of kindling fire is very singular. To do this, they prepare two small pieces of flat dry wood, and make a small hole in each, and, having fitted into these holes a little cylindrical piece of wood, to which a thong is fastened, they whirl it about with such velocity, that the motion soon sets them on fire; and then, by applying the lighted piece of wood to some dry moss, as we use tinder, they make as great a fire as they please.

Polygamy is practised among these people; and Mr. Hearne relates, that a chief, named Matonabee, who, with others, accompanied him in his travels, purchased a wife at a tent of Indians, where they stopped for refreshment, though he had six before, and most of them of the size of grenadiers. Indeed, the chief pride of an Indian is to have a wife of strength rather than beauty; for, as they have neither beast of burden nor water-carriage, every good hunter is under the necessity of having persons to carry his furs to market; and none are so well adapted for this work as the women, who are inured to carry heavy goods from their very childhood; so that he who is capable of providing for three, four, or more, women, is, comparatively speaking, a great man. Jealousies will sometimes appear among them, notwithstanding habit has familiarized them to their situation; but, as the husband is always arbitrator, the disputes are soon settled, and submission must be paid to his commands.

As some of the Indians of Mr. Hearne's travelling party were engaged in hunting, they discovered the track of a strange snow-shoe; and, tracing it, they came to a little hut, where they found a young woman alone. She proved to be one of the western Dog-ribbed Indians, who had been taken prisoner by those of Athapusco, and had eloped from them when they were in the vicinity, with an intention of returning to her own country; but the distance being so great, she had forgot the track, and had, therefore, built a hut for her protection, in which she had lived about seven moons, without seeing a human face.

"During this time," says our author, "she had sup-

ported herself by snaring partidges, rabbits, and squirrels. That she had not been in want was evident from her appearance, and the stock of provisions she had still by her. Of a real Indian, she was one of the finest women of any I ever saw. She had shewn infinite ingenuity in procuring a livelihood. When the few deer-sinews she had carried off with her were all expended in making snares, and sewing her clothes, she had used those of the legs of rabbits, with much dexterity and success. Of the skins of those animals she had likewise made herself a complete and neat suit of winter-clothes; and it was evident she had extended her care beyond mere comfort, as her dress exhibited no little variety of ornament.

"Her leisure-hours had been employed in twisting the inner rind of willows into small lines, of which she intended to make a fishing-net. Five or six inches of an iron-hoop served her for a knife, and this, together with an awl of the same metal, were all the implements in her possession. She lighted a fire by rubbing two hard sulphureous stones against each other; and, when a few sparks were produced, she had touch-wood ready to receive them.

"The comeliness of her person, and her approved accomplishments, occasioned a strong contest among the party, who should have her to wife; and she was actually won and lost by almost ten men the same evening. Matonabbe, though he had no less than seven women grown, and a young girl about twelve years old, wished to put in his claim for her; but one of his wives shamed him from this, by observing that he had women enough already. This piece of satire, however true it might be, irritated the chief so much, that he fell upon the poor creature, and bruised her so excessively, that, after lingering some time, she escaped from his tyranny by death.

"It appeared that, when the Athapusco Indians surprised the friends of the young woman, they had butchered them all, except herself and three other women. Among the victims of their barbarity were her father, mother, and husband. She had a child, about four months old, which she concealed in a bundle of clothing, and carried with her; but, when they joined the Athapusco women, one of them snatched it from her, and killed it on the spot. Her new husband, she said, was remarkably fond of her; but this piece of barbarity she could never forget, and took the first opportunity of eloping from the murderers of her infant."

During the progress of Mr. Hearne's journey, one of the women who belonged to the party was taken in labour; a circumstance that detained them two days. The instant, however, that the poor woman was delivered, the tents were struck, and, with her child on her back, and a small burden besides, she was forced to keep pace with them, and frequently had to wade knee-deep in water and melted

snow. Her looks, exclusive of her piteous moans, were a sufficient proof of the anguish she endured; and Mr. Hearne says, he never felt more than he did for this miserable woman, whom it was not in his power to relieve.

One night, when the travelling party halted, one of Matonabbee's wives, and another woman, eloped, and it was supposed they had gone to rejoin their former husbands, from whom they had been forcibly taken. The chief was almost inconsolable for the loss of his wife, though he had still six remaining. Indeed, it seems she was by far the handsomest of his seraglio, and possessed every valuable quality to be found in an Indian. She appeared, however, unhappy with Matonabbee, and, probably, preferred being the sole wife of a young man of less note, to sharing the divided affection of the greatest man of the country.

Among these people it is customary to wrestle for the woman to whom they are attached; and, of course, the strongest carries off the prize. Indeed, without a considerable share of bodily strength, or some acquired consequence, it is seldom permitted to keep a wife, whom a stronger man thinks worth his notice, or whom he wants to assist in carrying his goods. This savage and unnatural custom prevails throughout all their tribes, and excites a spirit of emulation among the youth to distinguish themselves in gymnastic exercises, to enable them to protect their wives and property.

The manner in which they tear the women, and other property, from each other, is not so much by fighting as by dragging each other by the head. Seldom any hurt, however, is done in those rencounters. Before the contest begins, it is not unusual for one or both of the combatants to cut off his hair, and to grease his ears, in private. If one only is shorn, though he be the weakest man, he generally obtains the victory.

The by-standers never interfere on these occasions; not even the nearest relations, except by advice to continue or abandon the contest. Scarcely a day passes without some overtures being made for contests of this kind; and Mr. Hearne says, it often affected him much to see the object of the dispute sitting in pensive silence, and awaiting the termination of the combat, which was to decide her fate. Sometimes a woman happens to be won by a man whom she mortally hates; but even in this case she must be passive.

Unprincipled and savage as these tribes appear, in robbing each other, not only of their property, but their wives, they seldom carry their enmity further than wrestling. A murder is seldom heard of among them; and the perpetrator of such a horrid crime is sure to be forsaken, even by his own relations and former friends.

Their affection for their children is singularly great, as will appear from the following anecdote:—Two small

canoes, passing a to the middle of it bark of a birch-tree, wife, and their child, produced a not that both of the save the other, but greatest loss to the to prove it more re than the woman; was more for the ad perish, because he and, consequently, remaining was spent the woman strongly to her husband, the they took leave in the noe, was drowned safe; ashore.

canoes, passing a river at Fort York, when they had got to the middle of it, one of them, which was made of the bark of a birch-tree, sunk, in which was an Indian, his wife, and their child. The other canoe being small, and incapable of receiving more than one of the parents and the child, produced a contest between the man and his wife; not that both of them were willing to devote themselves to save the other, but the difficulty lay, which would be the greatest loss to the child. The man used many arguments to prove it more reasonable that he should be drowned than the woman; but she alleged, on the contrary, it was more for the advantage of the child that she should perish, because he, as a man, was better able to hunt, and, consequently, to provide for it. The little time still remaining was spent in mutual expressions of tenderness; the woman strongly recommending, as for the last time, to her husband, the care of her child. This being done, they took leave in the water; the woman, quitting the canoe, was drowned; and the man, with the child, got safe ashore.

The natives of New Britain have a horrid custom of waging perpetual war, and exercising the most brutal cruelties on their neighbours, the Esquimaux. Impelled by this savage disposition, the party who accompanied Mr. Hearne were joined by a number of Indians, who, for that purpose, had equipped themselves in military array.

As soon as our traveller was apprised of their intention of murdering a people who had done them no injury, he zealously strove to dissuade them from such a design; but so far were his entreaties from being regarded, that they apprehended he was actuated by cowardice; and, with many marks of derision, told him, he was afraid of the Esquimaux. Knowing that his personal safety depended on the ideas his attendants formed of his courage, he was obliged to change his tone, and affect the language of a hero.

When they arrived in the vicinity of the country of the Esquimaux, three Indians were despatched to look for any of those people who might be on the banks of the Copper-mine River; and every precaution was taken to prevent an alarm, that the destined victims might fall into their hands without apprehension. The three spies returned, and reported that they had discovered five tents, in the most favourable situation for a surprise. The whole thoughts of the Indians were now absorbed in planning the best mode of attack, and of stealing on the poor savages, when asleep, and killing them all.

Having crossed the river in canoes, and got all the weapons in order, each painted a part of his shield with some figure, generally the sun, moon, or some bird or beast of prey, on which they placed their reliance for success in the intended engagement. From the hurry in which this business was executed, and the deficiency both of skill and colours, most of the paintings had little resemblance

to any thing in heaven or earth; but they satisfied the artists, and that was sufficient.

This piece of superstition being completed, they advanced towards the Esquimaux tents, with the utmost caution and silence; and, though an undisciplined rabble, and by no means accustomed to war, no sooner had they entered on the horrid scene, than they acted with the utmost uniformity. All were united in the general cause, and as ready to follow as Matonabbee to lead. Never was a reciprocity of interest more generally regarded; and, if ever the spirit of disinterested friendship animated the breast of a northern Indian, it was here displayed in glowing colours. Property of every kind ceased to be private: each was proud of an opportunity of supplying the wants of his neighbour. The attacking party was judged to be quite as numerous as the Esquimaux could possibly be, and, besides, being so much better equipped, nothing less than a miracle was likely to save the poor savages from a general massacre.

The land was so situated, that they walked under cover of the rocks and hills till within two hundred yards of the tents. Here they halted, to watch the motions of the enemy, and would have persuaded Mr. Hearne to remain till the engagement was over. But, though he disclaimed any interference in the deed of death, he thought it more prudent to accompany them; and the Indians were not a little gratified with his promptness to be of the party.

The last ceremonies were now performed, which consisted in painting their faces; some black, some red, and others a mixture of the two. They next made themselves as light as possible for running, by stripping themselves almost naked; and our traveller, fearing he might have occasion to run with the rest, pulled off his stockings and cap, and tied up his hair as closely as possible.

"It was now," says Mr. Hearne, "near one in the morning, when, finding the Esquimaux all still, they rushed from their ambuscade, and fell on the unsuspecting savages, who did not perceive their danger till it was too late to avoid it. The scene was shocking beyond description. The unhappy victims were surprised in the middle of their sleep; men, women, and children, to the number of twenty, ran out of their tents, stark naked, and endeavoured to fly; but the Indians had possession of the land-side; and, as they did not attempt to throw themselves into the river, the whole fell a sacrifice to unprovoked barbarity.

"Their shrieks were most dreadful; but no part of this affair filled me with deeper horror, than the fate of a young girl, apparently about eighteen: she was stabbed so near me, that she fell down at my feet, and twisted round my legs; so that I could scarcely extricate myself from her dying grasp. I solicited hard for her life; but the murderers made no reply till they had transfixed her with two spears. They then looked sternly at me, and, in ridicule, asked if I

wanted an Esquimaux wife. Though the poor wretch was twining round their spears, they continued their taunts, when I begged they would, at least, release her from her misery. On this, one of them pierced her through the breast. The love of life, however, prompted her to attempt to ward off the blow, which, in her situation, was the extreme of mercy to inflict.

"My situation, and the terror of my mind, at the sight of this butchery, can neither be conceived nor described. Though I summoned up all my resolution, it was with difficulty I could refrain from tears; even at this hour I cannot reflect on the transactions of that horrid day, without the most painful emotions."

When these people were all massacred, seven other tents, on the other side of the river, attracted their notice; but, providentially for the Esquimaux, the baggage and canoes had been left some way up the river, and there was no other way of crossing it. The river here was about eighty yards over, and, to alarm them, if they could not kill them, they began firing. The poor Esquimaux, though on the watch, were so much unacquainted with the nature of fire-arms, that they did not attempt to fly. When the bullets struck the ground, they ran, with a vacant curiosity, to see what they were. At length one of them was wounded in the leg, which immediately threw them into confusion. They ran to their canoes, and were soon out of the reach of the northern Indians.

Having plundered the tents of the deceased of all the copper utensils they could find, they assembled on the top of an adjacent hill, and, forming a circle with their spears erect, clashed them together, and gave many shouts of victory, frequently calling out, "tima? tima?" or what cheer? by way of derision, to the poor surviving Esquimaux, who were standing almost knee-deep in the water.

After parading for some time, they set out for their canoes, and, sailing under cover of the bank, they approached the other tents, where the Esquimaux, thinking probably they were gone, had returned, and were busy in tying up bundles. These were seized, but the owners fortunately escaped again in their canoes, except one old man, who was too intent on his business, and who fell a sacrifice to their fury, for not fewer than twenty had a hand in his death. As they were retreating from the first scene of blood, they found an old woman, sitting by the side of the river, killing salmon, which lay very thick at her feet. Whether from the noise of the fall, or a great defect in sight, she had not been apprized of the murder of her companions, though not more than two hundred yards distant from the scene of blood; nor did she discover her enemies till they were just within reach of her. She was pierced through with numerous spears, with the most marked and studied cruelty.

After having plundered the second encampment, the

northern Indians threw the tents into the river, and destroyed a large stock of provisions, merely from the wish of doing all the mischief in their power to the unhappy Esquimaux, who were standing on a distant shoal, the woful spectators of their loss.

The following custom must appear shocking to every humane mind. When parents grow so old as to be unable to support themselves by their own labour, they require their children to strangle them, and their performing it is esteemed an act of duty. This is done in the following manner: The old person's grave being dug, he goes into it, and, after having conversed and smoked his pipe, or, perhaps, drank a dram or two with his children, he informs them that he is ready; upon which two of them put a thong about his neck, one standing on one side, and the other opposite to him, which they pull violently till he expires: they then cover him with earth, and over that erect a kind of rough monument of stones. Such old people as have no children require this office of their friends; but in this case it is not always complied with.

Like all rude nations, these Indians are strongly addicted to superstition. They believe in the existence of a number of good and bad genii, spirits who interfere in the affairs of mortals, and produce all their happiness or misery. It is from the evil genii, in particular, that their diseases are supposed to proceed, and to the good genii that they deem themselves indebted for a cure. The ministers of the genii are the jugglers, who are also the only physicians among the savages. These jugglers are supposed to be inspired, by the good genii, with the knowledge of future events: they are called in to the assistance of the sick, and are supposed to be informed whether their patients will recover, and in what manner they must be treated.

Respecting these jugglers, the following particulars are related by M. Hearne. "Several of the Indians being indisposed, the conjurers, who are always the doctors, began to try their skill to effect their recovery. No medicine, except charms, is used for any complaint, whether external or internal. In ordinary cases, sucking the diseased part, blowing and singing to it, spitting, and uttering much unintelligible jargon, compose the process of the cure.

"When a friend, for whom they have a particular regard, is supposed to be dangerously ill, they occasionally have recourse to a very extraordinary piece of superstition, namely, swallowing hatchets, knives, or the like. On these occasions a conjuring-house is erected, by driving the ends of four small poles into the ground, the tops of which are tied together, and then covered with a tent-cloth, with a little aperture at the top, to admit the light. In the middle of this tent the patient is laid; and sometimes five or six conjurers, quite naked, enter; and, securing the door, kneel round the patient, and begin to suck and blow

the part affected. After a short process of this kind, they sing and talk as if conversing with familiar spirits, which they pretend actually appear to them in the form of beasts or birds of prey.

"Having finished this ideal conference, they call for the hatchet, bayonet, or the like, which is always prepared by another person, and has a string fastened to one end, to assist in drawing it up again, after they have swallowed it; for they do not pretend to be able to digest or pass it.

"I once saw an experiment of this kind. A man being dangerously ill, and some extraordinary experiments being judged necessary, one of the conjurers consented to swallow a broad bayonet. The house was erected, as before mentioned, the invocations took place, and the bayonet being called for, it disappeared in the twinkling of an eye. I am not credulous enough to suppose that the juggler actually swallowed it; but I confess I could see nothing but the small piece of wood at the end of the string, or one similar to it, between his teeth.

"The juggler then paraded backward and forward for a short time, when he feigned to be greatly disordered in his stomach and bowels; and, after many wry faces and hideous groans, by the help of the string and some tugging, he at length produced the bayonet, apparently from his mouth, to the no small surprise of the spectators. He then looked round with an air of exultation, and, retiring into the conjuring-house, renewed his incantations, which he continued, without intermission, for the space of twenty-four hours."

Mr. Hearne admits he was not able to detect the deception, more particularly as it was performed by a naked man, and the natives themselves seemed to exult at this triumph, as they supposed it, over his former incredulity. The sick man soon recovered, and in a few days prosecuted his ordinary business.

During the stay of the party at Indian Lake, a man being entirely palsied on one side, the conjurers set about curing him; and the person who had swallowed a bayonet in the summer, now offered to swallow a piece of board, as large as a barrel-stave, for his recovery. After the usual preparatory ceremonies, the board was delivered to the conjurer, who apparently shoved one-third of it down his throat, and then walked round the company, continuing to swallow it, till no part was visible, except a small piece of the end.

As our traveller had doubted the former trial of his skill, the Indians, to cure his unbelief, gave him the most favourable station for seeing the exploit performed; but still, though he could not be convinced of what was in itself impossible, he was unable to detect the imposition. Soon after, being questioned as to his opinion of the performance, as he was unwilling to offend by owning his

sentiments that it was a juggle, he only hinted at the impossibility of swallowing a piece of wood, longer than the man's whole back, and twice as wide as his mouth. On this some of them laughed at him for his ignorance, and said, that the spirits in waiting swallowed, or otherwise conveyed away, the stick, and only left the forked end apparently sticking out of the conjuror's mouth. Matonabee, though a man of sense and observation, was so bigotted to the reality of those feats, that he assured Mr. Hearne he had seen a man swallow a child's cradle, with as much ease as he could fold up a piece of paper and put it in his mouth.

As soon as the conjuror had finished the swallowing remedy, five other men and an old woman, all proficient in the art, stripped naked, and entered with him into the conjuring-house, where they began to suck, blow, sing, and dance, round the poor paralytic; and continued this farce for three days and as many nights, without intermission, or taking the least refreshment. At last, when they came out, their mouths were quite parched and black, and they were not able to articulate a single syllable. They laid themselves on their backs, with their eyes fixed, as if in the agonies of death, and, for the first day, were treated like young children, by being fed by hand.

The paralytic, however, had not only recovered his appetite, but was able to move all the fingers and toes of the side that had been so long dead. In three weeks he could walk, and at the end of six went a hunting for his family. After that he accompanied Mr. Hearne to the fort, and frequently visited the factory during the following years. But his nature seemed quite changed; for, from being lively, benevolent, and good-natured, he became pensive, quarrelsome, and discontented, and never recovered the look of health.

Though the deception performed by the Indian conjurers must be unquestionable, the apparent good effects of their charms on the diseased, can only be accounted for on the principal of faith in the patient, which sets the mind at ease, and inspires hope, so essential to the well-being of man. As a proof of the implicit confidence which is placed in the supernatural powers of these jugglers, even the threat of revenge on any person that has offended them is often fatal. The very idea that the conjuror possesses the means of destruction, preys on the spirits of the unhappy victims of his ill-will, and soon brings on a disorder that terminates his existence.

Mr. Hearne says, the natives always thought him possessed of this art; and, accordingly, he was once solicited to kill a man, who had offended a chief, and who was then several hundred miles off. To please his friend, he drew some rude figures on a bit of paper, and gave it to the Indian, who wished for the destruction of his enemy. But what was his surprise, on being told, the next year,

that the man, who was then in perfect health, being acquainted with his design against him, almost immediately sickened and died. He was frequently afterwards importuned to execute revenge on others; but, having once established his character by this fatal instance of Indian credulity, he never complied, in future, with such requests.

The *Copper Indians* are so called from their proximity to the Copper River. Mr. Hearne relates that, when he arrived at their spot, and they were made acquainted with the object of his journey, they highly approved of it, and even offered their assistance, particularly in lending their canoes, which they said would be very useful during the remainder of the journey. Our traveller, according to his instructions, smoked the calumet of peace with the principal of the Copper Indians, and was delighted with the prospect of a settlement in their country; and seemed to think there could be nothing to prevent it; for, though he acknowledged that he had never seen the sea clear of ice at the mouth of the Copper River, it did not occur to him, that this must prevent ships from approaching their territories.

The whole party of the Copper Indians, notwithstanding they had never seen an Englishman before, were extremely civil and obliging; and our traveller made them a present of some articles, to conciliate their affection. They pronounced him to be a perfect human being, except in the colour of his hair and eyes; the former, they said, was like the stained hair of a buffalo's tail; and the latter like the eyes of a gull.

The *Esquimaux Indians*, who reside on the eastern coast of Hudson's Bay, derive their name from an Indian word, that signifies eaters of raw flesh; for, after thoroughly drying the flesh of the beasts they kill, they eat it without any other preparation. They are rather low in stature, and, though thick set, are neither well made nor strong. Their complexion is a dirty copper colour, though some of the women are something fairer. One singular part of their dress is their snow-eyes, as they properly call them. These are bits of wood or ivory, formed to cover the organs of sight, and tied at the back of the head. In each piece are two slits, of the same length with the eyes, but narrower, through which they see distinctly. This invention prevents a very painful disorder, occasioned by the brightness of the light reflected from the snow.

Their tents are made of deer-skins, and are pitched in a circular form. In winter, they have huts half underground, rising and pointed like a cone: these are always erected in the most sheltered situations. Their domestic utensils consist of stone-kettles, wooden troughs, dishes, scoops, and spoons made of the horns of the musk-ox. Some of the kettles are capable of containing five or six gallons, and are hollowed out in the form of an oblong square.

Mr. Hearne did not see any bird peculiar to those parts, except what the Copper Indians call the Alarm Bird. It appears to be of the owl genus; and its name is said to be well adapted to its qualities. When it discovers either man or beast, it directs its flight towards them, and, hovering over them, flies round their heads. Should two objects at once arrest its attention, it flies from one to the other alternately, making a loud screaming, like the crying of a child. In this manner it will follow travellers for a whole day. The Copper Indians have a great value for these birds, as they frequently indicate the approach of strangers, or conduct them to herds of deer and musk-oxen, which, without such assistance, they might possibly miss.

Having walked about thirty miles south-eastward of the river, the travelling party came to one of the copper-mines, if it deserves that appellation. It is no more than a jumble of rocks and gravel, which have been rent by an earthquake, and through which rolls a small stream.

The Indians, whose partial accounts gave rise to this expedition, represented the mine as so immensely rich, that a ship might be ballasted with the ore instead of stone, with perfect facility, and that the hills were entirely composed of that metal, all in portable lumps. After a search of four hours, Mr. Hearne and his attendants could find only one piece of copper of any size, and that did not weigh more than four pounds. Yet it seems probable, that this metal has formerly been in much greater plenty, as the rocks and stones are every where tinged with verdigrease.

Before Churchill River was settled by the Hudson's Bay Company, the northern Indians had very little iron-work among them: almost every implement was made of copper; and to this spot they annually resorted, till this metal began to fail, and they found other resources, of a superior kind. Yet, to this day, the Copper Indians prefer their native ore for almost every use, except that of the hatchet, the knife, and the awl.

The Copper and Dog-ribbed Indians, lying so remote from the factory, generally use the intermediate tribes as brokers; and, in consequence, pay very dearly for every European article they stand in need of. Several attempts have been made to induce those distant nations to traffic immediately with the Hudson's Bay Company at the fort; but, though liberal presents have been given to those who had the resolution to venture so far, both for themselves and their chiefs, the northern Indians have constantly plundered them of every thing, before they could reach their homes.

Mr. Mackenzie, who visited this country for the purpose of establishing a north-west company in the fur-trade, undertook several excursions into these northern regions, some time after Mr. Hearne, which began in 1789, and

closed in the year 1791. He explored, and called upon, with that named entered a river, not till he reached it, describes as very different from an Indian tribe, extreme ferocity.

ice in the month of May, carp, white fish, his name, he relates, though not more than a wide estuary, length, finished his journey in two days, and proved, that there was a communication between the Atlantic and Pacific that it must be impossible to discover.

This enterprising expedition, on the 10th of October, south-west direction, what are called the Indians compute at the rate of 1000 miles, describes the western part of a beautiful scene, groves of poplars, the uplands, and the birds were observed humming-birds. moose-deer were seen. Mackenzie observed the other parts of the country, dark, like those of the tinge of red. The bark of the trees, sometimes with borax, women add a shower of forty-five feet in length, teeth of the sea-otters.

We shall conclude this account of those Indians with America.

The character of these circumstances constantly employed, constant subsistence, and with their neighbours, gaiety of temper, or, therefore, are, in general, desponding. That giddy vision in Europe. Their they procure with labour, and every thing

closed in the year 1793. The Slave Lake, which he explored, and called by that name, appeared to be the same with that named Athapuseo. From the Slave Lake he entered a river, now called by his own name, and proceeded till he reached the Arctic Ocean. The Slave River he describes as very considerable, and says it received its name from an Indian tribe, called Slaves, merely from their extreme ferocity. The Slave Lake he found covered with ice in the month of June: the fish it contains are chiefly carp, white fish, trout, and pike. The river called after his name, he relates, is sometimes fifty fathoms in depth, though not more than three hundred yards in breadth, and has a wide estuary, with many islands. Mr. Mackenzie, at length, finished his course, which had occupied an hundred and two days, and tended, with former experiments, to prove, that there is not any communication between the Atlantic and Pacific Ocean, except at so high a latitude, that it must be impeded by perpetual ice.

This enterprising traveller proceeded to Fort Chapivian on the 10th of October, 1792, up the River Unjiga, in a south-west direction, till he reached a high land, beyond what are called the Stony Mountains, the height of which he computes at eight hundred and seventeen yards. He describes the west side of the River Unjiga as exhibiting a beautiful scene, interspersed with hills and lawns, with groves of poplars, and enlivened with vast herds of elks on the uplands, and of buffaloes on the plains. Among the birds were observed blue jays, yellow birds, and beautiful humming-birds. Beavers are common, and tracks of moose-deer were remarked. Towards the Pacific, Mr. Mackenzie observed, that the natives were fairer than in the other parts of North America. Their eyes were not dark, like those of the other Indians, but grey, with a tinge of red. The dress of the men is only a robe, made of the bark of the cedar-tree, rendered as fine as hemp, sometimes with borders of red and yellow threads, and the women add a short apron. Some of their canoes are forty-five feet in length, the gunwale being inlaid with the teeth of the sea-otter.

We shall conclude this section with a general account of those Indians who inhabit the most northern parts of America.

The character of the Indians is altogether founded upon their circumstances and mode of life. A people who are constantly employed in procuring the means of a precarious subsistence, and who are generally engaged in war with their neighbours, cannot be supposed to enjoy much gaiety of temper, or a high flow of spirits. The Indians, therefore, are, in general, grave even to sadness; and they despise that giddy vivacity which is peculiar to some nations in Europe. Their subsistence depends entirely on what they procure with their hands; and their lives, their honour, and every thing dear to them, may be lost by the

smallest inattention to the designs of their enemies. As they have no particular object to attach them to one place rather than another, they remove wherever they expect to find the necessaries of life in the greatest abundance. The different tribes are extremely small, when compared with civilized societies, in which industry, arts, agriculture, and commerce, have united a vast number of individuals, whom a complicated luxury renders useful to one another; and these small tribes live at an immense distance from each other.

A certain species of government is established in every tribe, and is nearly similar over the whole continent of America. Destitute of arts, riches, or luxury, an American chief has no method by which he can render himself considerable among his companions, but by a superiority in personal qualities of body or mind. But, as nature has not been very lavish in her personal distinctions, where all enjoy the same education, all are nearly equal, and will desire to remain so. Liberty is the prevailing passion of the Americans, yet they are far from despising all sorts of authority; they are attentive to the voice of wisdom, which experience has conferred on the aged; and they enlist under the banners of the chief, in whose valour and military address they have learned to repose their confidence. In every society, therefore, there is to be considered the power of the chief and of the elders, and according as the government inclines more to the one or to the other, it may be regarded as monarchical, or as a species of aristocracy. Among those tribes which are most engaged in war, the power of the chief is naturally predominant, because the necessity of having a military leader was the first source of his superiority, and the exigencies of the state continue to support it. His power, however, is rather persuasive than coercive; he is revered as a father, rather than feared as a monarch. He has neither guards, prisons, nor officers of justice; and one act of ill-judged violence would occasion his deposition. The elders in the other form of government, which may be considered as an aristocracy, have no more power.

The management of business among the Indians is extremely simple, and such as may recall, to those who are acquainted with antiquity, a picture of the most early ages. The heads of the families meet together in a house or cabin appointed for the purpose. When the business is over, and they happen to be well provided with food, they appoint a feast upon the occasion, of which almost the whole nation partakes. The feast is accompanied with a song, in which the real or fabulous exploits of their forefathers are celebrated. Their dances, like those of the Greeks and Romans, are chiefly of the military kind; and these, with the addition of their music, accompany every feast.

The only employments of the men are war and hunting:

6 Y

every other concern, even the little agriculture they use, is left to the women. Their most common motive for entering into a war, when it does not arise from an accidental rencounter or interference, is either to revenge the death of some friend, or to acquire prisoners who may assist them in the toils of the chase. These wars are either undertaken by some private adventurers, or at the instance of the whole community. In the latter case, all the young men who are disposed to go out to battle give a piece of wood to the chief, as a token of their design to accompany him. The chief, who is to conduct them, fasts several days, during which he converses with no one, and is particularly careful to observe his dreams, which the presumption natural to savages generally renders favourable. Among a variety of superstitious ceremonies used on this occasion, one of the most horrid is that of setting the war-kettle on the fire; after which they send a large shell to their allies, inviting them to come and drink the blood of their enemies. }

Having finished all their ceremonies, they issue forth, with their faces blackened with charcoal, intermixed with streaks of vermillion, which give them a most horrid appearance. They then exchange their clothes with their friends, and dispose of all their finery to the women, who accompany them to a considerable distance.

The great qualities of an Indian warrior are vigilance and attention, to give and to avoid a surprise; and, indeed, in these they are superior to all nations in the world. Accustomed to continual wandering in their forests, having their perceptions sharpened by keen necessity, and living in every respect according to nature, their external senses have a degree of acuteness, which, at first, appears incredible. They can trace out their enemies, at an immense distance, by the smoke of their fires, which they smell, and by the tracks of their feet on the ground, imperceptible to an European eye, but which they can distinguish and count with the utmost facility. These circumstances, however, give them no superiority, because their enemies are equally skilful. When they go out, therefore, they take care to avoid making use of any thing by which they might incur the danger of a discovery. They light no fire to warm themselves, or to prepare their victuals: they lie close to the ground all day, and travel only in the night; and, marching along in files, he that closes the rear diligently covers with leaves the tracks of his own feet, and of theirs who preceded him. When they halt to refresh themselves, scouts are sent out to reconnoitre the country, and beat up every place where they suspect an enemy may lie concealed. In this manner, they enter the villages of their foes; and, while the flower of the nation are engaged in hunting, massacre all the children, women, and helpless old men; or make prisoners of as many as have strength enough to be useful. But, when

the enemy is apprised of their design, and coming on in arms against them, they throw themselves flat on the ground among the withered herbs and leaves, which their faces are painted to resemble. Then they allow a part to pass unmolested; when, all at once, with a tremendous shout, rising up from their ambush, they pour a storm of musket-bullets on their foes. The party attacked returns the same cry: every one shelters himself with a tree, and returns the fire of the adverse party, as soon as they raise themselves from the ground to give a second volley. Thus does the battle continue until the one party is so much weakened as to be incapable of further resistance. But, if the force on each side continue nearly equal, the fierce spirit of the savages, inflamed by the loss of their friends, can no longer be restrained. They abandon their distant war, and rush upon one another with clubs and hatchets in their hands, magnifying their own courage, and insulting their enemies with the bitterest reproaches. A cruel combat ensues: death appears in a thousand hideous forms, which would congeal the blood of civilized nations to behold, but which rouse the fury of savages. They trample exultingly over the dead bodies, tearing the scalp from the head, wallowing in the blood like wild beasts, and sometimes devouring the flesh. The flame rages on till it meets with no resistance; then the prisoners are secured, those unhappy men, whose fate is a thousand times more dreadful than theirs who have died in the field. The conquerors set up a hideous howling, to lament the friends they have lost. They approach in a melancholy gloom to their own village: a messenger is sent to announce their arrival; and the women, with hideous shrieks, come out to mourn their dead brothers or their husbands. When they are arrived, the chief relates, in a low voice, to the elders, every particular of the expedition. The orator proclaims aloud this account to the people; and, as he mentions the names of those who have fallen, the shrieks of the women are redoubled. The men also join in these cries, according as each is most connected with the deceased by blood or friendship. The last ceremony is the proclamation of the victory: each individual then forgets his private misfortunes, and joins in the triumph of his nation: all tears are wiped from their eyes, and, by an unaccountable transition, they pass in a moment from the bitterness of sorrow to an extravagance of joy.

For the enemies of their nation they have no sense of pity; and their resentment is easily extended from the individual who has injured them to all others of the same tribe. The prisoners, who have themselves the same feelings, know the intentions of their conquerors, and are prepared for them. The person who has taken the captive attends him to the cottage, where, according to the distribution made by the elders, he is to be delivered to supply the loss of a citizen. If those who receive him

have had their families, they adopt the captive as a member. or their resentment is great to endure the death of those who have neglected, the whole nation is concerned, where he begins the scene of cruelty. His enemies, on the other hand, begin at the approach the more by the roots, one mouth, and tears thrusts the mangled red-hot, which he pulls off the flesh from his joints, and gasps which they sear in burning, and pinching his flesh, thus manifesting it with greediness, in an enthusiasm of thus torn off the flesh, dons about an iron others are employed in every way that frequently unbind to think what new fresh the strength of such a variety of profound a sleep, to awake him, and then to the stake, they stick him all over easily take fire, but sharp reeds into even teeth with pincers, after having burnt him after having so many wound; after having as to carry nothing the skin from the coals, or boiling water more unbind the w pain and weakness and stones, falling ther and thither, with compassion, or wear

have had their family weakened by war, or other accidents, they adopt the captive into the family, of which he becomes a member. But, if they have no occasion for him, or their resentment for the loss of their friends be too great to endure the sight of any connected with those who were concerned in it, they sentence him to death. All those who have met with the same sentence being collected, the whole nation is assembled at the solemnity. A scaffold is erected, and each prisoner is tied to the stake, where he begins the death-song, and prepares for the ensuing scene of cruelty with the most undaunted courage. His enemies, on the other side, are determined to put it to the proof, by the most refined and exquisite tortures. They begin at the extremity of his body, and gradually approach the more vital parts. One plucks out his nails by the roots, one by one; another takes a finger into his mouth, and tears off the flesh with his teeth; a third thrusts the mangled finger into the bowl of a pipe, made red-hot, which he smokes like tobacco; then they pound the toes and fingers to pieces between two stones; they pull off the flesh with their teeth, and cut circles about his joints, and gashes in the fleshy parts of his limbs, which they sear immediately with red-hot irons, cutting, burning, and pinching, them alternately: they then pull off his flesh, thus mangled and roasted, bit by bit, devouring it with greediness, and smearing their faces with the blood, in an enthusiasm of horror and fury. When they have thus torn off the flesh, they twist the bare nerves and tendons about an iron, tearing and snapping them, whilst others are employed in pulling and extending the limbs in every way that can increase the torment. Then they frequently unbind him, to give a breathing to their fury, to think what new torments they shall inflict, and to refresh the strength of the sufferer, who, wearied out with such a variety of unheard-of torments, often falls into so profound a sleep, that they are obliged to apply the fire to awake him, and renew his sufferings. He is again fastened to the stake, and again they renew their cruelty: they stick him all over with small matches of wood, that easily take fire, but burn slowly; they continually run sharp reeds into every part of his body; they drag out his teeth with pincers, and thrust out his eyes; and, lastly, after having burnt his flesh from the bones with slow fires; after having so mangled the body that it is one complete wound; after having mutilated the face in such a manner as to carry nothing human in it; after having peeled the skin from the head, and poured a heap of red-hot coals, or boiling water, on the naked skull, they once more unbind the wretch, who, blind and staggering with pain and weakness, assaulted on every side with clubs and stones, falling into their fires at every step, runs hither and thither, until one of the chiefs, either out of compassion, or weary of cruelty, puts an end to his life

with a club or a dagger. The body is then thrown into the kettle, and this barbarous employment is succeeded, in some of the tribes, by a feast on the mangled remains.

The women, forgetting not only the female character but humanity itself, outdo the men in this scene of horror; while the principal persons of the country sit round the stake, smoking, and looking on without the least emotion. What is most extraordinary, the sufferer himself, in the little intervals of his torments, smokes too, appears unconcerned, and converses with his torturers about in different matters. Indeed, during the whole time of the execution, there seems a contest which shall exceed, they in inflicting the most horrid pains, or he in enduring them with a firmness and constancy almost above human: not a groan, not a sigh, not a distortion of countenance, escapes him; he possesses his mind entirely in the midst of his torments; he recounts his own exploits; he informs them what cruelties he has inflicted upon their countrymen, and threatens them with the revenge that will attend his death; and, though his reproaches exasperate them to madness, he continues his insults, even of their ignorance of the art of tormenting, pointing out more exquisite methods, and more sensible parts of the body to be afflicted. The women have this courage as well as the men; and it is as rare for any Indian to behave otherwise, as it would be for an European to suffer as an Indian. "I am brave and intrepid," exclaims the savage in the faces of his tormentors. "I do not fear death, nor any kind of tortures; those who fear them are cowards; they are less than women: life is nothing to those that have courage: may my enemies be confounded with despair and rage! O! that I could devour them, and drink their blood to the last drop!"

