The copy filmed here has been reproduced thanks to the generosity of:

Seminary of Quebec  
Library

The images appearing here are the best quality possible considering the condition and legibility of the original copy and in keeping with the filming contract specifications.

Original copies in printed paper covers are filmed beginning with the front cover and ending on the last page with a printed or illustrated impression, or the back cover when appropriate. All other original copies are filmed beginning on the first page with a printed or illustrated impression, and ending on the last page with a printed or illustrated impression.

The last recorded frame on each microfiche shall contain the symbol ➡ (meaning "CONTINUED"), or the symbol ▼ (meaning "END"), whichever applies.

Maps, plates, charts, etc., may be filmed at different reduction ratios. Those too large to be entirely included in one exposure are filmed beginning in the upper left hand corner, left to right and top to bottom, as many frames as required. The following diagrams illustrate the method:

L'exemplaire filmé fut reproduit grâce à la générosité de:

Séminaire de Québec  
Bibliothèque

Les images suivantes ont été reproduites avec le plus grand soin, compte tenu de la condition et de la netteté de l'exemplaire filmé, et en conformité avec les conditions du contrat de filmage.

Les exemplaires originaux dont la couverture en papier est imprimée sont filmés en commençant par le premier plat et en terminant soit par la dernière page qui comporte une empreinte d'impression ou d'illustration, soit par le second plat, selon le cas. Tous les autres exemplaires originaux sont filmés en commençant par la première page qui comporte une empreinte d'impression ou d'illustration et en terminant par la dernière page qui comporte une telle empreinte.

Un des symboles suivants apparaîtra sur la dernière image de chaque microfiche, selon le cas: le symbole ➡ signifie "A SUIVRE", le symbole ▼ signifie "FIN".

Les cartes, planches, tableaux, etc., peuvent être filmés à des taux de réduction différents. Lorsque le document est trop grand pour être reproduit en un seul cliché, il est filmé à partir de l'angle supérieur gauche, de gauche à droite, et de haut en bas, en prenant le nombre d'images nécessaire. Les diagrammes suivants illustrent la méthode.

## PREFACE.

---

**THE** utility and importance of Geography have been frequently discussed, and satisfactorily demonstrated; and the flattering reception given to works of merit, on this subject, has been highly creditable to the taste and discrimination of the British public. It is, however, comparatively, of recent date that this science has assumed a form sufficiently inviting to captivate general attention, and to procure a ready admission into the lady's library, the tradesman's parlour, and the peaceful retirement of the sequestered cottage. Formerly it was confined, like all other branches of literature, to the academic shade; and the method by which it was inculcated rendered it dry and tedious: But, since men have made it their business to blend entertainment with study, and to gratify a laudable curiosity, whilst they profess to give scientific instruction, it has burst forth with such effulgence, and mingled, like the rainbow, so many beauties in itself, that whoever possesses the means of becoming acquainted with the world which he inhabits, and the innumerable objects by which he is surrounded, naturally turns his thoughts to a subject comprising within itself a portion of universal literature, and presenting him at once with a compendious library.

Interesting matter and variety of subject are almost inseparable from a modern system of Geography, conducted upon a popular plan: as the four quarters of the globe, with their respective appendages, are laid under contribution for the gratification of the reader; and every empire, kingdom, state, republic, and colony, are explored on his account. For him the continents of the earth and the islands of the sea are accurately described;—the incense-breathing groves of Asia, the burning deserts of Africa, the extensive wilds of America, and the populous cities of Europe, are successively traversed, to augment his stores of knowledge;—the splendid monuments of antiquity, the romantic scenery of the changing landscape, the secrets of mineralogy, and the charms of botany, alternately claim his notice;—and all the tribes of animated nature pass in review before him. His fellow-men, of various climes and complexions, have still greater claims on his attention; and whilst, borne on the excursive wings of fancy, he makes the tour of the world, he becomes acquainted with the persons, habits, genius, religion, laws, manners, and customs, of its inhabitants;—their government, revenues, language, literature, arts, sciences, manufactures, and commerce, afford him ample subjects of meditation;—and their civil and military history form no inconsiderable part of his intellectual banquet.

Nor is it merely on these accounts that a system of Geography may be read with pleasure and profit: for experience has verified the assertion of Dr. Watts, that "every son and daughter of Adam is *interested* in it;" and Mr. Echard has remarked, that "no ingenious person can be excused for his ignorance in this science, which is the only one that comes under the capacity of *all mankind*:" it may be perused, therefore, with great personal *advantage*, by people of *every* rank and description, from the prince to the peasant. Here the young and the gay may find ample store of amusement; whilst the aged and the studious will refresh their memories by re-

## PREFACE.

tracing circumstances and events which time had nearly obliterated from the tablet of their minds. In these illustrative pages, the naturalist and the philosopher will meet with objects peculiarly suited to their respective tastes;—the historian will become intimately acquainted with the extent and boundaries of the countries whose vicissitudes he is recording;—the politician may acquire a complete knowledge of the various forms of government subsisting in the world;—military and naval officers will become familiar with the fields on which they may hereafter have an opportunity of gathering unfading laurels, and with the seas or rivers which, on some future occasion, may add to the brilliant victories of British seamen. The merchant and trader will also profit by the information which is here to be gained respecting the commerce, manufactures, and the natural productions and commodities of all nations; and the moralist will learn “to look through nature up to nature’s God,” and to adore that beneficent Providence which hath cast his lot in a land of happy civilization and freedom.

In presenting the following work before a judicious public, it may be necessary to observe, that the editor and proprietor have no wish to depreciate the labours of their predecessors in this department of literary compilation: but they are decidedly of opinion, that the pleasing study of Geography may be rendered still more alluring, by such a selection of matter as will render *every chapter* acceptable, and *every page* attractive. And, under this idea, they have determined to draw their intelligence from the most accurate and respectable sources; to avail themselves of the most interesting works, however voluminous or expensive; and, upon all occasions, to enliven their narrative with the introduction of pertinent and pleasing anecdotes, illustrative of the respective subjects to which they relate.

With respect to *arrangement*, it has been judged advisable to divide the work into four parts, corresponding with the grand division of the terrestrial globe; and to subdivide each of these into chapters, containing a description of the various empires, kingdoms, states, and islands, belonging to each quarter; among which, Asia, for a variety of cogent reasons, claims pre-eminence; whilst Europe, as the reader’s own country, must be left to form the conclusion.

It may be proper to add, that, in pursuance of this plan, all the NEW DISCOVERIES, which demand a considerable share of attention, will be regularly classed under the quarters of the world, instead of being thrown carelessly and promiscuously together, as has been the case in many preceding publications.

The Index to this work will be executed on a plan entirely new; as it is designed to serve, by the copiousness of its contents, and the accuracy of its references, as a complete Gazetteer of the World, which has been long reckoned among the *desiderata* of literature.

To illustrate the geographical descriptions, and to exhibit the most accurate representation of the persons, costume, habits, and ceremonies, of different nations, a series of engravings will be given, which, it is confidently hoped, will be considered *real embellishments*; while the neatness and accuracy of the maps, the quality of the paper, and the beautiful clearness of the type, will unitedly prove that every *possible* exertion has been made to render this new system of Geography worthy of universal patronage and support.

# COMPENDIUM OF ASTRONOMY;

WITH  
REMARKS

ON THE  
*USE OF THE GLOBES.*

## SECTION I.

*History of Astronomy, Origin of the Zodiac, Constellations, &c.*

**A**STRONOMY seems to have engaged the attention of mankind in the simplest ages, and from the most remote antiquity. The antediluvians are said to have been skilled in that science; the Chinese appear to have made astronomical observations soon after the flood; and Confucius, who lived five hundred and fifty-one years before the Christian era, has recorded several eclipses. The Japanese, Siamese, and the inhabitants of India, have also, from time immemorial, been acquainted with astronomy. The Druids were skilled in this science; and the Gauls, in general, were consequently able sailors. It appears, also, that the Mexicans were acquainted with astronomy, and made use of intercalary days to bring the solar and civil years to an equality: but with this difference in regard to the method established by Julius Cæsar in the Roman calendar, that they did not interpose a day every four years, but thirteen days every fifty-two years; which produces the same regulation of time.

The Chaldeans and Egyptians were particularly celebrated for their skill in astronomy; and their countries, on account of the general clearness of the air, were highly favourable to astronomical observations. In those warm climates, where the sky is generally serene, the shepherds, watching their flocks by night, would be naturally led to a contemplation of the firmament; and would soon discover that the innumerable multitude of stars observed the same course as the sun; if this shining orb, in the splendor of light, performed its course from east to west, while it afforded to the world the advantages of day, the stars, also, and the moon, glided along in parallel circuits, during the cool refreshing night: one star only seemed to keep its place, and to be as a centre of revolution to all the other luminaries; and this they called the *polar star* or *pole*. When these observations had been made on the celestial bodies in general, and the aspect of the heavens had become somewhat familiar, they were led to observe that some of the luminaries appeared to change their relative situation in the heavens; particularly, the sun and moon appeared to be constantly overtaken and left behind by the stars, as they all seemed to move along together round the earth; sometimes to approach towards the pole, then to recede from it, which evidently produced the seasons of the year, and which gave them an opportunity, in the different seasons, of becoming acquainted with all the visible stars in the northern, and most of those in the southern, hemisphere, in the course of one revolving year.

The space round the heavens, in which the moon and planets appeared in their various forms and motions, they considered as a broad circle or belt; and ingeniously divided it into twelve equal portions, which they called *houses*. During the space of one revolving year, this circle seemed to wheel three hundred and sixty-six times about, and the sun to complete three hundred and sixty-five daily courses; hence, the circle continually gaining upon the luminary, the sun was said to enter, occupy, and leave, the several houses successively. This circle is called the *Zodiac*, from a Greek word, implying an *animal*.

Those parts of the circle which the sun seemed to occupy in the spring, when the flocks and herds are increased by the fecundity of the season, were called the houses of *Aries*, or the ram; *Taurus*, or the bull; and

*Gemini*, or the twins, from the goat's frequently bringing forth twin-kids; these were afterwards changed into the twin-brothers, *Castor* and *Pollux*. The other signs of the zodiac were *Cancer*, or the Crab, denoting the retrograde motion of the sun in midsummer; *Leo*, or the Lion, expressive of the intense heat of summer; *Virgo*, or the Virgin, with ears of corn, denoting the harvest; *Libra*, or the Balance, shewing the equality of day and night in autumn; *Scorpio*, or the venomous Scorpion, representing the diseases at the fall of the leaf; *Sagittarius*, or the Archer, signified the hunting season; *Capricornus*, or the Goat, that climbs the craggy mountain, was meant to shew that the sun now mounted the zodiac; *Aquarius*, or the Water-bearer, represented the setting-in of the rain; and *Pisces*, or the Fishes, denoted the fishing season.

In the summer, a short time preceding the annual inundation of the river Nile, a star of the first magnitude appeared in the east, a little before sun-rise. It seems probable that the Egyptians, for a while, kept with anxiety the watches of the night, for fear of too sudden an irruption of the waters; but this brilliant star annually making its appearance a little before the inundation took place, it afterwards sufficed to await the coming of the star. They gave it the names of *Thaut*, the dog; and *Anubis*, the barker or monitor.

It should seem to require an effort in the imagination to see figures of animals, &c. in the firmament; but the ancients imagined that they discovered things of this sort in the arrangement of the stars: and accordingly, in the different houses in the zodiac, and in the stars surrounding their bright *Anubis*, they saw, by help of a fertile fancy, one bright star represent an eye, another the termination of a tail or horn, these a body, those a limb, &c., till all the signs were determinately fixed. The figures thus sketched out by the fancy of the shepherds were subsequently embellished with the fictions of mythology, till the heavens were nearly filled with imaginary creatures; and these being increased in succeeding ages, served astronomers in their accounts of the starry heavens, as the present divisions of the earth assist geographers in the description of the globe.

The number of constellations in the northern hemisphere is thirty-four; in the southern forty-seven, and in the zodiac twelve. Those stars which are not included in the constellations, are called *unformed stars*; those clusters which are so distant as not to be distinctly seen, are, from their cloudy appearance, comprised under the name of *nebula*; and that light-coloured irregular circle which encompasses the heavens, and is distinguishable from the etherial blue by its brilliancy, that zone which owes its splendor to the innumerable stars of which it is formed, and which passes through several of the constellations in its ample range, is called the *Galaxy*, the *via lactea*, or the milky way.

## SECTION II.

### *Of the Copernican or Solar System.*

THE Copernican, or Solar System, consists of the sun, seven primary planets, fourteen secondary planets, four newly-discovered bodies, which Dr. Herschel has termed *asteroids*, and the comets.

The SUN is situate near the centre of the orbits of all the planets, and revolves on his axis in twenty-five days fourteen hours and eight minutes. This revolution is determined from the motion of the spots on his surface, which first appear on the eastern extremity, and then gradually come forwards towards the middle, and pass on till they reach the western edge, and then disappear. When they have been absent for nearly the same period of time which they were visible, they appear again as at first, finishing their entire circuit in twenty-seven days twelve hours and twenty minutes.

The spots on this luminary may be viewed with an achromatic telescope of two or three feet focal length, or with a reflector of twelve or eighteen inches; care being taken to guard the eye by the intervention of a dark glass, to take off the dazzling brightness of the sun.

The sun is also affected by a small motion round the centre of gravity of the solar system, occasioned by the various attractions of the surrounding planets; but, as this centre of gravity is generally within the body of the sun, and can never be at the distance of more than the length of the solar diameter from the centre of that body, astronomers generally consider the sun as the centre of the system, round which all the planets revolve.

As the sun revolves on an axis, his figure is supposed not to be strictly globular, but a little flatted at the poles; and that his axis makes an angle of about eight degrees, with a perpendicular to the plane of the earth's orbit. As the sun's apparent diameter is longer in the month of December than in June, the sun is consequently

# THE COPERNICAN, or Solar System

Published May 25 1807 by THOMAS KELLY, Printer, near St. Paul's Church, London.

nearer to the earth in our winter than it is in summer; for the apparent magnitude of a distant body diminishes as the distance increases. The mean apparent diameter of the sun is stated to be thirty-two minutes two seconds; hence, as the distance of the sun from the earth is ninety-five millions of miles, its real diameter is eight hundred and eighty-six thousand one hundred and forty-nine miles; and, as the magnitudes of all spherical bodies are as the cubes of their diameters, the magnitude of the sun is one million three hundred and seventy-seven thousand six hundred and thirteen times that of the earth: the diameter of the earth being only seven thousand nine hundred and sixty-four miles, the diameter of the sun is above one hundred and eleven times the diameter of the earth.

MERCURY is the least of all the planets whose magnitudes are accurately known, and the nearest to the sun. The inclination of its axis to the plane of its orbit, and the time in which it revolves on its axis, are unknown, consequently the vicissitudes of its seasons, and the length of its day and night, are also unknown.

When viewed through a powerful telescope, Mercury sometimes appears in the form of a half moon, and sometimes a little more or less than half his disk is seen; hence it is inferred, that he has the same phases as the moon, except that he never appears quite round, because his enlightened side is never turned directly towards us, unless when he is so near the sun as to be rendered invisible by the splendor of the solar rays. The enlightened side of this planet being always towards the sun, and his never appearing round, are evident proofs that he shines not by his own light; for, if he did, he would constantly appear round. The best observations of this planet are those made when he is seen on the sun's disk, called his *transit*; for, in his lower conjunction, he sometimes passes before the sun, like a little spot, eclipsing a small part of the sun's body; as may be seen with a good telescope. The node from which Mercury ascends northward above the ecliptic is in the fifteenth degree of Taurus, and, consequently, the opposite or descending node is in the fifteenth degree of Scorpio. The earth is in the fifteenth degree of Taurus on the 6th of May, and in the fifteenth of Scorpio on the 4th of November; and when Mercury comes to either of his nodes at his inferior conjunction, (that is, when he is between the earth and the sun,) he will pass over the sun's disk, if it happen on or near the days above mentioned; but, in all other parts of its orbit, he goes either above or below the sun, and consequently his conjunctions are invisible.

Mercury performs his periodical revolution round the sun in eighty-seven days twenty-three hours fifteen minutes and forty-three seconds; his greatest elongation is twenty-eight degrees twenty minutes; his distance from the sun, thirty-six millions eight hundred and fourteen thousand seven hundred and twenty-one miles; the eccentricity of his orbit is estimated at one-fifth of his mean distance from the sun; his apparent diameter, eleven seconds; hence his real diameter is three thousand one hundred and eight miles, and his magnitude about one-sixteenth that of the earth.

Mercury emits a bright white light; he appears a little after sun-set, and again a little before sun-rise; but, on account of his proximity to the sun, and the smallness of his magnitude, he is seldom seen.

VENUS is the brightest, and, apparently, the largest, of all the planets; her light is distinguished from that of the other planets by its brilliancy and whiteness, which are so considerable, that in a dusky place she causes an object to project a sensible shadow. When viewed through a powerful telescope, this planet appears to have all the phases of the moon, from the crescent to the enlightened hemisphere, though she seldom appears perfectly round. Her illuminated part is constantly turned towards the sun; hence the convex part of her crescent is turned towards the east when she is a morning star, and towards the west when she is an evening star; for, when she is west of the sun, as seen from the earth, that is, when her longitude is less than that of the sun, she rises before him in the morning, and is called a morning star; but when she is east of the sun, that is, when her longitude is greater than the sun's longitude, she shines in the evening after sun-set, and is called an evening star.

Venus is a morning star, or appears to the west of the sun, for about two hundred and ninety days, and she is an evening star, or appears to the east of the sun, for nearly the same time, though she completes her revolution round the sun in two hundred and twenty-four days sixteen hours forty-nine minutes and ten seconds. Should the reader enquire why Venus appears a longer time to the eastward or westward of the sun than the whole time of her entire revolution round him, it may be replied, that, while Venus is going round the sun, the earth is going round him the same way, though slower than Venus, and therefore the *relative* motion of Venus is slower than her *absolute* motion.

Venus is sometimes seen on the disk of the sun in the form of a dark round spot. These appearances, however, can only happen when she is between the earth and the sun, and when the earth is nearly in a line

with one of her nodes. The last transit of Venus was in 1769, and another will not occur till the year 1874. The time which this planet takes to revolve on its axis, and the inclination of its axis to the plane of its orbit, have been given by different astronomers; but Dr. Herschel, from a long series of observations, published in the Philosophical Transactions for 1793, concludes, that the time of its rotation on its axis is uncertain, and that the position of its axis is equally uncertain; that its atmosphere is very considerable; that it has probably inequalities on its surface, but that it requires a better eye than his, or the assistance of better instruments than he is possessed of, to discover any mountains.

The diameter of Venus is seven thousand four hundred and ninety-eight miles; her distance from the sun is sixty-eight millions seven hundred and ninety-one thousand seven hundred and fifty-two miles; and her magnitude something less than that of the earth.

This planet, like Mercury, is never seen at midnight, or in opposition to the sun; being visible only for three or four hours in the morning or evening, as she rises before, or sets after the sun.

The EARTH, which we inhabit, is placed between the orbits of Venus and Mars, and revolves round the sun, at the distance of ninety-five millions of miles, in three hundred and sixty-five days five hours forty-eight minutes and forty seconds. Its diameter is seven thousand nine hundred and sixty-four miles; and it turns round its axis from west to east in twenty-four hours; which occasions the *apparent* diurnal motion of the sun, and of all the heavenly bodies round it, from east to west in the same time: it is, therefore, the cause of this apparent rising and setting, and of the alternation of day and night: for although the sun, moon, and stars, *appear* to rise in the east and to set in the west, that appearance is in reality occasioned by the earth turning the contrary way. Thus, children travelling in a carriage, or sailing on a river, are induced to suppose that the trees, hedges, banks, or other objects, are running away in a direction exactly opposite to their route. And if it be urged, as an objection, that we are unable to *perceive* any rotation of the earth, notwithstanding the rapidity with which it is supposed to move, we reply—that as our globe is not impeded by any resisting obstacles, its motion cannot be communicated to the senses; and, as an illustration of this remark, it may be added, that vessels on a smooth sea are sometimes turned completely round by the tide, without the knowledge of the passengers who happen to be employed in the cabin.

But besides the *diurnal* rotation of the earth, which occasions the regular succession of day and night, and the *apparent* motion of the heavenly bodies, it has another, called its *annual* motion, on which depend the vicissitudes of the seasons—spring, summer, autumn, and winter.

This annual progressive motion may be easily deduced from an attentive observation of the celestial bodies: for as the sun's apparent rotation round the earth, in the course of a day, from east to west, may be referred to the diurnal motion of the earth upon its axis, in a contrary direction; so likewise his seeming annual revolution in the heavens, and his rising and setting continually in different parts of them, may be referred to that motion of the earth in its orbit which it completes in the space of a year.

The phenomena of the different seasons will appear plainly from the following observations of an intelligent astronomer:—

“Suppose a line to be drawn from the centre of the sun to the centre of the earth, it is evident that the sun will be vertical to that part of the earth which is cut by this line. Now, when the earth is in Libra, the sun will appear to be in Aries, the days and nights will be equal in both hemispheres, and the season a medium between summer and winter; the line dividing the dark and light hemispheres, passes through the north and south poles, and consequently divides all the parallels of latitude into two equal parts: hence the inhabitants of the whole face of the earth have their days and nights equal, viz. twelve hours each. While the earth moves from Libra to Capricorn, the north pole will become more and more enlightened, and the south pole will be gradually involved in darkness, consequently the days in the northern hemisphere will continue to increase in length, and in the southern hemisphere they will decrease in the same proportion, all the parallels of latitude being unequally divided. When the earth has arrived at Capricorn, the sun will appear to be in Cancer; it will be summer to the inhabitants of the northern hemisphere, and winter to those in the southern; the inhabitants at the north pole, and within the arctic circle, will have constant day, and those at the south pole, and within the antarctic circle, will have constant night. While the earth moves from Capricorn to Aries, the south pole will become more and more enlightened; consequently, the days in the southern hemisphere will increase in length, and in the northern hemisphere they will decrease. When the earth has arrived at Aries, the sun will appear to be in Libra, and the days and nights will again be equal all over the surface of the earth. Again, as the earth moves from Aries towards Cancer, the light will gradually leave the north pole,

## A COMPENDIUM OF ASTRONOMY.

and proceed to the south: when the earth has arrived at Cancer, it will be summer to the inhabitants in the southern hemisphere, and winter to those in the northern: the inhabitants of the south pole (if any) will have continual day, those at the north pole constant night. Lastly, while the earth moves from Cancer to Capricorn, the sun will appear to move from Capricorn to Cancer, and the days in the northern hemisphere will be increasing, while those in the southern will be diminishing, in length; and while the earth moves from Capricorn to Cancer, the sun will appear to move from Cancer to Capricorn, the days in the northern hemisphere will then be decreasing, and those in the southern hemisphere increasing. In all situations of the earth, the equator will be divided into two equal parts, consequently the days and nights at the equator are always equal. Thus the different seasons are clearly accounted for, by the inclination of the axis of the earth to the plane of its orbit, combined with the parallel motion of that axis."

Respecting the *figure* of the earth, the ancients held various opinions: some imagined it to be cylindrical, or in the form of a drum; but the general opinion was, that it was a vast extended plane, and that the horizon was the utmost limit of the earth, and the ocean the boundary of the horizon. These opinions were held in the infancy of astronomy; and, in the early ages of Christianity, some of the ecclesiastics went so far as to pronounce it *heretical* for any person to declare that there was such a thing as the antipodes. But by the industry of succeeding ages, when astronomy and navigation were brought to a tolerable degree of perfection, such shadow always appeared circular on the disk or face of the moon, in whatever position the shadow was projected, it was discovered that the earth, which cast the shadow, was spherical; since nothing but a sphere, when turned in every position with respect to a luminous body, can cast a circular shadow.

The rotundity of the earth has also been demonstrated by its circumnavigation, which has been performed at different times by Sir Francis Drake, Lord Anson, Captain Cook, &c. And a variety of simple observations will establish the truth of the doctrine here laid down, beyond the power of contradiction. Thus, if a vessel sail northward, in north latitude, the people on board may observe the polar star gradually to increase in altitude the farther they go: they may likewise observe new stars continually emerging above the horizon which were before imperceptible; and, at the same time, those stars which appear southward will continue to diminish in altitude till they become invisible. The contrary phenomena will happen if the vessel sail southward; hence the earth is evidently spherical from north to south, as well as from east to west.

Again, if we take a stand on the sea-shore, on a clear day, and view ships leaving the coast, in any direction whatsoever; as they recede from us, we may distinctly observe the rigging of the vessels, when the hulls are quite out of sight, as if sunk in the waters. An observer in an evening, from the top of a hill, may distinctly see the setting sun, when it appears to those below to have sunk below the horizon; nay, a person swift of foot, when it has set to him below, may, in some situations, by running up the hill, regain his view. Thus, when rising, does it first tip the tops of the mountains with its rays; and thus do sailors, on their first making land, discover the high parts of the coast, but not the very shore, till they are pretty close in with it.

Now, were the surface of the sea an extensive plain of waters, we should lose sight of the objects, either through defect of sight, thickness of atmosphere, or some similar cause, and then they would disappear all at once.

These observations clearly prove the rotundity of the earth, though common experience shews us that it is not strictly a *geometrical sphere*; for its surface is diversified with mountains and valleys: but these irregularities no more hinder the earth from being reckoned spherical, considering its magnitude, than the particles of dust upon an artificial globe hinders it from being esteemed round.

The Moon is called a satellite, or attendant of the earth, from the circumstance of performing her revolution round it, from change to change, in twenty-nine days twelve hours forty-four minutes and rather more than three seconds, which makes a lunation: but she completes her orbit from one point in the heavens, or from a particular fixed star, to that point or star again, in twenty-seven days seven hours forty-three minutes and five seconds, moving at the rate of about two thousand two hundred and seventy miles an hour. The diameter of the moon is two thousand one hundred and eighty miles, and her distance from the centre of our earth, about two hundred and forty thousand miles.

The moon is said to be at the *full* when (our earth lying between it and the sun) all the enlightened part of it is visible; it is at the *change* when, being between us and the sun, its illumined part is turned from us; and it is termed *half moon* when, being half way between the other two positions, we see but half the enlightened part.

As the light of the sun is reflected on our earth by means of the moon, so, if that satellite be inhabited, our

earth performs the same beneficial purpose in return. Before and after the change of the moon, when it is only visible a little while in the morning and evening, its whole body may be sometimes seen distinctly; and at such times, one side of it resembles a bright slender crescent, but the greater part seems of a very dark hue. "The bright part," says Mr. Walker, "is as the day-light of the moon; the dark part as the moon-shine reflected from our earth."

It is asserted, that, in Italy, and some other countries, where the air is peculiarly clear, the moon at the change is visible when it rises or sets with the sun;—a circumstance which must be occasioned by the light reflected from our globe, which, at that period, is a full moon, and affords thirteen times as much light as we receive from our satellite when at the full. Allowing this to be the case, it appears that the inhabitants of the moon, if such exist, have a full moon when we have change, and a waxing when we have a waning one, all the lunar seasons being the reverse of ours. It may also be remarked, that, as the moon turns only once round on her axis while she performs her orbit, one side, being always turned toward our earth, must consequently receive two weeks of moon-light from the earth, and two weeks of sun-shine successively; the other side remaining two weeks in darkness, and an equal space in constant day. The day and night, therefore, must be a month in length; and, from the inclination of the moon's axis to the ecliptic, she can experience scarcely any diversity of seasons.

As the moon's declination from the equator is not sufficient to occasion a change of seasons, it has been conjectured that her inhabitants may measure their year by observing when one of the poles of our earth begins to be illumined, and the other to recede from view, which always happens at our equinoxes. The year is supposed to be of the same absolute length both to the earth and moon, though they differ very materially as to the number of days; the lunarians having only twelve, while we have three hundred and sixty-five.

The moon is sufficiently near our globe to enable us to observe, even with the naked eye, many inequalities on her surface; and, by the aid of telescopes, astronomers have distinctly discovered them to be mountains, valleys, &c., to which geographical names have been given, though without regard to figure or situation. Even the heights of some of the lunar mountains have been calculated by means of the shadows projected from them on the moon's surface; and the great astronomer, Herschel, has discovered three volcanoes in this planet. The principal one, at the time of observation, was in a part of the moon's disk not then enlightened; but it appeared to be about three miles in diameter, and illuminated the hills in its vicinity, whilst it ejected great quantities of smoke and burning lava. The other two seemed either to have been recently extinguished, or to threaten an immediate eruption.

Various arguments have been adduced for and against the probability of the moon having an atmosphere; but the discoveries of Dr. Herschel, and the attentive observations of other astronomers, seem to determine that question in the affirmative; as streaks of light have been seen to dart instantaneously from different places in the moon at the time of a solar eclipse, which have been taken for lightning, and which seem to evince not only the existence of a lunar atmosphere, but a striking similitude between the moon and our earth.

In the motion of the moon we may perceive a slow continual change, which, though extremely minute, seems to evince that the present order of things must come to an end. It is a known fact, that the moon now completes her period in less time than formerly, approaching nearer to the earth, and going sooner round it. Hence eclipses which occurred several centuries ago, appear, from the accounts given by ancient historians, to have happened differently both in time and place from what the calculations founded upon our astronomical tables make them to have done.

As the moon's motion on her axis is perfectly uniform, completing one revolution in the course of a lunation, our globe would be constantly over the same meridian of the moon, if the motion of that satellite in her journey round the earth were also equable; but she, like the other planets, is observed to move in her orbit with different degrees of velocity, and this occasions what is termed the libration of the moon, and the successive exhibition and disappearance of her opposite limbs, or margins. When her motion is quickest, we see rather more of her western side; when slowest, a little more of her eastern side is presented to view. And as the moon's axis is rather inclined to its orbit, and preserves its parallelism round the earth, we sometimes see one of her poles, and sometimes another, which causes her to have an apparent wavering motion.

We must now turn our attention to the phenomenon of the Harvest-Moon, which is particularly worthy of consideration.

It is generally supposed that the moon rises about fifty minutes later every day than on the preceding; but this idea is correct only with respect to those parts about the equator; for in places of considerable latitude, as

in England, there is a remarkable difference about the time of harvest, when, for several evenings successively, the full moon rises very soon after sun-set; and by thus appearing before the termination of twilight, she prolongs the light to the great benefit of the husbandman, who is employed in gathering in the fruits of his labour; and hence the full moon at this season of the year is aptly denominated the harvest-moon.

The people who reside at the equator do not receive this benefit, nor, indeed, do they stand in need of it, their seasons varying but little, and their weather changing at periodical times. At the polar circles, where the mild season is of short duration, the autumnal moon rises at sun-set from the first to the third quarter; and at the poles, which are not visited by the cheering rays of the sun for half a year together, the winter full-moons shine without setting from the first to the third quarter.

These phenomena result from the different angles made by the horizon, and by different parts of the moon's orbit, which nearly coincides with the ecliptic. In northern latitudes, the least angle made by the horizon and ecliptic is, when Aries rises and Libra sets; as the greatest is made when Libra rises and Aries sets. In the latitude of London, as much of the ecliptic rises about Aries and Pisces in two hours, as the moon goes through in six days; and, of course, while the moon is in these signs, she differs but two hours in rising for six days together; that is, about twenty minutes later, at a mean rate, every day or night, than on the preceding. In about a fortnight afterwards, however, the moon comes to the opposite signs, Libra and Virgo, and differs almost four times as much in rising, appearing about an hour and a quarter later every day or night than on that which preceded it.

As the moon can never be full but when opposite to the sun, and that luminary never appears in Virgo and Libra but in August and September, the moon is never full in the opposite signs, Pisces and Aries, but in those months; and hence it is obvious that we can have but two full-moons in the year, which rise so early for a week together, as already mentioned. The former of these is called the *harvest-moon*, for the reason previously assigned, and the other is called the *hunter's moon*.

The moon, being in Pisces and Aries every lunation, must consequently rise in this manner twelve times in the year; but in winter she rises in these constellations at noon, when she is waxing; in winter, at midnight, when she is waning; and in spring, in the morning, at the time of her change. Now, as in the former instances, she is but a half moon, and at the time of change is invisible; our assertion that there are but two full moons of the above description in a year, is not affected by these circumstances.

As the ecliptic and horizon are coincident every day, for an instant, on the polar circle, one half of the ecliptic, from one solstitial point to another, rises, and the other half sets, at the same moment: that which rises at once is twenty-four hours in setting, and that which sets at once is twenty-four hours in rising. At the poles, one half of the ecliptic is continually above the horizon, and the other half never rises. It is, also, necessary to observe, that the augmentation or decrease of our moon-light depends upon the opposition of our satellite to the sun. Hence the wintery parts of our globe, where the nights are long and tedious, receive the greatest proportion of light from the moon; and in the arctic and antarctic regions, it shines every second fortnight, or from the first to the third quarter, without setting.

MARS, though sometimes apparently as large as Venus, never shines with so brilliant a light, and, when viewed through a telescope, appears of a dusky red colour. Hence it is conjectured that this planet is encompassed with a thick cloudy atmosphere, through which the red rays of light penetrate more easily than the other rays. This being the first planet without the orbit of the earth, he exhibits to the spectator different appearances from those of Mercury and Venus. He is sometimes in conjunction with the sun, like Mercury and Venus, but was never known to transit the sun's disk. Sometimes he is directly opposite to the sun, that is, he comes to the meridian at midnight, or rises when the sun sets, and sets when the sun rises; at which time he shines with the greatest lustre, being nearest to the earth. When viewed through a powerful telescope, he appears sometimes full and round, at others gibbous, but never horned. The preceding appearances clearly shew, that Mars moves in an orbit more distant from the sun than that of the earth. The apparent motion of this planet, like that of Mercury and Venus, is sometimes direct, or from east to west; at others retrograde, or from west to east; and sometimes he appears stationary. Sometimes he rises before the sun, and is seen in the morning; at others he sets after the sun, and is seen in the evening.

Mars revolves on his axis in twenty-four hours thirty-nine minutes and twenty-two seconds; and performs his revolution round the sun in six hundred and eighty-six days twenty-three hours fifteen minutes and forty-four seconds. His apparent semi-diameter, at his nearest distance from the earth, is twenty-five seconds, consequently his mean distance from the sun is one hundred and forty-four millions nine hundred and seven thou-

sand six hundred and thirty miles; his diameter four thousand two hundred and eighteen miles; and his magnitude a little more than one-seventh of that of the earth.

JUPITER is the largest of all the planets, and, notwithstanding his immense distance from the sun and the earth, he appears to the naked eye almost as large as Venus, though his light is less brilliant. When in opposition to the sun, (that is, when he comes to the meridian at midnight, or rises when the sun sets, and sets when the sun rises,) Jupiter is much nearer to the earth than he is a little before and after his conjunction with the sun; hence, at the time of opposition, he appears larger and more luminous than at other times. When his longitude is less than that of the sun, he is a morning star, and appears in the east before sunrise; but when his longitude is greater than that of the sun, he is an evening star, and appears in the west after sun-set. Jupiter revolves on his axis in 9 hours and 56 minutes, which is the length of his day; but, as his axis is nearly perpendicular to the plane of his orbit, he has no diversity of seasons.

This planet is surrounded by faint substances, called zones or belts; which, from their frequent change in number and situation, are supposed to consist of clouds. One or more dark spots frequently appear between the belts; and when a belt disappears, the contiguous spots disappear likewise. The time of the rotation of the different spots is variable, being less by six minutes near the equator than near the poles.

The inclination of the orbit of Jupiter to the plane of the ecliptic is 1 degree 18 minutes 56 seconds; the place of his ascending node about eight degrees in Cancer; and he performs his revolution round the sun in 4330 days 14 hours 27 minutes and 11 seconds; moving at the rate of 29,894 miles per hour; his mean distance from the sun being 494,499,108 miles. His diameter is 89,069 miles; and his magnitude 1400 times that of the earth.

Jupiter is attended by four satellites or moons, each of which revolves round him in a manner similar to that of the moon round the earth. These satellites were first discovered by Galileo, the inventor of telescopes, in the year 1610, and the discovery has proved of the greatest importance: for, as these satellites revolve round Jupiter in the same direction which Jupiter revolves round the sun, they are frequently eclipsed by his shadow, and afford an excellent method of ascertaining the true longitudes of places on the land. To these eclipses we are also indebted for the discovery of the progressive motion of light, and the aberration of the fixed stars.

The satellites of Jupiter appear of different magnitudes and brightness: the fourth generally appears the smallest, but sometimes the largest; and the apparent diameter of its shadow on Jupiter is sometimes greater than the satellite itself. Dr. Herschel has discovered that Jupiter's satellites revolve about their axes in the time in which they respectively revolve about the primary planet.

The first satellite is the most important, on account of its numerous eclipses. The times of the eclipses of the satellites of Jupiter are calculated for the meridian of Greenwich, and inserted in the third page of the Nautical Almanac for every month; and their configurations or appearances with respect to Jupiter are inserted in page XII. As the earth turns on its axis from west to east at the rate of fifteen degrees in a hour, or one degree in four minutes of time, a person one degree westward of Greenwich will observe the emersion or immersion of either of these satellites four minutes later than the time mentioned in the Nautical Almanac; and, if he be one degree eastward of Greenwich, the eclipse will happen four minutes sooner at his place of observation than at Greenwich. These eclipses should be observed with a powerful telescope, and a pendulum clock, which beats seconds or half seconds.

SATURN shines with a pale feeble light, being the farthest from the sun of any of the planets that are visible to the naked eye. This planet, when viewed through a powerful telescope, appears to be surrounded by an interior and exterior ring, beyond which are seven satellites, of which six are in the same plane with the rings. These rings and satellites are all opaque and dense bodies, like that of Saturn, and shine only by the light which they receive from the sun. The disk of Saturn is also crossed by obscure zones or belts, like those of Jupiter, which vary in their figure according to the direction of the rings. Saturn performs his revolution round the sun in 10,759 days 1 hour 51 minutes and 11 seconds; hence his mean distance from the sun is 907,089,032 miles; and his progressive motion in his orbit is 22,072 miles per hour. His diameter is 78,730 miles, and his magnitude 966 times that of our earth.

The fourth satellite of this planet was discovered by Huygens, a Dutch mathematician, in the year 1655. The first, second, third, and fifth, were discovered at different times, between the years 1761 and 1685, by Cassini, a celebrated Italian astronomer; and the sixth and seventh were discovered by Dr. Herschel, in the years 1787 and 1789. The last two satellites are nearer to Saturn than the other five, and therefore are,

properly speaking, the *first* and *second*; but, to distinguish them from the other satellites, and to prevent confusion in referring to former observations, they are called the *sixth* and *seventh*.

The first, second, third, and fourth satellites, as well as the sixth and seventh, are all nearly in the same plane with Saturn's ring, and are inclined to the orbit of Saturn in an angle of about thirty degrees; but the orbit of the fifth satellite is said to make an angle of fifteen degrees with the plane of Saturn's ring. Sir Isaac Newton conjectured that the fifth satellite of Saturn revolved round its axis in the same time that it revolved round Saturn; and the observations of Dr. Herschel have verified the accuracy of this opinion.

The *Ring of Saturn*, which was first discovered by Huygens, is a thin, broad, and circular arch, surrounding the body of the planet without touching it, like the wooden horizon of an artificial globe. If the equator of the artificial globe be made to coincide with the horizon, and the globe be turned on its axis from west to east, its motion will represent that of Saturn on its axis, and the wooden horizon will represent the ring, if it be supposed a little more distant from the globe.

This ring revolves round the axis of Saturn, and in a plane coincident with the plane of his equator, in 10 hours 32 min. and rather more than 15 sec. The ring, being a circle, appears elliptical, from its oblique position; and it appears most open when Saturn's longitude is about 2 signs 17 degrees, or 8 signs 17 degrees.

The GEORGIIUM SIDUS, or GEORGIAN, is the remotest of all the known planets belonging to the solar system. It was discovered at Bath by Dr. Herschel, on the 13th of March, 1781, and is frequently called by foreigners *Herschel*, in honour of the discoverer. The Royal Academy of Prussia, and some others, called it *Uranus*, because the other planets are named from such heathen deities as were relatives: thus, *Uranus* was the father of Saturn, *Saturn* the father of Jupiter, *Jupiter* the father of Mars, &c. This planet, when viewed through a telescope of a small magnifying power, appears like a star of between the sixth and seventh magnitude.

In so recent a discovery of a planet at such an immense distance, the theory of its magnitude, motion, &c. must necessarily be imperfect. Its periodical revolution round the sun is said to be performed in rather more than eighty-three years; and its magnitude is upwards of eighty times that of the earth.

The Georgium Sidus is attended by six satellites: of which the second and fourth were discovered in 1787; and the others in 1798. They are all said to be nearly perpendicular to the elliptic; and it is a singular fact, that they perform their revolutions round the planet contrary to the order of the signs.

We must now lay before the reader a brief account of the new planets or asteroids, Ceres, Pallas, Juno, and Vesta.

On the 1st of January, 1801, M. Piazzi, Astronomer-Royal at Palermo, discovered a new planet between the orbits of Mars and Jupiter, which he styled CERES FERDINANDIA, from the island in which it was discovered, and Ferdinand IV. King of the Two Sicilies. The elements of the theory of this planet are at present very imperfectly known. When seen through a telescope, it appears like a star of the eighth magnitude; its distance from the sun is said to be about two four-fifths times that of the earth, and its periodical revolution near four years and eight months. Its diameter, according to Dr. Herschel, is about one hundred and sixty-two miles.

On the 28th of March, 1802, Dr. Olbers, of Bremen, while examining some of the stars near the Ceres Ferdinandia, perceived a star of the seventh magnitude, situated near the northern part of the constellation Virgo, which had the appearance of a planet. By continuing his observations, he soon discovered it to be a new planet, to which he gave the name of *Pallas*. As the theory of the various phenomena of this planet is less known even than that of Ceres Ferdinandia, the accounts of its magnitude, distance, and the time of its periodical revolution round the sun, are, of course, very imperfect. Its distance from the sun, and the time of its revolution, are said, however, to be nearly the same as those of the Ceres Ferdinandia, and its diameter is computed at ninety-five miles.

On the 1st of September, 1804, Mr. Harding, of Lilienthal, in the duchy of Bremen, discovered the planet *Juno*, which appears like a star of the eighth magnitude. The planets *Ceres*, *Pallas*, and *Juno*, are all so nearly at equal distances from the sun, that it is not yet decided which of the three is the nearest, or the most remote.

On the 29th of March, 1807, Dr. Olbers discovered another planet, which has been named *Vesta*; but of this no satisfactory accounts have hitherto been published: and, in fact, Dr. Herschel considers all these newly-discovered bodies as holding a middle rank between planets and comets, and has, therefore, termed them asteroids.

Though the planets already described, and their attendant satellites, are considered as the whole of the

*regular* bodies which form the solar system, yet that system is occasionally visited by other bodies, called *comets*, which are supposed to move round the sun in elliptical orbits. Of the number, use, and revolution of these, our knowledge is very imperfect; but they seem far to exceed the number of the planets; and, in fact, no fewer than four hundred and fifty are *supposed* to belong to the solar system.

Like the planets, they are observed to be opaque bodies, shining only by the influence of the sun, and, like them, are carried along in their orbits, by the combination of the centripetal and centrifugal forces; sometimes seeming to go forward, sometimes backward, and sometimes to be stationary. The great eccentricity of their orbits makes them liable to suffer considerable alterations, from the attraction of the planets, and of each other.

It seems, therefore, to prevent disturbances in the spheres, that, while the planets revolve all of them nearly in the same plane, the comets are disposed in very different ones, and distributed over various parts of the heavens. The tails of the comets appear to be vapours exhaled from their bodies and the gross atmospheres that surround them; and, like smoke, they are always in the plane of the comet's orbit, and opposite to the sun; except that their extremities incline towards the parts which the comet has left; and they resemble the smoke of a burning coal, which, if the coal remain fixed, ascends from it perpendicularly; but, if the coal be in motion, ascends obliquely from the motion of the coal: the tails, however, are of so subtle a vapour, that the stars may be seen distinctly through it.

They are called comets, from their having a long tail, somewhat resembling the appearance of hair. This, however, is not always the case; for some comets have appeared, which were as well defined and as round as planets; but, in general, they have a luminous matter diffused around, or projecting from them. These bodies sometimes lose their splendour suddenly, while their bulk remains unaltered. Their apparent magnitude is very different: sometimes they seem only of the size of the fixed stars: at other times they will equal the diameter of Venus, and sometimes even of the moon. In 1652, Hevelius observed a comet, which seemed not inferior to the moon in size, though it had not so bright a splendour, but appeared with a pale and dim light. Of the comet which appeared in the early part of 1661, he observed, that its body was of a yellowish colour, bright, and conspicuous, but without any glittering. In the middle was a dense ruddy nucleus, almost equal in size to Jupiter, encompassed with a fainter substance. The nucleus soon grew bigger and brighter, and appeared divided into a number of parts, one of which, much denser and brighter than the rest, was round, and represented a little lucid star. In about a week, the nuclei became more obscure and confused, and the whole head much diminished, both in brightness and magnitude; two weeks afterwards, its roundness was a little impaired, and the edges lacerated; a month after which, its matter was much dispersed, and no distinct nucleus appeared. The nucleus of the comet of 1618 is said, a few days after coming into view, to have broken into three or four parts of irregular figures. One writer has compared them to so many burning coals, observing that they changed their situation while he was looking at them, as when a person stirs a fire; and a few days after, were broken into a great number of small pieces. Another account of the same comet is, that, on the 1st and 4th of December, the nucleus appeared to be a round, solid, and luminous body, of a dusky red colour, larger than any star of the first magnitude: on the 8th, it was broken into three or four parts, of irregular figures; and, on the 20th, was changed into a cluster of small stars. Comets have often, also, different phases, like the moon.

As the tail of a comet is owing to the heat of the sun, it lengthens as the comet approaches nearer to, and shortens as it recedes from that luminary. If the eye be in a line, drawn through the middle of the tail, lengthways, the whole will appear round; if out of that line a little, it will appear short; and it is called a bearded comet when the tail hangs down towards the horizon. If the tail of a comet be viewed sideways, it sometimes seems bent, when the earth is not in the plane of the comet's orbit continued; but when that plane passes through the eye of the spectator, the tail appears straight.

The most remarkable comet that has appeared in Europe within the last fifty years, was first observed, at London, towards the end of September, 1807. About seven o'clock in the evening, it appeared with the brightness of a star of the second magnitude, with a short luminous tail, and a nucleus distinct and bright. It continued moving in a northerly direction, at the rate of more than a degree per day, till about the end of the year; its tail first diminishing in size and brightness, and, afterwards, the nucleus, and the comet itself. Its greatest brightness was during the month of October, while receding from the sun and the earth: and it was clearly defined with a common large aperture two-feet night-telescope, with three glasses, of a power of about eight times. Another comet appeared in England in the autumn of 1811.

Here let us pause, and acknowledgo with the learned and eloquent Dr. Chalmers, that if the discoveries of science were even to stop here, we should have "enough to justify the exclamation of the Psalmist, 'What is man that thou art mindful of him, or the son of man that thou shouldest deign to visit him?' They widen the empire of creation far beyond the limits which were formerly assigned to it. They give us to see that yon sun, throned in the centre of his planetary system, gives light and warmth, and the vicissitude of seasons, to an extent of surface, several hundreds of times greater than that of the earth which we inhabit. They lay open to us a number of worlds, rolling in their respective circles around this vast luminary—and prove that the ball which we tread upon, with all its mighty burden of oceans and continents, instead of being distinguished from the others, is among the least of them; and, from some of the more distant planets, would not occupy a visible point in the concave of their firmament. They let us know, that though this mighty earth, with all its myriads of people, were to sink into annihilation, there are some worlds where an event so awful to us would be unnoticed and unknown, and others where it would be nothing more than the disappearance of a little star which had ceased from its twinkling. We should feel a sentiment of modesty at this humiliating but just representation. We should learn not to look on our earth as the universe of God, but as one paltry and insignificant portion of it; that it is only one of the many mansions which the Supreme Being has created for the accommodation of his worshippers, and only one of the many worlds rolling in that flood of light which the sun pours around him to the outer limits of the planetary system."

### SECTION III.

#### *Of the Fixed Stars, the Doctrine of the Sphere, &c.*

HAVING briefly surveyed the solar system, which, however stupendous in itself, is small in comparison of the immensity of the universe, we proceed to the contemplation of those other vast bodies called the *fixed stars*; which, being of infinite use in the study of astronomy, claim a particular notice in this article. The fixed stars are distinguished by the naked eye from the planets, by continually exhibiting that appearance which we call *twinkling*. This arises from their being so extremely small, that the interposition of the least body, of which there are many constantly floating in the air, deprives us of the sight of them; when the interposed body changes its place, we again see the star, and this succession being perpetual, occasions the twinkling. But a more remarkable property of the fixed stars, and that from which they have obtained their name, is their never changing their situation with regard to each other. The stars which are nearest to us seem largest, and are therefore called those of the first magnitude. Those of the second magnitude appear less, being at a greater distance; and so proceeding on to the sixth magnitude, which includes all the fixed stars that are visible without a telescope. As to their number, though in a clear winter's night, when the moon is absent, they seem to be innumerable, owing to their strong sparkling, and our looking at them in a confused manner; yet, when the whole firmament is divided into signs and constellations, the number that can be seen at one time, by the unassisted eye, is not above a thousand. Since the introduction of the telescope, indeed, the number of the fixed stars has been justly considered as immense; because the greater perfection we arrive at in our glasses, the more stars always appear to us. Mr. Flamsteed, late astronomer royal at Greenwich, has given us a catalogue of about three thousand stars, which are called *telescopic stars*, from their being invisible without the assistance of that instrument. Dr. Herschel, to whose ingenuity and assiduity the astronomical world is so much indebted, has evinced what great discoveries may be made by improvements in the instruments of observation. M. de la Lande, in speaking of his discoveries, says, "In passing rapidly over the heavens with his new telescope, the universe increased under his eye; forty-four thousand stars, seen in the space of a few degrees, seemed to indicate that there were seventy-five millions in the heavens!" Even these, however, are as nothing when compared to those that fill the whole expanse,—

"And shall we say," enquires Dr. Chalmers, "that these vast luminaries were created in vain? Were they called into existence for no other purpose than to throw a tide of useless splendour over the solitudes of immensity? Our sun is only one of these luminaries, and we know that he has worlds in his train. Why should we strip the rest of this princely attendance? Why may not each of them be the centre of his own system, and

give light to his own worlds? It is true that we see them not; but could the eye of man take its flight into those distant regions, it should lose sight of our little world, before it reached the outer limits of our system—the greater planets should disappear in their turn—before it had described a small portion of that abyss which separates us from the fixed stars, the sun should decline into a little spot, and all its splendid retinue of worlds be lost in the obscurity of distance—he should, at last, shrink into a small indivisible atom, and all that could be seen of this magnificent system, should be reduced to the glimmering of a little star. Why resist any longer the grand and interesting conclusion? Each of these stars may be the token of a system as vast and as splendid as the one which we inhabit. Worlds roll in these distant regions; and these worlds must be the mansions of life and of intelligence. In yon gilded canopy of heaven, we see the broad aspect of the universe, where each shining point presents us with a sun, and each sun with a system of worlds—where the Divinity reigns in all the grandeur of his high attributes—where he peoples immensity with his wonders; and travels in the greatness of his strength through the dominions of one vast and unlimited monarchy.”

We now proceed to the doctrine of the SPHERE; and, in speaking upon this subject, we shall consider the earth as at rest, and the celestial bodies as performing their revolutions around it. This method cannot lead the reader into any error, since we have previously explained the true system of the universe, from which it appears, that it is the *real* motion of the earth which occasions the *apparent* motion of the heavenly bodies. It is also attended with this advantage, that it agrees with the information of our senses.

“The ancients,” says a respectable geographer, “observed, that all the stars apparently turned round the earth, from east to west, in twenty-four hours; that the circles which they described in those revolutions were parallel to each other, but not of the same magnitude; those passing over the middle of the earth being the largest, while the others diminished in proportion to their distance from it. They also perceived, that there were two points in the heavens, which always preserved the same situation. These points they termed celestial poles, because the heavens seemed to turn round them. In order to imitate these motions, they invented what is called the *Artificial* or *Armillary Sphere*, through the centre of which they drew a wire, called an *Axis*, the extremities of which are fixed to the immovable points called *Poles*. They farther observed, that on the 20th of March, and 23d of September, the circle described by the sun was at an equal distance from both the poles. This circle, therefore, must divide the earth into two equal parts, and on this account was called the *Equator*. It was also called the *Equinoctial Line*, because the sun, when moving in it, makes the days and nights of equal length all over the world. Having also observed, that from the 21st of June to the 22d December, the sun advanced every day towards a certain point, and having arrived there, returned towards that from whence it set out, from the 22d of December to the 21st of June; they fixed *these points*, which they called *Solstices*, because the direct motion of the sun was stopped at them; and represented the bounds of the sun’s motion by two circles, which they named *Tropics*, because the sun no sooner arrived there than he turned back. Astronomers, observing the motion of the sun, found its quantity, at a mean rate, to be nearly a degree, or the three hundred and sixtieth part of a great circle in the heavens, every twenty-four hours. This great circle is called the *Ecliptic*; and it passes through certain constellations, distinguished by the names of animals, in a zone called the *Zodiac*. It touches the tropic of Cancer on one side, and that of Capricorn on the other, and cuts the equator obliquely, at an angle of 23 deg. 29 min., the sun’s greatest declination. To express this motion, they supposed two points in the heavens, equally distant from, and parallel to, this circle, which they call the *Poles* of the zodiac, which, turning with the heavens by means of their axis, describe the *two polar circles*. In the armillary sphere, the equinoctial, the two tropics, and two polar circles, are intersected at right angles by two other circles, called *Colures*, which serve to mark the points of the solstices, equinoxes, and poles of the zodiac. The ancients also observed, that when the sun was in any point of his course, all the people inhabiting directly north and south, as far as the poles, have noon at the same time. This gave occasion to imagine a circle passing through the poles of the world, which they call a *Meridian*, and which is immovable in the artificial sphere, as well as the horizon; which is another circle representing the bounds betwixt the two hemispheres, or half-spheres, viz. that which is above it, and that which is below it.”

## SECTION IV.

*Description and Use of the Terrestrial Globe.*

THE terrestrial globe is an artificial representation of the surface of the earth; on which are delineated, according to their relative situations, the continents, islands, empires, kingdoms, and states, into which the known world is divided, together with their principal cities, oceans, rivers, lakes, &c.

The *axis of the earth* (represented on an artificial globe by the wire which passes through its centre from north to south) is an imaginary line, upon which it is supposed to turn, and around which all the celestial bodies seem to revolve in twenty-four hours. The *arctic* and *antarctic poles* are the northern and southern extremities of this axis.

The *equator* is a great circle of the earth, drawn round it, at an equal distance from each of the poles, and dividing it into two equal parts, called the northern and southern hemispheres.

The *ecliptic* is a great circle, in which the sun makes his apparent *annual* progress among the constellations, or it is the real path of the earth round the sun, and cuts the equator in an angle of 23 deg. 28 min.: the points of intersection are styled the *equinoctial points*.

The *horizon* is a great circle which divides the visible half of the heavens from the invisible; and, when applied to the earth, is either spoken of as the *sensible* or *rational horizon*. The former is that circle which terminates our view: the latter is an imaginary line passing through the middle of the earth, parallel to the sensible horizon.

The horizon, on the artificial globe, is a circular flat piece of wood, surrounding the globe, and intended to represent the rational horizon. It is divided into several circles; and, on the *New British Globes*, (from which this description is drawn,) they are arranged in the following order:—

The *first* circle is marked *amplitude*, and is numbered, from 0 to 91 degrees, from the east and from the west, towards the north and south.—The *second* circle is marked *azimuth*, and is numbered, from 0 to 90 degrees, from the north and south points of the horizon towards the east and west.—The *third* circle contains the thirty-two points of the compass, divided into half and quarter points: the degrees in each point are comprised in the azimuth circle.—The fourth circle contains the twelve signs of the zodiac, with the figure and astronomical character of each sign.—The *fifth* circle contains the degrees of the signs, each sign comprising 30 degrees.—The *sixth* circle is occupied by the days of the month corresponding with each degree of the sun's place in the ecliptic.—The *seventh* circle shews the equation of time, or the difference between a correct sun-dial and a well-regulated clock.—And the *eighth*, or outward circle, contains the names of the twelve calendar months.

The *brazen meridian* is the circle in which the globe hangs, and is divided into four quadrants of 90 degrees each. In the upper semicircle of this meridian, the degrees are numbered from 0 to 90, from the equator towards the poles, in the lower semicircle; the degrees are similarly numbered from the poles towards the equator; and they are used for ascertaining the latitudes of places, and for the elevating of the poles. Every place upon the earth is supposed to have a meridian passing through it; and though there are only twenty-four meridians, or lines of longitude, drawn upon the artificial globe, the deficiency is supplied by the brass meridian, to which any place on the surface of the globe may be brought.

*Parallels of latitude* are circles drawn through every ten degrees of latitude parallel to the equator. Every place on the earth is supposed to have a parallel of latitude passing through it, though only sixteen of these circles are drawn on the artificial globe.

The *tropics* are two small circles parallel to the equator, and 23 deg. 28 min. distant from it: that which lies on the north side is called the *tropic of cancer*, and that on the south side is termed the *tropic of capricorn*.

The *polar circles* are two small circles parallel to the equator, at the distance of 66 deg. 32 min. from it. The northern is called the *arctic*, and the southern the *antarctic circle*.

The *analemma* is a calendar of the months, drawn on that part of the globe which represents the Pacific Ocean, and extending from the tropic of cancer to that of capricorn: the months and days marked on it are divided, to correspond with the sun's declination for every day in the year.

The *hour-circle*, on the artificial globe, is a small circle of brass, which turns on the north pole, and is divided into twenty-four equal parts, corresponding with the hours of the day; and these are subdivided into halves and quarters. On the New British globes, there is also an hour circle at the south pole, numbered with two rows of figures, and furnished with an index or pointer.

The *mariner's compass*, which is usually fixed beneath the artificial globe, is designed to represent the horizon, and is used by seamen to ascertain the situation or course of their vessels. It consists of a circular box, which contains a paper card, divided into 32 points, or equal parts, each point comprising 11 deg. 15 min., or the thirty-second part of 360 degrees. The magnetical needle fixed on this card always points *towards* the north, but is subject to a *variation* toward the east or the west. At present, in England, the magnetic needle points about 24 degrees to the *westward* of the north. In rectifying either of the artificial globes, therefore, allowance must be made for this variation.

The *quadrant of altitude* is a necessary appendage to the artificial globe. It is a thin slip of brass divided into ninety degrees, and may be screwed on any part of the brass meridian. On the terrestrial globe it is principally used in measuring the distances of places.

Having now described all the parts of the terrestrial globe, we proceed to lay down such instructions for using it, as may enable our readers, even *without a master*, to work the subjoined problems.

The first thing to be done is to *rectify the globe*; which, however simple in itself, always puzzles the learner, and renders him unable to proceed a single step without a master. To this, therefore, the reader is requested to pay particular attention. Place the globe in such a position that the magnetic needle in the mariner's compass may point 24 degrees to the *westward of the north*; then the brazen meridian will stand due north and south; and all the points of the horizon will be correct. Having done this, loosen the screw at the bottom of the globe, so that the brass meridian may turn freely, and *elevate the pole* according to the given latitude; that is, bring the degree marked on the brass meridian to the wooden horizon. For example:—Suppose the globe to be placed with the hour-circle at the top, and the equator coinciding with the wooden horizon; if, in this case, you are required to rectify the globe for the meridian of London, you must move the globe downwards towards the north point of the wooden horizon till 51½ degrees, as marked on the brass meridian, come exactly level with the horizon; because London is situate in 51 deg. 31 min. *north latitude*; and 51½ degrees will be sufficiently near for instrumental illustration. Or, should you be required to rectify the globe for the meridian of Buenos Ayres in Brazil, you must turn the globe till rather more than 34½ degrees on the *opposite side* of the brass meridian, and *below* the equator, coincide with the wooden horizon; because Buenos Ayres is situate in 34 deg. 35 min. of *south latitude*. By the elevation of the north or south pole, therefore, we merely mean, that the degrees on the brass-meridian, on the north or south side of the equator, must be brought to the north or south side of the wooden horizon, according as the given latitude is north or south.

When the reader has committed these remarks to memory, and has made himself familiar with the lines, circles, &c., already described, he may proceed to work the following problems.

**PROBLEM I.** *To find the latitude and longitude of any place.*—Bring the given place to the brazen meridian, and the degree which stands directly over it will be the latitude; and the degree marked upon the equator which stands directly under the brass-meridian will be the east or west longitude, accordingly as it is numbered toward the east or west upon the equator. Here it is of considerable importance to remark, that the situation of cities, &c. is usually pointed out on the terrestrial globe by a small mark, thus, o. This mark, therefore, and not merely the *name* of the place, should be brought to the brass-meridian, or otherwise the *longitude* may be incorrect.

**PROBLEM II.** *The longitude and latitude of any place being given, to find that place on the globe.*—Bring the degree of longitude to the brass-meridian, and under the degree of latitude upon the same meridian you will find the place, on the north or south of the equator, as the latitude is north or south. Thus, if it be asked, What place is situate in 113 deg. 2 min. of east longitude, and in 23 deg. 8 min. of north latitude? you will find that Canton in China is intended.

**PROBLEM III.** *To find all those places which have the same longitude or latitude.*—In respect of the *longitude*, bring the given place to the brass-meridian, and observe all the places under the edge of that meridian, both on the north and the south side of the equator; for all these will have the same longitude. And in regard of the *latitude*, bring the given place to the brass-meridian, and, having marked its latitude, turn the globe gently round, and observe all those places which pass under the same degree, for these will have the same latitude.

**PROBLEM IV.** *To find the difference of latitude or longitude between two places.*—To ascertain the difference of latitude, bring one of the given places to the brass-meridian, and mark the degree above it; then bring the other place to the meridian, and the number of degrees between it and the place previously marked will be the difference of latitude. To find the difference of longitude, bring one of the places to the brass-meridian, and note its longitude; then bring the other place to the meridian, and the number of degrees between its longitude and that of the former place, counted on the equator, the nearest way round the globe, will give the answer.

**PROBLEM V.** *To find the shortest distance between two given places.*—Lay the graduated edge of the quadrant of altitude over the given places, so that the division marked 0 may rest on one of the places; then the degrees on the quadrant contained between the two places will give you the distance in degrees; and these will be reduced to geographical or English miles, by multiplying by 60 or by 69½; as 60 geographical, or 69½ English, miles make a degree. This problem may also be answered by taking the distance between the given places with a pair of compasses, and applying that distance to the equator, which will shew the number of degrees it contains.

**PROBLEM VI.** *The hour being given at any place, to find what hour it is in any other part of the world.*—Bring the place at which the time is given to the brass-meridian, and set the hour-circle to the given hour; then turn the globe till the other place comes to the brass-meridian, and the hour-circle will shew the time required.

**PROBLEM VII.** *To find the Antæci, Periæci, and Antipodes of any place.*—First place the two poles of the globe in the horizon, and bring the given place to the eastern point of the horizon; then, if the given place be in north latitude, observe how many degrees it is to the northward of the east point of the horizon; the same number of degrees to the southward of the east point will shew the *antæci*, or those who live under the same meridian, but on different sides of the equator, and equi-distant from it. An equal number of degrees, reckoned from the *west* point of the horizon towards the *north*, will shew the *periæci*, or those who live under opposite meridians, but on the same side of the equator, and at equal distances from it. And the same number of degrees, counted towards the *south of the west*, will point out the *antipodes*, or those who live under opposite meridians and in opposite parallels. N.B. If the given place be in *south latitude*, the same rule will serve, reading south for north, &c.

**PROBLEM VIII.** *To find the sun's place in the ecliptic, and his declination.*—Look for the given day in the circle of months on the wooden horizon, and immediately against it, in the circle of degrees of the signs, are the sign or degree in which the sun is for that day. Having found the same sign or degree in the ecliptic, on the surface of the globe, bring it to the brass-meridian; and its distance from the equator, reckoned on the meridian, will be the sun's declination. Or, if you bring the analemma to the graduated side of the brass-meridian, the degree on that meridian exactly above the given day of the month, will be the sun's declination.

**PROBLEM IX.** *To find the sun's rising and setting, for any given day, at any place.*—Rectify the globe for the latitude of the place, bring the sun's place to the meridian, and set the hour-circle to 12. Then bring the sun's place to the eastern point of the horizon, and the hour-circle will shew the time of the sun's rising; bring it to the west point of the horizon, and the hour-circle will shew the time of setting.

**PROBLEM X.** *To find the sun's meridian altitude, at any place, for any given day.*—Elevate the globe for the latitude of the place, and bring the sun's place to the brass-meridian. Then reckon upon the meridian the number of degrees between the sun's place and the horizon, which will point out the sun's meridian altitude.

**PROBLEM XI.** *The sun's meridian altitude being given, to find the latitude of the place.*—Having found the sun's place in the ecliptic, bring it to the brass-meridian, and move the globe, till the distance between the sun's place and the north or south point of the horizon (as the question may require) be equal to the given altitude: then the elevation of the pole will answer to the latitude required.

**PROBLEM XII.** *To find the angle of position between two given places.*—Elevate the north or south pole, as the case may require, as many degrees above the horizon as are equal to the latitude of one of the given places. Bring that place to the brass-meridian; screw the quadrant of altitude upon the degree over it; and move the quadrant till its graduated edge touches the other place: then the number of degrees on the wooden horizon, between the brass-meridian and the graduated edge of the quadrant (reckoning towards the elevated pole) will give the angle of position required.

PROBLEM XIII. To find that part of the equation of time which depends on the obliquity of the ecliptic.—Having found the sun's place in the ecliptic, and brought it to the brass-meridian, count the number of degrees between that meridian and the sign Aries, on the equator and on the ecliptic: then the difference, allowing four minutes of time to a degree, will shew the equation of time. It may be proper to add, that, if the number of degrees on the ecliptic exceed those on the equator, the sun is faster than the clock; but, if the number of degrees on the equator exceed those on the ecliptic, the sun is slower than the clock.

## SECTION V.

### Description and Use of the Celestial Globe.

THE celestial globe is an artificial representation of the heavens, on which the fixed stars are laid down in their natural situations. In using this globe, the student is supposed to be situated in the centre of it, and viewing the stars in the concave surface; and, when it is turned on its axis from east to west, it exhibits the apparent diurnal motion of the heavenly bodies.

In order to avoid needless repetitions in our description of this instrument, it will be necessary to remind the reader, that several things which have already been explained, as belonging to the *terrestrial globe*, are also common to the *celestial*; viz. the axis—the brazen meridian—the hour-circle—the horizon, with its eight circles—the mariner's compass—the quadrant of altitude—the ecliptic, &c. The *equator* on the terrestrial globe is called the *equinoctial* on the celestial.

The ZODIAC is a space which extends about eight degrees on each side of the ecliptic, like a belt or girdle, within which the motions of all the planets are performed.

The zodiac, like the ecliptic, is divided into twelve equal parts, called *signs*, each containing 30 degrees. The sun makes his apparent annual progress through the ecliptic at the rate of nearly a degree in a day. The names of the signs, and the days on which the sun enters them, are as follow:—

#### SPRING SIGNS.

- ♈ Aries, the Ram, 21st of March.
- ♉ Taurus, the Bull, 19th of April.
- ♊ Gemini, the Twins, 20th of May.

#### SUMMER SIGNS.

- ♋ Cancer, the Crab, 21st of June.
- ♌ Leo, the Lion, 22d of July.
- ♍ Virgo, the Virgin, 22d of August.

These six signs are called *northern signs*, being north of the equinoctial: when the sun is in any of these signs, his declination is north.

#### AUTUMNAL SIGNS.

- ♎ Libra, the Balance, 23d of September.
- ♏ Scorpio, the Scorpion, 23d of October.
- ♐ Sagittarius, the Archer, 22d of November.

#### WINTER SIGNS.

- ♑ Capricornus, the Goat, 21st of December.
- ♒ Aquarius, the Water-bearer, 20th of January.
- ♓ Pisces, the Fishes, 19th of February.

These six signs are called *southern signs*: when the sun is in any of these signs, his declination is south.

The spring and autumnal signs are called *ascending signs*; because, when the sun is in any of these, his declination is increasing. The summer and winter signs are called *descending signs*; because, when the sun is in any of these signs, his declination is decreasing.

The *cardinal points* in the heavens are the zenith, the nadir, and the points where the sun rises and sets.

The *zenith* is a point in the heavens exactly over our heads, and is the elevated pole of our horizon. The *nadir* is a point in the heavens exactly under our feet, being the depressed pole of our horizon, and the zenith of the horizon of our antipodes.

The *celestial meridians* are lines drawn from pole to pole directly across the equinoctial; they are also called *circles of declination*. The *parallels of declination* are less circles drawn parallel to the equinoctial.

The *poles of the ecliptic*, or those points on which the celestial meridians meet, on each side of the globe, are 90 degrees distant from every part of the ecliptic.

The *colures* are two great circles; one of which passes through the equinoctial points Aries and Libra, and the other through the solstitial points, Cancer and Capricorn; for which reason they are called the equinoctial and solstitial colures. They divide the ecliptic into four equal parts, and mark the four seasons of the year.

The *constellations* occupy the whole surface of the celestial globe; and are divided into the northern, the southern, and those in the zodiac; and with all these the learner should make himself as familiar as possible.

The *right ascension* of the sun, moon, or stars, is that degree of the equinoctial which comes to the brass-meridian with the celestial body whose right ascension is required: in fact, it is exactly the same as the *longitude* of a place on the terrestrial globe.

The *declination* of any heavenly body is its distance north or south from the equinoctial, reckoned upon the meridian; and corresponds with the *latitude* of places on the terrestrial globe.

*Oblique ascension* is that degree of the equinoctial which comes to the meridian with the sun, moon, or a star, reckoning eastward from the first point of Aries. *Oblique ascension* is that degree of the equinoctial which comes to the horizon with the given star, &c. And *ascensional difference* is the difference between the right and oblique ascensions.

*Right descension*, *oblique descension*, and *descensional difference*, have the same reference to the setting of the sun, the moon, or a star, as the preceding terms have to its rising.

The *latitude* of a star, or planet, is its distance north or south from the ecliptic, counted toward the pole of the ecliptic on the quadrant of altitude. The sun being always in the ecliptic, has no latitude. The *longitude* of any celestial body is its distance, counted eastward on the ecliptic from the first point of Aries. The longitude of the sun on the celestial globe is the same as the sun's place in the ecliptic on the terrestrial globe.

The *rising* of any celestial body is when its centre appears in the eastern part of the wooden horizon;—its *culminating* is when it comes to the brass-meridian; and its *setting* is when its centre disappears in the western part of the horizon.

The *altitude* of any heavenly body is an arc of a vertical circle, contained between the centre of the given body and the horizon. When the object is upon the meridian, this arc is called the *meridian altitude*.

*Amplitude* is the distance (either north or south) of any celestial object from the east or west point of the horizon, at the time of rising or setting. *Azimuth* is the distance of a vertical circle passing through any heavenly body, from the north or south point of the horizon, and is either easterly or westerly.

As the *planets* are moving bodies, they cannot be represented on the celestial globe; but their places in the zodiac may easily be found, by referring to White's Ephemeris or the Nautical Almanac; and if the learner stick a small piece of paper on the places thus found, he may find their rising, setting, &c. as easily as that of the fixed stars.

These definitions, if committed to memory, will enable the reader to work the following problems.

**PROBLEM I.** *To find the right ascension and declination of a given star.*—This is exactly the same as finding the longitude and latitude of a place on the terrestrial globe; as when the given star is brought to the meridian, the degree of the equinoctial will shew the right ascension, and the degree on the meridian over the star will give its declination.

**PROBLEM II.** *Having the right ascension and declination of any star given, to find it on the globe.*—This is done the same as Problem II. on the terrestrial globe.

**PROBLEM III.** *To find the rising, culminating, and setting of any star, &c.*—Having rectified the globe for the given latitude, and brought the sun's place to the meridian, set the hour-circle at 12. Then bring the given star successively to the eastern point of the horizon, the brass-meridian, and the western point of the horizon; and, by looking each time at the hour-circle, you will see the time of its rising, culminating, and setting.

**PROBLEM IV.** *To find the latitude and longitude of a given star, &c.*—Bring the pole of the ecliptic which is in the same hemisphere with the given star, to the brass-meridian, and screw over it the quadrant of altitude. Insert a piece of quill or other substance between the globe and the meridian, to keep the former steady, and move the quadrant till it come exactly to the centre of the given object: then the degree of the quadrant cut by the star will be the latitude, and the degree of the ecliptic cut by the quadrant will be the longitude required.

**PROBLEM V.** *To find on what day of the year any star passes the meridian, at a given hour.*—Bring the star to the brass-meridian, and set the hour-circle to the given time. Then turn the globe till the index point to 12 at noon, and the day of the month corresponding with the degree of the ecliptic, then under the meridian will be the day required.

**PROBLEM VI.** *To represent the face of the heavens for any night and hour, in any given latitude.*—Rectify the globe for the latitude of the place, bring the sun's longitude to the meridian, and set the hour-circle to

12 o'clock: then turn the globe till the index point to the given hour; and the stars in the heavens will appear in the same situation as upon the globe. If the globe, in this case, be taken into the open air, and a pencil be placed erect on either of the stars drawn on its surface, it will point out that particular star in the heavens.

**PROBLEM VII.** *The latitude, day of the month, and hour, being given, to find the altitude and azimuth of any star.*—Rectify the globe for the given latitude, bring the sun's place to the meridian, set the hour-circle at 12, and turn the globe till the index point to the given hour. Then fix the quadrant of altitude on the zenith, and bring it over the star. The degree upon the quadrant cut by the star will be its altitude, and the distance between the foot of the quadrant and the north or south point of the horizon, will be the azimuth.

**PROBLEM VIII.** *The latitude, day of the month, and hour, being given, to find what planets will be visible.*—Rectify the globe for the latitude of the place, bring the sun's place to the meridian, and set the hour-circle to 12. Then, if the given time be before noon, turn the globe *eastward* till the index has passed over as many hours as the time wants of noon; but, if the given time be past noon, turn the globe *westward*, till the index has passed over as many hours as the time is past noon. Steady the globe in this position, and look in an ephemeris for the longitudes of the planets; and if any of them be in the signs of the zodiac which are above the wooden horizon, such planets will be visible.

**PROBLEM IX.** *To find the distance of two stars from each other in degrees.*—Lay the quadrant of altitude over the given stars, so that the division marked 0 may rest on one of them, and the degrees between them, counted on the quadrant, will give their distance.

**PROBLEM X.** *To find the time of the moon's rising, southing, and setting for any latitude and day of the year.*—Look in an ephemeris for the moon's longitude and latitude for the given day, and mark its place in the zodiac with a small paper patch; then its rising, southing, and setting, may be found as easily as those of the stars. The term *southing* implies the same as the *culminating* of the stars, viz. coming to the meridian.

A NEW AND  
COMPLETE SYSTEM  
OF  
UNIVERSAL GEOGRAPHY.

PART I.

ASIA.

THIS division of the terraqueous globe demands the first attention of the geographer and the historian; as it was in this quarter that those grand and interesting events took place, which are recorded in the Holy Scriptures of truth, and which we are commanded to inculcate upon the minds of our children, and of our children's children. It was here that the eternal Jehovah first smiled propitiously on the works of his own creation, and emphatically pronounced them "very good;" whilst "the morning-stars sang together, and all the sons of God shouted for joy." Here our first progenitors were placed in the garden of Eden, which breathed ambrosial sweets around them, and presented to their hands the most delicious fruits and flowers; whilst the lion and the lamb, equally harmless, bounded over the enamelled carpet of the earth, and the heavens resounded with the songs of innumerable birds, warbling amidst the unfading foliage of the trees. Here, subsequently to the introduction of sin, and man's expulsion from the lovely bowers of Paradise, an ark was prepared, by the Divine command, for the preservation of one family from the universal deluge, and, by the migration of different branches of that family, the whole world was progressively peopled. In Asia, the descendants of Abraham were led safely to, and planted in, the land of promise. Here the law of ten commandments was given from heaven, with a degree of pomp and solemnity which may be more easily conceived than described; and a series of miracles evinced and illustrated the power, wisdom, and love, of that adorable Being, who had "chosen Israel as his own inheritance." On this continent the holy prophets uttered their predictions; and here the stupendous work of man's redemption was accomplished by the co-equal Son of God, "who died for our sins, and rose again for our justification." Here also the truths of Christianity were first promulgated;—the first Christian churches were

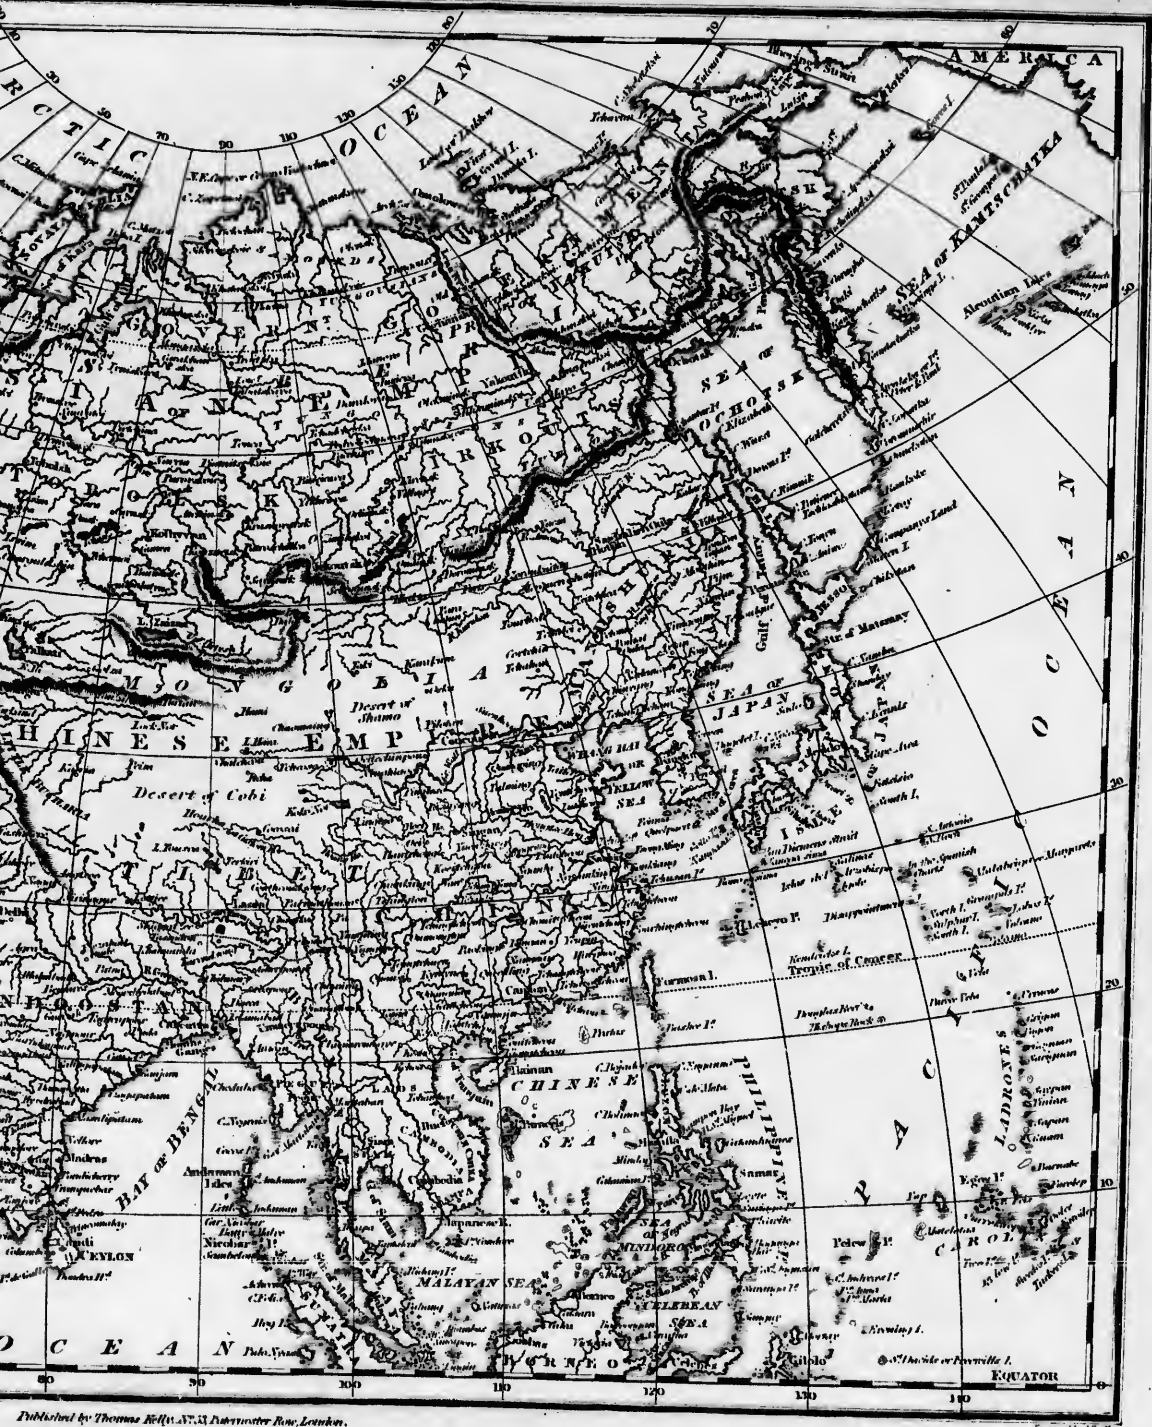

planted;—the blood of the martyrs was first shed;—and from hence the brightest rays of the gospel of peace gradually beamed forth upon a dark and barren world. Finally, in Asia languages were first spoken, arts and manufactures were practised, edifices were reared, and empires were founded, whilst all the other divisions of the globe were uninhabited and unexplored. And whether we advert to the serenity of its climate, the natural fertility of its soil, the fragrant and salubrity of its plants, gums, and spices, the deliciousness of its fruits, or the richness of its various productions, which sparkle in the mines, embroider the meads, and mingle with its streams, its right of pre-eminence in a geographical description of the earth will be sufficiently and unanswerably established.

This extensive continent is situated between 25 and 190 degrees of east, or 170 of west, longitude; and between the equator and 78 degrees of north latitude. It is about six thousand miles in length, from the Dardanelles on the west, to the eastern shore of Tartary; and about five thousand five hundred miles in breadth, from the most southern part of Malacca to the northernmost cape of Asiatic Russia. It is bounded by the Frozen Ocean on the north. On the west it is separated from Africa by the Red Sea; and from Europe, by the Levant or Mediterranean, the Archipelago, the Hellespont, the Sea of Marmora, the Bosphorus, the Black Sea, the River Don, and a line drawn from it to the River Tobol, and thence to the River Oby, which falls into the Frozen Ocean. On the east, it is bounded by the Pacific Ocean, which separates it from America; and on the south by the Indian Ocean: so that it is almost surrounded by the sea. The following table will convey an accurate idea of the different countries into which it is divided, with their comparative extent of territory, their respective bearings from London, and the religions professed by their inhabitants.

Though inland seas are less numerous in Asia than in Europe, yet, in addition to a portion of the Mediterranean, this quarter of the globe includes the Red Sea and the Gulf of Persia, the bays of Bengal and Nankin, and other gulfs, which render the coasts much more diversified than those of Africa or America.

The Red Sea, or the ancient Arabian Gulf, is the grand line of division drawn by nature between Asia and Africa; but its advantages have been principally experienced by the latter, which is completely destitute of any other inland sea. This celebrated gulf extends about fourteen hundred and seventy British miles, from the Straits of Babelmandel to Suez, and terminates, not in two equal branches, as described in old maps, but in an extensive western branch, whilst the eastern runs but a short distance beyond the parallel of Mount Sinai. The Gulf of Persia is another inland sea, about half the length of the former, into which the rivers Tigris and Euphrates pour their tributary streams.

The other Asiatic gulfs do not exhibit such characteristic features of what are strictly termed inland seas; but this extensive tract of country contains seas which are totally detached, and entirely different from any that occur in the other quarters of the world. Such are the Euxine and the Caspian seas, the latter of which extends about seven hundred miles in length, and from one hundred to two hundred in breadth. This sea receives several important rivers; and though the northern shores are low and swampy, in other parts the coasts are steep, and the water is of such considerable depth, that a line of four hundred and fifty fathoms will not reach the bottom.

The lake of Aral, situated about a hundred miles on the east of the Caspian, has been but little explored, from the circumstance of its being skirted with sandy deserts; but it is about two hundred miles in length, and seventy in breadth. Its water is salt, like that of the Caspian; and the rivers Sirr and Gihon (the Jaxartes and the Oxus of antiquity) disembody themselves into it.

The sea of Baikal, in Asiatic Russia, extends about three hundred and fifty miles in length, but its greatest breadth does not exceed thirty-five. The water, though tinged with green, is fresh and transparent, and contains abundance of fish.

The principal rivers of Asia are the Kianku and Hoan Ho, the Lena, the Oby, and the Yenisey, which, in the length of their course, rival any others in the world. Next in importance are the Amur and the Maykaung of Laos, the Burrampooter, and the Ganges; to which the Euphrates and the Indus are very inferior.

The mountains of Asia do not equal those of Europe in elevation. The Altaian chain, however, may be ranked among the most extensive on the surface of the globe; as it extends about five thousand miles, which is a greater distance than that occupied by the Andes of South Ame-

rica. To the south of this ridge extends the elevated desert of Shamo, in a parallel direction from east to west; and in this central prominence of Asia the lofty region of Thibet may be included. The other principal ranges of mountains are Bogdo, Changai, Belur, the Ghauts of Hindoostan, and the Caucasian range between the Caspian and the Euxine seas.

The prevailing form of government in Asia is absolute monarchy; and the blessings of freedom are entirely unknown to its inhabitants, with the exception of the wandering tribes of Tartars and Arabs. Many of the Asiatic nations, when the Dutch first came among them, seemed to consider it impossible that any other form of government could subsist than that of regal despotism.

With regard to religion, Asiatic Turkey, Arabia, Persia, part of India, and part of Tartary, acknowledge Mahomet for their prophet and legislator. Other parts of Tartary, India, China, and the Asiatic Islands, are principally inhabited by heathens and idolaters, among whom are the worshippers of Brama and Foe, the devotees of Confucius, and those who profess to adore the supreme Ruler of the universe, under the symbol of fire.

Jews are to be met with in every part of Asia; and these people inhabited the remoter regions of India some centuries before the discovery by the Portuguese. Christianity, though planted here by the apostles and primitive fathers, suffered an almost total eclipse by the conquests of the Saracens, and afterwards of the Turks. Incredible, indeed, have been the hazards and sufferings of the missionaries, to propagate their doctrines in the most distant regions, and amongst the grossest idolaters; but their labours have hitherto failed of success, owing in a great measure to the avarice, cruelty, and injustice of the Europeans, who resort thither in search of power or opulence.

The languages principally spoken in this division of the globe are the Turkish, the modern Greek, the Chinese, the Japanese, the Russian, the Persian, the Malayan, the Arabic, and the Tartarian. The European languages are also spoken upon the coasts of China and India.

The inhabitants of the southern parts of Asia are extremely indolent, that they never stir but with reluctance. But the northern tribes, who occupy the extensive regions of Tartary, are robust and active, hate idleness, and are continually roving about. The first are the most ingenious, the latter the most courageous: the former have brought several arts to great perfection, the latter deem courage the greatest virtue, and athletic exercises the most essential marks of genius. This disparity of disposition occasions them to despise each other, on account of that contrast which marks their characters: each is satisfied with the nature of his own country; and each imagines, that his peculiar mode of life leads by the most direct road to earthly felicity.

## CHAPTER I.

## TURKEY IN ASIA.

**T**his vast region is situated between twenty-eight and forty-four degrees of north latitude, and between twenty-six and forty-five degrees of east longitude. It extends about eleven hundred and twenty miles in length, and upwards of a thousand in breadth; and is computed to contain four hundred and seventy thousand and four hundred square miles. Its boundaries are, the Black Sea and part of Circassia on the north; Persia on the east; Arabia and the Levant on the south; and the Archipelago, the Hellespont, and Propontis, on the west.

*Divisions.*] Asiatic Turkey is divided into three parts, viz. *Syria*, including Palestine, on the east of the Levant Sea;—the *eastern provinces* of Irac Arabia, or Chaldea; Diarbeck, or Mesopotamia; Curdistan or Assyria; Turcomania, or Armenia; and Georgia; including Mingrelia, Imaretta, and part of Circassia;—and *Natolia*, or Asia Minor, comprising Natolia Proper, Amasia, Aladulia, and Caramania.

*Climate, Soil, &c.*] The climate of Turkey in Asia has always been considered excellent; as there are a softness and serenity in the air, which are not found on the European side of the Archipelago; and the heat of summer is considerably moderated by those ranges of mountains which are capped with perpetual snow. The soil is extremely various; but in general it is tolerably fertile. Palestine, in particular, was, in former times, luxuriantly productive; and modern travellers assure us, that, notwithstanding its present desolate and neglected state, it still exhibits visible signs of its natural fertility. Even Volney gives his evidence to this fact; and Dr. Shaw remarks, that “if the Holy Land were as well peopled, and as well cultivated, as in ancient times, it would be still more fruitful than the best provinces of Syria and Phœnicia.” Wherever wheat is sown, if it be not destroyed by rain, it grows to the height of a man, and yields an exuberant harvest; and the cotton that is gathered in the plains of Ramah and Zebulon is of greater value than that which grows in the vicinity of Sidon and Tripoli. In its happier days, this country abounded with pomegranates, dates, figs, citrons, oranges, hemp, flax, cedars, cypresses, and many other stately and fragrant trees; oil, honey, gums, and drugs; together with a profusion of cattle, fowls, fish, &c.; so that Moses had the strictest regard to veracity, when he described the Land of Promise as “a land flowing with milk and honey; a

land of wheat and barley; of vines, figs, and pomegranates; of oil, olives, and honey; a land where there is no lack of any thing.”

For the following remarks on the present aspect of this part of the country, and the interest excited by it, we are indebted to M. Chateaubriand, who travelled through Greece, Palestine, Egypt, and Barbary, during the years 1806 and 1807.

“When you travel in Judea, the heart is at first filled with profound disgust; but when, passing from desert to desert, boundless space opens before you, this disgust gradually wears off, and you experience a secret awe, which, far from sinking the spirits, invigorates the mind, and elevates the genius. Extraordinary appearances every where proclaim a country teeming with prodigies. The scorching sun, the towering eagle, the barren fig-tree, all the poetry, all the pictures of scripture, are found here. Every name revives the recollection of something significant—every grotto indicates something symbolical—every hill suggests the voice of a prophet. In these regions the Almighty himself hath spoken. Rivers that are now dried up, rocks that are rent in sunder, sepulchres half opened, attest the miracle. The desert still appears mute through terror, and you would imagine, that it had never presumed to interrupt the awfulness of silence since it heard the voice of the Eternal.”

*Lakes, Rivers, &c.*] **THE LAKE ASPHALTITES**, or Dead Sea, is called in the Jewish writings the Sea of Sodom, the Salt Sea, and the Sea of the Desert. The name of Asphaltites was given to it on account of the great quantity of Asphaltum, or Bitumen, found on its borders. It was called the Dead Sea, because it was supposed that no creature could exist in it, on account of its excessive saltness. It has been generally understood that this lake was formed by the overthrow of the cities of Sodom and Gomorrah, which, for their detestable crimes, perished in an extraordinary conflagration. And it is worthy of remark that, even at present, clouds of smoke are often seen to issue from it, and new crevices to be formed on its banks. “According to the tradition of the inhabitants,” says Strabo, “the valley of the lake was formerly peopled by thirteen flourishing cities, which were swallowed up by a volcano.” This account is further confirmed by the ruins which travellers have discovered on the western border. The eruptions have long since

ceased; but earthquakes, which usually succeed them, still continue to be felt at intervals in that country.

The excessive saltiness of the water, which infinitely exceeds that of the sea, is the cause that deprives it of vegetable and animal productions, and occasions that deadly aspect which reigns on the borders of the lake. The origin of the mineral by which it is impregnated is easily discovered, for on the south-west shore are mines of fossil salt, situated in the side of the mountains, which from time immemorial have supplied the neighbouring Arabs.

"The valley, which encloses the Dead Sea," says M. Chateaubriand, "displays a soil resembling the bottom of a sea that has long retired from its bed; a beach covered with salt, dry mud, and moving sands, furrowed as it were by the waves. Here and there, stunted shrubs with difficulty vegetate upon this inanimate tract; their leaves are covered with salt, which has nourished them, and their bark has a smoky smell and taste. Instead of villages, you perceive the ruins of a few towers. Through the middle of this valley flows a discoloured river, which reluctantly creeps towards the pestilential lake by which it is engulfed. Its course amidst the sands can be distinguished only by the willows and the reeds that border it; and the Arab lies in ambush among these reeds, to attack the traveller, and to plunder the pilgrim.

"Such is the scene once famous for the benedictions and the curses of heaven. This river is the Jordan; this lake is the Dead Sea; it appears brilliant, but the guilty cities entombed in its bosom seem to have poisoned its waters. Its solitary abysses cannot afford nourishment to any living creature; never did vessel cut its waves; its shores are without birds, without trees, without verdure; and its waters are excessively bitter, and so heavy, that the most impetuous winds can scarcely ruffle their surface."

"We descended from the ridge of the mountains, to pass the night on the banks of the Dead Sea, and afterwards proceed along the Jordan. In this manner we marched for two hours, following the fissures formed between the sand-hills, in mud baked by the rays of the sun. A crust of salt covered the surface, and resembled a plain of snow, from which a few stunted trees reared their heads. We arrived suddenly at the lake: no murmur, no cooling breeze, announced the approach to its margin. The strand, bestrewed with stones, was hot; the water of the lake was motionless, and absolutely dead along the shore. It was quite dark. The first thing I did on alighting, was to walk into the lake up to my knees, and to taste the water. I found it impossible to keep it in my mouth; it far exceeds in saltiness that of the sea, and produces upon the lips the effect of a strong solution of alum. Before my boots were completely dry, they were covered with salt; our clothes, our hats, our hands, were, in less than three hours, impreg-

nated with this mineral. Galen, as early as his time, remarked these effects, and Pœocke confirms their reality.

"The moon, rising at two in the morning, brought with her a strong breeze, which, without cooling the air, produced a slight undulation on the bosom of the lake. The waves, charged with salt, soon subsided by their own weight, and scarcely broke against the shore. A dismal sound proceeded from the lake of death, resembling the stifled clamours of the people engulfed in its waters. The dawn now appeared on the opposite mountains of Arabia. The Dead Sea, and the valley of the Jordan, glowed with an admirable tint; but this rich appearance only served to heighten the desolation of the scenery."

THE SEA OF TIBERIAS, so called from a city of that name on the south-west shore, is sometimes in scripture termed the Lake of Genesareth, and the Sea of Galilee. The River Jordan runs through it; and, according to Josephus, it is a hundred furlongs in length, and about forty in breadth. In some particulars it differs widely from the Dead Sea, for it is extolled for the sweetness and excellency of its water, and the abundance and variety of its fish.

The only river of note in Palestine is the JORDAN, which originates in the Lake Phiala. It runs to the south-west, sending its waters to the Lakes of Samaehon and Tiberias; and, after a course of nearly a hundred miles, discharges into the Dead Sea. Its breadth exceeds sixty feet; but its depth is only ten or twelve. In winter it overflows its channel, and, swelled by the periodical rains, and the melting snows, forms a sheet of water, sometimes a quarter of a league broad. The season of its inundation is generally March, when the snows dissolve on the mountains of the Shaik; at which time its waters are troubled, and its course becomes rapid and impetuous. Its banks are thickly covered with reeds, willows, and various shrubs, which serve as an asylum for various kinds of birds and wild beasts.

M. Chateaubriand spent two whole hours on the banks of the Dead Sea, desirous of seeing the Jordan, at the place where it discharges itself into the lake; but the Arabs, his companions, refused to conduct him to it, because the river near its mouth turns off to the left, and approaches the mountains of Arabia. "I was therefore obliged," says he, "to make up my mind to proceed to the curve of the river that was nearest to us. We broke up our camp, and for an hour and a half advanced over a fine white sand, with extreme difficulty. We were approaching a grove of balm-trees and tamarinds, which, to my great astonishment, I perceived amidst this barren tract. The Arabs suddenly halted, pointing to something that I had not yet remarked at the bottom of the ravine. Unable to make out clearly what it was, I thought

a perceived sand in motion. On drawing nearer, however, to this singular object, I beheld a yellow current, scarcely distinguishable from the sand on its shores. It was sunk considerably below its banks, and its sluggish stream rolled slowly on. This was the Jordan.

"I had surveyed the great rivers of America with that pleasure which solitude and nature impart; I had visited the Tiber with enthusiasm, and sought with similar interest the Eurotas and the Cephissus: but I cannot express what I felt at the sight of the Jordan. It not only brought to my recollection its ancient renown, and one of the most celebrated names which the most exquisite poetry ever confided to the memory of man; but its shores also presented to my view the theatre of the miracles of my religion. Judea is the only country in the world, that revives in the traveller the remembrance of human affairs, and of celestial things; producing in the mind, by this combination, ideas and feelings, which no other country is capable of exciting.

"The Arabs stripped, and plunged into the Jordan. I durst not follow their example, on account of the fever by which I was tormented; but I took up some water from the river in a leathern vessel; I thought it rather brackish; but, though I drank a considerable quantity, I felt no inconvenience from it. I even think it would be pleasant, if it were purified from the sand that it carries along with it.

"About two leagues from the place where we halted, I perceived, higher up the river, a thicket of considerable extent, to which I determined to proceed, concluding in my own mind, that this must be nearly the spot where the Israelites passed the river, opposite Jericho; where the manna ceased to fall; where the Hebrews tasted the first fruits of the promised land; where Naaman was cured of his leprosy; and, lastly, where Jesus Christ was baptized by his illustrious fore-runner, John the Baptist. We advanced towards this place; but, as we drew near, we heard the voices of men in the thicket. Unfortunately, the human voice, which every where else cheers you, and which you would love to hear on the banks of the Jordan, is precisely what most alarms you in these deserts. My companions proposed an immediate retreat; but I declared that I had not come so far to be so hasty to return; that I agreed to go no higher up the river; but that I was resolved upon examining it facing the spot where we then stood. They reluctantly yielded to my purpose, and we again repaired to the bank of the Jordan, which a bend of the river had carried to some distance from us on the right. I found it to be of the same breadth and length here as a league lower down; that is, about six or seven feet deep close to the shore, and about fifty paces in breadth. Having finished such notes as I wished to make, I saluted the Jordan for the last time, took a bottle of its water, and a few rushes from its bank, and quitted the river."

But the *principal* rivers of Asiatic Turkey are, the Euphrates and the Tigris; the comparative course of the former being computed at fourteen hundred, and that of the latter at eight hundred, British miles. The other rivers of note are the Kizil Irmak, the Halys of antiquity; the Minder or Menander; the Orontes; and the Sarabat, or ancient Hermus, celebrated for its golden sands.

*Mountains.*] Among the mountains of Asiatic Turkey, the first rank is due to the Taurian chain; which extends about six hundred miles east and west, from the Euphrates to near the shores of the Archipelago. A modern traveller found the ascent and descent to occupy three days; and he observes, that the heights abound with cedars, animes, and junipers.

Mount Ararat, on which Noah's ark rested, after the waters of the deluge had subsided, is situate in the midst of a large plain, on the east of Armenia. M. Tournefort observes, that this mountain presents the most disagreeable spectacle imaginable, as it has neither houses, trees, nor shrubs, on its surface; and appears as if continually mouldering away. He divides it into three regions: the lowermost of which is occupied by a few shepherds tending wretched flocks; the second is inhabited by crows and tigers; and all the rest is covered with snow, which, during half the year, is involved in thick clouds. On the side of the mountain, next Erivan, is a very abrupt precipice, the extremities of which have a black appearance, as if smutted with smoke; and in this direction masses of rock are continually falling with a hideous noise. The Olympus (now called Keshik Dag) is one of the highest mountains in Asia; and about a hundred and forty miles to the westward rises Mount Ida, the summit of which was styled Garganus: from this the western prominences extend to the Hellespont; and amidst them stood the famous city of Troy.

In Syria, the celebrated mountain of Libanus, or Lebanon, runs in a direction north and south of the Mediterranean; and the Anti-Libanus is a short detached range, nearly parallel on the east. The hills in and near Jerusalem will be noticed in our description of that interesting city.

*Animals.*] The best horses of Arabian extract; and are sparingly fed with barley and chopped straw, to accustom them to abstinence, and to endure fatigue. The hyena and the wild boar are frequently seen in Asia Minor; and tigers of the smaller kind occupy a part of Mount Ararat. The sheep in the vicinity of Smyrna have immensely large tails, which are mere lumps of fat, and often weigh ten or twelve pounds. The goats of Angora are extremely beautiful; the hair being of a dazzling whiteness, and as fine as silk. It is curled naturally into locks of eight or nine inches long, which make the finest camblets. This hair is spun in the country, and manufactured at Angora. These

Van Eignont, envoy extraordinary from the United Provinces to the court of Naples, in reciting his travels through Anatolia, says, "In the country are great numbers of storks, which afford the inhabitants an odd kind of diversion. They place hen-eggs in the stork's nest; and, when the young are hatched, the mule, on seeing them of a different form from its own species, makes a tedious noise, which calls together a crowd of other storks hovering about the nest, and who, to revenge the disgrace that the female has in appearance brought on her nest, destroy her, by pecking her to death; the mule in the mean time making the heaviest lamentation, as if bewailing his misfortune, which obliged him to have recourse to such disagreeable severities.

"Here," says the same author, "I also saw the creature called the camelion. It was found among the ruins of Old Smyrna castle. The creature was pretty large, and I saw it change its colour three several times, becoming black, white, and green. It was placed on a piece of red cloth, and often turned, but never assumed that hue. Whether the creature were too large, and the smaller only imitated this colour, or from any other reasons, is beyond my philosophy to determine. With regard to its food, during the eight days it lived with us, I did not observe it to eat any thing except small flies, which it caught in the air with its tongue."

*Minerals, and Mineral Waters.*] Ancient Lydia was famous for the production of gold; but at present there is no trace of any metal but copper. The mineralogy of the country, however, in modern times, has been very imperfectly known; as the indolence of the inhabitants prevents their researches into the bowels of the earth. The best mineral waters are those near the city of Prusa, at the bottom of Mount Olympus. The water is highly celebrated for its medicinal virtues; and two magnificent baths are erected for the accommodation of the invalids who resort to it, one for men, and the other for women.

*Curiosities.*] Many natural curiosities are found in Palestine, particularly stones exactly resembling citrons, melons, peaches, olives, bunches of grapes, and even several kinds of fish; they are found principally about Mount Carmel: those that resemble olives are the *Lapides Judaici*, which have always been deemed medicinal. In the neighbourhood of Bethlechem is found a stone of the slate kind, which exhibits in every flake the representation of a variety of fishes. Near the lake Asphaltites are a number of hillocks, resembling places where there have been lime-kilns, and abundance of saline efflorescences.

A thorny bush grows in the plains of Jericho, which bears a fruit that has some similitude to an unripe walnut. From this fruit the natives extract an oil, which is an excel-

lent remedy for bruises, when internally applied, and for wounds when used externally. Its reputation is so great, that it is preferred even to the balm of Gilead.

Two more natural curiosities abound in the plains of Jericho, viz. the wood-olive, the outward coat of which is green, like the common olive, but, being taken off, a nut of a woody substance appears: it is of about the thickness of an almond-shell, and ribbed lengthways. And the karoub, or locust-tree, which bears a fruit like a bean, containing some small seeds: the shell, when dried, is eaten, and has a very agreeable taste. These are thought to be the locusts on which John the Baptist fed, and not the animal of that name, as many have supposed.

*Cities, &c.*] JERUSALEM, the ancient capital of Judea, once renowned for the splendor of its monarchs, the sumptuous magnificence of its temple, and the pomp of its worship, exhibits at present no remains of the city, as it existed in our Saviour's time, or as it was afterwards rebuilt by the emperor Adrian; scarcely one stone being left upon another. Even the situation is altered; for Mount Sion, the most eminent part of the ancient Jerusalem, is now nearly excluded; whilst Mount Calvary, which is expressly said to have been "without the gate," is almost in the centre of the city. With respect to its present state, it is but about three miles in circumference, and thinly inhabited. The walls are weak, and without bastions; and the ditch inconsiderable. The gates are six in number, viz. Damascus, St. Stephen's, Herod's, Sterquelina, Bethlechem, and Mount Sion Gate; beside the Golden Gate, which is shut up, on account of a prophecy which the Turks have among them, that by this gate the Christians are to take Jerusalem.

For the following interesting particulars relative to this city we are indebted to our countryman Dr. Clarke, whose travels have been recently laid before the public.

"At three o'clock we mounted our horses, and proceeded on our route. No cessation of fatigue or heat could counterbalance the eagerness and zeal which animated all our party, in the approach to Jerusalem. Every individual pressed forward, hoping first to announce the joyful intelligence of its appearance. At length, after about two hours had been passed in this state of anxiety and suspense, ascending a hill towards the south, a Greek, in the van of our cavalcade, exclaimed, that he saw the holy city; and instantly throwing himself from his horse, was seen bareheaded, upon his knees, facing the prospect he surveyed. Suddenly the sight burst upon us all. Who shall describe it? The effect produced was that of total silence throughout the whole company. Many of the party, by an immediate impulse, took off their hats, as if entering a church, without being aware of it. The Greeks and Catholics shed torrents of tears; and presently beginning to cross themselves with unfeigned devotion, asked, if they might be permitted to take off the covering from

their feet, and proceed barefooted to the holy sepulchre. We had not been prepared for the grandeur of the spectacle which the city exhibited. Instead of a wretched and ruined town, by some described as the desolated remnant of Jerusalem, we beheld, as it were, a flourishing and stately metropolis, presenting a magnificent assemblage of domes, towers, palaces, churches, and monasteries, all of which, glittering in the sun's rays, shone with inconceivable splendor. As we drew nearer, our whole attention was engrossed by its noble and interesting appearance. The lofty hills by which it is surrounded, give to the city itself an appearance of elevation inferior to that which it really possesses. About three-quarters of an hour before we reached the walls, we passed a large ruin upon our right hand, close to the road. At this place, two Turkish officers, mounted on beautiful horses sumptuously caparisoned, came to inform us, that the governor, having intelligence of our approach, had sent them to escort us into the town. When they arrived, we were all assembled upon an eminence, admiring the splendid appearance of the city; and, being impressed with other ideas than those of vain ostentation, would gladly have declined the parade, as well as the interruption occasioned by a public entry. As we approached the city, the concourse of people became very great, the walls and the road-side being covered with spectators. An immense multitude at the same time accompanied us on foot; some of whom, welcoming the procession with compliments and caresses, cried out, "Good Englishmen! Success to England!" others, cursing and reviling, called us a set of rascally christian dogs, and filthy infidels. We could never learn, why so much curiosity had been excited, unless it were, that, of late, owing to the turbulent state of public affairs, the resort of strangers to Jerusalem had been less common; or that they expected another visit from Sir Sidney Smith, who had marched into Jerusalem with drums beating and colours flying, at the head of a party of English sailors. Novelty, at any period, produces considerable bustle at Jerusalem; the idleness of its inhabitants, and the uniform tenor of their lives, rendered more monotonous by the cessation of pilgrimages, naturally dispose them to run after a new sight, or to listen to new intelligence. The arrival of a Tartar courier from the vizier's army, or the approach of foreigners to the city, rouses Christians from their prayers, Jews from their traffic, and even Mahometans from their tobacco, or their opium, in search of something new.

"Men who are entitled to high consideration, and to whose authority even reverence is due, have written to illustrate the topography of Jerusalem; and some of the ablest modern geographers have applied all their talents, ingenuity, and information, to describe it. It would, therefore, seem like wanton temerity, to dispute the identity of places, whose situation has been so ably discussed, and so gene-

rally admitted, were there not this observation to urge that the descriptions of Jerusalem since the Crusades have principally issued from persons who had no ocular evidence of the places they describe. If, as spectators upon the spot, we confessed ourselves dissatisfied with the supposed identity of certain points of observation in Jerusalem, it was because we refused to tradition what appeared contrary to the evidence of our senses. Possessing as much enthusiasm as might be necessary in travellers viewing this "holy city," we still retained the power of our understandings sufficiently to admire the credulity, for which no degree of preposterousness seemed too mighty. There is much to be seen at Jerusalem, besides its monks and monasteries; much to repay pilgrims, of a very different description from those who usually resort thither, for all the fatigue and danger that they must encounter. At the same time, to men interested in tracing, within the walls, antiquities referred to in sacred history, no sight can be more mortifying than the city in its present state. The mistaken piety of the early Christians, in attempting to preserve, either confused or annihilated the memorials it endeavoured to perpetuate. On viewing the havoc they have made, it may now be regretted, that the Holy Land was ever rescued from the dominion of Saracens, far less barbarous than their conquerors. The absurdity of hewing the rocks of Judea into gilded chapels, and of disguising the face of nature with painted domes and marble coverings, by way of commemorating the scenes of our Saviour's life and death, is so evident and so lamentable, that it has not escaped the reprehension of travellers no way remarkable for their incredulity.

"We were conducted to the governor's house, who received us in very great state, offering his protection, and exhibiting the ordinary pomp of Turkish hospitality, in the number of slaves, who brought fuming incense, coffee, preserved fruit, and pipes, to all the party, profusely sprinkling us, as usual, with rose and orange flower water. Being then informed of all our projects, he ordered his interpreter to go with us to the Franciscan Convent of St. Salvador, a large building like a fortress, the gates of which were thrown open to receive our whole cavalcade. Here we were admitted into a court, with all our horses and camels, the vast portals were then again closed, and a party of the most corpulent friars we had ever seen from the warmest cloisters of Spain and of Italy waddled round us, and heartily welcomed our arrival.

"From the court of the convent we were conducted by a stone staircase to the refectory, where the monks, who had received us, introduced us to the superior, who was not a whit less corpulent than any of his companions. In all the convents I had ever visited, and they are not few in number, I had never beheld such friars as the Franciscans of St. Salvador.

"After being regaled with coffee, and some delicious lemonade, we were shewn to our apartments, to repose ourselves until supper. The room allotted to our English party we found to be the same which many travellers have already described. It was clean, and its walls were white-washed. The beds also had a cleanly appearance, although a few bugs warned us to spread our hammocks upon the floor, where we slept for once unmolested. Upon the substantial door of this chamber, whose roof was of vaulted stones, the names of many English travellers had been carved. Among others, we had the satisfaction to notice that of THOMAS SHAW, the most learned writer who has yet appeared in descriptions of the Levant. Dr. Shaw had slept in the same apartment in 1722, seventy-nine years before our coming.

"In the morning we set out to visit what are called 'The Holy Places.' From the monastery we descended to the church of the holy sepulchre, the external appearance of which resembled that of any ordinary Roman Catholic church. Over the door we observed a bas-relief, executed in a style of sculpture meriting more attention than it has hitherto received. At first sight, it seemed of higher antiquity than the existence of any place of Christian worship; but, upon a nearer view, we recognised the history of the Messiah's entry into Jerusalem, the multitude strewing palm-branches before him: the figures were very numerous. Entering the church, the first thing they shewed us was a slab of white marble in the pavement, surrounded by a rail. It seemed like one of the grave-stones in the pavement of our English churches. This, they told us, was the spot where our Saviour's body was anointed by Joseph of Arimathea. We next advanced towards a dusty fabric, standing in the midst of the principal aisle, and beneath the main dome. This rested upon a building partly circular and partly oblong, as upon a pedestal. The interior of this strange fabric is divided into two parts. Having entered the first part, which is a kind of anti-chapel, they shew you, before the mouth of what is called the sepulchre, the stone whereon the angel sat: this is a block of white marble, neither corresponding with the mouth of the sepulchre, nor with the substance from which it must have been hewn; for the rocks of Jerusalem are all of common compact limestone. Dr. Shaw, speaking of the holy sepulchre, says, that all the surrounding rocks were cut away, to form the level of the church, so that now it is 'a grotto above ground:' but even this is not correct. There are no remains of any ancient known sepulchre, that with the most attentive and scrupulous examination we could possibly discover. We doubted, therefore, whether this were the identical tomb in which Christ lay, and are of opinion, that not a remnant of the original sepulchre can now be ascertained. Yet, with all our sceptical feelings thus awakened, it may prove how power-

2. VOL. I.

ful the effect of sympathy is, if we confess that, when we entered into the *Sanctum Sanctorum*, and beheld, by the light of lamps now continually burning, the venerable figure of an aged monk, with streaming eyes and a long white beard, pointing to the place '*where the body of our Lord was*,' and calling upon us 'to kneel and experience pardon for our sins,' we knelt, and participated in the feelings of more credulous pilgrims. Captain Culverhouse, in whose mind the ideas of religion and patriotism are inseparable, with firmer emotion drew from its scabbard the sword he had so often wielded in the defence of his country, and placed it upon the tomb. Humbler worshippers heaped the memorials of an accomplished pilgrimage; and while their sighs alone interrupted the silence of the sanctuary, a solemn service was begun. Thus ended our visit to the sepulchre.

"If the reader has caught a single spark of this enthusiasm, it were perhaps sacrilegious to dissipate the illusion; but much remains untold. Every thing beneath this building seems discordant, not only with history, but with common sense. Forty paces from the sepulchre, beneath the roof of the same church, and upon the same level, are shewn two rooms, one above the other. Close to the entrance of the lower chamber, or chapel, are the tombs of Godfrey of Boulogne, and of Baldwin, kings of Jerusalem, with Latin inscriptions in the old Gothic character. At the extremity of this chapel they exhibit a fissure or cleft in the natural rock, which they say happened at the crucifixion; and, to complete the *naïveté* of the tradition, it is added, that THE HEAD OF ADAM WAS FOUND WITHIN THE FISSURE! Then, if the traveller has not already heard and seen enough to make him regret his waste of time, he may ascend by a few steps into a room above. There they will shew him the same crack again, and immediately in front of it a modern altar. This they venerate as Mount Calvary, the place of crucifixion; exhibiting upon this contracted piece of masonry the marks or holes of the three crosses, without the smallest regard to the space necessary to erect them. After this, he may be conducted through such a farrago of absurdities, that it is wonderful the learned men who have described Jerusalem should have filled their pages with any serious detail of them.

"But, quitting these degrading fallacies, let us break from our monkish instructors; and, instead of viewing Jerusalem as pilgrims, examine it by the light of history with the Bible in our hands: we shall thus find many interesting objects of contemplation. If Mount Calvary has sunk beneath the overwhelming influence of superstition, studiously endeavouring to modify and disfigure it, through so many ages; if the situation of Mount Sion yet remains to be ascertained; the Mount of Olives, unadorned by fanatical labours, exhibits the appearance it presented in all the

D

periods of its history. From its elevated summit, almost all the principal features of the city may be discerned; and the changes that eighteen centuries have wrought in its topography may perhaps be ascertained. The features of nature continue the same, though works of art have been done away; the beautiful gate of the temple is no more; but Siloa's fountain happily flows, and Kedron sometimes murmurs in the valley of Jehosaphat.

"The hill which now bears the name of Sion is situated upon the south side of Jerusalem, part of it being excluded by the wall of the present city, which passes over the top of the mount. If this be indeed Mount Sion, the prophecy of Micah, that the plough should pass over it, has been fulfilled to the letter, for such labours were actually going on when we arrived. Here the Turks have a mosque over what they call the tomb of David. No Christian can gain admittance; and, as we did not choose to loiter among the other legendary sanctities of the mount, having quitted the city by what is called 'Sion Gate,' we descended into a dingle or trench, called Tophet or Gehinnon by Sandys. As we reached the bottom of this narrow dale, sloping towards the valley of Jehosaphat, we observed upon the sides of the opposite mountain, facing Mount Sion, a number of excavations in the rock. We rode towards them, their situation being very little elevated above the bottom of the dingle, upon its southern side. When we arrived, we instantly recognised a peculiar sort of sepulchres, and, alighting from our horses, found that we should have ample employment in examining them. They were all of the same kind of workmanship, exhibiting a series of subterraneous chambers, hewn with wonderful art, each containing one or more repositories for the dead, like cisterns carved in the rock, upon the sides of those chambers. The doors were so low, that, to look into any one of them, it was necessary to stoop, and, in some instances, to creep upon our hands and knees: these doors were also grooved, for the reception of immense stones, once squared and fitted to the grooves, by way of closing the entrances. Of such a nature were, indisputably, the tombs of the sons of Heth, of the kings of Israel, of Lazarus, and of Christ. The burying-places of the ancients were universally excluded from the precincts of their cities. In order, therefore, to account for the seeming contradiction implied by the situation of the place now shewn as the tomb of the Messiah, it is pretended that it was originally on the outside of the walls of Jerusalem; although a doubt must necessarily arise, as to the want of sufficient space for the population of the city between a boundary so situated and the hill which is now called Mount Sion. The sepulchres we are now describing carry in their very nature satisfactory evidence of their being situated out of the ancient city, as they are now out of the modern. They are not to be confounded with those tombs, commonly called 'sepulchres of the kings,'

to the north of Jerusalem. What, therefore, are they? Some of them, from their magnificence and the immense labour necessary to form the numerous repositories they contain, might lay claim to regal honours; and there is one, which appears to have been constructed for the purpose of burying a single individual. Are we not authorised to seek here for the sepulchre of Joseph of Arimathea, who, as a pious Jew, necessarily had his burying-place in the cemetery of his countrymen, among the graves of his forefathers? The Jews were remarkable for their rigid adherence to this custom: they adorned their burial-places with trees and gardens; and the tomb of this Jew is accordingly described as being in a garden; and it was 'in the place where our Saviour was crucified.'

"Leaving the mountain where all these sepulchres are hewn, and regaining the road which conducts towards the east into the valley of Jehosaphat, we passed the *fountain of Siloa*; from hence we ascended to the summit of the MOUNT OF OLIVES, passing in our way a number of Hebrew tombs. Here indeed we stood upon holy ground; and it is a question, which might reasonably be proposed to Jew, to Christian, or Mahometan, whether, in reference to the history of their respective nations, it be possible to attain a more interesting place of observation. So commanding is the view of Jerusalem afforded in this situation, that the eye roams over all the streets and around the walls, as if in the survey of a plan or model of the city. The most conspicuous object is the mosque, erected upon the site of the Temple of Solomon. This edifice may perhaps be regarded as the finest specimen of the architecture among the Saracens which exists in the world. A spectator, standing upon the Mount of Olives, and looking down upon the space enclosed by the walls of Jerusalem, in its present state, as they have remained since their restoration in the sixteenth century, must be convinced, that, instead of covering two conspicuous hills, Jerusalem now occupies only one eminence, namely, that of Mount Moriah, where of old the temple stood, and where the famous mosque of Omar is now situated. It is probable, that the whole of Mount Sion has been excluded, and that the mountain covered by ruined edifices, whose base is perforated by ancient sepulchres, and separated from Mount Moriah by a deep trench, extending as far as the fountain of Siloa towards the eastern valley, is in fact that eminence, which was once surrounded by the 'bulwarks, towers, and regal buildings of the house of David.' There seems to be no other way of reconciling the accounts which ancient authors give of the space occupied by the former city. That the summit of this mountain was formerly included within the walls of the ancient city, seems forcibly demonstrated by the remains, which to this hour are upon it, both of walls and sumptuous edifices. In this view of the subject, the topography of the city seems more reconcileable with

ancient documents. The present church of the holy sepulchre, and all the trumpery attached to it, will, it is true, be thrown into the back ground; but the sepulchres of the kings of Judah, so long an object of research, do then become a prominent object in the plan: the possible site of our Saviour's tomb may be denoted; and

— Silon's brook, that flow'd  
Fast by the Oracle of God,

will continue in the situation assigned for it by Christian writers of every sect and denomination, since the age of the apostles and earliest fathers of the church.