Nothing forms a stronger contrast than this cruelty of the savages towards their enemies, and the warmth of their affection towards their friends, and those who are in alliance with them. Among these, all things are common; and this, though it may partly arise from their not possessing very distinct notions of separate property, is chiefly to be attributed to the strength of their attachment; because, in every thing else, with their lives as well as their fortunes, they are ready to serve their friends. Has any one of these succeeded ill in his hunting,—has his harvest failed,—or is his house burned,—he feels no other effect of his misfortune, than that it gives him an opportunity to experience the benevolence and regard of his countrymen; but to the enemies of his nation, or to those who have privately offended him, the American is implacable. He conceals his sentiments; he appears reconciled, until, by some treachery or surprise, he has an opportunity of executing a horrible revenge. No length of time is sufficient to allay his resentment; no distance of place great enough to protect the object: he crosses the steepest

mountains, pierces the most impracticable forests, and traverses the most hideous bogs and deserts, for several hundreds of miles; bearing the inclemency of the seasons, the fatigue of the expedition, the extremes of hunger and thirst, with patience and cheerfulness, in hopes of surprising his enemy, on whom he exercises the most shocking barbarities.

The loss of their friends is lamented among the Indians with a variety of mournful ceremonies. Of these, the most remarkable, as it discovers both the height and continuance of their grief, is what they call the feast of the dead, or the feast of souls. The day of this ceremony is appointed by public order; and the neighbouring tribes are invited to be present, and to join in the solemnity. At this time, all who have died since the last solemn occasion (which is renewed every eight or ten years) are taken out of their graves; those who have been interred at the greatest distance from the villages are diligently sought for, and brought to this great rendezvous of carcases.

This general disinterment has been thus described by Lafitau, to whom we are indebted for some curious particulars respecting these nations.

"The opening of these tombs displays one of the most striking scenes that can be conceived; this humbling portrait of human misery in death, which appears in a thousand various shapes of horror in the several carcases, according to the degree in which corruption has prevailed over them, or the manner in which it has attacked them. Some appear dry and withered; others have a sort of parchment upon their bones; some look as if they were baked and smoked, without any appearance of rottenness; some are just turning towards the point of putrefaction, while others are swarming with worms, and covered with corruption. I know not which ought to strike us most, the horror of so shocking a sight, or the tender affection of these poor people towards their departed friends; for nothing deserves our admiration more than that eager diligence and attention with which they discharge this melancholy duty of their tenderness, gathering up carefully even the smallest bones; handling the carcases, disgusting as they are, cleansing them from the worms, and carrying them upon their shoulders through tiresome journeys of several days, without being discouraged from the offensiveness of the smell, and without suffering any other emotions to arise than those of regret for having lost persons who were so dear to them in their lives, and so lamented in their death.

"They bring them into their cottages, where they prepare a feast in honour of the dead; during which their great actions are celebrated, and all the tender intercourses which took place between them and their friends are called to mind. The strangers, who have come sometimes a

hundred miles to be present on the occasion, join in the tender condolence; and the women, by frightful shrieks, demonstrate that they are penetrated with the sharpest sorrow. The dead bodies are carried from the cabins for the general re-interment. A great pit is dug in the ground; and thither, at a certain time, each person, attended by his family and friends, marches in solemn silence, bearing the dead body of a son, a father, or a brother. When they are all convened, the dead bodies, or dust of those which were quite corrupted, are deposited in the pit, when the torrent of grief breaks out anew. Whatever they possess most valuable is interred with the dead. The strangers are not wanting in their generosity, and confer those presents which they have brought along with them for the purpose. Then all present go down into the pit, and every one takes a little of the earth, which they afterwards preserve with the most religious care. The bodies, ranged in order, are covered with new furs, and, over these, with bark, on which they throw stones, wood, and earth. Then, taking the last farewell, they return each to his own cabin.

"The custom of offering presents to the dead arises from a rude notion of the immortality of the soul. They believe this doctrine most firmly, and it is the principal tenet of their religion. When the soul is separated from the body, they conceive that it still continues to hover around it, and to require and take delight in the same things with which it formerly was pleased. After a certain time, however, it forsakes this dreary mansion, and departs far westward, into the land of spirits. They have even gone so far as to make a distinction between the inhabitants of the other world; some, they imagine, particularly those who in their life-time have been fortunate in war, possess a high degree of happiness, have a place for hunting and fishing, which never fails, and enjoy all sensual delights, without labouring hard in order to procure them. The souls of those, on the contrary, who happen to be conquered or slain in war, are supposed to be extremely miserable."

## SECTION II.

### CANADA.

*Situation, Boundaries, and Extent.*] This country, which is six hundred miles in length, and about two hundred in breadth, is situated between forty-five and fifty-two degrees of north latitude, and between sixty-one and eighty-one degrees of west longitude. It is bounded, on the north and east, by Nova Scotia; on the south, by New England and New York; and, on the west, by unknown regions.

*Climate, Seasons, Soil, &c.*] The extremes of heat and cold are amazing; the thermometer in July and August rising to ninety-six degrees, while in winter the mercury

freezes. The snow the frost is so intense, of doors for any time frost-bite, which intervals only increase winter, as at Peterborough the sledges, drawn and speedily conveyed half, whence flues double windows and body is covered with May, the thaw general the river bursting with rage to the sea is crashes against a rotation instantaneous.

The face of the woody; but there chiefly towards Upper soil mostly consists twelve inches, in, however, very few used by the French employed, and is the shores of the River.

*Rivers.*] The river very numerous, and principal are the Ottawa and Trois Rivières; St. Lawrence. This taking its course receives the Outaouais continues the same four hundred miles large vessels; and, twenty miles from the considerable depth. After streams, this great sières, where it is intense, and the forms a variety of bays.

*Lakes, Cataracts.* Its magnitude, as it may properly be supposed to be the globe. According to that, if the utmost exceed sixteen hundred, and appears of huge rocks. In the waters of this lake summer, is very warm.

freezes. The snow begins in November; and in January the frost is so intense, that it is impossible to remain out of doors for any time without the risk of what is called a frost-bite, which endangers the limb; and the warm intervals only increase the sensation and the danger. But winter, as at Petersburg, is the season of amusement; and the sledges, drawn by one or two horses, afford a pleasant and speedy conveyance. Several stoves are placed in the hall, whence fires pass to the apartments; and there are double windows and doors. On going abroad, the whole body is covered with furs, except the eyes and nose. In May, the thaw generally comes on suddenly, the ice on the river bursting with the noise of cannon; and its passage to the sea is terrific, especially when a pile of ice crashes against a rock. Spring is like summer, and vegetation instantaneous.

The face of the country is generally mountainous and woody; but there are savannas and plains of great beauty, chiefly towards Upper Canada. In the lower province the soil mostly consists of a loose blackish earth, of ten or twelve inches, incumbent on cold clay. This thin mould is, however, very fertile, and manure was seldom or never used by the French settlers; but, of late, manure has been employed, and is found in considerable quantities on the shores of the River St. Laurence.

*Rivers.*] The rivers which intersect this country are very numerous, and many of them large and deep. The principal are the Outtaonais, St. John, Seguinay, Despraires, and Trois Rivières; but they are all swallowed up by the St. Laurence. This river issues from the Lake Ontario, and, taking its course north-east, washes Montreal, where it receives the Outtaonais, and forms several fertile islands. It continues the same course, and meets the tide upwards of four hundred miles from the sea, where it is navigable for large vessels; and, below Quebec, three hundred and twenty miles from the sea, it becomes broad, and of considerable depth. After receiving in its progress innumerable streams, this great river falls into the ocean at Cape Rosières, where it is ninety miles broad, and where the cold is intense, and the sea boisterous. In its progress it forms a variety of bays, harbours, and beautiful islands.

*Lakes, Cataracts, &c.*] Lake Superior is so called from its magnitude, as being the largest on the continent. It may properly be termed the *Caspian* of America, and is supposed to be the largest body of fresh water on the globe. According to the French charts, it is fifteen hundred miles in circumference; but some writers suppose, that, if the utmost extent of every bay were taken, it would exceed sixteen hundred. The water is pure and transparent, and appears throughout the lake to lie upon a bed of huge rocks. It is worthy of remark, with respect to the waters of this lake, that although their surface, during summer, is very warm, yet, on letting down a cup to the

depth of about six feet, the water drawn from thence is excessively cold.

Though this lake is supplied by near forty large rivers, yet it does not appear, that one-tenth part of the waters conveyed into it is discharged through the only visible outlet. How such a superabundance of water can be disposed of remains a secret; but it certainly has a passage through some unfathomable subterraneous cavities. The entrance into the lake from the straits of St. Marie affords one of the most beautiful prospects in the world. On the left appear many pleasant little islands; and on the right is an agreeable succession of small points of land, that project a little way into the water, and contribute, with the islands, to render this delightful basin calm and secure from tempestuous winds.

Lake Huron, which is next in magnitude to Lake Superior, lies between forty-two and forty-six degrees of north latitude, and between four and ten degrees of west longitude. Its shape is nearly triangular, and its circumference about one thousand miles. On the north side of this lake is an island, one hundred miles long, and only eight miles broad, which is called *Manataulin*, or "the place of spirits," and is considered as sacred by the Indians. At the north-east corner, this lake communicates with Lake Michigan, by the Straits of Michillimackinac; and it is a remarkable fact, that although there is no diurnal ebb or flood to be perceived in the waters of these straits, yet, from particular attention to their state, a periodical alteration has been discovered. It seems, they have been observed to rise, by gradual but almost imperceptible degrees, till, in seven years and a half, they attained the height of above three feet, and in the same space of time they gradually subsided to their former state; so that in fifteen years they had completed this inexplicable revolution.

Lake Ontario is situated between forty-three and forty-five degrees of north latitude, and between one and four degrees of west longitude. Its form is nearly oval, and its circumference about six hundred miles. Near the south-east part it receives the waters of the Oswego River, and on the north-east it discharges itself into the River Iroquois, which, on reaching Montreal, takes the name of St. Laurence.

Lake Erie, situated between forty-one and forty-three degrees of north latitude, and between three and eight degrees of west longitude, is nearly three hundred miles long, and above forty in breadth. A point of land projects from the north side into the water, several miles towards the south-east, and the islands and banks towards the western extremity are so infested with rattlesnakes, as to render landing upon them extremely dangerous. This lake is of a more dangerous navigation than any of the others, on account of the craggy rocks which project

mountains, pierces the most impracticable forests, and traverses the most hideous bogs and deserts, for several hundreds of miles; bearing the inclemency of the seasons, the fatigue of the expedition, the extremes of hunger and thirst, with patience and cheerfulness, in hopes of surprising his enemy, on whom he exercises the most shocking barbarities.

The loss of their friends is lamented among the Indians with a variety of mournful ceremonies. Of these, the most remarkable, as it discovers both the height and continuance of their grief, is what they call the feast of the dead, or the feast of souls. The day of this ceremony is appointed by public order; and the neighbouring tribes are invited to be present, and to join in the solemnity. At this time, all who have died since the last solemn occasion (which is renewed every eight or ten years) are taken out of their graves: those who have been interred at the greatest distance from the villages are diligently sought for, and brought to this great rendezvous of carcases.

This general disinterment has been thus described by Lafitau, to whom we are indebted for some curious particulars respecting these nations.

"The opening of these tombs displays one of the most striking scenes that can be conceived; this humbling portrait of human misery in death, which appears in a thousand various shapes of horror in the several carcases, according to the degree in which corruption has prevailed over them, or the manner in which it has attacked them. Some appear dry and withered; others have a sort of parchment upon their bones; some look as if they were baked and smoked, without any appearance of rottenness; some are just turning towards the point of putrefaction, while others are swarming with worms, and covered with corruption. I know not which ought to strike us most, the horror of so shocking a sight, or the tender affection of these poor people towards their departed friends; for nothing deserves our admiration more than that eager diligence and attention with which they discharge this melancholy duty of their tenderness, gathering up carefully even the smallest bones; handling the carcases, disgusting as they are, cleansing them from the worms, and carrying them upon their shoulders through tiresome journeys of several days, without being discouraged from the offensiveness of the smell, and without suffering any other emotions to arise than those of regret for having lost persons who were so dear to them in their lives, and so lamented in their death.

"They bring them into their cottages, where they prepare a feast in honour of the dead; during which their great actions are celebrated, and all the tender intercourses which took place between them and their friends are called to mind. The strangers, who have come sometimes a

hundred miles to be present on the occasion, join in the tender condolence; and the women, by frightful shrieks, demonstrate that they are penetrated with the sharpest sorrow. The dead bodies are carried from the cabins for the general re-interment. A great pit is dug in the ground; and thither, at a certain time, each person, attended by his family and friends, marches in solemn silence, bearing the dead body of a son, a father, or a brother. When they are all convened, the dead bodies, or dust of those which were quite corrupted, are deposited in the pit, when the torrent of grief breaks out anew. Whatever they possess most valuable is interred with the dead. The strangers are not wanting in their generosity, and confer those presents which they have brought along with them for the purpose. Then all present go down into the pit, and every one takes a little of the earth, which they afterwards preserve with the most religious care. The bodies, ranged in order, are covered with new furs, and, over these, with bark, on which they throw stones, wood, and earth. Then, taking the last farewell, they return each to his own cabin.

"The custom of offering presents to the dead arises from a rude notion of the immortality of the soul. They believe this doctrine most firmly, and it is the principal tenet of their religion. When the soul is separated from the body, they conceive that it still continues to hover around it, and to require and take delight in the same things with which it formerly was pleased. After a certain time, however, it forsakes this dreary mansion, and departs far westward, into the land of spirits. They have even gone so far as to make a distinction between the inhabitants of the other world; some, they imagine, particularly those who in their life-time have been fortunate in war, possess a high degree of happiness, have a place for hunting and fishing, which never fails, and enjoy all sensual delights, without labouring hard in order to procure them. The souls of those, on the contrary, who happen to be conquered or slain in war, are supposed to be extremely miserable."

## SECTION II. CANADA.

*Situation, Boundaries, and Extent.* This country, which is six hundred miles in length, and about two hundred in breadth, is situated between forty-five and fifty-two degrees of north latitude, and between sixty-one and eighty-one degrees of west longitude. It is bounded, on the north and east, by Nova Scotia; on the south, by New England and New York; and, on the west, by unknown regions.

*Climate, Seasons, Soil, &c.* The extremes of heat and cold are amazing; the thermometer in July and August rising to ninety-six degrees, while in winter the mercury

country, which is supposed to be the largest body of fresh water on the globe. According to the French charts, it is fifteen hundred miles in circumference; but some writers suppose, that, if the utmost extent of every bay were taken, it would exceed sixteen hundred. The water is pure and transparent, and appears throughout the lake to lie upon a bed of huge rocks. It is worthy of remark, with respect to the waters of this lake, that although their surface, during summer, is very warm, yet, on letting down a cup to the

freezes. The snow begins in November; and in January the frost is so intense, that it is impossible to remain out of doors for any time without the risk of what is called a frost-bite, which endangers the limb; and the warm intervals only increase the sensation and the danger. But winter, as at Petersburg, is the season of amusement; and the sledges, drawn by one or two horses, afford a pleasant and speedy conveyance. Several stoves are placed in the hall, whence flues pass to the apartments; and there are double windows and doors. On going abroad, the whole body is covered with furs, except the eyes and nose. In May, the thaw generally comes on suddenly, the ice on the river bursting with the noise of cannon; and its passage to the sea is terrific, especially when a pile of ice crashes against a rock. Spring is like summer, and vegetation instantaneous.

The face of the country is generally mountainous and woody; but there are savannas and plains of great beauty, chiefly towards Upper Canada. In the lower province the soil mostly consists of a loose blackish earth, of ten or twelve inches, incumbent on cold clay. This thin mould is, however, very fertile, and manure was seldom or never used by the French settlers; but, of late, manure has been employed, and is found in considerable quantities on the shores of the River St. Laurence.

*Rivers.*] The rivers which intersect this country are very numerous, and many of them large and deep. The principal are the Outtanais, St. John, Seguinay, Despraires, and Trois Rivières; but they are all swallowed up by the St. Laurence. This river issues from the Lake Ontario, and, taking its course north-east, washes Montreal, where it receives the Outtanais, and forms several fertile islands. It continues the same course, and meets the tide upwards of four hundred miles from the sea, where it is navigable for large vessels; and, below Quebec, three hundred and twenty miles from the sea, it becomes broad, and of considerable depth. After receiving in its progress innumerable streams, this great river falls into the ocean at Cape Rosières, where it is ninety miles broad, and where the cold is intense, and the sea boisterous. In its progress it forms a variety of bays, harbours, and beautiful islands.

*Lakes, Cataracts, &c.*] Lake Superior is so called from its magnitude, as being the largest on the continent. It may properly be termed the *Caspian* of America, and is supposed to be the largest body of fresh water on the globe. According to the French charts, it is fifteen hundred miles in circumference; but some writers suppose, that, if the utmost extent of every bay were taken, it would exceed sixteen hundred. The water is pure and transparent, and appears throughout the lake to lie upon a bed of huge rocks. It is worthy of remark, with respect to the waters of this lake, that although their surface, during summer, is very warm, yet, on letting down a cup to the

depth of about six feet, the water drawn from thence is excessively cold.

Though this lake is supplied by near forty large rivers, yet it does not appear, that one-tenth part of the waters conveyed into it is discharged through the only visible outlet. How such a superabundance of water can be disposed of remains a secret; but it certainly has a passage through some unfathomable subterraneous cavities. The entrance into the lake from the straits of St. Marie affords one of the most beautiful prospects in the world. On the left appear many pleasant little islands; and on the right is an agreeable succession of small points of land, that project a little way into the water, and contribute, with the islands, to render this delightful basin calm and secure from tempestuous winds.

Lake Huron, which is next in magnitude to Lake Superior, lies between forty-two and forty-six degrees of north latitude, and between four and ten degrees of west longitude. Its shape is nearly triangular, and its circumference about one thousand miles. On the north side of this lake is an island, one hundred miles long, and only eight miles broad, which is called *Manataulin*, or "the place of spirits," and is considered as sacred by the Indians. At the north-east corner, this lake communicates with Lake Michigan, by the Straits of Michillimackinac; and it is a remarkable fact, that although there is no diurnal ebb or flood to be perceived in the waters of these straits, yet, from particular attention to their state, a periodical alteration has been discovered. It seems, they have been observed to rise, by gradual but almost imperceptible degrees, till, in seven years and a half, they attained the height of above three feet, and in the same space of time they gradually subsided to their former state; so that in fifteen years they had completed this inexplicable revolution.

Lake Ontario is situated between forty-three and forty-five degrees of north latitude, and between one and four degrees of west longitude. Its form is nearly oval, and its circumference about six hundred miles. Near the south-east part it receives the waters of the Oswego River, and on the north-east it discharges itself into the River Iroquois, which, on reaching Montreal, takes the name of St. Laurence.

Lake Erie, situated between forty-one and forty-three degrees of north latitude, and between three and eight degrees of west longitude, is nearly three hundred miles long, and above forty in breadth. A point of land projects from the north side into the water, several miles towards the south-east, and the islands and banks towards the western extremity are so infested with rattle-snakes, as to render landing upon them extremely dangerous. This lake is of a more dangerous navigation than any of the others, on account of the eraggy rocks which project

into the water, in a perpendicular direction, many miles together, affording no shelter from storms.

About six leagues from the fort of Niagara, in Canada, is the greatest cataract in the world, known by the name of the *Waterfall of Niagara*. The river at this fall runs from the south-south-east to the north-north-west; and the rock of the fall forms a kind of figure like a hollow semicircle, or horse-shoe. Above the fall, in the middle of the river, is an island about eight hundred feet long; the lower end of which is just at the perpendicular edge of the fall. Before the water comes to this island, it runs but slowly, compared with its motion afterwards, when it grows extremely rapid, running with a surprising swiftness before it comes to the fall. It is perfectly white, and, in several places, is thrown high up into the air. The water that runs down on the west side is in greater abundance, and whiter, than that on the opposite side; and seems almost to outfly an arrow in swiftness. When a person is at the fall, and looks up the river, he may perceive that the water is every where exceedingly steep, almost like the side of a hill; but, on looking at the fall itself, it is impossible to describe the astonishment it occasions.

The height of the cataract, as measured by mathematical instruments, is found to be exactly a hundred and thirty-seven feet; and, when the water is come to the bottom, it flies back to a great height in the air. The noise may sometimes be heard at the distance of forty miles, but seldom farther. At some times, the fall makes a much greater noise than at others; and this is regarded as an infallible prognostic of rain or other bad weather.

From the place where the water falls there arises a prodigious vapour, like a thick smoke, insomuch that, when viewed at a distance, a stranger might suppose that the Indians had set their forests on fire. These vapours rise very high in the air, when it is calm, but are dispersed by the wind, when it blows hard. If any person go into this vapour, or if the wind blow it on him, it is so penetrating, that in a few moments he will be as wet as if immersed in water.

Some persons are of opinion, that when birds happen to fly into the smoke of the fall, they immediately drop down, and perish in the water; either because their wings are become wet, or that the tremendous noise of the fall astonishes and confounds them: but others think, that this idea is merely chimerical; because, among the great numbers of birds found dead below the fall, there are no other sorts than such as live and swim frequently in the water, as swans, geese, ducks, teal, &c. Great flocks of these animals are often seen going to destruction in the following manner:—They swim in the river above the fall, and so are carried down lower and lower by the water; and, as water-fowl are commonly pleased with being carried by the stream, they indulge themselves in this pleasure, till

the rapidity of the water renders it impossible for them to rise, and they are consequently hurried down the precipice.

In the months of September and October, such prodigious quantities of dead water-fowl are found every morning below the fall, that they afford ample subsistence for the garrison at the fort. Here also are frequently found the bodies of deer, bears, and other animals, which have attempted to cross the water above the fall. Some melancholy instances of human beings having lost their lives in a similar manner are related by travellers; and the following one is too affecting to be passed over in silence:—

“An unfortunate Indian was reposing, in a state of inebriety, in his canoe, which was properly secured, at the distance of some miles above the cataracts, while his wife sat on the shore to watch his slumbers. After some time, a sailor, from one of the vessels on the lake, happened to arrive at the spot, and began to take some indecent liberties with the Indian female. The woman naturally attempted to rouse her husband; but, before she could effect her design, the brutal mariner cut the cord of the canoe, and set it adrift. The little vessel glided swiftly down the stream, and in the space of a few minutes it was seen to enter the Rapids. The Indian, awakened by the violent motion of the waves, started up, and, on perceiving his perilous situation, he grasped his paddle with a look of inexpressible horror; but, finding it absolutely impossible to stem the force of the current, he calmly wrapped himself up in his blanket, and resumed his former position at the bottom of the canoe. In the space of a few moments, he was hurried down the precipice, and was never discovered more.”

There is an island in the middle of the fall, which was formerly supposed inaccessible; but an accident that happened about sixty years ago made it appear otherwise. Two Indians went out from Fort Niagara to hunt upon an island that is situated in the middle of the river, above the great fall, which was then stocked with abundance of deer; but, having indulged too freely in the use of some French brandy, they fell asleep, and their canoe drove back with the stream, till it approached that island which is in the middle of the fall. Here they were awakened by the noise of the cataract, and began to give themselves over as lost; but, after some vigorous exertions, they effected a landing upon the island. At first, they exulted in the idea of their escape; but, upon cool reflection, they found themselves hardly in a better state than if they had gone down the fall, since they had no other alternative than either to throw themselves down the same, or perish with hunger. After some time, however, hard necessity put them on invention; and, as they found plenty of wood on the island, they made a ladder of the bark of

the lind-tree, in order to reach the water below: one end of this ladder they fastened to a large tree, that grew on the side of a rock above the fall, and let the other end down to the water. By this contrivance, they descended to the bottom in the middle of the fall; and then threw themselves out into the water, thinking to swim on shore. Scarcely, however, had they begun to swim, before they were thrown back with violence against the rock from which they came; and, after several fruitless attempts, they were compelled to re-ascend to the island. After some time, they discovered Indians on the shore, who appeared to pity their misfortune, but gave them little hope of assistance. These, however, ran to inform the commandant of the fort of the situation of their friends; and he soon projected the means of their deliverance, in the following manner:

The water that runs on the east side of this island is shallow, especially toward the eastern shore. The commandant, therefore, caused some poles to be made and pointed with iron; and, by the help of these, two Indians offered to walk to the island, to save their unfortunate brethren, or to perish in the attempt. Each had two such poles in his hands, to set at the bottom of the stream, in order to keep him steady, and in this manner they safely reached the island, and brought away the poor creatures, who were almost perishing for want of food.

On the west side of this island are some small rocks; and in former times a part of the rock at this side of the fall hung over in such a manner, that the water which fell perpendicularly from it left a vacancy below, so that people could go under, between the rock and the water; but, some years ago, the prominent part broke off and fell down. The breadth of the fall, as it runs in a semi-circle, is reckoned to be about three hundred feet.

Every day, when the sun shines, from ten o'clock in the morning till two in the afternoon, may be seen, below the fall, the similitude of a beautiful rainbow, and sometimes two, one within another. The brightness and clearness of this phenomenon depends on the quantity of vapour that results from the spray of the cataract; for, when the wind drives the vapours away, the rainbow disappears; but, as soon as new vapours come, it resumes its former appearance. The rock of the fall consists of a grey limestone.

What are called the great cohoes falls of the Mohawk River have also a surprising appearance. The river is near a quarter of a mile broad, and the water, precipitating itself from several rocks which project from the rest, falls down on every side them in torrents, and, being broken near the bottom by many separate crags, rises in a white froth. The descent is here said to be about seventy feet, in which height are probably included the steep descents just below the above disjointed precipice; from

whence also rises a misty cloud, that descends like small rain, and exhibits, when the sun shines, a beautiful rainbow, which moves as the spectator moves, according to the angle of vision.

*Vegetable Productions.]* The forests which occupy the uncultivated parts of North America are the most extensive in the world, and exhibit a scene of unequalled magnificence. The trees lose themselves in the clouds; and there is such a prodigious variety of species, that, even among those persons who have taken most pains to describe them, there is not one, perhaps, that knows half the number. That part of the country which we are now describing produces two sorts of pines, the white and the red; four sorts of firs; two sorts of cedar and oak, the white and the red; the male and the female maple; three sorts of ash-trees, the free, the mungrel, and the bastard; three sorts of walnut-trees, the hard, the soft, and the smooth; vast numbers of beech-trees and white wood; and white and red elms and poplars. The Indians hollow the red elms into canoes, some of which, made out of one piece, will contain twenty persons; others are made of the bark, the different pieces of which they sew together with the inner rind, and daub over the seams with a bituminous substance, resembling pitch, to prevent their leaking; and the ribs of these canoes are made of boughs of trees. About November, the bears and wild cats take up their habitations in the hollow elms, and remain there till April. Here are also found cherry-trees, plum-trees, the vinegar-tree, the fruit of which, infused in water, produces vinegar; an aquatic plant called alaco, the fruit of which may be made into a confection; the white thorn; the cotton-tree, on the top of which grow several tufts of flowers, which, when shaken in the morning before the dew falls off, produce a sort of honey, that may be boiled up into sugar, the seed being a pod containing a very fine kind of cotton; the sun-plant, which resembles a marigold, and grows to the height of seven or eight feet; Turkey-corn, French-beans, gourds, melons, the hop and tobacco-plants, &c.

*Animals.]* Among the quadrupeds of Canada we may enumerate stags, elks, deer, bears, foxes, wild cats, ferrets, weasels, squirrels of different kinds, hares, and rabbits. The southern parts contain wild bulls, roebucks, and goats; and the marshes, lakes, and pools, swarm with beavers.

The animal called a musk-rat, from its yielding a strong musk, is exactly shaped like our water-rat, only somewhat larger. These creatures build houses, as the beavers do, in marshes by the water-side, with two or three ways to them: and the inside of them is neatly plastered. They consist of three stories, so that the rats ascend from one into the other as the water rises. In short, they are in all respects beavers in miniature.

The elk of Canada is of the size of a horse or mule. Its flesh is very agreeable and nourishing, and its colour a mixture of light grey and dark red. It is dangerous to approach very near this animal when he is hunted, as he sometimes springs furiously on his pursuers, and tramples them to pieces. To prevent this, the hunter throws his clothes to him, and while the deluded animal exhausts his fury on these, proper measures are taken to despatch him.

The buffalo is a kind of wild ox, of much the same appearance with those of Europe: his body is covered with a black wool, which is highly esteemed. The flesh of the female is very good; and the buffalo-hides are as soft and pliable as chamois leather, but so very strong, that the bucklers which the Indians make of them are hardly penetrable by a musket-ball. The Canadian roebuck is a domestic animal, but differs in no other respect from those of Europe. Wolves are scarce in Canada, but their furs are accounted excellent. The black foxes are greatly esteemed, and very scarce; but those of other colours are more common, and some on the Upper Mississippi are of a silver colour, and very beautiful. They live upon water-fowls, which they decoy within their clutches by a thousand curious tricks, and then spring up and devour them. The Canadian pole-cat has a most beautiful white fur, except the tip of the tail, which is as black as jet. Nature has given this animal no defence but its urine, the smell of which is intolerably offensive: this, when attacked, it sprinkles plentifully on its tail, and throws it on the assailant. The Canadian wood-rat is of a beautiful silver colour, with a bushy tail: the female carries under her belly a bag, which she opens and shuts at pleasure, and in that she places her young when pursued. Here are three sorts of squirrels; that called the flying squirrel will leap upwards of forty paces, from one tree to another. This little animal is easily tamed, and is very lively. The Canadian porcupine is less than a middling-sized dog; and, when roasted, he eats full as well as a sucking pig. The hares and rabbits differ little from those of Europe, only they turn grey in winter.

The feathered tribes here are eagles, falcons, goshawks, tercols, and partridges with long tails, which they spread out as a fan, and make a very beautiful appearance. Woodcocks are scarce in Canada, but snipes, and other water-game, are plentiful. Here are no less than twenty-two different species of ducks, and a great number of swans, turkeys, geese, bustards, teal, water-hens, cranes, and other large water-fowl. The Canadian wood-pecker is a beautiful bird. Thrushes and goldfinches are found here, together with larks and blackbirds; but the chief bird of melody is the white bird, which is a kind of ortolan, very showy, and remarkable for announcing the return of spring.

The sea on the coast of Canada, and the lakes, contain a variety of fish, among which are salmon, trout, turtle,

lobsters, sturgeon, tunny, shad, lamprey, smelts, conger-eels, mackarel, soles, herrings, anchovies, and pilchards.

The chaourason is an armed fish, about five feet long, and as thick as a man's thigh, resembling a pike: its colour is a silver grey; and under its mouth is a long bony substance, ragged at the edges. This fish is an inhabitant of the lakes. The sturgeon is both a fresh and salt-water fish, taken on the coast of Canada and the lakes, from eight to twelve feet long, and proportionably thick. The achigau and the gilthead are fish peculiar to the River St. Laurence.

Among the reptiles of this country, the rattle-snake chiefly merits attention. Some of these are as big as a man's leg, and they are long in proportion. What is most remarkable in this animal is the tail, which is scaly, like a coat of mail, and on which it is said there grows, every year, one ring or row of scales; so that its age may be known by its tail, as we know that of a horse by its teeth. In moving it makes a rattling noise, from which it takes its name. The bite of this serpent is mortal, if a remedy be not applied immediately. In all places where this dangerous reptile is bred, there grows a plant, which is called rattle-snake herb, the root of which (such is the goodness of Providence) is a certain antidote against the venom of this serpent, and that with the most simple preparation; for it requires only to be pounded, or chewed, and applied like a plaster to the wound. The rattle-snake seldom bites passengers unless it is provoked; and never darts itself at any person without first rattling three times with its tail. When pursued, if it has but a little time to recover, it folds itself round, with the head in the middle, and then darts itself with great fury and violence against its pursuers; nevertheless, the savages chase it, and find its flesh very good: it also possesses medicinal qualities.

*Divisions and Population.*] Canada is divided into two parts; Upper and Lower Canada: the former being the western division on the north of the great lakes, or sea of Canada; while the lower division is on the River St. Laurence, towards the east.

In 1784, the population of the two Canadas, according to an actual enumeration, amounted to one hundred and thirteen thousand and twelve, French and English, exclusive of ten thousand loyalists in the upper parts. The Indians were calculated at thirty thousand. But the population has increased greatly since that period.

*Manufactures and Commerce.*] The principal exports are furs and skins, with some fish, pot-ash, and ginseng. In 1798, the beaver-skins exported were one hundred and six thousand, and other furs in proportion. The imports are spirits, wines, tobacco, sugar, salt, and provisions for the troops. Except some linen and coarse woollen cloths, manufactured articles are chiefly imported from England.

*Language.*] The general language of this country is

CANADA.]

the French; who are much French descent.

*Religion.*] provinces are present government were granted passed. The various sects.

*Government.*

liament of G that there shall and Lower Canada, who, with the king, shall have declare his disbelieving any bill not fewer than Lower, Canada must be authorized for life, unless years, or by the power. The than sixteen months Canada, chosen and districts. vened at least to continue four years.

*Cities, Towns.*

is situated on a shore of the River two parts, districts and the Lower stone rock, at built round the river.

That part deserves surprising strength of art. The basin of two large mortars twenty-four pound are commanded are several other liar strength of perfectly inaccessible. The Lower Town have some concealed contrast to the and irregular, and the air confined.

The governor of two parts; so

the French; English being confined to the British settlers, who are much fewer in number than the inhabitants of French descent.

*Religion.*] About nine-tenths of the inhabitants of these provinces are Roman Catholics, who enjoy, under the present government, the same rights and privileges as were granted them in 1772, by the act of parliament then passed. The rest of the people are Protestants, of various sects.

*Government.*] By the Quebec Act, passed by the parliament of Great Britain, in the year 1791, it is enacted that there shall be, within each of the provinces of Upper and Lower Canada, a legislative council and an assembly, who, with the consent of the governor appointed by the king, shall have power to make laws; but the king may declare his dissent at any time within two years after receiving any bill. The legislative council is to consist of not fewer than seven members for Upper, and fifteen for Lower, Canada; to be summoned by the governor, who must be authorised by the king. They hold their seats for life, unless they forfeit them by an absence of four years, or by transferring their allegiance to some foreign power. The house of assembly is to consist of not less than sixteen members from Upper, and fifty from Lower, Canada, chosen by the freeholders in the several towns and districts. The council and assembly are to be convened at least once in every year, and every assembly is to continue four years, unless sooner dissolved by the governor.

*Cities, Towns, &c.*] QUEBEC, the capital of Canada, is situated on an elevated point of land, on the north-west shore of the River St. Laurence. This city is divided into two parts, distinguished by the appellation of the Upper and the Lower Town. The former is erected on a limestone rock, at the summit of the point, and the other is built round the base of the eminence, on the border of the river.

That part denominated the Upper Town possesses a surprising strength, being equally fortified by nature and art. The basin is commanded by a battery, mounting two large mortars, two thirty-six pounders, and thirty-two twenty-four pounders. The passes from the Lower Town are commanded by another battery of six guns, and there are several other batteries and redoubts, besides the peculiar strength of the rock, which, in some parts, is so perfectly inaccessible, as to obviate the necessity of walls. The Lower Town is chiefly inhabited by persons who have some concern in the shipping. It forms a striking contrast to the upper division, as the streets are narrow and irregular, the houses unsightly and inconvenient, and the air confined and unwholesome.

The governor's house is a plain stone edifice, consisting of two parts, separated by a spacious court. The old

division is built on an inaccessible part of the rock, and contains most of the public offices, though the apartments are small and inconvenient. The other is appropriated to the residence of the governor, and, though not strictly elegant, is tolerably finished. In the adjoining garden is a parapet-wall, on which a few guns are planted.

The other public buildings are, a monastery of Franciscan friars, three nunneries, and an old edifice, plainly fitted up, for the accommodation of the legislative council and assembly of representatives. There are, likewise, artillery-barracks, capable of containing five hundred men; an armoury, where ten thousand stand of arms are arrayed with the most exquisite neatness; and an engineer's drawing-room, containing plans of the fortifications of different fortresses, and a variety of models.

The market affords a cheap and plentiful supply for the tables of the inhabitants. The population may be estimated at twelve thousand individuals, two-thirds of whom are of French extraction. A large garrison, constantly kept at Quebec, renders it very lively, and the society is described as being very extensive and agreeable.

The surrounding scenery, as beheld from several parts of the Upper Town, is, perhaps, equal in grandeur and diversity to that of any part of the world. An assemblage of trackless forests, magnificent rivers, stupendous rocks, enamelled meads, lakes, villages and towns, successively open on the view of the spectator.

TROIS RIVIERES is a town containing about three hundred houses, near the mouth of a river called St. Maurice. Its trade is inconsiderable, and the adjacent country is a sandy sterile tract. The streets in the town are ill-built, and extremely narrow. The public edifices are, two churches, one for English Episcopalians, and the other for Roman Catholics; an old Franciscan monastery, and a prison.

Mr. Weld here visited the convent of St. Ursule, the only religious order now existing in the town. It is a large building, adjoining to that of the Franciscans, which is now deserted; and beneath the same roof is an hospital, attended by the sisterhood. The chapel is lofty, but its area is small: the doors open towards the street, under a portico; and nearly opposite is a grand altar, enriched with a profusion of decorations, and having on each side a lattice, one of which communicates with an apartment, furnished with an altar, and surrounded with pews, for the accommodation of such nuns as are precluded from attending the chapel by indisposition.

"A lovely female," says our author, "who came to the lattice to withdraw a curtain, for the gratification of the visitors, was apparently one of those unfortunate beings who repent, when too late, of a rash vow, which has deprived them of every earthly blessing, and doomed them to a state of perpetual wretchedness, in direct opposition

to the gracious intentions of the Almighty. While drawing aside the curtain, she cast an expressive glance at the spectators, and then retired silently to a bench at a little distance. The traces of sorrow and fixed melancholy, visible on the countenance of this amiable creature, were sufficient to interest the most volatile, or to soften the most obdurate heart: and, at the same time, to deprecate the cruelty, ignorance, and superstition, of a sect, who, under the specious cloak of holy zeal, either persuade or compel a young and inexperienced girl to renounce the world, and all its pleasures, for a life of solitude, and the mockery of repentance for crimes never committed. A seclusion so unprofitable to mankind, and indisputably offensive to Him whose tender mercies are over all his works, requires no comment."

The hospital contains two spacious airy apartments, and about fourteen neat and comfortable beds. The only invalid, at the time of Mr. Weld's visit, was an old priest, who appeared to be hastening to his grave: he was seated by his bedside, in an easy chair, and attended, with the utmost assiduity, by one of the Ursuline nuns, whose dress consisted of a black gown, a white linen handkerchief, a silver cross, suspended from the breast, a linen head-piece, which entirely concealed the hair, and a veil of black gauze, which flowed loosely over the shoulders, and covered one half of the face.

A long passage leads from the hospital to a tolerably pleasant parlour, where the travellers were treated with the utmost politeness, by the superior and some lay-sisters, who produced a number of fancy works for their inspection, which, in compliance with a regular custom, were purchased, as a genteel mode of bestowing a small donation on the order.

MONTREAL is situated on the opposite bank of the river, nine miles distant from La Prairie, and contains five hundred houses within the walls, exclusive of seven hundred in the suburbs. In the lower part of the town, where is the greatest assemblage of shops, the houses are extremely gloomy, and, in consequence of being secured with doors and windows of sheet-iron, each habitation may be said to bear a strict resemblance to a prison. The buildings are chiefly of stone, except in the suburbs, where many of them are constructed of timber. The streets are all narrow, three of which, running parallel to the river, are intersected by others at right angles. On that side of the town next the water, is a small square, appropriated to the purposes of a market; and, on the opposite side, is La Place d'Armes, apparently designed for the soldiers to perform their exercise in; but they have given the preference to a long walk, in the vicinity of the barracks.

On one side of La Place d'Armes is a Romish cathedral, containing five altars, richly decorated. The doors of the edifice are left open during the greatest part of the day,

for the admission of such persons as may wish to perform either public or private devotions. The crowds that resort hither on a Sunday, in fine weather, are so numerous, that the steps on the outside are frequently covered with the zealots, who, being unable to obtain admission, remain kneeling on the stones during the time of service. As the bells are always rung in the most discordant manner, before and during the celebration of masses, christenings, marriages, and burials, such of the inhabitants as are not attached to such unmusical sounds are greatly annoyed.

Scarcely a morning ever dawned, but our traveller beheld a funeral-procession, which here, as in most other Roman Catholic countries, is conducted with much pomp and ceremony. Formerly the vaults beneath the cathedral were appropriated to the reception of the dead; but, as some fears have been entertained of a contagion arising from too great an assemblage of bodies, the present cemeteries are without the walls. There are, likewise, in Montreal four convents, four Romish churches, and one church respectively for English Episcopalians and Presbyterians.

The walls of Montreal are evidently mouldering away, and in some parts they are already sunk into ruins. The gates, however, are in tolerable preservation.

The inhabitants are remarkable for their urbanity and attention to strangers, and are partial to convivial amusements among themselves. The majority of them are of French extraction, who have a strong aversion to the English language, and who retain many of the customs of their ancestors. There are, however, many English, Scotch, and Irish, inhabitants, who are either eminent merchants or people of great respectability.

"The Island of Montreal," says Mr. Weld, "is one of the largest in the River St. Laurence, possessing a fertile soil, and a tolerable share of cultivation. The scenery is prettily diversified with hill and dale, and towards the centre are some large mountains, the most considerable of which is embellished with trees and gardens, occasionally dotted with rural habitations. On the side next the river is an ancient monastery, with some spacious fenced enclosures, pleasantly embosomed in the woods, where the contemplative ambulator may roam for miles together, and listen to the warbling of the feathered inhabitants, while a thick and verdant umbrage effectually secures him from the rays of the sun. The view from the mountain is strikingly grand and picturesque, comprising a vast extent of country, fertilized by the St. Laurence, which comes from the right, over the tremendous Rapids, with a noise like thunder; and then, as the blustering gale that has spent its fury, and howled itself to rest, it glides smoothly and silently along, till it is lost in the horizon. To the left are seen the churches, monasteries, and other build-

ings, of Montreal, dilapidated walls of islands, altered the fruits of the earth with its magnificence, that terminated in variety, and so no assemblage, the inhabitants are accustomed to the admiration,

So great is the variety, and so noble the objects combined in the exquisite assemblage, that even those persons who are constantly habituated to them, still find something worthy of remark and admiration, every time they ascend the eminence."

KINGSTON is situated at the entrance of a deep bay, near Lake Ontario. It is a place of considerable trade, and contains, besides a fort and barracks, a church for the use of English Episcopalians, and about one hundred private houses, the generality of which are constructed of timber, and inhabited by emigrants from the United States. The fort is a stone building, consisting of a square and four bulwarks. The barracks are usually occupied by near a hundred men. The bay affords excellent anchorage, and is accounted the most commodious harbour in the vicinity of Lake Ontario. On its borders are two dock-yards, where most of the British vessels of burden, on the lake, have been built. These vessels ply chiefly between Kingston and Niagara, and are seldom known to touch at any other place.

As there is no regular market at Kingston, the inhabitants are obliged to provide themselves with fresh provisions in the best manner they are able. Fire-wood is brought in sledges, during the winter, from the banks of the river and the adjacent islands, and is sold at only one dollar a cord. Some schools are established in the district, but their number is very inconsiderable. The children are instructed in reading and writing for one dollar a month. The district contains no paupers, and poor's rates are consequently unknown to the inhabitants.

NIAGARA contains a court-house, an edifice designed for the accommodation of the legislative bodies, a prison, and about seventy houses, the latter of which are chiefly built of wood. In the upper part of the town, however, there are some well built and commodious habitations.

Most of the English, in Canada, who have any office under government, are persons of a liberal education, which renders the society of the place extremely pleasant. Most of the houses have been erected within the short space of a few years, and in that time there has been such an influx of people into the town and its environs, that provisions, horses, town lots, &c. have risen in value nearly fifty per cent. within that small space; and the place is still increasing, with surprising rapidity, on account of the constant emigration of people, who prefer Canada to the United States, and of the back country trade, that is regularly carried on through Niagara.

The situation of the town is about one hundred and fifty feet from the water's edge, on the top of the western bank, which, together with that on the opposite shore, is very lofty, and forms an extensive plain. It consequently commands an interesting view of the lake and surrounding scenery, but, unfortunately, the air is very insubstantial.

The fort is erected at the entrance of the river, on a point of land that is laved on one side by the river, and, on the other, by the waters of the lake. This edifice, together with the outworks, occupies a space of about five acres. Several batteries, redoubts, and parallel lines of fascines, secure it on the land-side, and towards the river it is stockaded. Opposite the lake is a spacious and well-fortified store-house. This building, however, with every part of the fort, is shamefully neglected; and the men in garrison, amounting to five hundred persons, exhibit but a very indifferent picture of cleanliness; as, at the time of our traveller's visit, which happened on a Sunday, when they might reasonably have been expected to make at least a creditable appearance, they were as dirty as though they had wrought in the trenches for a week without intermission.

About three quarters of a mile from Niagara, on the brink of the river, is an edifice, designed for the accommodation of such naval officers, on the lake, as are detained in town during the winter-season; and directly opposite is a wharf, for the purpose of landing cargoes that are brought up the lake.

DETROIT is situated on the elevated bank of the river, and contains a large Romish church, and about three hundred private houses. The streets all run parallel to the river, and are intersected at right angles; but they are unpaved, narrow, and extremely dirty. The town is encircled with a strong stockade, through which two gates open to some extensive wharfs, on the brink of the river, for the accommodation of shipping, and two others open to different sides of the town.

This town is celebrated for its commerce; and the stores and shops are so well supplied with fine cloth, linen, and every article of wearing-apparel, that they may be purchased, of as good a quality, and nearly as reasonable, as at New York or Philadelphia. About two-thirds of the inhabitants are traders, of French extraction. Provisions, of every kind, are plentiful, particularly fish, which are caught in the river and adjacent lakes; yet the inhabitants feel an inconvenience from the want of salt, as it is but lately that salt-springs have been discovered in this country, and even these are in the hands of government.

The town of Detroit is usually crowded with Indians, but, at the approach of night, the majority of them are obliged to remove beyond the gates. The circumjacent country is remarkably flat, and none of the rivers

have a fall sufficiently strong to turn a mill; the inhabitants are, therefore, obliged to grind their corn by wind-mills. The soil of the country is very light, but remarkably rich, and yields an abundant supply of wheat and Indian corn. The climate is much more healthy than in the vicinage of Niagara; yet the summers are extremely hot, and intermittent fevers frequently occur.

*Customs, Manners, &c.* The manners of the settlers in Canada resemble those of the French, in point of gaiety, urbanity, and vanity. The women can generally read and write, and are thus superior to the men; but both are sunk in ignorance and superstition, and blindly devoted to their priests.

It is observed that, the taste for political intelligence is less prevalent in Upper Canada than in the United States: One weekly newspaper only is printed, and were it not for the support afforded by government, the sale of the papers would not refund the proprietor for one-fourth of his expence. The newspaper-press is occasionally employed in printing the orders and notices issued by the governor, and the several acts of the legislature.

For the following remarks on the Indians of this country we are indebted to the pen of Mr. Weld:—

"The most striking distinction between the Indians and Europeans is their complexion; which is commonly of a copper colour, but which varies in the most surprising manner; some of them having no darker skins than the French or Spaniards, while others are nearly black. The contemplation of this fact, has induced many French missionaries, and other persons, who have resided for a considerable time among the Indians, to suppose that their colour does not naturally differ from that of the nations of Europe, but that the darkness prevalent among them is to be solely attributed to their use of unguents, and their constant exposure to the ardent rays of the sun, and the smoke of wood-fires. It is indeed a well-known fact, that their complexion at their birth is much lighter than in their advanced years: and it is equally true, that they endeavour, by every means in their power, to render their skins dark, imagining it will contribute greatly to the improvement of their personal appearance; yet I am inclined to ascribe the diversity of their colour to nature, from the consideration that the children almost invariably bear the complexion of their parent. With respect to their whiteness, when first issued into the scenes of human life, it affords no foundation to the opinion of the missionaries; as the infant negroes only acquire their glossy sable hue on being exposed to the sun and air, in the same manner as the tender blade, when first emerging from the bosom of the earth, gradually relinquishes its delicate whiteness, and assumes, first a light, and then a deeper, green.

"The general distinguishing marks of the Indians near

Lake Ontario are, long black hair, straight, and extremely coarse; dark small eyes; prominent cheek-bones; and sharp noses, rather of an aquiline shape. The generality of the men are remarkably straight and well-proportioned, have a firm erect walk, and, not unfrequently, a dignified deportment. Their breath is exceedingly sweet, their teeth good, and their limbs well turned.

"The females, on the contrary, are low of stature, ungraceful in their carriage, and extremely coarse and corpulent. Their faces are rounder, and their cheek-bones much higher, than those of the men; and, at the age of thirty, their foreheads are invariably covered with wrinkles, their skin becomes loose and shrivelled, and their whole appearance is calculated to inspire disgust. There are, however, some individuals, who, in their youth, possess an agreeable assemblage of features. The sudden change which they undergo may, probably, be attributed to the hard labour imposed on them by the men, and to their constant exposure to the sun.

"The long lock of hair, observable on the head of the men, is usually decorated with silver trinkets, beads, &c.; the other part of their hair, and the whole of their beard, are painfully eradicated by a brass instrument appropriated to that purpose. The women, however, do not deprive themselves of this natural covering, but wear it plaited up behind, and divided in the middle of the forehead. When they wish to appear to peculiar advantage, they paint the skin, between the separation, with a streak of vermilion.

"Such of the Indians as occupy the vicinity of the great north-westerly lakes, and have any dealings with European traders, have relinquished the furs and skins, which formerly composed their dress, as finding it more conducive to their comfort and advantage to barter these articles for woollen-cloths, blankets, &c. Their shoes, or moccasins, however, are still made of the skin of the buffalo, deer, or elk, which is commonly deprived of the hair, and exposed to the smoke of a wood-fire, till it attains a deep brown hue. The moccasin is formed of a single piece of leather, with one seam behind, and another from the instep to the toe. A flap, about two inches deep, is left round the place where the foot is put in, and this flap, together with the seam, is fancifully decorated with beads and porcupine-quills. If worn by a man, it is edged with tags of copper, filled with scarlet hair; or, if intended for a woman, it is ornamented with ribands. These, however, are only worn on particular occasions, as they are very costly, and soon wear out. A moccasin of plain leather is worn in common.

"Above the moccasins are worn the Indian leggings, fabricated of blue or scarlet cloth, and something similar in appearance to pantaloons, but the seams are on the outside; and, when intended for dress, they are covered with

a profusion of  
their moccasins,

This was a greater o

a profusion of ribbons and beads. These leggings, with their moccasins, two little aprons suspended from their waist, a girdle, a tobacco-pouch, and scalping-knife, compose the whole of their ordinary and military dress; but, when they visit their friends, or the weather is cool, they array themselves in a shirt of gaudy figured calico, or cotton, and either a large piece of broad cloth, a loose coat, or a blanket, which is fastened round their waist with a girdle, and held together on their breasts with the left hand: their ears and noses are also decorated with large pieces of metal, and their faces are painted in the most fantastic manner. The dress of the women is nearly similar.

"Yet, notwithstanding their attention to personal decoration, the habits of the Indians are wretched in the extreme, the greater part of them being constructed of slender poles, covered with the bark of the birch or elm tree. The formation of these hovels is as various as the fancies of the owners. Their utensils are but few, seldom exceeding a couple of iron or brass pots, obtained from the Europeans, a few wooden spoons and dishes of their own fabrication; and some vessels of stone.

"On the first view, a traveller is led to pronounce the Indians a cold and phlegmatic people; and, indeed, the appellation seems justly applied, when we contemplate their simple remarks on any curious production of art, or the coolness with which they behold any new and striking spectacle.

"In the presence of strangers they are usually reserved, but never embarrassed; and such is the astonishing firmness of their disposition, that they would sit down to dinner at the table of the most illustrious monarch, with as much unconcern as in one of their own rustic hovels. They deem it indispensibly requisite that a warrior should accommodate his behaviour to that of the persons with whom he is in company; and, as they are extremely observant, a stranger is seldom able to accuse them of awkwardness or vulgarity.

"One of these Indians, being invited to dine with me and some other gentlemen at Detroit, came, with his son, a child of nine years old, to partake of the repast. When the dessert was brought to table, a dish of peaches was handed to the little Indian, who, with becoming propriety, helped himself to one; but, happening to put it immediately to his lips, his father surveyed him, with an angry look, and reprimanded him, in a low voice, for not peeling his peach, as he might have observed the opposite gentleman had done. The boy was evidently covered with confusion, but immediately drew a plate towards him, and retrieved his fault in the most graceful manner. He was afterwards helped to some port wine, which, proving ungrateful to his palate, occasioned him to distort his face. This was a greater offence than the other, and his father

sharply observed, that he must never expect to be either a renowned warrior, or a good man, if he now expressed any dislike to what his host had kindly given him. The little fellow's heart swelled with the pride of true courage, and he emptied his glass with a look of apparent pleasure.

"It is but seldom that the Indians inflict corporal punishment upon their offspring, but, if they prove refractory, a little water is thrown in their faces, which is dreaded as the severest disgrace, and produces an instantaneous change in their behaviour. The children themselves, while under the immediate care of their parents, are extremely attentive to their commands and advice; but, when they are able to provide for themselves, they lose that species of respect, and will no longer submit to any sort of control. The aged, however, never experience any disrespect, but are always treated in the kindest manner, and held in the most profound veneration.

"These people have the most unconquerable contempt and aversion for any persons who have tamely submitted to bondage, and even such as have lost their liberty, after a hard struggle with their oppressors, are accounted, by the Indians, as no better than old women. Hence it is impossible to offer a greater insult to an Indian than to tell him that he resembles a negro, or that you suppose some of his ancestors were negroes. They look upon those sons of bondage as mere animals, and would at any time kill them without the least concern."

On the evening of his arrival at Maldan, our traveller's attention was attracted, previously to his retiring for the night, towards the island of Bois Blanc, by the sound of Indian music. He accordingly crossed the river with his companions, in a boat, in order to witness their merriment. The principal musicians were three aged men, who sat beneath the shade of a tree, diffusing pleasure and hilarity around them, by their singing and instruments; while the dancers, consisting of about twenty women, moved sideways round a small fire, having their faces inwards, and their arms folded round each other's neck.

After these female performers had amused themselves for some time, a larger fire was made up, and the men approached, to the number of fifty, to dance in their turn. They first proceeded, in a large circle, round the fire, following the steps of their leader, who seemed strictly observant of the music. At the termination of their round they altered their step, and began to stamp upon the earth with great vehemence, occasionally leaping and bowing their heads towards the fire. At length, after several circumvolutions, the principal dancer began to stamp with incredible fury, when he was imitated by all his followers, and their amusement concluded. In the space of a few minutes a new set of performers took their places, and thus they continued to dance, by turns, till near three o'clock in the morning.

Mr. Weld closes his remarks upon this people by observing that, "notwithstanding their dispositions are naturally charitable, friendly, and hospitable, yet so extremely wretched and filthy are their dwellings, so nauseous their common food, and so disgusting their general uncleanness, that few persons, who have ever experienced the blessings attendant on civilization, would feel the least inclination to pass much of their time in such a society."

*History.*] Canada was discovered by the English as early as 1597; but the first settlement in it was made by the French, in 1608, who retained possession of it till 1760, when it was conquered by the British arms, and, by the treaty of Paris in 1763, ceded by France to the crown of England, under the government of which it has ever since continued.

### SECTION III.

#### NOVA SCOTIA.

*Situation, Extent, and Division.*] This country is situated between forty-three and forty-nine degrees of north latitude, and between sixty and sixty-seven degrees of west longitude, and is in length three hundred and fifty miles, and in breadth two hundred and fifty. It is bounded by the River St. Laurence on the north, by the Gulf of St. Laurence and the Atlantic Ocean on the east, by the same ocean on the south, and by Canada and New England on the west. In 1784, it was divided into two provinces, Nova Scotia and New Brunswick.

*Seas, Bays, and Capes.*] The seas adjoining to Nova Scotia are the Atlantic Ocean, Fundy Bay, and the Gulf of St. Laurence. The lesser bays are Chenigto and Green Bay, upon the isthmus which joins the north part of Nova Scotia to the south, and the bay of Chaleurs on the north-east; the bay of Chedibucto on the south-east; the bay of the Islands, the ports of Bart, Chebucto, Prosper, St. Margaret, La Heve, Port Maltois, Port Rossignol, Port Vert, and Port Joly, on the south; Port La Tour, on the south-east; Port St. Mary, Annapolis, and Minas, on the south side of Fundy Bay; and Port Roseway, now more populous than any of the other.

The chief capes are Cape Portage, Ecoumenac, Tourmentin, Cape Port, and Epis, on the east; Cape Forgeri, and Cape Canceau, on the south-east; Cape Blanco, Cape Vert, Cape Theodore, Cape Dore, Cape La Heve, and Cape Negro, on the south; Cape Sable and Cape Fourche, on the south-west.

*Rivers.*] The river of St. Laurence forms the northern boundary. The rivers Risgouche and Nipisiguit run from west to east, and fall into the Bay of St. Laurence. The rivers of St. John, Passamagadi, Penobscot, and St. Croix, which run from north to south, fall into Fundy Bay, or the sea a little to the eastward of it.

*Lakes.*] There are many lakes; among which the Grand Lake is thirty miles long, and about nine broad.

*Climate.*] The climate of this country, though within the temperate zone, has been found unfavourable to European constitutions. The atmosphere is loaded with heavy fogs during great part of the year; and for four or five months it is intensely cold: but, though the cold in winter and the heat in summer are very great, they come on so gradually, as to prepare the body for enduring both.

*Soil and Vegetable Productions.*] Nova Scotia was formerly almost a continued forest; and agriculture, though attempted by the English settlers, made little progress. In most parts, the soil is thin and barren; the corn it produces is of a shrivelled kind, like rye, and the grass intermixed with a cold spongy moss. However, there are some tracts in the peninsula, to the southward, which are not inferior to the best land in New England; and, by the industry and exertions of the royalists from the other provinces, are now cultivated, and likely to be fertile and flourishing. In general, the soil is adapted to the produce of hemp and flax. The timber is extremely proper for ship-building, and produces pitch and tar: and flattering accounts have been given of the improvements making in the new settlements.

*Animals.*] Among the animals of this country are great numbers of deer, beavers, and otters. Wild fowl, and all manner of game, and many kinds of European fowls have, from time to time, been brought into it, and thrive well. At the close of March, the fish begin to spawn, when they enter the rivers in such shoals as are incredible. Herrings come up in April, and sturgeon and salmon in May. But the most valuable appendage of New Scotland is the Cape Sable coast, along which is a continued range of cod-fishing banks, navigable rivers, basins, &c.

*Chief Towns, &c.*] FREDERIC TOWN, the capital of the province of New Brunswick, is situated on the River St. John, about ninety miles from its estuary. St. Ann's is almost opposite, and there are some other settlements near the Bay of Fundy.

HALIFAX, in the province of Nova Scotia, is commodiously situated for the fishery, and stands on a fine harbour. It has a good timber entrenchment, strengthened with forts, sufficient to guard it against an Indian enemy. Halifax has a communication with most parts of the province, either by land-carriage, the sea, or navigable rivers, and in the harbour lies a small squadron of ships, which puts to sea in summer, under a commodore, to protect the Newfoundland fishery. Were it not for this fishery, the inhabitants must often starve, as all their provision comes from New England. Though the town has a tolerable appearance, the adjacent country is not proportionably improved. The ground is very hard to be cleared

and, when cleared, most from the country. It is so frequently so frequented by the people, that the cannon of their

Since the establishment of a considerable part of the States has been raised; as the water-side, and the sand inhabitants fishing and population Windsor, Norton, Annapolis. Of these are Shelburne, 1

*Trade.*] The commerce of this country, at the settlements, was worth upwards of a hundred pounds. The amount of the produce amounted to thirty

*History.*] Notwithstanding the smallness of this country, it has been the seat of European settlement in it was given by Alexander, from the province of New Scotland transferred from the French to the British. It was no longer of Utrecht; and it has to have so much a to be obtained by the French, by possession in their power to principle, three times in 1749, at the charge where they erected a earl of that name, settlement.

#### ISLANDS IN THE GULF OF ST. LAURENCE.

The principal islands are Cape Breton, St. John, and Cape Breton.

CAPE BRETON is situated between 45 degrees of north latitude and 55 degrees of west longitude, and is separated from Nova Scotia by a narrow strait. It is the communication with the Gulf of St. Laurence.

and, when cleared, it is worth little. But it has suffered most from the incursions of the Indians, which were formerly so frequent, and attended with such cruelties, that the people could hardly extend themselves beyond the cannon of their fort.

Since the conclusion of the war, which separated a considerable part of America from the British crown, the emigration of loyalists to this province from the United States has been very great; and by them new towns have been raised; as Shelburne, which extends two miles on the water-side, and is said to contain upwards of nine thousand inhabitants. Of the old settlements, the most flourishing and populous are Halifax, and the townships of Windsor, Norton, and Cornwallis, between Halifax and Annapolis. Of the new settlements, the most important are Shelburne, Barr-town, Digby, and New Edinburgh.

*Trade.*] The amount of imports from Great Britain to this country, at an average of three years, before the new settlements, was about twenty-six thousand five hundred pounds. The articles exported in exchange are timber, and the produce of the fishery, which, at a large average, amount to thirty-eight thousand pounds.

*History.*] Notwithstanding the forbidding appearance of this country, it was here that some of the first European settlements were made. The first grant of lands in it was given by James I. to his secretary, Sir William Alexander, from whom it had the name of Nova Scotia, or New Scotland. Since then, it has frequently been transferred from one private proprietor to another, and from the French to the English nation, backward and forward. It was not confirmed to the English till the peace of Utrecht; and their design in acquiring it does not seem to have so much arisen from any prospect of direct profit to be obtained by it, as from an apprehension that the French, by possessing this province, might have had it in their power to annoy our other settlements. Upon this principle, three thousand families were transported, in 1749, at the charge of the government, into this country, where they erected the town of Halifax, so called from the earl of that name, to whose wisdom and care we owe this settlement.

#### SECTION IV.

#### ISLANDS IN THE GULF OF ST. LAURENCE.

The principal islands in the Gulf of St. Laurence are Cape Breton, St. John's, Newfoundland, and Bermuda.

CAPE BRETON lies between forty-five and forty-seven degrees of north latitude, and between fifty-nine and sixty degrees of west longitude. It is about one hundred miles in length, and fifty in breadth, and is separated from Nova Scotia by a narrow strait, called the Gut of Censo, which is the communication between the Atlantic Ocean and the Gulf of St. Laurence. The soil is barren; but it has

good harbours, particularly that of Louisburg, which is near four leagues in circumference, and has every where six or seven fathoms water.

This island is said to have been discovered at a very early period, (about A.D. 1500,) by the Normans and Bretons, who navigated these seas; and, being supposed a part of the continent, was called Cape Breton. They did not, however, take possession of it till 1713, when they erected Fort Dauphin: the harbour being found difficult, Louisburg was built in 1720, the settlers being chiefly from Europe, as the French in Nova Scotia did not choose to leave that country. In 1745, Cape Breton was taken by some troops from New England; and has since remained subject to the British crown. The climate is cold and foggy, not only from the proximity of Newfoundland, but from numerous lakes and forests. The soil is mere moss, and has been found unfit for agriculture. The chief towns are Sidney and Louisburg: the whole inhabitants of the isle do not exceed one thousand. The fur-trade is inconsiderable, but the fishery very important, this island being esteemed the chief seat; and the value of this trade, while in the French possession, was computed at a million sterling. There is a very extensive bed of coal in this island, in a horizontal direction, not more than six or eight feet below the surface; but it has been chiefly used as ballast.

ST. JOHN'S, situated in the Gulf of St. Laurence, is about sixty miles in length, and thirty or forty in breadth, and has many fine rivers; and, though lying near Cape Breton and Nova Scotia, has greatly the advantage of both in pleasantness and fertility of soil. Upon the reduction of Cape Breton, the inhabitants of this island, amounting to four thousand, submitted quietly to the British arms; and, to the disgrace of the French governor, there were found in his house several English scalps, which were brought there to market by the savages, this being the place where they were encouraged to carry on that barbarous and inhuman trade. This island was so well improved by the French, that it was styled the granary of Canada. It has several fine rivers, and a rich soil. Charlotte-town is its capital, and is the residence of the lieutenant-governor, who is the chief officer in the island. The inhabitants are estimated at about five thousand.

NEWFOUNDLAND is situate on the east side of the Gulf of St. Laurence, between forty-six and fifty-two degrees of north latitude, and between fifty-eight and fifty-nine degrees of west longitude. It is separated from New Britain by the Straits of Belle-Isle, and from Canada by the Bay of St. Laurence; being three hundred and fifty miles long, and two hundred broad. The coasts are extremely subject to fogs, attended with almost continual storms of snow and sleet, the sky being usually overcast. The cold of winter is tedious and severe, and the summer-

heat, though sometimes violent, is not sufficient to produce any thing valuable, the soil being rocky and barren: it is, however, watered by several rivers, and has many large and excellent harbours. This island seems to be rather hilly than mountainous, with woods of birch, small pine, and fir; but on the south-west side are lofty headlands. It is chiefly valuable for the great fishery of cod, carried on upon those shoals which are called the banks of Newfoundland. Great Britain and the United States, at the lowest computation, annually employ three thousand sail of small craft in this fishery, on board of which, and on shore, are upwards of one hundred thousand hands, to cure and pack the fish. This fishery is computed to yield three hundred thousand pounds a year from the cod sold in Catholic countries. The numbers of cod, both on the great bank and the lesser, are inconceivable; and not only cod, but several other species of fish, are caught there in abundance, all of which are nearly in equal plenty along the shores of Newfoundland, Nova Scotia, New England, and the island of Cape Breton; and very profitable fisheries are carried on upon all their coasts.

The principal towns in Newfoundland are Placentia, Bonavista, and St. John; but not above one thousand families remain here in winter. A small squadron is sent in the spring to protect the fisheries and inhabitants, the admiral of which, for the time being, is governor of the island; besides whom there is a lieutenant-governor, who resides at Placentia.

When this island was first discovered, the English saw some people on shore, painted with ochre, and clothed with stag-skins, formed into a sort of gowns, that reached about half-way down the leg, the sleeves coming half-way down the arm, and beaver-skins about their neck. They were bare-legged, and most of them bare-footed. Their heads were uncovered. They wore their hair pretty long, a great lock behind, with a feather, standing erect, on the crown of the head, and a small lock plaited before. Their hair was of different colours; and their clothes, as well as their bodies, were painted red.

This island was discovered by Sebastian Cabot, in 1496, and both the French and English had made settlements there in the beginning of the seventeenth century. After various contests and disputes, however, the island was entirely ceded to England by the treaty of Utrecht, in 1713; but the French were left at liberty to dry their nets on the northern shores of the island; and, by the treaty of 1763, they were permitted to fish in the Gulf of St. Laurence, but with this limitation, that they should not approach within three leagues of any of the coasts belonging to England.

By the treaty of 1783, they were to enjoy their fisheries on the northern and western coasts, the inhabitants of the United States having the same privileges as before their independence; and the preliminaries of October, 1801, confirmed the privileges granted to the French.

## CHAPTER IV.

### THE UNITED STATES.

#### *Extent and Boundaries.*

THE greatest extent of the United territory, as commonly computed, is from east to west in the northern part, where it exceeds one thousand three hundred British miles, though, according to some writers, it is only one thousand two hundred and fifty; and the line along the shores with the Atlantic nearly corresponds; but the breadth from the Canadian lakes to the southern frontiers of Florida is about one thousand British miles. The square acres, exclusive of Louisiana, have been computed at six hundred and forty millions, and those covered with water being supposed fifty-one millions, there will remain five hundred and eighty-nine millions of acres.

The eastern boundary of the United States is the Atlantic Ocean, and the western, in part, the Mississippi,

which has been considered as a limit of Spanish America; but the recent acquisition of Louisiana extends this boundary in the southern part to the mountains of Natchi and the Rio Bravo; for geographers are inclined to regard the ancient limits of Louisiana in preference to the encroachments which the Spaniards have made upon the original French territory, these settlements having been formed by the permission of the French, in consequence of the family compact. Towards the north, also, the western limit may be extended by actual possession as far as the Pacific Ocean.

On the north, an imaginary line, pervading the great lakes of Canada, is continued along the River St. Laurence to latitude forty-five degrees, not far to the south of Montreal, when it passes due west, follows a chain of moun-

tains north-east, and afterwards diverges south-east to the River St. Croix, which falls into the Bay of Fundi. On the south a similar line, about latitude thirty-one degrees, divides the United States from the Spanish dominions of West and East Florida. The southern boundary of Louisiana is the Gulf of Mexico; and the west longitude of the whole of the United States is between sixty-four and ninety-six degrees.

*Divisions.*] The United States have, by some writers, been regarded under two divisions, the northern and the southern; but this classification is reprobated by the Americans. Others have divided them into northern, middle, and southern; while others denominate all those that border on the ocean, Atlantic States, and the rest, Inland States. But we shall give a general table, with the number of inhabitants belonging to each, taken from the census of 1801, which contains the last enumeration that has been made, and includes the slaves.

1 District of Maine .....	151,719
2 Vermont .....	154,465
3 New Hampshire .....	183,858
4 Massachusetts .....	422,845
5 Rhode Island .....	69,122
6 Connecticut .....	251,002
7 New York .....	586,203
8 New Jersey .....	211,149
9 Pennsylvania .....	602,365
10 Delaware .....	64,273
11 Maryland .....	349,692
12 Virginia .....	886,149
13 Kentucky .....	220,960
14 North Carolina .....	478,103
15 South Carolina .....	345,491
16 Georgia .....	162,684
17 Tennessee .....	105,602
18 Ohio .....	45,365
19 Louisiana .....	42,375
	<hr/> 5,333,422

The population was also thus estimated; under another form, in 1801, and has probably increased since that period.

*Climate, Seasons, and Face of the Country.*] The climate of the United States, like that of England, is chiefly remarkable for sudden transitions from heat to cold, or the reverse. The north-west wind is extremely bleak, as it passes the extent of the frozen continent. In the plains, on the east of the Apalachian mountains, the summer-heats are excessive; and, in some places, even ice will not preserve animal food from putrefaction. Near the mountains, the climate is salubrious, even in the southern states. In the northern states, the winter is longer

than in England; but the summer-heats are more intense. Rain is commonly attended with a north-east wind, while on the west side of the Apalachian mountains a south-west wind accompanies it. In Georgia the winter is very mild, and the east wind is there the warmest.

The excessive heat experienced in the plains is considered as one cause of the yellow fever, which so frequently proves fatal in this country, and the return of which is annually apprehended.

In Volney's work, entitled "*Tableau du Climat et du Sol des Etats Unis*," there are some curious remarks on the change of climate produced in North-America, by the clearing of the forests and the cultivation of the soil, which, contrary to the general opinion, he conceives to be for the worst. He says, the consequence has been, from demonstration, that the winters are shorter, the summers longer, and the autumns more backward, without any abatement of the intenseness of the cold; and he confirms the idea of the deterioration of the climate by the experiments of a Mr. Williams and Dr. Rush; the result of which is, that bilious fevers always follow the destruction of the woods, the clearing of the lands, and the draining of swamps; it requires many years of cultivation to make them disappear entirely, or take a milder form; and that pleurisies and other diseases, purely inflammatory, which were formerly the only ones known, are at present much less common, which proves an evident alteration in the purity of the air, when more impregnated with oxygen.

In New England, the extremes of heat and cold can neither be conceived by an European, nor accounted for by an American; though the latter attributes the intense cold to the high lands and back lakes. New England is situated between forty-one and forty-six degrees of north latitude; yet, in the months of July and August, the heat is often as intense as in the West-Indies. An American geographer, in describing the climate of this region, says, "The heat in summer is intense, and the cold in winter equally severe. All fresh-water lakes, ponds, and rivers, are usually passable on ice, from Christmas till the middle of March. The longest day is fifteen hours and sixteen minutes; and the shortest eight hours and forty minutes."

"For several days together," says Mr. Janson, "in the hottest weather, there is not a breath of air; and the nights, with the additional annoyance of swarms of that aggravating and poisonous insect the mosquito, are nearly insupportable to an European; who will undergo a complete perforation of the skin, and every wound will poison, to the diameter of half an inch, till his blood is reduced to the state of that of the natives, or the temper of the climate, when he may find respite from their nocturnal attacks: they make a buzzing noise nearly equal to that of

the bee; and yet, with this notice, it is impossible to guard against their assaults. The croaking of the toad, of which there are infinite varieties, the noise of the locust, and the no less offensive chirping of the grasshopper, together with the sounds of many other restless reptiles, join in dismal discord, to deprive the way-worn traveller of his rest; with these his disturbed fancy may associate the birds and beasts of prey under his window. Custom, however, will reconcile man to all things. In addition to all these inconveniences, he will be sure to find his bed overstocked with bugs and fleas, which will attack him in one quarter, while mosquitos seize him in another: curtains of thin gauze are some defence against the latter; but, from the harbour the former find in the coarse woollen bed-chamber furniture, they rove at large and uncontrolled.

"To many days intense heat, a violent storm of wind and rain will, perhaps, succeed, attended with tremendous lightning; which often sweeps away whole fields of corn, and deluges the earth; then again will the heat break out with redoubled violence, causing fevers, dysenteries, and agues, which of late years have proved a dreadful scourge in America."

The seasons in the United States, in some degree, correspond with those in Europe, but not with the equality to be expected on a continent; as, even during the summer-heats, single days will occur, which require the warmth of a fire. Even the estuary of the Delaware is generally frozen for six weeks every winter; nor does the western coast of North-America seem warmer than the eastern. Belknap says, that, in New Hampshire, they reckon upon eight months of cold weather in the year; a proportion not common in England.

The face of this extensive country is not so minutely diversified as might have been expected, the features of nature being here on a larger and more uniform scale than in Europe. The abundance of timber, giving the idea of one immense forest, and the diversity of the foliage, contribute greatly to enrich the landscape; but it is here reputed a weed; and the planter seldom spares trees near his habitation, as, the roots having no great room to spread or penetrate, they would be dangerous during a violent wind. The landscape is less ennobled by lofty mountains than by rivers of great magnitude; and is frequently injured by the barren aspect of large fields, which have been exhausted by the culture of tobacco, and which scarcely produce a solitary weed or a blade of grass.

The northern provinces, called New England, are generally hilly, as they approach the skirts of the Apalachian chain, which has been appropriately called the spine of the United territory. The vales in these northern regions are thickly clothed with wood, and often pervaded by considerable rivers; many romantic cascades are formed by

rivulets falling from the rocks, while towards the shore the land is level and sandy. In Virginia, a central state, the Blue Mountains, and other ridges of the Apalachian, add great charms and variety to the prospect, which is farther enlivened by many beautiful plants and birds, particularly the humming-bird, sucking the honey of various flowers, and rapidly glancing in the sun its indescribable hues of green, purple, and gold. Here, a plain from one hundred and fifty to two hundred miles in breadth, reaching from the mountains to the sea, is studded with the villas of land-owners of the higher class. Similar levels appear in the Carolinas and Georgia. Beyond the Apalachian ridges extends another rich plain of amazing size, pervaded by the muddy waves of the Mississippi. In Kentucky, the surface is agreeably waved with gentle swells, reposing on a vast bed of lime-stone; and a track of about twenty miles along the Ohio is broken into small hills and narrow valleys.