"As we descended from the mountain, we visited an olive-ground, always mentioned as the Garden of Gethsemane. This place is, not without reason, shewn as the scene of our Saviour's agony, the night before his crucifixion; both from the circumstance of the name it still retains, and its situation with regard to the city. We found a grove of aged olive-trees, of most immense size, covered with fruit almost ripe. It is a curious and interesting fact, that, during a period of little more than two thousand years, Hebrews, Assyrians, Romans, Mahometans, and Christians, have been successively in possession of the rocky mountains of Palestine; yet the olive still vindicates its paternal soil, and is found at this day upon the same spot, which was called by the Hebrew writers, 'Mount Olivet,' and the 'Mount of Olives,' eleven hundred years before the Christian era.

"The rest of this day's journey was spent in viewing antiquities, justly entitled to the highest consideration among the curiosities of Jerusalem; the 'sepulchre of the Virgin Mary,' and the 'tombs of the patriarchs.' All of these are in the valley between the Mount of Olives and the city, on the eastern side of the brook Kedron, at the foot of the mountain. The 'sepulchre of the Virgin' is to the north of the other tombs: these being nearly opposite to the area of Solomon's Temple, where the mosque of Omar is now situated. We descended to it by a noble flight of fifty marble steps, each of these being twenty feet wide. Appropriate chapels, within a lofty and spacious vault, distinguished the real or the imaginary tombs of the Virgin Mary, of Joseph, of Anna, and of Caiaphas.

"Proceeding hence towards the south, along the eastern side of the valley, between the Mount of Olives and Mount Moriah, towards the bridge over the Kedron, across which Christ is said to have passed in his visits to the garden of Gethsemane, we came to 'the sepulchres of the Patriarchs,' facing that part of Jerusalem where Solomon's Temple formerly stood. The antiquities, which particularly bear this name, are four in number: according to the order in which they occur, from north to south, they are severally called, the sepulchres of Jehosaphat, of Absalom, the cave of St. James, and the sepulchre of Zechariah. From the difficulty of conveying any able artists to Jeru-

salem, and the utter impossibility of finding any of the profession there, these monuments have never been faithfully delineated. To form the sepulchres of Absalom and Zechariah, the solid substance of the mountain has been cut away; sufficient areas being thereby excavated, two monuments of prodigious size appear in the midst, each seeming to consist of a single stone, although standing as if erected by an architect, and adorned with columns, which appear to support the edifice, but of which they, in fact, form an integral part, the whole of each mausoleum being of one entire block of stone. These sepulchres are a continuation of one vast cemetery, extending along the base of all the mountainous elevations which surround Jerusalem upon its southern and eastern sides. The 'sepulchre of Jehosaphat,' and the 'cave of St. James,' are smaller works, of the same nature with the monuments ascribed to Absalom and Zechariah. They all contain apartments and receptacles for the dead, hewn after the same surprising manner. A very extraordinary circumstance concerning the two principal sepulchres is, that, at present, there is no perceptible entrance to the interior. The only way of gaining admittance to that of Absalom is, through a hole recently broken for that purpose; and to that of Zechariah there is no entrance of any kind.

"Having now examined all the antiquities to the south and east of Jerusalem, we crossed the bed of the brook Kedron, by the bridge before mentioned; then ascending to the city by a very steep hill, on which tradition relates that Stephen the martyr was stoned, we made the circuit of the walls upon the northern and western side; but, finding nothing remarkable, we entered by the gate of Jaffa.

"The streets of Jerusalem are cleaner than those of any other town in the Levant, though, like all of them, they are very narrow. The houses are lofty; and, as no windows appear on any of the lower stories, and those above are latticed, the passage through the streets seems to be between dead walls. We visited the shops, which are in a most unwholesome situation, being covered over, and to all appearance a nursery for every species of contagion. Scarcely any thing was exposed to sale; as the various articles of commerce were concealed through fear of Turkish rapacity.

"On the following morning we left Jerusalem by the gate of Damascus, on the north-west side, to view the extraordinary burial-place, erroneously called 'the sepulchres of the kings of Judah,' about a mile distant from the walls. This place does not exhibit a single sepulchral chamber, as in the instances so lately described, but a series of subterraneous chambers, extending in different directions, so as to form a kind of labyrinth somewhat resembling that in Egypt, known by the name of the 'sepulchres of the Ptolemies.' Each chamber contains a certain

number of receptacles for dead bodies, not much larger than our coffins. The taste manifested in the interior of these chambers seems also to denote a later period in the history of the arts: the skill and neatness visible in the carving is admirable; and there is much of ornament displayed in several parts of the work. We also observed slabs of marble exquisitely sculptured, such as we had not seen in the burial-places before mentioned. The entrance is by an open court, excavated like a quarry, and forming a square of thirty yards. We lighted some wax tapers, and descended into the first chamber; in the sides of which were some square openings like door-frames, offering passages to yet interior chambers. In one of these we found the appearance of a white marble coffin, entirely covered with the richest and most beautiful sculpture, but, like all the other sculptured work about the place, it represented nothing of the human figure, nor of any animal, but consisted entirely of foliage and flowers, chiefly of the leaves and branches of the vine.

"When we regained the city, we waited upon the governor, to thank him for the civilities we had received. Upon this occasion we used all the interest we had, to obtain admission into the mosque erected upon the site of the temple by the Caliph Omar, in the seventh century. He entreated us not to urge the request, saying his own life would certainly be required as the price of our admission: we were, therefore, compelled to rest satisfied with the interesting view it afforded from his windows, which regarded the area of the temple. The sight was so grand, that we did not hesitate in pronouncing it the most magnificent piece of architecture in the Turkish empire; and, considered externally, far superior to the mosque of St. Sophia in Constantinople. By the sides of the spacious area in which it stands, are certain vaulted remains, which plainly denote the masonry of the ancients; and evidence may be adduced to prove, that they belonged to the foundations of Solomon's Temple. As to the mosque itself, there is no building in Jerusalem that is to be compared with it, either in beauty or riches. The lofty Saracenic pomp so nobly displayed in the style of the building, its numerous arcades, its capacious dome, with all the stately decorations of the place, its extensive area, paved and variegated with the choicest marbles, the extreme neatness observed in every avenue towards it, and, lastly, the sumptuous costume observable in the dresses of all the eastern devotees, passing to and from the sanctuary, make it altogether one of the finest sights the Mahometans have to boast."

To this narrative of the existing state of Jerusalem, we shall append the following remarks of M. Chateaubriand:—"The houses of Jerusalem are heavy square masses, very low, without chimnies or windows; they have flat terraces or domes on the top, and look like prisons or sepulchres.

The whole would appear to the eye one uninterrupted level, did not the steeples of the churches, the minarets of the mosques, the summits of a few cypresses, and the clumps of nopals, break the uniformity of the plain. On beholding these stone buildings, encompassed by a stony country, you are ready to enquire, if they are not the confused monuments of a cemetery in the midst of a desert.

"Enter the city; but nothing will you there find to make amends for the dulness of its exterior. You lose yourself among narrow unpaved streets, here going up hill, there down, from the inequality of the ground; and you walk among clouds of dust or loose stones. Canvases stretched from house to house increases the gloom of the labyrinth; bazars, roofed over, and fraught with infection, completely exclude the light from the desolate city. A few paltry shops expose nothing but wretchedness to view and even these are frequently shut, from apprehension of the passage of a *cadi*. Not a creature is to be seen in the streets, nor a creature at the gates, except now and then a peasant gliding through the gloom, concealing under his garments the fruits of his labour, lest he should be robbed of his hard earnings by the rapacious soldier. Aside, in a corner, the Arab butcher is slaughtering some animal, suspended by the legs from a wall in ruins: from his haggard and ferocious look, and his bloody hands, you would rather suppose, that he had been cutting the throat of a fellow-creature than killing a lamb. The only noise heard from time to time in this *Deicide* city is the galloping of the steed of the desert: it is the janissary, who brings the head of the Bedouin, or returns from plundering the unhappy Fellah.

"Amid this extraordinary desolation, cast your eyes between the Temple and Mount Sion: behold a petty tribe cut off from the rest of the inhabitants of this city. The particular objects of every species of degradation, these people bow their heads without murmuring; they endure every kind of insult without demanding justice; they sink beneath repeated blows without sighing; if their head be required, they present it to the scimitar. On the death of any member of this proscribed community, his companion goes at night, and inters him by stealth in the Valley of Jehosaphat, in a shadow of Solomon's Temple. Enter the abodes of these people, you will find them, amidst the most abject wretchedness, instructing their children to read a mysterious book, which they, in their turn, will teach their offspring to read. What they did five thousand years ago, these people still continue to do. Seventeen times have they witnessed the destruction of Jerusalem, yet nothing can discourage them, nothing can prevent them from turning their faces towards Sion. To see the Jews scattered over the whole world, according to the word of God, must doubtless excite surprise: but to be struck with supernatural astonishment, you must

view them at Jerusalem; you must behold these rightful masters of Judea living as slaves and strangers in their own country; you must behold them expecting, under all oppressions, a king who is to deliver them. Crushed by the cross that condemns them, and is planted on their heads, skulking near the temple, of which not one stone is left upon another, they continue in their deplorable infatuation. The Persians, the Greeks, the Romans, are swept from the earth, and a petty tribe, whose origin preceded that of those great nations, still exists unmixed among the ruins of its native land. If any thing among nations wears the character of a miracle, that character, in my opinion, is here legibly impressed."

NAPOLOSE is the ancient city of Sichem, or Shechem, by which latter name it is always denoted in the scriptures. It is even yet a city of considerable magnitude, and the metropolis of an extensive country, abounding with all the necessities of life.

This city is particularly entitled to attention, as being the burial-place of several of the Old Testament worthies. Here, in their ancient sepulchres, as everlasting as the rocks in which they are hewn, the traveller contemplates the spot where the remains of Joseph, of Eleazer, and of Joshua, were severally deposited. If any thing connected with the remembrance of past ages be calculated to awaken local enthusiasm, the land around this city is pre-eminently entitled to consideration. The sacred narrative of events, which occurred in the fields of Sichem, from our earliest years, is remembered with delight; but, with the territory before our eyes, where those events took place, and in the view of objects existing as they were described above three thousand years ago, the grateful impression kindles into ecstasy. Along the valley may still be seen, as in the days of Reuben and Judah, "a company of Ishmaelites coming from Gilead, with their camels bearing spicery, and balm, and myrrh," who would gladly purchase another Joseph of his brethren, and convey him as a slave to some Potiphar in Egypt. Upon the circumjacent hills, flocks and herds are seen feeding, as of old; nor in the simple garb of the shepherds of Samaria, at this day, is there any thing repugnant to the notions we may entertain of the appearance formerly presented by the sons of Jacob.

Sichem, or Napolose, as it is now called, was considered, in the time of Alexander the Great, as the capital of Samaria; and its inhabitants were styled *Samaritans*, not merely from the country which they occupied, but as a sect at variance with the Jews. The principal object of veneration among them is *Jacob's well*, over which a church was formerly erected. This is situated at a small distance from the town, in the road to Jerusalem, and has been visited by pilgrims of all ages, but particularly since the Christian era, as the place where the Messiah revealed

himself to the woman of Samaria. The spot is so distinctly marked by the evangelist John, and is so little liable to uncertainty from the circumstance of the well itself, and the features of the country, that, if no tradition existed to identify it, the site of it could scarcely be mistaken. "Perhaps," says Dr. Clarke, "no Christian scholar ever read the fourth chapter of John's gospel attentively, without being struck with the numerous internal evidences of truth, which crowd upon the mind in its perusal. Within so small a compass, it is impossible to find in other writings so many sources of reflection and of interest. Independently of its importance as a theological document, it concentrates so much information, that a volume might be filled with the illustration it reflects upon the history of the Jews, and upon the geography of their country. All that can be gathered from Josephus on these subjects, seems to be as a comment to illustrate this chapter. The journey of our Lord from Judca into Galilee; the causes of it; his passage through the territory of Samaria; his approach to the metropolis of that country; its name; his arrival at the Amorite field, which terminates the narrow valley of Sichem, or Napolose; the ancient custom of halting at a well; the female employment of drawing water; the disciples sent into the city for food, by which its situation out of the town is so obviously implied; the question of the woman, referring to existing prejudices which separated the Jews from the Samaritans; the depth of the well; the oriental allusion contained in the expression '*living water*;' the history of the well, and the customs thereby illustrated; the worship upon Mount Gerizim;—all these occur within the space of twenty verses; and, if to these be added that remarkable circumstance mentioned in the 51st verse of the chapter, where it is stated that, 'as he was now going down, his servants met him,' his whole route from Cana being a *continual descent* towards Capernaum, we shall perhaps consider it as a record, which, in the words of HIM who sent it, 'we may lift up our eyes, and look upon; for it is white already to harvest.'

NAZARETH is a small town in the province of Galilee, and about seventy miles distant from Jerusalem. It is situated on the side of a barren rocky elevation, facing the east, and commanding the view of a long valley. A handsome church has been erected over the cave in which the Virgin Mary is said to have resided; and there is also a convent of Franciscan friars; but both the church and the convent, in their present state, exhibit proofs of having been recently repaired, or entirely re-built. The monks exhibit to travellers several objects of veneration in Nazareth; such as the workshop of Joseph, which is situated near the convent, and was formerly included within its walls; the synagogue where Christ is said to have read the scriptures to the Jews, and which at present is a church;

and a precipice without the town, where they affirm the Messiah leaped down, to escape the rage of the Jews, after the offence his doctrine in the synagogue had occasioned. From Luke's description of the place, the monks suppose, that Nazareth formerly stood eastward of its present situation, upon a more elevated spot. But the latest English traveller who has visited this place asserts, that the present town occupies exactly the same spot as the place anciently did. "Induced by the words of the evangelist," says he, "to examine the place more attentively than we should otherwise have done, we went, as is written, 'out of the city, unto the brow of the hill, whereon the city is built,' and came to a precipice corresponding with the words of the gospel. It is above the Maronite church, and probably the precise spot alluded to by the text of St. Luke's gospel."

BETHLEHEM, situated about six miles to the south-east of Jerusalem, has been rendered for ever memorable as the birth-place of that adorable personage, who is styled "The Author and the finisher of our faith." Here the first Christians built an oratory over the supposed spot, on which the incarnate God was discovered in a manger. The Emperor Adrian ordered it to be demolished, and a statue of Adonis to be erected in its stead; but the empress Helena destroyed the idol, and built a church on the same spot. This edifice is in the form of a cross, and the long nave or foot of the cross is adorned with forty-eight columns of the Corinthian order, in four rows. These columns are two feet six inches in diameter at the base, and eighteen feet high, including the base and capital. The altar is dedicated to the wise men of the east; and on the pavement, at the foot of the altar, is a marble star, said to correspond with the point of the heavens where the miraculous star that conducted those visitants became stationary. Two spiral staircases, each composed of fifteen steps, open on the sides of the outer church, and conduct to a subterraneous church beneath, which is said to be the place of the Saviour's nativity. As it is supposed to occupy the original site of the stable, it is irregular; the length of it being thirty-seven feet six inches, the breadth eleven feet three inches, and the height nine feet. It is hewn out of the rock; and the sides and the floor are covered with beautiful marble. The church receives no light from without, but is illuminated by thirty-two lamps sent by different Christian princes. At the farther end, on the other side, there is a spot marked by a white marble, incrusting with jasper, and surrounded by a circle of silver rays, resembling those with which the sun is represented, and which is intended to mark the spot where the child Jesus was born.

The pictures which adorn this church are of the Italian and Spanish schools, representing the Virgin and child, the annunciation, the adoration of the wise men, the visit

of the shepherds, and all the mysteries of the place. The ornaments of the manger are of blue satin, embroidered with silver. Incense is continually smoking before the cradle of the Saviour; and, during the time of performing mass, a fine organ plays the sweetest and most tender tunes of the best Italian composers. At a short distance to the southward of Bethlehem, the famous fountains, pools, and gardens, of Solomon are shewn. The pools are three in number, lying in a row, and so disposed that the waters of the uppermost fall into the second, and those of the second into the third. They are of a quadrangular figure, equal in breadth, but differing in length, the breadth of each being four hundred and fifty feet; but the length of the first is eight hundred feet, of the second one thousand feet, and of the third one thousand one hundred feet. They are very deep, and lined with plaster; and at about the distance of seven hundred feet is a fountain, from which they receive their waters. On the eastward of the city the well of David is shewn, for the waters of which that monarch so passionately longed. And about two furlongs from this well are the remains of an aqueduct, which anciently conveyed the waters of Solomon's pools to Jerusalem.

ALEPPO, the finest and most opulent place in Syria, is superior in its buildings and conveniences to most of the Turkish cities. The houses, according to the oriental custom, consist of a large court, with a dead wall toward the street, an arcade or piazza running round it, paved with marble, and an elegant fountain of the same in the middle. Aleppo and its suburb are seven miles in compass, standing on eight small hills, on the highest of which the citadel or castle is erected. An old wall, and a broad ditch, now in many places turned into gardens, surround the city, which was estimated by the late Dr. Russel to contain 230,000 inhabitants, of whom 30,000 were Christians, and 5000 Jews; but, at present, according to Mr. Eton, it does not contain more than 50,000, which depopulation has chiefly taken place since 1770. Whole streets are uninhabited, and bazars abandoned. It is furnished with most of the conveniences of life, excepting good water, within the walls, and even that is supplied by an aqueduct, distant about four miles, said to have been erected by the Empress Helena. The streets are narrow, but well paved with large square stones, and are kept very clean. Foreign merchants are numerous here, and transact their business in caravanseras, or large square buildings, containing their warehouses, lodging-rooms, and counting-houses. This city abounds in handsome mosques, public bagnios, and bazars, or market-places, which are formed into long, narrow, arched streets, with little shops, as in other parts of the east.

the time of the

Romans, it was called the "ornament of Asia." In 1034, a Turkish rebel, named Tzachas, assumed the regal title, and, having seized upon Smyrna, made it his capital. At the beginning of the thirteenth century, it all lay in ruins, except the fortress. In the wars between the Turks and Greeks, it greatly declined, and was taken with immense slaughter by Tamerlane, in 1402; but in a subsequent period it revived; and its commodious harbour and advantageous situation have rendered it the emporium of all the traffic of Asia Minor.

The public edifices have been chiefly erected by the Turks, with the materials of the ancient city. The bezestan, or market, and the tizir-khan, were both raised with the white marble of the theatre. The haven is defended by a strong castle, and sheltered from all winds, except the westerly, by high mountains.

The mosques, baths, market, and khans, are the principal buildings, and some of them are very noble. The streets in general are narrow, intricate, and inconvenient; but the most disagreeable circumstance to those who live here is the great heat, which commences in June, and continues till September. During this season the ground is burnt up, and exhibits large chasms, which it is imagined give vent to bituminous vapours, that, if confined, would occasion earthquakes. Few years pass without a shock or two; but, in general, they are rather alarming than destructive. They usually happen when the weather is calm, in spring and autumn; at which time the sea withdraws a considerable way from the beach, and the water is very low. A terrible one happened in 1688, which overthrew a great part of the city. Smyrna is frequently visited by the plague. When it rages violently, the consuls, factors, merchants, &c. retire into the country; and many people abandon their dwellings to live abroad under tents.

This city is one of the seven that contended for the honour of being the birth-place of Homer, to whose memory a temple was erected. It is likewise the seat of one of the seven Asiatic churches, mentioned in the book of Revelation. In the environs, Roman medals have been frequently found; and near it are the remains of an ancient Roman circus or theatre.

The following anecdote is naturally connected with the mention of this city, and cannot fail of proving acceptable:—In the month of March 1797, a dreadful insurrection broke out in Smyrna, on account of a janissary, who was killed by a Slavonian, a subject of Venice. The Turks became furious; but, not daring to attack the Franks, they turned their rage against the Greeks, and committed murders, and every act of atrocity: at length they set fire to part of the city, and the lives of the European residents were preserved with the greatest difficulty. An aga, arriving from Constantinople at this critical juncture, appeased the tumult, having condemned eighteen

Turks to be put to death. The first Greeks found in the streets were compelled to be the executioners; and among these was an old respectable merchant, who, performing his new office with much timidity and awkwardness, occasioned some unnecessary pain to the person whom he was appointed to kill. A Turkish officer, after reproaching the venerable Greek, struck him with his cane; upon which the aga exclaimed, "What! in my presence! and towards a man already unhappy by the meanness of his new office! Off with the head of that dog!" The Turkish officer was immediately seized and beheaded.

DIARBECK, the capital of Diarbeck, or Mesopotamia, is situated between two rivers, and encompassed by two walls, the outermost of which is defended by seventy-two towers. There are but three gates. Over that towards the west, some Latin and Greek inscriptions are seen, though many of the letters are almost obliterated. The name, however, of Constantine is visible, and frequently repeated, which gives occasion to surmise, that the city was either originally built, or greatly repaired and improved, by that emperor. The Tigris forms a half-moon about it, and a steep precipice descends from its walls to the water-side. It contains about 20,000 inhabitants, and, upon the whole, is one of the most commercial and populous cities in Asiatic Turkey. It is supplied with water from the Tigris, by means of an artificial canal, and embellished with several market-places, and other elegant buildings, particularly a spacious mosque, which was formerly a Christian church. On the sides of the river are several caravanseras or inns; and near the town is a chapel, in which the Turks affirm is the place of Job's sepulture. The neighbouring country is pleasant and fertile.

BAGDAD, the principal city of Irac, or Chaldea, is delightfully situated in a fine plain, on the eastern bank of the Tigris. It was founded by the Caliph Almansur, in the 145th year of the Hegira, and is built upon the site of the ancient Seleucia. It was the seat of most of the caliphs of the race of Al-Abbas; but, at present, it retains few marks of its ancient grandeur. In form it is of an irregular square, and rudely fortified; but the convenience of its situation renders it one of the seats of the Turkish government, and it has still a considerable trade; being annually visited by the caravans from Smyrna, Aleppo, and the west. The houses are generally large, built of brick and cement, and arched over, to admit a free circulation of the air; many of the windows are of elegant Venetian glass, and the ceilings richly ornamented. Most of the houses have also a court-yard before them, in the middle of which is a small plantation of orange-trees. The number of houses is computed at 80,000. The bazars, or market-places, are tolerably handsome and extensive, filled with shops of all kinds of merchandise, to the number of twelve thousand. Here, also, are five mosques, a castle

of white stone commanding the river, and a palace occupied by the Turkish governor.

ERZERUM, the capital of Turcomania, is situated on the northern extremity of the province, about ten days' journey from the frontiers of Persia, and five from the Euxine Sea. It is the residence of a Turkish bashaw, is defended by a good castle, and has a strong garrison of janissaries.

Erzerum is a place of great trade, which principally consists of copper and brass wares, the ore of which is found in the neighbouring mountains, printed calicoes, red and yellow leather, silk, madder, gall-nuts, caviare, and beautiful furs. It is likewise a repository for vast quantities of merchandise, which come from the East-Indies. All who go from hence to Persia, except Turks, pay a capitation-tax of five crowns, and five per cent. for all specie which they carry with them. Every stranger who enters the town is obliged to pay five crowns, and all merchandise is taxed at nine per cent.

Fuel is so scarce in this city, that the inhabitants are under the necessity of substituting cow-dung, made into turfs; the perpetual burning of which occasions a scent throughout the place which is very offensive to strangers. Every thing you eat or drink, even the very cream, is tainted with this vapour; yet travellers assert, that there are coals in the neighbouring hills; but the inhabitants neither understand their nature, nor how to dig for them. The water is excellent; rivulets of which run through most of the streets; but the wine and brandy are difficult to be got at, though they are extremely bad, when procured, for the sale of them is strictly prohibited. The Greeks are obliged to inhabit the suburbs, because, being tinkers, they make such a perpetual clattering with their hammers, that it would disturb the tranquillity of the Turks, who cannot bear the thoughts of a noisy trade.

TEFLIS, the principal city in Georgia, is handsomely built, and makes a fine appearance: the houses are of stone, with flat roofs, and are remarkably clean; but the streets are narrow and dirty. It is situated on the side of the river Kur, at the foot of a mountain, and is surrounded by strong walls, except on the side next the river. Here are thirteen Greek churches, besides one for the Armenians, and one for Roman catholics: and the environs are prettily ornamented with pleasant houses and fine gardens.

MOUSUL, the capital of Curdistan, or Assyria, stands on the banks of the Tigris, opposite to the ruins of the ancient city of Nineveh. The people here have great commercial connections with the inhabitants of Bagdad, and the merchants of Curdistan. Caravans likewise pass through it to and from Persia. It is singular, that the soil on the city side of the river is barren, but on the opposite side very fertile. The heat is so excessive in summer, that none go out of doors from two hours after

sun-rise till an hour after sun-set. There is, likewise, a malignant and dangerous wind, called the *samiel*, which often blows from hence to Surat, and is supposed to be the same mentioned in the book of Job. It is impregnated with little streaks of fire, as small as hairs, which immediately kill those who inhale them, and turn them as black as a coal. When the people perceive them coming, they fall flat on their faces, and sometimes escape. This wind is felt chiefly on the banks of the river, and is supposed to proceed from sulphureous vapours. Independent of this wind, the hot air is often dangerous, and injures the lungs, inflames the blood, and parches the skin, or raises it into blisters, and occasions it to peel off. On this account travellers wear a kind of mask, made of soft crape, to preserve their eyes; but, after all their precaution, they often become inflamed.

*Antiquities.*] The countries comprised in Asiatic Turkey once contained all that was rich and magnificent in architecture and sculpture, and even the remains of their splendid monuments are so numerous, that they have afforded materials for many voluminous publications. The most remarkable of these, however, are the ruins of Balbec and Palmyra; which have been justly said to form the pride of all antiquity.

Balbec, the ancient Heliopolis of Cœlo-Syria, is pleasantly situated upon a rising plain, between Tripoli, in Syria, and Damascus, at the foot of Mount Libanus.

"In taking a view of this city, from the south," says a traveller, who visited it a few years ago, "we see the present town encompassed with its wall; and, at the east end, the most considerable ruins of the ancient Heliopolis, particularly the remains of its magnificent temple, which are mostly surrounded by a Turkish fortification.

"The portico, which formed the grand front of the temple, is so noble, that no ornaments seem wanting to render it complete; but it is disfigured by two Turkish towers, built on its ruins. Behind it an hexagonal court, into which the portico leads, is adorned with the most magnificent buildings, now in ruins; but enough is still left to give an idea of their ancient grandeur. The walls are adorned with pilasters of the Corinthian order, with statues for niches; the doors are finely ornamented, and the entablature, which surrounds the building above the pilasters, is richly adorned with festoons: but the colonnade which surrounded these edifices is destroyed, scarcely any thing remaining but the pedestals; and the whole court is covered with broken columns, capitals, and other parts of the building.

"This leads into a quadrangular court, in which are likewise remains of magnificent edifices, much in the same taste. The portico was crowned with an attic course, which was also carried through the two courts, and seems to have been ornamented with statues.

"We now come to the great temple, the approach to which was through the anterior portico and courts. Little more of this edifice remains than nine lofty columns supporting their entablature. It is remarkable, that the shafts of these columns consist of three pieces, most exactly joined together without cement, being only strengthened with iron pins, received into a socket, worked in each stone. Most of the bases have two such sockets, one square and another circular, corresponding with two others, of the same shape and dimensions, in the under part of the shaft. On measuring some of the largest of those that were circular, it was found that the iron pin which they received must have been a foot long, and above a foot in diameter. By the sockets in all the fallen fragments of this temple, it appears that each stone had probably been fastened in this manner. How much this method contributed to the strength of the building is remarkably seen in the most entire temple, where a column has fallen against the wall of the cell with such violence, as to beat in the stone it fell against, and break part of the shaft, while the joinings of the same shaft have not been in the least opened by the shock.

"The temple, which is most perfect, is irregularly placed with respect to the former, and is also built upon a much lower horizontal plan. It was a peristyle of eight columns in front, and fifteen in flank, which still continue to support their entablature, notwithstanding several unsuccessful attempts of the Turks to destroy them, in order to get at the iron employed in strengthening this noble building. The arch of the portico is divided into compartments by the richest mouldings and carved work, cut in the solid stone. These compartments are in an alternate succession of one hexagon and four rhomboids, inclosing figures and heads in alto relievo. The rhomboid pannels contain heads of gods, heroes, and emperors; the hexagons also contain the heads of the same subjects, and sometimes entire figures, relating to the ancient mythology; as Leda and the swan, Ganymede riding on the back of an eagle, a half length of Diana, &c. On the inside of this temple a row of fluted Corinthian columns reach to the top of the building, supporting a rich entablature. Between each column is a niche, finely ornamented, and above each niche an opening answering to it, supported by small columns. The roof is fallen down, and out of the ruins of the entablature grow many shrubs.

"At some distance, to the west of these superb remains, is a magnificent circular temple. The order of this structure without is Corinthian, and within both Corinthian and Ionic; but the shafts of all the columns are of one piece. The lower or Ionic story is converted into a Greek church, and for that purpose is separated from the higher or Corinthian story. Turkish houses, and other modern additions, erected against it, destroy its symmetry.

2. VOL. I

"On the south-west part of the city, where the walls enclose a small part of the foot of Anti-Libanus, is a single Doric column, of considerable height; but nothing in its size, proportions, or workmanship, is so remarkable as a little basin on the top of its capital, which has a communication with a semicircular channel, cut longitudinally down the side of the shaft, and five or six inches deep. It is said, that water was formerly conveyed from the basin by this channel; but how the basin was supplied cannot now be ascertained.

"The city-walls, like those of most of the other ancient cities of Asia, seem the confused patch-work of different ages. The pieces of capitals, broken entablatures, and, in some places, reversed Greek inscriptions, to be seen in surveying them, shew that their last repairs were made after the decline of taste, with such materials as lay nearest at hand. The city-gates, in general, correspond with what has been said of the walls; but that on the north side presents the ruins of a large subasement, with pedestals and bases for four columns, in a taste of magnificence and antiquity much superior to that of the other gates.

"Near the city-walls is a quarry of free-stone, from which, probably, the immense stones employed in the subasement of the great temple were taken, while the more ornamented parts of those buildings were supplied from a quarry of coarse white marble, on the west of the city, and at a greater distance. In the first quarry there are still some vast stones cut and shaped for use. One of these stones, thus shaped, but not entirely detached from the quarry at the bottom, we found to be seventy feet long, fourteen broad, and fourteen feet five inches deep. This stone, according to these dimensions, contains fourteen thousand one hundred and twenty-eight cubic feet; and, were it Portland stone, should weigh about two millions two hundred and seventy thousand pounds avoirdupois, or about one thousand one hundred and thirty-five tons."

PALMYRA is situated in the wilds of Arabia Petrea, about two hundred miles to the south-east of Aleppo. It is approached through a narrow plain, lined, as it were, with the remains of antiquity; and, opening all at once, the eye is presented with the most striking objects that are to be found in the world. The temple of the Sun lies in ruins; but the access to it is through a vast number of beautiful Corinthian columns of white marble, the grandeur and beauty of which should be seen, to be fully understood, and justly appreciated. Superb arches, amazing columns, a colonnade extending four thousand feet in length, terminated by a noble mausoleum, temples, fine porticoes, peristyles, intercolumniations, and entablatures, all of them in the highest style, and finished with the most beautiful materials, appear on all hands, but so dispersed and dis-

jointed, that it is impossible to form an idea of the whole when perfect.

"Nothing but ocular proof," says our author, "could convince any man, that so superb a city, formerly ten miles in circumference, could exist in the midst of what now are tracts of barren uninhabitable sands. Nothing, however, is more certain, than that Palmyra was formerly the capital of a great kingdom, that it was the pride as well as the emporium of the eastern world, and that its merchants dealt with the Romans and the western nations for the merchandises and luxuries of India and Arabia. Its present altered situation, therefore, can be accounted for only by natural causes, which have turned the most fertile tracts into barren deserts.

"The Asiatics think that Palmyra, as well as Balbec, owes its origin to Solomon; and in this they receive some countenance from sacred history. In profane history it is not mentioned before the time of Mark Antony; and its most superb buildings are thought to be of the lower empire, about the time of Gallianus. Odenathus, the last king of Palmyra, was highly caressed by that emperor, and even declared Augustus. His widow, Zenobia, reigned in great glory for some time; and Longinus, the celebrated critic, was her secretary. Unwilling to submit to the Roman tyranny, she declared war against the emperor Aurelian, who took her prisoner, led her in triumph to Rome, and murdered her principal nobility, and, among others, the excellent Longinus. He afterwards destroyed her city, and massacred its inhabitants, but expended large sums out of Zenobia's treasures in repairing the temple of the Sun, the majestic ruins of which have been mentioned: none of the Palmyrene inscriptions reach beyond the Christian era, though there can be no doubt that the city itself is of much higher antiquity. The emperor Justinian made some efforts to restore it to its ancient splendor, but without effect, for it gradually dwindled to its present state."

*Government, Laws, &c.*] The Turkish government is generally represented as a compound of all that is shocking and unnatural in arbitrary power. But from the accounts of Sir James Porter, who resided at the Porte, in quality of ambassador from his Britannic Majesty, it appears, that the rigours of that government are considerably moderated by the power of religion. For though in this empire there is no such thing as hereditary succession to property, the rights of individuals may be rendered secure, by being annexed to the church, which is done at a trifling expence. Even Jews and Christians may in this manner secure the enjoyment of their lands to the latest posterity; and so sacred and inviolable has this law been held, that there is no instance of an attempt on the side of the prince to trespass or reverse it. Neither does the observance of this institution altogether depend on the supersti-

tion of the sultan: he knows, that any attempt to violate it would shake the foundation of his throne, which is solely supported by the laws of religion. Were he to transgress these laws, he would become an infidel, and cease to be the lawful sovereign. The same observation extends to all the rules laid down in the Koran, which was designed not only as a system of religion, but also as a political code. The laws there enacted, having all the force of religious prejudices to support them, are inviolable; and by them the civil rights of the Mahometans are regulated. Even the comments on this book, which explain the law where it is obscure, or extend and complete what Mahomet had left imperfect, are conceived to be of equal validity with the first institutions of the prophet; and no member of the society, however powerful, can transgress them with impunity, or violate them without punishment.

The subjects of the Turkish empire, who hold their possessions by a kind of military tenure, on condition of their serving in the field with a particular quota of men, consider themselves, while they perform that agreement, almost independent of the emperor, who seldom calls for the head or the estate of a subject, who is not an immediate servant of the court. The most unhappy subjects of the Turkish government are those who approach the highest dignities of state, and whose fortunes are constantly exposed to sudden vicissitudes, and depend on the breath of their master. There is a gradation of great officers in Turkey, of whom the visier, or prime-minister, the *kiaja*, second in power to the visier, the *reis-effendi*, or secretary of state, and the *aga* of the janissaries, are the most considerable. These, as well as the *mufi*, or high-priest, the *pachas*, or governors of provinces, the civil judges, and many others, are commonly raised, by application and assiduity, from the most obscure situations, and are often the children of Tartar or Christian slaves taken in war. Tutored in the school of adversity, and arriving at pre-eminence through a thousand difficulties and dangers, these men are generally as distinguished for abilities, as deficient in virtue. They possess all the intrigue and corruption, which often accompanies ambition in an humble rank; and they have an additional reason for plundering the people, because they are uncertain how long the dignities to which they have attained may continue in their possession.

The fundamental law in the Turkish legislature is, that every thing must be decided by the testimony of witnesses. With these, therefore, both plaintiff and defendant must be equally provided; but there are few law-suits without false witnesses. The art of the judge is employed in discovering to which of the parties he shall allow the right of affirming; and this first judgment decides the cause; for, if one party denies, the other is permitted to prove. If, therefore, a man be sued by another he never saw, for

a debt he never owed, he will be obliged to pay, on the deposition of two Turkish witnesses, who shall affirm their knowledge of the debt. The only defence that can be made in such a case is, to admit the debt was due, but assert that it had been paid. If the judge will admit of the party's producing witnesses, they may easily be procured, and it will only cost a trifling compensation to those who have taken the trouble to perjure themselves, and ten per cent to the judge by whose means the cause is gained. The punishment for false witnesses is, that the party be led through the streets upon an ass; but this is seldom executed.

With respect to the criminal statutes, that law which sentences the murderer to lose his life, permits, at the same time, the nearest relations of the murdered to grant him a pardon. The criminal is conducted to the place of punishment: but the executioner takes on himself the office of mediator, and negotiates to the last minute with the next of kin to the deceased, or his wife, who commonly follows, to be present at the execution. If the proposals are refused, the sentence is executed; if accepted, the criminal is re-conducted to the tribunal, to receive his pardon. But an accommodation seldom takes place, as the selling the blood of relations is justly considered a scandalous transaction.

Robbers on the highway are not punished, unless taken in the commission of some daring crime. The territories of the Grand Signor are infested with banditti, who commit the greatest enormities; and the efforts of government too often serve only to disperse them, and drive them farther from the capital. If they commit robberies, or even murders, in a village, the *cadi* goes thither, and imposes a fine on the inhabitants, without troubling himself to secure the offenders. On this account, the peasants take care to conceal the robberies that have been committed from the judges, whose presence is more dangerous than that of the thieves.

That doctrine of the Koran, which enjoins submission to the decrees of Providence, seems improper to constitute part of a criminal code, as will appear from the following circumstance:

A Turk having killed a Christian by a violent blow on the skull with a club, the judge, after surveying the instrument employed in committing the murder, declared it could not have caused the death of the Christian without the particular interference of Providence, which mortals had no right to oppose. If, however, the Christian had committed the murder in question on the body of a Turk, the decision would have been very different.

Each quarter has its tribunal, in which a *cadi*, attended by a clerk, sits all day long, to hear complaints, and administer justice, which is the more speedy, as the payment of the expences immediately follows the sentence.

The prices of commodities are fixed by an officer, who proclaims them, and takes care that the weights and measures are honest. Delinquents are condemned to the *bastinado*, or some severe punishment. Bakers sometimes have an ear nailed to their shop, or are hanged, according to the caprice of the judge; and one instance is recorded of a baker, who, having been proved guilty of making bread deficient in weight, as well as being concerned with others in raising the price of that necessary article, was, by order of the Grand Signor, baked alive in his own oven.

Landed property, in this country, is held particularly sacred, as will appear from the following anecdote:—One of the Ottoman princes having determined to build a mosque upon a particular spot, found no difficulty in making the necessary purchases of the houses on the premises, till a Jew, who possessed a house of small value in the centre, refused to part with it at any price. Large offers were made, but the Jew remained inflexible, his obstinacy prevailing over his avarice. The courtiers pleased themselves with the expectation of seeing the Jew's house demolished, and himself dragged to punishment; but, contrary to general example, the prince descended from the throne to consult the law, and wrote thus to the mufti: "A man desires to build a temple: all the Mussulmen, proprietors of the ground on which it is to be erected, are in haste to participate of so good a work. One man only, and he a Jew, refuses all offers. What punishment does he deserve?" "None," replied the mufti, "property is sacred without distinction of individuals, and a temple may not be erected in violation of so holy a law. As it appears to be the desire of the Jew to transmit his property to his children, and it is the right of the sovereign to insist on hiring any ground he may choose, a contract for the hire of the ground must be made out to this Jew and his descendants: then the house may be pulled down, and the temple built, without fear that the prayers of the Mussulmen offered therein should be rejected." The decree of the mufti was executed.

*Revenues.*] The revenues of this empire arise from the customs, and a variety of taxes, which fall chiefly on the Christians, and other subjects, who are not of the Mahometan persuasion. The rich pay a capitation-tax of thirty shillings a year, tradesmen fifteen shillings, and common labourers six shillings and ten-pence halfpenny. Another branch of the revenue arises from the tribute annually paid by the Tartars, and other nations bordering upon Turkey, but governed by their own princes and laws. All these, however, are trifling, when compared with the vast sums extorted from the governors of provinces, and officers of state, under the name of *presents*. These persons, to indemnify themselves, exercise every species of oppression that avarice itself can suggest, till, becoming opulent from

the vitals of the people whom they are sent to govern, their riches give rise to a pretended suspicion of disloyalty or misconduct, and the whole fortune of the offender devolves to the crown. The devoted victim is seldom acquainted with the nature of the offence, or the name of his accuser; but, without giving him the least opportunity of making a defence, an officer is dispatched with the imperial decree, to take off his head. The unhappy pacha receives it with the highest respect; and, after he has read it, he exclaims: "*The will of God and the emperor be done.*" Then he takes the silken cord, which the officer has ready in his bosom, and, having tied it round his own neck, and offered a short prayer, the officer's servants throw him on the floor, and, drawing the cord tight, soon dispatch him; after which his head is cut off, and carried to court.

The following remarks of M. Chateaubriand, on the government and police of Jerusalem, will fully illustrate those oppressions to which we have alluded, and which sometimes lead to a catastrophe so truly tragical.

"Jerusalem is comprehended in the pachalik of Damascus, for what reason I know not, unless it be a result of that destructive system which is naturally, and, as it were, instinctively, pursued by the Turks. Cut off from Damascus by mountains, and still more by the Arabs, who infest the deserts, Jerusalem cannot always prefer its complaints to the pacha when oppressed by its governors. It would be much more natural to make it dependant on the pachalik of Acre, which lies near it; the Franks and the Latin fathers might then place themselves under the protection of the consuls residing in the ports of Syria; and the Greeks and Turks would be able to make known their grievances. But this is the very thing that their governors are desirous of preventing; they would have a mute slavery, and not insolent wretches who dare complain of the hand that oppresses them.

"Jerusalem is therefore at the mercy of an almost independent governor, who may do with impunity all the mischief he pleases, if he be not afterwards called to account for it by the pacha. It is well known that, in Turkey, every superior has a right to delegate his authority to an inferior; and this authority extends both to property and life. For a few purses a janissary may become a petty aga, and this aga may, at his good pleasure, either take away your life, or permit you to redeem it. Thus executioners are multiplied in every town. The only thing ever heard in this country, the only justice ever thought of, is, *Let him pay ten, twenty, or thirty purses. — Give him five hundred strokes of the bastinado. — Cut off his head.* One act of injustice renders it necessary to commit a still greater. If one of these petty tyrants plunder a peasant, he is absolutely obliged to plunder his neighbour also; for, to escape the hypocritical integrity of the

pacha, he must procure by a second crime sufficient to purchase impunity for the first.

"It may perhaps be imagined, that the pacha, when he visits his government, corrects these evils, and avenges the wrongs of the people. So far from this, however, the pacha is himself the greatest scourge of the inhabitants. His coming is dreaded, like that of a hostile chief. The shops are shut up; the people conceal themselves in cellars; they feign to be at the point of death on their mats, or withdraw to the mountains.

"The truth of these facts I am able to attest, since I happened to be at Jerusalem at the time of the pacha's visit. Abdallah is sordidly avaricious, like almost all the Mussulmen: in the capacity of commander of the caravan of Mecca, and under the pretext of raising money for the better protection of the pilgrims, he thinks that he has a right to multiply his extortions; and he is always devising new ways of fleecing the people. One of the methods which he most frequently employs is, to fix a very low maximum for all kinds of provisions. The people are delighted, but the dealers shut up their shops. A scarcity commences; the pacha enters into a secret negotiation with the shopkeepers, and, for a certain number of purses, grants them permission to sell at any price they please. These men are, of course, desirous to recover the sums which they have given the pacha: they raise the price of necessaries to an extraordinary height, and the people, dying a second time for want, are obliged to part with their last rag, to keep themselves from starving.

"I have seen this same Abdallah practise a still more ingenious vexation. I have observed, that he sent his cavalry to pillage the Arabian farmers beyond the Jordan. These poor people, who had paid their usual tax, and who knew that they were not at war, were surprised in the midst of their tents and of their flocks. They were robbed of two thousand two hundred sheep and goats, ninety-four calves, a thousand asses, and six mares of the purest blood: the camels alone escaped, having followed a sheik who called them at a distance. These faithful children of the desert carried their milk to their masters in the mountains, as if they had known that these masters were bereft of every other species of nourishment.

"A European could scarcely guess what the pacha did with his booty. He put more than twice as high a price upon each animal as it was worth, rating each goat and sheep at twenty piastres, and each calf at eighty. The beasts thus appraised were sent to the butchers and different persons in Jerusalem, and to the chiefs of the neighbouring villages, who were obliged to take them, and pay for them at the pacha's price upon pain of death. I must confess that, had I not been an *eye-witness* of this double iniquity, I should have thought it absolutely incredible. As to the asses and horses, they became the property of

the pacha, when he

ne the property of

the soldiers; for, according to a singular convention be-  
tween these robbers, all the beasts with a cloven hoof  
taken in such expeditions belong to the pacha, and all  
other animals fall to the share of the troops.

"Having exhausted Jerusalem, the pacha departs; but, in  
order to save the pay of the city-guards, and to strengthen  
the escort of the caravan of Mecca, he takes the soldiers  
along with him. The governor is left behind with about a  
dozen men, who are insufficient for the police of the city,  
much less for that of the adjacent country. The year before  
my visit, he was obliged to conceal himself in his house,  
to escape the pursuit of a band of robbers, who entered  
Jerusalem, and were on the point of plundering the city.

"No sooner is the pacha gone, than another evil, the  
consequence of his oppression, begins to be felt. Insur-  
rections take place in the plundered villages; they attack  
each other, mutually intent on wreaking hereditary ven-  
geance. All communication is interrupted; agriculture  
perishes; and the peasant sallies forth at night to pillage  
his enemy's vine, and to cut down his olive-tree. The  
pacha returns the following year; he demands the same  
tribute from a country whose population is diminished. In  
order to raise it, he is obliged to redouble his oppressions,  
and to exterminate whole tribes. The desert gradually  
extends; nothing is to be seen but here and there habita-  
tions in ruins, and near them cemeteries, which keep con-  
tinually increasing: each succeeding year witnesses the  
destruction of a house, the extinction of a family; and  
soon nothing is left but a cemetery to mark the spot where  
once stood a village."

*Population.*] The population of this country is by no  
means equal either to its extent or fertility, nor have the  
best geographers been able to ascertain it, because of the  
uncertainty of its limits. It certainly is not so great as it  
was before the Christian era, or even under the Roman  
emperors, owing to various causes; and, above all, to the  
tyranny under which the natives live, and the practice of  
polygamy, which is undoubtedly unfavourable to popula-  
tion. The number of inhabitants, however, in Asiatic  
Turkey, has been recently computed at ten millions.

*Commerce, Manufactures, &c.*] Smyrna is the prin-  
cipal port for what is called the Levant Trade; and to this  
place France used formerly to send sugar, coffee, cochineal,  
and indigo; but at present, in consequence of the  
loss of her Indian colonies, and the crippled state of her  
navy, this trade is a mere name. England sends out, be-  
sides West-Indian produce, iron, tin, cloths, shalloons, &c.  
In Aleppo there are some flourishing manufactures of silk  
and cotton; and the caravans from Bagdad and Bassora  
frequently bring thither the products of India and Persia.  
Asiatic Turkey is also celebrated for its carpets, which  
bear a high price in Europe; and Damascus is universally  
famed for its steel for warlike weapons.

*Languages and Literature.*] The radical languages of  
this extensive tract of country are the Slavonic, which was  
probably the mother-tongue of the ancient Turks; the  
Arabic, the Syriac, and the modern Greek. The educa-  
tion of the Turks seldom extends farther than reading the  
Koran, and writing a common letter. Some few of them  
understand astronomy so far as to calculate the time of  
an eclipse; but these are considered as men of very extra-  
ordinary attainments.

*Manners, Customs, &c.*] The Turks, who form the  
major part of the inhabitants of this country, are, in ge-  
neral, of the middle stature, and well made, with a toler-  
ably fair complexion, black hair and eyes, and regular fea-  
tures. Most of the women are deemed handsome during  
their youth, but begin to look old at the age of thirty. In  
their dispositions the Turks are grave, sedate, and passive;  
but, when agitated by passion, furious, raging, ungovern-  
able, jealous, suspicious, and vindictive, beyond concep-  
tion; and, in matters of religion, tenacious and morose.  
The morals of the Asiatic Turks, however, are far prefer-  
able to those of the European. They are hospitable to  
strangers, and the vices of avarice and inhumanity are  
chiefly found among their great men. They are likewise  
punctual in their dealings with each other; and their char-  
ity and public spirit are conspicuous in their building car-  
avanscras, or places of entertainment, on roads that are  
destitute of other accommodations. With the same laud-  
able view they search out the best springs, and dig wells  
for the refreshment of poor pilgrims and travellers.

The men shave their heads, leaving a lock on the crown,  
and wear their beards long. They cover their heads with  
a turban, and never remove it but when they sleep. Their  
shirts are open, without collar or wristband; and over these  
they throw a long vest, tied with a sash, in which they fre-  
quently have a dagger, and carry their money and their to-  
bacco-pouch. Over the vest they wear a loose gown,  
somewhat shorter. Their breeches, or drawers, are of a  
piece with their stockings; and, instead of shoes, they wear  
slippers, which they put off when they enter a mosque or  
a private habitation.

The first part of the women's dress is a pair of drawers,  
very full, and reaching to the heels; over this is the shift,  
with wide sleeves hanging half way down the arm, and  
closed at the neck with a button. They have a long waist-  
coat made close to the shape, with long sleeves falling  
back, and varying in materials and ornaments, according  
to their respective ranks. They have also a robe exactly fit-  
ted to the shape, and reaching to the feet, with very long  
falling sleeves: this is girt with a girdle about four inches  
broad, which persons of respectability have richly orna-  
mented. The *curdee* is a loose robe lined with crimine or  
sable, which they throw off or put on, according to the  
weather.

The head-dress is composed of a cap called *talpoc*, which is in winter of fine velvet, and in summer of a light stuff. This is fixed on one side of the head, hanging a little way down, with a tassel bound with a circle of diamonds, or a rich embroidered handkerchief. On the other side of the head the hair is laid flat, and tastefully ornamented with flowers, feathers, or a large bouquet of jewels, representing natural flowers. The hair hangs at its full length behind, divided into tresses, braided with pearls or ribbons.

No woman, let her rank be what it will, is permitted to walk in the streets without two *murlins*; one that hides the whole head-dress, and hangs half-way down the back, and another that covers all the face except the eyes. The shape is also entirely concealed by a *serigee*, which has long sleeves reaching to the finger-ends, and which is wrapped round like a riding-hood. By this means they are so disguised, that a woman of the first rank cannot be distinguished from her slave; and it is impossible for the most jealous husband to know his wife when he meets her.

Such of the Turkish ladies as are virtuous make no use of paint to heighten their beauty, or to disguise their complexion; but they often tinge their hands and feet a deep yellow with *henna*: and they universally blacken the inside of their eye-lids with a powder called *ismid*. This operation is performed with a cylindrical piece of silver, steel, or ivory, about two inches long, of the size of a common probe. This instrument they wet with water, that the powder may adhere to it, and, applying the middle part horizontally to the eye, shut the eye-lid upon it, and draw it through.

When the overtures of a man mean nothing more than an insult, the Turkish women are inexorable; but it is impossible to consider without horror the dismal consequences of the blind passions to which they are sometimes a prey. We do not here allude to those women who so frequently sell their charms, and whose mutilated dead bodies are so often seen in the environs of cities, a circumstance that may be accounted for on the principles of avarice or fear in the men; but to those women of a more exalted rank, whom an irresistible fury overpowers, and who escape privately from their harems. These unfortunate beings always carry off with them their jewels, and think nothing too good for their lovers. Overcome by their unhappy passion, they do not perceive that this very wealth becomes the cause of their destruction. The seducers to whom they fly seldom fail, in a short time, to punish their temerity, and insure the possession of their effects, by a crime which, however monstrous, the government is least ready to visit with punishment. The bodies of these women, stripped and mangled, are frequently seen floating in the ports, under the very windows of their assassins; but these dreadful examples, so likely to intimidate the rest, seldom excite terror, or produce reformation.

The common salutation of the Turks is by an inclination of the head, and laying their right hand on their breast. Few or none of the considerable inhabitants of this extensive empire have any inclination to walk or ride, either for health or diversion. In fact, laziness is so congenial to their dispositions, that they laugh at the Europeans for taking a walk, deeming it ridiculous to walk merely for the sake of amusement. A European ambassador, once giving an entertainment to all the foreign ministers and Europeans, excited the curiosity of some Turks of distinction, who expressed the greatest astonishment at seeing some of the first characters among the Europeans stand up to take a part in the dances on the occasion. To walk or to ride to their gardens, where they are situated at a small distance, once or twice a week, at the proper seasons, is as much as most of them care to do. Their active diversions consist in shooting at a mark, or tilting with darts, at which they are very expert. Some few of their great men are fond of hunting, and take the field with numerous equipages, which are joined by their inferiors; but this is often done for political purposes, that they may know the strength of their dependents. The most religious among them find sufficient exercise in conforming to the frequent ablutions, prayers, and rites, prescribed by the Arabian impostor:

At their meals they use a round table, placed upon a stool about fourteen inches high, beneath which a piece of red cloth is spread. There is no table-cloth; but their knees are covered with long silk napkins. The dishes are placed in the middle of the table, being brought in one by one, and changed as soon as every one has tasted a little. The leban in basins, bread, salads, pickles, spoons, &c. are disposed in order round the edges. They use neither knives nor forks. The first dish is broth, and the last pillaw. The intermediate dishes are mutton roasted and stewed with herbs, and cut to pieces; stewed pigeons, fowls, &c. stuffed with rice and spices; but the most favourite dish is a whole lamb stuffed with rice, almonds, raisins, and pistachios. It is observable, that the Turks and Jews seldom or never eat beef, their favourite food being mutton. The common bread is made of wheat, badly fermented, and badly baked: people of fashion have, however, a better sort. Beside these, they have biscuits and rusks stewed with fennel-flour. They have a desert of sweet starch, and a thin syrup with currants, raisins, dried apricots, slices of pears, pistachios, and apples swimming in it; of which each eats a spoonful, and then the repast is concluded.

They usually breakfast on honey, fried eggs, &c. and dine about eleven o'clock; but the principal meal is supper, which is served up at six in the summer, and five in the winter. They drink water at meals, and coffee after dinner. The licentious drink wine and spirits publicly

but the hypocritical part of the people in private; and, when they once begin, they generally drink to excess.

Visitants are entertained with a pipe of tobacco, wet sweetmeats, and coffee, without sugar or milk. When particular respect is intended, sherbet and a sprinkling of rose-water are added. But as soon as the wood of aloes is introduced, it is understood that the host begins to wish his visitor gone. Men and women here smoke to excess. The tube of the pipe is made of the wood of the rose-tree, but the bowl is of clay.

The Turks retire to rest early, and sleep in the principal part of their clothes. Their bed consists of a mattress, and over it a sheet in summer, and a carpet, with a sheet sewed to it, in winter. The men are either lulled to rest by music, smoke themselves to sleep, or are talked to sleep by their women, who are taught to tell innumerable stories for that purpose.

Though inebriety impels the Turks to commit many outrages, and though their laws forbid the use of wine, there are, and have been for years past, in their capital cities, public taverns, which are protected by the government, because the tax imposed upon their proprietors augments the revenue. Their police affixes the seal to the door of every tavern; but a little wicket is contrived underneath, which they pretend to overlook, and affords an entrance always open and public. It requires only a little stooping to evade the law, and get intoxicated without molestation.

All the capital places of Turkey have many public bagnios, which are frequented by people of all sects and conditions, except those of very distinguished rank, who have generally private baths in their own houses, constructed in the following manner:

Two small chambers, built with brick, and faced with marble or plaster, communicate, and are each enlightened by small cupolas, cut in chequers. This little edifice is commonly joined to the house by a small room, in which they undress. Double doors, folded over and listed with felt, shut in the first and second part of the stove. A wood fire is kept up in a subterraneous vault, the entrance of which is without. This fire-place is under the farthermost chamber, and heats a caldron immediately beneath the marble floor, which serves as a ceiling to the vault. Pipes, placed within the walls, come from the inside of the caldron, and go out at the cupola, to evaporate the water, which is kept continually boiling. Other tubes, communicating with a reservoir, are likewise contained within the brick-work, and furnish the inside with cold water, by means of cocks placed at the side of those which yield the warm water. Small seats of smooth wood are made to sit on; and drains are cut in the marble to carry off the water which is thrown down.

These private baths, thus heated twenty-four hours

before they are used, by being thus constructed, have so great a degree of heat, that, after being entirely undressed in the exterior chamber, and having put on very high sandals of wood to keep the feet from being burnt by the marble-floor, it is impossible to enter the first room, without stopping a moment between the two doors, to let the lungs dilate; after which it is impossible to enter the second stove, under which the heat is most active, without taking the same precautions; and, it is probable, that the air of this room bears the same proportion to that of the first, as this does to the external air. A sudden perspiration, rushing through all the pores, is felt on entering; but the violence of this heat does not prevent the women from staying in these baths five or six hours together.

Those who have not private baths, go to the public ones; which are always prepared, and contrived in such a manner as to contain a great number of people. Some of the women, more delicate and scrupulous than the rest, take the bath for themselves alone, and go thither with their particular friends. To complete the entertainment, they carry with them their provisions. Their pleasures consist in enjoying greater liberties than they could otherwise possibly procure. Bathing women, called *telleks*, with their hands wrapped in little bags of serge, rub the skin till it is dry. They likewise make use of a very fine clay, mixed with rose-leaves, and afterwards dried in the sun, as a kind of soap, with which they rub the head, pouring on it warm water from large metal basins. The women's hair, thus cleansed and perfumed, is afterwards tied up in a great number of small tresses. These public baths are likewise frequented by the men, but at different hours from those set apart for the women; as it is death for any male to enter the bath when females are present.

With respect to amusements, the Turks generally entertain themselves within doors with chess or draughts; but they are prohibited from betting upon any games, by the laws of the Koran. The Turkish music consists of two sorts, one for the field, and the other for the chamber. The first, which is performed before the great military officers, and also used in the garrisons, consists of trumpets, cymbals, hautboys, and large drums, the upper head of which is beaten with a heavy drum-stick, and the lower with a small switch. Besides these, they have small drums, which are beat upon after the manner of our kettle-drums; and this music has a good effect at a distance. Their chamber-music consists of a guitar, an Arab fiddle, a dulcimer, the dervises' flute, a couple of small drums, and the diff, an instrument which serves to beat time to the voice, which is frequently the worst of all their music; for many of them bellow so hideously, as to spoil what would otherwise be harmonious. As they are unacquainted with the method of writing music, they are obliged to learn entirely by the ear. However, when several persons play

together, they keep exact time. The Turkish ballets are very pleasant and entertaining, both for their figures, and the variety of their steps; and the dresses of the dancers are light and elegant.

The burials of the Turks are very decent. The corpse is attended by the relatives, chanting passages from the Koran, and, after being deposited in a mosque, it is committed to the earth by an iman, or priest, who pronounces a funeral-oration at the time of interment.

To these remarks on the Asiatic Turks, it may be proper to add some information relative to the other inhabitants of this extensive region.