*Soil, Agriculture, &c.* The soil of the United States is generally fertile, often, on the east of the Blue Mountains, a rich loamy earth, sometimes a yellowish clay, which gradually becomes more sandy towards the sea. Belknap, in his Account of New Hampshire, says, the summits of the mountains are frequently marshy, and haunted by aquatic birds, while the valleys below are dry. This circumstance is owing to the hard rock, two or three feet under the surface of the mountain, which is impenetrable by water. Sometimes there are considerable marshes, and what are called salt-meadows, and spots called *Barrens*, which, even in the original forests, are found to be bare of trees for a considerable space.

"The soil," says Mr. Parkinson, "is, in general, very thin; in many places, not more than from one inch to an inch and a half thick. The under stratum is of a loose sandy nature, and so light, that, after the frosts are over, the pavement in the streets will not bear even the weight of a man; and the fields are so like a quagmire, that a man on horseback would be endangered in attempting to pass over them. From such lightness, the soil is apt, when rain comes, to form into small channels, that afterwards constitute what are termed gulleys, which are holes like quarries or marl-pits, and which, in the course of six or eight weeks, become from eight to ten feet deep, and the same in width. The loose earth, thus detached from its primary bed, covers the contiguous surface, for an acre or two together, where the best soil is, and even spoils that. This may account for their not having ditches cut, for division-fences or drains. I apprehend that, if ditches were cut and quick-set, as is done in England, the fences would fall down, by the water washing away the soil that composes the bank. The land is materially injured, in many parts, for want of drains; but I think the expence would exceed the profit: they would soon lodge up, and,

consequently, remember that I thus excavated, land; since no or rivers, the and of so light down.

"Those swamps, rich, are light and to be so fertile, this, however, is sort of vegetable small sticks, rotted, and covered, which land is very fine soil that freely a of raising it she much, or keep it if the earth were better for it. In England, it is The heat is from your shoes, it wise your toes sun's intense heat not thrive in America, since I have perished. consequently, want jettying on the sides. I do not remember that I ever saw five yards of earth, in any space thus excavated, with the sides standing as they do in England; since no grass will grow on the banks of the canals or rivers, the soil being too poor to produce vegetation, and of so light a nature, as to keep continually crumbling down.

"Those swamps, or bottoms, which the Americans term rich, are light and crumbly. Lands of this kind are said to be so fertile, as not to bear wheat, when first cleared: this, however, is not owing to their richness, but to a sort of vegetable manure, composed of leaves of trees, small sticks, rotten wood, &c., with which they are covered, and which is too light and loose for wheat. This land is very fine for Indian corn, which thrives best in a soil that freely admits the sun to its roots. The manner of raising it shews that it is impossible to plough too much, or keep the soil too light. I am of opinion, that, if the earth were moved every day, the crop would be the better for it. Instead of this sort of land being firm, as in England, it is here like chaff, and light under foot. The heat is frequently so great, that, if sand get into your shoes, it will compel you to take them off, otherwise your toes will become excoriated. I suppose the sun's intense heat is the reason why English grasses will not thrive in America; and I have planted some Indian corn, since I landed in England, but none of it has prospered. Then the winter in America is very severe, and sets in so suddenly, as to find those plants in a very porous state; consequently, the cold penetrates so quickly into them that they are killed. Indeed, the effect of extremes is as great as it would be to any plant reared in a hot-house being taken, in its warm state, and exposed to the most severe frost."

The following remarks on the Barrens in Kentucky are extracted from the work of M. Michaux.

"The Barrens, or meadows, of Kentucky, comprise an extent of sixty or seventy miles in length, by fifty to eighty in width; and, from the signification of this word, I expected to cross a barren space, producing only some occasional plants. I was confirmed in my opinion by what the inhabitants said of these meadows, before I reached them; as they told me, I should probably perish with heat and thirst, and that I should not find a single shady spot throughout the whole distance; for most of the Americans, who live amongst the woods, cannot conceive that there are districts entirely open, and still less that any person can reside on them. Instead, however, of finding such a country as had been described to me, I was agreeably surprised to meet with a beautiful meadow, the abundant grass of which was from two to three feet high, and afforded excellent food for cattle.

"In some parts of these meadows, I observed several

species of wild climbing vines, but particularly that called by the inhabitants summer-grapes. The bunches were tolerably large, and the grapes of as good a quality as those that grow in the environs of Paris, with the exception that they are not quite so compact.

"It appears to me, that the attempts made at Kentucky for cultivating the vine would have been more successful on the Barrens; the soil of which seems more fit for this kind of cultivation than that of the banks of the Kentucky, which, though richer, is rendered too moist by the nature of the country, and the vicinity of the forests.

"The Barrens are circumscribed by a skirting of wood, from two to three miles in breadth; the trees of which it is composed are clear-planted, that is, thinly, and at a farther distance from each other, the nearer they are to the meadow. On the side of Tennessee, this skirting is exclusively formed by post-oaks, the wood of which, being very hard and permanent, is preferable to any other kind for making enclosures. I also perceived, here and there in the meadow, some black oaks and walnut-trees, about twelve or fifteen feet high, which composed some small bowers of wood, but which were always so distant from each other, as not in any degree to circumscribe the view. The surface of these meadows is in general very even; towards Dripping-spring only, I observed a high and long hillock, containing a few trees, and interspersed with enormous pieces of rock.

"It appears that the Barrens contain a great number of subterraneous caverns, some of which are very near the surface. A short time before I arrived, an ebullition had taken place on the road, near Bears-Wallow, beneath the feet of a traveller, who only escaped by mere chance. One may easily conceive the danger of such accidents, in a country where the houses are so distant from each other, and where perhaps a traveller is not seen once in a fortnight.

"There may also be seen, in these meadows, a number of wide holes, in the shape of a funnel, and the breadth of which varies in proportion to their depth, from fifteen to thirty feet. In some of these holes, above five or six feet from the bottom, runs a small thread of water, which loses itself in a crevice at the base. These kind of springs are never dry, a circumstance which induces emigrants to reside wherever they are found; for, except the River Big-Barren, I did not observe, in these plains, the smallest rivulet or creek. I have heard, that some attempts have been made to dig wells, but I cannot pretend to say what success attended them. From the above observations, however, it will be evident, that the want of water, and of wood for enclosures, will for a long time prove an obstacle to the increase of the establishments in this part of Kentucky. The latter of these inconveniences might, however, be avoided, by changing the present manner of

enclosing lands, for that of live hedges. The Barrens are, at present, but thinly peopled, in proportion to their extent; for, on the road, where the houses are nearest together, there were but eighteen in the space of seventy miles.

"Some inhabitants divide the land of the Barrens into three classes, according to their quality; and, in their opinion, the middling class is the largest. In that which I crossed, the soil was yellowish, and rather gravelly, and appeared very fit for the cultivation of wheat: maize, however, is almost the only kind of grain that is raised. Most of the emigrants, who come to settle in the country, travel along the skirts of the wood already mentioned, or by the rivers Little and Big Barren, on account of the advantage of the meadows in that quarter, for the pasturage of cattle, and of which the inhabitants, who reside in the most fertile of the wooded cantons, are, in a great degree, deprived, by reason of the paucity of grasses."

"Every year, in March or April, the inhabitants set fire to the grass, which, at this period, is dry; because its extreme length would, for a fortnight or three weeks, prevent the cattle from obtaining the new crop that begins to shoot. This custom is, however, generally condemned; for, the firing being made too early, the new grass is deprived of its protection against the spring-frosts, by which its vegetation is retarded. This custom of burning the meadows was formerly practised by the natives, who came to hunt in these districts, and is still adopted by them in the other parts of North-America. Their object in setting fire to the grass was, to attract the stags, bison, &c. to the burnt parts, by which they could perceive them at a distance. It is only by actual observation that the smallest idea can be formed of these conflagrations. The flames, which generally fill a line several miles in extent, are sometimes propelled by the wind with such rapidity, that men on horseback have not unfrequently been overtaken and destroyed by their violence. The American hunters and the savages preserve themselves from this danger by a method as simple as it is ingenious. They quickly set fire to the part of the meadow in which they stand, and afterwards retire to the burnt spot, where the flames which threatened them have ceased for want of aliment."

It is computed that three-fourths of the inhabitants of the United States are employed in agriculture; and, notwithstanding the practice of land-jobbing, and other tendencies to monopoly, they are enabled, in times of peace, almost annually to increase the exportation of grain and flour. In 1786, Pennsylvania exported one hundred and fifty thousand barrels of flour; in 1789, no less than three hundred and sixty-nine thousand six hundred and eighteen barrels. Among the products of the field are wheat, rye, barley, buck-wheat, oats, beans,

peas, and maize. In Virginia, rice is cultivated, and is found to succeed well on the banks of the Ohio. The German spelt is also sown in Pennsylvania; and, in several provinces, hemp and flax succeed to some extent. The culture of turnips, and some other vegetables, common on English farms, seem, as yet, to excite little attention; but many cultivated grasses are sown, and in Virginia there are lucern, cinquefoil, burnet, red, white, and yellow, clover, &c.; particularly the red clover, which, Dr. Barton observes, is not only sown for the purpose of a pasture-grass, and for hay, but also as a manure for land. With this latter view it is much attended to in Pennsylvania. In the maritime parts of Virginia, they sow, with the same intention, a native species of cassia, called the maggoty bay-bean, partridge-pea, &c. The potatoe is a native of the country; and there is a sort, called ground-nuts, which are much liked. There are several kinds of melons and cucumbers; hops are also cultivated; and tobacco, a well-known product of Virginia. Orchards are very common; and cyder is a common beverage in the northern and middle states. Peaches are greatly cultivated in Virginia, where the peach-brandy is noted; and there are also excellent apricots and nectarines.

In a country where farmers form such a great proportion of the community; it is necessary to descend from the general outlines to the particular circumstances of their agriculture. Mr. Parkinson seems to have had more experience as a farmer, in America, than any other English emigrant. We, therefore, cannot do better than to extract a few passages from his volumes, relative to agricultural pursuits in America, which will afford much entertainment to the reader.

Mr. P. engaged a farm at Baltimore, which consisted of three hundred acres, for three hundred pounds per year currency. It contained only two hundred acres of cleared land; and, he adds that, he does not think such poor land would let in England for half the sum, if at all.

"On the 1st of May, 1799," says our author, "I entered upon my farm at Orange Hill, three miles from Baltimore. I will explain why I gave so great a rent for this, after having had all the offers which I have previously mentioned.

"I thought nothing in the farming line likely to be profitable, except the selling of milk, and what, in that country, is called truck, which is garden-produce, fruit, &c.; finding labour so very dear, and scarcely to be had at all, except by the keeping of slaves, which I did not like. The price of milk being from sixpence to eight-pence per quart, seemed to me sure of paying well; and as linseed-cake was not in general use, and was to be bought cheap, this, too, was of great advantage. I could buy one hundred and four cakes for fifteen shillings, the cakes weigh-

ing two pounds each, and other food; and, being so much better than the milk, do not keep it long.

"The custom of weather being only time when were thus compelled to milk, and to be wise we should frequently turn were also a milk generally boil the milk to whey at the morning. I in town by bread and milking our town, and our milk.

This was a very thing to be done two years I sold my land any assistance I think it possible to sell.

"My first work which were called in England would be called meadow and of different descriptions that, when I moved did not know what not, expecting that to my supposition keepers at nine a summer; and that being about the more; at Philadelphia twenty-six acres brought me one of the cakes for the seventy-eight pounds well on that sort corn, blades, stalks but very little of milk was much to be got fat, and were first thing of

ing two pounds each: this was cheap, compared with other food; and the cakes are very good in quality, not being so much pressed as they are in England; but they do not keep so well. My expectations, so far, were fully answered. But I found great trouble in this business: for, in the two years that I followed it, I could never meet with any servant that would milk properly; therefore we were obliged to milk the cows and sell the milk ourselves, as well as feed the cows, and do greatest part of the farming work.

"The custom in the towns is, to rise very early; the weather being so hot in summer, that the morning is the only time when one can draw breath with pleasure. We were thus compelled, in summer, to rise at two o'clock, to milk, and to be in town before the sun was up; otherwise we should find the breakfast over, and the milk would frequently turn sour by twelve o'clock in the day. There were also a number of Frenchmen in Baltimore, who generally boil the milk before they use it; but it would boil to whey and curds if it were not delivered betimes in the morning. In winter we rose at four o'clock, and were in town by break of day; and by such care and assiduity, and milking our cows regularly, we got the best of custom, and our milk became esteemed more than any other. This was a very good business, compared with any other thing to be done in farming in America. During the whole two years I seldom met with a man or woman who would lend any assistance to us so early in the morning; nor do I think it possible to hire people to do what we did ourselves.

"My first work on the farm was to dress the meadows, which were called fine; though the greater part of them in England would not have been thought worthy of being called meadow at all, being overrun with briars and weeds of different descriptions. Their state, indeed, was such, that, when I mowed them, I sometimes, in making the hay, did not know whether it was worth putting together or not, expecting that it would not be sold; but, contrary to my supposition, it was readily bought by the stable-keepers at nine pounds per ton. It was, however, a dry summer; and this is not the usual price: five pounds being about the average, one year with another, at Baltimore; at Philadelphia and New York not so much. The twenty-six acres produced fourteen tons of hay, which brought me one hundred and twenty-six pounds, while the cakes for the cows (a much better feed) cost me only seventy-eight pounds fifteen shillings. They milked very well on that sort of food, with the addition of Indian corn, blades, stalks, and corn, all chopped up together; but very little of this mixture served with the cakes. The milk was much liked; and the greater part of the cows got fat, and were sold to the butchers. This was the first thing of and done in America, and very much

30. VOL. I.

surprised many gentlemen of my acquaintance; and the linseed-cakes began to be much sought after before I left the country. I have been told that there have been many tons of those cakes thrown away as good for nothing; and so little was their use known there, that, when we had them in the waggon, the people asked if we ate them ourselves.

"The next business in the farm, after cleaning and dressing the meadows, was to plant Indian corn. This is usually done in the first week of May, but mine was so late as the last week; for I was near two months getting a plough made, therefore I hired for the listing, as they call it. I put in my corn in drills, and harrowed the seed in, and it did very well; which so much amazed all who saw me, that you would imagine there was some charm in their old method of setting it by the hoe. I found drilling to be the best and cleanest way, and my corn prospered and grew very well; beyond the expectation of any farmers there, and much contrary to their wishes; for, as I had published a Treatise on Agriculture, the lower class of people seemed to have a desire that nothing I did should succeed; and, from my opinion of the land, I was much afraid their wishes would be gratified. And having never cultivated such poor land before, nor raised Indian corn, I had little idea what the soil would do. I had thus only one encouragement; which was, that other people's land was as bad as mine, and some a great deal worse.

"We still remained, during all this time, without any one to assist us, except the hiring for the ploughing. We had the corn to plant, and the cows to mind, and every thing to do: and, to put us in spirits, now and then an Englishman would come, and tell us a most lamentable story of what sufferings he had undergone, that he had been cheated out of his money, and how poor the land was, with all sorts of murmurings; constantly ending by asking my wife and family how they liked America? to which the answer, 'Not at all,' was returned very quickly. It is impossible to express what a man feels in such a situation. I remember one Englishman, after repeating all the things that could fill a stranger's mind with trouble and horror, said, with a very heavy sigh, as he was going out of the house, 'It is the devil's own country, to be sure!' Among other things, he had told us of the thunder and lightning, &c.; and, some few days after, we had a specimen of this, for such a dreadful scene I had never beheld—it thundered and lightened, blew and rained, in such a manner, as to swim a great part of our corn out of the drills, and to seem as if there was going to be an end of the world. Such behaviour is meant as friendship by these Englishmen; though it is very uncomfortable to hear: and this I had to suffer every day of my life, and sometimes two or three times a day. Besides all this, the lower sort of Americans (who dislike an Englishman as much as it is possible for one man to dislike another) con-

tinually contrive to insult him, by any unpleasant expression they can make use of; and their conduct in this respect may in some measure be accounted for, from the better sort of people, in common conversation, always saying, if any thing is done better than usual in the management of land, as ploughing in a proper manner, or a fine horse or cow is seen—"It is like the English;" and that such preference is constantly given to the English, disgusts them much.

"After my sons, and myself, had hoed the corn, I began to look out for a piece of land for sowing turnips, which appeared to me likely to be very profitable; for I was told that they were to be sold at one dollar per bushel, and, though I did not myself know how many bushels an acre would produce, it was generally stated in conversation at one thousand bushels. I thought this must be a ready way to get rich; but, like all other American calculations, I have found it to be erroneous; for the last year I had a very good crop, yet it only produced three hundred and sixty bushels, and, the average price being then three shillings a bushel, it was one of the most profitable crops I experienced in that country. I believe, however, it would not be possible for a man to sell the produce of more than three acres in one season, and in one city or town; but even this is a very handsome profit (one hundred and sixty-two pounds) for so small a spot of ground. In that case, he must have two men and two horses employed every day, for about two months, at an expence of about thirteen pounds ten shillings, for selling them.

"How to get my land prepared for my turnips I did not know, as I could not meet with any man, as a servant or labourer, to do any thing, especially to plough; but, with some difficulty, I hired a man to come to plough, with his own horses, at three dollars a day, which was at the rate of a dollar for a quarter of an acre; and I was obliged to consider it as a very great favour that I got it done at all. Myself and my two sons had previously scraped up all the dung we could, and mixed it with earth for a compost, for these turnips: this we had done immediately after the gusts of rain, which always prevented us from hoeing the corn, for they made the land so soft that we could not walk across it, for a day or two, without sinking as deep as the plough had gone, or deeper. Though I had not myself ploughed for some years, I was compelled now to begin again to land the corn; I holding the plough, while one of my sons led the horse betwixt the rows, and my other son harrowed after us, with a small harrow made for that purpose. By this process, though contrary to the general custom of the country, we raised a very fine crop of corn. When the man had ploughed three acres of the turnip-land, I had got harrows made; therefore we harrowed it ourselves, with our own horses. I then wanted a roller, which I was lucky enough to buy,

row, from a gentleman of the name of Bowley, who lived within one mile and a half of us, and with whom I had the honour of an acquaintance, and found him very neighbourly on every occasion; so we got our land in such fine order as was not usual in America. We then employed ourselves in picking up the refuse stuff, by raking the land over with rakes, and burnt it; as it was not yet a proper time to sow turnips; the 10th of August being the time in that country.

"Buck-wheat being a crop very much spoken of, I set off to plough three acres and a half for that purpose. The weather was very hot, and the land dry; so that I found it stiff work. I completed the ploughing, however, and my sons harrowed it, and by these means we got the buck-wheat sown. As soon as this was done, it was time to sow turnips. I then began, with my sons, to drill the land, lead manure, and put in the seed. We could, with very hard work, sow only twenty drills a day; which took five cart-loads of manure, besides having the drills to make, the seed to sow and harrow in, and even all the water to draw out of a well, for our cows and horses, twice a day; for there was no water on the farm but in the well close to the house; so that we had at all times between twenty and thirty head of cattle to fetch out of different pastures, and water there. These employments brought us to the time for mowing our hay.

"I had forgot to mention that we had cocked ten acres of clover and leaved it, among other things, before; and had the good luck to meet with a man to mow it, who gave me a promise to mow the meadow, and bring a partner along with him. His wages were a dollar a day, with his meat and a pint of whisky. He mowed nearly an acre, on some days; on the average about three roods. He having asked for this second job as a favour, and that I would not engage any one else, and the time being appointed, I made myself easy as to getting the meadow mowed; but I never saw him again. When the time came, I began to enquire for mowers. First one set came and took it to do, and then another; and I found there were a set of people who had made it their business to persuade the men who undertook it to disappoint me. Not one came to begin to mow: and I began to think that I must mow it myself, or else lose the hay, which was the only thing of any real value on the farm. At last, with a great deal of trouble and vexation, I got it mowed, with many fresh men, and my sons and myself cocked the hay, and stacked it, and hard work we had! The turnips were ready to hoe at the same time, so that we were pretty full-handed; and it was the general talk that we should kill ourselves; and I really think never three people worked so hard in the world, for the length of time, in such a climate.

"The turnips grew beyond any thing I could expect,

and particularly of Paris. Having part of the clover to Judge Peter's left some lands for purpose, nor near of the clover was perceive to an in had a pound of it it was not sown. Seeing this, I got of the turnips, and when in twenty-five of so much deeper so that any spect which these turnips then sowed another two rows: the turn the plaster of Paris in the increased part where the first two to two where the and a better kind.

"Having got our peaches began to them. My sons and we were fortunate had been one of my employment which cart, drinking which the money they get for us as came to a peace per peck: to them, however, if

and particularly four rows which I did with some plaster of Paris. Having, at the time when I entered, sown a part of the clover also with plaster of Paris, according to Judge Peter's direction, and, by way of experiment, left some lands without any, the plaster answered no good purpose, nor made any other difference than that this part of the clover was of a much finer green, so that one might perceive to an inch how far it went, but I do not think I had a pound of hay more where it was sown than where it was not sown. On the turnips, however, it amazed me. Seeing this, I got a bushel of plaster for some other part of the turnips, and sowed it on a square near to the road; when in twenty-four hours I could discern the crop to be of a much deeper green, and in forty-eight hours so much so that any spectator would have supposed the land on which these turnips grew to be of superior quality. I then sowed another bushel of it on two rows, and missed two rows: the turnips grew to a much greater size where the plaster of Paris was put, than in the rest of the field, in the increased proportion of about two to one in weight where the first two bushels were applied, and about three to two where the last bushel, besides being much juicier, and a better kind.

"Having got our hay stacked, turnips hoed, &c. the peaches began to be ripe, and we wanted a purchaser for them. My sons and myself set to work to pull them, and we were fortunate enough to find a black fellow, who had been one of my mowers, to sell them; this being an employment which they like, viz. riding to market in a cart, drinking whisky, and cheating you out of part of the money they get for the truck. He sold as many peaches for us as came to seventeen pounds, at an average of fourpence per peck: there would have been little profit upon them, however, if we had hired men to pull them.

"As soon as this business was over, the corn began to be ready to be topped and pulled, and the turnips for taking to market; so we kept our black fellow to be our market-man. We had turnips to get ready for market, and the corn to cut, the remaining part of the day. I ventured to cut it up by the roots, and set it up in shocks. This process, the inhabitants told me, would spoil all the corn, both blades and tops; but, as I wanted it chiefly for the cows, I was of a different opinion, which proved to be right. For, having invented a machine for cutting up the stalks, blades, husks, and corn, altogether, it thus made most excellent feed for cows, and not bad for horses: but it did not answer with the pigs, as they will not eat mouldy corn at all, but cows like it better. Had I remained in that country, I should have continued to cut corn for cattle in the same manner, the cows preferring soft corn to the hard; and there was besides less waste in that method than any other. The machine for cutting is the best I ever saw: with the assistance of a person to

fill the box, I could cut enough of that sort of food in two hours to serve twenty-seven head of horses and cows for twenty-four hours.

"About this time, which was in September, four of my family were seized with the yellow fever; so that myself and one of my sons, for about fourteen days, had all the work to do, and to churn, cook our own victuals, and the family to nurse besides—a very distressing situation! The sick part of the family were light-headed; I discovered my wife to have a great desire to come to England again; and I thought that (should God spare them) I would return as soon as I possibly could: but at that time I had not the least notion that it was the yellow fever, or I should have been more alarmed. I was myself their doctor; and the remedy I chiefly used was red port, of which I gave them plenty. The way in which they caught the infection was by suffering a gentleman to put a trunk in the passage of our house: for, the fever then raging very bad at Philadelphia, the mayor of Baltimore ordered all communication to be stopped at the distance of three miles from the city, which was just at the spot where we lived: and the gentleman opening his trunk in the passage, while the children stood looking at him, the next day one of them was taken with the disorder. It is a sleepy complaint, so much so, that the persons afflicted can scarcely be kept awake; therefore my wife desired the child, a girl about nine years of age, to walk in the air: she walked towards a patch of turnips, where she lay down, and fell asleep among them; and, had not her elder brother perceived which way she went, in all probability she would have lost her life; for, it being then in the evening, and the turnip-tops very high, we should never have found her, which is often the case in this disorder. By God's mercy, however, they all recovered in about fourteen days; but it reduced my wife so much, that she never got her strength again while she continued in the country.

"Luckily an Irishman came to ask for work, who had a wife, and we got her into the house; and, though the most drunken woman I ever saw, she proved useful to us. She would rise in the morning, to help to milk, and wash the clothes, and wash dishes, at times, when sober; but she would be drunk for a day or two together. Before that time, we had done every thing ourselves, and afterwards tried several others, but never could find one of any use at all, except this woman, therefore we kept her about twelve months. The man soon brought another Irishman, a very bad fellow; but, having our Indian corn and the buckwheat to get in, the turnips to send to market, and the fruit of a large apple-orchard to pick, we were glad to keep them, bad as they were. I hired a man and his son, and their team of horses, and, with my own waggon and horses, we got our Indian corn harvested, buck-wheat in,

and apples picked. We manured the buck-wheat land, and sowed it with rye; and tried plaster of Paris to dust it with, as lime, when wet, before sowing, but to no effect.

"About this time I bought sixteen cows; thinking our black fellow would do very well for selling the milk, as we could measure it, and he then could not cheat us. But in this I was very much disappointed; for he had so many tricks, in mixing water with the milk, &c. that I was obliged to discharge him from that employment. I then put the Irishman to sell the milk; and he did this very well for fourteen days; for, having been a watchman in the city, he knew every street and house in it, and proved a very useful fellow. At the end of fourteen days, however, he informed me that it was necessary for him to receive his money from the customers weekly: for, his trade increasing, it prevented him from selling so much milk as he might do; saying, once a week he could return round, during the day, and collect the money. I readily agreed to this: but, when we came to settle, in fourteen days afterwards, he was nine pounds in my debt, and unable to give me any account of this deficiency. Having seen him continually intoxicated, I easily guessed what had become of the money; which, however, he honestly worked out. By this time the black fellow and the Irishman nearly killed one of my horses, which had almost frustrated this project of selling milk; but, knowing that nothing else would answer, I put my youngest son to this employment, and he performed it wonderfully well. The cows now increased so much in their milk, by eating cakes, that we had more than he could easily sell; therefore my other son joined his brother. I bought two sulkies, and fixed the milk-churns behind; and then we did famously; had plenty of money from our milk business, and increased our number of cows to twenty.

"I bought nineteen ewes and a tup, to try how sheep would answer. They were very expensive in wintering; for they wanted food, in the same way as horses or cows, for nearly four months, and a house to run into at night. They cost me thirteen shillings and sixpence each: and I sold twelve of the ewes at twenty-one shillings each, after they had reared their lambs; the lambs sold at nineteen shillings each; and the remainder of the ewes at nineteen shillings each. Their wool I sold at three shillings per pound, to more than twenty customers. They paid, on the whole, very well. I discovered among these sheep some of the small-tailed kind, and found them to be more inclined to fatten than many of the others; but, at that time, I had not the least idea of what they descended from, not having seen in England any thing like them, except the Dishley sheep. These came from Holland."

Concerning the other articles of culture, Mr. P. observes, in another part of his work, "I set half an acre

of early potatoes, in drills eighteen inches asunder, with some compost made from the last year's manure; and a very good crop they proved, at the rate of three hundred and sixty bushels per acre, when full-grown.

"Having ploughed the land that was in corn the year before, I next sowed seventeen acres of oats and six acres of barley. It is usual to sow one bushel of barley, oats, &c. per acre; and I was told by an Irishman, my neighbour, that if I sowed more I should reap neither straw nor corn, for he had tried it repeatedly. It, therefore, required no experiment on that head; nor was I inclined to make one, knowing that poor land requires little seed; but, as I am fond of experiments, and I must be doing something new, I got five bushels of barley, and sowed it with one bushel per acre on five acres of the field which had borne the year before as fine Indian corn as I ever saw in the country, though I expected not to be repaid for my trouble; but I had never experienced one bushel of barley per acre, nor had I the least thought how land could be regularly covered to bear so small a produce. The land appeared in as fine order as could be for barley; and I chose, in different parts of the field, the very best of it. It proved, too, a very fine time for sowing the oats and barley, with rains proper for its coming out of the ground; nor did I ever see barley look better, when it came up; and the land being sown with timothy, it altogether made a most beautiful appearance.

"One acre also of the land, which I had manured, and had turnips on the year before, I now sowed with barley and timothy, to see the difference, and to try what the manure would do. This looked as well as the other. Mr. Bowley, my neighbour, came to view the process; and acknowledged he never saw such good farming in the country. 'But that,' he said, 'availed nothing; the land was so poor, that without dung its produce was not worth the cultivation, and dung and labour it would not pay for.' This proved very true. I asked him how many oats I might expect an acre: he said, he never had more than six bushels, and often not so many; but, probably, I might have more. As I cut them for the cows, the straw and corn together, I cannot tell what was the produce: I estimate it at four bushels per acre, which is nearly the average crop of the oats grown about Baltimore.

"My barley I thrashed out; and, on the five acres where no manure had been put, I found that I had one bushel per acre, and of a much worse quality than the seed had been; so that, when all expences were paid, I lost about six dollars per acre; and the rent being also about six dollars per acre, the total loss upon these five acres would be sixty dollars, or twenty-two pounds ten shillings currency. Now by this crop it may be seen, how, when the English farmer strikes largely into farming in America, he may lose his money. The other acre of

barley, which had fourteen bushels, rather better than oats and bad but in the farm, and country.

"The timothy prospered equally; but, whether this plant, I cannot say, thrashed out, the in appearance, as

"After we had and a half for winter was possible, and good dung of the cake, and Indian up together. The nature for that so potatoe-tops to be would be put to eight thousand bushels which would have potatoes, or any thing in the raw state, covered eighteen there, or in any other manner, by adding three loads of good dung the whole to a produce better especially with turnip than any thing else, and the utility to the community that it should be made.

"The produce bushels to the acre and sixpence per America; but the that country to the some potatoes are per bushel, I do not know what I saw in America and sixpence per Philadelphia or New York, and potatoes in Philadelphia, I do not sell for so much. No money, therefore, a gentleman, who, I heard and sixty dollars shillings currency; the planting and taking in Philadelphia made

barley, which had been manured with compost, produced fourteen bushels, and of a much superior quality; being rather better than what I sowed. The land where the oats and bad barley grew was by much the best field in the farm, and was accounted excellent land in that country.

"The timothy, though it came up very fine, did not prosper equally with that sown in the fall of the year; but, whether this was the nature of the climate or of the plant, I cannot say. The rye we harvested; and, when thrashed out, the produce was four bushels per acre, and, in appearance, as good a crop as any in the country.

"After we had sown the oats, I prepared four acres and a half for winter-potatoes, in as correct a manner as was possible, and dunged with twelve thousand bushels of good dung of the cows and horses, made from linseed-cake, and Indian corn-stalks, blades and tops all chopped up together. This, however, I found to be of too hot a nature for that soil; so much so, as to cause some of the potato-tops to burn up and die. Had three loads of mould been put to each load of dung, I am of opinion forty-eight thousand bushels of compost might have been made, which would have produced a much better crop of potatoes, or any thing else, bushel for bushel, than the dung in the raw state. This quantity of compost would have covered eighteen acres of land; and I am certain that there, or in any other country, manure prepared in a proper manner, by adding mould in the above proportion, viz. three loads of good earth to one load of dung, thus bringing the whole to a sort of rich garden-earth, would always produce better crops of any kind. This will be the case especially with turnips, which will thus pay more for labour than any thing I know of, and be of very great utility to the community at large; and, if so, it is desirable that it should be made generally known.

"The produce of the potatoe-crops was one hundred bushels to the acre, which sold at about three shillings and sixpence per bushel. They were good in quality for America; but there are no potatoes equal in flavour in that country to the English, nor so mealy; and, though some potatoes are sold there at seven shillings and sixpence per bushel, I do not think a crop of potatoes, in any market I saw in America, will average more than three shillings and sixpence per bushel, nor even so much in Philadelphia or New York. I heard a Scotchman, who was selling potatoes in Philadelphia market, say, that they did not sell for so much as they cost getting out of the ground. No money, therefore, will be got by that crop. I know a gentleman, who, from correct accounts, lost two hundred and sixty dollars, (which is seventy-seven pounds ten shillings currency,) by eleven acres, short of paying for the planting and taking out of the ground: they were sold in Philadelphia market, and the produce had been great.

50. VOL. I.

"Having got the corn planted, and the potatoes set, I took a tour, of about three hundred miles, into what is termed the Eastern Shore, which lies by the bay-side, called the Peninsula of Chesapeak, to view the crops of wheat, as that is a great wheat-country. I had, been told, this is the best farming country in America; and I think it the best large tract of land I ever saw there, it being not so broken or gullied as all other parts are, though not quite free from that condition.

"I went by way of Annapolis, where I saw some very beautiful Indian corn, intended for roasting ears; and, under it, cucumbers, melons, &c., which made a most beautiful and luxuriant appearance: this was in the month of June. In my way I visited Colonel Mercer, with whom I spent some very pleasant days. He was cradling and reaping his wheat, which he thought very fine, and, in the best parts, calculated to have fifteen bushels on an acre. It being the time at which the wheat is all nearly ripe, I had a proper view of those crops, so as to form a very good idea of the produce; and I think there might be from four to five bushels per acre on an average. I rode out every day about the fields.

"The manner of reaping is cradling by the scythe: I have heard a great deal said of the dexterity of that process; and the accounts are really astonishing. But the cause is, that the crops are so thin and short, that many could not be reaped at all by any other means, except at more expence than they are worth. But where there is any thing like our crops in England, they cannot cradle at all, but are compelled to reap in the same manner as we do. There are always reapers, as well as cradlers, at the same time: and where there is a little stronger wheat, it is cut with the sickle; and some whole fields are thus reaped: the men are, in general, as good reapers as in most parts of England, and mowers too. It is said that a man will cradle five acres per day; but the cause is not the dexterity of the man, but the scanty crop he has to cradle. I mowed my oats and barley, having no cradles: they would not make a swath; therefore, in the straggled manner they fell, they cost as much time and labour in gathering as they were worth. I am of opinion, that many of the English waggons and waggoners would carry the produce of ten acres upon one waggon: and the reader may easily conceive this to be true; for where there is but one bushel per acre, it is only ten bushels of wheat on the waggon.

"Now, from this sort of cropping, according to my calculation of making manure, it will take ten acres or more to make two loads of it; therefore, one hundred acres give only twenty loads, which will only manure two acres of the hundred: so that, from such produce, it will be fifty years before the whole field could be got dunged."

7 E

From these facts and observations, the English reader will be able to form an accurate idea of *American farming!*

*Rivers, Lakes, &c.]* The chief rivers of the United States have already been described in our general description of North-America; but we shall here mention a few of a more confined course, and more particularly belonging to the United territory. That great western boundary the Mississippi, besides the celebrated Ohio, pervading the centre of the United States from east to west, receives many other considerable streams, among which is the Illinois, which waters many extensive and fertile meadows. Some more northern streams, flowing into the Mississippi, are the Wisconsin, the Chipaway, and the St. Croix. The noble stream of the Ohio receives, from the north, the Great and Little Miami, and the Wabash; from the south, the Great Kenhaway, the Kentucky, the Green River, the Cumberland, and the Tennessee; while the country on the west of Georgia is watered by several streams, which run into the Gulf of Mexico.

Of the numerous rivers which flow, on the east, into the Atlantic, may be mentioned the Penobscot, the Kennebec, the Saco, the Merimac, and the Connecticut, a long and distinguished stream, which gives its name to the province; but which yields in length and grandeur to the Hudson River, which, rising from several lakes in the northern parts of New York, flows into the ocean near the city of that name. The River Delaware, which washes Philadelphia, being joined by numerous streams, is more remarkable for its width than for the length of its course. The Susquehanna is distinguished by both these attributes, and, after a long and circuitous course, forms the chief stream that contributes to the Bay of Chesapeak; which also receives the Patowmack and the Fluvanna, or James River. The Patowmack is not only distinguished as the seat of the capital, but also on account of its irruption through the Blue Ridge of the Apalachian Mountains, being first joined by the Shenandoa, a considerable river from the south. The range, however, consists of broken rocks, and the scene yields greatly in sublimity to the passage of the Lauricocha, through the Andes, worn into perpendicular walls, of a stupendous height and length. More to the south the chief rivers flow westward into the Ohio. But the Black Water and Staunton join the Roanoke Inlet; and Pamlico Sound receives a river of the same name. The Pedee, the Santee, the Savannah, and the Altamaha of Georgia, are the other principal rivers of the United States.

Besides the great lakes which form the northern boundary, and which have been already mentioned, there are some considerable ones in the northern parts of the United territory. Those on the west have been little explored. The small lakes called Cedar, Little Winnipeg, and Leech, supply the sources of the Mississippi:

on the east, the most important lake is that of Champlain, rather resembling a wide river, which flows into that of St. Laurence, and supplies an easy communication with Canada. The Champlain is the boundary between the states of New York and Vermont, being in length about seventy-five geographical miles, while the breadth seldom exceeds four or five; and it terminates in a broad river, called Chamby or Richlieu, which falls within the limits of Canada. Lake George, at the southern extremity of Champlain, approaches within a few miles of the Hudson River. Besides many small lakes south-west of the Champlain, there are several other lakes in the same direction, and also in the province of New York, as the Oneida, the Cayuga, the Seneca, &c.