The *Curds*, who, in the summer, pass from Mousul to the sources of the Euphrates, are a pastoral people, conducting their herds from one country to another; and, in the time of Tournefort, they extended as far west as Toxat, where other hordes, those of the Tureomans, began to appear.

The Armenians, though they profess the Christian faith, retain many singular manners and customs; but they are described as a sensible and polite people, and the principal conductors of the Levant trade, for which their frugality and enterprise render them peculiarly qualified.

The *Druzes* are a remarkable people of Syria, who have attracted the observation of many writers. Though they affect the exterior appearance of Mahometans, yet they seem to have little or no religion; but even among them there are sects, who do not accord in the modes of belief. A modern traveller says, they practise neither circumcision, prayer, nor fasting; they observe neither festivals nor prohibitions. They drink wine, eat pork, and allow marriage between brothers and sisters, though not between fathers and children. Near Antioch there is said to be a sect, which professes some of the most dissolute tenets of Paganism.

The *Circassians*, who inhabit the frontiers of the Caucasus, are supposed to have derived their origin from the Arabs; and they are considered by some as the remains of those armies which were formerly sent by the caliphs to the Caucasus; while others are of opinion, that they are descended from the Mamelukes.

Much having been reported of the beauty of the Circassian women, the following extract from a recent author will be thought interesting:—

“Girls are brought up by the mother. They learn to embroider, to make their own dresses, and that of their future husbands. The daughters of slaves receive the same education, and are sold, according to their beauty, from twenty to a hundred pounds, and sometimes much higher. These are principally Georgians. Soon after the birth of a girl, a wide leather belt is sewed round her waist, and continues till it bursts, when it is replaced by a second. By a repetition of this practice, their waists are rendered

astonishingly small; but their shoulders become proportionably broad, a defect however which is little attended to. On the wedding-day, the belt is cut with a dagger by the husband, a custom sometimes productive of fatal accidents. The bridegroom pays for his bride a marriage-present, or *kalym*, consisting of arms, or a coat of mail; but he must not see her, or cohabit with her, without the greatest mystery. This reserve continues during life. A Circassian will sometimes permit a stranger to see his wife, but he must not accompany him. The father makes the bride a present on the wedding-day, but reserves the greatest part of what he intends to give her till the birth of her first child. On this occasion, she pays him a visit, receives from him the remainder of her portion, and is clothed by him in the dress of a matron, the principal distinction of which consists in a veil. Until this time, the dress of the women is much like that of the men, excepting that the cloak is longer, and frequently white, a colour never worn by men; the cap too is generally red or rose-coloured.

“The Circassian women participate in the general character of the nation; they take pride in the courage of their husbands, and reproach them severely when defeated. They polish and take care of the armour of the men. Widows tear their hair, and disfigure themselves with scars, in testimony of their grief. The men had formerly the same custom, but they are now grown more tranquil under the loss of their wives and relations.”

We shall subjoin some farther particulars of the Circassians from the splendid work of M. Pallas, who travelled amongst these people, at the request of the empress Catherine, part of them, on the southern line of the Caucasus, being subjects of Russia.

“The Circassians are a handsome race. The men are generally of a tall stature, and of a thin form; they are very slender about the loins, have a small foot, and great strength in the arms. They have mostly a martial appearance; yet there are some traces left, from which it may be inferred, that they are descended from parents belonging to the tribe of the Nagais. Although their females are not all Circassian beauties, yet they are generally well shaped, have a fair complexion, dark-brown or black hair, and are justly proportioned. I have, however, met with a greater number of beauties among the Circassian women, than in any other unpolished race.

“Over the shift, the girls wear a laced jacket, because the petticoat, which reaches to the ancles, is open along the front, and resembles part of the men's dress; but married women wear wide breeches. Besides the belt above mentioned, there is another point which contributes to preserve the elegant shape of the girls: they live abstemiously, their whole allowance consisting of milk and pastry. In compliance with the ideas which the Circassians, as well as the Turks, entertain of beauty, a woman must

 ne Circassians,  
 a woman must

have a very narrow waist. When females go abroad, they wear wooden clogs, to keep their feet clean, and at the same time make use of mittens on their delicate hands. Painting the face is considered here as a proof of the loss of virtue; but girls dye the nails of their fingers with the flowers of the balsamina, which in the Circassian language is called *kna*. Their head-dress consists of a cap resembling that worn by the other sex: under this the hair is turned up in a thick queue, which is covered with linen. The Circassians compress the waist of both sexes from early infancy, by means of straps, on which the sabre is suspended: hence they are, in general, uncommonly thin between the loins and the breast. Their feet are uniformly of an extraordinary small size, because they also compress them in the tightest manner within their morocco slippers, which gives them the appearance of dancers.

"The dress of the men is light and becoming. The upper garment is furnished with a small embroidered pocket, on each side of the breast, for holding cartridges. On the head, which is shorn, the more opulent wear a cap, quilted with cotton, in the form of a melon, and adorned with gold and silver laces: the whiskers are likewise suffered to grow. Over the lower dress, which is composed of light stuff, the higher orders generally wear a short rich waistcoat, to supply the place of armour, either with or without a surtout coat. The upper dress is made shorter than the under; the sleeves are sometimes open, and bordered with furs. The breeches have knee-straps, and the seams are bound with lace or embroidery of gold and silver threads, manufactured by the women. When a great man makes a visit in form, he puts on all his accoutrements, over which he sometimes wears a coat of mail. These coats of mail are fabricated of polished steel rings, and imported, some from Persia, and some from Kubesha, to the people about the Circassian mountains. The helmet and the arm-plates are made of polished steel. In the girdle they carry their dagger and pistols, and the bow and quiver are tied round their hips. In common visits, the coat of mail is worn below the upper dress, and they arm themselves only with a sabre, and cover their heads with an ordinary cap.

"It is common to see Circassians of the lower class walking in the fields, dressed in their shaggy felt cloaks; and this they do in the warm days of summer. When they go without a sabre and other arms, they provide themselves with a strong staff, on the top of which is fixed an iron head, and the lower end is furnished with a sharp iron pike, about eighteen inches long, which they throw expertly like a dart. Persons of rank and wealth never leave the house without a sabre; nor do they go beyond the limits of the village without being completely armed, and having their breast-pockets supplied with ball-cartridges. Their clergy, and the literati, let the beard

grow; the clergy generally wear a deep red turban, and scarlet breeches, somewhat longer than those of the latter."

These people reside, from time to time, in villages which, from various causes, are frequently deserted. On migrating, they destroy their habitations, carry off the timber with their utensils, and burn what they cannot remove. If they afterwards happen to settle at some distance from water, they form a canal, which they conduct, by means of small banks, from the nearest rivulet. They sometimes erect, in the fields, round huts of wicker-work, in which is a pit, used as a place of retreat. In the vicinity of the village are placed stacks of hay and corn, secured by a fence; they sometimes manufacture large baskets, which are fixed on the ground, and secured with covers, to preserve their threshed corn.

Their habitations consist, in general, of a large room for the mistress of the house, and a small apartment for the female slaves and girls. The large room has a door on the right-hand corner, leading to the street, and another on the left, leading to the inner yard. In the interior, against the front wall, is a chimney, made of plastered wicker-work, with a commodious fire-place, and a short flue. "At that end of the room which leads to the yard, we remarked," says M. Pallas, speaking of the houses of the upper classes, "a broad couch, with carved balusters: in a collateral line was a window facing the street, which was sometimes used as an entrance to the room. Around the whole wall, and above the sofa, were hung, on pegs and poles, various articles of female dress, such as needle-work, apparel, and furs: below the roof, and in a transverse direction, was placed their store of Turkey wheat in ears, which they occasionally roast in hot ashes, and collect the grains, separated from them by heat, for immediate use, and likewise to preserve them for warlike expeditions; as these grains, together with a species of cheese made of millet, afford, on such occasions, their principal subsistence. The husband commonly resides in a separate apartment, and seldom makes his appearance when his wife receives company."

The principal pursuits of the higher orders are war, pillage, and the exercise of hunting: they live a wandering life, assemble in drinking parties, and undertake military excursions. The lower orders are kept in due subordination; and, though the prince exacts no imposts, they are compelled to serve in the field. Vassals, or boors, are considered as hereditary property; as they implicitly obey the will of their lords, and their lives and possessions are entirely at their disposal: yet there is not any instance of their having been sold to slavery. These vassals, and the slaves subjected during their wars, form the majority of the lower order: they till the land, attend the flocks, carry timber and fuel from the forest, get in the harvest, make hay, and are occupied in the several do-

partments of agriculture. Their wives and adult girls also assist at the harvest. When the Circassians remove to some distance from the villages, they raise temporary huts, by joining poles, which they cover with branches of trees and long grass, so that they appear in the form of haystacks. Their great men take up their abode in huts of the same construction, when, in their excursions, they are obliged to be stationary for a length of time.

Every male peasant is obliged to labour for a stated time, at hay-making, for his lord; also to cut wood in the forest, to carry both the hay and wood to his habitation, and to deliver for every bullock a cart-load, or seven sacks, of millet. When a peasant marries, he is obliged to present to the lord of the manor two cows and two oxen, for obtaining his consent: but the inhabitants of the mountains, tributary to the Circassian nobles, present, in general, for each family, only one sheep, or its value in felts, felt cloaks, cloth, copper vessels, and other articles. Every peasant, who possesses sheep, is obliged to contribute one to the prince's household, during the summer-encampment.

The laws of hospitality and revenge, though opposite in their nature, are strictly observed among the Circassians. The law of hospitality is founded on certain principles, and every person conforming to it is protected from all injuries. He who undertakes the cause of a stranger, defends him, if occasion require, not only at the hazard of his own life, but also that of his relatives; nor does he suffer him to depart without a proper guard, and consigns him over to the ruler of the next district, under condition that an injury offered to the guest shall be avenged with the same rigour as one offered to a relation. Revenge is taken with equal impartiality. The murder of a relative must be avenged by the next heir, though an infant at the time when the act was committed: and the vengeance is exercised, sooner or later, either publicly or privately, on the life of the murderer. This desire of revenge extends to the whole tribe, inasmuch that the hostile chiefs of two different tribes, when they accidentally meet each other, are under a necessity of fighting for their lives, unless they have mutually engaged to pursue a different route. Such is the spirit of resentment, that all the relatives of a murderer are implicated in the guilt; and this desire of revenge occasions much bloodshed among all the nations of the Caucasus; for, unless pardon be obtained, the principle operates during succeeding generations.

The youth of both sexes maintain a free intercourse with each other, as the Circassian women in general are not reserved. In their courtships, respect is paid to the rank of the parties. A married pair do not appear before their parents during the first twelve months, or till the birth of a child.

Polygamy is allowed among the Circassians, the first wife having many more privileges than the second or third; few, however, have more than one wife, and she regards her husband's intrigues with indifference, or perhaps with complacency.

The education of the children of the higher order tends to suppress every feeling of affection. They are, soon after birth, committed to the care of a man of rank, frequently not very opulent; and the parties have no desire to see a son till he is an adult, and capable of bearing arms, nor is any notice taken of the girls till after marriage. The tutor of a male takes upon him the whole care of his education: he instructs the youth in all the practices of robbery; he provides him with arms as soon as he is able to wield them; and, when fully accoutred, he presents him to his father; and the grateful pupil rewards his tutor with a considerable part of the spoil he is able to acquire, for instructing him in the predatory arts.

The female children of the great are trained to all kinds of ornamental work, such as embroidery, weaving of fringe, making of dresses, and plating of baskets and straw-mats. The person entrusted with their education must procure for his ward a husband of equal rank, on pain of losing his head.

The following singular customs, peculiar to the Circassians, are related by a Russian traveller of distinction:—

“Some of these people are so expert in stealing cattle, and carrying off women, that they make a trade of it. Their principal endeavours are directed towards carrying off beautiful virgins, or handsome women. Such as they take, they keep as concubines, or sell them to the Armenians, who supply the Turkish harems, making them pass for Christians, in order to enhance their value. They also carry their children to Kaffa market, with their cattle, where they obtain seven thousand Turkish piasters for a young and handsome girl.” Kluman, of Vienna, one of the latest travellers of credit, in his voyage to the Crimea, asserts the same thing. “These female slaves,” says he, “when brought to market, are locked up in a small private apartment. When there, I was desirous of seeing some, and spoke to the salesman for that purpose. One of them was, consequently, brought to me, into a room where I was waiting. She was well dressed, but her face was veiled; she kissed my hand, agreeably to the oriental custom, and her master ordered her to walk to and fro. She was elegant in the extreme; when she unveiled her face, she absolutely enchanted me, so inexpressible was her beauty. Her hair was light, her eyes full and blue, her nose a little long, her lips lovely, her features regular, her complexion white and soft, and her cheeks tinged with a fine carmine; she had a long neck, and a fine bosom completed the charms of her person. sired to wipe her face with a white handkerchief, to shew me her beauty was not owing to paint. She then shewed her teeth, which were white and regular. I was allowed to feel her pulse, in order to be convinced of her health. After this she was ordered to withdraw. Her price was four thousand piasters, or about one hundred and twenty-five pounds English; which, he said, was the value of such a slave."

With respect to their funerals, they wrap up the dead in large winding-sheets, and bury them without a coffin. In different places, about Mount Caucasus, epitaphs, crosses,

and inscriptions, are seen, which indicate them to have been made by Christians. Probably, these are the remains of the Greek empire, when the seat of it was at Byzantium; or else of the colony of Moravians, who quitted their country about the end of the fifteenth century, in which they were exposed, and sought an asylum here, though they are now entirely degenerated, and mixed with others, preserving only their name and language.

For the history of the Turks, we must refer the reader to the article of *Turkey in Europe*, to which it properly belongs.

## CHAPTER II.

### CHINA.

#### *Situation, Extent, and Boundaries.*

CHINA, properly so called, is situated between twenty and forty-two degrees of north latitude, and between ninety-eight and a hundred and twenty-three degrees of east longitude; extending thirteen hundred and fifty miles in length, and one thousand and sixty in breadth, and containing a surface of one million two hundred and ninety-eight thousand square miles. Its boundaries are, the celebrated wall of China on the north; the Pacific Ocean,

which separates it from North America, on the east; the Chinese Sea on the south; and the mountains and rivers of Asiatic Russia and Tibet on the west.

*Divisions and Population.*] The following statement of the division, population, and extent of China, was delivered to Lord Macartney, at his request, by a Chinese mandarin, named Chow-ta-Zhin, and appears to have been founded on authentic documents, taken from one of the public offices in Pekin.

PROVINCES.	Population.	Square Miles.	Acres.
Pe-che-lee	38,000,000	58,949	37,727,360
Kiang-nan	32,000,000	92,961	59,495,040
2 Provinces }	19,000,000	72,176	46,192,640
Kiang-see	21,000,000	39,150	25,056,000
Tche-kiang	15,000,000	53,480	34,227,200

With respect to this statement, it has been observed, that "the extent of the provinces is ascertained by astronomical observations, as well as by admeasurement. The number of individuals is regularly taken, in each division of a district, by a tything-man, or every tenth master of a family. These returns are collected by officers resident so near as to be capable of correcting any gross mistake; and all the returns are entered in the register at Peking. Though the general statement is strictly the result of those returns added to each other, which seem little liable to error, yet the amount of the whole is so prodigious, as to appear incredible. It must, however, be recollected, that population in China is not subject to be materially diminished by war. Celibacy is rare, even in the military professions. The number of manufacturers, whose occupations are not always favourable to health, whose constant confinement to particular spots, and sometimes in a close or impure atmosphere, must be injurious, and whose residence in towns exposes them to irregularities, bears but a very small proportion to that of husbandmen in China. In general, there seem to be no other bounds to Chinese populousness than those which the necessity of subsistence may put to it. From a consideration of the influence of all these causes, therefore, the great population of China, asserted in this statement, will not, perhaps, seem surprising, though it appears from it, that every square mile in this vast empire contains, upon an average, about one-third more inhabitants, being upwards of three hundred, than are found upon an equal quantity of land, upon an average, in the most populous country in Europe."

*Climate, Soil, &c.*] The air of this country differs according to the situation of the respective parts. Towards the north it is sharp, in the middle temperate, and in the south hot. As the low lands are rendered fertile by innumerable canals, the higher grounds are cultivated by the labour of the people, who have levelled some of the hills, and increased the surface of others, by flattening them at the summit. They have also divided a great number into separate ridges, regularly secured with stone walls; and the surfaces of these terraces are sown with numerous kinds of grain, and watered by machines curiously adapted to the purpose.

Some of the hills are cut in the most fanciful shapes, so as to resemble, at a distance, a variety of animal figures, as elephants, camels, leopards, boars, tigers, &c. Those, which, by way of eminence, are called "The Hills of Five Horses' Heads," have a great affinity to their appellation, and may be deemed a stupendous production, both as to nature and art: nor are they only expert at levelling natural hills, but equally adroit in raising artificial mounts; so that every cultivated part is effectually secured from colds, heats, blasts, and droughts.

From this concise view of the natural fertility of the

soil, and the ingenuity, as well as industry, of the inhabitants, the reader may infer the production of a superabundant supply, not only of the necessities, but delicacies, of life; and also the opulence, populousness, and pleasantness, of a region thus situated and cultivated. And, with respect to the general aspect of the country, such is the variegated prospect of its verdant lawns, delightful groves, sequestered bowers, wonderful canals, winding streams, verdant trees, glittering cascades, and lofty turrets, that the eye cannot behold it without entertaining the idea of a perfect elysium.

*Agriculture.*] It is remarked by the Abbe Raynal, in his Philosophical and Political History, that, to do honour to the profession of agriculture, the emperors of China become husbandmen officially. It is one of their public functions to break up the ground in the spring; and the parade of magnificence that accompanies this ceremony draws together all the farmers in the vicinity of the capital. The example of the prince is followed in all the provinces, and, at the same season, the viceroy repeats the same ceremonies, in the presence of a numerous concourse of husbandmen.

Where the face of a hill or mountain is not nearly perpendicular to the level surface of the earth, the slope is converted into a number of terraces, one above another, each of which is supported by mounds of stone. By this management it is not uncommon to see the whole face of a mountain completely cultivated to the summit. These stages are not confined to the culture of any particular vegetable: pulse, grain, yams, sweet potatoes, onions, carrots, turnips, and a variety of other culinary plants, are produced upon them. A reservoir is sunk in the top of the mountain; and the rain-water collected in it is conveyed, by canals, to the different terraces.

The collection of manure is an object of so much attention with the Chinese, that a prodigious number of old men, women, and children, are constantly employed about the streets, and public roads, with baskets tied before them, and holding in their hands small wooden rakes, to pick up the dung of animals, and any thing that may answer the purpose of manure; but, above all others, except the dung of fowls, the Chinese farmers prefer the soil collected by nightmen. This manure is mixed sparingly with a portion of stiff loamy earth, and formed into cakes, which are afterwards dried in the sun. They are then thrown into a large cistern, containing all other sorts of dung, together with the leaves, roots, and stems, of plants, mud from the canals, offals of animals, and even the shavings collected by the barbers. With all these as much water is mixed as will dilute the whole; and in this state, generally in the act of putrid fermentation, it is applied to the ploughed earth.

The Chinese husbandmen always steep the seeds they

intend to sow in liquid manure, until they swell, and germination begins to appear, which, they say, has the effect of hastening the growth of plants; as well as of defending them against the insects hidden in the ground in which the seeds are sown. Perhaps this method has preserved the Chinese turnips from the fly, that is often fatal to their growth elsewhere. They also apply liquid manure to the roots of plants and fruit-trees, as contributing much towards forwarding their growth and vigour.

The following method is adopted for watering the fields in seasons of drought. Two men stand upon projecting banks, opposite to each other, each holding in his hand a rope, fastened to a bucket, which, when filled with water from the river, after swinging it to and fro several times, is thrown with rapidity into a reservoir, made near the river's bank; and from this, by means of small channels, the water is conveyed over the adjoining fields. At other times, a long pole, the length of which is unequally divided, is made to turn upon a pivot across an upright post; a bucket, fixed at the shortest end, is lowered into the river, which, when filled, is hoisted by the longest lever, and its contents poured into the reservoir.

The construction of the Chinese plough is very simple; and, in places where the soil is light, it is drawn by men and women. There is no counter to the plough; the share, which penetrates, being made to terminate in a curve, performs the office of a mould-board for turning back the earth. It is sometimes made of iron, but more frequently of a timber called iron-wood.

The process of shelling or husking rice is performed by putting the grain into a strong earthen vessel, or large stone mortar, fixed in the ground, and striking it with a conical pestle, adapted to the end of a lever. This pestle is often wrought by a person treading upon the end of the lever. Another mode of effecting this is, by placing the grain between two flat circular stones, the uppermost of which is made to turn round, but at such a distance from the undermost, as not to crush the rice placed between them.

Amongst the modes for raising water from rivers, for irrigating their lands, the Chinese make use of a chain-pump, the chambers of which, instead of being cylindrical, are always square. The inside of a hollow wooden trunk is divided in the middle, by a board, into two compartments; a chain, made to turn over a small wheel or roller, at each extremity of the trunk, is fastened to flat and square pieces of wood, exactly fitted to the capacity of the cavity; these move with the chain round the rollers, and raise a volume of water proportionate to the dimensions of the hollow trunk. The power to work this machine may be applied different ways: when it is intended to raise a great quantity of water, sets of wooden arms, in the form of the letter T, are fixed to the lengthened axis of the rollers, and smoothed, for the foot to rest upon. The

axis is made to turn upon two uprights, rendered steady by a piece of timber stretched across them. Two or three men, by treading upon the projecting part of the wooden arms, supporting themselves, at the same time, by a cross-beam, give a rotatory motion to the chain; and the parts called lifters, being attached to it, raise up a constant and abundant stream of water.

The Chinese have no meadow-land, and but little pasturage; nor are oats, beans, or turnips, sown in the fields for the use of cattle. There are scarcely any parks or pleasure-grounds, but those appertaining to the emperor. The roads, being narrow, occupy but little land, as the chief intercourse is by canals. Commons, or waste grounds, are unknown in China; nor do they suffer their arable lands to lie fallow. The labour of the inhabitants is principally applied to the raising of articles which administer to the comforts, but not to the luxuries, of life. Even soldiers, when not on duty, are busied in husbandry.

*Mountains.*] The Chinese chains of mountains, some of which are supposed to rival the Apennines and Pyrenees, may be seven or eight in number; but so imperfect is our knowledge of this empire, that no general appellations have been conferred; and scarcely is the name of one Chinese mountain known to geography. D'Anville, amidst all his information from the French Jesuits, who had long resided in China, lays down the mountains, in all his maps, as confused spots, scattered over the whole country; and Du Halde merely informs us, that some of them contain mines of silver, and some produce marble and crystal, whilst others yield a variety of medicinal herbs.

*Rivers, Lakes, Canals, &c.*] The Hoambo, or Yellow River, so called from the yellow tinge of its waters after heavy rains, rises towards the frontiers of Hindoostan, in the intermediate mountains between Tartary and the province of Suchan, and, after maintaining a serpentine course of near 1900 miles, discharges itself into the Eastern Ocean.

The Ky-am, or Blue River, has its source in Tibet, whence it flows from east to west, and empties itself into the Eastern Ocean. It is chiefly remarkable for its breadth and depth. The Pearl River is so named from the number of precious stones found among its gravel, which, by moonshine, overspreads its waters with so uncommon a lustre, as gives their surface the transparent gloss of waving pearl.

The River Tomin, in harvest-time, turns blue; of which the adjacent inhabitants avail themselves, by using its waters for the purpose of dying. The waters of a river near Pomgaw are so thin, that timber will not float on them; and those of another, in the neighbourhood of Ching-tien, are odoriferous. The waters of the Xo are medicinal, and much resorted to by the diseased for the cure of various disorders.

But the most remarkable river in China is one near the city of Hang-chou, which rises annually, upon a certain day, to a stupendous height. Multitudes repair to behold this phenomenon; though neither Asiatic nor European philosophers have yet defined the cause of it. When the surges subside, the surface of the shores, which they covered, is pared off, and becomes excellent salt; a commodity equally useful and salutary to the inhabitants of an inland district, who would be greatly distressed, were they not supplied by means of this inundation.

Du Halde informs us, that the lake of 'Tong-tint-hou, in the province of Hou-quang, is more than eighty leagues in circumference: that of Hong-si-hou is partly in the province of Kiang-nan, and partly in an adjoining division of the empire: that of Poyang-hou, in the province of Kiang-si, is about thirty leagues in circumference, and is formed by the confluence of four rivers, as large as the Loire: the navigation of this last is dangerous. There is also a considerable lake, not far to the south of Nankin, called Tai-hou; and the map of D'Anville indicates a number of smaller lakes, chiefly in the eastern and central parts of China.

The Chinese *canals* are equally admirable in design and execution, and exhibit the most striking proofs of human invention, diligence, and assiduity. Some of these extend several hundred miles, and are deep enough to contain vessels of considerable burden. They are admirably disposed, and the banks on each side are lined with hewn stone. When the wind permits, vessels are navigated in them by the usual means of sails; and, in calms, they are towed by men. These vessels are fitted up for all the conveniences of life; and it has been thought, by some, that in China the water contains as many inhabitants as the land. The whole country is chequered, as it were, and watered by sluices from the large canals, over which are erected a great number of bridges, with the centre arches so constructed as to admit of the passage of vessels without the least obstruction. The most superb of these canals is that called Yun-lean, or the Royal Canal; a most stupendous work, that divides China into two parts, north and south, and opens an uninterrupted communication between the two extremities of the empire.

*Animals.*] China produces horses, oxen, swine, buffaloes, and deer of various kinds. Tigers, leopards, and other wild animals, are also very numerous. The mang-tehang-tse, or musk roe-buck, is a species of deer, without horns. The bladder, or bag, that grows beneath its belly, exhibits, when opened, grains of musk adhering to the inner coats of the bag: the valuable perfume extracted from this animal is of great importance to the commerce of the country. The Chinese camel is about the size of a middle-sized horse, of a dun or ash colour, well-made, and has two bunches upon its back. The sheep have short

fleshy tails, weighing several pounds, in high estimation among Chinese epicures. There are abundance of mules here; some are killed and eaten, their flesh being much admired. They resemble those of Europe in point of shape and size, but are of a lighter colour, and very fleet.

With respect to birds, eagles, cranes, storks, birds of paradise, pelicans, peacocks, pheasants, geese, swans, ducks, and a great variety of others, are found here in abundance.

Wild-duck hunting is a very common practice amongst the Chinese. They scoop out a large gourd, and fit it to their heads, leaving proper apertures for sight and respiration; they then go naked into the water up to their chins, that nothing may appear above water but the gourd, which the duck, being accustomed to see floating, soon approaches, and, pecking at it, the duck-hunter seizes him by the feet, and secures him.

Some of the rivers of China produce a yellow fish, which is delicious food. They are very large, and only to be caught at stated seasons. The meal-fish is much esteemed, and the eyes are remarkable, being surrounded by a black ring, which is again enclosed by two white circles of an admirable brightness. The armour-fish, so termed from the vast number of scales with which it is covered, is deemed excellent food; and there is a saying concerning it among the Chinese, which is, "that the armour is fit for a soldier, and the flesh food for an emperor."

Gold and silver fish are generally kept by the opulent, in the ponds which embellish their gardens; and many varieties are found in the rivers, canals, and lakes, with which the country is intersected.

Among the insects the most remarkable are, a species of moth, as large as a humming-bird; a butterfly of amazing size and beauty; and a species of lizard, called the wall-dragon. But the most useful insect of this country is the silk-worm.

*Vegetable Productions.*] China abounds with vegetable productions; among which may be noticed, orange, lime, and citron trees; a kind of date-tree; the pea-tree, which produces a fruit resembling the pea of Europe; the meal-tree, the pulp of which yields excellent flour; and the varnish-tree, which produces an excellent varnish. In the vicinity of Nankin is found the tallow-tree, which grows to the height of a common cherry-tree; its beautiful white blossom is followed by its fruit, growing in bunches, which is contained in a hard brownish husk, which, when ripe, separates in the middle like a chestnut. Each husk contains three small kernels, about the size of a hazel-nut; and every kernel is covered with a hard, white, oily substance, which has the properties of tallow; but, in stripping it off, it does not soil the hands. With this the Chinese make candles; though, to harden them, they are generally dipped in the wax produced by an insect found in Cochin-China. From the shell and kernel is extracted a good deal of oil:

in high estimation; abundance of mules flesh being much in point of shape very fleet.

Storks, birds of paradise, swans, ducks, are in abundance.

so that this tree produces tallow for candles, and oil for lamps.

The tea-tree commonly bears leaves from top to bottom, which are indented like our sweet-brier; and the flower is very much like that, with six upper and six under leaves. The fruit is of the size of a small pipkin, finely flavoured, and tastes somewhat like a clove. The seed is round, blackish, and about the size of a large pea, when dry and shrunk. Being put into the mouth, it yields at first a sweet, but, being kept longer in it, a bitterish, taste; and yields likewise a quantity of oil, which, in some parts, they use as sauce to food. It seldom, if ever, grows to above the size of a rose-bush, or, at most, a filbert-tree.

There are several kinds of tea, some finer, smoother, and more fragrant than others, according to the soil they grow in. That called Singlo is deemed the most elegant, and used by the more opulent. Some are denominated from their particular colours or qualities; as the Vowi, or Bohea, is so called from its dark or brown colour. This sort is much esteemed in China for its flavour and medicinal qualities.

The tea-tree often grows upon the sides of mountains, and among rocky cliffs, which are inaccessible to man. But the Chinese obtain the leaves by the following singular stratagem. Those declivities are often the habitations of monkeys, whom they mock and imitate, till the animals, to revenge themselves, break off the branches, and shower them down upon the insulters; from which branches the Chinese afterwards strip off the leaves.

When Doctor Lettsom had read the above passage, taken from Grosier's Description of China, he wrote to the author, to thank him for having given an account of the tea-tree, which coincided so exactly with his own, and which had been treated with unmerited ridicule. The doctor likewise mentions drawings, in which monkeys are represented gathering the branches or leaves of the tea-tree, without exhibiting any menacing attitude. They appeared to be rather fulfilling an office to which they had been regularly trained; and the more so, because others were walking, or sitting by the people, as if tamed and domesticated, whilst they were quietly gathering the leaves from the trees.

The largest and oldest leaves, which are the least esteemed, and destined for the use of the lowest classes, are often exposed to sale, with little preparation, and still retaining that kind of vegetable taste, which is common to most fresh plants, but which vanishes in a little time, while the more essential flavour remains without diminution. The young leaves undergo a considerable preparation, before they are delivered to the purchaser. Each leaf passes through the fingers of a female, who rolls it up, almost to the form it had assumed before it became expanded, in the progress of its growth.

In the most recent accounts of the preparation of the tea-plant, the idea of strewing the leaves upon sheets of copper is exploded; and it is affirmed, that they are placed upon earthen or iron plates, made much thinner than can be executed by any European artist. The plates are placed over a charcoal-fire, which renders the leaves dry and crisp. The colour and astringency of the green tea is thought to be derived from the early period at which the leaves are plucked.

The Chinese neither drink their tea in the manner we do, nor so strong, but use it only as their common beverage. They were first obliged to have recourse to it, to correct the unwholesome brackishness of their waters, which, in some places, were not only distasteful, but productive of diseases; so that, when its virtues became known, it grew into universal use. It is considered, by them, as a great diluter and purifier of the blood; a strengthener of the brain and stomach; a promoter of digestion, perspiration, and other secretions; and, particularly, an excellent diuretic.

The use of tea was introduced into England before the Restoration, as mention is made of it in the first act of parliament, that settled the excise on the king for life, in 1660. Catherine of Lisbon, wife of Charles II. rendered the use of it common at his court.

The plant called *camellia sesanqua* is similar to, and often substituted for, the tea-tree. The petals of this plant, called, by the Chinese, chawhaw, or flower of tea, from their resemblance to each other, and likewise the flowers of the Arabian jessamine, are sometimes mixed among the teas, in order to increase their flavour. The *camellia sesanqua* bears a nut, from which is extracted an edible oil, equal to the best kinds imported from Florence.

But, of all the shrubs growing in this country, the cotton-shrub is looked upon as the most useful. As soon as the harvest is got in, the peasants sow cotton in the fields; and, raking the earth over the seeds, there soon springs up a shrub, about two feet high, the flowers of which are in general yellow, but sometimes red. A small button, about the size of a nut, and opening in three places, succeeds the flower, and, on the fortieth day after the flower's appearance, discovers three or four wrappings of white cotton; this, which is fastened to the bottom pod, contains seed for the ensuing year. As all the fibres of the cotton are fastened strongly to the seeds they inclose, the people separate them with an engine. The cotton is afterwards carded, spun, woven, and converted into calico.

*Minerals.*] Iron, copper, quicksilver, lead, white copper, load-stones, pit-coal, salts of various kinds, and quarries of marble, are contained in the mountains of China. Here are also mines of gold: but, as one of the fundamental maxims of the Chinese government is that of not introducing a superabundance of the precious metals, for

fear of hurting industry, these are but slightly worked, and the currency of that metal is supplied by the grains the people pick up in the sand of rivers and mountains. The silver specie is furnished from the mines of Honan.

*Curiosities, Natural and Artificial.*] Some volcanoes, and lakes of particular qualities, are found in different parts of the Chinese empire. The volcano of Linesung sometimes makes so furious a discharge of fire and ashes, as to occasion a tempest in the air; and some of the lakes are said to petrify fishes, when put into them.

The Chinese bridges, from their construction and extent, cannot be sufficiently admired. They are sometimes built upon barges, strongly chained together, yet so as to be parted, to let the vessels pass that sail up and down the river. Some of them run from mountain to mountain, and consist only of one arch. That over the river Saffrany, though only consisting of a single arch, is four hundred cubits in breadth, and five hundred in length, and connects two mountains; and some, in the interior of the empire, are still more stupendous.

The bridge of Suen-tcheou, in the province of Fo-Kien, is built over an arm of the sea, and supported by above three hundred pillars: its length is about two thousand five hundred feet, its breadth twenty; and the stone work, from pier to pier, at the top, consists of large single massy stones. The iron bridge in the province of Koei-cheou consists of chains of iron, reaching over a river extremely deep and rapid, though not broad. On each bank are raised two massy piles of masonry, to which are fastened chains that cross to the opposite side, and on these are laid broad planks.

The triumphal arches of this country, though not built in the Greek or Roman style of architecture, yet demand attention. They are mostly erected to the memory of great men, with vast labour and expence; and are said, in the whole, to be eleven hundred; many of which are particularly magnificent. Their sepulchral monuments are also very conspicuous.

The pagodas, or temples, erected to their fabulous deities, are very numerous: they consist, in general, of one tower, terminating in a dome. Some are built of brick, and others of hard-tempered earth.

The celebrated Porcelain Tower, in the vicinity of Nankin, consists of a prodigious number of pieces of timber, differently boxed, and let one into another, which is considered a great embellishment in Chinese architecture. It must be acknowledged, that this labyrinth of beams, girders, &c. has something in it striking; though, in fact, it is no better than a regular kind of embarrassment and confusion, proceeding from the ill taste of this people for architecture, who are entire strangers to that noble simplicity so justly admired in the best European buildings.

The great wall of China, which is a master-piece of

industry, genius, and perseverance, excelling every fortification attempted by the ancients, was built, some centuries before Christ, by the Chinese Emperor Chinchu Voang, to prevent the incursions of the western Tartars. This wall, which begins in the province of Shen-si, on the side of Tartary, is continued over mountains and valleys to the forty-second degree of north latitude, and then reaches southward as far back as to the thirty-ninth. It is principally built of brick, and cemented with the strongest mortar, insomuch that, though it has stood upwards of two thousand years, it still continues firm. It is about fifteen hundred miles in length, including its numerous turnings and windings, and the intermediate spaces supplied by the mountains, which, in several places, form a natural fortification; and in many others there is a wide ditch only; so that of the real wall there is no more than four hundred miles. Its height does not exceed thirty feet. During the reign of the Chinese emperors, it was continually guarded by a million soldiers; but, since the conquest of China by the Tartars, they are satisfied with guarding only particular parts of it. It has three or four lofty towers, or forts, within the compass of every mile, many of which are situated upon the highest mountains; and the wall is broad enough upon the top for six horses to gallop abreast.

To raise men for building this wall, which is stated to have been completed in five years, the emperor commanded, that three out of every ten men throughout his dominions should work at it; and afterwards two out of every five were compelled to labour at this vast undertaking. It is also said, that though the inhabitants of each province worked as near their own abode as they could, yet, either by the length of their journey, or the difference of climate, almost all those employed in its construction died unexpectedly. This raised a tumult in the empire, which caused the murder of the emperor, and his son Agutzi, in the fortieth year of his reign. When it is considered that this structure, besides being extended along dreary wastes, and even surfaces, is carried over expansive rivers, in the form of bridges, some having two tiers of arches, and also, in the same shape, across deep and wide extended valleys, uniting, as it were, the mountains which form them; that it ascends the highest, and descends the steepest, precipices: and with all this, considering the immensity of labour, the ingenuity of the artists, the difficulty of transporting materials, and the short time of its completion, the imagination is lost in the contemplation of an object, whose grandeur is not surpassed by any work of art in the universe.

*Public Roads.*] The most striking proofs of the art and industry of the Chinese are exhibited in the projection and execution of their high roads, which are broad, well paved, and secure. They are generally bordered with

lofty trees, and sometimes with walls eight or ten feet high, which prevent travellers from entering the fields. Openings are left, however, at certain intervals, which give a passage into the cross-roads that lead to different villages. On all the great roads, covered seats are erected at proper distances, where travellers may shelter themselves from the inclemency of the weather.

The inns are spacious, but, in general, badly supplied with provisions; so that travellers are obliged to carry beds with them, or to sleep on a plain mat. Government requires of those who keep inns, to give lodging only to those who ask and pay for it. "We met with many turrets," says Mr. Bell, "to attend the embassy," called post-houses, erected at a certain distance from each other, with a flag-staff, on which was hoisted the imperial pendant. These places are guarded by soldiers, who run from one part to another with great speed, carrying letters which concern the emperor. The turrets are in sight of each other; and, by signals, they can convey intelligence of any remarkable event. By these means, the court is informed, in the speediest manner, of whatever disturbance may happen in the most remote parts of the empire." Coaches are not used in this country: but gentlemen commonly travel in sedan-chairs, palanquins, or on horseback; and ladies, in close litters, suspended between two mules.

*Cities, &c.*] PEKIN, the metropolis of China, is pleasantly situated in a fine fertile plain, in the most salubrious part of the empire, abounding with all the necessities and comforts of life, except tea, none of which grows in that province. The frost is rather severe in winter; but the heat in summer is moderate.

Pekin is built in the form of an oblong square, and is divided into two cities. That which contains the imperial palace is called the Tartar city, because, when the present family came to the throne, the Chinese were driven without the walls, where they erected a new city, which, being joined to the other, renders the whole an irregular form, of about eighteen miles in circumference. The walls and gates of Pekin are of the height of fifty cubits, so that they completely hide the city; and slopes are constructed within the town, by which horsemen may ascend the walls.

The gates are not embellished with statues, nor other carving; all their beauty consisting in their prodigious height, which, at a distance, gives them a noble appearance. The arches of the gates are built with mortar, and the rest with large bricks, excellently cemented.

The principal streets are spacious, and three or four miles long. The shops of the merchants, for neatness and riches, excel most in Europe. The name of the tradesman, and the articles he deals in, are placed over the shop-door; the entrance to which, besides being decorated with streamers, is embellished with gildings, sculptures, paintings, &c. in a manner which attracts and charms the eye: but the

principal Chinese shops and markets are kept in the suburbs.

As all provisions are brought to this city by land-carriage, the streets are filled with carts, camels, horses, and other beasts of burden, with their drivers; so that it is difficult to pass through the gates in a morning or evening: the artificers also contribute to increase the crowd, as they work in the houses of those who employ them, and are perpetually looking out for business. Barbers go about ringing bells, to get customers: they carry with them a stool, basin, towel, pot, and fire; and, when any person calls to them, they run up to him, and, placing their stool in a convenient place in the street, shave the head, clean the ears, put the eye-brows in order, and brush the shoulders, all for the value of little more than a halfpenny. They then ring their bell again, and are ready for another customer. The tailors, who ply in the streets, go home to the houses of their customers, and do their work there. They do not use thimbles, but tie a rag upon their thumbs; nor do they sit down to their work, but sew standing.

Prostitutes are not suffered to live within the walls: their houses are of a particular kind, and many of them lodge together, generally under the inspection of a man, who is responsible for any disturbance they occasion.

The principal streets are guarded by soldiers, who patrol night and day, not only with their swords, but with whips in their hands, with which they lash indifferently all persons concerned in any breach of the public peace. Indeed, there is always in this city a garrison of forty thousand men, to preserve good order. Here are no clubs, balls, or other nocturnal meetings; and the soldiers take into custody all persons whom they see in the streets in the night-time, if they do not give a good account of themselves.

It has been remarked of the palace, that "its grandeur does not consist so much in the nobleness and elegance of the architecture, as in the multitude of its buildings, courts, and gardens, all regularly disposed; for within the walls are not only the emperor's house, but a little town, inhabited by the officers of the court, and a multitude of artificers." F. Artier, a French jesuit, says, that the palace is more than three miles in circumference; and that the front of the building shines with gilding, paint, and varnish, while the interior is set off and furnished with every thing that is most beautiful and precious in China, the Indies, and Europe. The gardens are large tracts of ground, in which are raised, at proper distances, artificial mountains, from twenty to sixty feet high, which form a number of small valleys, plentifully watered by canals, which, uniting, form lakes and meres. Beautiful barks sail on these pieces of water; and the banks are ornamented with ranges of buildings, not any two of which have the least resemblance to each other. Every valley has its house of

pleasure, large enough to lodge a European nobleman, with all his retinue. In the middle of a lake, which is nearly half a league in diameter every way, is a rocky island, on which is built a magnificent palace, containing more than a hundred apartments. The mountains and hills are covered with trees, particularly such as produce beautiful and aromatic flowers; and the canals are edged with rustic pieces of rock, disposed with such art as exactly to resemble the wildness of nature.

The palaces of the chief mandarins occupy a considerable extent of ground, as they have only one floor: they consist of several open courts, in which the buildings are not contiguous; and they are so fond of privacy, that they have no windows towards the street; neither will they suffer their neighbours to have any which can overlook them.

According to the best information given to the late English embassy, the whole population of this city was about three millions. The low houses of Peking seem scarcely sufficient for so vast a population; but very little room is occupied by one family, at least in the middle and lower classes of life. A Chinese dwelling is generally surrounded by a wall six or seven feet high. Within this inclosure, a whole family of three generations, with all their respective wives and children, will frequently be found. One small room is made to serve for the individuals of each branch of the family, sleeping in different beds, divided only by mats suspended from the ceiling.

NANKIN is the capital of the province of Kiang-nan, and was for many ages the metropolis of the empire. It was originally surrounded with a triple wall, measuring about sixteen leagues in circumference; but the palace, once famous for its splendour and magnificence, has been destroyed. The streets of this city are narrow, but well paved; the houses are low, but handsome; the shops spacious, and well furnished with goods. Nankin is celebrated for its great number of libraries: it excels likewise in printing, and in artificers of most kinds.

The public buildings are rather mean, except a few temples, the city-gates, and a tower of porcelain, about two hundred feet in height. The population is estimated at about four millions, including those who live in barks upon the water; and, indeed, wherever a city is situated on the banks of a canal or river, there is seen another large floating city of barks; so that the rivers and canals in China are, in proportion, as populous as the land.

CANTON is the capital city and sea-port of the province of Quang-tong. There can hardly be a more charming landscape, than that which presents itself on entering the river that leads to the town. It is various, gay, and animated. On one side, meadows, of a most lovely green, extend out of sight; on the other, groves, or little hills, appear, which rise in the form of amphitheatres, ascended

by steps made of green sods. Here rocks are seen covered with moss; there villages rising among the copses. Sometimes canals present themselves, which form islands, or, losing themselves in the earth, expose to view their beautiful banks, the whole forming a most delightful prospect.

Canton unites, as it were, three cities in one: they are separated by high walls, but so contiguous, that the same gate serves to pass from one to the other. The whole forms a figure almost square, and is not much less in compass than Paris. The streets are long and straight, and paved with hewn stone; but mostly narrow, except a few which are adorned with triumphal arches. They are wholly taken up with shops, which make a fine show; and tradesmen, who deal in the same articles, reside in the same quarter of the town.

Many of the public edifices are very handsome. Besides thirteen triumphal arches, there are a great number of idol-temples, surrounded with cells of the Bonzes. The hall of Confucius and the academy of the literati are curious structures; and the palaces of the mandarins are built in a peculiar style of Chinese grandeur. Here are market-places for fish, flesh, poultry, vegetables, and all kinds of provisions, which are sold very cheap.

The houses, though very neat, are far from being stately; almost all of them consist of a ground-floor, and are built of earth, ornamented with bricks, and covered with tiles. The windows, in summer, are of cane, to let the air through; in winter, of oyster-shells, scraped till they are semi-transparent. The walls are covered with thin white paper; and, in winter, charcoal is burnt in the middle of the rooms. Some of the meaner sort of people have their habitations composed of wood. The houses of the European factors are built on a fine quay, having a regular facade of two stories towards the river. They are constructed, with respect to the interior, partly after the Chinese, and partly after the European mode. Adjoining to these are a considerable number of houses, which belong to the Chinese, and are let out by them to the commanders of vessels, and to merchants, who make only a temporary stay.

The river is crowded on both sides with junks, arranged in rows, containing a prodigious number of people. These junks, lying close together, form streets; and each junk, containing a whole family, is divided into various apartments. The common people, who inhabit them, rise betimes in the morning, either to fish, or work in the rice-ground, which yield two crops annually.

The great quantity of money, brought hither from the most distant countries, draws the merchants of the several provinces to this port, where may be found almost every thing that is rare or curious in the empire. The inhabitants are industrious, ingenious, and expert in the imitative art, and in the embellishment of their manufactures

though these are not in estimation with the people at Peking, being undervalued by them, and, as they say, neither substantial nor well-wrought. They also complain, that the materials are either scanty or ill-chosen, and the internal workmanship too slight. Notwithstanding, the silks at Canton, called *sha*, are there accounted the best of that kind, especially the flowered sorts, which are wrought open like lace, and much worn in summer.

Though the number of artificers in this city is almost incredible, yet, not being sufficient for its trade, they have established a great many manufactories at Fo-shen, which have rendered it famous throughout the whole province. During the troubles in which Canton was involved, the trade was carried to this borough, distant four leagues. It is at least three leagues in circumference, is a place of great resort, and not inferior even to Canton, either for its wealth or the number of its inhabitants. The viceroy resides at Canton, which has under its jurisdiction seventeen cities, one of the second, and sixteen of the third rank.

The population of Canton has been variously estimated. At the time of Lord Macartney's embassy, it was computed, that there were in this city, and its suburbs, one million two hundred thousand inhabitants, and there were five thousand trading vessels lying before the city.

The factories belonging to different European nations, each of which has its peculiar flag flying, are handsome buildings, arranged in a line along the river, without the city-walls; and in the vicinity are warehouses also for the reception of articles for sale, as well as for Chinese merchandise for exportation. Whatever purchases are made for the English East-India Company, are done by agents, whose liberal emoluments place them above the temptation of fraudulent or dishonourable practices; and who are bred in the habits of method, punctuality, and probity.

As no European is permitted to take his wife with him to Canton, the English supercargoes live together at a common table, which is maintained by the company; and each of them has apartments appropriated to himself, consisting of three or four rooms. The period of their residence rarely exceeds eight months in a year; and as, during that time, they are almost constantly occupied in the service of the company, they may submit with the less uneasiness to the restrictions under which they live.

MACAO, situate at the mouth of the Tigris, is capable of receiving sixty-four gun ships into its road at the entrance of Typa; and in its port, which is below the city, and communicates with the river to the eastward, ships of seven or eight hundred tons half laden.

The entrance of the port is defended by a fortress, consisting of two batteries, which, on entering, it is necessary to pass within pistol-shot. Three small forts, two of which are mounted with a dozen guns, and one with six, guard the southern part of the city from all Chinese enterprises;

these fortifications, which are in the very worst state, would by no means be formidable to Europeans, but are fully adequate to keep in awe the whole maritime force of the Chinese. There is, besides, a mountain, which commands the country, and on which a detachment might hold out a very long siege.

The land-side is defended by two fortresses, one of which mounts forty guns, and can contain a garrison of a thousand men. It has a cistern, two springs of running water, and cuscumates to enclose warlike ammunition and provisions; another, upon which are mounted thirty guns, cannot allow of more than three hundred men. Here is a spring, which is very abundant, and never dry.

The city of Macao has a very pleasant appearance. The remains of its ancient opulence are several fine houses, let out to the supercargoes of the different companies, who are obliged to pass the winter here; the Chinese compelling them to quit Canton on the departure of the last vessel belonging to their nation, and not suffering them to return till the arrival of the ships from Europe in the following monsoon.

The whole population of Macao may be estimated at twenty thousand persons, of whom one hundred are Portuguese by birth; about two thousand of half-blood, or Portuguese Indians; and as many Caffreslaves, who serve as domestics: the rest are Chinese, and employed in commerce, or the different trades which render the Portuguese themselves tributary to their industry.

*Government.*] The original plan of the Chinese government was almost completely patriarchal. Duty and obedience to the father of each family were strongly recommended and enforced; but, at the same time, the emperor was considered as the father of the whole. His mandarins, or great officers of state, were considered as his substitutes; and the degrees of submission, which were due from the inferior ranks to the superior, were settled and observed with the most scrupulous precision. This simple claim of obedience required great address and knowledge of human nature, to render it effectual; and the Chinese legislators enveloped their dictates in a number of mystical appearances, so as to strike the people with awe and veneration. The mandarins had peculiar modes of speaking and writing; and the people were taught to believe, that the princes partook of divinity; so that they were seldom seen, and more seldom approached. "In the great palace of Peking," says Sir George Staunton, "all the mandarins resident in the capital assembled, about noon, on his imperial majesty's birth-day, and, dressed in their robes of ceremony, made the usual prostrations before the throne; incense of sandal and rose-woods burning upon it at the same time, and offerings being made of viands and liquors, as if, though absent, he were capable of enjoying them. Mr. Barrow, a gentleman of the embassy, was present,

while the same ceremonies were observed at Yuen-min-yuen; and he was informed, that they likewise took place on that day in every part of the empire, the prostrators being every where attentive to turn their faces towards the capital. On the days of the new and full moon, similar incense is burnt, and offerings are made before the throne by the officers of the household in the several palaces of the emperor."

Self-interest is no small occasion of the great respect, which is shown to the emperor by his subjects; for, as soon as he ascends the throne, the whole authority of the empire is in his hands, and the fortunes of his subjects are entirely at his disposal. All places of honour and profit are in his gift. Honesty, learning, experience, and gravity of behaviour, are said to be the only qualifications to ensure success to the candidate for any post of trust or dignity. He has absolute power over the lives and properties of all his subjects. Offenders are arraigned and tried in the different provinces; but the sentence is always presented to the emperor, who either confirms or rejects it, as he pleases. He can impose what taxes he thinks fit upon his subjects, to supply the necessities of the state. This power, however, is seldom made use of; and there is a custom every year of exempting a province, sometimes two or three, from their usual taxes, if they have suffered through sickness or dearth. The right of making peace or war belongs to the emperor: he may make what treaties, and upon what terms, he pleases, provided they are not dishonourable to the empire. The judgments passed by him, are irrevocable; and his sovereign courts and viceroys dare not use the least delay in registering them; while, on the other hand, the sentences pronounced by other magistrates are not obligatory, till they are confirmed by the emperor. Another singular circumstance belonging to the Chinese government is, the right that the emperor has of choosing his successor, whom he may elect not only from the royal family, but from among his other subjects. And there have been emperors, who, finding none of their family able to support the dignity of a crown, have chosen for their successors persons of obscure birth and fortune, but eminent for virtue and understanding. The grave itself does not put an end to the monarch's power over his subjects, which is exercised even upon the dead, whom he disgraces or honours, when he is inclined either to reward or punish themselves or their families. He confers upon them, after their decease, titles of honour; canonizes them as saints; or, according to their language, "makes them naked spirits." Sometimes he builds them temples; and, if their administration of public affairs has been very beneficial, or their virtues remarkably eminent, he commands the people to honour them as gods.

Notwithstanding these powers, there are three circumstances, which, if an emperor have any regard to his re-

putation, will induce him to govern by the rules of strict justice. The first is, that the old legislators have always made it a standing maxim, that kings are properly the fathers of their people; and hence the title most honourable and esteemed among them is that of ta-fou, or grandfather. Their philosophers constantly maintain, that the state is but a large family; and that he, who knows how to govern the one, is the best capable of ruling the other. And no virtues will compensate in a prince the want of affection for his people. Secondly, every mandarin may tell the emperor of his faults, provided it be done in a respectful and becoming manner. Thirdly, if the emperors have any regard for their character, the manner in which their histories are written is alone sufficient to restrain them within the bounds of rectitude. A certain number of men, chosen on account of their learning and impartiality, observe all the actions, and even words, of their prince; and each of these persons, by himself, and without any communication with the others, sets down, on loose slips of paper, the various occurrences, as they happen; and then puts them, through a chink, into an office, set apart for this purpose. In these papers, both the emperor's virtues and faults are set down with liberty and impartiality; and, in order that neither hope nor fear may bias these biographers, this office is never opened during the life of the reigning prince, nor while any of his family sit on the throne. When the crown goes into another line, which often happens, all these loose memoirs are collected and compared, and a true history of the emperor is compiled from them, to propose him as an example to posterity, if he has acted wisely; or to expose him to common censure and odium, if he has been inattentive to the welfare of his people.

The emperor has two sovereign councils; the one is called the extraordinary council, and is composed of princes of the blood only; the other is called the council in ordinary, and comprises several ministers of state. There are, also, at Peking, six sovereign courts, whose authority extends all over the provinces of China. Each of these courts has business of a distinct nature; but affairs of importance cannot be concluded without the mutual concurrence of all. Thus, in time of war, the number of troops, the qualities of their officers, and the marching of the armies, are provided for by the fourth court; but the money to pay them must be had of the second.

Viceroys are appointed for the inspection of the provinces; and their power is very considerable; but this is, in some degree, counterbalanced by that of the great mandarins, who may accuse them, when they are satisfied it is necessary for the public good. The people have also the right of petitioning the emperor, against their governors. And, the more effectually to protect private persons, whose complaints cannot always reach the ears of the prince,

s of the prince,

persons of known wisdom and reputation are dispersed up and down in every province, who inform themselves in what manner the mandarins behave in the execution of their offices, and bring those to punishment whom they discover to be guilty of acts of oppression. Sometimes the emperor himself visits his provinces in person, for the purpose of doing justice to all his subjects. In one of these excursions, he met with an old man, weeping bitterly; and, upon enquiring the cause of his grief, the man, ignorant of the dignity of the person to whom he was speaking, replied, "I had but one son, who was the comfort and support of my life; and of him I have been deprived by the power of a mandarin, and thus rendered miserable during the remainder of my life: for how can I, poor and friendless, oblige so great a man as he is to make me restitution?" "This may not be so difficult as you imagine," said the emperor: "lead me to the mandarin's house." This was done; and the mandarin, convicted of the violence of which he was accused, was condemned to instant death; whilst the emperor bestowed on the afflicted father the office of the criminal; at the same time charging him to execute it with equity, lest he, also, should be made an example.

*Laws, Punishments, &c.*] The civil laws of the Chinese are principally taken from their books of morality, and their grand basis is filial piety. Their penal laws are so combined, that no fault escapes punishment, and the correction never exceeds the crime committed. Every person accused must be examined before five tribunals, whose enquiries are directed, not only against him, but also against his accuser, and the witnesses that appear in the cause. He must, indeed, remain in confinement during this process; but the Chinese prisons are spacious and convenient; and it is the duty of a mandarin to inspect them frequently, to see that the prisoners are properly treated, to send for physicians when any of them are taken ill, and to supply them with medicines at the expence of government. The accused are always treated with lenity, being considered innocent until their guilt is substantiated; and even then, they are scarcely allowed to want for any thing. A gaoler, presuming to treat his prisoners with unbecoming harshness, would be severely punished; and even the judges must answer at their peril for any additions to the severity of the law. While the culprit remains in prison, a copy of the whole process is laid before the emperor; and several other copies are made out, both in the Chinese and Tartar languages, which are submitted to the consideration of the most learned doctors. When the crime is of a very heinous nature, and fully proved, the emperor writes at the bottom of the sentence, "When you receive this order, let it be executed without delay;" but, in general, he writes, "Let the criminals be detained in prison, and executed in autumn," that

being the season appointed for capital punishments. The emperor possesses a power of granting pardons; but, according to the constitution of the empire, he can only extend his mercy to the son of a widow, who has not married again; to the heir of an ancient family; to the descendant of some graudee or citizen, who has deserved well of his country; or to the sons or grandsons of a mandarin, who has acquired popularity by a faithful discharge of his duty. Children and very old men cannot be cited before a tribunal. The son of a very aged father and mother may be pardoned, if private property, or the public peace, be not injured by his liberation; and, if several sons of such a venerable pair be all guilty, or accomplices in the same crime, the youngest is generally reprimanded, that he may administer comfort to his parents.

The bastinado is the slightest of the Chinese punishments, and has no infamy annexed to it. The emperor may even cause it to be inflicted on some of his courtiers, without affecting their reputation; and a mandarin may order it to be inflicted on any disorderly person, without the form of trial. The number of blows is in proportion to the crime, but never less than twenty.

The pan-tsee is an instrument of punishment, which every mandarin may use at discretion, either when any one neglects to salute him, or when he administers public justice. Upon these occasions he sits gravely behind a table, on which is placed a bag of small sticks; his officers being furnished with some of these pan-tsees, and waiting his signal to use them. When he means to punish any one, he takes one of these small sticks from the bag, and throws it into the hall of audience: the culprit is then laid down on the ground, and a strong domestic gives him five blows on his posteriors. If another stick be thrown, he receives five blows more; and so long as the mandarin thinks proper. After this, the criminal is ordered to kneel, and thank his judge for his kind correction.

The wooden collar is a singular punishment. It is formed of two pieces of wood, hollowed in the middle for the neck, with long slips of paper upon it, expressing the crime for which the punishment is inflicted, and the time it is to continue. When it is put on, the person cannot raise his hand to his mouth, but is obliged to be fed, and to carry this disagreeable load day and night. These collars are lighter or heavier, according to the nature of the offence: they commonly weigh about fifty or sixty pounds; but, on some occasions, they exceed a hundred. The criminals are generally exposed in some public place; but they find various ways to lighten their excessive load: some walk with their relations and friends, who support the four corners, that it may not gall their shoulders; others have a chair to support the four corners; and some kneel, and, placing the edge of the collar on the ground, amuse themselves with viewing the passers.

These punishments are all which the Chinese laws permit the mandarins to inflict on criminals: they may, indeed, condemn to exile; but their sentence must be examined by the supreme courts. Mean and ignoble persons are beheaded; for, in China, the separation of the head from the body is disgraceful: on the contrary, persons of quality are strangled, which is a more honourable death; but, if their crimes be very heinous, they are punished like mean persons; and sometimes their heads are cut off, and hung on a tree in the highway. Murder is punished with death: rebels, traitors, and servants who murder their masters, are cut in pieces; but for theft, where no violence is offered, the offender escapes with a severe bastinado.

What is called cutting in pieces is a most cruel punishment. The executioner fastens the criminal to a post; then flaying the skin off his head, pulls it over his eyes; and afterwards mangles him, by cutting pieces from all parts of his body; and, when he is weary of this barbarous exercise, he leaves him to the cruelty of the populace. It must be observed, however, that, although this punishment has sometimes been inflicted with all these dreadful circumstances, the law only enjoins, that the criminal's belly shall be opened, his body cut into several pieces, and his remains brown into a ditch.