*Forests, Swamps, &c.]* The primeval forests are so numerous throughout the United territory, that none seem to be particularly distinguished. There does not appear to exist, on the whole continent of America, any of those sandy deserts which are so remarkable in Asia and Africa. On the contrary, there is an abundance of water, even in the most torrid regions.

The large tract in the eastern part of Virginia and North Carolina, called the Dismal Swamp, occupies about one hundred and fifty thousand acres; but it is entirely covered with trees, juniper and cypress, on the more moist parts, and, on the drier, with white and red oaks, and a variety of pines. These trees attain a prodigious size; and among them there is often thick brushwood, so as to render the swamp impenetrable, while other forests in North-America are commonly free from underwood. Cattle soon fatten on cane-reeds, and tall rich grass of the vicinity, and are taught to return to the farms of their own accord. In this swampy forest, bears, wolves, deer, and other wild animals, abound. Many parts are so dry as to bear the weight of a horse, while some are overflowed, and others so soft, that a man would sink in them up to his neck. A canal has been led through it; and even in the dry parts water of the colour of brandy, as is supposed from the roots of the junipers, gushed in at the depth of three feet. In the northern part, the timber is an article of trade, while in the southern, rice prospers to some extent; and in the neighbourhood none of those diseases are known, which are so common in other marshy situations.

The appearance of this swamp is that of a vast plain, slightly inclined, the greater elevation being about thirty feet. About the middle is Lake Drummond, which is formed from the drainings of this vast tract of useless land, for centuries undisturbed by man: the lake is crowded with fish, of great size and variety, surrounded by lofty trees: it is unruddled by the wind, and so transparent, that its numberless inhabitants are seen in shoals by those who have resolution and perseverance sufficient to visit them.

During the summer, for several days, the timber, and dead branches of trees, collected of the new canes, branches of trees, planter often suffer flagration passing much damage, of the woods, &c.

On the northern extent, called Cape, occur in the soil. *Natural Curiosity.* Patowmack through common features follow:—

In Vermont the rocks, about two miles from the River Connecticut, are stactalitic, hundred and four feet in diameter, twenty feet in height, circular hall at the top, boils up a deep blue Hill, New Hampshire near Durham is easily moved with the setts, called Hudson, in manner a large rock, the small sandy Race Point, has

During the summer of 1806, a tremendous fire raged for several days in the Dismal Swamp, consuming the timber, and destroying large quantities of staves and shingles, collected for sale. For many miles, the navigation of the new canal was stopped by monstrous half-burnt branches of trees falling against it. In clearing land, the planter often sets fire to the wood; sometimes the conflagration passes the intended limit, and is productive of much damage, threatening, from the extent and thickness of the woods, destruction to the adjacent country.

On the north-east of the Chesapeak is another of great extent, called Cedar Swamp; and some other large swamps occur in the southern states.

*Natural Curiosities.*] Besides the irruption of the River Patowmak through the Blue Mountains, the principal uncommon features of nature in the United States are as follow:—

In Vermont there is a remarkable impendent ledge of rocks, about two hundred feet high, on the west bank of the River Connecticut; and in the same province is a curious stalactitic cave, in which, after a descent of one hundred and four feet, there opens a spacious room, about twenty feet in breadth and one hundred in length, with a circular hall at the farther end, at the bottom of which boils up a deep spring of clear water. In Rattle-snake Hill, New Hampshire, is also a stalactitic cave; and near Durham is a rock, so poised on another as to be easily moved with one finger. The rivulet in Massachusetts, called Hudson's Brook, has excavated in a singular manner a large rock of white marble. Morse says, that the small sandy desert, about five miles in length, near Race Point, has overwhelmed a forest of trees.

In Connecticut is a cave, which was for some time the retreat of Whaley and Goffe, two of the judges of Charles I.; and in the town of Pomfret is another, rendered remarkable by a humorous adventure of General Putnam. This cave has been described, and the story narrated, by Colonel Humphreys, to whom we are indebted for the following particulars.

"Some time after Mr. Putnam had removed to Connecticut, the wolves, which were then very numerous, broke into his sheep-fold, and killed seventy fine sheep and goats, besides worrying several lambs and kids. This dreadful havoc was committed by a she-wolf, which, with her annual whelps, had for several years infested the neighbourhood. The whelps were commonly destroyed by the vigilance of the hunters; but the old one was too sagacious to come within reach of gun-shot; and, upon being closely pursued, she would generally fly to the western woods, and return the next winter with another litter of whelps.

"This animal, at length, became such an intolerable nuisance, that Mr. Putnam and five of his neighbours

agreed to hunt alternately, until they could destroy her; and two of them, in rotation, were to be constantly in pursuit. It was known that, having lost the toes from one foot by a steel-trap, she made one track shorter than the other. By this vestige, the pursuers recognised, in a light snow, the route of the wolf. Having followed her to Connecticut River, and found she had turned back toward Pomfret, they immediately returned, and by ten o'clock next morning the blood-hounds had driven her into a cave about three miles distant from Mr. Putnam's house. The people soon assembled with dogs, guns, straw, fire, and sulphur, to attack their common enemy. and several attempts were made to dislodge her from the den; but the hounds came back wounded and intimidated; and neither the smoke of blazing straw, nor the fumes of burnt brimstone could compel her to quit her retirement.

"Wearied with these fruitless attempts, which had continued nearly twelve hours, Mr. Putnam proposed to his negro-servant to go down into the cavern, and shoot the wolf; and, on his declining the hazardous service, the general resolved himself to destroy the ferocious animal, lest she should escape through some unknown fissure of the rock. Accordingly, having provided himself with several strips of birch-bark, to light him in this darksome cave, he pulled off his coat and waistcoat, and, having a long rope fastened round his legs, by which he might be drawn back at a concerted signal, he entered head-foremost, with a blazing torch in his hand.

"The aperture of the cave, on the east side of a high ledge of rocks, is about two feet square: from thence it descends obliquely fifteen feet, and then running horizontally about ten more, it ascends gradually sixteen feet towards its termination. The sides of this cavity consist of smooth solid rocks, which seem to have been divided from each other by an earthquake. The top and bottom are also composed of stone, and the entrance, in winter, being covered with ice, is extremely slippery. It is in no place high enough for a man to raise himself upright, nor in any part more than three feet broad.

"Mr. Putnam having groped his passage to the horizontal part of the cavern, the most terrifying darkness appeared in front of the dim circle of light afforded by his torch; and all was silent, as the house of death. Cautionally proceeding onward, Mr. Putnam came to the ascent, which he slowly mounted on his hands and knees, till he discovered the glaring eye-balls of the wolf, who was sitting at the extremity of the den. Startled at the sight of fire, she gnashed her teeth, and gave a sudden growl; upon which the general kicked the rope, as a signal for pulling him out. The people at the mouth of the cave, hearing the growling of the wolf, and imagining their friend to be in the most imminent danger, drew him out with such celerity, that his shirt was stripped over his

head, and his skin severely lacerated. However, he boldly persisted in his resolution, and, having adjusted his clothes, and loaded his gun with buck-shot, he descended a second time. On his second approach, the wolf assumed a very fierce and terrible countenance, howling, rolling her eyes, snapping her teeth, and dropping her head between her legs; but, when she was on the very point of springing on him, Mr. Putnam fired at her head, and was immediately drawn out of the cave. After refreshing himself, and permitting the smoke to dissipate, he went down again, and, on applying his torch to the animal's nose, found her dead; then, taking hold of her ears, and kicking the rope, he drew her forth, to the astonishment of the admiring spectators."

¶ The greatest curiosities in the territory of Virginia are two natural bridges, which may be ranked among the most sublime works of nature in America. Rock-bridge has been described, some years ago, by Mr. Weld, in the account of his travels through the United States. The natural bridge, over a stream running from Stork Creek, which rises in Clinch Mountain, in the western part of this state, is far more stupendous. It is three hundred and thirty-nine feet in height, while Rock-bridge, according to Mr. Weld, is only two hundred and thirteen; but, from recent observations, the other exceeds it by one hundred and thirty-four feet. Its summit is described to project eighty-seven feet over its base, fronting the south-west, and to be arched as regularly as if formed by the hand of art.

The arch in front is about two hundred feet high, and slopes off to sixty feet, at the distance of one hundred and six feet from the entrance. From its mouth, in a straight direction, it measures four hundred and six feet; thence, at right angles, three hundred feet. The roof is regularly arched, and gradually descends to eighteen feet, which is the lowest part at the intersection of the second angle: it then rises to twenty, thirty, forty, and seventy-five feet, which is the height of the north-east entrance. The stream of water is from forty to fifty yards wide, at its common height; but it is sometimes suddenly swelled by rains to ten or twelve feet perpendicular. The approach to the south-west front is of a solid rock of lime-stone; the surface very smooth and regular, formed in a semi-circle; the rock of a bright yellow colour. The arch is partly obscured by a spur of the ridge which runs down the edge of the creek. Across the creek are several lofty trees, which add to the beauty of the scene. The view from the verge fills the mind with horror. From the level of the summit of the ridge, where the road passes, to the verge of the fissure, the mountain descends about forty-five degrees of an angle, and is from forty-five to fifty feet in perpendicular height. The rock is covered with a rich stratum of earth, which gives growth to many large trees.

To the west of the arch, about four hundred yards, the ascent to the verge is much more level.

In the province of New York, a rivulet runs under a hill, about seventy yards in diameter, forming a beautiful arch in the rock; and there is a stalactitic cave, in which was found the petrified skeleton of a large snake. In Pennsylvania, there are also some remarkable eaves, one of which resembles a church, with pillars and monuments. In the territory on the north-west of the Ohio, the savannas, or rich plains, extend for thirty or forty miles without any tree; they are crowded with deer, wild cattle, and turkeys, and often visited by bears and wolves; but this district is chiefly remarkable for a number of old forts, of an oblong form, with an adjoining tumulus, or tomb. As the Mexicans have a tradition that they passed from the north, these forts may probably be remains of their first residence, or of some nation which they subdued.

In the western part of Maryland there are said to be some remarkable eaves; and others occur in Virginia, particularly that called Maddison's Cave, on the north-west side of the Blue Ridge. It is in a hill of about two hundred feet high, the ascent of which, on one side, is so steep, that a biseuit may be pitched from its summit into the river which washes its base; and the entrance is in this side, about two-thirds of the way up. "It extends," says Mr. Jefferson, "about three hundred feet into the earth, branching into subordinate caverns, sometimes ascending a little, but more generally descending, and, at length, terminates, in two different places, at basins of water, of unknown extent, and which I should judge to be nearly on a level with the water of the river: however, I do not think they were formed by reflux water from that, because they are never turbid; because they do not rise and fall in correspondence with that in times of flood or of drought; and because the water is always cool. It is, probably, one of the numerous reservoirs with which the interior parts of the earth are supposed to abound, and which yield supplies to the fountains of waters, distinguished only by its being accessible. The vault of this cave is of solid lime-stone, from twenty to fifty feet high, through which water is continually percolating. This, trickling down the sides of the cave, has incrustated them over in the form of elegant drapery; and, dripping from the top of the vault, generates on that, and on the base below, stalactites of a conical form, some of which have united, and formed massive columns."

At a place called the Panther-gap in Virginia, is what is called the Blowing Cave, which is of about a hundred feet in diameter, and constantly emits a current of air, with such force as to keep the weeds prostrate to the distance of twenty yards before it: this current is strongest in dry frosty weather; and in long storms of rain weakest. There is another blowing cave in the Cumberland Mountain; but

all that is known of this is, that it is inconstant, and that a fountain of water issues from it.

A curiosity near the town of Winchester, highly worthy of attention, is a natural bridge of rock, that extends across a cleft in a mountain, which has been completely torn asunder by some great convulsion of nature. The length of this chasm is about two miles, and its depth, in several places, is upwards of three hundred feet. The arch is composed of several stones, so firmly united together, that they resemble an entire mass. It is supposed that this curious bridge was drawn across at the time of the mountain's disruption, by being loosened from its bed of earth on one side, and adhering obstinately to the other. Nor is it, indeed, more wonderful, that the arch should have been thus forcibly drawn over the fissure, than that the eminence should have remained disunited, from top to bottom, at this one spot, and that a passage should have been subsequently forced through it by water.

Proceeding through a deep wood, and ascending a hill, the traveller, who finds himself near the summit, and observes a sudden discontinuance of the trees on one side, is induced to make a pause; but when, in the space of a few moments, he finds himself on the edge of a terrific precipice, he is perfectly astonished, and is scarcely able to believe that the surrounding scenery is not the illusion of a disordered imagination. He now discovers himself to be on the top of the bridge, whence he may look down, on one side, over a protecting parapet of rock, into the tremendous abyss. The opposite side, however, has no such natural defence; but a gradual slope descends from the road that traverses the bridge to the very edge of the cleft, which is described as a perilous station. This declivity is covered with pines and cedars, as was formerly the case with the other side; but the trees, which grew within reach, have been successively cut down by visitors to the rock, who were desirous of seeing them fall to the bottom. The road already mentioned runs across the bridge, nearly in the centre, and is constantly frequented by waggons. A few yards distant is a narrow serpentine path, that leads through a varied scene of trees and rocks, to the bottom of the bridge, from which the stupendous arch is seen to advantage, and actually seems to touch the skies. The height of the bridge is two hundred and nineteen feet, the thickness of the arch forty, the width at the top ninety, and the space between the abutments at the bottom fifty feet. The abutments on either side consist of a solid mass of lime-stone, and appear, together with the arch, to have been formed by the labours of art. A rivulet, murmuring over a rocky bed, at the base of the fissure, is no small embellishment to the scene; and, indeed, it is impossible for any person of taste or sentiment to survey the whole without the enthusiasm of admiration.

50. VOL. I.

Another advantageous prospect of the rock-bridge may be had from an eminence about fifty feet lower than the top of the chasm; as from this station the spectator, at once beholds the arch in all its majesty, and forms a proper idea of its grandeur, from casting his eyes occasionally downwards to the profound abyss that lies beneath.

*Minerals and Mineral Waters.*] Gold has been found in considerable quantities in the county of Cabarrus, in the state of North Carolina, inasmuch that, of the gold coinage of 1804, about eleven thousand dollars in value were the produce of virgin metal from that country.

The ore found in North Carolina was on the estate of Mr. John Read, a native of Hesse Cassel, in Germany. It appears that the children of this gentleman, having been fishing in the creek, were attracted by the shining metal, and brought home several pieces, as a curiosity, totally ignorant of their real value. On being tried, the ore was found to contain gold of a very pure quality. Since this discovery they have picked up daily from one hundred to one hundred and twenty pennyweights; but Mr. Read himself found a lump of the ore weighing twenty-eight pounds, which, it was supposed, when fluxed, would be worth one thousand four hundred pounds sterling. At the mint it was regretted that the gold had been melted into very small ingots, for the convenience of carriage, it being many hundred miles from Cabarrus to Philadelphia. Thus a considerable portion of it was wasted. The finest particles yet remained, the large lumps alone being sought after.

In consequence of these promising appearances, a company has been formed for the purpose of exploring the lands, supposed to possess the largest portion of these natural treasures. It is entitled the North Carolina Gold Company, and has purchased thirty-five thousand acres for one hundred and ten thousand dollars. An agent, Mr. W. Thornton, was sent, in the summer of 1806, by the company to visit these lands, and, from the success of his experiments, he reports very favourably of the probable productiveness of the speculation. From his account the following particulars are extracted:

"The season of 1806 was one of the most unfavourable that could have been selected for examining the runs of gold, as they were all dry, so that it was necessary to carry the sand and gravel sometimes above a mile before water could be found. Some fine specimens were thus obtained, one of about two pennyweights, and some smaller; but, after obtaining about twenty dollars worth, the want of water to wash for more obliged us to desist. While thus engaged in the lands adjoining to the mine of Mr. Read, one of the proprietors of that concern observed, that he thought the prospect of the company as good as their own. Mr. Read and his partners possess about four hundred acres, and they are said to have ob-

tained already, from this small place, between thirty and forty thousand dollars worth of gold. That found on the company's land requires no purification."

Mr. Thornton visited Mr. Read's mine, and found that, by amalgamation with quicksilver, a great quantity of gold is obtained from the sand, after picking out all the lump-gold. He was informed, that they obtained about six or seven ounces at a distillation, several times a week, from a very small still. He afterwards visited the mines of Mrs. Parker and Mr. Harris. They lie in a hill that intersects the company's land. Mr. Harris, in ploughing across a small branch in his land, turned up a good-sized piece of gold. Having no regular weights, he tried it in a pair of scales against a pewter plate and spoon, which it outweighed. He then searched the run, and was successful in finding gold. This little branch runs immediately into the company's land, lying between it and Mrs. Parker's. But, as it was dry, Mr. Thornton made no search in it, nor in any of the branches on that side, though he was informed, that gold had been found in several.

Mrs. Parker's mine was discovered in a very unexpected manner. Hearing of several discoveries, she said, in a joking manner, to some company, while drinking tea with her, "I wish, gentlemen, any of you could find a gold-mine in my land;" on which one of the company replied, "I will go, madam, and search for you." He went, and in a little time returned with a very good specimen. After this, they found six hundred dollars worth, and, in the season of 1806, three hundred more, though they had not yet prepared any apparatus for even washing the gravel and sand.

At Philipsburgh, in New York, there is said to be a silver-mine, producing that metal in a virgin state; but, as no specimens are known to be extant, it is possible that this is only a vague report. It is also said that a lump of gold-ore was found near the falls of the river Rappahannoc, in Virginia, probably rolled down from its source, or that of some tributary rivulet.

Copper-ore is said to appear in Massachusetts; and in New Jersey a rich copper-mine was long wrought, pretended to have been discovered by a flame visible in the night, like one of the gold-mines in Hungary. Native copper is found on the River Tonawaga, which runs into Lake Superior.

Lead has been met with on the banks of the River Connecticut, two miles from Middleton, and is even said to have been worked, but abandoned on account of the expence. Some say it may be found in the province of New York. There is a considerable vein of lead-ore in the Shawangunk Mountains, in New Hampshire, which appears to be accompanied with manganese.

The lead-mines in Upper Louisiana have, according to

the president's message in 1804, continued profitable for several years. That called Burton's Mine is thirty-eight miles to the west-north-west of St. Genevieve, where the mineral is supposed to extend over two thousand acres of land, and is of two kinds, gravel and fossil. "The gravel-mineral is found immediately under the soil, intermixed with gravel, in pieces from one to fifty pounds weight of solid mineral. After passing through the gravel, which is commonly from three to four feet, is found a sand-rock, which is easily broken up with a pick, and, when exposed to the air, crumbles to a fine sand. This rock also continues five or six feet, and contains mineral nearly of the same quality as the gravel: but mineral of the first quality is found in a bed of red clay, under the sand-rock, in pieces from ten to five hundred pounds weight, on the outside of which is a white, gold, or silver-coloured fossil, of a bright glittering appearance, as solid as the mineral itself, and in weight as three to two; this being taken off, the mineral is solid, unconnected with any other substance, of a broad grain, and what mineralogists call potter's-ore. When it is smelted in a common smelting-furnace it produces sixty per cent., and when again smelted in a slag-furnace, produces fifteen per cent. more; making, cleanly smelted, seventy-five per cent. The gravel-mineral is incrustated with a dead grey substance, the eighth of an inch in thickness, has small veins of sulphur through it, and will not produce more than sixty per cent, when cleanly smelted."

There are other mines, about thirty miles to the south-west of St. Genevieve, where the lead is found in regular veins, from two to four feet in thickness, containing about fifty ounces of silver in the ton; but at the depth of twenty-five feet the operations are impeded by water. The mineral tract is here very rich and extensive, and the present produce is computed at more than forty thousand dollars annually. Before the cession of Louisiana, in 1803, they were wrought by the French, but in an inefficient manner. In Virginia there are said to be lead-mines, which yield from fifty to eighty pounds from one hundred of ore. This metal is also said to occur in South Carolina. Iron and coal are found in some quantity. In the district of Maine the founderies are supplied with bog-ore; and another kind is got in great abundance in Massachusetts, where there are considerable manufactures. There is one mine near Boston, of which the ore has a vitreous appearance, and is slightly magnetic; there are also mines of iron in Rhode Island, the Middle States, South Carolina, and Pennsylvania.

Dr. Morse observes, that iron-ore, in immense quantities, is found in various parts of Massachusetts, particularly in the old colony of Plymouth, in the towns of Middleborough, Bridgewater, Taunton, Attleborough, Stoughton, and the towns in that neighbourhood, which have, in

immense quantities, particularly in the towns of Middletown, Stoughton, which have, in

consequence, become the seat of the iron manufactures. The slitting-mills in this district, it is said, annually slit six hundred tons of irons; and one company has been formed, which will annually manufacture into nails, of a quality equal to those imported, five hundred tons of iron. The number of spikes and nails made in this state is supposed now to be twice as large as that made in 1788, and will probably soon preclude all foreign importations.

The iron-works on the river Patuxent, twelve miles from Providence, in Rhode Island, are supplied with ore from a bed four miles and a half distant, in a valley pervaded by a rivulet. A new channel has been formed for the water, and the pits are cleared by a steam-engine. There are also many iron-works in Maryland.

Coal has been discovered in great abundance on both sides of James River, and is said to have been first observed by a boy in quest of cray-fish. This mineral also abounds towards the Mississippi and Ohio; that of Pittsburgh being of a superior quality, but it is chiefly worked in Virginia, where the beds seem very extensive. In 1804, a coal-mine was discovered on the river Juniata, twenty-five miles to the west of Huntingdon, in Pennsylvania, and of course near the Apalachian mountains, which is now worked with considerable advantage. The bed of coal is horizontal, and upwards of ten feet thick. The price at the mine is seven or eight cents per bushel, and there is an easy water-carriage to Columbia. In Virginia a bed of coal, about twenty-four feet thick, has been found to rest on granite.

Black-lead, aluminous slate, and asbestos, are said to be found in Massachusetts. Zinc appears in Connecticut and New York; gypsum is met with in New York, and lime-stone and marble are found near James River, while a long bed of the former passes through North Carolina.

Talc is found in Pennsylvania and New York, and appears in New Hampshire, adhering to rocks of white or yellow quartz. The largest layers are met with in a mountain some miles to the east of Dartmouth College. Amethysts, or violet-coloured crystals, are found in Virginia; emeralds are also said to exist near Philadelphia. The diamonds of South Carolina are mere crystals of quartz. In Georgia there has been no mineralogical discovery worthy of mention, and, since the acquisition of Louisiana, there has been no opportunity of exploring that portion of territory, though it is understood to contain some mines of lead and iron, and even some appearances of silver, towards the Rio Colorado, or Red River.

*Mineral Waters.*] There are several mineral waters in different provinces of the United States, but none equal to those of Bath or Aix-la-Chapelle. In the province of Vermont, or the Green Mountain, there is a remarkable sulphureous spring, which dries up in two or three years, and bursts out in another place.

At Stafford, in Connecticut, is a medicinal spring, which is said to be a sovereign remedy for scorbutic and cutaneous disorders: and at Guildford, in the same state, there is another spring, whose water is of so curious a nature, that, upon being taken from the fountain, it will evaporate, even though put into a bottle, and tightly corked.

The most noted springs in the country of New York are those of Saratoga. They are eight or nine in number, and situated in the margin of a marsh, about twelve miles from the confluence of Fish Creek and Hudson's River. They are surrounded by rocks of a peculiar nature, formed by the petrification of the water. One of them, however, more particularly attracts the attention, as it rises above the surface of the earth five or six feet, in the form of a pyramid. The aperture in the top, which discovers the water, is perfectly cylindrical, and about nine inches in diameter. In this the water is about twelve inches below the top, except at the time of its annual discharge, which is commonly in the beginning of summer. At all times it appears to be in as great agitation as if boiling in a pot, although it is extremely cold. The same appearances are observable in the other springs, except that the surrounding rocks are of different figures, and the water flows regularly from them.

From repeated observations and experiments, the principal impregnation of these waters has been found to be a fossile acid, which is predominant in the taste. They are also strongly impregnated with a saline substance, which is very discernible in the taste and smell of the petrified matter about them. From the corrosive and dissolving nature of the acid, the water acquires a chalybeate property, and receives into its composition a portion of calcareous earth, which, when separated, resembles an impure magnesia. As the different springs have no essential variety in the nature of their waters, but the proportions of the chalybeate impregnation, it is highly probable that they originate in one common source, but flow in separate channels, where they have a connection with metallic bodies, in greater or less proportions.

The prodigious quantity of air contained in this water produces the fermentation and violent action already noticed; for, after standing a small time in an open vessel, the air escapes, becomes rapid, and loses all that life and pungency which distinguish it when first taken from the fountain. The particles of dissolved earth are deposited as the water flows off, which, with the combination of the salts and fixed air, concrete, and form the rocks about the springs.

The effects produced by this water upon the human body are various; the natural operation of it, however, is cathartic, and in some instances it acts as an emetic. As it is drank, it produces a very agreeable sensation in the mouth, but it is no sooner swallowed than it is succeeded by an

unpleasant taste, and some pungent eructations, similar to those produced by a draught of cider, in a state of fermentation.

Several curious experiments having been made on these waters, we shall take the liberty to present our readers with the following, extracted from Dr. Mitchell's Journal:—

"A young turkey, held a few inches above the water, in the crater of the lower spring, was thrown into convulsions in less than half a minute, and exhibited evident signs of approaching death; but, on removal and exposure to the fresh air, it revived and became lively. On immersion again for a minute in the gas, the bird was taken out languid and motionless.

"A small dog, put into the same cavity, and compelled to breathe the contained air, was, in less than a minute, thrown into convulsive motions, and soon after lost the power to cry or move; but, when taken out and exposed to the fresh air, he began to revive, and soon acquired strength enough to stagger from the place.

"A trout, recently caught, and briskly swimming in a pail of brook-water, was carefully put into a vessel just filled from the spring: the fish was immediately agitated with strong convulsions, gradually lost the power to move or poise itself, and in a few minutes expired.

"A candle, repeatedly lighted, and let down near the surface of the water, was instantaneously extinguished, and not a vestige of fire remained about the wick.

"In addition to these experiments, it is said that a bottle, filled with the water, and shaken, emits a considerable quantity of aerial matter, that either forces out the cork, or bursts the vessel. Wheaten flour, also, when moistened with this water, and made into dough, will rise, with a proper application of heat, into light spongy bread, without the aid of yeast or leaven; from which circumstances it appears, that the air extricated from the water is precisely similar to that produced by ordinary fermentation.

"We are likewise informed, that some lime-water, made of abalactiles brought from a subterranean cave at Rhinebec, became immediately turbid on mixture with the spring-water; but when the water had been recently drawn, the precipitate was speedily re-dissolved. Some of the rock surrounding the spring, on being thrown into a fire, calcined to quick-lime, and slacked very well; and it has been frequently observed, that, on the evaporation of the aerial, the water has lost its transparency, and deposited a calcareous sediment: whence it appears that the gas is aerial acid, that the rock is lime-stone, and that by means of the former the water becomes capable of dissolving and conveying the latter."

In the county of Morris, in New Jersey, is a cold mineral-spring, much frequented by valetudinarians, and used

with considerable success: and in the township of Hanover, in this county, on a ridge of hills, are a number of wells, which regularly ebb and flow about six feet, twice in every twenty-four hours. These wells are nearly forty miles from the sea, in a straight line.

In the county of Cape May, in the same state, is a spring of fresh-water, which boils up from the bottom of a salt-water creek, which runs nearly dry at low tide; but at flood tide is covered with water directly from the ocean to the depth of three or four feet: yet in this situation, by letting down a bottle well corked, through the salt-water into the spring, and immediately drawing the cork with a string prepared for that purpose, it may be drawn up full of pure fresh-water.

In the county of Hunterdon, near the summit of the Muskonetkony mountain, is a noted medicinal spring, to which invalids resort from every quarter. It issues from the side of the mountain in a very romantic manner, and is conveyed into an artificial reservoir for the accommodation of those who wish to bathe. This water is a strong chalybeate, and has been sometimes used with great success.

There are several medicinal springs in Virginia, some of which are indubitably efficacious, while others may probably owe their reputation as much to fancy and change of air, as to their real virtues. However, as none of them have undergone a chemical analysis in skilful hands, nor been so far the subject of observations as to have produced a classification of the disorders they relieve, we can give little more than an enumeration of them.

The most efficacious of these, according to Mr. Jefferson, are two springs in Augusta, near the sources of James River, where it is called Jackson's River. The one is distinguished by the name of the Warm Spring, and the other of the Hot Spring. The Warm Spring issues with a very bold stream, sufficient to turn a great mill, and to keep the waters of its basin, which is thirty feet in diameter, at the vital warmth, or ninety-six degrees of Fahrenheit's thermometer. The matter with which these waters is allied appears to be very volatile; and, from its smell, and the circumstance of its turning silver black, it is evidently sulphureous.

The Hot Spring, situated about six miles from the former, is much smaller, and raises the mercury in Fahrenheit's thermometer to one hundred and twelve degrees, which is fever-heat. A fountain of common water, issuing within a few inches of its margin, gives it a very singular appearance. These springs are much resorted to, notwithstanding a total want of accommodations for invalids. Their waters are strongest in the hottest months, which occasions their being visited principally in July and August.

The sweet springs are situated in the county of Botetourt, at the eastern foot of the Alleghary mountains.

Having been found to relieve cases in which the above-mentioned springs have been ineffectually tried, their composition is supposed to be different. They differ also in their temperature, being as cold as common water.

On the Patowmac River, in Berkely county, are some medicinal springs, much more frequented than those of Augusta; but their waters are weakly mineralized, and scarcely warm. It is probable that many invalids prefer these springs to those of Augusta, as being situated in a fertile and populous country, perfectly secure from the Indians, and well provided with accommodations.

In the low grounds of the great Kanaway, seven miles above the efflux of Elk River, is a large hole in the earth, from which incessantly issues a bituminous vapour, in so strong a current as to give to the sand about its orifice the motion which it has in a boiling spring. On presenting a lighted torch or candle within eighteen inches of the aperture, the vapour flames up in a column of eighteen inches diameter and four feet in height, which sometimes burns out within twenty minutes, and, at other times, has been known to continue for upwards of three days. The flame is unsteady, and of the same density with that of burning spirits, and smells like burning pit-coal. Water sometimes collects in the basin, which is remarkably cold, and is kept in ebullition by the vapour issuing through it; and it is a singular fact, that, if the vapour be fired in this state, the water becomes hot, and evaporates in a very short time.

"The mention of uncommon springs," says Mr. Jefferson, "leads to that of Syphon fountains. There is one of these near the intersection of Lord Fairfax's boundary with the north mountain, not far from Brook's Gap, on the stream of which is a grist-mill, that grinds two bushels of grain at every flood of the spring. There is another near the Cow-pasture River, and about sixteen miles from the Hot Springs, which intermits once in every twelve hours.

"After these may be mentioned the Natural Well in Frederick county. It is somewhat larger than a common well: the water rises in it as near the surface of the earth as in the neighbouring artificial wells; and its depth is unknown. It is said, there is a current in it, tending sensibly downwards. If this be true, it probably feeds some fountain of which it is the natural reservoir, distinguished from others, like that of Madison's Cave, by being accessible. It is used with a bucket and windlass, as an ordinary well."

There are five noted licks or salt-springs in Kentucky, viz. the higher and lower Blue Springs on Licking River, from which issue streams of brinish water; the Big Bone Lick, Drenon's Lick, and Bullet's Lick, at Saltsburgh. The last of these springs has supplied Kentucky and Cumberland with salt, at twenty shillings per bushel, Vir-

ginia currency; and some is exported to the Illinois country. The method of procuring water from these licks is by sinking wells from thirty to forty feet deep; and the water thus drawn is more strongly impregnated with salt than the water from the sea.

Springs that emit sulphureous matter have been found in several parts of Kentucky. One is near a salt-spring in the vicinity of Boonsborough; and there are three springs of bitumen near Green River, which empty themselves into a common reservoir, and, when used in lamps, answer all the purposes of the best oil. It is said, that a man, near Lexington, having dug about six feet below the surface of the earth, came to a large flat stone, under which was a well of common depth, regularly and artificially formed.

In the county of Wilkes, in Georgia, is a medicinal spring, which rises from a hollow tree, about five feet in length. The inside of the tree is covered with a coat of nitre, an inch thick; and the leaves round the spring are encrusted with a substance as white as snow. The water is said to be a sovereign remedy for the scurvy, gout, consumption, and every other disease arising from humours in the blood. A person, who had a severe rheumatism in his arm, having, in the space of ten minutes, drank two quarts of the water, experienced a momentary chill, and was then thrown into a perspiration, which, in a few hours, left him entirely free from pain, and in perfect health.

This spring, being situated in a fine healthy part of the state, where there are excellent accommodations, proves a pleasant and salutary place of resort for invalids from the maritime and unhealthy parts of this and the neighbouring states.

*Vegetable Productions.*] In a country that experiences, on one frontier, all the severity of winter, and, on the other, enjoys the full radiance of the West-Indian summers, we may naturally expect no small variety of native plants. So numerous and important, indeed, are they, as to render it impossible, in a work not wholly devoted to the subject, to give them particular notice; we shall, therefore, select such as, from their utility and beauty, have the strongest claims to attention.

The maple-tree, which grows in low and rich lands, furnishes a quantity of sweet juice, from which is extracted sugar, although, in some measure, inferior to that obtained from the cane. In the months of February and March, the inhabitants of Louisiana, and the western states of America, reap this profitable harvest. As soon as the rays of the sun have acquired sufficient force to penetrate the earth, the sap circulates in the maple in such abundance, that it would force an outlet, if one was neglected to be made. From this flows a liquor, which, being collected by travellers, gave rise to the opinion that

it contained something more than the common sap of plants. Experiments soon discovered its utility: the following is the mode of preparing the sugar, as described by Du Lac:

"As soon as the winter has given place to a milder season, the inhabitants, that wish to obtain sugar, transport their families to the woods; and there erect cottages. Their first care is to provide themselves with troughs, afterwards they pierce each tree with an auger of about half an inch in diameter. Some require to be pierced in six places, others only in two. When the season is favourable, that is to say, when cold nights succeed fine days, the maples fill the holes so pierced three times in twenty-four hours with a juice very strongly impregnated with sugar; but when, on the contrary, the weather is rainy, it loses in quality and quantity. When enough is collected, it is placed in a pot over a fire, and evaporated. The residue forms a pleasant syrup, which has been employed with success at Paris, for colds, &c."

Michaux states, that the sugar extracted from the maple is of as dark a colour as that of clayed sugar after the first baking; it is sold in loaves of six, eight, and ten pounds, at the rate of about seven-pence per pound. The inhabitants manufacture it only for their own consumption: most of them take tea and coffee every day, but they only use that sugar which is obtained by the first evaporation of the sap, as, on account of the great expence which would attend the process, no person is employed in refining it.

Of the common herbaceous plants and shrubs, which are known to the generality of readers, from their introduction into the gardens of Great Britain, are the collinsonia, used by the Indians against the bite of the rattlesnake, the lobelia cardinalis, the thorn-apple, the Pennsylvanian lily and golden martagon, the biennial oenothera, with many species of aster, monarda, and rudbeckia.

The mountainous ridges are not sufficiently high to be rich in alpine plants; their climate, however, is sensibly cooler than that of the plains, on which account those of the south are inhabited by the vegetables of Pennsylvania and the northern states; while the highlands of these abound in the plants of Canada. But the most beautiful flower-plants are principally confined to Virginia and the southern states; where the unfolding verdure of the wide savannas, the magnificence of the primeval forests, and the wild exuberance of the swamps, offer to the botanist every thing that, by colour, by fragrance, and by form, can fix his attention.

Of the vegetables that inhabit the low shores of the Floridas, Georgia, and South Carolina, the mangrove-tree, the only shrubby plant that can flourish in salt-water, and the fragrant and snowy-flowered pancratium of Carolina, are alone worth of notice.

Those low ridges of calcareous soil running parallel with the rivers, and rising from the level savannas into extensive lawns and high hills, are generally covered with woods, except where they have been converted into tillage. In these rich tracts grow the lofty palmetto, the evergreen oak, the sweet bay, the common laurel, the broom-pine, and the red cedar. The straight silvery columns of the papaw-sig, rising to the height of twenty feet, and crowned by a canopy of broad sinuated leaves, form a striking feature in this scenery; while the fruit and fragrant blossoms of the orange, first introduced by the Spanish settlers, and now completely naturalized here, remind one of the ancient traditions of the groves of the Hesperides. The magnificence of the great magnolia is, however, superior to all the rest: in this rich soil it rises above one hundred feet, with a perfectly erect trunk, supporting a shady conical head of dark green foliage: from the centre of the coronets of leaves that terminate the branches expands a large rose-shaped blossom of pure white, which is succeeded by a crimson cone, containing the seeds of a beautiful coral-red colour, and these, falling from their cells, remain for several days suspended from the seed-vessel by a silky thread, about six inches in length.

The trees that grow upon the savannas are of the aquatic kind, such as magnolia glauca, or beaver-tree, American olive, and Gordonia lasianthus, covered with silvery fragrant blossoms: these are generally either single, or grouped into small open groves, while the larger part of the meadow is overgrown with long succulent herbage, intermixed with shrubs and plants; the candleberry myrtle, with numerous species of kalmias, andromedas, and rhododendrons, in thickets and shrubberies, over-arched by the crimson granadilla, or the clitoria, also display their beauties and luxuriance. The sides of the pools are adorned by the bright cerulean flowers of the ixir, the golden blossoms of the canna-lutea, and the rosy bunches of the hydrangia; while the edges of the groves, and the boundaries of the savannas, rising imperceptibly towards the forests, are fringed by innumerable varieties of the sensitive plant, irritable dionæa, the amaryllis atamasco, and thick rows of the royal palmetto.

The swamps are at all times, even in the height of summer, mostly under water, and are distinguished from the rest of the country by the crowded stems of the cane, the light foliage of the tupelo-tree, the fringe-tree, and the white cedar: this last is, perhaps, the most picturesque tree in all America: four or five rude pillars rise from the ground, and unite in a kind of arch at the height of about seven feet, and from this centre there springs a straight column, eighty or ninety feet high, without a branch: it then divides into a flat umbrella-shaped top, covered with finely divided leaves of the most delicate green. This

tree forms, at its base, the crane; and the favourite repast of the animals.] The

are nearly similar in size and colour, mentioned the bird seen near the Mississippi; the western

the forms, at its top; a secure abode for the eagle and the crane; and the oily seeds contained in its cones are the favourite repast of the paroquets.

**Animals.]** The domestic animals of the United States are nearly similar to those of England, with some difference in size and colour. Among the wild animals may be mentioned the bison, large herds of which used to be seen near the Mississippi, and they were once very numerous in the western parts of Virginia and Pennsylvania.

Moose-deer are now extremely rare, and will probably soon be extirpated. The black moose-deer are said to have been sometimes twelve feet in height; but the grey species seldom exceed the height of a horse. They have large palmated horns, weighing thirty or forty pounds; and Mr. Pennant mentions one pair that weighed fifty-six pounds, and were thirty-two inches in length. The American stag rather exceeds the European in size, and feeds in great herds in the rich savannas of the Missouri and Mississippi, where there are also herds of that kind called the Virginian deer.

In the northern states are two kinds of bears, both black; but the animal called the ranging bear is found in all the states, as well as the wolf. Several kinds of foxes are also to be met with; and the wolverine seems a kind of bear. The catamount, or cat of the mountains, found in the northern and middle states, is probably the same with the puma of Pennant, which he says is sometimes in North America called the panther. One killed in New Hampshire was six feet in length, and the tail three; but the length of the leg did not exceed twelve inches.

The racoon, or *ursus lotor*, is about the size of a fox, though not quite so high, and rather thicker. If taken young, it is easily tamed, and stays in the houses, where it catches mice in the night. The name of *lotor*, or washer, is very appropriate for this animal, as it prefers hollow trees that grow on the banks of creeks, or rivulets that run through the swamps; and in these places it is generally found. This animal is very common in the southern and western states, as well as in the more distant parts of Pennsylvania and Virginia: it commits great devastation in the fields of maize, by climbing on the stalks, laying them by its weight, and nibbling the ears: the inhabitants hunt it with dogs during the night, as it seldom makes its appearance in the day-time. Its skin is used in the United States for making hats.

The smaller beasts of prey are the lynx, the ocelot, and the margay, of the cat kind: these and many other animals supply furs. Some kinds of monkeys are said to be found in the southern states. The morse, or sea-cow, and the seal, used to frequent the northern shores, and the manati, common in South America, is said sometimes to appear on the southern coasts. There are also six kinds of squirrels, which do great injury to the plantations of maize.

One of the favourite diversions of the Americans is that of hunting wild animals; and the following particulars relative to this subject will probably afford much amusement to our readers:—

Bear-hunting is the sport most frequently adopted; and the inhabitants of the Alleghany Mountains have the reputation of being very expert at it. Towards the middle of autumn almost all of them hunt the bears; they sell their skins, and their flesh serves them, in a great degree, for food at this season. They give it the preference to every other kind of meat, and consider it as the only one of which a large quantity can be eaten without inconvenience. They make hams of the hind-legs, which are highly esteemed. In the autumn and winter the bears become exceedingly fat, and some of them will weigh as much as four hundred weight. The fat is consumed in the country, where it is used instead of oil. These animals are hunted with strong dogs, which, without coming into their reach, tease and aggravate them, and, at length, force them to climb up a tree, where they are shot by the hunters.

Mr. Lawson, of Philadelphia, has related the following account of a contest between a man and a bear.

“A farmer, named Wayborne, in Ovid township, went out one afternoon through the woods in search of his horses, taking with him his rifle-gun, with the only load of ammunition he had in the house. On his return home, about an hour before dusk, he perceived a very large bear crossing the path, on which he instantly fired, and the beast fell; but, immediately recovering his legs, made for a deep ravine a short way ahead. Here he tracked him awhile by the blood; but night coming on, and expecting to find him dead in the morning, he returned home. A little after day-break the next morning, taking a pitchfork and hatchet, and his son, a boy about ten or eleven years of age, with him, he proceeded to the place in quest of the animal. The glen in which the bear had disappeared the evening before, is eighty or ninety feet from the top of the banks to the bottom of the brook below: down this precipice a stream three or four yards in breadth is precipitated in one unbroken sheet, and, forming a circular pool, winds away among thick underwood below. After reconnoitering every probable place of retreat, he at length discovered the bear, which had made his way up the other side of the ravine as far as the rocks would admit him, and sat under a projecting cliff, steadfastly surveying the motions of his enemy. Wayborne, desiring his boy to remain where he was, took the pitchfork; and, descending to the bottom, determined to attack him from below. The bear kept his position until the farmer got within six or seven feet; when, on the instant of making a stab with the pitchfork, he found himself grappled by Bruin, and both together rolled down towards the pond, at least twenty or twenty-five feet, the

bear biting his left arm and breast, and hugging him almost to suffocation. By great exertion, he forced his right arm partly down the animal's throat, and in that manner endeavoured to strangle him, but was once more hurled down through the bushes, a greater distance than before, into the water. Here, finding the bear gaining on him, Wayborne made one desperate effort, and forced his head partly under water; and, repeating his exertions, at length weakened the animal so much, that, calling to his boy, who stood on the other side, in a state little short of distraction for the fate of his father, he sunk the edge of the hatchet, by repeated blows, into his brain. Wayborne, though a robust muscular man, was with great difficulty able to crawl home, where he lay upwards of three weeks with his wounds, his arm being mashed from the shoulder to the elbow into the bone, and his breast severely mangled."

Another interesting anecdote, of the same kind, is thus related: "A planter, who frequented the Edenton market, resided on the other side of the Great Dismal Swamp, where it is only eight or ten miles broad. He had spent an evening freely; that is, in these parts, not without copious draughts of grog or toddy; and, inspired by these with fool-hardy temerity, he determined to cross the Great Dismal, instead of going the usual, but longest, road. Few were bold enough to proceed, even in the day-time, by the route he had rashly adopted; but this man was of uncommon strength, and of a daring mind. Resisting the entreaties of his friends, he sallied forth about midnight from Edenton, on foot, and with a trusty stick in his hand. About the middle of the forest, the moon shining bright, he perceived the cub of a bear before him, at which he threw his stick, with an effect which caused the young inhabitant of the woods to roar; and this brought the enraged mother to its relief. The man had recovered his stick, and was proceeding to secure the cub, (delicious eating as a young pig,) when Mrs. Bruin advanced. A battle immediately commenced between the savage matron and the incautious man. The latter had, however, recovered from the stupidity occasioned by drinking, yet, though he abandoned the possession of the cub, he could neither pacify the mother, nor avoid her embraces. The man survived the bloody conflict, and the account he gave of the battle is yet current in the district of Chowan. He related that, having delivered up the cub, he wished to evade a contest with the dam, but she pressed so closely upon him, that he was obliged to prepare for battle. For some time he defended himself with his stick, in which interval the bear merely tore his jacket. She fought upon her hind legs, and thus the combatants were nearly of the same height. While the stick served him, he evaded the bite, as well as the hug, of the bear; but on making a desperate blow, the weapon was shivered, and then they came to closer quarters. He now substituted

his fists, and with lusty sinews dealt his blows upon the hard head and tough hide of the bear. They closed, and in the struggle which ensued, the man suffered most dreadfully from the hug of his enraged opponent."

Mr. Janson, while hunting in a swamp in Alligator county, called the Little Dismal, met with an adventure which had nearly cost him his life.

"I was on horseback," says he, "and had for my guide a negro-man on foot, belonging to a planter of my acquaintance, who went before me, guided by notches cut in the trees. My horse had frequently gone the road, and appeared conscious of the difficulty, recognising the marshy places; and, trusting to his judgement, he avoided many pieces of broken ground, with a sagacity inherent in that well-trained animal. I carried my gun in my hand, loaded with slugs, and more ammunition slung across my shoulders. About midway, and about two hundred yards before me, I saw a large quadruped nimbly climb a tree. The negro, looking in a contrary direction, did not perceive the motion, and, eager to fire, I did not inform him. We went a foot's pace, and when within gun-shot, I discovered the beast through the foliage of the wood, and immediately fired. The shot took effect, and my astonishment was great to see a monster, of the species of the tiger, suspended by his fore-feet from the branch of a tree, growling in tones of dreadful discord. The negro was greatly terrified; and my horse, unused to the report of a gun fired from his back, plunged, and was entangled in mire. Losing the reins, I was precipitated into the morass, while the negro vociferated, "Massa, Massa, we are lost!" Recovering, I beheld the ferocious brute on the ground, feebly advancing towards us. By an involuntary act I presented my empty gun, at the sight of which, conscious, no doubt, that the same motion had inflicted the smart he felt, the creature made a stand, gave a hideous roar, and turned into the thickest part of the swamp, while, in haste, and great agitation, I reloaded my piece. The poor slave, whose life to him was as dear as mine could be to me, held up his hands, and thanked the God whom he worshipped for his deliverance. I was unconscious of the danger I had courted, till he told me the beast I encountered was a panther, larger than any he had ever seen spoiling his master's flocks and herds, and that, when pursued by man, those animals rally with great ferocity. Had I been apprised of this, I should have sought my safety in flight, rather than have begun an attack; but I conjectured the creature to be of no larger dimensions than a wild cat, when I fired."

Deer-hunting also is not unattended with danger; as this sport frequently induces people to go amongst the swamps till they lose their way, and perish with hunger. An accident of this kind had nearly happened to Mr. Janson. He was induced to accompany a Mr. Carter,

of Edenton, into the swamp. He derived much pleasure from the sport, and was not aware of the danger. He started and ran the sportsmen are placed through one of the swamps. They sometimes become sportsmen is either to fire with effect. to the test, for we lowered, and pressed pursuit impracticable enough to alarm us to the direction to the open country. the knowledge of the panion loved his job carried it too far; I acquaintance into the following game in and rinth, they were act as that now appro were so evident, th the trick he had on him with vengeance. He assured me I appeared at a loss such was the effect every five minutes left, and even chall had caught, chargin I observed him wal them with great att them, and as the se hand, so he appear to guide his course tales I had heard o others being many c time they were near of desperation. A was apparently en length he called ou pointed to a large tr which we stood, was he, 'is the north sid I was in doubt onl trees we have late On going round the the mossy appeara them clearly shewer served the effect on well as upon old h rarely obliged to re

of Edenton, into the Dismal Swamp, as this gentleman derived much pleasure from toiling the whole day in pursuit of game. He had with him a couple of dogs, which started and ran the deer till they came within shot. The sportsmen are placed at certain breaks in the underwood, through one of which the deer will pass at full speed. They sometimes bound past so suddenly, that a young sportsman is either startled, or cannot seize the moment to fire with effect. "I was not," says our author, "put to the test, for we had started no game when the morning lowered, and presently the wind and rain rendered farther pursuit impracticable. We had, however, penetrated far enough to alarm me greatly, and to puzzle my guide as to the direction to be taken for the purpose of reaching the open country. My fears were greatly heightened by the knowledge of the following circumstance:—my companion loved his joke, but, like many other jesters, often carried it too far; having designedly led some of his acquaintance into the swamp, and, under pretence of following game in another direction, left them in the labyrinth, they were actually obliged to pass just such a night as that now approaching threatened to be. His doubts were so evident, that, with some agitation, I mentioned the trick he had once played his friends, and threatened him with vengeance, if he dared to repeat it upon me. He assured me I was perfectly safe, but for some time appeared at a loss in which direction to proceed; and such was the effect produced on my mind, that I fancied every five minutes we had come to the spot we had just left, and even challenged trees by certain marks my eye had caught, charging Mr. Carter with having lost the way. I observed him walk round several large trees, surveying them with great attention. He would then climb one of them, and as the seaman from the main-top looks out for land, so he appeared to be looking for some known mark to guide his course. My fears were increasing, and the tales I had heard of men perishing in the swamp, and of others being many days in extricating themselves, in which time they were nearly famished, drove me almost to a state of desperation. All this time my companion in silence was apparently employed in fixing upon our course; at length he called out that he had discovered it. He then pointed to a large tree, the bark of which, in the direction in which we stood, was incrustured with green moss. 'This,' said he, 'is the north side of the tree; I now know our course; I was in doubt only till I ascertained this point, and the trees we have lately passed did not fully convince me.' On going round the tree, I found the other sides free from the mossy appearance. He observed, that but few of them clearly shewed it in the swamp, but I have since observed the effect on all trees less exposed to the air, as well as upon old houses and walls. He said that he was rarely obliged to recur to this guide, as he never ventured

into the swamp but when the day promised to be fair, as he could work his way by the sun.

"I found in many parts of the swamp good walking ground, the lofty trees being at some distance from each other, and the underwood by no means so thick as to impede our road; but after thus proceeding a few miles, the pursuit of game is impracticable. Sometimes we had to cross where it was knee-deep, but my companion had in this case generally marked a place where we could pass over on a fallen tree. I had mounted one of these, of a monstrous size, and was proceeding heedlessly along; when I suddenly found myself sink up to the middle in dust; the tree having become rotten, though it retained its shape. This was a good joke for my friend, but a sad disaster for me; for I had great difficulty in getting out of the hole into which I had fallen; the tree, like ice, being more rotten in some parts than others, I was compelled to break my way till I came to a part sound enough to bear me, and, having fallen between two knots, I could not conveniently get out of the trunk into the swampy ground beneath, had I been so inclined. With fearful steps I advanced to the end, but was very wary how, in future, I trusted to a bridge formed by a fallen tree."

The squirrels of Carolina are so numerous, that the inhabitants are obliged, three or four times a day, to send their children round the corn-fields to scare them. At the slightest noise they issue out by dozens, and take refuge in the trees; whence they descend the instant the enemy has passed. Like the bears of North-America, they emigrate on the approach of winter: at which time they appear in Kentucky in such great numbers, that the inhabitants are obliged to unite in order to expel them. This kind of hunting is sometimes considered an excursion of pleasure; persons generally go two together, and in one morning often kill from thirty to forty. A single individual, on the contrary, can with difficulty kill any; for the squirrel, fixing himself on the trunk of the tree, turns successively in opposition to the hunter, so that the latter cannot hit him.

Among the birds of the United States there any many kinds of eagles, vultures, owls, and numerous sorts called by European names, though they generally appear different to the naturalist. Wild turkeys are rather scarce in the southern states, but numerous in those of the west. In the parts least inhabited, they are so fearless, that they may be shot by a pistol: they are not alarmed at a noise; but they have a very penetrating sight; and, the moment they perceive a hunter, they flee with such rapidity, that, for some minutes, a dog cannot come up with them; and when on the point of being seized they take to the wing. They generally harbour in the swamps, and along the rivers and creeks, whence they come out only in the morning and evening: they roost on the tops of the highest trees, where, notwithstanding their size, it is not easy to

discover them. In autumn they feed principally on chestnuts and acorns, and, when killed, often weigh from thirty-five to forty pounds. The wakon of Virginia has some resemblance to the bird of Paradise: and vast varieties of aquatic birds crowd the numerous lakes and rivers; the largest being the wild swan, which sometimes weighs thirty-six pounds. The Virginia nightingale, which takes its distinguishing epithet from this province, is adorned with a plumage of bright crimson and blue, and sings most delightfully. The natural note of the mocking-bird is very melodious, as it imitates the song of every other bird, but with superior strength and sweetness. In plumage, a bird of the species of the woodpecker, misnamed, in the southern states, the woodcock, is the most beautiful. It has the golden hue of the English goldfinch, variegated with crimson, black, and white. On its head it has a beautiful tuft, but its notes are harsh and discordant. It is of the size of the dove, and is generally seen on decaying trees, in quest of insects. The woodpecker is smaller, of a greenish tint; and the noise occasioned by its bill against a tree is like the quick strokes of a blacksmith's hammer on his bare anvil, beginning loud and gradually dying away. The flesh of both these birds is black, tough, and ill-flavoured. If the name of nightingale were to be given to any of the feathered race in the southern states, that called *Whip-poor-Will* is best entitled to it. This bird sings a plaintive note, almost the whole night long, resembling the pronunciation of the words by which it is named. It has been said to be so very wary, that it is seldom seen, much less taken; and that many have imagined the noise does not proceed from a bird, but from a frog. This is a wild conjecture. The bird is no otherwise shy, than because nature has assigned to it the task of watching in the night, when certainly it can seldom be seen; but its existence is as well known as that of the mocking, or other rare birds.

The humming-bird is the smallest of all the winged creation, and by far the most beautiful, being arrayed in scarlet, green, and gold. It sips the dew from the flowers, which is its chief nourishment, and is too delicate to be brought alive to England.

Mr. Janson was much disconcerted by the bull-frogs, the first evening which he passed in America. "These animals," says he, "are four times the size of the English frog, and raise their heads above the water, for the space of two minutes, at intervals, (for I have since particularly noticed them,) when they continue this most discordant noise. I could seldom find them out of water, and, when I came upon them by surprise, on the margin of a pond, they fled to it by prodigious jumps. I had made many efforts to catch one of them, though in vain; but, returning one evening from a shooting-party, being about to draw my charge, and observing one in a marsh near me,

rising to make his roar, I discharged the contents of my piece, and immediately saw it floating on the water. A dog, which had accompanied us, brought it to me. It measured six inches in length, and its hind-legs were nearly as long as the body. In colour, and somewhat in shape, it more resembled the toad than our green-speckled frog. I severed its body, and brought home the hind-quarters, more delicate, in appearance, than those of a chicken. In France I had conquered my repugnance to the flesh of a frog; and, having heard that some people in America extolled such food, I resolved to have a little fricassee made of this part of the bull-frog. In accomplishing my purpose I had many difficulties to combat. Not a domestic of the house would touch it; and, determined to carry my point, I seized the stew-pan, procured the necessary ingredients, and cooked a dish greatly to my satisfaction."

Dr. Morse enumerates near forty kinds of serpents, found in the United territories; Virginia, in particular, producing great numbers. The rattle-snake is the largest, being from four to six feet in length, and is one of the most dreaded. Near Bedford, M. Michaux met with a man who had been bitten by a rattle-snake the night before. He was lying on the ground, wrapped up in a blanket. The first symptoms which appeared, an hour after the accident, were violent vomitings, almost immediately succeeded by a high fever. "At the time when I saw him," says our author, "his leg and thigh were prodigiously swelled, his respiration was extremely difficult, and his face was bloated, resembling those, whom I have had occasion to see at the hospital, afflicted with the hydrophobia. I asked him some questions, but his senses were so entirely absorbed, that it was impossible to obtain any answer: I however learned from the people of the house, that, immediately after the bite, they had applied the juice of some plants to the wound, until the arrival of the doctor, who lived at the distance of fifteen or twenty miles. In America, I have known several persons to whom the same accident has happened: those who did not die in consequence of it, have ever since remained valetudinarians, and are remarkably susceptible of affections arising from the changes of the atmosphere. In the mountainous part of Pennsylvania, there are great numbers of rattle-snakes; many of which we found killed on the road. In hot and dry weather, they come from beneath the rocks, and conceal themselves in places which contain water."

Among the fish are most of those which are esteemed in Europe; and of those that are peculiar may be mentioned that large kind of white trout found in the lakes. The oysters produced in the beds, near New York and Boston, are five times as large as those consumed in London. All the rivers and coasts swarm with the various

UNITED STATES  
catale kinds, and numerous.

In North-America which are known various to the farmers all ideas of grove are to be seen on the stubble, in the joint, in great main in that state stalks lie hid in the is no doubt that The flies come on the butterflies in all the summer.

In North-America may be found most of the insects which are known in Europe. The Hessian fly is so injurious to the farmer, that, in many parts of the country, all ideas of growing wheat have been given up. They are to be seen on the wheat when young, then in embryo in the stubble, betwixt the lowest joint and the second joint, in great numbers, exactly like flax-seed. They remain in that state during the winter, and, as the corn-stalks lie hid in the fields when the wheat is growing, there is no doubt that these insects deposit their eggs in them. The flies come out in the spring, in the same manner as the butterflies in England, and continue among the wheat all the summer.

"In white or garden-peas," says Mr. Parkinson, "there is a worm that eats a large hole through every pea, or nearly: and this is in embryo when the pea is green, as I bottled some, and corked them up; but in the spring there was a great number of the flies in the bottle, and the peas were all eaten through: therefore they are not to be avoided. These peas are, in consequence, not pleasant to use for the table."

The tumble-bug is a sort of beetle, which in the summer forms a cave in the earth: and, when an animal drops his dung, two of these go to the place, and roll up into a round ball a piece as big as a small walnut, which they push forwards with their fore-feet or legs to their cave. It is said, that there is an egg in the inside of every one of those balls. There are such quantities of these beetles, that they greatly impoverish the land.

Locusts appear once in eleven, or, as some say, fourteen, years. They come, like an army, in one day apparently; making a continual humming; and, being so many thousands, they cause a very great alarm. They remain about one month, and do much damage to all kinds of trees, by eating in a circular manner round the bark of young shoots, on every part of the tree, about three or four inches from the end, and sometimes at a greater distance. This causes great injury to the fruit the ensuing season.

Small black flies are so numerous in the United States, that it is usual to have some kind of poison to destroy them: for which purpose a substance called fly-stone, mixed with sugar and water, is spread on a plate.

Another destructive insect, said to be peculiar to America, is the cock-roach, or blatta Americana of Linnaeus. They are said to be so flat, that they creep into every chest or drawer where there is the least crevice. They gnaw woollen-cloths of every kind, but especially such as have had hair-powder on them. They frequently throw off their exterior skin; and, after every change of this kind, they appear fresh and young. The Americans know this species by the name of kakkerlac. In the houses of many

parts of America they often commit great depredations by gnawing and devouring both clothes and provisions, and it is extremely difficult to guard against their ravages. With respect to provisions, every thing they run over contracts from them so nauseous a smell, as to be scarcely eatable.

According to Reaumur, these cock-roaches have a formidable enemy in a large species of sphex. He says, that when one of the latter encounters a cock roach, he seizes it by the head, pierces its body with his poisonous sting, and afterwards carries it off into his hole. Here the female has deposited her eggs; and the bodies of the cock-roaches serve the larvæ for food, till they attain their winged state.

"In North Carolina," says Mr. Janson, "I observed a curious species of the ant, very diminutive, and in prodigious numbers. If undisturbed, they will completely cover a piece of meat, bread, or sugar, and in a short time carry it to their nests, to which they are constantly going and returning by different tracks. They are chiefly to be found in houses, from which it is impossible to exclude them. It is said that, when tasted, which often happens, from their being concealed in victuals, they are an agreeable acid; and I have seen people eat them, rather than brush them away. These very small insects are of different colours, red and black: so far from associating with each other, a severe battle is fought, whenever they meet; and thus one house will be pestered with the black, and another with the red ant."

"In the Carolinas," says Mr. Janson, "there are innumerable commonwealths of bees, subject to no control from man. They build their hives in the hollow parts of large trees, and as near the summit as they can find a convenient cavity. The hunting of these industrious societies is an object of both profit and pleasure to the inhabitants. When their retreat has accidentally been discovered, it is marked by cutting notches in the trees to the nearest habitation, and a day is appointed for a bee-hunt. Half a dozen men, or more, assemble, each provided with a gun, for the double purpose of killing game in their expedition, and for defence against the beasts of the forest. They also carry axes to cut down the tree.

"On an occasion of this nature, as the party cautiously approached the marked spot, they were surprised to find the proprietors of the hive in great wrath flying over their property; and, on a nearer view, they witnessed the cause of the tumult. A bear, of enormous bulk, attracted by the smell of the ripe honey, of which those animals are extremely fond, had scented the tree some minutes before the arrival of the two-legged plunderers. Bruin was in the act of lapping the honey, which he obtained by thrusting his paw through a hole in the centre of a knot, which the bees used as the entrance to their

cell. The insects, in their defence, attacked him by swarms, and darted their stings into the most vulnerable parts of his face; to guard which, he applied one paw full of honey over the annoyed parts, and ate the next, in swallowing which he would give a few strokes amongst his antagonists, and then proceed to another scoop of honey. A ball from a rifle-gun brought Bruin, in the midst of his repast, to the ground. The hunters quickly felled the tree, and, being prepared to resist the darts of the owners, soon secured the remainder of the honey, the comb of which had been dreadfully mangled by the paw of the bear; but his carcase made them ample amends.

"Mr. Andrew Nilson, of Philadelphia, a native of Ireland, who served under General Washington in the American army during the whole of the war, informed me, that at the time Lord Cornwallis was pursuing the Americans through the Carolinas, at which time he was a quarter-master-serjeant, he had, during a day's rapid retreat, marked a hive of bees. At night, whilst both the pursuers and the pursued were obliged to halt and rest, he privately singled out a file of soldiers, with whom, carrying a barrel for the purpose, he retrograded some miles to attack the bee-hive, which was then at an equal distance between the two armies. He arrived with his party at the tree, which they felled without creating alarm; and the moon afforded them light to secure the honey, which was slung upon a pole. After proceeding with it two or three miles, they were surprised by an armed reconnoitering party. To escape was impossible; and resistance, having no arms, was in vain. Convinced that his rashness had thrown him into the hands of his enemy, he prepared to surrender himself and party as prisoners of war. He was hailed—the parole and countersign were demanded, and Nilson repeated those given out for the night by the American commander, which, to his great joy, proved satisfactory. It was a party from the American army, watching the early approach of their pursuers; and the commanding officer proved to be the major of the regiment to which the offending serjeant belonged. Being interrogated as to the motive of the honey-men being from their quarters, Nilson told the truth, with an humour peculiar to his country; which so pleased the major, that he ordered the delicious banquet to be brought forward, and both parties sat down, and regaled themselves on the fruits of the industrious bees. The canteens of the armed men contained spirituous liquors; which, operating on the honey, produced a pretty mellow effect. The major, however, got his party off; but Nilson continued so long upon the spot, that his men could not reach their friends with their booty, and were obliged to leave what remained in the barrel a prey to the pursuing British."

*Religious Sects.*] "The constitution of the United States," says Dr. Morse, "provides against the making

of any law respecting an establishment of religion, or prohibiting the free exercise of it. And in the constitutions of the respective states religious liberty is a fundamental principle. All being thus left at liberty to choose their own religion, the people, as might easily be supposed, have varied in their choice. The bulk of the people would denominate themselves Christians; a small proportion of them are Jews; some plead the sufficiency of natural religion, and reject revelation as unnecessary and fabulous; and many, we have reason to believe, have yet their religion to choose."

The following denominations of Christians are more or less numerous in the United States, viz. Congregationalists, Presbyterians, Dutch Reformed Church, Episcopalians, Baptists, Quakers, or Friends, Methodists, Roman Catholics, German Lutherans, German Calvinists, or Presbyterians, Moravians, Tunkers, Mennonists, Universalists, and Shakers.

Of these various sects, the most numerous are the *Congregationalists*, who seem generally agreed in this opinion, that "Every church, or particular congregation of visible saints, in gospel order, being furnished with a pastor, and walking together in truth and peace, has received from the Lord Jesus full power and authority, ecclesiastical within itself, regularly to administer all the ordinances of Christ, and is not under any other ecclesiastical jurisdiction whatsoever." Their churches, with some exceptions, disclaim the word *Independent*, as applicable to them, and claim a sisterly relation to each other.

Congregationalists are divided in opinion respecting the doctrines of the gospel, and the proper subjects of its ordinances. The body of them are Calvinists; a respectable proportion are what may be denominated Hopkensian Calvinists; besides these, some are Arminians, some Arians, a few Socinians, and a number who have adopted Dr. Chauncy's scheme of the final salvation of all men.

Next to the Congregationalists, the *Presbyterians* are the most numerous denomination of Christians in the United States. They have a constitution by which they regulate all their ecclesiastical proceedings, and a confession of faith, to which all church-officers and members are required to subscribe. Hence they have preserved a singular uniformity in their religious sentiments, and have conducted their ecclesiastical affairs with a considerable degree of order and harmony.

The body of the Presbyterians inhabit the middle and southern states, and are united under the same constitution. By this constitution, the Presbyterians who are governed by it are divided into four synods and seventeen presbyteries, viz. Synod of New York, five presbyteries, ninety-four congregations, sixty-one settled ministers. 2. Synod of Philadelphia, five presbyteries, ninety-two congregations, sixty settled ministers, besides the mini-

sters and congregations, viz. Synod of Virginia, four presbyteries, forty settlements, and ministers of the Carolinas, four presbyteries, forty-two congregations, of Abington, suppose the number which make no record of the number of settlements, the whole number in connection will be supplied by two ministers, and besides a number of particular charges. Besides which the missionaries, once Philadelphia.

The *Presbyterian* constitution, presbyteries, assemblies possess wholly moral or spiritual character. They are subject to the laws of Christ from the privilege requisite for obtaining the highest punishment is that of excluding from the congregation.

The *Church Session* is a body of judicatory, composed of elders of a particular congregation, invested with the spiritual power and has power to regulate the conduct of all members and witnesses, to punish, suspend, or excommunicate, or to deserve these censures for the spiritual interests delegates to the high court.

A *Presbytery* is a ruling elder from each district. Three ministers convened, are competent to have cognizance of the particular church, cognizable by the session, issuing appeals from censuring candidates removing, or judging doctrine or discipline that injure the purity

sters and congregations belonging to Baltimore presbytery. 3. Synod of Virginia, four presbyteries, seventy congregations, forty settled ministers, exclusive of the congregations and ministers of Transylvania presbytery. 4. Synod of the Carolinas, three presbyteries, eighty-two congregations, forty-two settled ministers, the ministers and congregations of Abington presbytery not included. If we suppose the number of congregations in the presbyteries which make no returns to their synods to be one hundred, the number of settled ministers in the same to be forty, the whole number of Presbyterian congregations in this connection will be four hundred and thirty-eight, which are supplied by two hundred and twenty-three settled ministers, and between seventy and eighty candidates, besides a number of ordained ministers, who have no particular charges. Each of the four synods meet annually; besides which they have a joint meeting, by their commissioners, once a year, in General Assembly at Philadelphia.

The Presbyterian churches are governed by congregational, presbyterial, and synodical, assemblies: these assemblies possess no civil jurisdiction; their power is wholly moral or spiritual, and that only ministerial or declarative. They possess the right of requiring obedience to the laws of Christ, and of excluding the disobedient from the privileges of the church; and the powers requisite for obtaining evidence, and inflicting censure; but the highest punishment to which their authority extends, is that of excluding the contumacious and impenitent from the congregation.

The *Church Session*, which is the congregational assembly of judicatory, consists of the minister or ministers and elders of a particular congregation. This body is invested with the spiritual government of the congregation, and has power to enquire into the knowledge and Christian conduct of all its members; to call before it offenders and witnesses of its own denomination; to admonish, suspend, or exclude from the sacraments, such as deserve these censures; to concert measures for promoting the spiritual interests of the congregation, and to appoint delegates to the higher judicatories of the church.

A *Presbytery* consists of all the ministers, and one ruling elder from each congregation, within a certain district. Three ministers and three elders, constitutionally convened, are competent to transact business. This body has cognizance of all things that regard the welfare of the particular churches within its bounds, which are not cognizable by the session: also a power of receiving and issuing appeals from the sessions; of examining and licensing candidates for the ministry; of ordaining, settling, removing, or judging, ministers; of resolving questions of doctrine or discipline; of condemning erroneous opinions, that injure the purity or peace of the church; of visiting

particular churches, to enquire into their state, and redress the evils that may have arisen in them: of uniting or dividing congregations, at the request of the people, and whatever else pertains to the spiritual concerns of the churches under their superintendence.

A *Synod* is a convention of several presbyteries. The synod has power to admit and judge of appeals, regularly brought up from the presbyteries; to give its judgment on all references of an ecclesiastical kind; to collect and regulate the proceedings of presbyteries; to take effectual care that presbyteries observe the constitution of the church, &c.

The highest judicatory of the Presbyterian church is styled *The General Assembly of the Presbyterian Church, in the United States of America*. This assembly is to consist of an equal delegation of bishops and elders from each presbytery within their jurisdiction, by the title of *Commissioners to the General Assembly*. Fourteen commissioners make a quorum. The General Assembly constitutes the bond of union, correspondence, and mutual confidence, among all churches, and has power to receive and issue all appeals and references which may regularly be brought before them from inferior judicatories; to regulate and correct the proceedings of the synods, &c. To the General Assembly also belongs the power of consulting, reasoning, and judging, in controversies respecting doctrine and discipline; of reproving, warning, or bearing testimony against error in doctrine, or immorality in practice in any church, presbytery, or synod; of corresponding with foreign churches; of putting a stop to schismatical contentions and disputations; and, in general, of recommending and attempting reformation of manners, and of promoting charity, truth, and holiness, in all the churches; also of erecting new synods, when judged necessary.

The confession of faith adopted by the Presbyterian church embraces what are called the Calvinistic doctrines; and none who disbelieve these doctrines are admitted into fellowship with their churches. The General Assembly of the Presbyterian church holds a friendly correspondence with the General Association in Connecticut by letter, and by admitting delegates from their respective bodies to sit in each other's general meetings.

Unconnected with the churches of which we have been speaking, there are four small presbyteries in New England, who have a similar form of ecclesiastical government and discipline, and profess the same doctrines. Besides these, there is the "Associate Presbytery of Pennsylvania," having a separate ecclesiastical jurisdiction in America, and belonging to the Associate Synod of Edinburgh, which they declare is the only ecclesiastical body, either in Britain or America, with which they are agreed concerning the doctrine and order of the church of Christ,

and concerning the duty of confessing the truth, and bearing witness to it by a public testimony against the errors of the times. This connexion is not to be understood as indicating subjection to a foreign jurisdiction; but is preserved for the sake of maintaining unity with their brethren in the profession of the Christian faith, and such an intercourse as might be of service to the interests of religion. This sect of Presbyterians is commonly known by the name of *Seceders*, on account of their seceding from the national church of Scotland, in the year 1736.

The *Dutch Reformed Churches* in the United States, who maintain the doctrine of the Synod of Dort, held in 1618, are between seventy and eighty in number, constituting six classes, which form one synod, styled, "*The Dutch Reformed Synod of New York and New Jersey.*" From the first planting of the Dutch churches in New York and New Jersey, they have, under the direction of the classes of Amsterdam, been formed exactly upon the plan of the established church of Holland, as far as that is ecclesiastical.

The *Protestant Episcopal Church* in the United States (the churches of that denomination in New England excepted) met in convention at Philadelphia, October, 1785, and revised the book of common prayer and administration of the sacraments, and other rites and ceremonies, with a view to render the liturgy consistent with the American Revolution. But this revised form was adopted by none of the churches, except one or two in Philadelphia. In October, 1789, at another meeting of their convention, a plan of Union among all the Protestant Episcopal churches in the United States of America was agreed upon and settled; and an adequate representation from the several states being present, they again revised the book of common prayer, which is now published, and generally adopted by their churches. They also agreed upon, and published, seventeen canons for the government of their church; the first of which declares, that, "there shall, in this church, be three orders in the ministry, viz. bishops, priests, and deacons."

At the same time they agreed upon a constitution, which provides that there shall be a general convention of the Protestant Episcopal Church in the United States, on the second Tuesday of September, of every third year, from 1789. That each state is entitled to a representation of both the clergy and laity; or either of them, and may send deputies, not exceeding four of each order, chosen by the convention of the state. That the bishops of the church, when three or more are present, shall, in their general conventions, form a separate house, with a right to originate and propose acts for the concurrence of the house of deputies, composed of clergy and laity; and with a power to negative acts passed by the house of deputies, unless adhered to by four-fifths of the other

house. That every bishop shall confine the exercise of his episcopal office to his proper diocese or district. That no person shall be admitted to holy orders, until examined by the bishop and two presbyters, having produced the requisite testimonials: and that no person shall be ordained, until he shall have subscribed the following declaration: "I do believe the Holy Scriptures of the Old and New Testament to be the Word of God, and to contain all things necessary to salvation; and I do solemnly engage to conform to the doctrines and worship of the Protestant Episcopal Church in the United States."

They have not yet adopted any articles of religion other than those contained in the apostles' and Nicene creeds. The number of Episcopal churches in the United States is not ascertained: in New England there are between forty and fifty; but in the southern states they are much more numerous. Four bishops, viz. of Connecticut, New York, Pennsylvania, and Virginia, have been elected by the conventions of their respective states, and have been duly consecrated; the former by the bishops of the Scotch church, the three latter by the bishops of the English church. And these four, in September 1792, united in the consecration of a fifth, elected by the convention of the state of Maryland.

The *Baptists*, with some exceptions, adopt the doctrines of Calvin, and the independent form of church government. Except those who are styled "*Open Communion Baptists*," of whom there is but one association, they refuse to communicate in the ordinance of the Lord's Supper with other denominations; because they hold that immersion only is the true baptism, and that baptism is necessary to communion; it is, therefore, improper and inconsistent, in their opinion, to admit unbaptised persons to join with them in this ordinance, though they allow ministers of other denominations to preach to their congregations.