The torture, both ordinary and extraordinary, is sometimes used in China. The former is applied to the hands or feet: for the hands, small pieces of wood are applied diagonally between the fingers of the criminal, which are also tied close with cords, and he is left for some time in that painful situation. The torture for the feet is still worse. An instrument, consisting of three cross-pieces of wood, is provided; that in the middle being fixed, and the others moveable: the feet of the condemned person are then put into this machine, which squeezes them so close, that the ankle-bones are completely flattened. The extraordinary torture consists in making small gashes in the body, and then tearing off the skin like thongs. This, however, is never inflicted but for treason, or some other heinous crime, where the prisoner's guilt has been clearly proved, and it is necessary to make him discover his accomplices.

Robbery between relations is more severely punished than any other; and that is accounted the most atrocious, where nephews or younger brothers appropriate to themselves beforehand any part of the inheritance, which they have a right to share with their uncles or brothers. Information against a parent, elder brother, or uncle, even though the accusation be just, is invariably punished with a hundred blows of the *pan-tee*; abusive language is death by strangling; to strike them is punished with decapitation; and, if any one presume to hurt or maim them, his flesh is torn from his bones with red-hot pincers. Homicide,

though purely accidental, is always punished with death. A rope, six or seven feet long, with a running noose, is thrown over the criminal's head, and a couple of domestics, belonging to the tribunal, pull it strongly in opposite directions: they then quit it suddenly, and in a few moments give a second pull, which generally completes their melancholy business.

The office of executioner in China is so far from being attended with any disgrace, that it is esteemed an honourable employment: he even wears a sash of yellow silk, which is the badge of the emperor's service, and one of the distinguished ornaments of the princes of the blood; and his instrument of punishment is wrapped in silk of the same colour.

*Revenue, &c.*] The following statement of the Chinese revenues is taken from Sir G. Staunton's account of the British embassy.

"The public revenues of China Proper are said to be little less than two hundred millions of ounces of silver, which may be equal to about sixty-six millions of pounds sterling. From the produce of the taxes, all the civil and military expences, and the incidental and extraordinary charges, are first paid upon the spot, out of the treasuries of the respective provinces, where such expences are incurred; and the remainder is remitted to the imperial treasury at Peking. This surplus amounted, in the year 1792, according to an account taken from a statement furnished by Chow-a-Zhin, to the sum of 36,614,328 ounces of silver, or 12,904,776*l*. A land-tax was substituted in the last reign for the poll-tax, as better proportioned to the faculties of individuals. Most imports, and all luxuries, are likewise taxed; but the duty, being added to the original price of the article, is seldom distinguished from it by the consumer. A transit duty is also laid on goods passing from one province to another. Each province in China, which may be compared to a European kingdom, is noted chiefly for the production of some particular article, the conveyance of which, to supply the demand for it in the others, raises this duty to a considerable sum, and forms the great internal commerce of the empire. Presents from the tributaries and subjects of the emperor, and the confiscations of opulent criminals, are not overlooked in enumerating the revenues of the public treasury. Taxes, such as upon rice, are received in kind. The several species of grain, on which many of the poorer classes of the people principally subsist, are exempted from taxation: so is wheat, to which rice is always preferred by the Chinese."

Extraordinary expences, in case of insurrections or other occurrences, are generally levied by additional taxes on the provinces adjacent to the scene of action, or connected with the occasion of the expence.

revenues. Besides what the emperor derives from his demesnes there, the chiefs pay to him a tribute, which frequently increases, as they are better able to afford it. Goods imported into China, from Tartary, or through it, such as furs and leather, are liable to the payment of a small duty, in passing the great wall; but all Chinese goods, exported to Tartary, pass free.

In the mode of taxation in China, much equity and humanity are displayed. Every citizen, from twenty to sixty years of age, pays a tribute proportionate to his income. If any persons neglect to pay, they receive the bastinado, or are thrown into prison; and sometimes a certain number of such aged poor are quartered upon them, as government would otherwise have to maintain; and these must receive subsistence, till the demands of government are satisfied.

*Military and Marine Force.*] From the information given to the gentlemen of the English embassy by Van-ta-Zhin, who was himself a distinguished officer, it appeared, that the total of the army in the pay of China, including Tartars, amounted to one million infantry, and eight hundred thousand cavalry; and, from the observation made by the embassy, in the course of their travels through the empire, of the garrisons in the cities of the several orders, and of the military posts at small distances from each other, there appeared nothing improbable in the calculation, with respect to the infantry; but they met few cavalry; though they were of opinion, that a great body of horse might be employed on some distant service. The marine force is comprised chiefly of the junks, which we have already mentioned, and other small ships, that trade along the coast, or to the neighbouring countries.

*Religion.*] There is no state-religion in China; nor is any day observed as a sabbath; but the temples are open every day for the visits of devotees, who may be divided into three sects, one of which acknowledges Confucius for their founder, the second Lao-kium, and the third Foë.

Confucius was born about five hundred and fifty years before Christ, and was cotemporary with Pythagoras. In early life he gave proofs of a liberal genius; and, as he advanced in years, applied himself to the study of moral philosophy. His reputation gradually spread through the empire; and he was soon at the head of three thousand followers, out of whom he made choice of seventy-two, to propagate his doctrine in different places. His moderation and candour were equal to his genius and learning, as he prudently avoided giving offence to the prejudices of his country, by a too-zealous and violent attack upon its errors.

At the age of fifty-five he was elevated to the dignity of first minister of his native country, which he governed with so much wisdom and authority, that, in a little time,

the face of things underwent a complete change: but the king, seduced by the allurements of a woman, soon forgot the excellent advice and instructions of his minister; and Confucius, after vainly endeavouring to reclaim him, set out in search of wiser princes in other kingdoms: nor had he occasion to travel a great way, for all were ambitious to receive him as their guest. He died at the age of seventy-three, and had a magnificent monument erected to his memory near the city of Kio-feu.

The Chinese entertain a profound veneration for his memory, and have a chapel dedicated to him in almost every city, where the mandarins and other literati assemble on particular days, presenting oblations to him, after the manner of a sacrifice. It is said, however, that they venerate rather than adore him, and meet to honour and celebrate his memory.

Lao-kium, the founder of the second sect, was born about six hundred years before Christ, in the province of Houquang. At a very early age he applied to the study of the sciences, and made himself master of the history, laws, and customs of his country. He wrote a book containing five thousand sentences, replete with excellent morality. At length, after having spent a life of solitude and sanctity, he died at a place called U, where a tomb was erected to his memory. This philosopher constantly recommended solitude, as an infallible mean of elevating the human mind above earthly objects, and of emancipating it from its material chains. Such, however, was his ignorance of divine truth, that he even denied the immortality of the soul.

Foë, the founder of the third sect, was born in India, about a thousand years before Christ. He taught the doctrine of the transmigration of souls, and held out happiness under certain conditions, which consist more in donations for the erecting of temples, and maintenance of priests called bonzes, than in the observance of moral duties; the neglect of which is the punishment of the defaulters in having their souls pass into the bodies of the meanest animals, in which their sufferings are to be apportioned to their transgressions.

The idol Foë is generally represented by three figures: one is a man of gigantic stature, with a monstrous belly, sitting cross-legged, in the oriental style; this they call the idol of immortality: the second is about twenty feet high, and is styled the idol of pleasure: and the third, about thirty feet high, with a crown on his head, is denominated the great king Kan. Exclusive of these, they have a considerable number of little idols, not in their pagodas only, but in their houses. All of them have their *tos*, or household gods. These petty idols, however, are not treated with that respect, which is shewn to their great gods; on the contrary, if they do not sometimes grant them their requests, they give them the bastinado. But the great gods,

in the temples, are worshipped with the most profound veneration.

The temples of Foë abound with images, some of which exhibit so strong a likeness to those in churches of the Roman faith, that a Chinese, conveyed into one of the latter, might imagine the votaries he saw were adoring the deities of his own country. On the altar of a Chinese temple, behind a screen, is frequently a representation, which might answer for that of the Virgin Mary, in the person of *Shin-moo*, or the sacred mother, sitting in an alcove, with a child in her arms, and rays proceeding from a circle round her head, with tapers continually burning before her. The resemblance of the worship of the Chinese to the forms of the catholic church, in some other particulars, has been, indeed, thought so striking, that some of the missionaries have conjectured, that the Chinese had formerly received a glimpse of Christianity from the Nestorians, by the way of Tartary.

Foë is said to have left behind him five grand commandments, viz. Never to deprive any creature of its life; never to rob any man of his property; never to be guilty of incontinence; never to tell a lie; and never to drink wine.

According to Staunton's account, the religion of the emperor is considered novel in China, and its worship is performed with most magnificence in Tartary. In the summer solstice, the emperor goes in solemn procession to a temple called *Tien tan*, or the Eminence of Heaven, to pay obedience, and return thanks for its benign influence; and a similar ceremony, in the winter solstice, is performed in the temple of the earth; but personification does not take place in either. This religious worship of heaven and earth is confined to the person of the emperor; and, for his accommodation, it is performed at Pekin, where he annually appears abroad in several other magnificent processions.

The religion of the Tartars, though nearly similar in its doctrines with that of the worshippers of Foë, is different in mode of worship. They have no priests of the order of bonzes, but priests of their own, named Lamas; and, instead of worshipping the god Foë, they pay adoration to the Great Lama, or high-priest, whom they denominate the Immortal Father, believing that he never dies; and the priests omit nothing that may give credit to the deceit; for, when one Lama happens to die, they immediately appoint another that resembles him as nearly as possible.

The Great Lama resides in Tibet, where he is never seen but by his favourites, except when he makes his appearance in the temple, to receive the offerings and adorations of the people. He then sits upon a kind of throne, lighted only by a few lamps, which give so feeble a light, that there is no possibility of discerning plainly the features of the impostor. The people, therefore, implicitly believe that he is immortal.

With respect to the state of Judaism in this empire, the Jews, who many ages ago inhabited a part of the country, have, at this period, a synagogue at Kai-fong-fou, the capital of Ho-nan. They were visited, in the year 1704, by an Italian Jesuit, named Gozani, who had several conferences with them. They permitted him to enter their *sanctum sanctorum*, reserved only for the high-priest; and shewed him twelve little tabernacles, or presses, in which were deposited their sacred books. Among these was a book, written in beautiful characters, on long sheets of parchment, rolled round several wooden rollers. This was their pentateuch, which, they said, was miraculously preserved in the time of a great inundation, that happened in 1643, when the whole city of Kai-fong-fou was laid under water; but, as the leaves and characters had sustained some injury from the water, the chief officers of their synagogue had caused twelve copies of it to be taken, and deposited in the tabernacles.

Exclusive of the above manuscripts, they had numbers of small volumes, in old chests, containing extracts from the pentateuch, and fragments of other sacred books. However, they said they had lost several of their canonical books at the time of the inundation. Gozani, upon comparing their pentateuch with a Bible he had carried with him, found an exact agreement between them, with regard to chronology, as well as the age and genealogy of the patriarchs. In other respects, however, the text was much corrupted.

Gozani relates, that, from an allowed tradition amongst them, their ancestors entered China under the dynasty of Han, which commenced two hundred and six years before Christ, and continued on the throne four hundred and twenty-six years: so that in this wide space of time we must place the uncertain epocha of the first settlement of the Jews in the Chinese empire.

They adhere stedfastly to most of the ancient ceremonies enjoined by the laws of Moses, as circumcision, a strict observance of the sabbath, and of other feasts, particularly that of unleavened bread. When they read the pentateuch in the synagogue, they cover their faces with a transparent veil, in memory of Moses, who descended from the mountain with his face covered. They also eat the Paschal lamb, and abstain from blood.

Christianity is said to have been planted in China nearly as soon as the religion of Mahomet. It must be acknowledged, however, that it did not make the same early progress. Some writers assert, that the patriarch of the Indies sent Christian missionaries to China, in the eighth year of the reign of Tai-tsou, or about the middle of the seventh century of the Christian era; and that, four years after this, Tai-tsou suffered them to preach the gospel in his country. They further say, that, in the year 1625, a stone tablet, ten feet long and five broad, was found in the

sm in this empire, ited a part of the ogue at Kai-fong-erc visited, in the Gozani, who had permitted him to d only for the high- e tabernacles, or eir sacred books. eautiful characters, and several wooden ich, they said, was a great inundation, e city of Kai-fong- leaves and charac- e water, the chief welve copies of it nacles.

province of Shensi, containing the names of seventy missionaries, who came from Judca to preach the gospel to the Chinese, together with a compendium of the Christian faith, all cut in Syriac characters. Towards the end of the sixteenth century, however, when the European missionaries first set footing in China, they found no remains of Christianity among them. Rogers, a Neapolitan jesuit, first opened the mission in China, and was succeeded by Ricci, of the same society, who continued the work with such success, that he is considered by the jesuits as the principal founder of this mission. He, in some measure, reconciled the ancient religion of the country with the first principles of theology, assuring the people, that his moral system was the same with that of their celebrated philosopher Confucius; which secured him many followers. In 1630, the Jesuits were succeeded by the Dominicans and Franciscans; and now it was that commotions broke out. Their first disputes were on the subject of certain ceremonies concerning the worship of Confucius, and some honours paid to the dead; for as, in their funeral-obsequies, they burnt incense, and practised libations, sacrifices, and other rites, savouring of idolatry, these were condemned by one part of the missionaries, as incompatible with the purity of the Christian faith. Others, of a more moderate temper, and who had little hope of raising up this infant plantation to maturity without such indulgences, were for tolerating these rites, looking on them as things of an indifferent nature. Several years were spent in altercation: but the literati, who possessed all the employments under government, were so obstinately attached to Confucius, and the established rites of their country, that no reasonable condescension could induce them to abate any thing of their superstition; though even their monarch, Chang-hi, granted an edict in 1692, allowing Christianity to be preached throughout the empire. Strenuous appeals were made to Rome by both parties of the contending missionaries. At length, in 1704, the pope decreed, "That the words Tien and Changti should not any longer be applied to the Deity; that the Christians should not enter the temples erected to Confucius, and thenceforward pay no further adoration to their ancestors; and, lastly, that those tablets of their forefathers, bearing the inscription of *'the seat of the soul,'* should be removed from every Christian's habitation. This decree, however, was softened by a few privileges. The converts were allowed to appear in the halls of their ancestors, as *spectators* of the rites there performed; and they had the indulgence of hanging up the tablets of their progenitors in their houses.

This decree, and a subsequent bull of Clement XI. in 1715, excited the utmost confusion. The ministers of state, and the other mandarins, jealous of the growing reputation of the missionaries, were continually disclaiming against them; and, at length, obtained a revocation of an

edict, that had been passed in favour of the Christian religion by Chang-hi; and, in the reign of his successor, Yone tchiu, all the missionaries were banished to Canton; and pwards of three hundred churches were either pulled to the ground, or converted to profane uses. From the period of this catastrophe, which happened in 1723, Christianity was so far from gaining ground in China, that the professors of it were persecuted with the utmost rigour, till the month of February, 1785, when the late emperor Kien-long, was pleased to put a stop to it.

At present, the protestant missionaries are making the greatest possible exertions, consistent with prudence, for the introduction of Christianity among the natives; and this design appears likely to receive great assistance from the recent translation of the New Testament into the Chinese language.

*Superstition.* Of the extreme superstition of the common people among the Chinese, some idea may be formed from the following circumstance, related by Staunton.

"There is only one female figure in the temple of Foë particularly prayed to by unmarried women, who desire husbands, and married women, who wish for children. But, as the doctrine of Foë admits of a subordinate deity, propitious to every wish that can be formed in the human mind; as the government of the country never interferes with mere opinions, or prohibits any belief which may not affect the peace of society, it is no wonder it should spread among those classes of the people, who are dissatisfied with the ordinary events of nature. Thus, from extreme superstition, the temples are particularly frequented, and the superintendent deity first consulted, previous to the undertaking of any thing of importance, whether it be to enter into the matrimonial state, to set out on a journey, to make or conclude a bargain, or any other momentous event.

"This is performed by various methods. Some place a parcel of consecrated sticks, differently marked and numbered, which the consultant, kneeling before the altar, shakes in a hollow bamboo, until one of them falls on the ground; its mark is examined, and referred to a correspondent mark in a book, which the priest holds open, and sometimes it is written on a piece of paper, pasted upon the inside of the temple. Polygonal pieces of wood are, by others, thrown into the air. Each side has its particular mark: the side that is uppermost, when fallen on the floor, is in like manner referred to its correspondent mark in the book or sheet of fate. If the first throw be favourable, the person who made it prostrates himself in gratitude, and undertakes the business in agitation with entire confidence. But, if the throw should be adverse, he tries a second time, and the third throw determines the question. They return thanks when the oracle proves propitious to their wishes. Yet they

often cast lots to know the issue of a projected enterprise, and then supplicate for its proving favourable.

"Every town is imagined to be under the protection of certain stars or constellations: of which last the Chinese reckon twenty-eight: they have stars, also, which answer to the twelve signs of the zodiac, called the twelve mansions of the sun.

"In fine weather, persons of every class live much without doors, and, accustoming themselves to watch the appearances of the heavens, they connect them, by habit, with terrestrial events, as if these had a dependance on the former. Some fortuitous occurrences taking place, have strengthened the belief, and the vanity of prescience has laid the foundation of the pretended science of astrology."

An eclipse of the sun is always considered, by the Chinese, as portending some national calamity; and, as they estimate their own happiness by the degree of virtue possessed by their sovereign, they attribute their misfortunes to his privation of moral excellence. Even the emperor is forced, as it were, to accede to the idea, and govern himself accordingly. On the eve of an eclipse, for example, he never engages in any important enterprise; but seems desirous of avoiding the converse of his ministers, that he may secretly examine into his past actions, with a view to correct their errors, for which the approaching eclipse may be sent as an admonition; and his subjects are invited freely to offer their advice.

*Language, Learning, &c.]* The Chinese language is justly considered the most singular in the world. Almost every syllable constitutes a word, and there are scarcely fifteen hundred distinct sounds; yet, in the written language, there are at least eighty thousand characters, or different forms of letters, so that every sound may have about fifty senses. The leading characters are denominated keys, which are not of difficult acquisition. The language seems, originally, to have been hieroglyphical; but, afterwards, the sound alone was considered. Abstract terms are expressed, as usual, by relative ideas.

The difficulty of comprehending and retaining such a number of arbitrary marks and characters, as are found in the Chinese written language, greatly retards the progress of their erudition. But there is no part of the globe where learning is attended with such honours and rewards, and where there are more powerful inducements to cultivate and pursue it. The literati are revered as a superior species, and are the only nobility known in China. If their birth be ever so obscure, they become mandarins of the highest rank, in proportion to the extent of their learning. On the other hand, however exalted their birth may be, they quickly sink into indigence, if they neglect those studies by which their ancestors were elevated. It has been observed, that there is no nation in the world where the first honours of the state lie so open to the

lowest of the people, and where there is less hereditary greatness. The Chinese range all their works of literature into four classes. The first is the class of *King*, or the sacred books, which contain the principles of the Chinese religion, morality, and government, and several curious and obscure records, relative to these subjects. History forms a separate class: yet, in this first class, there are placed some historical monuments, on account of their relation to religion and government; and, among others, the *Tekun-ificou*, a work of Confucius, which contains the annals of twelve kings of Lou, the native country of that illustrious sage. The second class is that of the *Su* or *Che*; that is, of history and the historians. The third class, called *Tsu*, or *Tse*, comprehends philosophy, and contains all the works of the Chinese literati; the productions, also, of foreign sects and religions, which the Chinese consider only in the light of philosophical opinions; and all books relative to mathematics, astronomy, physic, military science, the art of divination, agriculture, and the arts and sciences in general. The fourth is called *Tsie*, or *Miscellanies*; and contains all the poetical books of the Chinese, their pieces of eloquence, &c. They are acquainted with most kinds of poetry in use among Europeans, and have stanzas, odes, elegies, epigrams, satires, and even songs and ballads, peculiar to themselves. Although they have not the same resources as Europeans, in the attracting fictions of ancient mythology, they supply the deficiency by bold and ingenious metaphors, and by using the names of several animals in an allegorical sense. Thus, the eagle is called *the host of the clouds*; the jackdaw, *the bird of speech*; the head, *the sanctuary of reason*; the eyes, *the stars of the forehead*, &c. But, to give a clearer idea of their poetry, we will lay before our readers part of a poem, which was written by the Emperor Kien-Long, after he had sat about fifty years on the throne of China.

After expatiating on the natural beauties which distinguish the country of his ancestors, and describing the beautiful prospect which the sea exhibits in the gulf of Lea-tong, he proceeds to celebrate the mountains that surround the city of Monkden, in the following manner:—

"Mountains! by you I begin—mountain of iron, embroidered mountain, to direct the paths of the traveller, dost thou present thyself at so remote a distance—To suspend his fatigue, and cheer his sight, dost thou exhibit a form and colour so singular—Thou art a certain mark to point out the route he ought to pursue, in order to reach, without interruption, the goal of his repose.—Shall I exhibit thee in that point of view wherein thou appearest majestically beautiful and enchanting; or in that wherein thou inspirest sadness mingled with terror:—No; to name thee only is sufficient to make thee known.—In vain should I attempt to describe those amphithe-

the meridian; as likewise the revolutions of Saturn, Jupiter, Mars, Venus, and Mercury: and their observations in these particulars have been nearly the same with ours, in point of exactness: though they have no tables for the retrograde and stationary aspects of the planets.

The Chinese divide their year into twelve lunar months, some of which consist of twenty-nine, others of thirty days; and every five years they have an intercalary month, to adjust the lunations with the sun's course. They reckon by weeks, as we do, and give the name of a planet to each of the seven days. Their astronomical day begins at midnight, which is divided into twelve equal parts, each answering to two of our hours. Though they are not acquainted with the art of making clocks, they have solar quadrants, and other chronometers.

The Chinese boast, that they were acquainted with the art of navigation, and the Indian Seas, long before the birth of Christ; and pretend to the invention of the mariner's compass, to which their sailors superstitiously offer perfumes in sacrifice.

The Chinese compass-box has, upon its upper surface, several concentric circles, of correspondent sizes. The innermost contains eight different characters, which represent the four cardinal points, east, west, north, and south; and the four bisecting ones, north-east, south-west, north-west, and south-east. These eight characters are also meant to express as many equal divisions of the natural day, each of three hours; and that of the east, being placed towards the sun-rising, the rest, of course, will represent, nearly, the position of the sun at the different times of the day.

The next circle has twenty-four divisions, with appropriate characters, denoting a twenty-fourth part of the heavens, and, consequently, a twenty-fourth part of the natural day; each point containing fifteen degrees, a proportionate part of three hundred and sixty, the number of degrees into which all celestial circles are divided.

Another of the circles contains the cycles of sixty years, by which the Chinese reckon their chronology; and the two remaining ones explain their doctrines of mythology and philosophy.

Physic is at a low ebb among the Chinese; as there are no public schools nor professors of the healing art. They have some good practical physicians, the greatest part of whose medicines consists of herbs, roots, fruits, seeds, &c. which are, for the most part, good stomachics and gentle aperients; but they are totally ignorant of anatomy. The science of medicine, among them, consists in the knowledge of the pulse, of which their ideas are exceedingly erroneous. By the beating of the pulse they pretend to know the cause of any disorder, and in what part of the body it lies. They say, that the pulse of a man differs from that of a woman, and that it changes with the seasons of the year. To form a decisive judgment of the

cause of complaint in a patient, they lay his arm upon a pillow, and then apply their fingers to the artery. At first, they touch it gently, then a little closer, and, lastly, press it very hard. They take time to examine the beating, and distinguish the differences, according as the motion is more or less quick, uniform, or irregular, which they observe with the most attentive exactness. According to the variations, they pronounce what part of the body is affected, how long the disorder will continue, and whether the patient will recover or not.

In diseases arising from plethora, as well as in many other cases, a free use of the lancet is often necessary to preserve life; yet surgery, in China, is so little understood, that venesection is never performed. If at any time the faculty think it necessary to puncture any part of the body, to let out what they call a collection of vapour, it is done with a gold or silver needle, which operation gives exquisite pain to the patient. But blood-letting is never practised, as will appear from the following anecdote:—

Some years since, a gentleman was requested to visit a friend of a Chinese merchant, who was ill, and finding his complaint to be a large abscess upon the thigh, and in a state of maturity, he opened it with a lancet, pressed out the matter, and applied proper dressings, promising to revisit him the next day. The following morning, the gentleman's Chinese servant, learning what had been done, appeared greatly distressed, and exclaimed violently against the merchant, for suffering him to draw blood of a Chinese with any instrument, as he must have known, that, should the patient die, he would be put to death, without regard to the motives which suggested the operation. The patient, however, recovered, and was grateful to his benefactor.

*Manufactures, and Commerce.*] China is so happily situated, and produces such a variety of materials for manufactures, that it may be said to be the native land of industry; but it is an industry devoid of elegance. The manufacture of that earthen ware, generally known by the name of China, was long a secret in Europe; but it is now well known, that the principal material is a pulverised earth, and that several European countries far excel the Chinese in manufacturing this commodity. In England, in particular, it has been carried to a high degree of perfection.

The Chinese silks are generally as thin as gauze, though some of them are more durable; and their cotton and other cloths are admired, as furnishing a light but warm dress. Their ink, for the purpose of drawing, is said to be made of oil and lamp-black; and they manufacture paper from the bark of bamboo; but it is not comparable, for writing or printing, to that of Europe. Their trade is open to all nations; but, since the discovery of the porcelain manufacture, it has been considerably diminished.

*Manners, Customs, &c.*] The Chinese, in their persons, are of a middle stature, with broad faces, black hair, small dark eyes, short noses, and thin beards, which they wear long on the bottom of the chin and upper lip, but pull from their cheeks with tweezers. Their complexion, toward the north, is fair; toward the south, swarthy; and the fatter a man is, the greater is his fame for personal beauty. Men of rank, who are not much exposed to the sun, are generally of a delicate complexion; and the literati suffer their nails to grow to an enormous length, to distinguish them from mechanics. The women have little eyes, black hair, regular features, plump rosy lips, and a delicate, though florid, complexion.

An absurd custom prevails throughout China, of confining the feet of female infants in such a manner, that they can never possibly grow to their full size; and this smallness of the feet is accounted such an essential accomplishment, that the Chinese ladies never think they can purchase it at too dear a rate. As soon, therefore, as a female infant is born, the nurse wraps up its feet in tight bandages; and the consequent torture must be endured, until the feet have ceased to grow. Thus the women are almost entirely deprived of the use of their feet, and walk in a most awkward hobbling manner.

There is but little difference between the ordinary dress of men and women among the Chinese. Rank and dignity, however, are distinguished by certain accessory ornaments, and those insignia are regulated by government.

The general dress consists of a long vest, which folds over the breast, and reaches to the ground. It is fastened, on the right side, by four gold or silver buttons, placed at a little distance from each other; the sleeves are wide toward the shoulder, growing narrow as they approach the wrist, where they terminate in the form of a horse-shoe, covering the hands, and leaving nothing visible but the ends of the fingers. The vest is tied round the waist with a silk sash, from which is suspended a sheath, containing a knife and a pair of chopsticks, which are used instead of forks. Under this vest both men and women wear short wide shirts, of different kinds of cloth, according to the season: these are made somewhat similar to a waistcoat that folds over the bosom, and with close narrow sleeves, fastened at the wrist; and under the shirt some persons wear a silk net, to prevent it from adhering to the skin: they also wear drawers of satin or cotton, and over these a pair of white trousers.

In warm weather, the Chinese have their necks bare; but, in winter, they cover them with a satin cape, sewed to their vest, and edged with fur; and the vest itself is also trimmed with sheep skin, or quilted with silk and cotton. People of quality line theirs with sable skins, or the finest fox-skins edged with sable; and, in very cold weather, they wear a surcoat that reaches to the waist, with wide short

sleeves, terminating at the elbow. People of rank never go abroad without boots, which are generally made of quilted satin or cotton; they have neither heel nor top, but are made to fit the foot with great exactness; and, as the foot of the boot is like the leg, slippers are worn over them, with good substantial soles. When they ride, however, they have other boots, made of calf-skin or horse-leather, which are remarkably soft and pliable. This article of dress is considered so indispensable, that, when any one pays a Chinese a visit, and he happens to be without his boots, he will actually make his friend wait till he has put them on.

Formerly they were at great pains to preserve their hair; but the Tartars compelled them to cut off the greater part of it, and to alter the form of their clothes, after their fashion. Thus the Chinese, though painted as if bald, are not so naturally; that small portion of hair, which they preserve on the tops of their heads, being all that is allowed by government: it is generally very long, and plaited into a tail. In summer, they wear a cap, shaped like an inverted funnel, made of rattan or cane, lined with satin, and ornamented at the top with a tuft of red hair, which flows loosely in the wind, and has a very pretty effect. In winter, these caps are made of plush, turned up with fur; and, being very shallow, are tied under the chin with a string. The mandarins and literati wear a cap of the same form, but it is lined with red satin, and covered with white, with red silk fringe flowing from the top, instead of hair. With respect to colours, the emperor and princes of the blood only have a right to wear yellow; and certain mandarins have liberty to wear satin of a red ground: this privilege, however, is only assumed on days of ceremony; for, in general, they are clothed in black, blue, or violet. The inferior ranks are allowed to wear no other colours but blue or black.

The dress of a Chinese peasant differs from that worn by citizens in the same proportion as in other countries. It generally consists of a pair of large drawers, wooden shoes, terminating at the toe in a sharp point, and a coarse linen frock, over which is thrown a cotton vest, that descends to the middle of the thigh.

The dress of the women consists, in general, of a robe, close at top, and so long as to cover their toes; and the sleeves, if not held up, would hang down to the ground: of course, their hands are seldom seen. The colour of these dresses is entirely optional; but black or violet are usually chosen by women advanced in years.

The head-dress consists chiefly in arranging the hair into a variety of curls, and interspersing it with gold or silver flowers. Sometimes part of it is formed into a roll, fastened with silver bodkins, while the rest flows down the neck in ringlets; but, in cold weather, it is generally wrapped round with a sort of black hood. Some of the

ladies ornament their heads with the figure of a fabulous bird, which is made of copper or silver gilt, according to the rank of the wearer: its wings are extended, and lie pretty close to the head-dress, embracing the upper part of the temples, while the long spreading tail forms a kind of plume on the top of the head. Its body is placed directly over the forehead, and the neck and tail hang down; but the former, being joined to the body by an invisible swivel, plays freely about, and moves with the slightest motion of the head. Persons of quality sometimes have several of these birds made up into a single ornament; and young ladies frequently wear a crown of pasteboard, the forepart of which rises in a point above the forehead, and is covered with jewels, while the rest of the head is decorated with artificial flowers and diamond pins.

The colour proper for mourning, in China, is white. A son can wear no other for three years after the death of his father or mother; and, ever afterwards, his clothes must be of one colour. Silks and furs are forbidden to children; and the law has even prescribed the time when they are first to wear a cap. This is put upon their head by the master of the ceremonies, who addresses them in the following manner: "Consider, that you now receive the dress of those who have attained to maturity, and that you cease to be children: renounce, therefore, all childish thoughts and inclinations; assume a grave and serious deportment; apply yourselves closely to the study of virtue and wisdom, and endeavour to merit a long and happy life."

The manners of the Chinese bear little resemblance to those of any other nation; and their historians assure us, that they have remained unaltered for the space of four thousand years. The women are condemned to almost perpetual imprisonment within their own houses; and a young man, who resolves to enter into the married state, knows nothing of the features or person of his intended, but from the account of some female confidant, who both negotiates the match, and determines the sum which must be paid to the parents of the bride; for, in China, a father does not bestow any portion on his daughter; but every man is expected to give a dowry to his wife. If, however, the negotiators deceive the bridegroom in their account of the lady, he is at liberty to refuse her, on forfeiting the purchase-money.

The calendar is invariably consulted for a lucky day to solemnize the nuptials; and, in the intermediate time, letters pass between the young couple, presents are exchanged betwixt the two families, and the bridegroom purchases some jewels for his bride. When the appointed day arrives, the bride is locked in a close palanquin, the key of which is delivered to a trusty domestic, who must deliver it to none but the husband; and the lady is carried to her new home, preceded by a band of music,

and followed by her relations. Every thing that composes her portion is also borne before and behind her, by persons of both sexes, while others walk on each side with flambeaux and lighted torches. The bridegroom, richly dressed, waits the arrival of the procession at his gate, and, on receiving the key, eagerly opens the palanquin. If he be contented with the person of his spouse, he receives her with many expressions of joy; but, if he be much disappointed, he suddenly shuts the chair, and sends her back to her relations.

When the bride is so fortunate as to give satisfaction, she quits her palanquin, and is followed by her relations into the hall, where the new-married couple pay their respects to the parents of the bridegroom. The bride is then entertained by the ladies that have been invited to the wedding; and the male visitants sit down to a banquet with the husband, till the approach of night warns them to retire to their respective habitations.

A Chinese can only have one lawful wife; and this wife must be nearly of his own age and rank; but he may purchase as many concubines as he pleases, provided he enters into a contract to treat their daughters well. These women are entirely dependant on the lawful spouse, and are expected to pay an implicit obedience to her commands. Their children are considered as hers, and address her only by the appellation of mother: indeed, she is generally given to understand, that her husband engages these concubines merely to increase the number of her children and female attendants. Some husbands, desirous of male issue, which they have not by their wives, will hire a concubine from this motive only; and, when their wish is accomplished, they dismiss her, with free permission to marry.

On the death of a lawful wife, the concubines and their children mourn for her three years; and the husband may then raise his favourite of these women to the place of the defunct; on which occasions, age, rank, and all the above-mentioned ceremonies, are dispensed with.

In all seraglios, she who is first brought to bed has the preference of the rest; and, till a woman has had one child, she is not supposed to sit down at table with the rest of the family, but is obliged to act the part of an attendant. Next to barrenness, the greatest scandal is to bring several females into the world; and hence it often happens, that, when a woman has three or four girls together without a boy, she will either expose or strangle them with her own hands; and, whenever the parents are indigent or unfortunate, they consider it as a merciful act to remove an infant from a miserable existence.

A widower or widow may enter a second time into the married state; without being subjected to any restrictions respecting the equality of age or rank. A widow or quality, being absolute mistress of herself, seldom marries

again, but those of ordinary rank do; and persons, of the poorer class, are often sold, for the benefit of their late husband's relations. As soon as the bargain is concluded, a couple of porters bring a chair, in which the poor widow is shut up, and conducted, by a number of trusty people, to the abode of her new spouse.

Marriage is so highly esteemed in China, that a poor man, who is unable to purchase a wife, will sell himself for a slave, on condition that he shall be permitted to marry a female slave in the family. Old bachelors are universally regarded with contempt, and, as the Chinese consider it most unfortunate to leave no children to mourn over their graves, there is scarcely an unmarried man to be found in the country.

Divorces are allowed, in cases of adultery, mutual dislike, jealousy, or hereditary and infectious diseases. If a wife elope from her husband, he can sue out a process, and obtain a sentence to sell the fugitive, who then ceases to be his wife, and becomes his slave. If a man absent himself from his wife for three years, she may lay her complaint before a tribunal, and will be allowed to marry again.

Marriage is deemed illegal in China, in the following cases:—1. If a young woman has been betrothed to a young man, and presents have been given and received by the parents of the intended husband and wife. 2. If, instead of a beautiful young woman, another be substituted of a disagreeable figure; or if the daughter of a freeman marry his slave; or if any one give his slave to a free woman, under a pretence that he is his son, or relation: in all these cases the marriage is null and void; and those who have had any concern in making up the match are liable to severe punishment. 3. A mandarin of letters is forbidden to form an alliance with any family residing in the city, or province, of which he is governor. 4. No Chinese youth can enter into the conjugal state during the time of mourning for a father or mother; if promises have been made, they cease on that event taking place; but, after the usual time of mourning is expired, the relations of the intended bride may write to the surviving parents of the young man, to remind him of his engagement. 5. The solemnization of marriage must be suspended when a family experiences any severe misfortune, and even if a near relation be thrown into prison; though this may be set aside, provided the unfortunate person give his consent. 6. Two brothers cannot marry two sisters; nor is a widower allowed to marry his son to the daughter of a widow whom he chooses for his own wife. A man is, also, strictly forbidden to marry any of his own relations.

The apartments of the Chinese ladies are generally situated in the most retired part of the house, and here they employ themselves with painting, music, or needlework; and keep birds, dogs, and other animals, for their

diversion; but they are secluded from all society, except their domestics, and never intermeddle with the business of their husbands. "A wife," says the Chinese book of ceremonies, "is not mistress of herself; she has nothing at her disposal; she can give no orders, but in her own apartment; and here all her authority is confined."

The education of a child commences as soon as it is born, and the book of ceremonies prescribes that its nurse must speak little, adhere strictly to truth, have a mild temper, and behave with the utmost propriety, both to her equals and superiors. The child is taught to use its right hand as soon as it can put it to its mouth, and then it is weaned. At six years of age, (if a boy,) he is taught the numbers most in use, and made acquainted with the names of the principal parts of the world; at seven, he is separated from his sisters, and no longer allowed to eat with them, nor to sit down in their presence; at eight, he is instructed in the rules of good breeding and politeness; at nine, he studies the calendar; at ten, he is sent to a public school, where he is taught reading, writing, and accounts; from thirteen to fifteen, he is instructed in music; at fifteen, he is taught archery and horsemanship; and, at twenty, his education is considered complete.

The book first put into the hands of children, points out what they ought to learn, and the manner in which they should be taught: this volume is a collection of short sentences in rhyme, and the pupils are obliged to give an account in the evening of what they have learned in the exercise of the day. After this elementary treatise, they receive the four books which contain the doctrines of Confucius; but the meaning of the work is never explained to them, until they have got by heart all the characters, or words, in the book. While thus employed, they are likewise taught to form the characters with a pencil. For this purpose they are furnished with large leaves of paper, on which very large characters are written, or printed, with red ink; and all they are required to do is, to cover these red characters with black ink, and to follow exactly their shape and figure, so that they may be insensibly accustomed to form the different strokes.

After a scholar has made himself master of the characters, he is allowed to compose; but the subject is pointed out to him only by one word. Competitions are also established in China, but most of these are of a private nature: twenty or thirty families, all of the same name, and who have only one hall for the names of their ancestors, agree among themselves to send their children twice a month to this hall, to compose; and each head of a family, in turn, gives the subject of the literary contest, and adjudges the prize.

In every city, town, and village, in China, there are school-masters, who teach such sciences as are generally cultivated in the empire. Parents, possessed of a certain

fortune, provide tutors for their children, to form their minds to virtue, and to initiate them in the rules of good breeding; as well as to make them acquainted with the laws and history of their country. These masters have, for the most part, attained to some degree among the literati, and frequently arrive at the most important employments of the state. The education of the women is generally confined to giving them a taste for solitude, and accustoming them to modesty and silence; and, when their parents are rich, they are likewise instructed in such accomplishments as are most likely to render them agreeable to the other sex.

Every province of China abounds with free-schools, and even some of the villages are not destitute of this advantage. The sons of a peasant are there received as readily as those of a grandee; their duties and their studies are the same; the attention of the masters is equally divided between them; and, from this obscure source, talents often spring, which afterwards make a conspicuous figure on the theatre of life.

The Chinese eat all kinds of flesh, fish, and fowl, as Europeans do. They account horse-flesh extremely delicate, and, in times of scarcity, the poor people will eat dogs, cats, snakes, frogs, or any kind of vermin; but the common food consists of rice, pulse, and roots, with flesh and fish-broth. Their meat is always seasoned in the dressing; and, before it is served up, it is cut into little square pieces, like dice. They use neither cloth, napkins, knives, nor forks; but they have two little round sticks, with which they take up their meat very dexterously; and, in eating rice and broth, they hold the cup to their mouths, and lade it in with these chopsticks. Contrary to all other oriental nations, they use high chairs, and tables; and, at an entertainment, almost every one has a small lacquered table to himself.

The principal strong liquors used by the Chinese, are *hockshue* and *samshue*. The first is of the colour of brown beer, but remarkably clear and strong: this is said to be an infusion of wheat in scalding-hot water, but it tastes more like mum than beer. *Samshue* is a spirit distilled from rice, either of a pale or reddish colour, and has been mistaken, by some travellers, for wine. The principal beverage, however, is tea.

The multitude of ceremonies used, on all occasions, by the Chinese, are extremely irksome to strangers. An invitation to an entertainment is not supposed to be given with sincerity, till it has been renewed three or four times in writing. A card is sent on the evening preceding the entertainment, a second on the morning of the appointed day, and a third when every thing is prepared. The master of the house always introduces his guests into the hall, where he salutes them one after another. He then orders *samshue* to be brought to him, in

a small cup, made of silver, porcelain, or precious wood, and placed on a small varnished salver. He takes this in both hands, bows to the surrounding company, advances toward the fore part of the hall, and, raising his eyes and the cup toward heaven, pours out the liquor on the ground, in imitation of the well-known libations of antiquity.

After this ceremony, he pours fresh liquor into his cup, and reverently places it on a table, set apart for the most considerable guest; who, in return, calls for another cup, and endeavours to place it on the table intended for the master of the feast, but the latter prevents him, with a thousand apologies, according to the rules of Chinese politeness.

A superior domestic conducts the chief guest to an elbow-chair, covered with rich flowered silk, in which, after many apologies, he sits down, and the rest of the company follow his example, by taking their seats, in order to abridge the ceremony.

Scarcely are the company seated, before several comedians enter the hall, and all bow together, so low that their heads touch the ground, four times: after this, one of them produces a list of the pieces they are able to perform extempore, and, when the piece is fixed on, they commence their representation with a flourish of trumpets, fifes, and drums. The hall-floor serves for a stage, which, on this occasion, is covered with a carpet. The actors, about to perform, are placed in some of the adjoining apartments, whence they come forth to act their respective parts, and the guests present are generally the only spectators. Sometimes, however, the master of the house will admit a certain number of people into the court, to be partakers of the amusement.

Every person has twenty-four dishes, in succession, served up to him, all of which are in the form of ragouts. They never begin to eat till the master of the feast leads the way; but, on his giving the accustomed signal, all the company snatch up their chopsticks, and carry them to their mouths in regular uniform motion, as if they were performing some military exercise: they also take as much care as possible that their mouths all move together, for to be before-hand, or to make the rest wait, is accounted extremely vulgar.

Towards the middle of the entertainment, soup is brought in, accompanied with small loaves, or pies; which the guests take up with their chopsticks, steep them in the soup, and eat them without waiting for any signal, or being obliged to keep time with each other. The entertainment, however, continues, in other respects, with the utmost formality, until tea is introduced; after which, they usually take a turn in the garden, or in another apartment. Meanwhile the tables are spread with a desert, which, like the feast itself, consists of twenty-four

dishes, made up of sweetmeats, preserved fruits, hams, shell-fish, and salted ducks, baked or dried in the sun. The same ceremonies which preceded the repast are now renewed, and the master invites his guests to drink more freely, but no person is compelled to drink more than he likes, provided all the customary motions be gone through. About midnight, the company breaks up; a small sum of money is given to the domestics; and each person returns home in a chair, preceded by several servants, who carry large lanterns of oiled paper, inscribed with the name and quality of their master. Without such an attendance, they would inevitably be stopped by the city-guard; and, on the ensuing morning, they return a card of thanks to the officer of the watch.

Visits from the inhabitants of a city to a governor are always attended with presents. As soon as the visitors enter the hall of audience, they range themselves in a line, fall on their knees, and bow their heads even to the ground, unless prevented by the governor's politeness. Sometimes the most considerable among them takes a cup of wine in both hands, and presents it to the governor, exclaiming, "Behold the wine that giveth happiness!" After him, another advances with sweetmeats, exclaiming, in like manner, "Behold the sugar of long life!" and these ceremonies are repeated three times, by different persons.

Visits to a superior must always be paid before dinner; but, if a visit be returned the same day, this punctilio may be dispensed with. The cards, which are previously sent on this occasion, are generally of red paper, ornamented with flowers, and folded like a screen: the visitor's name is written in one of the folds, and many respectful expressions in the other. If the visit be to an intimate friend, or person of inferior rank, the visiting card is only a leaf of plain paper; and black cards are invariably sent to persons who are in mourning.

When a visitor arrives at the house of a superior, he is introduced into the hall by a couple of servants, who hold an umbrella and a fan, inclined to each other, so as to form a screen before him; and these barriers are not removed, till he has advanced near enough to salute the master of the house, who never rises from his chair. If, however, the person visited be the inferior, he goes into the street to conduct the stranger in; they bow to each other as soon as they meet, and a set of short compliments are interchanged; at every step they halt, and dispute who shall enter first, till at length the visitor suffers himself to be overcome, and walks to the next apartment.

When the guest or guests have entered, then commence all those formalities, which are minutely pointed out in the Chinese book of ceremonies; and, after a quarter of an hour's grimace, they seat themselves opposite to each other. They are obliged to sit upright, with downcast looks, their hands stretched out on their knees, and their

feet even. Loquacity is, also, studiously avoided; and sometimes not a single word is spoken, except the prescribed compliments, which are uttered with all imaginable submission, and always in the third person; as, "The favour your lordship has conferred on me so much beneath him, lays his servant under the deepest obligation.— Permit the servant to offer his lord this curiosity, which his poor country affords."

A little time after the company have taken their seats, as many cups of tea are brought in as there are persons present; and the manner of taking up the cup, conveying it to the mouth, and returning it to the servant, form so many articles in the book of ceremonies, which are always performed with the most rigid minuteness and punctuality. When it is time to retire, the master of the ceremonies conducts each of the guests to his chair, waits till he is taken up, and then bids him adieu. But, if the stranger be about to return home on horseback, a ceremony still more tiresome must be gone through; for he will not be so rude as to mount before the master of the house; and the latter urges him to it: the stranger then protests, that the world shall be turned upside down, before he will be guilty of such unpardonable rudeness; and the altercation continues till the master retires out of sight, and the visitor takes his seat in the saddle. He then directs his course homeward; and, when he has gone a little way, a servant is dispatched after him, to wish him a pleasant journey.

The Chinese form of salutation, even among persons of ordinary rank, is much less expeditious than that of Europeans. A common salute consists in joining both hands together before the breast, moving them in an affectionate manner, bending the head a little, and reciprocally uttering a complimentary word, something like "your humble servant." When a person meets one of superior rank, he joins his hands by locking the fingers together, raises them above his forehead, and afterwards brings them gradually toward the ground, making a profound obeisance with his whole body. When two friends happen to meet after a long absence, they both fall on their knees opposite to each other, bend their bodies to the earth, then raise them up, and repeat the same two or three times. When they see a man in good health, the usual address is, "Prosperity is painted on your looks;" or, "You have a happy countenance."

When two mandarins of considerable rank meet in their sedan-chairs, each joins his hands, lowers them down, and then raises them to his forehead, and repeats this till they are out of each other's sight. But, if one be of higher rank than the other, the latter orders his chair to stop; or, if he be on horseback, he dismounts, and makes a profound obeisance to his superior.

Plays are sometimes performed on open scaffolds, and in half a dozen streets at a time. On each side of the

stage are screens; and the actors are richly dressed; but they have no painted scenery. As no women bear a part in these exhibitions, female parts are performed by boys, or young men of an effeminate cast. Some companies of players consist of men from twenty to forty years of age, and these are most highly esteemed by the Chinese; but Europeans generally admire those between twelve and eighteen. Their tragedians seem to act with great propriety, so as to affect the passions of a spectator, who is totally ignorant of the language; and it is much to the credit of the Chinese government, that no pieces are suffered to be performed, except such as tend to inspire youth with a love of virtue, and an utter abhorrence of vice. The streets are so crowded on these occasions, that there is scarcely any possibility of passing; and when an actor plays his part well, he is always encored. Plays are generally concluded with sham fights, tumbling, and other feats of agility.

Hunting is free to every one in China. Such persons as wish to enjoy the diversion alone, shut up a quantity of game in parks, which have been enclosed for that purpose. When the emperor goes a hunting, he selects thirty thousand of his body-guards, who are armed with darts and javelins, and are disposed in such a manner, that they completely environ a considerable extent of ground upon the mountains. The guards, thus posted, form a large circle, marching nearer to each other with an equal pace, taking care not to quit their ranks: the circle is thus reduced to a much smaller one, and the beasts are gradually enclosed as in a net; for the guards, alighting from their horses, keep so very close to each other, that not the smallest outlet is left for any to escape. The animals in this small circle are hunted so close, that they frequently fall at the feet of the hunters through extreme fatigue, and are thus taken with the utmost facility. Sometimes the hunters will thus take two or three hundred hares, together with a prodigious number of wolves and foxes.

Once a year the emperor goes a hunting into Tartary; and, at these times, he often meets with tigers, of extraordinary fierceness; yet, when these animals find themselves enclosed by the hunters, they seem to be struck with a kind of terror at the sight of such a number of enemies, all ready to direct the points of their lances at them. Far from imitating the stag and other animals, which, so hemmed in, run up and down without ceasing, and try every means to escape, the tiger squats down, and endures for a long time the barking of the dogs, which are let loose upon him; but, at length, being excited, either by excess of rage or the absolute necessity of defending himself, he darts forward, with prodigious leaps, to some particular part which he has fixed on, and there attacks the hunters; but they check his progress with the points of their lances, and usu-

ally plunge them to his heart at the moment he is preparing to seize some of them.

The Chinese cannot enjoy any amusements but such as are authorised by law; and even with respect to their annual public entertainments, which have been established by custom in every city of the third class, the law has determined, that none shall be admitted to them but either graduate doctors of unblemished reputation, mandarins of law or arms, who have retired from public life, aged heads of families, or citizens of exemplary virtue. These entertainments consist of feasting and music, and are principally intended to preserve mutual regard and friendship. At these assemblies some articles of the law are read, after which the president adds, "If we have been assembled at this solemn festival, it is not so much for the pleasure of eating and drinking, as to encourage us to shew fidelity to our sovereign, obedience to our parents, affection to our brethren and sisters, veneration to our elders, attachment to our friends, and a desire to promote universal concord among our neighbours and fellow-citizens." The airs which are sung, and the instrumental accompaniments, likewise tend to harmonize the spirits, and conciliate universal benevolence; so that these banquets have been justly styled "feasts of love, and assemblies of instruction."

The vernal festival is celebrated, throughout the empire, in a way that evidently tends to the encouragement of moral labour and industry. In the morning, the governor of every city comes from his palace, crowned with a garland of flowers, and enters his chair, in which he is carried, amidst a profusion of standards, lighted flambeaux, music, and effigies of illustrious persons, who have acquired celebrity by their encouragement of agriculture. The houses are hung with rich carpeting, and illuminated by lanterns; triumphal arches are erected at certain distances; an earthen figure of a large cow, with gilded horns and magnificent trappings, is borne by about forty men; a child, with one foot naked and the other shod, called the "Spirit of Diligence," follows, driving on the image with a rod; labourers, with all the implements of husbandry, march behind; and a troop of comedians, and people in masks, bring up the rear.

Thus attended, the governor advances to the eastern gate of the city, as if he designed to meet the spring, and then returns to his palace in the same order. After this, the cow is stripped of her ornaments; a number of earthen calves are taken from her belly, and distributed among the crowd; the cow herself is broken and distributed in like manner; and the whole is concluded by a speech from the governor, in praise of agriculture, and an exhortation to the people not to neglect so useful and invaluable an art.

Two other public festivals are celebrated at a great expense: one at the commencement of the year, which is called "Taking leave of the old year;" and the other on

the fifteenth of the first month; at which times all business is suspended, presents are given and received, inferior mandarins pay their respects to their superiors, children to their parents, and servants to their masters. Every family assembles in the evening to partake of a grand repast; but no stranger, nor distant relation, is admitted; from a superstitious notion, that he would rob the family of that good fortune which descends on their habitation with the first moment of the new year. On the next and following days they exhibit still more lively demonstrations of joy; for every shop is shut, visits are paid to relations and friends, plays are publicly acted, and the whole empire exhibits a general scene of festivity.

On the feast of lanterns, every part of the empire is so completely illuminated, that, if a person could take a view of it at once, all the country would seem in a blaze; for every person, both in city and country, on the coast, and on the rivers, light up painted lanterns, of various forms and sizes. Even the most indigent families exert themselves at this festival, and, according to the best of their abilities, contribute to the general illumination.

The lanterns used on this occasion are generally large, of various shapes, and covered with transparent silk, on which flowers, animals, and human figures, are usually painted. They are lighted by lamps or wax-candles; and to the corners of each are fixed elegant streamers of silk or satin. Some of the largest lanterns exhibit moving figures, like the Chinese shades that may be seen in London. Persons, who lie concealed, put these figures in motion, by means of imperceptible threads, and the spectators are highly amused with horses galloping, ships sailing, armies in full march, &c. Some accompany these moving figures with humorous expressions, that seem to proceed from the shades on the lantern; while others carry about serpents, of an enormous length, illuminated within, from the head to the tail, and so contrived, that they wreath about in different forms, as if they were alive.

To augment the splendor of this festival, the Chinese exhibit a variety of those fire-works, for which they are justly celebrated. Magailens informs us, that he was greatly surprised at one of these exhibitions, where an arbour of vines, with red grapes, was represented, and the arbour burnt, without being consumed: the colour of the wood, fruit, and foliage, was also represented with astonishing exactness. The excellence of the Chinese artists, however, may be better conceived from a description of a spectacle of this nature, which was exhibited by the emperor Chang-hi, for the diversion of his court: "The fire-works commenced with six large cylinders, planted in the ground, which sent forth so many streams of flame, rising to the height of twelve feet, and falling in beautiful showers. These were followed by a covered box, supported by two pillars, which threw up a shower of fire;

several painted lanterns, and sentences written in large characters of burning sulphur; and six elegant branched candlesticks, with different tiers of lights, ranged in circles, so brilliant as to disperse the darkness of the night. At last, the emperor set fire to one of the works, which was instantly communicated through an extent of eighty feet; the fire reached several poles and painted figures, whence proceeded a prodigious multitude of rockets; and, at the same time, a number of painted lanterns and branched candlesticks were lighted in all directions."

The following account of the feast given by the emperor Kien-long, to the ancients, on the 14th of February, 1785, is too interesting to be omitted:

"This imperial feast, which Kien-long gave to the ancients, is one of those events which will make an epoch in the empire. Kang-hi, his uncle, set the example, who, ascending the throne very young, celebrated the sixtieth year of his reign, in 1722. Kien-long celebrated the fiftieth year of his reign, and the sixty-fifth of his age, on this day. At the end of 1784, he solemnly announced his intention, and made a number of promotions among the mandarins, professors of the arts, belles lettres, and military. He likewise exempted all the people from taxes that year, and finally repealed those which pressed hard on them. He ordered distributions of rice, and pieces of silk or stuff, to be given to every poor person throughout the empire, who had attained the age of sixty years. Those who were one hundred, had fifty bushels of rice, and two pieces of silk; one of the first, the other of the second quality. Those who had attained ninety years, received thirty bushels of rice, and two pieces of silk, of an inferior quality. Those who were less than sixty, and exceeding fifty, had five bushels of rice, and one piece of silk. Every other person had rice and silk in proportion to their ages, reckoning by ten years.

"This grand and solemn feast was held at the city of Peking, and gave great satisfaction to those for whom it was made.

"Three thousand aged men of quality being assembled at the palace, the emperor, who chose to do the honours of the table, took his place at the head. The only distinction made was, the elevation of his throne about a foot higher than the other seats, solely, as he declared, for the purpose of seeing that every thing was right, as the tables were served in all parts equally, where the guests were distributed four and four. At others, were the princes of the blood, the nobility, and the mandarins. At a circular table sat the emperor's family, to see that nothing was wanted by those ancient guests, and to exhort them to partake of the repast which their good master had invited them to. A numerous band of musicians played during the time, which was followed by a ballet, represented by the comedians of the court; and, at the end, the vocal

performers chanted a hymn, in honour of *Tien*, to return thanks for this particular day. The emperor then retired, and his ministers distributed to each of the company a present, with a wish, written upon it, 'That each might enjoy long life, and what they desired:' also a piece in verse, which the emperor had composed for the occasion, and which was nearly as follows: 'To the venerable ancients invited to the solemn feast, to rejoice with me, in memory of what was done before by my august uncle.'

'The blessings, which I have received from heaven, are without number: it is impossible for me to reckon them: but I cannot avoid expressing the peculiar happiness I feel, in having repewed this day, which has caused the most pleasing emotion in my heart, and which I shall ever call in pleasure to my memory, as having seen my princes and my people take their place by the side of their master, serving, and to be served, equally upon the same footing, without any distinction of rank, being equally happy as an assembly of friends, with the same motives of joy and gladness. This is the second time, by the special favour of God, that I have enjoyed the same sight, with the same feeling of heart. Our descendants will, no doubt, be penetrated with sentiments of the most tender veneration, when they read in history, that two emperors of my august race have celebrated, the one the sixtieth, and the other the fiftieth year of his reign; rejoicing, as in a family repast, with the whole empire, represented by the chosen of its aged people.'

With respect to the general character and temper of the Chinese, authors are much divided, some degrading them in the opinion of their readers, and others praising them in the most extravagant manner. It shall be our study, therefore, to avoid these extremes, and to extract the most impartial accounts of this truly singular people, from writers of acknowledged respectability.

Though naturally suspicious of strangers, they are eager to take advantage of them, and continually apply themselves to discover the inclinations, humours, and tempers, of those with whom they have any commerce; for, when they have an interest to manage, no people know better how to insinuate themselves into the good opinion of others, or to improve an opportunity to greater advantage. A foreigner is in continual danger of being cheated, if he trust to his own judgment; and, if he employ a factor, as is usual, both merchant and factor will unite to deceive him. Du Halde gives a striking example of the knavery and effrontery of a Chinese merchant: "The captain of an English vessel bargained with a person, at Canton, for several bales of silk, which the latter was to provide against a certain time. When they were ready, the captain went, with his interpreter, to the house of the merchant, in order to discover whether the goods

were sound. On opening the first bale, he found it according to his wish, but the rest were damaged and good for nothing. The captain, irritated by this discovery, reproached the merchant, in the severest terms, for his dishonesty; but the Chinese, after having heard him for some time, replied, with perfect composure, "Blame, sir, your knave of an interpreter; for he assured me, that you would not inspect the bales."

"I myself," says a traveller, who was frequently in China, "bought a piece of stuff, for waistcoats and breeches, without looking over the whole of it, presuming it was all alike, and sent it to the taylor; but was much surprised, on his bringing them home, to find my waistcoat of different colours and substances.—A gentleman, of my acquaintance, went into a goldsmith's shop, to buy a gold head for his cane; the shop-keeper, having none of the kind he wanted, but silver ones, told him, he would make one to the pattern; but this head, afterwards, proved to be a silver one gilt, and was, probably, one of those which the gentleman had seen in the shop.—When I have been in shops, I have frequently had my handkerchief, or fan, stolen from me, and, on demanding them again, have only been laughed at.—I knew a poor sailor, who pulled out his purse to count a few dollars, which he had borrowed from the purser, to buy some necessaries for his homeward passage, and a Chinese, observing him, snatched the purse out of his hand, and ran off. Several persons saw this infamous action, yet not one of them attempted to stop the thief, but, on the contrary, laughed at the Englishman's simplicity, in endeavouring to recover it. At last the Chinese, finding his pursuer at his heels, threw the purse from him; but when the poor mariner took it up, he found, to his great mortification, that there was but one dollar left. Had he overtaken the thief, it is highly probable that the aggressor would have been rescued, and the sailor sent home to the factory half-dead with blows; for the mob are often so insolent to foreigners, as if there were neither law nor government in the country; excepting when a mandarin passes, and then they all stand aside, with their eyes fixed on the ground.

The lower class of people are very dexterous in counterfeiting and adulterating every thing they sell. Sometimes, a stranger thinks he has purchased a capon, when, in reality, he has only a skin; all the rest having been scooped out, and the cavity so ingeniously filled, that the deception cannot be discovered till it is cut up. The counterfeited hams of China have been often described. They are made of a piece of wood, cut in the form of a ham, and coated over with a certain kind of earth, which is covered with hog's-skin; and the whole is so curiously painted and prepared, that a knife is necessary to detect the fraud.

The Chinese are naturally litigious and vindictive; but their revenge is always taken secretly; and they will not

only dissemble their malice, but appear patient, even to insensibility, till they have a favourable opportunity to accomplish their design. It is but justice, however, to observe, that they possess many good and amiable qualities. They are mild and affable, circumspect in all their actions, and always weigh the consequences of things before they carry them into execution. Politeness is considered as a principle of morality, and all ranks of men are constantly used to it; so that tradesmen, servants, peasants, and even footmen, may be often seen taking leave of each other on their knees; farmers, in their rustic entertainments, use more compliments than the most brilliant circle of Europeans; and even seamen, who, from their manner of living, acquire a natural roughness, treat each other like brothers, and pay one another such deference, that a stranger might think them united in the strictest bonds of friendship.

Filial piety is a virtue universally revered in China. Indeed, no instance is known of a legislator's having been under the necessity of enforcing it by law; for it is not only considered as a natural duty, but an important point of religion, and a point that is always observed with the utmost strictness and attention. This duty seems to be the main support of the government; for, as patriotism formed the basis of the ancient republics, filial piety is here inculcated, not only to preserve harmony and felicity in private families, but that all subjects should behave to their prince as dutiful children; and that the sovereign should cherish and protect his subjects as the common father of the nation.

The observance of this virtue is one of the first maxims impressed on the infant mind, and is strongly inculcated in all the public schools. The law has, also, regulated all the relative obligations between children and parents, husbands and wives, uncles and nephews, &c. restraining, on the one hand, by gentle chastisement, and encouraging, on the other, by honorary rewards. A father has the merit of every great action which his son performs; and the emperor grants only to fathers, whether living or dead, those marks of distinction which their sons have merited.

If a father charge his son with any crime before a magistrate, the son is supposed to be guilty; and, if the offence be capital, he must lose his life, without any other evidence.

"If a son," says an intelligent writer, "presume to strike or deride his parent, the whole country is immediately alarmed, and the judgment is reserved for the emperor himself. The criminal is sentenced to be cut into ten thousand pieces, and afterwards burnt; his lands and tenements are destroyed; and even the houses that stood contiguous to his habitation are rased to the ground. The magistrates of the place are also turned out of office, and all the neighbourhood threatened, as having given coun-

tenance to so diabolical a temper; for it is supposed, that a man would never have arrived at such a degree of wickedness at once; but must have discovered his depraved disposition on other occasions, of which the magistrates or neighbours should have taken immediate cognizance.

"Even the emperors themselves cannot reject the authority of their parents without incurring the universal detestation of the nation; and their history contains an anecdote of this kind, which makes the filial piety of the Chinese appear truly amiable.

"One of their emperors had a mother, who provoked him, by an imprudent intrigue, to banish her into a distant province; and, because he knew that his conduct, in so doing, would not be agreeable to his courtiers, he positively forbade them, on pain of death, to make any remarks upon the subject. For some time they remained silent, hoping that he would soon see his error, and recall the author of his existence; but, as their hopes were disappointed, they at length resolved to interfere, and brave all danger, rather than suffer so pernicious a precedent. The first, who ventured to put up a request in this affair, was put to death on the spot; yet, a day or two afterwards, another made a similar attempt; and, to show the world that he was willing to sacrifice his life to the public good, he ordered his hearse to stand at the palace-gate: the emperor, rather provoked than affected by this noble action, sentenced the petitioner to die; and, to terrify all others from following his example, ordered him to be put to the torture. Still, however, the Chinese persisted in their resolution, and bravely resolved to perish, one after another, rather than pass over in silence a base action. A third, therefore, ordered his coffin to be set at the palace-gate, and protested to the emperor, that he could no longer see him persist in his crime without remonstrating. 'What shall we lose by our death,' said he, 'but the sight of a prince, on whom we cannot look without amazement and horror? Since you will not hear us, we will go and seek out your ancestors, and those of the empress your mother; they will hear our complaints, and, perhaps, in the darkness and silence of the night, you may hear their ghosts and ours reproach you for your injustice.' The monarch was exasperated beyond all bounds at the boldness of his subjects, and inflicted on this petitioner, with many others, the severest torments he could devise. At length, however, after great numbers had voluntarily perished in this noble struggle, the emperor repented of his cruelty, and recalled his mother to the enjoyment of her former dignities; by which means he conciliated the esteem of his courtiers, and engaged the affection of all his faithful subjects.

"On the first day of every year, acknowledgments of duty and respect are renewed in the emperor's family, as well as in that of every loyal citizen and villager. About

sun-rise, all the mandarins of the different tribunals repair to the palace, dressed in their official robes, and the royal family and household, with distinguished badges, appear in their respective places. The emperor then leaves his chamber, to pay his respects to his mother, in an adjoining apartment. He is carried there in a chair of state, but quits it on entering the hall of audience; and the president of the tribunal of ceremonies presents a petition from the emperor, requesting her imperial majesty to receive, on her throne, the humble marks of duty and affection, which he is about to pay her. This is carried to the empress, in her apartment, and she immediately comes forth, dressed in a habit of ceremony, and followed by her whole court. When she has ascended the throne, the emperor and his suit approach, to the sound of soft music, and a mandarin cries out, *kneel*. Immediately the emperor, princes, and grantees, fall on their knees; and, on the mandarin's crying out, *prostrate yourselves*, they throw themselves on their faces. After nine prostrations, they all rise; a petition is presented to the emperor, from his mother, requesting him to return to his own apartments; the music again breathes some melodious strains; and the emperor returns to his own hall of audience, where he receives the compliments of the nobility.

"Besides this ceremony on new year's day, the emperor is obliged to visit his mother every five days, during his life; and an emperor, newly proclaimed, cannot receive the homage of his grantees, till he has first paid his respects to his mother. He never takes a wife without her consent, never bestows any principalities upon his children, nor grants any favour to his people, without previously consulting her. In short, the Chinese are of opinion, that the filial piety of their prince augments all the virtues of his subjects; that all wickedness commences with disobedience to parents; that every virtue is in danger when filial piety is attacked; that every thing which tends to promote this duty is a pillar to the state; and that every thing which militates against it is a public calamity."

The funeral-rites of the Chinese are considered as the most important of their ceremonies. A few minutes after a man has expired, he is dressed in his richest apparel, adorned with every badge of his dignity, and placed in the coffin; which is generally made of very durable wood, varnished, and sometimes gilt. The preparation of a coffin, in which the body may be enclosed after death, is one of the chief objects of attention to a Chinese during his life, and great sums are often expended on it; so that persons of opulence sometimes lay out a thousand crowns: the poorer classes will often expend all they are worth; and, in cases of extreme poverty, a son will sell himself for a slave, in order to purchase a coffin for his father; which, perhaps, shall remain twenty or thirty years useless, but is considered as the most valuable piece of furniture belonging

to the family. The manner of interment is as follows: First, they sprinkle some lime on the bottom of the coffin, and lay the body on it, taking care to place the head on a pillow, and to add a great deal of cotton, that it may remain steady. The body generally remains exposed seven days, and, during this time, all the friends, who have been invited, come and pay their respects to the deceased, the nearest relations remaining in the house. The coffin is then placed in the hall of ceremony, which is hung with white linen, interspersed with pieces of black or violet-coloured silk. Before the coffin is placed a table, on which stands the effigy of the deceased, or a carved ornament, inscribed with his name; and these are always accompanied with flowers, perfumes, and lighted tapers. In the mean time, all the sons of the deceased, clothed in linen and girded with cords, stand on one side of the coffin, in a mournful posture, whilst the widow and her daughters stand on the other side, behind a curtain, occasionally uttering dismal cries. During the time that the corpse is thus kept, there are tables, covered every morning with tea and sweetmeats; the persons, who come to pay their respects, are ushered in and out by a relation, appointed for that purpose; and a large sheet of paper is hung over the gate, expressing the name and quality of the deceased, and giving a short detail of his life and actions.

On the day of burial, the relations are again assembled, and most of them attend the corpse to the place of interment, in the following order: A number of men march in file, carrying pasteboard figures of slaves, elephants, lions, tigers, &c. Others follow with flags, censers filled with perfumes, and tables of sweetmeats; while melancholy and plaintive airs are played on drums, bells, and other instruments. Immediately after the musicians follows the coffin, which is carried under a canopy of violet-coloured silk, neatly embroidered, and covered with network. The eldest son, clothed in a canvas frock, having his body bent, and leaning on a staff, follows near the coffin; behind him are his brothers, two and two, leaning on crutches, as if unable to support themselves; and the procession is closed with the mother and daughters, carried in close chairs, and all the other relations and friends of the deceased, in mourning.

When they arrive at the place of interment, the coffin is deposited in a tomb; and, at a small distance, there are several temporary halls, with tables covered with provisions, and served up with great splendour to the mourners and attendants. The repast is sometimes followed by fresh marks of homage to the deceased; but these are generally dispensed with, and the company content themselves with complimenting the eldest son; who, however, answers only by signs. But, if the deceased were a grandee of the empire, his relations do not leave the tomb for a month or two, but reside in apart-

meats prepared for them, and renew their homage every day.

The generality of the Chinese have such a profound veneration for the burying-places of their ancestors, that no consideration can induce them to travel into remote parts of the world: and they seem to despise those of their countrymen, who, for the sake of trade, or other causes, go to the adjacent islands; because they imagine that these men must leave their bones in unhallowed ground.

Persons of rank are commonly buried in mountains, or in solitary places, remote from towns; and some of their sepulchres are very magnificent. If a tomb be erected in a valley or plain, a large heap of earth is raised over it, and covered with white plaster, so that no wet can penetrate it. In the vault, an altar is erected, and covered with meats, incense, lighted tapers, and figures of slaves and animals, which are supposed to be serviceable to the dead in another state. And, if the defunct held any considerable office, his most virtuous actions are engraved on marble, and fixed up in front of the tomb; while a number of figures, representing officers, eunuchs, horses, stags, camels, lions, and elephants, are ranged round in different rows; and groves of aged cypresses preserve an awful and melancholy gloom, which is calculated to make a deeper impression on the contemplative mind, than the costly decorations of funeral-monuments in Europe.

Every family of respectability has a large building, called the hall of ancestors, erected on some part of their estates, which is common for all the branches of that family. In this hall, a long table is set against the wall, on which are painted the figures of their progenitors, who have rendered themselves illustrious by their talents, or who have honourably filled some office under government. Sometimes, however, it contains only the names of men, women, and children, belonging to the family, with their ages and dignities, inscribed upon tablets.

In spring, the relations assemble at this hall; and the most opulent of them prepare a banquet, which seems to have been originally designed for the dead; for they never touch any of the viands till an offering has been solemnly made. But, exclusive of these annual entertainments, the Chinese consider themselves obliged to visit the tombs of their ancestors once or twice a year; when they begin by plucking up the weeds and bushes that surround the sepulchre, and conclude by placing wine and provisions upon it, which serve to regale their assistants.

*History.*] The national antiquity, to which the Chinese pretend, exceeds all credibility; as their annals have been carried beyond the period to which the scripture chronology assigns the creation of the world. Poan Kou is said by them to have been the first man; and the interval of time betwixt him and the death of their celebrated Con-

fucius, which was in the year before Christ 479, has been reckoned from 276,000 to 96,961,740 years. But, upon an accurate investigation of this subject, it appears, that all their historical events, prior to the reign of the emperor Yao, who lived 2057 years before Christ, are entirely fabulous, and full of contradictions. It appears, also, that the origin of the Chinese empire cannot be placed higher than two or three generations before Yao. The imperial annals are comprehended in six hundred and sixty-eight volumes; and consist of the pieces that have been composed by the tribunal or department of history, established in China for transmitting to posterity the public events of the empire, and the lives, characters, and transactions, of its sovereigns. It is said, that all the facts which concern the monarchy, since its foundation, have been deposited in this department, and, from age to age, have been chronologically arranged, under the inspection of government, with all possible precautions against illusion or partiality. It is asserted, that many of the Chinese historians exposed themselves to exile, and even to death, rather than disguise the defects and vices of their sovereign. But the emperor Chi-hoang-ti, at whose command the great wall was built, in the year 213 before the Christian era, ordered all the historical books and records, which contained the fundamental laws and principles of the ancient government, to be burnt, that they might not be employed by the learned to oppose the changes which he proposed to introduce. Four hundred literati were burnt, with their books: yet this barbarous edict had not its full effect; several books were concealed, and escaped the general ruin. After this period, strict search was made for the ancient records that yet remained; but, though much industry was employed for this purpose, it appears, that the authentic historical sources of the Chinese, for the times anterior to the year 200 before Christ, are very few; and that they are still in smaller numbers for more remote periods.

Upwards of twenty dynasties, or different tribes and families of succession, are enumerated in the annals of the Chinese. Yet neither Zinghis Khan, nor Tamerlane, though they often defeated the Chinese, could subdue their empire; and neither of them could keep the conquests they made. The celebrated wall of China, however, proved but a feeble barrier against the arms of those famous Tartars. At this period, the war with the Mandshur Tartars continued, and, in addition to this calamity, there was a great famine in China. The reigning monarch, Hoai-tsong, a worthless indolent man, suffered himself to be directed in every thing by his ministers and eunuchs, who greatly oppressed the people: a revolt was the consequence; and, in a short space of time, there were eight different factions, under the same number of chiefs. These were, however, afterwards reduced to two, and, at length, to one, headed by a commander named Li, who invaded the

provinces of Ho-nan and Shen-si, and assumed the imperial title.

This usurper committed the most dreadful ravages. In his attack of Cuif-ong, the capital of Ho-nan, that town was inundated, by a sudden breaking down of the dykes of the Yellow River, and three hundred thousand persons perished. He afterwards marched to Pekin, and entered without the least opposition; for he had privately conveyed into the city a number of his people, in disguise, who threw open the gates: and such was the supineness of Hoai-tsung, the emperor, that he knew nothing of this circumstance, till the usurper had laid the whole city under his subjection. As soon, however, as he heard the news, he marched from his palace, at the head of six hundred of his guards, who treacherously abandoned him. In this dilemma, he retired into the gardens of his palace, with his daughter, whom he beheaded, and then hung himself upon a tree. His wives, his prime minister, and some of his eunuchs, also terminated their own existence.

The news of this event soon reached the troops, then making war in Tartary, under the command of a general named Ou-sang-guey, who refused to acknowledge Li as his sovereign; on which the latter put himself at the head of his army, for the purpose of giving him battle. Ou-sang-guey shut himself up in a strong fortified town, whither Li marched his troops, and, having taken captive the father of Ou-sang-guey, ordered him to be loaded with irons, and placed at the foot of the town-wall, sending word to his son, at the same time, that if he did not immediately surrender, his father should be sacrificed. The father found means to send a message to his son, begging him to surrender; but the son sacrificed his filial esteem to the interests of his country, and the old man was put to a cruel death. On this, Ou-sang-guey, inflamed with rage, concluded a peace with the Mandshur Tartars, and engaged them to enter into an alliance with him against Li, whose superior force he was unable to resist.

Tsong-te, the king of these Tartars, readily came to his assistance, at the head of eighty thousand warriors, forced the usurper to raise the siege, pursued him even to Pekin, and so totally routed his army, that he was forced to fly into the province of Shen-si, where he spent the remainder of his days in obscurity. Ou-sang-guey, however, soon had cause to repent having joined so great and powerful a prince; for Tsong-te no sooner arrived at Pekin, than he began to think of improving the success of his arms, and the favourable disposition of the people, into the means of his advancement to the throne of China; but, being seized with an illness, that speedily brought on his dissolution, he had just time to declare his son emperor, who was only about six years of age. This election was confirmed by the grandees and people, who, in consideration of the signal services done by the father, con-

nived at the tender age of the child, who assumed the name of Tchuntchi, and is considered as the founder of the twenty-second dynasty.

This revolution, which united a considerable part of Great Tartary to the Chinese empire, happened in the year 1644: and, since the union, the Tartars seem rather to have submitted to the laws of the Chinese, than to have imposed any upon them. In fact, the latter may be said to derive as much advantage from it as the Tartars themselves. Both nations, so opposite in genius and character, have each been considerably benefited by the incorporation. The fierce spirit of the Tartar has given a degree of martial ardour to the peaceful temper of the Chinese, while the arts and commerce of the latter have humanized and softened the savage roughness of the former.

Two memorable events in the annals of China happened in the years 1771 and 1772, when a nation of the Tartars left their settlements under the Russian government, on the banks of the Wolga and Yaik, near the Caspian Sea, and, in a vast body of many thousand families, passed through the country of the Hassack, when, after a march of eight months, in which they surmounted innumerable difficulties and dangers, they arrived in the plains that lie on the frontiers of Carapan, and offered themselves as subjects to the Emperor Kien-long, who was then in the thirty-sixth year of his reign. He received them graciously, furnished them with provisions, clothes, and money, and allotted to each family a portion of land for agriculture. The following year, a second emigration of several thousand Tartar families took place, who also quitted their settlements under the Russian government, and submitted to the Chinese sceptre. The emperor caused the history of these migrations to be engraved upon stone, in four different languages.

The English opened their first commercial intercourse with China in the year 1634, pursuant to a licence granted by King Charles I. They long had many obstacles to encounter, in consequence of the superior influence of the Dutch and Portuguese; but, at present, they are the most favoured nation; although, through the prejudices and jealousies of the principal mandarins, the object of Lord Macartney's splendid embassy was rendered abortive.

Kien-long, the late emperor, ascended the throne in 1736, and died February 11, 1799. He was succeeded by Ka-king, the present emperor, who, immediately on his accession, degraded and imprisoned Hoo-choong-taung, the prime minister of his predecessor. This minister was in power at the time of the embassy, and was supposed to be very hostile to the object of it; his disgrace, therefore, excited a hope, that such another attempt might prove successful; but the failure of the late Russian embassy has proved, that no advantages are to be derived by negotiations with China.

## CHAPTER III.

## HINDOOSTAN.

*Name and Boundaries.*

**HINDOOSTAN**, or India within the Ganges, appears to have received its name from the river *Indus*, to which has been added the Persian termination *stan*, signifying a country. In former times it was called the empire of the Great Mogul, because it was then subject to the successors of Tamerlane; but such is the instability of human greatness, that the present mogul, a lineal descendant of that emperor, is merely a nominal prince, of little or no importance in the politics of the country. The boundaries of Hindoostan are, Tibet on the north; the bay of Bengal on the east; the Indian Ocean on the south; and Persia on the west.

*Divisions.*] Various arrangements have been adopted by geographers in their divisions of this extensive region; but the most simple and perspicuous is that of Major Rennell; who divides Hindoostan into four parts, viz. the provinces on the river Ganges,—those on the river Indus,—the central provinces,—and the southern provinces.

The provinces on the Ganges are those of Bengal, Bahar, Allahabad, Oude and Agra, with part of Delhi, and Agimere.

Those on the river Indus comprise Lahor, Cassimere, Cabul, Candahar, Moultan, and Sindi.

The central provinces are those of Guzerat, Berar, Orissa, Sircars, and Dowlatabad.

And the eastern provinces comprehend Madura, Tanjore, the Carnatic, the Deccan, Goleconda, Mysore, and the coasts of Malabar and Coromandel.

*British Possessions.*] The British possessions in Hindoostan are computed at about two hundred and thirteen thousand square miles; their population at between twelve and fourteen millions of inhabitants; and the revenues arising from them at about three millions and a half sterling. They consist of three distinct governments; viz. that of Calcutta, or Bengal, on the Ganges; that of Madras, on the coast of Coromandel; and that of Bombay, on the Gulf of Cambaya; to which are added the districts ceded by Tippoo Saib, in 1792; and the territory appropriated by the East-India Company after the taking of Seringapatam.

*Climate, Seasons, Soil, &c.*] Notwithstanding the great extent of this country, the climate and seasons are generally very regular; as the winds blow six months from the south, and six from the north, with little variation. The

months of April and May, and the beginning of June, are so sultry, that the reflection from the ground is apt to blister the face of a European; and the coldest day is hotter at noon than the hottest day in England. A breeze, or small gale of wind, however, blows every day, which is a great relief to the inhabitants. From Surat to Agra, and beyond, it seldom rains, excepting from the middle of June to the middle of September. During that season, it generally rains every day, and sometimes for a week together, without intermission; by which means the land is enriched, and the surface of the ground, which previously resembled the barren sands of Arabia, is soon covered with verdure. When the rainy season is over, the sky resumes its former serenity, and scarcely a cloud is to be seen during the remainder of the year. A refreshing dew, however, descends every night, which tends equally to fertilize the earth, and to cool the air.

The soil is, in many parts, so excellent, as to consist of black vegetable mould, to the depth of six feet. Rice is the principal grain; and, on the dry sandy lands of the coast of Coromandel, great industry is displayed in watering it. Maize and the sugar-cane are also favourite products. The cultivation of cotton also is widely diffused; and this plant particularly thrives on the dry coast of Coromandel. There is a considerable diversity in the modes of agriculture, as well as in the products, through so wide a country; but, in general, the implements are of the most simple description. The fertility of the land, however, amply compensates for any defect in practice or industry. The harvest is divided into two periods, the former being in September and October, and the latter in March and April.

*Rivers.*] The principal river in Hindoostan is the Ganges, which receives such a number of important tributary streams, that its magnitude exceeds what might have been expected from the comparative length of its course; which may, however, be estimated at about fourteen hundred British miles. Its source is still a curious object of investigation; for there cannot be much reliance placed on its delineation in the Chinese map of Tibet, published by Du Halde. Anquetil du Perron considers the source of the Ganges as still unexplored; and says, that the Chinese missionaries only discovered that of the Gagra, a large river running parallel with the Ganges on the east, and joining that noble stream above Chupra. The researches

of the jesuit Tieffenthaler seem to evince, that the Gagra springs from a lake called Lanken, to the west of the lake of Mansoror, whence one source of the Ganges is supposed to flow. He has laid down the latitude of the noted Gangoutra, or Cow's Mouth, in latitude thirty-three degrees, being a celebrated cataract, where the Ganges is said to pass through a vast cavern in a mountain, and falls into a large basin, which it has worn in the rock. At Hurdwar, about two hundred and eighty miles to the south of the Cow's Mouth, the Ganges is said to enter the wide plains of Hindoostan; and pursue a south-east direction by the ancient city of Canoge, once the capital of a kingdom, by Allahabad, Benares, Patna, &c. till, dividing into many grand and capacious mouths, it forms an extensive delta at its egress into the gulf of Bengal. Being navigable throughout, and thus affording the means of commercial intercourse, it has obtained the adoration of the inhabitants of its banks, from the innumerable benefits it continually bestows upon them; and it has been worshipped as a divinity since the period when, according to tradition, Madam Durga plunged into it, and disappeared. They relate, that this woman was their legislator; that, when she became superannuated, she descended to the bottom of the Ganges, and that she still resides there.

To the superstitious belief attached to this story many poor creatures have fallen victims. It is believed, that every one who is drowned in the Ganges is destined to enjoy, with this fair personage, eternal happiness, and that it is by her contrivance and interposition that accidents of this kind happen. When a man, therefore, is in danger of drowning, instead of endeavouring to extricate him, the by-standers wish him every kind of pleasure, recommend themselves to his favour, and even, if necessary, forward the catastrophe, or, at least, are afraid of incurring the displeasure of their fair divinity by assisting him to reach the shore. It is seldom, however, that they have occasion to extend so far their inhuman zeal towards any of their countrymen; for a native, who happens to fall into the water, persuading himself that he is going to enjoy eternal happiness, has no desire to escape from it.

The Hindoos bathe at least once a day; and men, women, and children, go into the water together, without the smallest idea of indecency. They leave their shoes on the bank, and sprinkle themselves as they enter the river: when they are up to the middle in water, they take off the piece of cloth which goes round their loins, and wash it, perform the ablutions directed by their religion, put on their apron again, and come out. Some Bramins often come to bathe, bringing with them a small brass vessel, of the shape of a censer, in which are some grains, about the size of a pea: these they throw, one at a time, into the

river, uttering, in a low tone of voice, a prayer or two. They then sprinkle themselves slightly on the back, touch their temples with the first joint of their thumb, wash their apron, and retire.

Besides the ceremonies observed in bathing, the Hindoos make offerings to the Ganges, of oil, cocoa, and flowers, which they expose on its banks, to be washed away by the stream. When they have a friend at sea, and wish to offer vows for his return, they light in the evening some small lamps, filled with cocoa-oil, and placing them in earthen dishes, which they adorn with garlands, they commit them to the stream. If the dish sink speedily, it is a bad omen for the object of their vows; but, if they can observe their lamp shining at a distance, they indulge the most pleasing hopes; and, if it go so far as to be at length out of sight, without being extinguished, it is considered as a sure token that their friend will return in safety.

"This Madam Durga, who has deified the Ganges," says a modern writer, "is held in great veneration: her festival is celebrated every year, in the month of October, and, while it lasts, nothing is known but rejoicing; the natives visit each other, and, on three successive evenings, assemble together for the adoration of their divinity. Her statue is placed in a small niche of clay, which is gilt, and adorned with flowers, pieces of tinsel, and other similar ornaments. The statue itself is dressed in the most magnificent attire they can procure, is about a foot high, and the niche, with its appendages, about three feet six inches. All the opulent Hindoos celebrate a festival of this kind in their own houses, and are ambitious of displaying the greatest luxury, lighting up their apartments in the most splendid manner. There is one of these celebrations, at least, in every quarter of the town; so that all the inhabitants have an opportunity of paying their devotions. The room is furnished with seats for the guests, and the statue is placed on a small stage, concealed by a curtain. The curtain being drawn up by the servants, a concert begins, in which the principal instrument is a sort of bag-pipe. The reed of this not being flexible, and the performer being wholly ignorant how to modulate its tone, nothing can be less musical than the sound it produces, unless it be the tunes that are played upon it: the most vile and discordant clarionet is melody itself, compared with this instrument, which would literally split the ears of any other audience. In the midst of this concert the pantomime is introduced, in which the personages of the scene, uncouthly dressed, and insupportably disgusting, from the rancid odour of the oil of cocoa, exhibit some ridiculous tricks, calculated to amuse the honest Indians, who laugh heartily, and give themselves up to the most extravagant joy. For two days every kind of respect and adoration is paid to the idol: but, on the third, appearances alter:—they abuse it, call it a prostitute, and load it with execra-

tion: & carry it to the river, where they throw it, howling. "It is the Brahma Durga, who, to memory, to object to, thus enforcing the laws of the ceremony, people, the never-ceasing. The new rampoote with the C in 1765. territory; with the C unites with mingled asembling of which the mouth den influx of from five. The cor nearly equ of these gr parate to th afterwards. The Indu portance to that of the to rise from Mountains may be abo

tions: this done, they take it upon their shoulders, and carry it to the banks of the Ganges, followed by the horrid din of the bag-pipe; where, reiterating their curses, they throw it into the water, amidst the most frightful cries and howling, and leave it to its fate.

"It is not easy to discover the drift of this ceremony. The Bramins say, in confidence, that the festival of Madam Durga was instituted to perpetuate and honour her memory, to retain the people in a devotion, which had for its object to give a character of sacredness to the Ganges, and thus enforce the precept, which enjoined the salutary practices of frequent ablution and bathing: but this lady not being the supreme deity, it was proper to conclude the ceremony with acts of insult, which would convince the people, that Bramah alone was entitled to the unmixed and never-ceasing adoration of mankind."

The noblest tributary stream of the Ganges is the Burrampooter. The course of this river, and its junction with the Ganges, were first ascertained by Major Rennell, in 1765. It runs four hundred miles through the British territory; and, for the last sixty miles before its junction with the Ganges, its breadth is from four to five miles. It unites with the Ganges below Luckipour, where the mingled streams form a body of running fresh water, resembling a gulf of the sea, interspersed with islands, some of which rival in size and fertility the Isle of Wight. In the months of the Ganges, and the Burrampooter, the sudden influx of the tide will rise instantaneously to the height of from five to twelve feet.

The course of the Burrampooter is supposed to be nearly equal in length to that of the Ganges. The sources of these great rivers are stated to be very near, yet they separate to the distance of more than a thousand miles, and afterwards join in their termination.

The other principal tributary streams which swell the Ganges, are the Gagra, the Jumna or Yunena, and the Soan. The Gagra, after pursuing a long course from the mountains of Tibet, passes through the province of Oude; and its comparative course is about seven hundred miles.

The Jumna rises from the mountains of Sirinagur, pursuing nearly a parallel course to the Ganges on the west, as the Gagra does on the east; but its comparative course does not exceed five hundred miles. The Soan is said to spring from the same lake or source with the Nerbudda, (which flows in an opposite direction to the Gulf of Cambay,) and joins the Ganges at a short distance below its union with the Gagra.

The Indus, and its confluent streams, are next in importance to the Ganges. The source of this river, like that of the Ganges, remains unknown; though it seems to rise from the eastern side of the Belur Tag, or Cloudy Mountains of Little Bucharia; its comparative course may be about a thousand British miles, when it forms a

delta, in the province of Sindi, entering, by several mouths, the Indian Ocean.

The tributary rivers of the Indus chiefly join it in the northern half of its course, where they form the Panjab, or the country of Five Rivers. From the west run into the Indus the Kameh, with its tributary streams, and the Comul: from the east the Behut, the Chumab, the Rauve, the Setlege, and the Hyphasis.

The Godaveri, which rises at Trimbuck Nassor, in the western Gaults, from several sources, about seventy miles to the north-east of Bombay, was little known in Europe till recent times. About ninety miles above its egress into the sea, it receives the Bain Gonga, which pervades several vast forests, in a singular wild country, inhabited by uncivilized people, in the centre of Hindoostan. The Bain Gonga was first discovered to Europeans by the late Colonel Caniac; its course is about four hundred miles, while that of the Godaveri is about seven hundred. This last river, like another Nile or Ganges, fertilizes the country; and, from the benefits which it confers, is esteemed sacred.

The next in consequence, in the central division of Hindoostan, is the Nerbudda, which may be called a solitary stream, as it receives few contributions. Its course is almost due west, and about equal to that of the Godaveri.

The Deccan, or most southern part of Hindoostan, is bounded and enriched by the Kistna, which rises at Balisur, not far to the south of Poonah, and forms a delta near Masulipatam, after a comparative course of about five hundred miles. This river rivals any Indian stream in the fertility diffused by its inundations: while the richest diamond-mines in the world are found in the neighbouring hills to the north.

To the south of the Kistna is the Caveri, another large and sacred stream, which passes by Seringapatam, the capital of Mysore, and forms a wider delta than any other southern river, when it enters the sea, after a course of about three hundred miles.

*Lakes.* The lakes of Hindoostan are few in number. Rennel mentions that of Colair, which, during the inundations, is about forty or fifty miles in extent, and is a considerable piece of water in all seasons; it is situated about mid-way between the Godaveri and Kistna, in the new soil gradually formed by the inundations of these rivers, about twelve miles to the north of Masulipatam. That of Chilka bounds the British Sircars on the north, and is a kind of salt creek, communicating with the sea: the lake of Pullicat is of a similar kind. One or two lakes are to be found in the vicinity of the Ganges and the Indus; and the country of Cassimire is supposed to have been originally a large lake, as reported in the native traditions: indeed, a considerable expanse of water still remains in the northern part of this country, called

the lake of Ouller, and is about fifty-three miles in circumference.

*Mountains.*] The mountains chiefly celebrated by the Hindoos may be said to be only visible from their country, being the northern chain of the Tibetan Alps, covered with perpetual snow: for which cause they are called Himmala, from a word denoting snow. But there appears much confusion, even in the most recent delineations of the Indian ranges of mountains, and their exact denominations. The eastern ridge, called, by Ptolemy, Sepyrus, may now be called Tipera. Those on the south of Asam may be styled the Garro mountains, being inhabited by a people of that name. The ridges to the south of Nipai and Bootan are far inferior in height to the Himmala.

The mountains to the west of the Indus, on the Persian frontier, may be taken for the Besius and Parvetius of Ptolemy; but the modern names are not accurately known.

The Gauts rise abruptly on each side, but particularly on the west, forming, as it were, enormous walls, supporting a high terrace in the middle, and pass through a great part of the Mahratta territories, to the north of Mysore. Opposite to Paniany, on the western coast, there is a break or interruption of mountains, about sixteen miles in breadth, chiefly occupied by a forest: exclusive of this gap, the mountains of Sukhien extend from Cape Comorin to Surat, at the distance of from forty to seventy miles from the shore.

*Forests.*] In this extensive portion of Asia, a great part of which remains in primitive wildness, there are many large forests, particularly near the mouth of the Ganges, and in the wide unexplored regions on the west of the Circars. These forests surpass, in exuberance of vegetation, any idea which Europeans can form: creeping plants, of prodigious size and length, extended from tree to tree, form an impenetrable gloom, and a barrier, as it were, sacred to the first mysteries of nature.

The most prominent feature in the Indian landscapes is the multitude of lofty trees, of the palm kind: all these rise, with a simple trunk, to a considerable height, terminated by a tuft of large leaves, and wholly destitute of branches, except while they are in fruit. The coasts of Malabar and Coromandel abound with cocoa-nut trees, the fruit of which supplies an agreeable nutriment, and the fibrous covering of the nut is manufactured into elastic cables. The areca-palm is also cultivated throughout India, for its nuts; which, mixed with the leaves of the betel-pepper, and a little quick-lime, are in general requested for chewing, as tobacco is used in Europe. The smaller fan-palm is distinguished for its broad fan-shaped leaves, which are used for writing on, and for thatching; its wood is used for rafters; and the palm-toddy, the com-

mon distilled spirit of the country, is made from its juice. This, although a large tree, is far inferior to the great fan-palm, which abounds on the lower mountains of the Carnatic; each leaf of this vast tree is capable of covering ten or a dozen men, and two or three of them are sufficient to roof a cottage. Other fruit-bearing trees are so numerous, that they are little known, even by name, to Europeans. The pillaw is a tree of equal singularity and use: from its trunk and largest branches are produced large fibrous bags, sometimes of the weight of twenty-five pounds, which are filled with nuts, like the chesnut, and resembling the almond in flavour. The mango is reckoned the most exquisite of the Indian fruits, and is found in considerable abundance, both wild and cultivated, through the whole peninsula.

*Animals.*] The cattle of Hindoostan are numerous, and often of a large size, with a hunch on the shoulders. The sheep are covered with hair, instead of wool, except in the most northern parts. Antelopes, of various beautiful kinds, abound, particularly that called the Nyl-Ghau. Apes and monkeys are numerous in various parts of Hindoostan; and the ouraig-outang is said to be found in the vast forests on the west of the Circars. The dogs are generally of the cur kind, with sharp erect ears, and pointed noses: the smallest size is that kept by the Parriars, or degraded poor, who are rendered doubly miserable by the fanatical prejudices of the system of the Bramins. The other animals are wild boars, tigers, bears, wolves, foxes, jackalls, and hyenas.

Elephants are common in all parts of India, and are trained to every sort of employment, even to hunting the tiger. It is customary to fasten on the back of this huge animal a pavilion, large enough to hold five or six persons, who ascend to it by a ladder, which is afterwards suspended from the crupper. When a tiger is to be hunted, the persons, who engage in the amusement, get into this pavilion, and have several well-trained dogs, that beat the country before them. The elephant follows the dogs till he gets scent of the tiger, which he does, generally, at a great distance. Immediately he raises his trunk into the air, like the mast of a ship, and seems anxious to keep it from being laid hold of by his enemy. On this signal the hunters prepare to fire.

In the mean time, the dogs press upon the tiger, which, on perceiving the elephant, stands immovable, with his mouth open and his claws extended, roaring dreadfully, and attentively watching every motion of the elephant. The latter approaches within the length of his trunk, which he still keeps erect, and out of danger: the two animals, for a moment, look at each other, and this is the time when the hunters usually fire. The shot makes the tiger start, on which the elephant seizes him, and, dexterously lifting him up with his trunk, and letting him fall again,

crushes him to death, by treading upon him, and forces his entrails through the wounds. Whenever a tiger makes his appearance near any place that is inhabited, he is hunted in this manner.

The birds which abound in India are of all the varieties known in other countries. Among the fish are dolphins, botenas, and albicores. The former has not the faintest resemblance to the descriptions of that fish, as given by our painters: it is as straight a fish as any that swims, and has a bright golden colour, appearing through a beautiful azure that is mixed with it. The fish is no sooner out of its element, than its colour begins to fade. There are many sorts of shell-fish on the coast of India, particularly oysters, which are little inferior to those caught on the coast of England.

The inhabitants of India are annoyed by swarms of insects and reptiles, such as musquitos, bugs, scorpions, snakes, and particularly serpents.

Travellers, who are not sufficient naturalists to class the latter, usually distinguish three principal sorts: First, the minute-serpent, which is a small black sort, with yellow rings, found frequently in pasture-land. The corrosive matter contained in the vesicles of this reptile is so sharp and violent, that it causes almost instantaneous death. The general opinion of the vulgar is, that a person may live just as many minutes after being bit, as the animal has rings round its body; and hence it is called the *minute-serpent*.

The second description of serpent is that called by the Portuguese *capella*, from a word in their language, signifying a cloak. It has a membrane on each side of the head, which, whenever the animal is irritated, rises up, and forms a kind of head-dress, that gives it a very beautiful appearance. This serpent is extremely venomous; but alkali cures its bite. The third species is the house-serpent, which is neither dangerous nor irritable. It even glides into the cradles of infants, without occasioning the least accident. Yet an emotion of horror is naturally excited on finding it in a human dwelling. As soon, therefore, as one of these reptiles is discovered, care is taken to destroy it; or, if it is to be caught, an enchanter is sent for.

This man arrives loaded with baskets, containing various kinds of snakes and serpents. His legs are furnished with a description of rings, which hang loosely on the ancle. These rings are cut in two, breadthwise, and the two parts hollowed, so that, at each motion of the juggler's foot, the two sides strike against each other, and produce a shrill noise, resembling the sound of a brass basin when struck with a hammer. Another instrument is also employed, called a drone bag-pipe; the noise of which is so great, that the serpent, stunned and overcome, is easily taken.

6. VOL. I.

The enchanter begins by making the serpents in the baskets dance; but he does not expose them till he has played some time to stupify them a little; yet, in spite of this precaution, as soon as the baskets are opened, the capelles, in particular, seem inclined to be angry; and, on being provoked, they rise up, and assume a threatening posture. The man keeps near them, and strikes occasionally with his foot to stupify them. When the right effect is produced, a giddiness takes place, the eye loses its lustre, and the serpent, by attempting to balance itself, exhibits the appearance of dancing.

The serpent that is to be caught, attracted by the noise, is sure to leave its retreat, and, on the sight of its fellow-creatures, it readily joins them, follows their example, and soon partakes of their supineness. The conjuror then puts a basket over its head, and, shutting it up, carries it off with the rest.

*Minerals.*] The diamond is found in beds of torrents, or in yellow ferruginous earth, under rocks of quartz, or sand-stone. The principal diamond-mines are those near Visiapour and Golconda, both near streams that flow into the Kistna, in the southern division of Hindoostan; Golconda being in the territory of the Nizam, while Visiapour belongs to the Mahrattas.

*Antiquities.*] The ancient monuments of Hindoostan are very numerous, and of various descriptions, exclusive of the tombs and other edifices of the Mahometan conquerors. But the most remarkable are those in the island of Elephanta, near Bombay; which have been thus described by the Rev. T. Smith, in his *Wonders of Nature and Art*:—

"The elephanta cave may be justly ranked among the most interesting antiquities of India; for it has not only excited the attention of every curious traveller, but ingenuity has been literally tortured, and conjecture almost exhausted, by the reiterated attempts of the learned to discover the era of its excavation, the purpose for which it was originally designed, and the true meaning of those hieroglyphic figures, which are still to be seen sculptured on the walls.

"This cave presents itself about half way up the ascent of the rocky hill, from whose bosom it is excavated; and the principal entrance is from the north. The massy roof is supported by four rows of columns, regularly disposed, but of an order in architecture different from any in modern use. Each pillar stands upon a square pedestal, and is finely fluted; but, instead of being cylindrical, gradually bulges out towards the centre. The capital is also fluted, and has the appearance of a cushion pressed flat by the enormous weight of the superincumbent mountain. Above these columns there runs a stone ridge, resembling a beam, cut out of the rock, and richly adorned with carved work; and along the sides of the cavern are

ranged forty or fifty colossal statues, which, as well as the pillars, are shaped in the solid rock. Some of these figures wear rich diadems; others have on their heads a sort of pyramidal helmet; and others display only bushy ringlets of curled or flowing hair. Many of them have four or six hands, in which they grasp the weapons of war and the trophies of peace, the symbols of justice and the ensigns of religion. Some of their countenances are extremely terrific, and some are marked with an air of deep dejection, while others are distinguished by a placid and serene benignity.

"At the upper end of the cave, amidst a profusion of sculpture, appears an enormous bust, with three heads, which is supposed to represent the great triple deity of India, *Brahma*, *Veeshnu*, and *Seeva*. The middle face, which is presented full, and expresses a dignified composure, is upwards of five feet in length, and nearly four in width. The face on the right was probably designed to represent the amiable attribute of the preserver *Veeshnu*, as the face is illumined with smiles, and gazes, enamoured, on a bunch of flowers, which its left-hand holds up to view: the right-hand holds a fruit, resembling a pomegranate, and on one of the wrists appears a ring, like that worn by the modern Hindoos. But the head on the left is certainly designed to express the dreadful attributes of the destroyer *Mahadeo*; for the features appear distorted by contempt and fury; serpents supply the place of hair; the tongue is violently thrust out between the teeth; the representation of a human skull is conspicuous on the covering of the head; and the right-hand grasps a hooded snake, which appears to be about a foot in thickness. Each side of this niche is supported by a gigantic figure, leaning on a dwarf.

"To the right of the grand bust, stands a large figure, which most travellers have denominated an *Amazon*, from the circumstance of its having no right breast, while the left is remarkably large and globular. This statue has four arms; the foremost right-hand rests upon the head of a bull; the other grasps a hooded snake; and in the inner left hand is a circular shield, which the figure turns toward itself: the head is richly ornamented. On the right stands a male figure, bearing a pronged instrument, somewhat like a trident; on the left is a female, holding a sceptre; and near the principal is a beautiful youth, sitting on an elephant. Above these are two curious figures, the one having four heads, and the other four arms; and at the top of the niche appears a groupe of small statues, supported by clouds.

"In a niche, on the left of the great bust, is a male figure, having four arms, and measuring nearly seventeen feet in height; and further to the left stands a female, about fifteen feet high, whose countenance is peculiarly soft and gentle. In the back-ground appear one figure

with four heads, supported by birds; another with four arms, seated on the shoulders of a man; and several smaller ones in attendance.

"On each side of these curious groupes is a small dark room, which, in ancient times, was probably sacred to the unpolluted Bramins; but is now occupied by bats, spiders, snakes, and scorpions. Captain Hamilton informs us, that, upon his entrance into the cave of Elephantia, he discharged a pistol, on purpose to drive away those dangerous creatures; and that, at the sound, a huge serpent, fifteen feet long and two feet thick, issued from a dark recess, which compelled him and his companions to make a precipitate retreat.

"To the left of the last described groupe is another, in which a male appears leading a female toward a majestic figure, seated in the corner of the niche, and wearing a head-dress, somewhat similar to that of a European judge on the bench: the countenance and attitude of the female are highly expressive of modesty and timid reluctance; but a male seems to follow, and urge her forward.

"In another niche, about fifty feet nearer the entrance, a very singular figure arrests the attention of every spectator. Its features are distorted, its mouth is wide open, and its whole aspect inexpressibly terrible. This statue, the limbs of which are carved in a gigantic style, has eight arms, but only six of them are now perfect. The two uppermost of those that remain are widely extended, and support a sort of canopy, upon which are sculptured various figures, in attitudes of adoration. One of the right hands grasps a sabre, and the other sustains, by the thigh, an infant, whom the furious monster seems about to destroy. Of the two left-hands, the uppermost holds a bell, which is constantly used in the religious ceremonies of the Hindoos, and the lower one supports what M. Niebuhr thinks a basin, to catch the blood of the infant; but what Mr. Hunter affirms, at the time of his visit, actually contained the mutilated figure of a child, with its face averted from the gigantic figure, and exceedingly bent; so that the head, which is now broken off, must have hung back very low, and have exhibited a horrid spectacle. Each arm of the great statue is decorated with bracelets, and on one of them is a chain of human skulls, which evidently shadow forth the destroying deity of India. Above and below this figure are several smaller statues, all of which have the sensations of distress and horror strongly depicted upon their countenances.

"On the opposite side of the cave are the figures of a man and woman, sitting, as the people of Hindoostan do at present, with an attendant on each side: at the feet of the male is the figure of a bull couchant; and in each corner of the niche stands a gigantic guard. Opposite is a correspondent niche; but the situation is dark, and the figures are greatly mutilated.

"A niche, filled with defaced sculptures, is observed on each side the entrance. On one side is a male, which appears to have had eight arms; but these are now broken off; in the back part is a figure with four arms, supported by birds; and another with four heads, whimsically elevated. In the opposite niche is a large figure, in a sitting posture, together with a horse in the back-ground, caparisoned according to the present mode of the country.

"At the west end of this grand cavern is a dark recess, twenty feet square, but destitute of any external ornament, except the altar in the centre, and eight figures which guard the four doors that lead into it. These figures, which are of the enormous height of thirteen feet and a half, are all finely sculptured in alto relievo, and appear as if starting from the wall to which they are attached. They have all rich collars round their necks, and their heads are decorated like those of the other statues. Such are the formidable guardians of a recess which was devoted to the most sacred mysteries of the Hindoo religion; but our pity and abhorrence are at once excited by the indelicate emblem, called the *Lingam*, under which they represented, in this pagoda, the power of the first creative energy, by whose operations all nature is produced.

"Exclusive of the interesting objects that have already been described, there are compartments on both sides, separated from the great cavern by fragments of rock and loose earth, which may probably have fallen from the roof. That on the right is very spacious, and contains several pieces of sculpture; the most conspicuous of which has a human body, but the head of an elephant; and is supposed to represent Ganésa, the first-born of *Seeva*, and the Hindoo god of Wisdom.

"The opposite compartment contains several figures: and a deep cavity in the rock is filled with excellent water, which, being always sheltered from the sun, is deservedly esteemed by those persons whom curiosity leads hither through a scorching atmosphere. J. Goldingham, Esq. observes, in his account of the elephant cave, that a traditional account of the extent of this cavity, and the communication of its waters, by subterraneous passages, with others very distant, was given him by a native of the island; which would make a considerable figure in the hands of a poet."

*Natural Curiosities.*] The most striking object of this description is the great Banian tree of India, which grows on an island in the river Nerbudda, and is supposed to be the most stupendous production of nature in the vegetable world. The following account of it, given by a writer of great respectability, cannot fail of proving acceptable:

"This tree, called *Cubeer Burr*, in honour of a famous saint, was formerly much larger than it is at present; for high floods have, at different times, carried away the banks

of the island where it grows, and along with them such parts of the tree as had extended their roots thus far: yet what still remains is about two thousand feet in circumference, measuring round the principal stems; but the hanging branches, the roots of which have not reached the ground, cover a much larger extent. The chief trunks of this single tree amount to three hundred and fifty, all superior in size to the generality of our English oaks and elms; the smallest stems, forming into stronger supporters, are more than three thousand; and from each of these new branches hanging roots are proceeding, which in time will form trunks, and become parents to a future progeny.

"The *Cubeer Burr* is famed throughout Hindoostan for its prodigious extent, antiquity, and beauty. Seven thousand persons, it is said, may easily repose under its shade; and there is great reason to believe that this is the amazing tree which Arrian describes, when speaking of the Gynosophists, in his book of Indian Affairs.

"English gentlemen, when on hunting or shooting parties, are accustomed to form extensive encampments, and to spend several weeks, under this delightful pavilion of foliage, which is generally filled with green wood-pigeons, doves, peacocks, and a variety of feathered songsters, together with monkeys, bats, &c. This tree not only affords shelter, but sustenance, to all its inhabitants, being loaded with small figs, of a rich scarlet colour, on which they regale with great delight.

"Milton's description of this tree, in the ninth book of his *Paradise Lost*, is equally elegant and accurate:

— "So counsel'd he, and both together went  
Into the thickest of the wood; where soon they chose  
The fig-tree; not that kind for fruit renown'd,  
But such as at this day, to Indians known,  
In Malabar or Deccan spreads her arms,  
Branching so broad and long, that in the ground  
The bended twigs take root, and daughters grow  
About the mother-tree, a pillar'd shade,  
High over-arch'd, and echoing walks between:  
There oft the Indian herdsman, shunning heat,  
Shelters in cool, and tends his pasturing herds  
At loop-holes cut through thickest shade."

About two miles westward of Gocauk is a view of one of the finest cataracts in Asia; for, after gaining the summit of a steep winding hill, the Gutpurba river appears perpendicularly rolling from the upper to the lower country. This river, in the rainy season, is said to be a hundred and sixty-nine yards broad, and the perpendicular fall of the water is one hundred and seventy-four feet two inches. "The river," says Mr. Moor, "comes, as far as we could see, from the westward, with a considerable declivity, and rushes with such impetuosity over the edge of the precipice, that the curve of the descending torrent is so great as to carry itself quite clear of any interruption;

and, somewhat more than midway, there appears to be a shelving ledge, formed by the fall of a rocky fragment, beyond which the river pours, and where a person, except from his apprehensions, might sit or walk in safety.

"The cavern, or basin, into which the river falls, is very capacious, with ragged sides, formed entirely of rock, and of greater height than the water-fall, owing to the declivity of the river's bed above the cataract; which declivity seems to have been caused by the incessant action of such a vast body of water upon its rocky bed. The sides of the river, in that part we have called a basin, is a continued rock for several hundred yards, and ponderous fragments are seen lying beneath, which have been rent from the solid side by some cause equally lasting and violent; and that the rocky precipice, over which the river rolls, is continually wearing away, very clearly appears, for in it may be seen deep large holes, spirally and circularly formed by the friction of eddies: the edge of the precipice, also, exhibits, in some places, the incomplete remains of these friction-formed holes, whence the rock has fallen.

"It is indeed terrific," continues our author, "to look from the edge of the precipice into the cavern below, which we accomplished by laying on our bellies, and creeping until the eye just peeped over; but the strongest head could bear such a sight but a very few seconds. We had no opportunity of examining the depth of water below, but could see that, throughout the extent of the cavern, from such a violent concussion, it was always in a state of ebullition. When at the bottom, the spray is felt to a considerable distance, and the noise may be heard several miles."

Mr. Moor concludes his observations in these words: "Although we saw the cataract at a very unfavourable time, being the driest part of a dry season, it was still sufficiently grand to convey to our minds a very exalted idea of its wonderful sublimity in the monsoon, when the river is at its plenitude; and we will venture to recommend it to any traveller, visiting these parts between the months of July and December, to make a point of seeing this cataract, as the most magnificent spectacle afforded to a contemplative eye, throughout the whole peninsula of India."

*Cities, &c.*] Calcutta, the chief city of Bengal, and the residence of the governor-general of India, is seated on the river Hoogly, the most westerly branch of the Ganges, at the distance of about a hundred miles from the sea; and the river is navigable up to the town.

Within these few years, Calcutta has been greatly improved, both in its appearance and in the salubrity of its air; for the streets have been properly drained, and the ponds filled up, by which means a vast quantity of stagnant water and noxious exhalations have been removed.

The best account of this city is given by M. de Grandpré, who visited Bengal a few years ago. Many improvements, which at the time of his arrival were only in contemplation, are now completed, particularly the splendid palace of the governor, which was erected during the administration of the Marquis Wellesley.

"In this metropolis of the English empire in Asia," says our author, "the magnificence of the edifices, the luxury which has converted the banks of the river into delightful gardens, and the costliness and elegance of their decorations, all denote the opulence and power of the conquerors of India and the masters of the Ganges."

"The windings of the river conceal, in some degree, the town of Calcutta, which we do not perceive till we are within a short distance of it. Fort-William, the finest fortress that exists out of Europe, presents itself immediately to the sight, which it astonishes by its grandeur and the splendour of the buildings that are seen above its ramparts. The houses which form the first front of the tower to the end of the glacis, are so many magnificent palaces, some of them having a peristyle of twenty-four pillars. All these structures, disposed in an irregular line through a space of more than a league, form an inconceivably striking prospect, and give to the town a most noble and majestic appearance.

"Calcutta is the only European settlement of any importance on this bank of the Ganges: the other nations have fixed upon the left side, while the English alone have preferred the right. Whatever were the causes of this preference, the situation is ill-chosen. The ground is not sufficiently raised above the level of the river, and frequently, in the high tides, the esplanade, which separates the citadel from the town, is not totally inundated, is at least covered with water in different parts, so as to be impassable.

"The air of Calcutta is by no means healthy, its position, between the river and a large lake in its rear, subjecting it to the influence of unwholesome exhalations: but the European inhabitants remedy this defect by living in the country. There is, however, one inconvenience that cannot be remedied, which is the situation of its port. This stands exactly at the turn of two points, which augment the violence of the current in every state of the tide. The bar is frequently here of sufficient strength to drive the vessels from their moorings. The currents being extremely violent, particularly in July and August, the time of the melting of the snow on the mountains in the interior parts of the country, the first effect of the flood-tide at these periods is, not only to stop the course of the river, but to surmount it with so much force as to require a rapid course of its own. Bengal lies so low, that when the sea, increased by these torrents, rushes in this manner into the bed of the river, its

violence is irresistible. The ebb-current, meeting a similar obstacle, has, at first, a tendency to raise itself; but the flood, being impelled with a superior force, gains the ascendancy, and passes over it. From this shock results a very heavy and foaming surge, which the tide pushes before it with a prodigious rapidity, to the imminent danger of every boat that is not prudently kept out of its way.

"As we enter the town, a very extensive square opens before us, with a large piece of water in the middle, for the public use. The pond has a grass-plot round it, and the whole is inclosed by a wall, breast-high, with a railing on the top. The sides of this inclosure are nearly five hundred yards in length. The square itself is composed of magnificent houses, which render Calcutta not only the handsomest town in Asia, but one of the finest in the world. One side of the square consists of a range of buildings, occupied by persons in civil employments under the Company, such as writers in the public offices. Part of the side towards the river is taken up by the old fort, which was the first citadel built by the English after their establishment in Bengal. It is an indifferent square, with extremely small bastions, that can mount at most but one gun, though the sides are pierced for two. The fort is without a ditch, and is no longer used for a fortification: the ramparts are converted into gardens, and, on the bastions and in the inside of the fort, houses have been built for persons in the service of the government, particularly the officers of the custom-house, who transact their business there. These fortifications are so much reduced from the scale on which they were originally constructed, that the line of defence is now only about a hundred and fifty yards in length, and the front not more than two hundred; though this small fort is much superior to that which the English had built at first at Madras.

"There are two churches of the English establishment at Calcutta, one of which is built in a superb and regular style of architecture, with a circular range of pillars in front, of the Doric order, and beautiful in their proportion; the cornice and architrave, ornamented with triglyphs, are in the same excellent state, and the edifice, altogether, is a model of grandeur and elegance. There are, also, besides these regular establishments, a Catholic church, belonging to the Portuguese mission; another, of the Greek persuasion, in which the service is performed by monks of the order of St. Basil; an Armenian conventicle, a synagogue, several mosques, and a great number of pagodas: so that nearly all the religions in the world are assembled in this capital."

For the following additional particulars, relative to Calcutta, we are indebted to an intelligent officer, in the service of his Britannic majesty:

"The European part of the town lies next the river,  
6. VOL. I.

and the houses are here much more elegant than at Madras, the garden-houses excepted. The reason of this is very evident: at Port St. George they are only used as offices or warehouses, the gentlemen invariably retiring to their garden-houses in the evening; whereas, at Calcutta, most of the merchants have their offices attached to their dwelling-houses, and, of course, both are kept in good order: for though the chunam, when kept clean and entire, rivals the Parian marble itself, yet, when it gets tarnished, or is suffered to drop off in parts, and thus discover the bricks underneath, nothing can have a more motly or beggarly appearance: and this is frequently the case at Madras, both in the Fort and in the Black-town.

"The great body of the native, or Black-town, stretches farther up, along the river-side, and is of considerable extent; abreast of this, the groves of masts that present themselves, bearing the flags of various nations, but chiefly the English, give one some idea of the commerce that must be carried on in this metropolis of India.

"Though the town itself is the residence of a great number of European gentlemen, yet the surrounding country, for some miles, is chequered, as at Madras, with handsome seats, which, from the fertility of soil, are encompassed with gardens and groves, far exceeding those of Madras in verdure and foliage."

"The governor's palace, or Government-house, as it is called, is situated on the western side of the esplanade, and is a most beautiful fabric. Over the four colossal arches that lead to it there are placed sphinxes, and various figures and emblems, that have a very good effect. The King's and Company's arms are emblazoned over the western and eastern gates. With respect to the interior of the building, it is the opinion of those who have seen it, that no adequate idea can be conveyed by words; the eye, not the ear, must be the medium of communication."

A most distressing event occurred in this city, in the year 1756, which is too remarkable to be omitted. The Indian subah, or viceroy, having quarrelled with the Company, and invested Calcutta with a large body of black troops, the governor, and some of the principal persons of the place, retreated, with their chief effects, on board the ships in the river; and those who remained for some hours bravely defended the place; but, their ammunition being expended, they surrendered upon terms. The subah, a capricious, unfeeling tyrant, instead of observing the capitulation, forced Mr. Holwel, the governor's chief assistant, and a hundred and forty-five British subjects, into a subterraneous prison, called the Black Hole, a place about eighteen feet square, and shut up from almost all communication of free air. Their miseries during the night were inexpressible; and, before morning, no more than twenty-three were found alive, the rest having died

of suffocation, which was generally attended with a horrible phrenzy. Among those saved was Mr. Holwel himself, who has written a most affecting account of the catastrophe. The nabob returned to his capital, after plundering the place, imagining he had routed the English out of his dominions; but the seasonable arrival of Admiral Watson and Colonel Clive put them once more in possession of Calcutta; and the war was concluded by the battle of Plassey, gained by the colonel, and the death of the tyrant, Surajah Dowla, in whose place Mhir Jaffier, one of his generals, who had previously signed a secret treaty with Clive to desert his master, and amply reward the English, was advanced to the subahship. In remembrance of this act of barbarity, the English erected a monument, between the old fort and the right wing of the building occupied by the civil officers of the Company, on the very spot where the deed was committed. It is a pyramid, truncated at the top, and standing upon a square pedestal, having a design in sculpture on each of its sides, and an inscription in the English and Moorish languages. It is surrounded with an iron railing, to prevent access to it, and exhibits a mournful appearance, well adapted to the event which it is designed to commemorate.

AGRA is one of the largest cities, and its castle the best fortification in India. The houses are so situated, as to command an agreeable prospect of the river; and the buildings of the great men are of stone, and elegantly constructed. The grand mosque is a magnificent edifice of marble and red free-stone, with high minarets, and gilded domes. The great number of mosques, caravanseras, squares, baths, and reservoirs, intermixed with gardens, trees, and flowers, render this place extremely pleasant. The palace is an elegant structure, situated, in the form of a crescent, on the banks of the river, and surrounded with beautiful gardens and fine canals.

DELHI, the former capital of India, and the principal place belonging to the present mogul, is chiefly noted for its palace, which is adorned with the usual magnificence of the East. Its stables formerly contained twelve thousand horses, brought from Arabia, Persia, and Tartary; and five hundred elephants. Here are also a spacious mosque, and a magnificent caravansera, situated in a large square, and surrounded by arches, supporting open galleries, where the Persian, Usbec, and other foreign, merchants reside, and have warehouses for their effects.