Some of the leading principles of the Particular Baptists are, The imputation of Adam's sin to his posterity; the inability of man to recover himself, effectual calling by sovereign grace, justification by the imputed righteousness of Christ, baptism by immersion, and that on profession of faith and repentance; congregational churches, and their independency, and reception into them upon evidence of sound conversion.

The people called *Quakers* came to America as early as 1636. The first settlers of Pennsylvania were all of this denomination; and the number of their meetings in the United States, at present, is about three hundred and twenty.

Their doctrinal tenets may be summarily expressed as follows: In common with other Christians, they believe in one eternal God, and in Jesus Christ, the Messiah and Mediator of the new covenant. To Christ alone, in whose divinity they believe, they give the title of the *Word of*

God, and not to the

God, and not to the Scriptures; yet they profess a high esteem for these sacred writings, in subordination to the Spirit who indited them, and believe that they are able, through faith, to make men wise to salvation. They reverence the precepts of scripture, and believe them practicable and binding on every Christian; and that, in the life to come, every man will be rewarded according to his works. In order to enable mankind to put in practice these precepts, they believe that every man coming into the world is indued with a measure of the light, grace, or good spirit, of Christ, by which he is enabled to distinguish good from evil, and correct the disorderly passions and corrupt propensities of his nature, which mere reason is altogether insufficient to overcome: that this divine grace is, to those who sincerely seek it, an all-sufficient and present help in time of need; and that by it the snares of the enemy are detected, his allurements avoided, and deliverance experienced, through faith in its effectual operation, and the soul translated out of the kingdom of darkness into the marvellous light and kingdom of the Son of God. Thus persuaded, they think this divine influence especially necessary to the performance of the highest act of which the human mind is capable, the worship of God in spirit and in truth; and therefore consider as obstructions to pure worship, all forms which divert the mind from the secret influence of this union of the Holy One. Though true worship is not confined to time or place, they believe it is incumbent on churches to meet often together, but dare not depend for acceptance on a formal repetition of the words and experiences of others. They think it is their duty to wait in silence, to have a true sight of their condition bestowed on them; and believe even a single sigh, arising from a sense of their infirmities and need of divine help, to be more acceptable to God, than any performances which originate in the will of man.

They believe the renewed assistance of the light and power of Christ, which is not at our command, nor attainable by study, but the free gift of God, to be indispensably necessary to all true ministry. Hence arises their testimony against preaching for hire, and conscientious refusal to support such ministry by tithes or other means. As they will not encourage any ministry, but such as they believe to spring from the influence of the Holy Spirit, so neither do they attempt to restrain this influence to persons of any condition in life, or to the male sex, but allow such of the female sex as appear to be qualified, to exercise their gifts for the general edification of the church.

They hold that, as there is one Lord and one faith, so his baptism is one in nature and operation, and that nothing short of it can make us living members of his mystical body; and that baptism with water belonged to an

inferior and decreasing dispensation. With respect to the Lord's Supper, they believe that communication between Christ and his church is not maintained by that nor any other external ordinance, but only by a real participation of his divine nature, through faith: that this is the supper alluded to, Rev. iii. 20; and that where the substance is attained, it is unnecessary to attend to the shadow.

Believing that the grace of God is alone sufficient for salvation, they neither can admit that it is conferred on a few only, while others are left without it; nor, thus asserting its universality, can they limit its operation to a partial cleansing of the soul from sin, even in this life. On the contrary, they believe that God doth vouchsafe to assist the obedient to submit to the guidance of his pure Spirit, through whose assistance they are enabled to bring forth fruits into holiness, and to stand perfect in their present rank.

As to oaths, they abide literally by Christ's positive injunction, "Swear not at all." They believe that "wars and fightings" are, in their origin and effects, utterly repugnant to the gospel, which breathes peace and good-will to men. They also are firmly persuaded, that, if the benevolence of the gospel were generally prevalent in the minds of men, it would effectually prevent them from oppressing, much more from enslaving, their brethren, of whatever complexion; and would even influence their treatment of the brute creation, which would no longer groan the victims of their avarice, or of their false ideas of pleasure. They profess that their principles, which inculcate submission to the laws in all cases wherein conscience is not violated, are a security to the salutary purposes of government. But they hold, that the civil magistrate has no right to interfere in matters of religion, and think persecution in any degree unwarrantable. They reject the use of those names of the months and days, which, having been given in honour of the heroes or gods of the heathen, originated in superstition; and the custom of speaking to a single person in the plural number, as having arisen also from motives of adulation. Compliments, superfluity of apparel or furniture, outward shows of rejoicing or mourning, and the observation of days and times, they deem incompatible with the simplicity and sincerity of a christian life; and they condemn public diversions, gaming, and other vain amusements of the world. They require no formal subscription to any articles, either as the condition of membership, or to qualify for the service of the church.

The Methodists made their first appearance in America about thirty-four years since. Their general style is, "*The United Societies of the Methodist Episcopal Church.*" They profess themselves to be "a company of men, having the form, and seeking the power of godliness, united in order to pray together, to receive the word of exhort-

ation, and to watch over one another in love, that they may help each other to work out their own salvation." Each society is divided into classes of twelve persons; one of whom is styled the *leader*, whose business it is to see each person in his class once a week, to advise, reprove, comfort, or exhort, as occasion may require; and to receive contributions for the relief of the church and poor. In order to admission into their societies, they require only one condition, viz. "A desire to flee from the wrath to come;" i. e. a desire to be saved from their sins. It is expected of all who continue in their societies, that they should evidence their desire of salvation by doing no harm, by avoiding all manner of evil, by doing all manner of good, as they have ability and opportunity, especially to the household of faith; employing them preferably to others, buying of one another, and helping each other in business; and also by attending upon all the ordinances of God, such as public worship, the supper of the Lord, family and private prayer, searching the scriptures, and abstinence. The late Rev. John Wesley is considered as the father of this class of Methodists, who, as they deny some of the leading Calvinistic doctrines, and hold some of the peculiar tenets of Arminius, may be called *Arminian Methodists*. The Rev. George Whitfield was the leader of the *Calvinistic Methodists*, of whom, a few in different parts of the United States are patronized and supplied with ministers by the will of the late Countess of Huntingdon.

The number of *Roman Catholics* in the United States is estimated at about fifty thousand, one half of which are in the state of Maryland. Their peculiar and leading tenets are too generally known to need a recital here. They have a bishop, who resides in Baltimore, and many of their congregations are respectable and numerous.

The German inhabitants in these states, who principally belong to Pennsylvania and New York, are divided into a variety of sects; the principal of which are Lutherans, Calvinists or Presbyterians, Moravians, Tunkers, and Mennonists. Of these the German Lutherans are the most numerous. Of this denomination, and the German Presbyterians or Calvinists, who are next to them in numbers, there are upwards of sixty ministers in Pennsylvania; and the former have twelve, and the latter six, churches in the state of New York. Many of their churches are large and splendid, and in some instances furnished with organs. These two denominations live together in the greatest harmony, often preaching in each others churches, and sometimes uniting in the erection of a church, in which they worship alternately.

The *Moravians* are a respectable body of Christians in these states. Of this denomination there were, in 1788, about one thousand three hundred in Pennsylvania; viz. at Bethlehem, between five and six hundred, which num-

ber has since increased; at Nazareth, four hundred and fifty; at Litiz, upwards of three hundred. Their other settlements, in the United States, are at Hope, in New Jersey, and at Wachovia, on Yadkin River, in North Carolina. Besides these regular settlements, formed by such only as are members of the brethren's church, and live together, there are, in different parts of Pennsylvania, Maryland and New Jersey, and in the cities of Newport, New York, Philadelphia, Lancaster, York Town, &c. congregations of the brethren, who have their own church and minister, and hold the same doctrinal tenets, and church rites and ceremonies, as the former, though their local situation does not admit of such particular regulations as are peculiar to the regular settlements.

They are called *Moravians*, because the first settlers in the English dominions were chiefly emigrants from Moravia. These were the genuine descendants of the church of the ancient United Brethren, established in Bohemia and Moravia as early as the year 1456. About the middle of the last century they left their native country to avoid persecution, and to enjoy liberty of conscience, and the exercise of the religion of their forefathers. They were received in Saxony, and other protestant dominions, and were joined by many serious people. They adhere to the Augustan Confession of Faith, which was drawn up by protestant divines at the time of the Reformation in Germany, in the year 1530, and presented at the diet of the empire at Augsburg; and which, at that time, contained the doctrinal system of all the established protestant churches. They retain the discipline of their ancient church, and make use of episcopal ordination.

They profess to live in strict obedience to the ordinances of Christ: such as the observance of the sabbath, infant baptism, and the Lord's Supper; and, in addition to these, they practise the washing of feet, the kiss of love, and the use of the lot. They were introduced into America by Count Zinzendorf, and settled at Bethlehem, which is their principal establishment in America, as early as 1741.

The *Tunkers* are so called in derision, from the word *tunken*, to put a morsel in sauce. The English word that conveys the proper meaning of Tunkers, is *sops*, or *dippers*. They are also called *Tumblers*, from the manner in which they perform baptism, which is by putting the person, while kneeling, head first, under water, so as to resemble the motion of the body in the action of tumbling.

The first appearance of these people in America was in the year 1719, when about twenty families landed in Philadelphia, and dispersed themselves in various parts of Pennsylvania. They are what are called General Baptists, and believe in general redemption. They use great plainness of dress and language, and will neither swear, nor fight, nor go to law, nor take interest for the use of their

money. They come on the sabbath, except on the first day, with their wives and children, and sit in the front of the church, with their feet, kiss of love, and use the trine in prayer, while the church-government of the English Baptists is allowed to speak in the church, usually ordained to deaconesses, and their gifts statedly.

They commonly wear their beards; keep the first day sabbath, except one congregation; and have the Lord's Supper, with its ancient attendants of love-feasts, washing of feet, kiss of charity, and right-hand of fellowship. They anoint the sick with oil for their recovery, and use the trine immersion, with laying on of hands and prayer, while the person baptized is in the water. Their church-government and discipline are the same with those of the English Baptists, except that every member is allowed to speak in the congregation, and the best speaker is usually ordained to be their minister. They have deacons, deaconesses, and exhorters, who are all licensed to use their gifts steadily.

The principal settlement of this sect is at Ephrata, sometimes called Tunkers' Town, in Lancaster county, sixty miles westward of Philadelphia. It consists of about forty buildings, of which three are places of worship: one is called Sharon, and adjoins the sisters' apartment, as a chapel; another, belonging to the brothers' apartment, is called Bethany. To these the brethren and sisters resort, separately, to worship, morning and evening, and sometimes in the night. The third is a common church, called Zion, where all in the settlement meet once a week for public worship. The brethren have adopted a dress similar to that of the White Friars, with some alterations; the sisters that of the nuns. All, however, do not live in celibacy. When they marry, they leave their cells, and go among the married people. They subsist by cultivating their lands, by attending a printing-office, a grist-mill, a paper-mill, an oil-mill, &c.; and the sisters by spinning, weaving, sewing, &c. They at first slept on board-couches, but now on beds, and have otherwise abated much of their former severity. This congregation keep the seventh day sabbath. Their singing is charming, owing to the pleasantness of their voices, the variety of parts, and the devout manner of performance.

The Mennonists derive their name from Simon Menno, a native of Witmars, in Germany, a man of learning, born in the year 1505. In the time of the reformation, by Luther and Calvin, he was a famous Roman Catholic preacher, till about the year 1531, when he became a Baptist. Some of his followers came into Pennsylvania from New York, and settled at German-town, as early as 1692. This is at present their principal congregation, and the mother of the rest.

The Mennonists do not, like the Tunkers, hold the doctrine of general salvation; yet, like them, they will neither swear nor fight, nor bear any civil office, nor go to law. Some of them wear their beards, wash each others feet, &c. and all are plain in their dress and mode of expression. Some have been expelled the society for wearing buckles in their shoes, and having pocket-holes in their coats. Their church-government is democratical. They

call themselves the Harmless Christians, Revengeless Christians, and Weaponless Christians. They are Baptists rather in name than in fact; for they do not use immersion. Their common mode of baptism is this: The person to be baptized kneels; the minister holds his hand over him, into which the deacon pours water, which runs through upon the head of the person kneeling. After this follow imposition of hands, and prayer.

The denomination styled *Universalists*, though their schemes are various, may properly be divided into two classes, viz. those who embrace the scheme of Dr. Chauncey, exhibited in his book, entitled, "The Salvation of all Men," and the disciples of Mr. Winchster and Mr. John Murray.

A summary of Dr. Chauncey's sentiments has been given as follows:—

"That the scheme of revelation has the happiness of all mankind lying at bottom, as its great and ultimate end; that it gradually tends to this end, and will not fail of its accomplishment, when fully completed. Some, in consequence of its operation, as conducted by the Son of God, will be disposed and enabled, in this present state, to make such improvements in virtue, the only rational preparative for happiness, as that they may enter upon the enjoyment of it in the next state. Others, who have proved incurable under the means which have been used with them in this state, instead of being happy in the next, will be awfully miserable; not to continue so finally, but that they may be convinced of their folly, and recovered to a virtuous frame of mind; and this will be the effect of the future torments upon many; the consequence of which will be their salvation, they being thus fitted for it. And there may be yet other states, before the scheme of God may be perfected, and mankind universally cured of their moral disorders, and in this way qualified for, and finally instated in, eternal happiness. But, however many states some of the individuals of the human species may pass through, and of however long continuance they may be, the whole is intended to subserve the grand design of *universal happiness*, and will finally terminate in it; inasmuch that the Son of God and Saviour of men will not deliver up his trust into the hands of the Father, who committed it to him, till he has discharged his obligations in virtue of it; having finally fixed all men in heaven, when God will be *all in all*."

The number of this denomination is not known. The open advocates of this scheme are few, though the number is larger who embrace the doctrine of the salvation of all men, upon principles somewhat similar, but variously differing from those on which the above-mentioned scheme is grounded.

The latter class of Universalists have a scheme differing essentially from that of the former, which they reject, as

inconsistent and absurd; and they cannot conceive how those who embrace it can, with any degree of propriety, be called Universalists, on apostolic principles, as it does not appear that they have any idea of being saved by or in the Lord with an everlasting or with any salvation. Hence they call them "Pharisaical Universalists, who are willing to justify themselves."

There are but a few of this denomination of Universalists in the United States. Of these few some are in Pennsylvania, some in different parts of New York, Connecticut, Rhode Island, and New Hampshire; but the body of them are in Boston and Gloucester, in Massachusetts. They have several constituted churches, which are governed by an ecclesiastical constitution, formed in 1789.

The small and singular sect of Christians called *Shakers* sprung up in America as lately as 1774, when a few of this sect came from England to New York, and there being joined by a few others, they fixed at Nisquennia, above Albany, which is their principal settlement; a few others, however, are scattered in different parts of the country.

The head of this party, while she lived, was Anna Leese, styled the Elect Lady. Her followers asserted, that she was the woman spoken of in the twelfth chapter of the Revelations, and that she spoke seventy-two tongues; and, although these tongues were unintelligible to the living, she conversed with the dead, who understood her language. They alleged, also, that she was the mother of all the Elect; that she travailed for the whole world; that no blessing could descend to any person but only by and through her, and that in the way of her being possessed of their sins, by their confessing and repenting of them, one by one, according to her direction.

Their leading tenets, as given by one of their own denomination, are, "That the first resurrection is already come, and now is the time to judge themselves. That they have power to heal the sick, to raise the dead, and cast out devils. That they have a correspondence with angels, the spirits of the saints, and their departed friends. That they speak with divers kinds of tongues in their public assemblies. That it is lawful to practise vocal music, with dancing, in the Christian churches, if it be practised in praising the Lord. That their church is come, out of the order of natural generation, to be as Christ was; and those who have wives, as though they had none. That by these means heaven begins upon earth, and they thereby lose their earthly and sensual relation to Adam the first, and come to be transparent in their ideas, in the bright and heavenly visions of God. That some of their people are of the number of the one hundred and forty-four thousand who were redeemed from the earth, and were not defiled with women. That the word everlasting, when applied to

the punishment of the wicked, means only a limited period, except in the case of those who fall from *their* church; and that for such there is no forgiveness, either in this world, or that which is to come. That it is unlawful to swear, game, or use compliments; and that water-baptism and the Lord's supper are abolished. That Adam's sin is not imputed to his posterity; and that the doctrines of election and reprobation are to be rejected."

The discipline of this denomination is founded on the supposed perfection of their leaders. The Mother, or the Elect Lady, it is said, obeys God through Christ. European elders obey her: American labourers and common people obey them; while confession is made of every secret thing, from the oldest to the youngest. The people are taught, that they are seen through and through, in the gospel glass of perfection, by their teachers, who behold the state of the dead, and innumerable worlds of good and evil spirits.

These people are generally instructed to be very industrious, and to bring in, according to their ability, to keep up the meeting. They vary in their exercises. Their heavy dancing, as it is called, is performed by a perpetual springing from the house-floor, about four inches up and down, both in the men's and women's apartment, moving about with extraordinary transport; singing, sometimes one at a time, sometimes more, making a perfect charm.

This elevation affects the nerves, so that they have intervals of shuddering, as if they were in a strong fit of the ague. They sometimes clap hands, and leap so as to strike the joists above their heads. They throw off their outside garments in these exercises, and exhaust their strength very cheerfully this way. Their chief speaker often calls for attention, when they all stop and listen to his harangue, and then fall to dancing again. They assert, that their dancing is the token of the great joy and happiness of the *New Jerusalem state*, and denotes their victory over sin. One of the postures which increases among them is turning round very swiftly for an hour or two. This, they say, is to show the great power of God. They sometimes fall on their knees, and make a sound like the roaring of water, in groans and cries, as they say, for the wicked world who persecute them.

Jews are not numerous in the United States. They have synagogues at Savannah, Charlestown in South Carolina, Philadelphia, New York, and Newport. Besides those who reside at these places, there are others scattered in different towns in the United States.

The Jews in Charlestown, among other peculiarities in burying their dead, have these:—After the funeral-dirge is sung, and just before the corpse is deposited in the grave, the coffin is opened, and a small bag of earth, taken from the grave, is carefully put under the head of the deceased; then some powder, said to be earth brought

from Jerusalem, taken and put upon their remembrance of returning.

*Superstitious Prejudices.*] It will not appear surprising that the people of the United States should be, at least, as credulous as those of other countries. *Fortune-tellers*, of both sexes, abound in all the country parts, and practise their arts with impunity; while persons of every rank in society implicitly become their dupes. Mr. Parkinson mentions that a female fortune-teller, being brought before the judge for her manner of getting her living, and being asked how she dared to deceive the people, said she did not deceive them; that, to convince him, she would tell him what he had had for breakfast that morning, and the name of each person in company; which she did, to the astonishment of the judge and the whole court: this was not easy to guess; for it is usual to have fish, flesh of different kinds, cold and hot, &c. Being asked by one of the counsellors, how she had got her money, and how she had built so many houses, she said, by telling lies, as he did. This woman continues to live in the same manner, and laughs at the court. All these insults naturally arise from the want of a proper provision for the judges, sufficient to give them dignity and power to enforce the laws. The preceding story, says Mr. P., was told one day where I was, and the judge was in company: I laughed at what was said; and a gentleman laid me a bottle of wine, that she would tell me my name, if I went into her house. I did not think that a fair trial of her conjuring, as I frequently was in Baltimore; therefore, she might know me. But I went to the house where she resided, jumped off my horse, and entered her apartment without any one apprising her of my intention. She could not tell my name; said she was neither witch nor wizard, but often guessed very well; that, if she did not succeed in guessing, she sometimes desired the person who had lost a horse, a cow, or any other property, to come again at an appointed time, and she would play the deuce with the holder of the stolen goods, if they were not delivered. If that happened, she then wrote a charm, which was a strange bugbear or fright to the people, especially to the negroes. By some deception she has surprised very genteel people. The reason why this was proposed to me was, that, a short time before this, Mrs. Latimer, the lady of a merchant, (and, like myself, an unbeliever,) to try Betty Fisher's conjuring, applied to her to have her fortune told, passing herself on the woman as an unmarried young lady. The fortune-teller said she was married, told the number and names of her children, as well as her own, &c.

"The reason that these impositions and insults are borne from people of such low description is, in part, the judges' fault; not from any want of sense, but it is

the equality which America first set out with,—that all men are alike, except they steal, murder, or commit an act of treason. There are no other things thought offensive to the subject's right, or worthy of punishment; and, even then, the courts are fearful to punish; or, at least, they seem to be so.

"I have every reason to think, that a conjuror or fortune-teller has more influence over the people given to vice in America, than either courts of justice or places of worship, and acts as a more powerful incentive to moral rectitude.

"Amidst a variety of reports, equally ridiculous, respecting Betty Fisher, of Baltimore, a belief prevails, that she possesses the extraordinary power of torturing the offender neglecting to restore stolen goods to the lawful owner; so that the thief cannot sleep by night, and that something comes into his room, and draws off the bed-clothes, with many tales of a similar kind. I have to thank her, however, for her name and cunning. I had an Englishman who worked with me, formerly a convict: he frequently stole small things from me; but I dared not to mention it, because he would be offended, and, of consequence, leave me. Therefore, I put up with it: at that time I did not know of Betty Fisher, or I readily could have stopped this man from these thefts. As a proof:—Having hired several Englishmen, there was one of them who had some very good wearing-apparel: one evening he had left a coat in the barn, for they slept there. During the time he was at supper the coat was gone. Knowing the convict's pilfering disposition, I desired the owner of the coat to say, when the men were all together, and I present, that I had told him of a conjuror at Baltimore, and that he would go to her the next day, to know who had got his coat. He did as I had directed him; the coat was brought to the barn the next morning, and put into the same place it was taken from.

"Some time after, this man, in the night, stole a pig from me. I went to the barn where this man was thrashing, and said, 'John, they tell me there is a pig stolen.' 'Yes, sir,' said John; 'and as you are going from the place, you must take care; or there are such a set of rascals in this country, they will steal every thing you have.' 'O,' said I, 'I will go to Betty Fisher to-day, and she will tell me the thief.'

"But, behold! without my going to Betty, the pig was at my house before I returned. My family perceived the snail not to be going; and the man had slipped out of the barn, to fetch the pig: so that I have just cause to say, that a conjuror is before all the laws in America to give a man his right; for all their law would not have brought back my pig; but the conjuror effected it without trouble. It is evident, that such criminals as I have described stand in greater awe of the devil than of the Al-

mighty; and, if they pray to or worship either, it is, in effect, the former; since the woman, as I have already mentioned, assures them the devil will torment them: and I doubt not its being so; but it is their own devil.

"The credulity of many individuals in other occurrences appeared to me equally surprising. I had two joiners at work at Orange-hill, when there came a man into the place where they were working, who informed them the place was unhealthy, on account of the badness of the water there; for a horse had been drowned in the well from which he got the water that they drank the day following. These men went to the well to draw up water; when they found in the bucket some hair, the mane of a horse; and immediately supposing that it was the hair of the horse that was drowned, they were taken sick, and vomited to a very great degree: one of them was so ill, that he was carried home in a cart; the other walked thither with some difficulty, and remained indisposed for several days.

"The case was, there had been a horse drowned; but it was in a well that had been filled up, fifteen yards from the other: the hair which they discovered had been taken from a horse of mine, and accidentally blown into the well. Now, from this and other events of the same nature, I do not wonder at the conjurors having that persuasive power over thieves."

*Government.*] In order to afford a correct view of the system of government adopted in the United States, it will be necessary to observe, that the articles of the confederation, which were entered into and ratified by congress, in the year 1778, were soon found inadequate to the production of a permanent constitution, which required a firm and executive power. Accordingly, after various amendments had been submitted from the different states, a new form was adopted in the year 1789, by which the government was vested in a president and two councils. The president is chosen for the term of four years. The senate, or superior council, consist of two senators from each state, chosen every six years; the house of representatives is elected every second year, and is not to contain more than two hundred members, each representing, according to the amount of the population, from thirty-three to fifty thousand inhabitants. The legislative power is vested in the two councils; while the executive is lodged with the president; and a vice-president is elected to supply his place on any emergency. The president commands the army and navy, and may pardon offences, except in case of impeachment; he also concludes treaties, with the consent of two-thirds of the senators, who are also to advise in the appointments of ambassadors, &c. Regulations are likewise formed to prevent any distinct state from assuming offices which belong to the community, such as forming treaties, issuing letters of marque,

and similar acts of independence, which might endanger the constitution. The judicial power is lodged in one supreme court, and in such inferior courts as the congress may ordain, the judges holding their offices during their good behaviour. Each province has also its peculiar government, consisting commonly of a senate and house of representatives, who are chosen annually, which causes continually electioneering cabals.

It is worthy of remark, that this system of government has always been subjected to the caprices and abuse of political intriguers, particularly those who espoused the principles of the French revolution. The consequence has been, that in the senate and the house of representatives the most furious and disgraceful quarrels have frequently taken place. To such extent, indeed, have the political cabals within them been carried, that some of the members, who have differed on trifling subjects, have actually assaulted each other with the poker and tongs belonging to the fire-place of the assembly; as will appear from a reference to any file of the *Courier*, the *Sun*, or the *True Briton*, London newspapers, for the months of April and May, 1797.

At present, the chief parties are the Federalists and Anti-federalists. The former have been accused of wishing to establish a monarchy and an hereditary aristocracy; while the latter have been suspected of inclining too much towards a speculative democracy. Inlay says, that the Federalists introduced the present government, while the Anti-federalists do not, like the French, wish to abolish the detached government of each state, but are merely so termed as oppositionists, and thence more democratic than the former. The chief real division of sentiments seems to be between the commercial men and the farmers; the former being bound to England by the ties of interest, while the latter breathe a greater spirit of independence, though they have no substantial property to boast of.

*Laws.*] For the following observations on the laws of this country we are indebted to Dr. Barton:

"The law of the United States is of a complex character; relating, first, to objects of state jurisdiction; and, secondly, to objects of federal jurisdiction.

"The objects of *state jurisdiction* comprehend every case which is not exclusively of federal jurisdiction, or not expressly prohibited by the federal constitution. The law affecting these objects is either written or unwritten. The *written* law of every state is composed of the constitution of the United States, acts of congress, and treaties; and of the constitution of the state, and the acts of the state-legislature. The *unwritten* law of every state is composed of so much of the common law of England, in criminal and civil cases, as was applicable to the circumstances of the state when it was first settled; and of the customs and usages of the people, sanctioned by time, or recognised

by the courts of to the American states only under the statute was en colony, and was suits of the settle the statute were lonies. Thirdly, V in general terms, tute. by the courts of law. The statute-law of England, prior to the American revolution, has force in the respective states only under particular circumstances: First, Where the statute was enacted previously to the settlement of the colony, and was suitable to the colonial situation and pursuits of the settlers. Secondly, Where the provisions of the statute were extended, by its own words, to the colonies. Thirdly, Where the colonial legislature has adopted in general terms, or re-enacted in detail, the English statute. Fourthly, Where the courts of law have recognised and enforced a convenient practice, originating in the presumption that a statute had been extended, and was in operation in the colony. The evidence of the law, prior to the American revolution, was the same as in England; but, subsequent to that epoch, the reports and elementary works of English jurists are cited in the American courts; not by way of authority, but by way of analogy and illustration. It will readily occur to the reader, that, on the same principle which recognises the law of nations, the law of merchants, the civil law, and the canon law, as a part of the common law of England, those codes are also recognised, in the system of American jurisprudence, as affording the rules of decision upon the subjects to which they respectively apply.

"The law of the several states is administered, as in England, through the medium of judicial and ministerial officers, acting collectively as courts, or individually as magistrates. The judicial officers are judges, justices of the peace, registrars of wills, or other similar officers, exercising a jurisdiction of an ecclesiastical nature, for the probate of wills, and issuing letters of administration. The ministerial officers are sheriffs, coroners, &c. &c. In each state, generally speaking, there are a court of errors and appeals, a supreme court, county courts of common pleas, and quarter sessions, an orphan's court, and a register's court. And, in almost every state, the justices of the peace have individually a limited cognizance of civil suits, besides the authority common to all judicial officers in criminal matters.

"The objects of federal jurisdiction are confined to the cases expressly delegated or contemplated by the constitution of the United States; and all these objects, both as to civil and criminal matters, are of a national character. It follows, from this view of the subject, that the law of the United States consists entirely of *written law*; viz. of the constitution of the United States, the acts of congress, and treaties. It is true that, in criminal as well as in civil cases, congress, in order to effectuate the powers expressly delegated to the federal government, may adopt the unwritten law of any individual state of the union, of England, of France, or of any other nation; but still it is only by force of the written law of the United States that the adoption can be accomplished. In the specified

*civil cases*, the constitution gives to the federal courts sometimes original, and sometimes appellate, jurisdiction; sometimes concurrent with the state courts, and sometimes exclusive: and by an act of congress, made to effectuate the judicial powers of the union, it is expressly provided, that 'the laws of the several states shall be regarded as rules of decision, in trials at common law, in the courts of the United States.' As the laws of the several states consist of the unwritten law, as well as of the written law, this provision gives, of course, a common law jurisdiction, in civil cases, to the federal courts; but, in *criminal cases*, no such general provision exists. The penal code of the United States rests, therefore, upon the constitution, and the several acts of congress, for defining and punishing crimes and offences: and if the jurisdiction of the federal courts, in criminal matters, is confined to the penal code of the United States, it has been anxiously asked, How it can embrace crimes and offences at common law? The question has generated a diversity of opinion; and even the judges of the supreme court of the United States have pronounced contrary decisions upon it. The federal courts having jurisdiction of the subject, are governed, according to its nature, by the laws of the United States, or of the individual states, by the law of nations, the law of merchants, and by the civil and canon law.

"The law of the United States is administered, through the medium of federal courts and officers, similar to those of the individual states, admitting, in some instances, the auxiliary aid of the state-courts and magistrates. The supreme court of the United States consists of a chief justice and five associate judges, and sits at the seat of the national government. The United States are divided into five circuits, each circuit composed of a specified number of districts, or states; and a circuit court, held by a judge of the supreme court, and the district judge of the proper state, sits twice a year in each district. Each state is erected into a federal district, in which a court is held four times a year by the district judge. Besides an attorney-general for the union, the United States appoint an attorney and a marshal, who has all the powers of a sheriff, for each district."

*Population.*] The population of these extensive territories was estimated, by order of congress, in 1790, and found to be three millions nine hundred and thirty thousand, exclusive of the inhabitants north-west of the Ohio, supposed to be twenty thousand. By the return of the population of the United States, printed at Washington, in the year 1802, the total was five millions one hundred and seventy-two thousand three hundred and twelve, the slaves being included, whose number was eight hundred and seventy-five thousand six hundred and twenty-six.

*Army.*] A small military force is kept, in time of peace,

for the sake of supporting public order. But a standing army is deemed incompatible with the republican government; and the strength of the state is computed from the militia, which is reckoned by Morse at seven hundred thousand.

The navy of the United States was, till recently, very inconsiderable; but, during the last war, a number of vessels have been built; and, as Mr. Pinkerton observes, "it is probable that, in the course of a century or two, the American fleet will rival any in Europe."

*Revenue.*] The revenue of these provinces is principally derived from the duties on imports and tonnage; the taxation being comparatively small. Morse informs us that the revenue, in 1789, amounted to two millions sixty-nine thousand and seventy-five dollars, while the expence in the year was seven hundred and forty thousand two hundred and thirty-two dollars. From the same authority it appeared that, in 1792, the domestic debt of the United States amounted to more than thirty-one millions of dollars, and the foreign debt to about twelve millions of dollars. The common interest of the American funds is six per cent.

According to the report of Mr. Gallatin, secretary of the treasury, published in 1803, the revenue of 1802, arising from the duties, exceeded ten millions one hundred thousand dollars, and that from the sale of public lands, four hundred thousand. The annual expences were nine millions eight hundred thousand dollars, of which seven millions three hundred thousand were appropriated to the payment of principal and interest of the public debt, and two millions five hundred thousand to the expences of government, &c. About ten millions of the public debt had then been discharged. The price of land was about two dollars per acre: but he should, in justice to the emigrants, have added what was the expence of clearing it. The expences of government, and the interest of the national debt, require about seven millions four hundred thousand dollars; the remaining sum is to go towards the extinction of the national debt.

It appears that the revenue of the United States, in 1805, amounted to about twelve millions and a half of dollars.

*Inland Navigation.*] On this subject, Dr. Barton observes, "Considerable progress has already been made in opening canals for inland navigation, though the numerous great rivers have been found sufficient for the purposes of general and extensive intercourse. Indeed, no country in the world can boast of superior means of inland commerce by the great river Mississippi, and many other navigable streams, not to mention the lakes of prodigious extent. In Pennsylvania several canals have been projected, but most of them have been laid aside. A very useful one, however, has been completed in this state:

this is the Connewaga Canal, by which the inconveniences of the falls of that name in the Susquehanna are avoided. An important canal upon the Potowmac River has also been completed. The Santee Canal, in South Carolina, is thought to be equal to any work of this kind within the United States. It was begun in 1792, and completed in 1800, at the expence of not less than one hundred and fifty thousand pounds sterling. It is thirty-five feet wide at the top, sloping down to a width of twenty feet at the bottom, and is calculated to contain a depth of four feet water, capable of passing boats of twenty-two tons. Many other canals are contemplated in different parts of the union, particularly one between the great bays of Chesapeake and Delaware. Within a few years considerable improvements have been made in the roads, particularly in Pennsylvania, where excellent turnpikes, little inferior to many of those in Britain, have been completed. Many bridges have also been erected, some of them, particularly in the New England States, of great extent. A fine bridge was erected in 1804 over the River Schuylkill, near Philadelphia. In short, improvements of every kind are rapidly advancing in almost every part of the United States.

*Manufactures.*] The chief manufactures of the United States are tanned leather and dressed skins; various works in iron and in wood; with several articles of machinery and husbandry. Cables, sail-cloth, cordage, twine, pack-thread, bricks, tiles, and pottery; paper, hats, sugars, snuff, gunpowder, with utensils in copper, brass, and tin; clocks and mathematical machines, and carriages. The domestic manufactures, in coarse cloths, serges, flannels, cotton and linen goods of several sorts; not only suffice for the families, but are sometimes sold, and even exported; and in most districts a great part of the dress of the inhabitants is the product of domestic industry. The number of persons to whom patents have been issued for inventions and improvements, as appears from the report, February, 1805, exceed six hundred.

Mr. Janson, in his interesting work, called the "Stranger in America," makes the following observations on this subject:—

"Manufactures, the great source of national wealth, are at a low ebb in the United States. The amazing tracts of uncultivated land draw the attention even of mechanics. At Boston, Newhaven, and other places, some Englishmen lost their capitals by endeavouring to establish cotton manufactories. The high price of labour absorbed every contemplated profit; and the fickleness of the people, and their partiality for European goods, would be great impediments to the sale of an article known to be of home-manufacture. Thus the country girls, who weave beautiful cottons, of various colours and patterns, and extremely durable, exchange the produce of their labour for fimsy Scotch calicoes; giving, to use their own terms,

'yard for yard,' outwear three or four; eagerly take in exchange the most frequently fashionable like the belles of the day. Cordage and iron; but the man who makes the nails, which they profit in this branch, every part of the branch, of which America is playing cards, whist, and other games, counterfeiting, with great exactness, the fish shilling per pair, the wool-cards, the tea, and ingenious pieces, more numerous than makers have the address.

"In Philadelphia, the quantity of stock manufactures carried on by the manufacturers a week. Thus they are endeavouring to sell what they have. This is not the greatest contempt shewn to the manufactures, but prevents the manufactures in the market, and thus the sacrifices. Thus this often comes to pass.

"Wines, of a taste French settlers on particularly the blacks, neously in those districts, the northern and middle equal to that from the

Dr. Barton observes, the United States must not to a mature state; the monopoly of Great Britain, rivalry of her fabric, prevent a constant advancement of industry and skill.

United States, daily every species of manufactures, simple productions, fairly stated, that the with all, or much, of the bricks:—Every quality of ashes, malt-liquors, molasses; starch, wax,

'yard for yard.' Though this home-wove cotton will outwear three or four garments made of that which they eagerly take in exchange, yet the latter is British, consequently fashionable; and the American mountain girls, like the belles of St. James's, study the fashions of the day. Cordage and sail-cloth are brought to great perfection; but the manufacture which thrives best is that of nails, which they cut of all sizes, and to considerable profit: in this branch they will soon be able to supply every part of the union. They also excel in a certain branch, of which Americans are great consumers; I mean, playing cards, which they make in Boston in great quantities, counterfeiting the English devices and wrappers with great exactness. Some of these are sold for an English shilling per pack. In Boston there is another card manufactory, and for a very different use. Here are made wool-cards, the teeth of which are constructed with a new and ingenious piece of mechanism; but as gamblers are more numerous than manufacturers, the playing-card makers have the advantage.

"In Philadelphia and the adjacent towns, a considerable quantity of stockings are made, and other small manufactures carried on; but for want of a regular demand, the manufacturers are obliged to attend the markets twice a week. Thus they lose one-third of their time in endeavouring to sell what they make in the other two-thirds. This is not the greatest hardship under which they labour: the contempt shewn to domestic manufactures generally prevents the manufacturer from disposing of his commodities in the market, which obliges him to make great sacrifices. Thus this industrious part of the community too often comes to poverty and distress.

"Wines, of a tolerable quality, have been made by French settlers on the Ohio, from various wild grapes, particularly the black and fox kinds, which grow spontaneously in those districts. Maple-sugar is prepared in the northern and middle states, and is by many deemed equal to that from the cane."

Dr. Barton observes, "that some of the manufactures of the United States may be considered as having advanced to a mature state; and, in regard to these, the ancient monopoly of Great Britain is at an end. Nor does the rivalry of her fabrics, nor those of other foreign nations, prevent a constant and increasing supply from American industry and skill. Foreign manufacturers, settled in the United States, daily enlarge that supply. Passing by every species of meal, boards, staves, shingles, and other simple productions of labour and mechanism, it may be fairly stated, that the United States can supply themselves with all, or much, of the following manufactures and fabrics:—Every quality of refined sugar, pot and pearl ashes, malt-liquors, distilled spirits from fruit, grain, and molasses; starch, wafers, glue, soap, candles, shoes, boots,

gloves; fine, common, and coarse hats; wrought silver and gold, including much plated ware; carriages for pleasure and for draught, ships and boats, cooper's wares of every kind, saddlery, harness, and trunks; every kind of cabinet-ware, lead, brass, pewter, and copper-ware, and those of tin and tin plated; many printed books, blank books, book-bindings, much paper-hanging and sheathing, printing and writing paper; cables, cordage, twine, and packthread; gunpowder, snuff, and manufactured tobacco; bricks, tiles, pottery, some slate, wrought marble and stones for buildings; coarse manufactures, for cotton, linen, and wool, and some middling, and a few of fine qualities; some hosiery; household furniture, of various qualities and descriptions; a considerable quantity and variety of engravings; carved and gilt works; bolts, spikes, and many nails; chemical and galenical preparations; cannon, muskets, rifles, pistols, bayonets, swords, clocks, and many watches, &c. &c. After repeated estimates, in various forms, and on different principles, it is held, by persons of information and experience, that the value of all the commodities manufactured in the United States, (those from meal and wood not included,) is considerably more than that of all the exported American products and manufactures. The progress of this important branch of the national industry is equal to every reasonable expectation. With respect to the finer manufactures, many of them are in their infancy, and many of them are not yet commenced. Not a few will probably be long delayed. Those branches, however, which depend on labour-saving machinery, have lately attracted the utmost regard, and will doubtless advance with rapidity within a few years. No country values more than America all the interesting branches of household manufactures; and as the females weave in several of the states, and not the men, few countries pursue family manufactures to so great an extent. The preparation of the manufactures of the dairy, which may be included under this head, has wonderfully increased within a few years. The butter, for example, exported in the year 1792, was only eleven thousand seven hundred and sixty-one firkins, weighing less than seven hundred thousand pounds; and the cheese, in the same year, one hundred and twenty-five thousand nine hundred and twenty-five pounds. In 1802, the butter was two millions three hundred and sixty-one thousand five hundred and seventy-six pounds; and the cheese was one million three hundred and thirty-two thousand two hundred and twenty-four pounds, although the consumption of the latter is annually increasing. It is, upon the whole, manifest, that the acquisition of foreign artists, the ingenuity of native Americans, the discovery of chemical secrets, the introduction of labour-saving machinery, and, above all, the vast abundance, and, perhaps, the redundancy of cotton-wool, must annually in-

It may be necessary to add, that the dollar bears a different value in various parts of the United States. In Pennsylvania it is equal to seven shillings and sixpence; and the eighth part of it is, in consequence, called an elevenpenny bit. In New England and Virginia it is six shillings; and in South Carolina the currency is sterling.

*Language and Literature.*] The English language has remained in constant use in the United States, and is generally spoken with considerable purity, though some medical and political writers occasionally make use of peculiar phrases and idioms, so that some have supposed that the dialect may in time become as different as the Portuguese is from the Spanish. But the best writers follow the classical models of their British ancestors.

Within the last sixty years, many authors of considerable merit have arisen in the United States. Literary academies publish their transactions; and magazines and newspapers contribute to the diffusion of useful knowledge, though the latter are devoted almost entirely to the purposes of commerce and faction; the small portions of them which are not filled with advertisements, containing the most virulent abuse, scarcely a paragraph of which, if published in England, but would be deemed a libel. In the northern provinces, called New England, some schools are established, and the Catholics have a college in Maryland.

*Universities, &c.*] Harvard University, in the province of Massachusetts, founded in 1638, is the most ancient as well as the chief, literary establishment in North-America. Yale College, in Connecticut, was founded in 1700, but the buildings only began to be erected at New Haven in 1717. It was rebuilt in 1750, and contains about one hundred and thirty students. The college of William and Mary, in Virginia, was built about the same time, and the students chiefly devote their attention to the law.

A college was founded in New York, by an act of the British parliament, in 1754, and is now called Columbia College. It is frequented by upwards of one hundred students. The college in Prince Town, in New Jersey, called Nassau Hall, was founded about the year 1738, and enlarged in 1747. The income is about nine hundred pounds a year, of which two hundred pounds are produced from land and public securities, while the remainder is paid by the students. The college is a large and handsome building, and stands in a pleasant and healthy situation.

Dartmouth College, in New Hampshire, was founded in 1769, for the instruction of the Indians, but has since become a place of education for the youth of the northern provinces.

There are several literary societies in Pennsylvania, particularly the American Philosophical Society, which originated in 1769, and published, in 1771 and 1786, two

53. VOL. I.

volumes of their transactions. The university of Pennsylvania was founded at Philadelphia during the war; and, having since been united with the college, has become a respectable seat of learning. There are also Dickinson College and Franklin College, in the same province.

In 1782, Washington College was founded at Chester Town, in Maryland. The university of Georgia, at Louisville, is a modern foundation, and possesses funds to the amount of fifty thousand acres of land. The foundation did not take place till 1801, though Dr. Morse says, the charter was granted in 1785. Some other states have colleges, or considerable academies.

Jefferson College, so named after the president, is a new foundation in the Mississippi territory.

In the winter of 1803, an academy of arts was founded at New York. The design is said to have originated with Mr. Livingston, formerly ambassador at Paris, and his brother was the first president. It has eight directors, elected by the subscribers, of whom there are about one hundred, each paying annually fifty dollars. The building, which contains the collection of statues and paintings, was formerly a circus, and now contains a valuable series of casts of admired ancient figures. The encouragement given to the students is similar to that of our own academy. In 1805, another academy of a similar nature was established at Philadelphia.

*Cities.*] The cities of the United States must be thus arranged, with respect to their size and importance:—1, Philadelphia; 2, New York; 3, Boston; 4, Baltimore; 5, Charlestown; but in respect to commerce, New York precedes Philadelphia, and Baltimore is considered to rank beneath Charlestown. There is, however, an embryo city, founded in honour of General Washington, and intended to rival all the rest; though it is evident it cannot equal, for a vast period of time, the commercial importance of New York and Philadelphia. The following account of it has appeared in the last edition of Morse's publication.

WASHINGTON, the metropolis of the United States, is situate at the junction of the rivers Patowmak and the eastern branches, in thirty-eight degrees fifty-three minutes of north latitude, extending nearly four miles up each, and including a tract of territory exceeded, in point of convenience, salubrity, and beauty, by none in America; for although the land in general appears level, yet, by gentle and gradual swellings, a variety of elegant prospects is produced, and a sufficient descent formed for conveying off the water occasioned by rain. Within the limits of the city are a great number of excellent springs; and, by digging wells, water of the best quality is obtained. Besides, the never-failing streams that now run through that territory are also collected for the use of the city.

The eastern branch is one of the safest and most com

7 M

modious harbours in America, being sufficiently deep for the largest ships for about four miles above its mouth, while the channel lies close along the bank adjoining the city, and affords a large and convenient harbour. The Patowmak, although only navigable for small craft, for a considerable distance from its banks next to the city, (excepting about half a mile above the junction of the rivers,) affords a capacious summer-harbour; as an immense number of ships may ride in the great channel opposite to, and below, the city.

The situation of this metropolis is upon the great post-road, equi-distant from the northern and southern extremities of the Union, and nearly so from the Atlantic and Pittsburgh, upon the best navigation, and in the midst of a commercial territory, probably the richest, and commanding the most extensive internal resources of any in America. It had, therefore, many advantages to recommend it, as an eligible place for the permanent seat of the general government.

The plan of this city appears to contain some important improvements upon those of the best-planned cities in the world, combining, in a remarkable degree, convenience, regularity, elegance of prospect, and a free circulation of air. The positions for the different public edifices, and for the several squares, and areas of different shapes, as they are laid down, were first determined on the most advantageous ground, commanding the most extensive prospects, and, from their situation, susceptible of such improvements as either use or ornament may hereafter require. The capitol is situated on a most beautiful eminence, commanding a complete view of every part of the city, and of a considerable part of the country around. The president's house stands on a rising ground, possessing a delightful water-prospect, together with a commanding view of the capitol, and of the most material parts of the city. Lines or avenues of direct communication have been devised, to connect the most distant and important objects. These transverse avenues, or diagonal streets, are laid out on the most advantageous ground for prospect and convenience; and are calculated not only to produce a variety of charming prospects, but greatly to facilitate the communication throughout the city. North and south lines, intersected by others running due east and west, make the distribution of the city into streets, squares, &c.; and those lines have been so combined as to meet at certain given points with the divergent avenues, so as to form, on the spaces first determined, the different squares or areas. The grand avenues, and such streets as lead immediately to public places, are from one hundred and thirty to one hundred and sixty feet wide, and conveniently divided into footways, a walk planted with trees on each side, and a paved way for carriages. The other streets are from ninety to one hundred and ten feet wide.

In order to execute this plan, Mr. Mellicott drew a meridional line, by celestial observation, which passes through the area intended for the capitol. This line he crossed by another, running due east and west, which passes through the same area. These lines were accurately measured, and made the bases on which the whole plan was executed. He ran all the lines by a transit instrument, and determined the acute angles by actual measurement, leaving nothing to the uncertainty of the compass.

PHILADELPHIA was originally designed, in 1683, by William Penn, the first proprietor and founder of the colony called Pennsylvania. Its form is an oblong square, extending about two miles east and west, on the western bank of the Delaware. The city is neatly built, the chief streets being one hundred feet in breadth, paved with pebbles, and the foot-paths with brick. They are mostly in a straight line, a form by no means picturesque; but the builders have only studied convenience, and the obtaining of a short access from one part to another. The charter of incorporation, granted by Penn, in 1701, was copied from that of Bristol in England; but the general assembly of the province, in 1789, formed a plan more congenial to their democratic sentiments; and the government of the city, the prisons, &c. may now be regarded as surpassing any in the world. There are many humane institutions, and a large public library in this city; but one street, called Water-street, always remains a source of filth and contagion, though it was in this street that the dreadful yellow fever first appeared in 1793. At present the Quakers do not exceed one-fourth part of the inhabitants, and their aversion to the elegancies and luxuries of life is diminishing daily. Handsome equipages are often seen in the streets of Philadelphia, and the theatre is much frequented. The population consists of about fifty thousand individuals.

NEW YORK, the capital of the province of the same name, is situated on a promontory at the mouth of Hudson River, and extends about two miles in length, and four in circumference. It was greatly injured during the war, but has since been enlarged and improved. The chief edifice is the Federal Hall, a neat building of Grecian architecture, in which Washington was installed president of the United States. New York is considered, in commerce, as the chief city in North-America, the harbour being capable of admitting ships of any burden. It is also the gayest city, and is allowed to exceed Charlestown, in South Carolina, though the latter is considered a rival in hospitality; but, in public institutions for the promotion of education, the arts, sciences, &c. it is very deficient. The population is said to equal that of Philadelphia.

New York is one of the most ancient cities of North-America, and is certainly the finest, both for its situation and its buildings. It is to its superiority of situation that

this city owes the visit the United States, two rivers, in which seasons of the year other American people, with which seller the most of the inhabitants have been replaced apartments are able and useful.

The streets are which are regular well provided, and neatness. The quality and diversity sold at a cheap rate.

situation that

this city owes the preference, which most strangers who visit the United States give it. Placed at the entrance of two rivers, in which the largest ships can navigate at all seasons of the year, it has a great advantage over the other American ports. The number of ships of all burthens, with which these rivers are filled, give to a traveller the most enlarged ideas of the activity and industry of the inhabitants. The houses, formerly built of wood, have been replaced by others of stone or brick; and the apartments are furnished with every thing that is agreeable and useful.

The streets are broad, and furnished with footways, which are regularly lighted at night. The markets are well provided, and remarkable both for their regulation and neatness. The fish-market is particularly so, for the quality and diversity both of sea and river fish, which are sold at a cheap rate.

The custom-house, the court of justice, the state-prison, and the poor-houses, are superb edifices. The guildhall, which was small, and in a bad situation, has been rebuilt on a more magnificent plan, in a better quarter of the town.

New York has two public promenades, the one in the centre of the city, the other at the point of union of the two rivers. Both, however, are little frequented. The merchants seek recreation in the country on Sundays; and the American ladies prefer walking in the principal street, whose broad and commodious footways are ornamented with beautiful trees, and where they enjoy the pleasure of beholding the elegant shops which line it.

Most of the merchants or proprietors of vessels have docks, in which their ships are sheltered from the tide and the winds. These docks, which are of great advantage to commerce, are very prejudicial to the health of the city. They are in the greatest number on the river towards the east, which is the most mercantile, and, at the same time, the most insalubrious situation.

Boston, the capital of the province of Massachusetts, and of all those northern provinces called New England, was regarded by Mr. Burke as the chief city in North-America; and he says that, from Christmas 1747 to Christmas 1748, five hundred vessels cleared from this port only, for foreign trade, and four hundred and thirty were entered inwards; not to mention coasting and fishing vessels, supposed to equal the others in numbers. He considers the people of New England as the Dutch of America, being carriers for all the colonies of North-America and the West-Indies. The trade of Boston has, however, since declined. This city is supposed to contain about twenty thousand inhabitants. The harbour is excellent, and sufficiently capacious to receive five hundred ships at anchor; with a narrow entrance, commanded by a castle. There is a pier, about five hundred yards in

length, and eighty feet wide; and the harbour is interspersed with about forty islands, which produce excellent grain and pasturage. This city suffered considerably by the war, but it has been improved, and the public buildings are tolerably elegant. It does not exceed two miles in length, being of a circular form; and on the west is the mall, planted with rows of trees.

Here are sixteen edifices for public worship; of which nine are for Congregationalists, three for Episcopalians, two for Baptists, one for Quakers, and one for Independents. The other public structures are the state-house, Faneuil-hall, an alms-house, a work-house, and a bride-well. That building which was formerly the governor's house, is now occupied, in its several apartments, by the council, the treasurer, and the secretary. The public granary is converted into a store, and the linen manufactory-house is now occupied by the bank.

The principal bridge in this, or in any of the United States, is that which was built over Charles River, between Boston and Charlestown, in the year 1786. This structure is fifteen hundred and three feet in length, being built on seventy-five piers, and having a draw of thirty feet in width. The abutment at Boston to the old landing is forty-five feet and a half, and that at Charlestown from the old landing is a hundred feet.

Each pier consists of seven piles of oak-timber, united by a cap-piece, strong braces, and girts; driven into the bed of the river, and secured by a single pile on each side, driven obliquely to a solid bottom. The piers are also connected to each other by large string-pieces, covered with four-inch plank. The bridge has a gradual rise from each end, so as to be two feet higher in the middle than at the extremities: it is about forty-three feet in width, and on each side is a passage six feet wide, railed in, for the safety of foot-passengers. Forty elegant lamps are erected at a suitable distance from each other, to illuminate it when necessary.

The draw is constructed on a capital plan: the machinery is very simple, and it requires the strength of two men only in raising it. The floor on the bridge, at the highest tides, is four feet above the water, which generally rises about twelve or fourteen feet.

"This bridge," says Dr. Morse, "was completed in thirteen months; and, while it exhibits the greatest effect of private enterprize within the United States, it is a pleasing proof how certainly objects of magnitude may be attained by spirited exertions."

ANNAPOLIS is the capital of Maryland, and the wealthiest town of its size in America. It is situated at the mouth of Severn River, thirty miles south of Baltimore, and the houses are, for the most part, very large and elegant. The design of those who planned the city was to have the whole in form of a circle, with the streets like

radii, beginning at the centre where the state-house stands, and thence diverging in every direction: the principal part of the buildings are arranged agreeably to this plan. The state-house is the noblest edifice of the kind in America.

RICHMOND, the seat of government in Virginia, stands on the north side of James River, and contains about three hundred houses; part of which are built upon the margin of the river, and the rest upon a hill, which commands an extensive prospect of the circumjacent country. Here a large and elegant state-house has been recently erected; and, in the lower part of the town, a handsome bridge, constructed on boats, has been thrown across James River.

Mount Vernon, the seat of the late General Washington, is situated on the Virginia bank of the Patowmak, where it is nearly two miles wide, and about two hundred and eighty miles distant from the sea. The area of the mount is two hundred feet above the surface of the river, and, after furnishing a lawn of five acres in front, and about the same in rear of the buildings, it falls off rather abruptly on those two quarters. On the north end it subsides gradually into extensive pasture-grounds; while, on the south, it slopes more steeply, and terminates with the stables, vineyard, and nurseries. On either wing is a thick grove of flowering forest-trees; and parallel with them, on the land-side, are two spacious gardens, into which one is led by the serpentine gravel-walks, planted with weeping-willows and shady shrubs.

The house itself, which is built of wood, but cut and painted to resemble stone, appears venerable and convenient, and the banquetting-room, in particular, is very superb. A lofty portico, ninety-six feet in length, and supported by eight pillars, has a charming effect, when viewed from the water; and the whole assemblage of the green-house, school-house, offices, and servants' halls, when seen from the land-side, has a striking resemblance to a rural village; especially as the lands on that side are laid out somewhat in the form of English gardens, in meadows and grass-grounds, ornamented with little copses, circular clumps, and single trees. A small park on the margin of the river, where the deer are seen through the thickets, alternately with the vessels as they are sailing along, add a romantic appearance to the whole scenery. On the opposite side of a small creek to the northward, a considerable extent of corn-fields and pasture-land affords a luxuriant landscape to the eye; while the blended verdure of woodlands and cultivated declivities on the Maryland shore, variegates the prospect in a most charming manner.

CHARLESTOWN, in South Carolina, is situated on the tongue of land which is formed by the confluence of Ashley and Cooper Rivers, which mingle their waters immediately below the town, and form a spacious and convenient harbour. The streets, from east to west, extend

from river to river, and, running in a straight line, not only open beautiful prospects each way, but also afford excellent opportunities, by means of subterraneous drains, for removing all nuisances. These streets are intersected by others nearly at right angles, and throw the town into a number of squares, with dwelling-houses in front, and offices and little gardens behind. Some of the buildings are elegant, and most of them neat, airy, and well finished. The public edifices are an exchange, state-house, armoury, and poor-house; besides ten churches, one meeting-house, and two Jewish synagogues.

The streets of Charlestown are wide, but not paved, and the feet of the passenger sinks into the sand every time he is obliged to quit the brick foot-paths attached to the houses. The rapid course of the coaches and cabriolets, the number of which is proportionably much greater in this than in any other town in America, continually reduces this moving sand, and attenuates it to such a degree, that the slightest wind fills the shops with its dust, and renders the situation of pedestrians peculiarly disagreeable. At certain distances, the inhabitants are supplied, by pumps, with water; but it is so brackish, that it is astonishing how a stranger can accustom himself to drink it. About seven-tenths of the town consist of wooden buildings; the rest are of brick. According to the last census, taken in 1803, its population, including strangers, amounted to ten thousand six hundred and ninety-nine whites, and nine thousand and fifty slaves.

Travellers, who may arrive here, or at the other towns of the United States, will find no furnished houses or apartments to let; no tables d'hôte, or cooks' shops, but only boarding-houses, where all their wants may be supplied. In Carolina, the charge at these establishments is from twelve to twenty dollars per week, which is excessive, and not proportionate to the price of the articles which are provided. Beef, for instance, seldom costs more than twelve sous per pound; and vegetables are dearer than meat. Besides the articles of consumption furnished from the country, the port of Charlestown is continually filled with small vessels, which arrive from Boston, Newport, New York, and Philadelphia, and from all the little intermediate harbours, which bring flour, salt meat, potatoes, onions, carrots, beet-root, apples, oats, maize, and hay: planks and timber also form a considerable article in the importations; and though all these productions are brought from a distance of nine or twelve hundred miles, they are cheaper, and of a better quality, than those of the surrounding country.

In winter, the markets of Charlestown are supplied with sea-fish alive, which are brought from the northern parts of the United States, in vessels so constructed that the sea-water is continually renewed in them. The ships engaged in this commerce return loaded with rice and cot

tons, the greater part of the freight being sent to the southern states. In the north, manufactures, and the necessary articles of commerce, are distributed, and make it into armies of families.

Wood is very abundant, of which they consume many miles, and, in the town; and the water at the confluence of the wood arises from a great number of sources, which are brought to the town.

NEW ORLEANS, the east bank of the Mississippi, is situated a few minutes of north of the time of the Mississippi. The regency of the town is largely disposed, being those of the river there. A great fire, which destroyed many houses, destroyed the town completely rebuilt, and the houses were destroyed. It was fortified; and it was resistance.

A French war, which was a volume, entitled "The exportation of the sugar of 1800 to June 1801 of flour, one thousand barrels of tobacco, with considerable quantities of inhabitants are women remarkable for their beautiful hair.

by some French. The advantage of its distance is a great mouth of the river, its trade to the West-India Islands, this important receptacle for the Missouri.

During the war, the inhabitants of the greater advantage, burg, whence

line, not only afford excellent drains, for intersected by a town into a front, and the buildings well finished. Use, armoury, meeting-house,

tons, the greater part of which is re-exported to Europe, the freight being always cheaper in the northern than in the southern states. The wool and cotton which remain in the north are more than sufficient for the supply of the manufactures, which are but few in number; and the excess is distributed in the country parts, where the women make it into articles of clothing for the use of their families.

Wood is very dear at Charlestown; and yet the forests, of which they do not even know the extent, begin at six miles, and, in some parts, at a less distance, from the town; and the conveyance is facilitated by the two rivers at the confluence of which it is situated. The dearth of wood arises from the scarcity of hands to cut it; and a great number of individuals burn, from economy, coals which are brought from England.

NEW ORLEANS, the capital of Louisiana, is seated on the east bank of the Mississippi, in thirty degrees two minutes of north latitude. The city was founded in the time of the Mississippi scheme, about the year 1720, under the regency of the Duke of Orleans. The plan is regularly disposed, the three principal and parallel streets being those of Orleans, Bourbon, and Charteris. Towards the river there is a noble quay. In the year 1786, a dreadful conflagration happened, which, out of eleven hundred houses, destroyed nine hundred. It has since been completely rebuilt, and now contains about one thousand four hundred houses, and ten thousand inhabitants. In 1793, it was fortified; but the works are bad, and could offer but little resistance.

A French writer, who, in 1805, published, at Paris, a volume, entitled, "*Memoires sur la Louisiane*," estimates the exportation of the city of New Orleans, from June 1800 to June 1801, at more than sixty thousand barrels of flour, one thousand bales of cotton, two thousand barrels of tobacco, and one thousand five hundred of sugar, with considerable quantities of indigo and peltry. The inhabitants are generally of French extraction, and the women remarkable for fine complexions and teeth, and beautiful hair. Boarding-schools have been established by some French emigrants.

The advantages for commerce are certainly very great. Its distance is about one hundred and five miles above the mouth of the Mississippi; but a week's sail will convey its trade to Mexico, and the British, French, and Spanish, West-India Islands; hence there is reason to believe that this important settlement will become the grand mart and receptacle for the produce of all the extensive countries on the Missouri, Mississippi, and Ohio.

During the war occasioned by the French Revolution, the inhabitants of the little town of Bedford obtained greater advantages by sending their grain, &c. to Pittsburgh, whence they were conveyed, by the Ohio and the

Mississippi, to New Orleans, there to be embarked for the Antilles, than by sending those articles to Philadelphia or Baltimore. Notwithstanding this, it is reckoned but two hundred miles from Bedford to Philadelphia, and one hundred and fifty miles from Bedford to Baltimore, on a well-frequented road; whilst the distance from Bedford to New Orleans is thought to be two thousand two hundred miles, viz. one hundred miles, by land, to Pittsburgh, and two thousand one hundred miles, by water, from Pittsburgh to the mouth of the Mississippi. Thus we perceive that the navigation of the Ohio and of the Mississippi is easy, and of light expence, since it compensates for the enormous difference which exists between the two distances. The situation of New Orleans, relative to the Antilles, insures great advantages to this town, over all the eastern parts of the United States; and, in proportion as the new states of the west increase in population, New Orleans will become the centre of an immense commerce.

SAVANNAH was formerly the capital of Georgia, but contained less than one thousand inhabitants. Augusta, which, from two houses, in 1780, rose to two hundred in 1787, has deprived it of its little consequence. The new seat of government is Louisville, on the banks of the River Ogeshe, about seventy miles from its mouth: the records and legislature were transferred thither in the year 1795.

PITTSBURGH, which stands at the junction of the Rivers Allegany and Monongala, commands the navigation of the noble River Ohio, and is already a town of considerable trade, the houses amounting to more than four hundred. Within less than a dozen years, this town has increased ten-fold, and is now a receptacle of the trade between Philadelphia, Baltimore, and the western states. Some vessels with three masts, carrying about two hundred and fifty tons, have here been constructed, and pass from the Ohio and Mississippi to the West-Indies.

The level ground on which this town is built is not more than from forty to fifty acres in extent. It is a triangle, the sides of which are confined, on all parts, either by the bed of the Rivers Monongala and Allegany, or by the mountains. The houses are mostly of brick; and, as many of these are not contiguous, but are separated by considerable spaces, the entire surface of the angle is occupied; and they have already begun to build on the sides of the high hills which command the town. It was at the upper part of the angle that the French constructed the Fort Duqu  ne, but which has been entirely destroyed, nothing remaining but the vestiges of the surrounding fosses. There is a delightful view, produced by the perspective of the rivers, the banks of which are shaded by forests, particularly those of the Ohio, which extends in a right line, and permits the eye to follow its course to a considerable distance.

The air of Pittsburgh and the vicinity is very healthful; intermitting fevers, so common in the southern states, are here unknown; nor are the inhabitants tormented with mosquitoes during the summer. The necessities of life are also one-third cheaper than at Philadelphia. Pittsburgh contains two printing-offices, each of which publishes two newspapers per week. This place has long been considered by the American Government as the key of the western countries. It was from thence that the federal forces were sent against the Indians, who opposed the first establishment of the Americans in Kentucky, and on the banks of the Ohio. But now that the Indians have been driven back to a great distance, and deprived of the power of annoying the inhabitants, even in the remotest parts of the interior; and the western countries having also acquired a vast population, there is at Pittsburgh only a weak garrison, in palisaded barracks, contiguous to the town, on the bank of the River Alleghany. But, though this town has lost its importance as a military post, it has acquired more in point of commerce. It is the depot of merchandise from Philadelphia and Baltimore, sent thither at the commencement of spring and autumn, to supply the states of the Ohio and Kentucky, and of the settlement of Natches.

The conveyance of merchandise from Philadelphia to Pittsburgh is performed in large covered waggons, drawn by four horses, harnessed two a-breast. The price of the carriage varies according to the season; but seldom exceeds six dollars per hundred weight. The distance is computed to be three hundred miles from Philadelphia to Pittsburgh; and the carriers perform the journey in twenty or twenty-four days: the charge of conveyance is not high, for the waggons generally return empty.

MARIETTA did not exist twenty-five years ago, but now contains two hundred houses. In the same state, recently admitted into the union under the name of the state Ohio, is the town of Gallipoli, which contains about a hundred houses, the inhabitants being mostly French.

KNOXVILLE, the seat of government in the state of Tennessee, is situated on the River Holston, which, at this place, is one hundred and fifty fathoms in width: the houses, in number about two hundred, are almost all of wood. Although it has been built nearly thirty years, this little town has not yet any kind of establishment of manufactory, except some tanneries. Commerce, however, is brisker here than at Nashville, and the stores, of which there are fifteen or twenty, are better provided. The merchants obtain their supplies by land from Philadelphia, Baltimore, and Richmond, in Virginia; and, in return, send by the same channel the productions of the country, which they buy from the farmers, or take in exchange for their goods. Baltimore and Richmond are the towns with which they have the greatest dealings. The price of

carriage from Baltimore is six or seven dollars the hundred weight. It is reckoned five hundred miles from this town to Knoxville, six hundred and forty to Philadelphia, and four hundred and twenty to Richmond.

They also send flour, cotton, and lime, to New Orleans, by the River Tennessee; but this method is not much used, the navigation of this river being very much interrupted, in two different places, by shoals and rocks. It is reckoned about six hundred miles from Knoxville to the efflux of the Tennessee into the Ohio, and thirty-eight miles from thence to that of the Ohio into the Mississippi.

There are many other towns in the country parts, but they are not worthy of a particular description. M. Michaux observes, that, in the United States, they frequently give the name of *town* to an assemblage of six or eight houses; and that their manner of building is not every where alike. At Philadelphia the houses are of brick; but in the adjacent towns, and even in the fields which surround them, the half, and frequently the whole, of the houses are of shingles; while, between seventy and eighty miles from the sea, in the middle and southern states, but particularly in those that lie to the westward of the Alleghany Mountains, seven-tenths of the inhabitants live in log-houses. These are made of the trunks of trees, from twenty to thirty feet long, and about four or five inches in diameter, placed one above the other, and supported by being dove-tailed at the ends. The roof is constructed of pieces of the same length as those that form the shell of the house; but they are not so heavy, and are gradually drawn together on each side: these limbs support the covering of shingles, which are fastened by means of small wooden pegs. Two doors, which often serve instead of windows, are made by sawing away a part of the trunks that form the body of the house: the chimney, which is always situated at one of the angles, is likewise made of the trunks of trees, of a convenient length. The back, which is of potters' clay, about six inches thick, separates the fire from the wooden wall; but, notwithstanding this slight precaution, the accident of fire very seldom happens in these houses. The space between the trunks of the trees is filled with clay, but in such a slovenly manner that the light is perceptible on every side; hence these hovels are extremely cold in winter, notwithstanding the great quantity of wood that is burnt in them.

The doors move on wooden hinges; very few of them have locks, and at night they only fasten them with a wooden pin. Two men can build one of these houses in four or five days, without the use either of nails or other iron-work. Two large beds serve for the whole family; and, in summer, the children often sleep on the ground, wrapt in a coverlet. The floor, which is planked, is raised about two feet above the surface of the soil. They use

feather-beds, and in these parts, making stockings round the room across it.

[*Ins.*] Taverns in the United States, every where, however, they are never fail to afford articles are considered profits of those of liquors, for which generally wait till are served for but small slices of fried eggs and a broiled piece of salt-beef for beverage. In ham. There are clean sheets, however, the traveller who but this is a point of little concern.

*Inns.*] Taverns, or inns, are very numerous throughout the United States, but particularly in the small towns: every where, however, except in the large towns and their environs, they are of a wretched description, though they never fail to afford brandy, rum, and whiskey. These articles are considered of the first importance, so that the profits of those who keep inns arise chiefly from the sale of liquors, for which there is a great demand. Travellers generally wait till the family-hour to take their meals: they are served for breakfast with bad tea, worse coffee, and small slices of fried bacon, to which are sometimes added eggs and a broiled chicken. For dinner they give you a piece of salt-beef, roasted chickens, and rum and water for beverage. In the evening there is coffee, with tea, and ham. There are always several beds in one chamber: clean sheets, however, are a great rarity; and fortunate is the traveller who arrives on the day when they are changed; but this is a point on which an American gives himself little concern.

"Keeping a tavern," says Mr. Parkinson, "is looked upon as advantageous; but, to my great surprise, I found only three Englishmen in that way of life, and all dissatisfied. One of them lives at Philadelphia, keeps one of the first taverns, and deals very largely in horses. He told me he did not like his situation; but, knowing the art of cropping and nicking horses, and breaking them for carriages, which is not much known in America, he is resorted to by many gentlemen from great distances. I was acquainted with some persons who had gone from two to three hundred miles to buy coach-horses of him. He told me, notwithstanding he appeared to have the best business in the country, that there was nothing to be done: he had sold forty-five horses in England in one day, which was more than he had ever disposed of in America in a year, where, for want of a return, they were rather a loss; the feeding of and attendance upon horses consuming the profit."

The idea of a *military officer* keeping a *public-house* must excite the risibility of an English reader; but this is by no means uncommon in the United States. M. Michaux observes, that he resided at Wheeling, in the house of *Captain Reyner*, who keeps a tavern, known by the sign of the Waggon, and who takes boarders at the rate of two dollars a week. The same writer mentions *Colonel Ripley*, who keeps the sign of the General Washington, and *Colonel Bird*, who keeps a good *eating-house*! Thus, in a country where to get intoxicated is a daily occupation, a man who in other civilized parts holds the

rank of a gentleman, is not degraded by keeping a *whiskey-shop*!

*Customs, Manners, &c.*] It is particularly worthy of remark, that the men who have given the most severe, though accurate, picture of the state of society in North-America, are those who have travelled through it under the idea of finding amongst its inhabitants the utmost extent of urbanity and moral perfection. Among the principal observers of this description is the celebrated M. Volney, who gives his reasons for visiting America in the following words:

"In the year 1793, when I embarked from Havre, it was with the doubt and indifference which the spectacle and experience of injustice and persecution had given. Melancholy from the past, and anxious for the future, I went with doubt among a *free* people, to see if a sincere friend of that liberty which had been profaned, might find for his age a peaceful asylum, of which Europe no longer offered him the hope."

How far the author's doubts were founded on justice will appear by what he observes immediately afterwards. "If, instead of giving way to the exaggerated description of the happiness of the Americans, I had considered, in a moral point of view, the conduct of that people and their government, from the epoch of 1783 to 1793, I should have proved, by incontestible facts, that there does not reign in the United States, in proportion to its population, the mass of its affairs, or the multiplicity of its combinations, either more economy in its finances, more good faith in its transactions, more decency in its public morals, more moderation in the spirit of party, or more care in the education of youth, than in most of the old states of Europe: that what there is of good and useful, that what exists there of civil liberty and security of persons and property, has depended more on popular and individual habits, on the necessity of working, and the high price of manual labour, than on any skilful measures or any wise policy of the government; that among nearly all its chiefs, the nation has retrograded from the principles of its formation; in a word, that the United States owe their public prosperity, and their civil and domestic tranquillity, much more to their insulated situation, to their distance from any powerful neighbour, and from every theatre of war, and, above all, to the general ease of their circumstances, than to the essential goodness of their laws, or the wisdom of their administration."

The manners of an Anglo-American and a French settler are thus described by this writer:—

"The American colonist, slow and silent, does not rise very early; but, once risen, he passes the whole day in uninterrupted and useful labour. As soon as he has breakfasted, he gives his orders to his wife, who receives them with timidity and coldness, and executes them with-

out opposition. If the weather be fair, he goes out to work, cuts down trees, makes fences, &c. If the weather is bad, he overlooks his domestic concerns. With such dispositions, and depending on himself, if he has a favourable opportunity, he sells his farm to go several miles into the woods to form a new establishment; his wife, serious and patient as himself, seconds his labours on her part, and they remain sometimes six months without seeing a stranger's face; but, at the end of four or five years, they will have subdued an extent of land sufficient to ensure a subsistence for their family.

"On the contrary, the French colonist rises early in the morning, though it should only be for the purpose of boasting of it. He consults his wife, he takes her advice, and it would be a miracle if they should always agree. The wife comments, controls, contests; the husband persists or gives way, is angry or is discouraged. Sometimes the house is left to his care, and he takes his gun, and he goes out to shoot, to travel, or to chat with his neighbours. Sometimes he stays within, and passes his time either in chatting with good-humour, or in quarrelling and scolding. The neighbours receive and return his visits. To visit and tattle are to the French a necessity of habit so imperious, that, over all the frontiers of Louisiana and Canada, not one colonist of that country can be cited who is fixed out of view of another. In many places, having asked how far off the most remote colonist was settled, I have been answered, 'He is in the desert, among the bears, a league from any habitation, without having a person to talk with.'

On the sad effects of the uncontrolled liberty allowed to youth in America, Mr. Janson makes the following interesting remarks:—

"One of the greatest evils of a republican form of government is a loss of that subordination in society which is essentially necessary to render a country agreeable to foreigners. To the well-informed this defect is irksome, and no remedy for it can be applied. The meaning of liberty and equality, in the opinion of the vulgar, consists in impudent freedom, and uncontrolled licentiousness; while boys assume the airs of full-grown coxcombs. This is not to be wondered at, where most parents make it a principle never to check those ungovernable passions which are born with their children, or to correct their growing vices. Often have I, with horror, seen boys, whose dress indicated wealthy parents, intoxicated, shouting, and swearing, in the public streets. In the use of that stupifying weed, tobacco, aping their fathers, they smoke segars to so immoderate a degree, that sickness, and even death, have been the consequence. This is fully elucidated by the following paragraph, copied from a newspaper, printed at Salem, in Massachusetts:—

"Died in Salem, Master James Verry, aged twelve, a

promising youth, whose early death is supposed to have been brought on by *excessive smoking of segars!*"

"That this pernicious custom was habitual in an infant, not four years of age, I was myself a witness. 'This little boy is the son of Thomas Taylor, a segar-maker, in Alexandria, near Washington. While conversing with the father, I observed the son smoking a large segar, made of the strongest tobacco. I expressed my astonishment; on which the infatuated parent, with an exulting smile, replied, that the child had contracted the habit above a year ago, and that he smoked three, four, or more, daily, which he was regularly supplied with, 'or he would cry for them.' In addition, he would steal them when opportunity offered, and, in fact, he was seldom without a lighted segar in his mouth.