OUEIN, in the province of Agimere, is about six miles in circumference, surrounded by a strong wall, with round towers; it has four mosques, and several Hindoo temples. The fort of Gwallior, to the eastward of Oujein, is worthy of notice. The insulated rock, on which it stands, is about four miles in length, but narrow; the sides are almost perpendicular, from two to three hundred feet above the surrounding plain. This fortress was taken

by surprise, in 1779, by a small number of British troops.

LAHORE, situated in one of the largest and finest provinces in Asia, exhibits a variety of mosques, caravanseras, baths, pagodas, palaces, &c. It is, at present, the capital of the Seiks, and was the residence of the first Mahometan conquerors, before they advanced to the more central parts. The Seiks at length found means to free themselves from the chains of despotism; and, during the calamities of the Mogul empire, their number increased considerably, by the refugees from different nations. They have in this city a temple, with an altar, on which stands their code of laws, and next to it a sceptre and a dagger.

CASSIMERE, the capital of one of the most pleasant provinces in India, was held in the highest estimation by the ancient emperors of Hindoostan, who frequently retired thither, when public affairs would admit of their absence, to enjoy a delightful retirement from the troublesome ceremonies of state. The houses of this city are in general two or three stories high, and built of brick and mortar, with a large intermixture of timber. On a standing roof of wood is laid a covering of fine earth, which shelters the building from the great quantity of snow that falls in the winter-season, and also communicates a refreshing coolness in summer, when the tops of the houses, which are planted with a variety of flowers, exhibit, at a distance, a spacious view of a beautifully chequered parterre.

"The wealth and fame of the city and province of Cassimere," says a modern writer, "have been caused by the manufacture of shawls, which they hold unrivalled, and almost without participation. The wool of the shawl is not produced in the country, but brought from the districts of Tibet, lying at the distance of a month's journey to the north-east. It is originally of a dark grey colour, and is bleached in Cassimere by a certain preparation of rice-flour. The yarn of this wool is stained with such colours as are judged the best suited for sale, and, after being woven, the piece is once washed. The border, which usually displays a variety of figures and colours, is attached to the shawls after fabrication; but in so nice a manner, that the junction is not discernible. The texture of the shawl resembles that of the shaloon of Europe, to which it has probably communicated the name. The price, at the loom, of an ordinary shawl, is eight rupees; and, in proportion to the quality, it advances from fifteen to twenty. But the value of this commodity may be largely enhanced by the introduction of flowered work; and, as the sum of a hundred rupees is occasionally given for a shawl to the weaver, half of the amount may be fairly ascribed to the ornaments. The shawls usually consist of three sizes, two of which, the long and the small square one, are in common use in India; the other,

AMEDABAD, the chief city in the province of Guzerat, is situated in a delightful plain, watered by the river Sambremetty; and is surrounded by a wall of brick and stone, flanked with round towers, forty feet high, and has twelve gates. The town, including its suburbs, is about four miles in length, and is so intermixed with gardens and groves, that it has a most pleasing and rural aspect at a distance. One of the adjacent villages is distinguished by the tombs and monuments of the ancient kings of Guzerat.

CAMBAYA, situated at the bottom of a gulf of the same name, is about six miles in circumference, and has very extensive suburbs; the streets are spacious, and the houses well built with brick. The English and Dutch have factories here, though great part of the trade is removed to Surat; on which account the city is but thinly inhabited. It is surrounded by a brick wall, and has a stately castle for the nabob.

BOMBAY belongs to the English East-India Company, and has a harbour capable of containing a thousand ships at anchor. The town is about a mile long, and indifferently built; and the climate was fatal to English constitutions, till experience taught them preservatives against its unwholesomeness. The best water is preserved in tanks, which receive it in the rainy seasons. The fort is a regular quadrangle, and well built of stone.

MADRAS, or FORT ST. GEORGE, is the capital of the British dominions in this part of India, and is distant, eastward from London, about four thousand eight hundred miles. No pains have been spared by the Company in rendering the fort impregnable to any force that can be brought against it by the natives. It protects two towns, called, from the complexion of their several inhabitants, the White and the Black. The White Town is fortified, and contains an English corporation of a mayor and alderman.

"Madras, properly so called," says a respectable writer, "is a very large town, surrounded by a ditch, and a sort of wall, falling in some places into ruins, but sufficient to resist a surprise, or a sudden attack of cavalry, which is no small advantage; for, in war, the light cavalry of the natives are the most audacious free-booters in the world, burning and plundering indiscriminately every place that falls in their way. Madras is thus protected from their attacks; and, in case of a siege, every thing of value is removed into the citadel.

"The fortress is separated from the town by an esplanade, outside the gates: it stands on the sea-shore, and presents six fronts towards the land. The fort, having been built at several times, is of a very irregular construc-

tion; not in regard to the polygon, but in the plan of the fronts, which are almost all different from each other. That towards the north-east is on the Italian model of Sordi. Its opposite, on the south-west, is according to the plan of the Chevalier De Ville.

"All the works are well-faced with brick, and in complete repair: the covered way is palisaded, and carefully provided with traverses; the barriers and palisadoes are well-closed, and kept in good condition; the depots of arms are spacious; and the citadel, with a good garrison, might hold out against a European army of thirty thousand men for twenty days after the trenches were opened. As this fortress is intended, in case of siege, for the retreat of all the servants of the Company, it is necessarily filled with houses, which gives it a dark and unpleasant appearance. On this account, the English do not reside in it; even the governor lives in the country; and the rest of the English follow his example. They repair in the morning to the fort, for the transaction of business, and remain there till three o'clock in the afternoon, when they return, and the place seems deserted. Even the theatre is in the country; so that the ground, to a considerable distance, presents to the view a multitude of gardens, spread over an extent so great, as to prevent persons, who reside at the opposite extremities, from visiting each other, unless on horseback, or in carriages; the palanquins in many instances would be insufficient for the purpose.

"The position of Fort St. George is equally fortunate with that of Pondicherry, and is in like manner strengthened, on the south side, by a river, that washes the extremity of the glacis. Over this river is a handsome bridge of bricks. The west side is protected by an inundation, which the fort can at any time command, by means of a sluice, situated at the beginning of the glacis, and defended by the covered way. The northern side, as at Pondicherry, is the only side open to an attack.

"The Black Town is what is properly called Madras; and even the Indians still give it the name of Madras-Patnam. This addition of patnam is applicable only to capital towns, though some of very inferior rank still retain it; which is owing to such places having declined from their ancient splendor, or to the name having been applied by the Indians at a time when they were accustomed to behold nothing superior. The Black Town exhibits only a spectacle of filth and dirt; none of the streets are paved, or even covered with sand, but have a soil of black earth, which, mixing with the water, forms large collections of mud, that engender infection, and allows a free passage only to carriages.

"The black population of Madras is very considerable. There are several pagodas in the town, some mosques, an Armenian church, and a Portuguese one, in which the

service is performed by Capuchin monks, subject to the ecclesiastical jurisdiction of the bishop of St. Thomas, a small village at the distance of a league southward of Fort St. George."

SERINGAPATAM is situated in an isle, surrounded by the river Caveri, which is even here about five feet deep, and runs over a rocky channel. The length of this isle is about four miles, and the breadth about a mile and a half; the western side, being allotted to the fortress, distinguished by regular out-works, magnificent palaces, and lofty mosques; for Tippoo and his father were Mahometans. The environs were decorated with noble gardens; and, among other means of defence, was what is called the *bound hedge*, consisting of every thorny tree, or caustic plant, of the climate, planted to the breadth of from thirty to fifty feet.

COCHIN, on the coast of Malabar, is constructed on a good plan, but the buildings are very indifferent. The governor resides in an edifice scarcely better than a baro, and all the houses are proportionably mean. Its situation, however, for commerce, is admirable; as it stands on a fine river, capable of admitting very large vessels. The water, at the flood, is never less than twenty feet deep, and the harbour is sufficiently extensive for any ships, however numerous, that might trade to it. A number of small rivers and canals run into it, which facilitate the inland communication to a great distance up the country, and would give extraordinary activity to commerce. Its position, at the extremity of the peninsula, renders it easy of approach in all seasons, and diminishes the danger to which navigation is exposed, by the monsoon, from the south-west: nothing but a fine day is necessary to enable vessels to get out, and even to reach Cape Comorin, from which there is a passage to any part of India.

*Laws, Government, &c.*] The government of the ancient mogul emperors was formerly despotic in the highest degree; and such is that of the different native princes, to whom part of the country is still subject. The British government of Bengal and its dependencies was first vested in a governor-general, and a supreme council, consisting of a president and eleven counsellors: but, in 1773, an act of parliament was passed, by which a governor-general and four counsellors were appointed, with whom was vested the whole civil and military government of the presidency of Fort William; and the management and government of all the territorial acquisitions and revenues in the kingdom of Bengal, Bahar, and Orissa, so long as the company should remain possessed of them. The governor-general and council, so appointed, are invested with the power of superintending and controlling the government and management of the presidencies of Madras, Bombay, and Bencoolen. The governor-general and council to pay obedience to the court of directors,

and to correspond with them. The governor-general and counsellors are likewise empowered to establish a court of judicature at Fort William, to consist of a chief justice and three other judges, to be named from time to time by his Majesty; they are to exercise all criminal, admiralty, and ecclesiastical jurisdiction; to be a court of record, and a court of oyer and terminer for the town of Calcutta, and the factory at Fort William and its limits, and the factories subordinate thereto.

The people of Hindoostan are governed by written laws; and their courts of justice are directed by precedents. The Mahometan institutes prevail only in the great towns, and their vicinity. The empire is hereditary, and the emperor is heir only to his own officers. All lands are transferred in the hereditary line, and continue in that state even down to the sub-tenants, while the lord can pay his taxes, and the latter their rent, both of which are immutably fixed in the public books of each district. The imperial demesne lands are those of the great rajah families, which fell to Tamerlane and his successors. Certain portions of them are called jaghire lands, and are bestowed by the crown on the great lords or onrahs, and upon their death they revert to the emperor; but the rights of the sub-tenants, even of those lands, are indefeasible.

*Military Force.*] A military force is always maintained in Bengal; but, in point of numbers, varies according to the occurrence of events. Our soldiers are aided by the Sepoys, a native militia, who have a train of useless followers, so that the effective men seldom constitute more than a fourth of the nominal army. A force of twenty thousand European soldiers might engage and defeat a hundred thousand of the natives.

*Literature.*] Much honour is due to the late Sir William Jones, one of the three judges in the supreme court, for the institution of the Asiatic Society at Calcutta; and the late governor-general, the Marquis of Wellesley, is entitled to the highest commendation, for having founded a university in the same city, for the cultivation of science, and the improvement of the human faculties, in a region of the highest splendour and luxury.

*Population.*] The population of this extensive region is calculated to amount to sixty millions, of which the British possessions are now supposed to contain a quarter, especially as the numerous recent conflicts must have considerably reduced the population in many other parts of Hindoostan.

*Language.*] The languages and dialects spoken in India are various. The language spoken at the court of Delhi is the Persian; what is deemed the learned language is the Arabic; but not any is so generally understood as the Persian, though much corrupted. The Hindoo language is a kind of mixture of Persian and Arabic words, though the accent and dialect differ in the several

parts where it is used: the purest is said to be spoken in the province of Agra.

The Moors and Malabars have different characters. The Moorish language is derived from the Persian, of which it has taken the alphabet. This language is much used in every part of Asia, China excepted. The soldiers and sailors all speak it.

The Malabar language is that of the country; it has its particular characters. The study of it is by no means disagreeable; and it has literary works numerous enough to afford any one, who is desirous of instructing himself, sufficient opportunities.

*Manufactures, Commerce, &c.*] The manufactures of Hindoostan have been long and justly celebrated: particularly those of muslins, silks, and the shawls of Cassimere, already mentioned. The natives are very industrious in all the handicraft trades which they understand; and, in weaving and embroidering, they are said to do as much work with their feet as with their hands. Painting and sculpture are but very imperfectly understood; and the brightness of the tints, observable in their painted muslins and calicoes, is owing to nature rather than art. They export, in addition to their manufactures, many of the productions of their country; as diamonds, spices, drugs, aromatics, rice, sugar, raw silks, and many other articles of luxury.

Mr. Grose observes, that though the Banians, who are professed merchants, have been represented, by some authors, as a tricking artful set of people, difficult to deal with; this is so far from being true, that they are, in general, the fairest dealers in the world; and that those of Surat, especially, are famous for their simplicity and the frankness of their transactions. As an instance of this, on a ship's arrival, laden with goods, nothing more is necessary, than for the commander, or supercargo, to bring his samples on shore, together with his invoice; and these merchants resorting to him, will, if the assortment suit them, immediately strike a bargain for the whole cargo, with no other trouble than settling the per centage, upon the items of the invoice. "In this manner," says our author, "many a cargo, from five to thirty thousand pounds, and upwards, have been sold in half an hour's time, with very few words; and the amount immediately paid, either in specie or by barter, according as the buyer and seller have agreed, with at least as much probity as is ever practised by Europeans of the most established reputation. Indeed, these Banians have an advantage over our merchants, but it is such a one as we cannot reasonably complain of; this is a surprising coolness and serenity, with which they conduct all their affairs. If a trader offer them a great deal less than their goods are worth, or fly out into a passion at their undervaluing his, they will not shew the least indecent heat of temper,

7. VOL. I.

but suffer him to exhaust his resentment without interruption, and then calmly return to the same point.

*Religion, &c.*] The religion of the Hindoos, supposed to be the same with that of the ancient Gymnosophists, is all contained in the sacred books, called *Vedas*, and written in the Shanscrit language, which is now known only to the *pundits*, or learned men, among them. These books are supposed to have been the work not of the supreme God himself, but of an inferior deity, named *Brimha*. They inform us, that Brahma, the supreme god, having created the world by the word of his mouth, formed a female deity, named Bawaney, who, in an enthusiasm of joy and praise, brought forth three eggs, from which were produced three male deities, named *Brimha*, *Veeshnu*, and *Seeva*. Brimha was endowed with the power of creating all terrestrial objects, Veeshnu with that of cherishing them, and Seeva with that of restraining and correcting them. Thus Brimha became the creator of man; and, in this character, he formed the four casts from different parts of his own body; the Bramins from his mouth, the Chehterees from his arms, the Bice from his belly and thighs, and the Soodera from his feet. Hence, say they, these four different casts derive the different offices assigned them; the Bramins to teach, the Chehteree to defend and govern, the Bice to enrich by commerce, and the Soodera to labour, serve, and obey. Brahma himself endowed mankind with passions, and understanding to regulate them; while Brimha, having created the inferior beings, proceeded to write the *Vedas*, and delivered them to be read and explained by the Bramins.

Were it possible to obtain a sight of their sacred books, we might probably be enabled to remove the veil which envelopes their numerous mysteries; but the following anecdote, related by the Abbe Raynal, will show how little reason we have to hope for such a communication: "The Emperor Mahmoud Akbar had an inclination to make himself acquainted with the principles of all the religious sects throughout his dominions, having discarded the prepossessions of a Mahometan education, and formed the resolution of judging for himself. It was easy for him to learn the nature of those systems that are formed upon the plan of making proselytes; but he found himself disappointed in his design, when he came to treat with the Hindoos, who will not admit any person to a participation of their mysteries. Neither the authority nor promises of Akbar could prevail with the Bramins to disclose the tenets of their religion; he was, therefore, obliged to have recourse to artifice. The stratagem he made use of was to cause a boy, of the name of Feizi, to be committed to the care of these priests, as a poor orphan of the sacerdotal line, who alone could be initiated into the sacred rites of their theology.

"Feizi, having received proper instructions for the part

T

he was to act, was conveyed privately to Benares, and received into the house of a learned Bramin, who educated him with the same care as if he had been his own son. After the youth had spent ten years in study, Akbar was desirous of recalling him; but he was struck with the charms of his preceptor's daughter, and the old Bramin, instead of restraining the growing passion of the lovers, declared his assent to their union. The young man, divided between love and gratitude, resolved to conceal the fraud no longer, and, falling at the feet of the Bramin, discovered the imposture, and asked pardon for his offence. The priest, without reproaching him in the least, seized a poniard which hung at his girdle, and was about to plunge it in his breast; but Feizi arrested his hand, and declared himself ready to do any thing to expiate his treachery. The Bramin, bursting into tears, promised to pardon him, on condition that he should swear never to translate the sacred volumes, nor disclose to any person the symbol of the Bramin creed. Feizi readily promised all that his preceptor required—and the sacred books of the Hindoos have never been translated."

The first and most noble tribe among the Hindoos are Bramins, who alone can officiate in the priesthood, like the Levites among the Jews. They are not, however, excluded from government, trade, or agriculture, though they are strictly prohibited from all menial offices. They must be regularly admitted into the presence of their prince, whenever they please, and every one who meets them on the road must give way for them. They alone are allowed to read the *Veda*, or sacred books, and to them is committed the instruction of the people; but they are not permitted to assume the sovereignty.

There are several orders of Bramins. Those who mix in society are said to be of depraved morals; nor is this to be wondered at, since they are exempt from the civil jurisdiction, and are also taught, by their religion, that the water of the Ganges will effectually wash away all their crimes. The others, who live secluded from the world, are either weak-minded men, or enthusiasts, who abandon themselves, without reserve, to indolence and superstition; and their religion, which was anciently of the allegorical and moral kind, has degenerated into extravagant and obscene superstitions, owing to their having realized those fictions, which were originally intended as mere symbols of more important matters.

The Chehteree, or second cast, are those next in rank to the Bramins, and from whom the Hindoo sovereigns are invariably chosen.

The Bice, or Banians, who constitute the third cast, are those people whose office or profession is trade and merchandise. They have no peculiar religion, unless it be, that two of the eight general precepts given by their legislator, Brahma, to the Hindoo nation, are supposed

more immediately to relate to them, namely, those which enjoin veracity in words and dealings, and avoiding all practices of circumvention in buying and selling. They are the great factors by whom most of the trade of India is carried on; and are not inferior to the Jews and Armenians, either in point of skill or experience, in whatever relates to commerce. The chief agents of the East-India Company are of this nation. They also act as bankers, and can give bills of exchange for most cities in India. As they believe in a transmigration of souls, they eat no living creature, nor kill even noxious animals, but endeavour to release them when in the hands of others.

The Soodera, or fourth class, is the most numerous of all, and comprehends all the labourers and artisans of Hindoostan. These last are divided into as many classes as there are followers of different arts; all the children being invariably brought up to the profession of their forefathers.

The temples or pagodas of the Hindoos are stupendous, but disgusting, stone buildings, erected in every capital, and under the direction of the Bramins. To this, however, there are some exceptions; "for in proportion," says Dr. Robertson, the philosophical historian of India, "to the progress of the different countries in opulence and refinement, the structure of their temples gradually improved. From plain buildings, they became highly ornamented fabrics, and some of them, both by their extent and magnificence, are monuments of the power and taste of the people by whom they were erected."

The pagoda of Seringham, superior in sanctity to that of Chillamburum, surpasses it as much in grandeur; and, fortunately, we can convey a more perfect idea of it, by adopting the words of an elegant and accurate historian. "This pagoda is situated about a mile from the western extremity of the island of Seringham, formed by the division of the great river Caveri into two channels. It is composed of seven square enclosures, one within the other, the walls of which are twenty-five feet high, and four thick. These enclosures are three hundred and fifty feet distant from one another, and each has four large gates, with a square tower, which are placed, one in the middle of each side of the enclosure, and opposite to the four cardinal points. The outer wall is near four miles in circumference, and its gateway to the south is ornamented with pillars, several of which are single stones, thirty-three feet long, and nearly five in diameter; and those which form the roof are still larger: in the innermost enclosures are the chapels. Here, as in all the other great pagodas of India, the Bramins live in a subordination which knows no resistance, and slumber in a voluptuousness which knows no wants."

There are several sects among the Hindoos; but their differences consist rather in external forms than religious

opinions. They all believe in the immortality of the soul, a state of future rewards and punishments, and transmigration. The virtues of charity and hospitality are inculcated in the strongest manner, and exist among them, both in theory and practice. "Hospitality," they say, "is commended to be exercised even towards an enemy, when he cometh into thine house; and good men extend their charity even to the vilest animals; for the tree doth not withdraw its shade even from the wood-cutter, nor doth the moon withhold her light from the chandalah." These pure doctrines, however, are intermixed with many vile superstitions; and, besides their inferior deities, they have a vast number of demi-gods, or deified heroes, who are supposed to inhabit the air, the earth, and the waters; so that every mountain, river, wood, &c. is supposed to be under the protection of one of these tutelar deities.

The Hindoos pray thrice every day, at morning, noon, and evening, turning their faces toward the east. They use many ablutions, and always wash before meals. Fruits, flowers, incense, and money, are usually offered in sacrifice to their idols; but, for the dead, they offer a particular sort of cake, called *punda*. They all seem to worship fire; or, at least, they pay an extraordinary veneration to it. Bishop Wilkins informs us, that they are enjoined to light up a fire at certain times, which must be produced by the friction of two pieces of wood, of a particular kind; and the fire thus produced is made use of for consuming their sacrifices, burning their dead, and other solemn purposes. They believe all religions to be equally acceptable to the Supreme Being, and insist, that if the Author of the universe preferred one to another, it would have been impossible for any other to have prevailed, than that which he approved. Every religion, therefore, they imagine to be adapted to the country where it is established; and they conclude that all, in their original purity, are equally acceptable.

The religion of the Hindoos particularly enforces the observance of hospitality; and, on that account, they consider a person on a journey as a sacred object. A traveller is not only received with kindness, but his wants on the road are anticipated. Chauderies, which are places nearly similar to caravanseras, are built, in which he may enter freely, lodge, dress his provisions, if he have any, and depart without paying any thing. The hospitality would certainly be greater, if the poor traveller could find also something to eat; but a gratuitous asylum, in a country where the chief want is shelter from the inclemency of the climate, is, at least, a considerable accommodation.

These chauderies are sometimes very spacious; they are attended by a man, whose business it is to sweep and keep them clean. A traveller arrives, and, without ceremony, takes possession of the house. Another comes; the first makes room for him; and the new comer, without saying

a word, fixes himself wherever he pleases. The same rule is observed, till the chaudery is full. When the heat has subsided, they proceed to the next halting-place. In the evening, each lies down to sleep, without order or distinction; but, if a European be present, they leave him a little corner to himself. Independently of the chauderies in or near the villages, there are others at regular distances on the roads in the country, far from any other habitation. The traveller, parched by an ardent sun, or assailed by a storm, in the midst of an immense plain, and deprived of every other resource, thus finds an asylum from the injuries of the weather and climate. If water should not be abundant in the neighbourhood, they are careful to dig large ponds, in which men and animals may bathe, and quench their thirst.

The erection of these chauderies is not only a principle of religion, but is even a mode of atonement for sins. The rich are all anxious to have them built, wherever they suppose them to be necessary. A placeman, who has made an ill use of his authority, and acquired great riches by illicit means, expects, by building such establishments, to obtain forgiveness. To do good to travellers is to render himself agreeable to the Deity; and a man like this, loaded with crimes, will die in tranquillity, persuaded that he shall enjoy eternal felicity in the bosom of Brahma, if he have erected two or three chauderies.

There is a religious order among the Hindoos, called Faquirs: these are a kind of mendicant friars, who make vows of poverty and celibacy, and seem insensible both to pleasure and pain. To obtain the favour of Brahma, they suffer most dreadful tortures; and the austerities some of them undergo are incredible to those that have not been eye-witnesses of them; some stand for years upon one foot, with their arms tied to the beam of a house, or branch of a tree, by which means their arms settle in that posture, and ever after become useless; some sit in the sun, with their faces looking upwards, till they are incapable of altering the position of their heads; the people, in all these cases, thinking it an act of piety to cherish and support them.

The ordeal trials of melted lead, or boiling oil, as practised in India, are considered, by the Hindoos, as a standing miracle. The ceremony is performed with great solemnity. The party, who has appealed to this trial for his innocence, whether on suspicion of murder, theft, conjugal infidelity in the women, or even in denying a debt, is publicly brought to the side of a fire, on which is placed a vessel of boiling water or oil, but most commonly melted lead. The prince or magistrates of the country being present, his hand is previously clean washed, and a leaf of a particular tree, with the accusation written upon it, is girt round his waist; and then, on a solemn invocation of the deity by the Bramin, the person plunges in his hand,

scoops up the boiling fluid, and, if he draws it out unhurt, he is absolved; otherwise, he receives the punishment prescribed by the laws for the crime with which he is charged. And so firmly believed is this method of purgation on that coast, that Mr. Grose observes, even some of the Indian Christians and Moors have voluntarily submitted their cause to its decision.

*Manners, Customs, &c.*] The complexion of the Hindoos is black; their hair is long; their persons are straight, and well-formed; their countenances open and pleasant; and their walk, as well as their whole deportment, is extremely graceful.

The dress of the men is a white vest of silk, muslin, or cotton, girt with a sash. The sleeves are very long; and the upper part of the garment is contrived to fit, so that the wearer's shape may be seen. Under this is another, somewhat shorter. Their breeches descend so low, as to cover their legs; they wear slippers, peaked like women's shoes, into which they put their bare feet. Their hair is tied up in a roll, over which they wear a small turban.

The dress of the women is a piece of white calico, tied about the waist, which reaches to their knees, and the rest is thrown across their shoulders, covering the breasts and part of the back. Their hair, like that of the men, is tied up in a roll, and adorned with jewels, or toys in imitation of them. They have pendants in their ears, and several strings of beads round their necks. They wear rings on their fingers, and bracelets on their wrists and ancles.

The Moors, or Mahometans, in India, wear turbans of rich muslin, and their garments reach down to their feet. Their sashes are tastefully embroidered, the ends being decorated with gold and silver tissue. In their sashes they usually stick their daggers, and they wear embroidered slippers.

The Hindoos are, in general, very sober, and abstain from all animal food; the Bramins, in particular, never eat any thing that has had animal life: curries of vegetables are their common diet, the chief ingredients of which are turmeric, spices, and the pulp of the cocoa-nut. They esteem milk the purest food, and venerate the cow almost as a divinity.

In manners, the inhabitants of Hindoostan resemble the other natives of Southern Asia. They are effeminate, luxurious, and taught to affect a grave deportment. This initiates them early into the arts of dissimulation; so that they can caress those whom they hate, and even behave with the utmost affability and kindness to such as they intend to murder.

Their common salutation is, by lifting one or both hands to the head, according to the quality of the person saluted; but they never salute with the left-hand singly. The salutation of a prince is, by bowing the body very

low, putting the hand to the ground, then to the breast, and afterwards raising it to the head; this is repeated twice; and some fall on their faces before a sovereign.

On visiting among friends, the master of the house never rises to receive his visitor, but requests him to sit down by him on the carpet (for their floors are spread with rich carpets); and betel and areka are offered him to chew, which, as in the neighbouring countries, they have almost continually in their mouths. They sit and chew together, but talk very little. They sometimes play at cards, but are never out of temper when they lose. They are remarkably fond of smoking: the poor roll up a leaf of tobacco, about four or five inches long, and, lighting it at one end, smoke the other till it is about half exhausted, and then throw it away.

Dancing-girls are generally engaged at public entertainments, to entertain the company with a variety of dances, and perform plays by torch-light in the open air, which they execute with great judgment. They embellish their necks with carcanets, their arms with bracelets, and their ancles with small gold or silver chains. In their noses they wear jewels; and some of them form black circles round the whites of their eyes.

The dance of these women is a cadenced movement, performed to the sound of a drum, which a black beats with his fingers, and which he accompanies with a song, that, to ears of the least delicacy, would seem barbarous. The mode of beating time is with a small bell, or cymbal, which the dancing-master holds in his hand. This bell, or cymbal, he beats against the edge of another, of the same kind, which produces a brisk vibrating sound, that animates the dancers, and gives precision to their movements. They display, however, no elegant attitudes, but are full of gesticulation; and the motion of their arms seems to occupy their whole care and attention. Sometimes, during the dance, they play with Moorish poniards, an exercise in which they appear to be very expert. "One of them, who was considered as eminently dexterous," says M. Grandpré, "was sent for, one evening, to the house of the Malabar chief, to dance in my presence. Seemingly, some one had given her a hint; for she took infinite pleasure in frightening me with her poniards, the points of which she presented to me suddenly, turning quickly round every time she passed near me, but stopping with great precision within a finger's breadth of my breast. This movement was directed and timed by a stroke of the small cymbal, which the dancing-master struck unawares at my ear, and which never failed to make me start, to the great amusement of the crowd, which this exhibition generally draws together."

M. Thevenot gives an account of some extraordinary feats of agility performed by a girl of thirteen or fourteen years of age, who diverted the company for the space

of two hours and upwards; and, amongst her other performances, this appeared, to our author, to be extremely difficult: She sat down upon the ground, holding in her mouth a long sharp sword, and, with her right-hand, she took hold of her left foot, brought it up to her breast, then to her left side, and, without letting go her hold, she put her head underneath her right arm, and, at the same time, brought her foot down along the small of her back, then quite under her, and this four or five times without resting, being always in apparent danger of cutting her arm or her leg with the edge of the sword. Then with her left-hand and right-foot she performed the same.

The girl, having rested a little, a hole, two feet deep, was dug in the ground, and filled with water, into which they threw a little clasp, which she was to fetch out without touching it with her hands. To this end, she placed her feet on the sides of the hole, turning herself backwards till she stood upon her hands in the same place where her feet had stood. Then, bending her arms, she let down her head into the water to search for the clasp, which she missed the first time; but, making a second attempt, and resting only on her left hand, she raised herself up again with the clasp at her nose.

After this, a man set the girl upon his head, and ran full speed with her a considerable way, the girl not tottering in the least. Then, setting her down, he took a large round earthen pitcher, and put it upon his head, with the mouth upwards; and, the girl having got on the top of the pitcher, he carried her about as before. This he did twice more, having once put the pitcher with the mouth downwards, and the other time with the mouth sideways. The man then took a basin, and placed it, bottom upwards, upon his head, with the pitcher upon it, and the girl upon that, carrying her about with equal ease and security. In the next place, he fixed in the basin a wooden truncheon, about a foot high, and as thick as one's arm, upon which he caused the girl to stand upright, and ran about with her, as he had done before. Sometimes she stood upon one foot, holding the other in her hand, and sometimes sat down upon the top of the truncheon. Then the man put into the basin four wooden pins, about four inches high, placed in a square form, with a board upon each of them, the breadth of two fingers, and upon these four other pins, with boards upon them, making, as it were, two stages above the basin. Then, the girl standing on the top of these little boards, the man carried her about with the same swiftness; and, though the wind was high, she did not appear in the least afraid of falling.

The manner of drinking among the Hindoos is remarkable. They religiously avoid touching the vessel which contains the liquor with their lips, but pour it into their mouths, holding the vessel at a distance: their idea is

7. VOL. I.

that they would be polluted by drinking any stagnant liquid. They will drink from a pump, or any running stream, but not out of a pool.

The most usual method of travelling is in a palanquin, which is a kind of couch, covered with an arched canopy, and furnished with cushions, a quilt, and pillows. It hangs upon a bamboo, and the person in it may either sit upright, or loll at his ease. It is commonly carried by four men, two before and two behind, by means of poles, the ends of which are placed on their shoulders.

There are in this country several other methods of carriage, one of which is the *hackree*, drawn by oxen, some of which will go as fast as horses on a full trot. These oxen, which are generally white and very large, are kept as sleek and clean as possible; and, as a contrast to the whiteness of their skins, their horns are painted with a shining black, and bells are commonly hung about their necks. The *hackrees* are open on three sides, covered on the top, and made to hold two people, sitting cross-legged, with a pillow at their backs, to recline upon: and, in order to conceal the ladies who may travel in them, they have either folding blinds, or painted cloth, falling down the open sides. Each *hackree* has its driver; but, in Bengal, the most eminent of the Hindoo merchants ride on horseback, or in a chaise, richly ornamented, and the reins adorned with silver or gold studs. The beasts commonly used for draught and carriage are oxen, which are very swift of foot, and will carry a man twenty or thirty miles a day; and there are caravans of them, which sometimes amount to eight thousand.

The houses in Hindoostan are of two kinds, those built by the Moguls, and those by the original Indians. The houses of the former are all in the Persian taste; in short, they seem to imitate the Persians in every thing; like them, they have elegant gardens, with pavilions, fountains, cascades, &c.

As the Hindoo inhabitants, throughout the country, are twenty or thirty to one of the others, most of the principal towns consist of the habitations of the former, which are, for the most part, very mean: in front of these houses are sheds, on pillars, under which the natives expose their goods to sale, and entertain their friends or acquaintance: there are no windows opening to the streets; and even the palaces of their princes have not any external elegance. The apartments in the houses of the wealthy are ornamented chiefly with looking-glasses, which are purchased of Europeans, and many of their ceilings are inlaid with mother-of-pearl and ivory. The private rooms are always in the back part of the houses, for the better security of the women.

The marriages of the Hindoos are conducted with the utmost splendor and extravagance; the little bride and bridegroom, who are frequently only three or four years

U

old, are, for several nights, carried through the streets, richly dressed, and adorned with the finest jewels their parents can procure, preceded by flags, music, and a multitude of lights. The astrologer having fixed on a fortunate hour, they are taken to the house, where the father of the bride lives, and, being seated opposite to each other, with a table between, they join their hands across it, and the priest covers both their heads with a kind of hood, which remains spread over them about a quarter of an hour, while he prays for their happiness, and gives them the nuptial benediction; after which their heads are uncovered, and all the company are sprinkled with rose-water and perfumes. The evening concludes with a magnificent entertainment, and sometimes the festival lasts several days.

The Hindoo women treat their husbands with extraordinary respect and tenderness: their conduct is, in general, blameless, and very few are ever known to violate the marriage-bed. They are entirely in the power of their husbands, to whom they bring no other fortune besides their clothes, and perhaps two or three female-slaves. They begin to bear children at twelve years of age, and sometimes younger; for Mr. Grose says, he has seen them pregnant in their tenth year; but they seldom have any after they are thirty years old, and frequently, before that time, they lose their bloom, and all that plumpness and delicacy, for which they are justly remarkable.

With respect to the funerals of the Hindoos, some of them bury the body, and others burn it. Mr. Grose saw both these ceremonies performed at Bombay. The first he mentions, was one who buried his wife, a young woman of about twenty years of age. Those who accompanied the husband dug a pit, in the form of a well, on one side of which was a niche for the corpse to be placed in a sitting posture, with room sufficient for a plate of raw rice, and a jar of water, by her side. The pit was no sooner ready, than she was put into it, with all her clothes and jewels, exactly as she wore them when alive; but she was no sooner placed, than her husband, who stood by, jumped into the grave, and very composedly took off all her jewels, and brought them up with him; after which the pit was filled up.

The ceremony of burning is performed in the following manner: Having washed and dressed the corpse, the relations and friends carry it on a bier to a small distance from the town. This is usually done the next day; but, if a person die in the morning, his body is always burnt the same evening; for, in these hot countries, a corpse will not keep long. The funeral-pile is usually prepared near some river or pond; and, if he be a person of wealth, great quantities of fragrant wood are mixed with the fuel. Mr. Grose was present at burning the corpse of a youth of about eighteen years of age, the son

of a Banian. The funeral-pile was prepared on the beach, the father assisting at it bare-headed, and dressed in such coarse tattered garments as are usually worn on such mournful occasions. As soon as the corpse is placed on the pile, and some prayers muttered by the attending Bramin, fire is set to it at one of the corners, when it soon blazes up, and consumes the body to ashes, without any noisome smell. What particularly excited our author's attention was the behaviour of the father, who, according to the Hindoo custom, of its being always the next and dearest relation that sets fire to the pile, walked thrice round it, with a sort of desperate haste, and then, with his face averted, thrust his hand behind him, and set fire to it; after which, he rolled himself in the sand, and smote upon his aged breast, with the appearance of extreme agony.

The Bramins are represented, by ancient travellers, as having been accustomed to terminate their own lives on funeral-piles, lighted up by themselves; but to what refinement or cruelty this custom was extended to helpless females, has not appeared. This horrid practice, however, is now nearly abolished in India, and is chiefly confined to the cast of the Bramins. When an individual of this cast dies, one of his wives is bound to exhibit this dreadful proof of her affection. This lamentable sacrifice is not imposed upon them by law, for they may refuse to make it; but in that case they lose their character, are held in dishonour, and are deprived of their cast; a misfortune so intolerable, that they prefer to it the alternative of being burnt alive. Nature, however, revolts in some of these widows, and, it is probable, if left to themselves, that they would never consent to so cruel a sacrifice; but the old women and priests are incessantly importuning them, and representing, that after death the most exquisite happiness will be their lot; and, as they are commonly young, it is no difficult matter to triumph over their weakness and irresolution.

The manner in which this sacrifice is performed, varies in different places. As practised in Bengal, it is horrible. The funeral-pile of the husband is erected near a wall, with just space enough between for a single person to pass, that the widow may walk, as is the custom, three times round it. A hole is made in the wall, at the height of the pile, in which a beam, upwards of twenty feet long, is placed, with a rope fastened to the end of it, and hanging to the ground, for the purpose of making it oscillate.

When the widow has performed her ambulations, and taken off her jewels, which she distributes among her companions, she ascends the pile, and lies down, embracing the corpse of her husband. The beam is then put into motion, and falls upon her so heavily as to break her loins, or deprive her, at least, of the power of moving. The pile is then set on fire, and the music striking up.

contributes, with the shouts of the people, to drown the noise of her groans, and she is thus, in the full sense of the expression, burnt alive.

The following account of the burning of a Hindoo woman, on the funeral-pile of her deceased husband, is taken from the voyages of Stavroinus, who was an eye-witness of the ceremony.—“We found the body of the deceased lying upon a couch, covered with a piece of white cotton, and strewed with betel-leaves. The woman, who was to be the victim, sat upon the couch, with her face turned to that of the deceased. She was richly adorned, and held a little green branch in her right-hand, with which she drove away the flies from the body. She seemed like one buried in the most profound meditation, yet betrayed no signs of fear. Many of her relations attended upon her, who, at stated intervals, struck up various kinds of music.

“The pile was made by driving green bamboo-stakes into the earth, between which was first laid fire-wood, very dry and combustible; upon this was put a quantity of dry straw, or reeds, besmeared with grease; this was done alternately, till the pile was five feet in height, and the whole was then strewed with rosin, finely powdered. A white cotton sheet, which had been washed in the Ganges, was then spread over the pile, and the whole was ready for the reception of the victim.

“The widow was now admonished by a priest, that it was time to begin the rites. She was then surrounded by women, who offered her betel, and besought her to supplicate favours for them, when she joined her husband in the presence of *Ram*, or their highest god, and, above all, that she would salute their deceased friends, whom she might meet in the celestial mansions, in their names.

“In the meantime, the body of the husband was taken and washed in the river. The woman also was led to the Ganges for ablution, where she divested herself of all her ornaments. Her head was covered with a piece of silk, and a cloth was tied round her body, in which the priests put some parched rice.

“She then took a farewell of her friends, and was conducted, by two of her female relations, to the pile. When she came to it, she scattered flowers and parched rice upon the spectators, and put some into the mouth of the corpse. Two priests next led her three times round it, while she threw rice among the by-standers, who gathered it up with great eagerness. The last time she went round, she placed a little earthen burning lamp at each of the four corners of the pile; then laid herself down on the right-side, next to the body, which she embraced with both her arms; a piece of white cotton was spread over them both; they were bound together with two easy bandages, and a quantity of fire-wood, straw, and rosin, was laid upon them. In the last place, her nearest relation, to whom, on the banks of the river, she had given her nose-

jewels, came with a burning torch, and set the straw on fire, and, in a moment, the whole was in a flame. The noise of the drums, and the shouts of the spectators, were such, that the shrieks of the unfortunate woman, if she uttered any, could not have been heard.”

Another account of these horrid rites is given by a traveller of undoubted veracity.—“A young woman, twenty years of age, having been informed that her spouse died at two hundred leagues distance, resolved to celebrate his obsequies by burning herself alive. In vain was it represented to her, that the news was uncertain; nothing was capable of making her change the resolution she had taken. We saw her arrive at the place of her suffering, with such extraordinary gaiety and confidence, that I was persuaded she had stupified her senses with opium. At the head of the retinue, which accompanied her, was a band of the country music, consisting of hautboys and kettle-drums. After that came several virgins and married women, singing and dancing before the widow, who was dressed in her richest clothes, and whose neck, fingers, arms, and legs, were loaded with a profusion of jewels and bracelets. A troop of men, women, and children, followed, and closed the procession. She had previously washed herself in the river, that she might join her husband without any defilement. The funeral-pile was made of apricot-wood, mixed with branches of sandal and cinnamon. She beheld it afar off with contempt, and approached it with apparent composure: she took leave of her friends and relations, and distributed her ornaments amongst them. I kept myself near her, on horse-back, along with two English merchants. Judging, perhaps, by my countenance, that I was sorry for her, to comfort me, she threw me one of her bracelets, which I luckily caught hold of. When she was seated on the top of the pile, the attendants set fire to it, and she poured on her head a vessel of fragrant oil, which she immediately seized on: thus she was stifled in a moment, without being observed to alter her countenance. One of the assistants threw in several cruses of oil to keep the fire, and filled the air with frightful cries. She was entirely consumed, her ashes were thrown into the river.”

*History.]* Zinghis Khan, who invaded Hindoostan in the year 1221, and compelled the emperor to forsake his capital, is said to have given the name of *Mogul* to India. Long before Tamerlane, descended in the female line from that conqueror, Mahometan princes had made conquests, and established themselves in India. After many revolutions, Tamerlane entered India, at the end of the year 1398, and rendered himself sovereign of an empire which extended from Smyrna to the banks of the Ganges. The history of the successors of Tamerlane, who reigned over Hindoostan, with little interruption, more than 350 years, has been variously represented; but all writers

agree, that they were magnificent and despotic princes; that they committed their provinces to rapacious governors, or to their own sons, by which their empire was often miserably torn in pieces. At length, the famous Aurengzebe, in the year 1667, though the youngest among many sons of the reigning emperor, after defeating all his brethren, ascended the throne, and may be considered as the real founder of the empire. After his decease the empire was disputed by several of his descendants, most of whom had the imperial sway but a short time, till Shah Jehan was put in tranquil possession. He was succeeded, in 1719, by a prince of the Mogul race, who assumed the name of Mahommed Shah: but having pursued measures obnoxious to his principal general, that officer invited Nadir Shah, otherwise Kouli Khan, the Persian monarch, to invade Hindoostan. The invasion of Nadir Shah may be considered as putting a period to the greatness of the Mogul empire in the house of Tamerlane. Nadir, however, when he had sufficiently enriched himself, reinstated Mahommed Shah; but a general defection of the provinces ensued. This circumstance was followed by an invasion from Achmet Abdallah, treasurer to Nadir Shah, who being assassinated in 1747, Achmet put himself at the head of a powerful army, marched against Delhi, and being opposed by the Mogul's eldest son, Ahmed Shah, a war was carried on with various success, and Mahommed Shah died before its termination. His son Achmet then ascended the imperial throne, and reigned about seven years.

About this time the Mogul empire may be said to have been virtually dissolved; for the Portuguese formed some settlements in India, which were followed by those of the Dutch. The French power began to predominate in 1749, but closed in 1761, with the loss of their principal settlement, Pondicherry. The English, as merchants, had long held small settlements in Hindoostan, but the expedition into Tanjore, in 1749, was the first enterprise against a native prince. Other contests followed, concerning Arcot, in the Carnatic. In 1756, the fort of Calcutta, the principal settlement of the English in the province of Bengal, was taken by the nabob, and many of our countrymen were barbarously suffered to perish in a confined prison, called the Black-hole, as already related. The battle of Plassey, fought in June, 1757, laid the foundation of the subsequent power of the English in India. Lord Clive, governor of Bengal, in 1765, obtained a grant from the nominal Mogul of Bengal, Bahar, and Orissa, on condition of paying him an annual tribute. In 1767, the English were engaged in a war with Hyder Ally, a military adventurer; who had dethroned the lineal sovereign of Mysore, and usurped the supreme authority, under the title of regent.

Hyder Ally, dying in 1783, was succeeded by his son,

Tippoo Sultan, who, of all the native princes in India, proved the most formidable to the British government, and the most hostile to its authority. The peace of Mangalore, in 1784, had, it was supposed, secured his fidelity by very feeble ties; and the splendid embassy which he shortly afterwards dispatched to France, afforded reason to apprehend that some plan was concerted between the old government of that country and the tyrant of Mysore, for the annoyance of Great Britain in its Indian possessions; but this plan was happily defeated.

The increasing power of Tippoo was not less formidable to the Dutch than to the English; and the vicinity of Cochin, their most flourishing settlement on the continent of India, to the territories of that aspiring monarch, made them entertain the greatest apprehensions for its safety. From the vicinity of Cranganore and Acottah to his boundary, and their situation within the territory of an acknowledged tributary to Mysore, (the rajah of Cochin,) the possession of them was a most desirable object with Tippoo. In the month of June, 1789, he marched a formidable force towards Cranganore, with a professed intention of making himself master of it. Unable to retain the possession of the forts themselves, and fearing for a settlement of superior value, the Dutch readily entered into a negotiation with the rajah of Travancore for the purchase of them. That politic people easily saw, that, by placing them in his hands, they erected a most powerful barrier, no less than the whole force of Great Britain, (who was bound by treaty to assist him,) against the encroachments of their ambitious neighbour upon their settlement of Cochin. The imprudence of the rajah, in entering upon such a purchase while the title was disputed, drew down upon him the heaviest censures from the government at Madras; and he was repeatedly cautioned not to proceed in the negotiation. Such, however, were the ardour and temerity of the rajah in making this acquisition, that he not only concluded the purchase with the Dutch, but even treated with the rajah of Cochin, without the privity of Tippoo, though he was the acknowledged tributary of that prince, for some adjacent territory.

Tippoo could not remain an indifferent spectator of these transactions. He insisted on the claim which he retained over these forts, in consequence of their being conquered by his father, and on the ground of a subsequent compromise. He asserted, that, according to the feudal laws, no transfer of them could take place without his consent, as sovereign of Mysore; and, on the 29th of December, he made a direct attack, with a considerable force, upon the lines of Travancore. On receiving a remonstrance from the British government of Fort St. George, however, he desisted, and remained perfectly quiet for nearly three months, though still asserting his claims to the feudal sovereignty of the forts.

attack as Lord Cornwallis destined for him. His camp was strongly situated, and fortified by a bound-hedge and several redoubts. Nevertheless, after causing his position to be reconnoitred in the morning of the sixth, the commander-in-chief issued orders for the attack that very evening. The army was to march at night in three divisions, and without cannon. The plan of attack was indeed bold beyond the expectation of our army; but, like a discovery in science, which excites admiration when disclosed, it had only to be known, to meet with general applause.

"The result of this operation was, that Tippoo was driven from his camp into Seringapatam, all his redoubts taken, and a lodgment established on the island, in a strong position, where Lieutenant Stuart remained posted. All possible preparations were made, from this time, for taking the capital by assault: and they were such as probably would have been crowned with full success. On the 16th of February, the Bombay army, under General Abercrombie, after overcoming various obstacles, joined the main army, and remained posted to the north-west of the city.

"On the 19th, it was stationed on the south side of the Caveri, in a situation that seemed to give the sultan much uneasiness. However, after attacking the advanced post of this army, on the night of the 21st, Tippoo made no further effort; and, on the 24th, when the preparations for the general assault were in great forwardness, it was announced, that preliminaries of peace were settled. The conferences for this purpose had begun on the 15th; but the operations on both sides continued till the 24th. After the cessation of arms, the conduct of Tippoo was so equivocal and suspicious, as to make it necessary, on the part of the British, to renew the preparations for the siege. Overawed, at length, by the firmness and decision of Lord Cornwallis, and probably alarmed by the discontent of his own people, the sultan reluctantly submitted to the terms proposed; and on the 19th of March the copies of the definitive treaty were delivered, by his sons, to Lord Cornwallis and the agents of the allied princes.

"The substance of the treaty was, that Tippoo was to cede one half of his dominions to the allied powers; that he was to pay three crores and thirty lacks of rupees; that all prisoners were to be restored; and that two of the sultan's eldest sons were to become hostages for the performance of the treaty."

The victories which had forced the sultan to sign this treaty served, for a short time, to suppress his ambition; but he still retained the same hatred of the British government, and resolved to revenge himself, whenever he should have an opportunity of resuming his arms. The war which took place between England and France, in consequence of the French revolution, seemed to present

such an opportunity, and Tippoo willingly listened to the suggestions of French emissaries, that, by entering into an alliance with that republic, he might receive from it such aid and support, as should not only enable him to regain the territory he had lost, but entirely to expel the English from Asia, and share their territories with the French.

In the month of February, 1798, a proclamation was issued, by the governor-general of the Isle of France, importing that an embassy had arrived at that place, with letters from Tippoo Sultan, addressed not only to the governor of that island, but to the executive directory of France, proposing to conclude an offensive and defensive alliance with the French; and to commence against the British power in India a war of aggression, for which he declared himself to be fully prepared. The proclamation concluded, by offering encouragement to the subjects of France to enter into the service of the sultan, on terms to be fixed with his ambassadors. The circumstances attending this proclamation, on enquiry, established the fact, that Tippoo had actually concluded an alliance with the French; and it also appeared, that he had dispatched an embassy to Zemaun Shah, the sultan of the Abdalli, the object of which could be no other than to encourage that prince in the prosecution of his long-intended invasion of Hindoostan. The French expedition to Egypt, likewise, in the same year, appeared to have for its ultimate object the execution of a plan of invasion of the British settlements in India.

In consequence of these transactions, Lord Mornington, then governor-general of Bengal, addressed a letter to Tippoo Sultan, in which he expressed his surprise and concern at the intercourse he maintained, and the alliance he had formed, with the French; proposing to send to him Major Doveton, who might more fully explain the sole means which appeared effectual for removing all distrust and suspicion, and establishing peace and good understanding on the most durable foundation. His lordship, at the same time, expecting but little satisfaction from the negotiation he had thus offered to open, determined promptly to assemble the armies on the coast of Coromandel and Malabar; and directed all his attention to strengthen and improve the defensive alliance concluded with the Nizam and the Paishwa of the Mahrattas. He also gave orders to the government of Fort St. George, to complete the equipment of their battering-train, and to advance it, with all practicable dispatch, to the most eligible station on the frontier of the Carnatic, with a view of proceeding towards Seringapatam, if such a movement should become necessary.

No other answer was received from Tippoo than vague professions of a wish to maintain peace and amity. The sultan, however, declined receiving Major Doveton, al-

ledging that no means more effectual could be devised than the treaties and engagements already entered into, to give stability to the foundations of friendship and harmony, or to promote the welfare and advantage of all parties.

As it was now sufficiently obvious, that the sultan only wished to gain time and increase his strength, Lord Mornington determined to avail himself of the superiority of his force, and commence hostilities immediately. Accordingly, on the 3d of February, 1799, he directed Lieutenant-General Harris to enter the territory of the Mysore, with the army assembled under his command: and, on the same day, issued orders to Lieutenant-General Stuart to be prepared to co-operate from Malabar; and signified to Rear-Admiral Rainier, and to the several allies of the company, that he now considered the British government in India to be at war with Tippoo.

The army of Bombay, under the command of Lieutenant-General Stuart, arrived at the head of the Poodicherrun-ghaut on the 25th of February, and took post at Seedapoor and Scedasere on the 2d of March. The army of Madras, under Lieutenant-General Harris, entered the territory of Mysore on the 5th of March, and commenced its operations by the reduction of several forts upon the frontier. On the 6th of March, Tippoo passed his own frontier, and attacked a detachment of the army of Bombay, under Lieutenant-General Stuart, the total strength of whose entire army did not amount to six thousand effective men. The attack of the enemy was sustained by a body not exceeding two thousand men, and the sultan's army was finally defeated and dispersed before General Stuart could collect the whole of his divided force.

In consequence of this signal defeat, Tippoo retreated to his camp, at Periapatam, and remained there until the 11th of March, without making any attempt to molest the army. He then returned to Seringapatam, whence, in a few days, he moved to meet Lieutenant-General Harris, and the army of Madras, between which and the forces of Tippoo an engagement took place on the 27th of March, in which the sultan was completely defeated, and driven from every post which he attempted to maintain. General Harris then proceeded on his march, without the least interruption, till, on the 30th, he crossed the Caveri, with his whole army, and, on the 5th of April, encamped within two miles of Seringapatam, which he resolved to besiege immediately.

On the 14th of April, the army of Bombay joined the army before Seringapatam. A large body of the enemy's cavalry had attended them closely during their march from Periapatam, but without producing any effect. On the night of the 20th, General Harris received a letter from Tippoo Sultan, expressive of a desire to open a negotiation for peace. To this overture the general replied by transmitting a draft of preliminaries, founded on instruc-

tions with which he had been furnished by the governor-general; and which were, in substance, that Tippoo should deliver all Frenchmen, or natives of the island of Mauritius or Bourbon, or of any other countries now subject to France, as also all Europeans, natives or subjects of countries at war with Great Britain, to be treated as prisoners of war; that he should renounce all connection with the French nation; that he should cede one half of the dominions, of which he was in possession before the war, to the allies; that he should pay two crores of rupees (above two million sterling); and that he should send, as hostages, four of his sons, and four of his principal officers, together with half the required treasure, within forty-eight hours, to the camp of the allies.—To these propositions the sultan replied, that they were weighty, and could not be brought to a conclusion without the intervention of ambassadors. General Harris, considering this as evidently intended to gain time, refused to admit any ambassadors, unless accompanied by the hostages and specie required.

The batteries began to batter in breach on the 30th of April; and, by the 3d of May, the walls were so much destroyed, that an arrangement was made for assaulting the place on the following day, when the breach was reported practicable. The troops, intended to be employed, were stationed in the trenches early in the morning of the 4th, that no extraordinary movement might lead the enemy to expect the assault, which it was determined to make in the heat of the day, as the time best calculated to insure success, since the troops of the sultan would then be least prepared to oppose the attack. Accordingly, at one o'clock, the troops began to move from the trenches, crossed the rocky bed of the Caveri, and mounted to the assault, in spite of every obstacle which the difficulty of the passage and the resistance of the enemy could oppose. Their impetuous attack was completely successful. Resistance, however, continued to be made from the palace of Tippoo, for some time after all firing had ceased from the works. Two of his sons were there, who, on assurance of safety, surrendered to the British troops; and guards were placed for the protection of the family, most of whom were in the palace. It was soon after reported, that Tippoo Sultan had fallen; and that many of his chiefs were slain. Measures were immediately adopted to stop the confusion, at first unavoidable in a city strongly garrisoned, crowded with inhabitants, with their property in ruins from the fire of a numerous artillery, and taken by assault.

The princes having been removed to the British camp, search was made for the body of the sultan; which, after much difficulty, was found in one of the gates, under a heap of slain. He had been shot through the head, and bayoneted in three parts of his body, as he attempted

to escape. The corpse was next day recognised by the family, and interred with the honours due to his rank.

Tippoo Sultan was, when he fell, about fifty years of age. He was about five feet nine inches high; his face was round, with large full eyes; and his countenance full of fire and animation. In his disposition, he was naturally cruel, passionate, and revengeful. It is probable, that his abilities have been over-rated, and that he was neither so wise a statesman, nor so able a general, as he has been represented. Though he possessed a considerable share of prudence, as not, in general, wanting either promptitude

or judgment, he at last fell a victim to ill-concerted schemes, dictated by his ambition and thirst of revenge.

The death of this restless and ambitious prince has given a security to the British possessions of Hindoostan, which they never could have had during his life. His territories have been divided between the British, the Nizam, and the Paishwa of the Mahrattas, except certain districts of Mysore, which have been assigned to a descendant of the ancient Rajahs of Mysore, who is to pay an annual subsidy to the British government of seven lacks of pagodas, or seventy thousand pounds sterling.

## CHAPTER IV.

### INDIA BEYOND THE GANGES.

#### *Situation, Boundaries, &c.*

THIS peninsula, comprising the wide and various regions between Hindoostan and China, is situated between one and thirty degrees of north latitude, and between ninety-two and a hundred and nine degrees of east longitude. Its length is about two thousand miles; its breadth one thousand; and it is computed to contain a surface of 741,500 square miles. It is bounded by Tibet and China on the north; by China and the Chinese Sea, on the east; by the same sea and the Straits of Malacca, on the south; and by Hindoostan and the Bay of Bengal, on the west.

*Divisions.]* India beyond the Ganges is divided into the Birman empire, comprising Ava, Pegu, and Aracan; the kingdoms of Siam, Cochin-China, Achem, and Tonquin; and the countries of Malacca, Laos, Cambodia, and Chiampa; which, for the sake of perspicuity, we shall describe under different sections.

#### SECTION I.

##### THE BIRMAN EMPIRE.

*Climate, Soil, and Productions.]* The climate of Ava is extremely salubrious; the seasons are regular; and the extremes of heat and cold seldom experienced; at least, the duration of the intense heat, which immediately precedes the commencement of the rainy season, is very short. The soil is remarkably fertile, and produces as luxuriant crops of rice as are to be found in the finest parts of Bengal. Sugar-canes, tobacco of a superior quality, indigo, cotton, and different tropical fruits, in perfection, are all indigenous products of this fertile country. Ava

produces likewise the best teak-timber, or Indian oak, which, for ship-building, in warm climates, is superior to European oak. It abounds in mines of gold, silver, rubies, and sapphires; it also affords amethysts, garnets, very beautiful chrysolites, jasper, loadstone, and marble.

Of quadrupeds, there are elks, elephants, and most others, both domestic and wild, that are common in the southern kingdoms of Asia.

Pegu, being situated between the tropics, is flooded, when the sun is vertical; but the slime left by the waters fertilizes the low lands. The higher ground is parched with intense heat, after the rains have ceased; and the natives are obliged to water their fields by the communication of small channels from cisterns and reservoirs.

The hills of Pegu are clothed with fine wood, and the bamboos are of great utility to the natives. The country abounds with oranges, lemons, citrons, figs, pomegranates, bananas, durians, mangoes, goyyas, cocoa-nuts, tamarinds, pine-apples, &c.

The inhabitants use a great quantity of rice, and some wheat: they have plenty of garden-stuff, which is a chief part of their food. They have also pulse of various kinds, good poultry, and a variety of fish. In some of the royal parks are ponds of clear water, where tortoises, of a middle size, are kept and fed, the shells of which are a mixture of several colours.

This country produces rubies, small diamonds, and other precious stones, iron, tin, and lead, salt-petre, wood-oil, oil of earth, elephants' teeth, sugars, &c. The iron is excellent in its quality, and little inferior to steel. It is the opinion of many geographers, that the Golden Chersonesus of the ancients was the southern part of Pegu.

There are but few horses or sheep, but the people plough with oxen and buffaloes. Deer are exceedingly numerous; but though these animals are very fleshy, they are not fat. Not any place abounds more in elephants than this and the adjacent countries: they compute the strength of their armies by the number and size of these animals.

The soil of *Aracan* is very fertile, and produces all kinds of fruit, with various sorts of grain. The climate is healthful and pleasant in summer, but otherwise in winter; the inhabitants being subject to agues from the great rains that fall during that season, which continues from October to April.

*Cities.*] The present capital of the Birman empire is *UMMERAPOORA*, which, by its spires, turrets, and lofty obelisks, indicates its being the seat of royalty. It is situated between a lake on the south-east, and a large river on the north-west. The number and singularity of the boats, that are generally moored in the lake, and the surrounding amphitheatre of lofty hills, conspire to render the scene picturesque and interesting. The fort is an exact square, with public granaries and store-rooms, and there is a gilded temple at each corner. In the centre of this fort stands the royal palace, with a wide court in front, beyond which is the *Lotoo*, or hall of council, supported by seventy-seven pillars, disposed in eleven rows.

Of the ancient capital, *Ava*, the following description is given by Major Symes:—

"The walls of this city are now mouldering into decay, ivy clings to the sides, and bushes, suffered to grow at the bottom, undermine the foundation, and have already caused large chasms in the different faces of the fort. The materials of the houses, consisting chiefly of wood, had, on the first order for removing, been transported into the new city of *Unmerapoora*: but the ground, unless where it is covered with bushes or rank grass, still retains traces of former buildings and streets. The lines of the royal palace, of the *Lotoo*, or grand council-hall, the apartments of the women, and the spot on which the *piasath*, or imperial spire, had stood, were pointed out to us by our guide. Clumps of bamboos, a few plantain-trees, and tall thorns, occupy the greater part of the area of this lately flourishing capital. We observed two dwelling-houses of brick and mortar, the roofs of which had fallen in; these, our guide said, had belonged to *Colars*, or foreigners. On entering one, we found it inhabited only by bats, which flew in our faces, whilst our sense of smelling was offended by their filth, and by the noisome mildew that hung upon the walls. Numerous temples, on which the Birmans never lay sacrilegious hands, were dilapidating by time. It is impossible to draw a more striking picture of desolation and ruin."

*PEGU*, formerly the capital of the country so called,

8. VOL. I.

is also in a ruinous state. It was raised, in 1757, by *Alompra*; but the temples were spared, and the vast pyramid of *Shomodoo* has alone been revered, and kept in repair. The present monarch, to conciliate the native *Pegu*ese, has permitted them to erect a new town within the spot on which their ancient city stood. It occupies about half its extent, and is the residence of the governor. It is decorated with that extraordinary edifice, the *Shomodoo*, situated on a double terrace. The building is composed of brick and mortar, octagonal at the base, and spiral at the top, without any cavity or aperture. *Rangoon*, though of recent foundation, is one of the chief ports of the *Birman* empire; and towards the mouth of the river *Pegu* stands *Sirian*, a place of considerable commerce, when in possession of the Portuguese. *Martaban* was a sea-port, much resorted to, till the harbour was clogged up, by order of the *Birman* monarch.

*ARACAN* is a large and well-fortified city, situated in a valley, and fifteen miles in circumference. It is enclosed by very high stone walls, and surrounded by a ridge of steep craggy mountains, so artificially formed, as to render it almost impregnable; beside which, there is a castle within, strongly fortified. The city is well watered by a fine river, that passes through it in different streams, and at length forms two channels, which empty themselves into the *Bay of Bengal*. The environs are very extensive, and the adjoining countries extremely pleasant. The villages, mountains, &c. are beautifully diversified with fields of different kinds of grain, intermixed with pieces of water, and numerous flocks of cattle.

*Government.*] The *Birman* monarch, like the other oriental sovereigns, is despotic; and the prevailing characteristic of the court is pride. There are no hereditary dignities or employments in the *Birman* government. All honours and offices, on the demise of the possessor, revert to the crown. The titles the monarch assumes in his public acts are, "Lord of earth and air; the monarch of extensive countries; the proprietor of all kinds of precious stones; the king who performs the ten duties incumbent on all kings; the master of the white, red, and mottled elephants; whose praises are repeated far as the influence of the sun and moon extends."

But though the form of government is despotic, the monarch consults a council of ancient nobles. The *tsáloe*, or chain, is the badge of nobility, the number of strings or divisions denoting the rank of the person, being three, six, nine, or twelve, while the emperor alone wears twenty-four.

The royal establishment is arranged with great precision; princes bear the title of *Praw*, which is similar to that of *Augustus* with the Romans, and denotes sacredness and supremacy. The elder son of the monarch is styled *Engy Teekien*. Next in rank to the princes are the *Wou-*

gees, or principal ministers of state, the name signifying "Bearer of the great burden." These are three or four in number, who form the ruling council of the nation, issue mandates to the viceroys of the several provinces, and, in fact, govern the empire, under the control of the monarch, whose will is absolute. There are inferior ministers and secretaries, who have their respective departments; so that the concerns of government are conducted with great order and precision.

*Revenues.*] The revenues of the Birman empire arise from one-tenth of all produce, and of foreign goods imported; but the amount cannot be satisfactorily ascertained. Yet, as grants are usually made in lands or offices, and as money is not issued from the royal treasury but on urgent occasions, it is reasonable to conclude, that the monarch is immensely rich.

*Military and Naval Force.*] Every man in the Birman empire is liable to military service, but the regular army is very inconsiderable. During war, the viceroys raise one recruit from every two, three, or four houses, which otherwise pay a fine of about forty pounds sterling. The family of the soldier are detained as hostages; and, in case of cowardice or desertion, suffer death. The infantry are not regularly clothed, but are armed with muskets and sabres; while the cavalry carry spears, about seven or eight feet in length. The royal magazines are said to contain about twenty thousand miserable firelocks. But the war-boats form the chief military establishment, consisting of about five hundred, formed out of the solid trunk of the teak-tree, the length from eighty to a hundred feet, but the breadth rarely exceeding eight. The prow is solid, with a flat surface, on which a piece of ordnance is mounted; the rowers are provided with swords and lances, and the soldiers are armed with muskets; and each boat is usually manned by about eighty or ninety men. The attack is impetuous, and chiefly conducted by grappling; but, the vessels lying low in the water, the greatest danger is that of being run down, by a larger boat striking the broad-side.

On the declaration of war, the heralds proclaim their sovereign's will with flaming torches in their hands; and the governors of provinces are obliged to raise such a number of troops as the state wants, in addition to the accustomed military establishment. Upon these occasions, a troop of perhaps several hundreds of elephants are seen in full march, the king seated on his throne upon the back of one of the whitest, attended by all his nobles, with trumpets, and other military music, sounding as they march to the field of battle.

*Laws.*] The laws of the Birman empire are founded on their leading principles of religion, and form a system of jurisprudence well adapted to the promotion of moral rectitude.

If a man be imprisoned for debt, and cannot, or will not, pay his creditor, the latter may dispose of him as a slave; and this privilege, granted to creditors, stimulates the common people to industry.

In fact, their system of laws adapts punishments to every species of crime, and subjoins precedents and decisions, to direct the inexperienced in all doubtful and difficult cases. The laws may be said to inform the prince and the magistrate of their respective duties, in manly and energetic language.

*Language and Literature.*] The Birman alphabet represents thirty-three simple sounds, and is written from left to right, like the European. Major Symes, who visited the country in the year 1795, says, the Birman books are more neatly executed than those of the Hindoos, and that in every *kioul*, or monastery, there is a library. He expresses surprise at the number contained in the royal library, and also at observing the books to be regularly classed, and the contents of each chest written, in gold letters, on the lid. The librarian very politely, he adds, opened two of the chests; and shewed him some very beautiful writing on their leaves of iron, the margins of which were ornamented with flowers of gold, neatly executed. The major was informed, that the books were upon various subjects; and that divinity, history, music, medicine, painting, and romance, had their separate treatises. The volumes were disposed under distinct heads, regularly numbered. He concludes this part of his account with remarking, that "if all the other chests were as well filled as those which were submitted to his inspection, it is not improbable, that his Birman majesty may possess a more numerous library than any potentate from the banks of the Danube to the borders of China."

*Manufactures and Commerce.*] The Birmans are very expert in gilding, and other ornamental manufactures. Their edifices and boats are constructed with taste and elegance; and at one of their villages is a manufacture of marble idols, the materials being remarkably fine, and almost transparent.

A very considerable trade is carried on between the capital of Ava and Unan, the nearest province of China, consisting chiefly in cotton, with amber, ivory, precious stones, and beetle-nuts; the returns being raw and wrought silks, velvets, gold-leaf, preserves, paper, and some utensils of hardware. Some thousands of boats are employed every year in transporting rice from the lower provinces, to supply Unanratoora and the northern districts. European broad-cloths, and hardware, coarse Bengal muslins, China-ware and glass, are imported by foreigners. The Birmans, like the Chinese, have no coin; but their currency consists of silver in bullion, and lead.

Commerce derives most essential service from the two noble rivers, Burampooter and the Ganges; which, when

they approach the sea, divide into such a multitude of channels, and receive such a number of navigable streams, that a tract of country, nearly equal to Great Britain in extent, enjoys, by their means, the finest inland navigation that can be imagined.

*Religion.*] The Birmans are not votaries of Brahma, but of Boodh, who reformed many doctrines inculcated by the former, and severely censured the sacrifice of cattle, or even depriving any creature of life. The Birmans believe in transmigration, after which the radically bad will be sentenced to lasting punishment, while the good will enjoy eternal happiness. Mercy they deem the principal attribute of the deity.

The talapoins, or priests, recommend charity and humanity, as the greatest of virtues; and, indeed, these men do honour to human nature; if the accounts given of them be correct. When the master of a vessel happens to be shipwrecked on the coast, and, by this calamity, becomes the slave of the sovereign, the talapoins humanely intercede for him, and take him under their care and protection. In their temples these men supply a distressed stranger with every thing he wants; and, as they are physicians as well as priests, they tenderly take care of sick persons, and, after their recovery, give them letters of recommendation to some other convent on the road.

The actions of these men are influenced by real charity and benevolence. They never make any enquiries about a stranger; it is sufficient that he is a human being, and that they can relieve his necessities. All religions are by them deemed good, which inculcate the moral duties and social virtues. They think that persecution, and all modes of worship which are contrary to humanity or universal philanthropy, are obnoxious to Providence; and that the Almighty delights not in being adored in various ceremonies; but that all modes of adoration should be consistent with the most refined benevolence.

*Customs, Manners, &c.*] The Birmans are generally robust, and distinguished by remarkably broad and flat foreheads. They are so fond of this formation, that, when a child is born, they bind a plate of lead on the forehead, which they do not remove till they are satisfied it has had the desired effect. Their noses are exceedingly red, and the nostrils wide: but their eyes are small, and quick of discernment.

The men are of an olive complexion, but the women are much fairer. Both are thinly clad, and the highest orders among them wear neither shoes nor stockings. They let their hair grow long, which they tie on the top of their heads with a riband, in the form of a pyramid. When women of fashion go abroad to pay visits, they wear a frock, of cotton or silk, under which is a scarf, girded round the waist, and hanging almost to their ankles. This dress is said to have been the invention of a Birman

queen, who considered it as the most graceful that could adorn the sex. Their hair is divided into locks, each of which is tied and ornamented with knots of fine cloth. The colour of the habits of the common people is generally a dark purple.

The disposition of the Birmans is strikingly contrasted with that of the natives of Hindoostan, from whom they are separated only by a narrow ridge of mountains. Notwithstanding the small extent of this barrier, the physical difference between the nations could scarcely be greater, had they been situated at the opposite extremities of the globe. The Birmans are lively, inquisitive, irascible and impatient; the character of their Bengal neighbours is precisely the reverse. The unworthy passion of jealousy, which prompts most oriental nations to imprison their women within the walls of a harem, and surround them with guards, seems to have scarcely any influence over the minds of this more liberal people. The wives and daughters of the Birmans are not concealed from the sight of men, but are suffered to have as free intercourse with each other, as the rules of European society admit.

The women, however, have just cause of complaint; as the law makes a degrading distinction between the sexes. The evidence of a woman is not equally valid with that of a man, nor is a female permitted to enter a court of justice, but must give her testimony on the outside. The custom of selling women to strangers is not held to be disgraceful; so that a foreigner, during his stay at any of the places within this empire, may be accommodated with a temporary companion: hence most of the foreigners who trade here take a female, and, from the account of travellers, they are, in general, very faithful to their foreign masters, and often essentially useful in transacting their business; but, when a foreigner leaves the country, he is not permitted to take his temporary wife with him; to prevent which, every ship, previous to departure, is searched by officers of the customs; and, if their vigilance should be eluded, means would be used to discover the ship in which the woman had embarked, so that it could never again put into a Birman port, without being liable to a confiscation of property, and subjecting the master to a heavy fine and imprisonment. Female children, descended from Birman mothers, are not permitted to be taken from the country. Men are at liberty to emigrate, but women are detained, as their departure would injure the common-wealth, by contracting the sources of population.

The houses of the Birmans are small, and built with branches of palm-trees, or canes, raised upon pillars, and covered with leaves of the cocoa-tree; but the better sort have more spacious buildings. All the houses are without chimnies, or any convenience for firing, so that they dress their victuals without doors, in earthen pots.

The Birmans are fond of poetry and music, and among their instruments is one called Heem, resembling the ancient pipe of Pan, formed of several reeds, neatly joined together, and sounded by a common mouth-piece, so as to produce a plaintive melody. Their principal diversions are fishing and hunting, the celebration of festivals, and acting comedies, by torch-light, from evening to morning.

The treatment of the sick, in some parts of the empire, is so absurd and inhuman, as almost to exceed credibility. When a patient is considered incurable, he is immediately taken to the bank of some river, where he is left to be drowned, or to be devoured by beasts and birds of prey. This barbarous custom, however, is chiefly confined to the people of Aracan.

The Birman funerals are solemnized with great parade, and external demonstrations of grief. The bodies of the rich are burnt; but those of the poor are either deposited in the earth, or cast into the river. Persons of rank are embalmed after their decease, and honey is the principal ingredient used to preserve the body from corruption.

*History.*] It appears that the Birmans, a brave and warlike race, formerly subject to the king of Pegu, became afterwards masters of Ava, and caused a revolution in the former country, about the middle of the sixteenth century, when they took Martaban. The Portuguese continued to influence these countries till they were expelled by the Dutch, who obtained settlements in various parts of the Birman territory; while the English had factories at Sirian, and even at Ava.

The Birmans continued to exercise their sovereignty over Pegu till about the year 1740, when a civil war broke out, during which the British factory at Sirian was destroyed. By some European aids, the Peguense, in 1750 and 1751, gained several victories over the Birmans; and, in 1752, Ava was besieged and taken; the last of a long line of Birman kings being reduced to captivity; but two of his sons escaped to Siam.

When Binga Della, king of Pegu, had completed the conquest of Ava, he returned to his own country, leaving his brother, Apporaza, to govern the late capital of the Birman kingdom. All wore the aspect of tranquil submission, when there suddenly arose one of those men, who are destined, by means almost invisible, to break the strongest rod of power, and to change the fate of empires. Alompra, a Birman of obscure birth, was the chief of a small village, and was continued in this petty office by the victors. With one hundred devoted followers he attacked a band of fifty Peguense, whom he put to the sword, and afterwards defeated a small force sent against him; and, about the autumn of 1753, took possession of Ava, while the Peguense government seems to have been lost by mere infatuation. After repeated defeats, Binga Della himself advanced against Alompra, and the war was

conducted by fleets, on the great river Irrawady, as well as by land; that of the Peguense being utterly defeated in close combat by that of the Birmans. Alompra, proceeding in his conquests, founded the town now called Rangoon, which signifies "victory achieved;" and, soon after, chastised the people of Cassy, who had revolted from the Birman authority. In 1756, he blockaded Sirian, which yielded to his arms; and, after having deprived the capital of any foreign aid by water, he advanced against the city of Pegu, situated on an extensive plain, and then surrounded with no mean fortifications, while the stupendous pagoda of Shomodoo served as a citadel. This capital was invested in January, 1757, and, in about three months, was taken by the Birmans. Alompra then proceeded to subdue the countries to the eastward, as far as the ancient boundary between Pegu and Siam. Tavoy has been since added to the Birman possessions in this quarter.

Alompra next determined to chastise the Siamese, for the encouragement they had given to his rebellious subjects, and ordered a fleet to sail to Merghi, a sea-port, which was easily taken, and was followed by the conquest of the large and populous city of Tanaserim.

The conqueror next advanced against the capital of Siam; but, two days after the siege had commenced, he was seized with a fatal disease, which saved the Siamese from destruction. He died within two days' march of Martaban, about the 15th of May, 1760, regretted by his people, who venerated him as their deliverer, and as a great and victorious monarch. This founder of the Birman empire had not completed his fiftieth year: his person, strong and well-proportioned, exceeded the middle size; and, though his features were coarse, his complexion dark, and his countenance saturnine, there was a dignity in his deportment, that became his high station.

He was succeeded by his son Namdogee, who suppressed several insurrections, and died in 1764, leaving an infant son, Momien, whose uncle, Shembuen, second son of the great Alompra, assumed the regency, and afterwards the crown.

Shembuen, to divert the national attention, declared war against Siam, and, in 1760, two armies entered that country, from the north and south, and, being united, defeated the Siamese, about seven days' journey from their capital. The Siamese monarch privately withdrew, after a blockade of two months, and the city capitulated; a governor being appointed, who swore allegiance to the Birman sovereignty, and engaged to pay an annual tribute.

Alarmed at the progress of these conquests, the Chinese advanced an army from the province of Yunen, but they were completely defeated by the Birmans. Policy spared the captives, who were invited to marry Birman wives, the Hindoo prejudices being here unknown. Shembuen re-

built ancient Ava, the metropolis of the empire, which had fallen to ruin during the late commotions. The Siamese, though vanquished, remained unsubdued; and there is an inveterate enmity betwixt the nations, which will prevent either servitude or alliance. A Siamese prince assumed the monarchy, and, in 1771, defeated the Birmans. Shembuen afterwards turned his arms to the west, and forced the rajah of Cachar to pay homage to his power. He died at Ava in 1776, and was succeeded by his son, Chenguza, whose tyrannical conduct occasioned a conspiracy, at the head of which was Shembuen Minderagee, the present monarch, younger brother of the deceased Shembuen. Chenguza was slain in 1782.

The southern conquests of the Birmans had already extended as far as Merghi; and the northern provinces, formerly belonging to Siam, had been reduced to subjection and tribute. Minderagee determined to pass the mountains of Anoupec, and subdue Arracan, the rajah being of a supine character, and his subjects unwarlike, though they had never been reduced to pay homage to any foreign power. This project was formed in 1783, and was speedily effected.

After this conquest, the Birman arms were again turned against Siam, and, in 1785, a fleet was sent to subdue the Isle of Junkseylon, which carries on a considerable trade in ivory and tin, and is the only remaining mart of Siamese trade on this coast. Meeting with a repulse, the Birman monarch left his capital, at the head of thirty thousand men, with a train of twenty field-pieces; but was defeated by the king of Siam, who, in his turn, failed in an invasion of the viceroyalty of Martaban, which comprehends all the Birman possessions of the south. In 1793, a treaty was ratified between the Birmans and Siamese, by which the latter ceded the western maritime towns, as far south as Merghi. But, with this exception, and that of some northern provinces, the Siamese monarchy retains a considerable portion of its ancient fame.

## SECTION II.

### SIAM.

*Extent and Boundaries.*] The length of the kingdom of Siam is about ten degrees, or nearly seven hundred British miles; but of this about one half is not more than seventy miles in medial breadth. It is bounded by Pegu and Laos, on the north; by Cambodia and Cochinchina, on the east; by Malacca and the Bay of Siam, on the south; and by the ocean, on the west.

*Climate, Soil, &c.*] The winter here is dry, and the summer wet. Were it not that the sun draws clouds and rain, and the wind blows from one pole, when the sun is declined towards the other, the torrid zone could not be in-  
8.

VOL. I

habited. Thus, in Siam, that luminary being to the south of the line during winter, the north winds blow continually, and cool the air. On the contrary, in the summer, while it is to the north of the line, and vertical to the Siamese, the south winds prevail, and thus either cause incessant rains, or, at least, dispose the weather to be humid. The land seems to be formed by the mud descending from the mountains; to which mud, and the overflowings of the river, the soil owes its fertility; for in the higher parts, not reached by the inundation, all is dried and burnt up by the sun, soon after the cessation of the rains.

*Vegetables.*] Those trees in Siam are the most profitable which produce cotton, oil, and varnish, to which may be added the bamboo, as it grows to a prodigious size, and is of great utility. In the forests is produced timber for ship-building, house-building, &c. Cinnamon-trees are natives of Siam, but not so good as those of Ceylon. The iron-wood, which grows here, furnishes anchors. There is, likewise, a wood as light as fir, and of the same colour, but more adapted for carving.

The grain principally used in Siam is rice; but wheat is sometimes sown upon the land that the inundation does not extend to. This is watered by small channels, cut through the fields. The natives rear pulse and roots in their gardens; and they have radishes, garlic, and potatoes; but no parsnips, carrots, onions, or turnips; nor have they any of the esculent herbs that are used in Europe.

In tilling their land, the Siamese employ both oxen and buffaloes. These they guide by a cord run through the gristle of the noses of the animals, with a knot on each side, that it may not slip: it then passes through a hole or ring at the head of the machine used for ploughing. Nothing can be more simple than this plough: it consists of three pieces of wood; one is a long beam, which serves for the draught-tree or pole; another is crooked, serving for the handle; the third is a strong short piece, fastened underneath at the end of the handle; and it is this which bears the share. The whole is fixed together by leathern thongs.

Of flowers, here are tuberoses, jessamins, gilly-flowers, tricolets, amaranthuses, &c.; and among the fruits may be enumerated oranges, lemons, citrons, pomegranates, tamarinds, bananas, ananas, mangoes, &c.

*Animals.*] The quadrupeds here are tigers, horses, oxen, buffaloes, sheep, and goats; and there are some hares, but not any rabbits. There is great plenty of deer. The elephants of Siam are of distinguished sagacity; and those of a white colour are treated with a degree of veneration; as the Siamese, according to their ideas of transmigration, believe that the souls of such are royal.

The birds are peacocks, doves, pigeons, partridges,  
Z

snipes, parrots, sparrows, and various others. A bird, called the nooktho, is a very remarkable one; it is larger than an ostrich, and has a bill near three feet long.

The sea yields fine lobsters, delicate turtles, and small oysters, besides a variety of fish that Europeans are unacquainted with. Here are fine river-fish, particularly eels.

The insects are white ants, gnats, palmer-worms, &c. The river Meinam is, at distant intervals, infested with small poisonous serpents; and the trees on its banks are illuminated with swarms of fire-flies, which emit and conceal their light as uniformly as if it proceeded from a machine of the most exact contrivance.

*Minerals.*] This country is said to have been formerly rich in minerals; and this appears correct from the great number of statues, and other cast works, that are found here, many of which are of gold. M. Vincent, a French physician, discovered a mine of very good steel, and another of crystal; also a mine of antimony, and another of emery; exclusive of a quarry of white marble, and a rich gold mine. The latter he concealed from the natives. They had plenty of tin, which is rendered hard, as well as white, by being mixed with kedmia, a mineral reduced easily to powder: and this white tin is called tutenage. There is a mountain, near the city of Louvo, which produces loadstones: and there is another, near Jonsalam, on the Malacca coast.

*Rivers.*] The principal rivers are the Meinam, or mother of waters, which discharges itself into the gulf of Siam; the Mecon, that passes through Laos and Cambodia, and the Tenaserim, which falls into the Bay of Bengal.

*Cities.*] Yuthia, or Siam, the capital of the kingdom, is situated on an isle, formed by the river Meinam; and, as it is intersected by several navigable canals, the convenience to the inhabitants is very great. The walls are thick and high. The only public edifices worthy of notice, are the temples, the pyramids, and the royal palace; but even these are greatly inferior to those of the Birmans.

Bankok, which is about eighteen leagues to the south of Siam, and twelve miles from the sea, is the only place towards the coast that is fortified with walls, batteries, and brass cannon. The Dutch have a factory at Ligor, which stands at the east side of the peninsula of Malacca, but belongs to Siam.

*Government.*] The government of Siam is despotic, and the sovereign, as among the Birmans, is revered with honours almost approaching to adoration. His ministers, when in council, never presume to address him, but upon their knees. He has two bodies of horse-guards, who are natives of Laos and Meen; and a third, composed of foreigners. These guards attend his majesty on all his excursions; but they are never suffered to enter the palace-gates. The king, when he goes abroad, either rides upon

an elephant, most superbly caparisoned, or is carried in a grand chair. Once a year, he passes through the city, with a numerous train of elephants, and bands of music. The populace, during the procession, fall prostrate at his approach, and rise, after he has passed, to gaze at him.

No officer, or other person, must ever presume to approach the king in his royal apartment, without a previous order; nor must the great officers visit each other privately; the visit must be on some public occasion; and they must always speak loud, so as to be heard; for, if they speak in a low tone of voice, they are suspected of some disloyal design.

Nobility, in Siam, does not depend on dignity of birth, or extent of possessions, but exclusively on the favour of the prince. He sometimes ennobles persons of the meanest extraction, provided they have performed any particular services. To these he gives, as a mark of distinction, either a golden or silver bousette, to hold their betel. The king has many lords, who are peculiarly attached to his person: these always live within the palace. Others are employed without, to govern affairs, and preserve good order among the people. The rank of each nobleman is distinguished, when he appears abroad, by the richness of his sword, as well as other marks of honour.

Ambassadors are considered in a very inferior light at the Siamese court, being deemed only the special messengers of the princes whom they represent. Those who come from the neighbouring sovereigns, that are dependent on, or connected with, the king of Siam, are obliged to prostrate themselves before him, and advance towards him on their hands and knees. Ambassadors from Asiatic monarchs are treated with some degree of greater respect. European ambassadors are exempted from many of the ceremonials which the others are obliged to observe.

*Laws.*] The laws of Siam are represented by all travellers as extremely severe; death or mutilation being punishments sometimes inflicted for trivial offences, though some are rational and equitable.

That for robbery is the being obliged to pay double the value of the effects stolen, or the suffering corporal punishment, in case the delinquent have no effects to compensate.

He who wrongfully keeps possession of another man's estate, is considered as a thief or robber; so that, when ejected by law, he is not only obliged to restore the inheritance to its right owner, but also to pay, exclusively, the full value of such estate; half of which goes to the injured party, and the other half to the judge who tries the cause.

Those convicted of treason or murder are trampled to death by elephants. Omissions, in a general execution of orders, are punished by cutting the head with a sword, called pricking the head, as if to punish the memory.

d with a sword,  
h the memory.

The bastinado is sometimes exercised in a very rigorous manner. Almost the smallest appearance of guilt confirms the crime; and to be accused is nearly sufficient to render a man culpable.

*Revenue.*] The revenues of the king arise from cultivated lands, exports and imports, vessels, gardens, fruits, fines, confiscations, &c. The sovereign claims six months' labour from all his male subjects; if he be at war, they are enrolled as soldiers; but, in time of peace, they are employed in agriculture, mining, building, fishing, rowing, &c. They are divided into bands, each of which is under the direction of a proper officer, who frequently supplies their necessities, by lending them money, or paying their creditors; but this often turns out to his own advantage, as all who are insolvent become his slaves.

*Army and Navy.*] The latest travellers that have visited this country estimate the army that might be occasionally raised at sixty thousand, with not less than three or four thousand elephants. During a war, the officers under the king raise one recruit from every two, three, or four houses, which otherwise pay a fine of about forty pounds sterling.

The Siamese navy consists of about half a dozen capital ships, the crews of which are foreigners: there are, however, exclusive of these, about sixty galleys of war; but they are small, with only one man to an oar, who is obliged to row standing, the oar being so short, that, if not held perpendicularly, it would not touch the water. The king, in his naval expeditions, only makes reprisals on such of his neighbours as injure him in his commerce. His royal balcons, or pleasure-barges, consist of about a hundred and fifty, and are very magnificent.

*Language and Literature.*] In this country there are two languages spoken, the Siamese and the Bali. The words chiefly consist of monosyllables, like the Chinese. In literature, the higher orders make considerable progress, as they are placed at an early age under the tuition of the talapoints, or priests, by whom they are instructed in such branches of learning as are necessary to qualify them for the respective departments in life for which they are intended.

*Manufactures and Commerce.*] The despotism of the Siamese government is a great restraint upon manufacture, and particularly the custom of devoting the service of six months, by every subject, to the king. Though these people are not much skilled in the fabrication of iron and steel, they are said to excel in that of gold. They import some jewels from Hindoostan, and export rice, in great quantities, to the Asiatic islands, and carry on an extensive trade in deer-skins with the Japanese.

*Religion.*] The talapoints teach the doctrine of transmigration, and inculcate many tenets equally absurd and

paradoxical: but they tolerate the free exercise of all other religions.

The principles of the Siamese morals are reduced to five negative precepts: The first, "kill nothing," is extended to vegetables and seeds, as well as animals; because they believe the seed contains the plant, or is only the plant itself, under a cover. The person, therefore, who keeps the precept inviolate, must live solely upon fruit, which they consider only as part of a thing that has life, and which does not suffer by having its fruit plucked from it; but, in eating the fruit, the kernel must be preserved, as being a seed. The precept even forbids the destruction of any thing in nature; they believe, that, to break a branch of a tree is like breaking the arm of an innocent man, and offends the soul of the tree; but, when once the soul has been dislodged from any body, they think there is no crime in feeding upon the latter. They have methods of evading many of the rules ordained by their religion.

The second precept, "steal nothing," is most religiously observed; as is the third, generally, "commit no impurity." The fourth, "lie not, nor slander," is enforced with great zeal by the talapoints, and observed, as much as the frailty of the human heart will admit, by their disciples. The fifth and last precept, "drink no intoxicating liquors," prohibits not only the drinking strong liquors to excess, but even the tasting them at all.

*Customs, Manners, &c.*] The natives of Siam are of small stature, but well-proportioned: their complexions are tawny, and both sexes have broad faces: their eyes are small, their mouths large, their lips thick, their noses short, and their jaws hollow. Their hair is black and thick, and each sex has it cut so short as to reach only to the top of their ears, which are particularly large. Both men and women dye their teeth black.

The dress of the Siamese is very light, the warmth of the climate rendering clothes almost unnecessary. A muslin shirt, with wide sleeves, and a kind of loose drawers, are the principal garments of the rich, a mantle being added in the winter. A high conical cap covers the head. The women do not use the shirt, but a scarf, and the petticoat is of painted calico. From the Mahometans rose the use of popushes, a kind of pointed shoe, without either quarter or heel, which they leave at the doors of the houses they enter, to avoid soiling the rooms.

Their houses are small, constructed of bamboos, and raised upon pillars, to guard against inundations. Those of the higher orders only differ in extent and ornaments.

The principal pieces of furniture are, a small couch, covered with a mat, which serves for a seat by day, and a bed by night; but, when they retire to rest, a mattress, stuffed with cotton, is added, in lieu of a bed; many have likewise a sheet, a quilt, and a pillow; the rest of the fur-

niture consists of lacquered tables, cabinets with drawers, copper and earthen vessels, china-ware, &c. Besides which, every family has a chest of working-tools.

Rice and fish are their chief articles of food; but they also eat lizards, rats, and several kinds of insects. The value of about a penny sterling will procure a poor man his daily pound of rice, with some dried fish, and arrack. The buffaloes yield rich milk, but butter, in this climate, would soon melt and become rancid, and cheese is unknown. Little animal-food is used here, mutton and beef being extremely bad. The higher orders have a favourite dish, called *balachaun*, made of small fish, reduced to a mash; and luxuries are introduced at stated festivals.

The Siamese have very clear ideas, and are extremely engaging in conversation. They are naturally kind and complaisant, though rather haughty when too much submission is shewn them. They abhor drunkenness; and a sincere affection subsists between men and their wives, who teach their offspring to be temperate, modest, obliging, and affectionate. They are partial to the customs of their ancestors, and little admire the curiosities of foreign countries.

Great subordination is observed here. Servants and slaves, when in the presence of their superiors, must either kneel, or sit on their heels, with their heads inclined, and their hands raised to their foreheads. When persons of inferior rank pass their superiors in the street, they bow the body, join their hands, and raise them to their heads. In visits, an inferior prostrates himself, and never speaks till he is addressed by the person to whom he makes the visit. The visited offers his place to the visitant, and presents him with fruit, betel, &c. The right-hand is looked upon as more honourable than the left; and that part of a room opposite the door is always offered to a visitor. If there be many guests present, they are all seated according to their respective ranks.

The fair sex, in this country, are not under much restraint, and are, in general, married at a very early age. The espousals are concluded by female negociators, and, as wealth is carefully concealed, for fear of extortion from the prince or magistrate, a magician is consulted respecting the propriety of the marriage. If his opinion be favourable, the lover makes three formal visits to his mistress. On the third visit, the relations of the parties meet, when the bride's portion is paid, and the marriage is considered as fully completed, without further ceremony. But, a few days afterwards, the new-married couple are sprinkled with water, appropriated for that purpose, and prayers are offered to heaven for their felicity. The wedding is then celebrated with feasting, dancing, and music, at the house of the bride's father. Although the men are permitted to marry several wives, very few, except the higher classes, have more than one; and this

is done rather for grandeur, than from motives of either convenience or regard. Amongst the ordinary class, women work for their husbands, and maintain them during the whole time they are in the service of the prince, which is about six months in the year. They till the land, buy and sell goods, and do other necessary business. Divorce is here tolerated, on condition that the husband restores to his wife the portion she brought him. In this case, the children are divided equally between the disunited parties, who are at liberty to marry again as soon as they please.

The method of travelling in Siam, is riding on the buffalo, the ox, and the elephant. Every person has an unlimited privilege to hunt and take a wild elephant, but he must not kill him. The female is employed in common uses, and the male is trained for war. Persons of rank ride in chairs, or sedans, which are square, with flat seats, placed on biers, and carried on men's shoulders. To some there are eight men, to others four. The Europeans have the privilege of riding in palanquins, or canopied coaches, carried on men's shoulders. Umbrellas are not allowed, but to such natives as have the royal sanction. The Siamese amusements consist of theatrical entertainments, taken from their mythology, interspersed with pantomime and dancing. They have, also, ox-races, boat-races, tumbling, wrestling, rope-dancing, and exhibitions of fire-works: and, as the men are extremely indolent, they are much addicted to games of chance.

The funeral-ceremonies of the Siamese resemble, in many instances, those of the Chinese. Their dead are deposited in lacquered coffins, which are placed upon a table, till every necessary preparation is made for the funeral. In the meantime, they light up tapers, and burn perfumes. The talapouns, or priests, assemble, and sing stanzas, for which they are well requited by the relations of the deceased. The corpse, in proper time, is taken into the fields to be burnt. The pile is made near some temple, in a square spot of ground, fenced with bamboo. The body is decorated with gilt and stained papers, representative of birds, flowers, fruits, &c. which are for the use of the deceased in the other world, where such emblems are supposed to be animated and realized. Various instruments of solemn music attend the procession to the funeral-pile, and the mourners are all dressed in white.

When they arrive at the place of interment, the body is taken out of the coffin, and laid on the pile; then the priests sing, and a fire-work is played off. About noon (for it is in the morning the dead are thus carried) the pile is kindled, and the ashes of the deceased are afterwards deposited in some part of the temple. The poorer sort do not burn the bodies of their deceased relations, but

either privately inter them, or else expose them on a scaffold in an open field, where they are devoured by birds of prey.

*History.*] By Loubere's account, the first king of Siam began to reign in the year 1300 of their epoch, or about 756 years after the Christian era. In 1568, the Pegu monarch declared war, on account of two white elephants, which the Siamese refused to surrender; and, after prodigious slaughter on both sides, Siam became tributary to Pegu; but, about the year 1620, Rajah Hapi delivered his crown from this servitude. In 1680, Phalcon, a Greek adventurer, being favoured by the king of Siam, opened an intercourse with France, in the view of supporting his ambitious designs; but they were punished, by his decapitation, in 1689, and the French connection, in consequence, ceased. The latter events of Siamese history are similar to, and coeval with, those of the Birman Empire.

Turpin asserts, that the first king began to reign about 1444 years before Christ, and that he had forty successors before the epoch of the Portuguese discovery, in 1546, many of whom were precipitated from their thrones, on account of their despotism. He says, that all these kings were of different families; and it is, therefore, probable, that he has confounded monarchs with dynasties.

The war of the white elephant, so called because it arose from the refusal of the king of Siam to yield one of these animals to the Birman monarch, ended in the subjugation of Siam; but the time when this happened is not known. Repeated cruelties sully the page of Siamese history; and one of the monarchs made the following ingenious apology for his own despotism.

"A Sancrit, proud of his dignity, supposed that he had a right to instruct the sovereign in his duty, and dared to represent to him, that all the nation murmured in secret at his extreme severity. The prince heard him, without appearing offended at his indiscreet zeal; but, some days after, sent to the house of his monitor an ape, an animal detested by the Siamese, with orders to let him have abundance of food, without any restraint or punishment. The Sancrit was obliged to suffer all the caprices of this new guest, who overturned the furniture, broke the vessels of porcelain, and bit all the domestics. At last, losing all patience, he warmly supplicated the monarch to be delivered from his domestic enemy. "What," replied the king, "you cannot suffer for two days the tricks of a little animal; and you wish that I should endure all my life the insolence of a people, a thousand times more wicked than all the apes of all our forests. Learn, that, if I punish the bad, I also know how to reward merit and virtue."

One of the most remarkable events, after the French had evacuated Siam, is the war against the kingdom of Cambodia, which was obliged, on this occasion, to seek

8. VOL. I.

the protection of Cochin-China. The Siamese army, having advanced too far into the country, was destroyed by famine; and even their fleet had little success, though it destroyed the town of Ponteanias, with two hundred tons of elephants' teeth.

In 1760, a remarkable revolution happened in Siam, preceded by violent civil wars between two rival princes. According to Forbin, in 1754, the Birmans, or people of the kingdom of Ava, had already languished five years under the Pegu domination, and had beheld the death of their king, their queen, and the greater part of their princes. The remembrance of their past misfortunes, and the acute sense of their humiliating servitude, made them incessantly sigh for a deliverer. They did not seek him among men softened by the luxury of the court, and who, proud of their titles, computed their talents by their ambition. They threw their eyes on one of their compatriots, named Manlong, a gardener by profession, who, though condemned to abject and painful functions, had the courage and firmness of a hero: they begged him to accept the sceptre, and to deliver them from the yoke of their tyrants. "Yes," replied this extraordinary man, "I consent to be your king; but the first step must be, to prove that you are worthy to have a chief like me. I command you to cut off the heads of all the little subaltern tyrants, whom the Peguans have sent to oppress you." They answered, that, if this were the only sacrifice, he should instantly be obeyed: and, after the massacre, Manlong was proclaimed king. He began by forming a strong cavalry, and a body of fusileers, who had orders to fire upon all fugitives of their own army; a discipline which, being rigorously observed, rendered the Birmans almost invincible. About 1759, they took, and completely ruined, the city and port of Siriam. Having advanced to Martavan and Tavail, the new monarch heard of the riches of Siam, and conceived the design of its conquest. He then dispatched thirty ships to pillage the cities of Merghi and Tanaserim; and was persuaded, that he should easily subdue the whole kingdom of Siam.

Upon the first tidings of this irruption, the Siamese monarch sent to the bishop of Tabraca, to request the assistance of the Christians; who, though only amounting to one hundred, behaved with great bravery. The Birman sovereign was only at a distance of three days' march from the capital, when he was attacked with an abscess, which proved mortal. Nevertheless, the suburbs of the Dutch quarter were ravaged and burnt; and the surrounding country exposed to the greatest cruelties. The death of Manlong, however, delivered the capital; the youngest of his sons, having assumed the sceptre, found himself under the necessity of returning to his own kingdom, in order to stifle any revolt.

The king of Siam was forced, soon after, to abdicate the

throne, having rashly pronounced a sentence of death against the favourite of his brother. He became a Talapoin, or priest, in May, 1762, and his example was followed by many nobles. Siam remained in a state of security, upon the report that the Birman prince had been dethroned upon his return to Ava; and that his elder brother, who had succeeded, had no wish to make conquests. The pacific monarch, however, having died suddenly, and a pretence of war being afforded by the assistance lent by the Siamese to a rebel Birman governor, on the 10th of January, 1765, in the dusk of the evening, a confused noise of a multitude, who filled the air with lamentations, was suddenly heard along the river of Merghi. This tumult occasioned a conjecture, that the enemy were about to appear. In fact, the Birmans were only three or four leagues from the town, and a pilot had perceived ten of their vessels. Yet, the reports being various, a momentary calm succeeded. But, about four o'clock in the morning, the sound of cannon announced the arrival of the enemy. Their conduct, though cruel, was not so atrocious as in the war of 1760.

After the capture of Merghi, a Birman general conducted the greater part of their army to the city of Tanasserim, which was reduced to ashes; but the victorious army, more intent on pillage than anxious to establish a conquest, devoured the spoil in debauchery; and, when it was exhausted, they proceeded in search of a supply. The general, flattered with his first success, promised himself easy triumphs, and marched against Yuthia, persuaded that the conquest of the capital would give a powerful example of submission to the other cities. The provinces on the north-west of the royal city were ravaged, the inhabitants only saving themselves by their dispersion into forests. The fire, which devoured the towns and villages, threw terror into the capital, and the Siamese, threatened with destruction, reunited their forces. They tried the fate of a battle, and fought with unusual ardour; but their sanguinary defeat left their country in the power of the conqueror. The fields, ravaged by the consuming flames, presented nothing but ashes; and famine became then more terrible than war. The Birmans built, at the confluence of two rivers, a fortified station, which they called Michong. The Siamese, on their part, attempted to fortify the capital, and eagerly invoked the assistance of two English vessels, which happened to arrive. The captain of one of them consented to defend the capital, on condition of being supplied with cannon and ammunition; but the jealous Siamese insisted, that he should first lodge his merchandise in the public magazine. He consented; and, after some conference with the ministers, prepared to justify the confidence which had been placed in his courage. He ordered descents, which were all destructive to the enemy: their forts were destroyed, be-

fore they were completed; and every day was marked by their defeat or their flight. But this dastardly court, on the demand of the captain for more ammunition, became afraid that he would, with his single ship, conquer this ancient monarchy. The Englishman, disgusted with the refusal, withdrew, after seizing six Chinese vessels, whose officers received from him orders upon the king of Siam, to the amount of the merchandise which had been lodged in the public treasury. Upon this retreat, the Birmans, finding no opposition, spread universal desolation; and even the temples were destroyed by fire. The superstitious monarch and his ministers placed all their confidence in their magicians. Even the officers and the soldiers, instead of military exercise, were solely occupied in the study of charms, supposed to render the wearers invisible. A Siamese prince, who had been banished to Ceylon, found means to raise a little army, and return to the assistance of his country: but the distracted court of Siam actually sent forces to oppose this deliverer. This imprudence so much irritated the Siamese, that many of them joined the Birmans, who, on the 7th of September, 1766, advanced within a quarter of a mile of the city, and, seizing on a high tower, raised a battery of cannon, which rendered them masters of the river. The danger becoming urgent, six thousand Chinese were charged with the defence of the Dutch factory, and of an adjacent temple. After some skirmishes, the Birmans made an assault, and seized on five considerable temples, which they changed into fortresses, opening a heavy cannonade. But, in an assault, on the 8th of December, they were obliged to retire. The Siamese officers, however, in their eagerness to secure the magazines of grain, as a future resource, produced an immediate famine. The streets and squares were filled with dead bodies; and a contagious disorder completed the horrid scene. During six months, the dead bodies in the streets were devoured by dogs, and even the walls began to be deserted, the centinels descending, by means of long cords, in expectation of finding more mercy from the enemy than their own officers, or, at least, a speedy death, more agreeable than the horrors of a lingering dissolution. The Dutch factory was in vain defended by the Portuguese and the Chinese; and, after a siege of eight days, it was taken and reduced to ashes. The whole Christian quarter of the city shared a similar fate; and the virgins were obliged to marry the first young men that presented themselves, the Birmans always reverencing the matrimonial tie.

After an ineffectual negociation, in which the Birmans insisted upon an unconditional surrender, the city was taken by assault, on the 28th of April, 1767. The wealth of the palace and temples was consumed, and the golden idols melted, by which the avaricious designs of the victors were frustrated. Scenes of violation and cruelty fol-

lowed their disappointment. The great officers of the kingdom were loaded with irons; and condemned to the galleys: the king was massacred at the gate of his palace, in attempting to escape. Nothing being left to destroy, the victorious army resumed its march to Pegu, accompanied, among other captives, with the remaining princes and princesses of the royal blood of Siam.

The missionaries and Christians fled, by the sea, to the port of Kanqoa, in Cochinchina. On the 16th of June, the Birmanians quitted Siam, after having burnt the town of Michong, a short time after its construction.

After the invaders had thus evacuated their conquest, the Siamese issued from their forests; and their first rage was directed against their gods, whom they accused of being idle and negligent of their duties, in thus abandoning them to a destructive enemy. Several of the statues, which remained, were known by the natives to contain gold and silver, placed there by superstitious persons, in a certainty of finding them, should they revisit this world. Having thus restored some degree of wealth to their country, they proceeded to elect a leader; and the unanimous choice fell upon Phai-Thac, an officer of acknowledged ability. This new prince displayed considerable clemency and talents; and, in the year 1768, suppressed a rebellion, which was instigated against him; since which, the Birmanians have in vain attempted to repeat their incursions into the Siamese territory.

### SECTION III.

#### COCHIN-CHINA.

*Situation, Extent, and Boundaries.* Cochinchina extends from about the twentieth degree of north latitude to Pulo Condore, which lies in eight degrees forty minutes. It is bounded by the kingdom of Tonquin, on the north; by Laos, and a range of mountains, which divides it from Cambodia, on the west; and by the Chinese Sea, on the south and east.

The kingdom is divided into twelve provinces, all lying upon the sea-coast, and succeeding each other from north to south. The breadth of the country bears no proportion to its length. Few of the provinces extend farther than a degree from east to west, some less than twenty miles.

*Climate, &c.* The climate is healthy, the violent heat of the summer-months being tempered by regular breezes from the sea. September, October, and November, are the rainy season: the low-lands are then suddenly overflowed by immense torrents of water, which fall from the mountains. The inundations happen generally once a fortnight, and last for three or four days. In December, January, and February, there are frequent rains, brought

by cold northerly winds, which distinguish this country by a winter different from any other in the East. The inundations have the same effect here as the overflowing of the Nile in Egypt, and render the country particularly fruitful.

*Vegetables.* The principal object of cultivation is rice, of which there are two kinds, one requiring a wet, the other a dry, soil. But, besides this, silk, cotton, pepper, cinnamon, coffee, beetle, and tobacco, are also cultivated. The vine is said to grow spontaneously upon the mountains; but the juice of the grape is not made into wine. There are also yams, sweet potatoes, greens, melons, and pumpkins.

*Animals.* The quadrupeds of this country are horses, mules, asses, elephants, tigers, goats, and monkeys. The pelican was seen here by some person belonging to the embassy; and Mr. Pennant, the eminent naturalist, observes, that the edible birds' nests, esteemed a luxury in China, are chiefly found in this country. They are formed by a species of swallow, from some unknown viscous substance. Ducks, and poultry in general, abound here; and the harbour of Turon is plentifully supplied with fish.

*Minerals.* Besides the gold that is found in the rivers, there are several mines of the richest ore, and, from the pure nature in which it is obtained, the gold may be extracted by the simple action of fire. The natives form it into ingots, of about four ounces, and make their payments with it to foreign merchants. It is also used as an ornament to their dress and furniture, and sometimes as an embellishment to their swords and scabbards. Prior to the troubles in Cochinchina, not only gold-dust, but also wax, honey, and ivory, were brought down from the mountains, and exchanged with the low-landers, for cloth, cotton, rice, and iron. Silver-mines were formerly either so rare, or the art of refining was so little understood, that silver used to be imported from abroad, and bartered for gold, to the advantage of the importers; but, lately, either new mines of silver have been explored, or a more facile mode of purifying it has been discovered; for it is now the chief medium of exchange for foreign goods, and is made up, for that purpose, in bars of about twelve ounces.

*Chief City.* Turon, the capital of Cochinchina, is situated about a mile above the river; the adjoining land has a gradual slope to the water's edge. The bay of Turon might, with more propriety, be called a harbour. It is very capacious, has good holding ground; and ships may anchor securely from every wind. The sea-breeze commences about three or four in the morning, and continues about twelve hours; to this succeeds the land-breeze, which lasts nearly as long, and is not contaminated by passing over swamps or marshes. of Cochín-Chine,  
a rude and bar-

barous people, with coarse features and black complexion, but the colour of the lowlanders is less dark; and, before the overthrow of the ancient government, they were considered a civil, affable, and harmless race.

The exterior dress of these people is hardly sufficient to discriminate the sexes; both wear a loose robe, with long sleeves, which cover their hands; but persons of rank, particularly the ladies, put on three gowns, of different colours, one over the other; the undermost touches the ground, the next is somewhat shorter, and the uppermost the shortest of all. Small collars are put round the neck of the robe, and this is sufficiently full to fold over the breast. They use no linen, but wear, next the skin, vests and trousers of silk or cotton. To complete their dress, every lady puts on a girdle, from which hangs a silk bag, having three partitions, to contain tobacco, areca-nut, and beetle-leaf; and the gentlemen have an ornamental rband thrown over the shoulder, like a belt, having affixed to it a small case, or purse, for their areca-nut and beetle. A few of the women appear in hats, but never with caps; and some of the men wear turbans.

Smoking is a custom very prevalent in both sexes of the Cochín-Chinese, but the women smoke less than the men. They have no wine, but indulge freely in the use of spirituous liquors, as well as in that of tobacco, and are very fond of chewing the areca-nut and beetle-leaf, kneaded into a sort of paste, with lime and water. The men are extremely indolent, the smoking of tobacco being their chief employment; but the women are remarkably industrious, both in domestic affairs and in cultivating the land. In towns, they often act as agents and brokers for foreign merchants, and are said to act with fidelity. Concubinage is not here accounted dishonourable. The lower class of the people transfer their wives and daughters, on moderate terms, without the least scruple, and treat all affairs of gallantry with perfect indifference.

The following particulars, extracted from the account of the embassy, will give a just and lively representation of the entertainments and amusements peculiar to these people.

"The chief of Turon gave an entertainment to a party from the ships. The table was spread with about a hundred dishes, or rather bowls, consisting of pork and beef, cut into small square pieces, served up with various kinds of savoury sauces. In others, were stewed fish, fowls, and ducks; the rest were loaded with fruits and sweetmeats. In lieu of bread, boiled rice was placed before each guest; two porcupine-quills supplied the want of a knife and fork; and their spoons, in form of shovels, were made of porcelain. After dinner, an ardent spirit, obtained from rice, something like whiskey, was served round in cups, and the host, by way of example, filled a bumper; and, when he had drank it, turned it up, to shew

that none was left in the bottom. He afterwards walked a short distance with the party, and took them to a kind of theatre, where a comedy was represented. The principal characters were a peevish old man and a humorous clown; and they were tolerably well supported. Not only the theatre, but all the adjoining trees, were crowded with spectators, who were more inquisitive to gaze at the strangers than to see the actors.

"On the return of the party from the entertainment, a messenger was dispatched to request them to stop till an elderly lady, who was on the way from her house, should come up with them. Approaching with wonder and surprise, she apologized, in the language of nature, for the liberty she had taken. She gazed at them with uncommon attention; and, shortly after, testifying her thanks for their politeness, retired, exulting in the gratification of an ardent curiosity. The attention of the party was arrested, in their turn, by a singular instance of oriental agility. A number of Cochín-Chinese young men were collected together, playing at shuttlecock. They had no battledore, neither did they use the hand at all; but, after running a short distance, met the descending shuttlecock, and struck it with the foot, so forcibly, as to drive it up high in the air.

"But sportive games are not the only instances in which these active and ingenious people use the feet, as others do their hands. The lower orders, and many of other ranks, are accustomed to go bare-footed. By this, the muscles of the toes have free motion, and acquire a strong contractile power, so as to render the foot an useful auxiliary to the hand, in the exercise of several mechanical trades, but more particularly in that of boat-building."

The boats in common use among them, consist of five planks only, united together by ribs or timbers. These planks are rendered flexible, by being exposed some time to a flame, and are then brought to the desired degree of inflection. The ends, being thus connected together in a line, the edges are joined, and fixed by wooden pins, and stitched with flexible threads of bamboo. The seams are afterwards paid with paste, made by mixing water with quick-lime from sea-shells. Other boats are made with wicker-work, the interstices of which are filled up with the same composition as is used for the former; and this luting, as it may be styled, renders them watertight. They are remarked for withstanding the violence of the waves, for being stiff upon the water, and for sailing with expedition.

The boat, which belonged to the chief of the district, was built after the above method, but on a larger scale. It had a carved and gilt head, not much unlike that of a tiger, and a stern decorated with sculpture, of various designs, painted in vivid colours.

## SECTION IV.

## MALACCA.

*Extent, Boundaries, &c.]* Malacca is about five hundred and sixty British miles in length, and about one hundred and fifty in breadth, a territory sufficiently ample for a powerful monarchy, had its native productions corresponded with its extent. It is bounded, on the north, by the river Rindang, which runs by Ligore to the east, and by a small range of hills, dividing it from the kingdom of Siam, and contains five provinces, receiving their denominations from their respective capitals. On the eastern coast, are those of Patani and Pahang, followed by the most southern kingdom of Johor. On the western coast are those of Keidah and Peirah, followed by another province, called the Malay coast, and of which the capital is Malacca.

*Products.]* The inland part of the peninsula appears full of extensive forests; nor do the ancient or modern maps indicate any towns or villages in these parts. The indolence of the inhabitants have prevented the country from being explored; but it produces pepper and other spices, with some precious gums and woods, among which, perhaps, the teak may be found. The chief mineral is tin, and the produce of gold is very modern and temporary. It has lately been observed rolling down in small particles, with a stream that issues from a mountain towards the north-east.

There is a variety of culinary vegetables and fruits, particularly the mangostan, which is very delicious, and pines, of most exquisite flavour. Sheep and oxen are scarce here; but swine, fowl, and fish, are plentiful. The wild animals of the country are elephants, tigers, wolves, &c.

*Chief City.]* The city of Malacca is said to have been founded upwards of two hundred years before the arrival of the Portuguese, in 1509; and, in the year 1511, Alphonso Albuquerque subdued it, after a most vigorous defence. He plundered it of immense treasures, vast magazines, and whatever could contribute to the elegancies and pleasures of life, and then put the prince to death. The king of Siam, enraged at this cruelty, took the city by storm, assisted by other princes, equally incensed against the murderer. But the Portuguese retook it, and built churches, monasteries, a castle, and a college for the Jesuits. In the year 1606, the Dutch, in conjunction with the king of Johor, began to be very troublesome to the Portuguese, and, after a series of hostilities for the space of thirty-five years, deprived them of it in 1641, by the following means:—Finding that considerable disputes had subsisted between the king of Johor and the Portuguese inhabitants, the Dutch formed a design of reducing the place. Accordingly, they fitted out a formidable squadron of ships at Batavia, and entered into an alliance with

the king of Johor, who attacked the city by land, while the Dutch invested it by sea; but the invaders, finding there was no possibility of reducing it, and hearing that the governor was a very sordid man, the Dutch, by letters secretly conveyed to him, offered him a considerable premium, if he would facilitate the surrender of the fort. The bribe was accepted; the Dutch soon entered the place; and, to save the payment of the premium, caused the governor to be assassinated.

Malacca is an extensive and populous city, surrounded with a stone wall and bastions. Many of the streets are spacious, and shaded with trees on both sides. The houses stand pretty close to each other, and are built chiefly of bamboos, though some of them are of stone. The governor's house is commodious, situated in the fort, and garrisoned by two hundred Europeans. The harbour is one of the best and safest in that part of the globe, and receives vessels from most part of the Indies. When possessed by the Portuguese, the city was remarkably opulent, being the principal mart for precious stones and gold; and, before the Dutch made Batavia the chief place of their commerce, it had all the rich commodities of Pegu, Coromandel, and other countries; but, at present, its commerce is very trifling.

*Customs, Manners, &c.]* The Malays are generally well made, though rather below the middle stature; their limbs are well shaped, but small, and particularly slender at the wrist and ankles. Their complexion is tawny, their eyes large, their noses seem rather flattened by art than nature; and their hair is long, black, and shining. The greater part of the men go naked, except having a piece of cloth round the waist. The women of Malacca, of the higher orders, wear a loose garment.

It has been observed by a modern writer, that, "while nature has done every thing in favour of the Malays, in their pristine state, society has done them every possible injury; for such has been the influence of an arbitrary government, that the natives of the most happy country on the globe have become remarkably ferocious in their manners. The feudal system, which was first concerted among the woods and rocks of the north, has reached the serene regions of the equator. The Malays are governed by despotic princes. This scene of arbitrary domain occasioned a general ferocity of manners. In vain did bounteous heaven bestow her rich blessings on the Malays: these celestial gifts served only to make the people ungrateful and discontented. Masters let out their servants, or rather those of their dependants, to the highest bidders, heedless of the loss which husbandry would suffer in the want of labourers.

"When the Portuguese took possession of the chief city of the peninsula, the inhabitants, ill brooking a submission to their new masters, either retired into the inland

parts, or died; lost the spirit of conquest, and while the Portuguese settlements in India were multiplying into every extremity, the ferocity is so violent, that settlements in India are prohibited. Malacca, from except in the case of exceeding two, always go armed, if they went unarmed, the structure was

This country is on the south; the reign of Aurangzeb, who discovered its source in the Ganges.

Besides being rich in mines, which yield gold, silver, and the most precious stones, the great number of the people have excelled in making brass of a saline quality, the face, is converted from the white and a ley is made white.

No taxes are levied on himself with the which his country by the natives, his neighbours. To piece of ground, wives, of whom to marriage, the what they expect precisely instruct

parts, or dispersed themselves along the coast. Having lost the spirit of commerce, they imbibed that of conquest, and subdued a large archipelago on their coast, while the Portuguese rendered Malacca the most considerable market in India. Lost to all commerce, they fell into every excess of fierceness and barbarity, and committed murder, when harm was least expected. This ferocity is so well known to European companies who have settlements in the Indies, that they have universally agreed in prohibiting masters of their vessels, who may put into Malacca, from taking on board any seamen of that nation, except in the greatest distress; and not, on any account, to exceed two or three. The Malays, who are not slaves, always go armed: they would think themselves disgraced, if they went abroad without their poniards; and it is remarkable, that they excel in the fabrication of these destructive weapons.

### SECTION V.

AZEM—TONQUIN—LAOS—CAMBODIA—AND SIAMPA.

#### AZEM.

This country is bounded by part of Independent Tartary, on the north; by China, on the east; by Tipra, on the south; and by Hindoostan, on the west. In the reign of Aurengzebe, it was conquered by the Moguls, who discovered it by navigating the river Lacquia, which has its source in the lake Chiamay, and discharges itself into the Ganges.

Besides being luxuriantly fertile, this country is rich in mines, which produce the most valuable and useful metals, as gold, silver, steel, iron, lead, &c. There is plenty of the most delicious animal-food, but dog's flesh is deemed the greatest dainty. They make no wine, though they have excellent grapes, which, when dried, are used in making brandy. The lakes of this country are of a saline quality, and the scum, which rises to their surface, is converted into salt. Another kind of salt is extracted from the leaves of what is called Adam's fig-tree: and a ley is made, which renders their silks admirably white.

No taxes are paid to government, the king contenting himself with the sole possession of the valuable mines which his country contains. Nor are those mines worked by the natives, but by slaves, which he purchases of his neighbours. To every subject is allotted a house, a large piece of ground contiguous, and an elephant to carry his wives, of whom he is permitted to have four. Previous to marriage, the Azemians inform the women minutely of what they expect them to do. The females, being thus precisely instructed in their duty, seldom disoblige their

husbands. The inhabitants, towards the north, have good complexions; but those who dwell southerly are rather swarthy. All have very large holes bored in their ears, from which descend heavy pendants of gold and silver. They wear their hair long, have a cap upon their heads, and go naked, except about their middles. They adorn their arms with bracelets, which are buried with them when they die. Their gold is current in ingots; but they have pieces of silver coin, each two shillings in value.

The residence of the king is in the metropolis, named Ghergong, or Kirgan. The city of Azoo is the royal burial-place. When any king is buried in the grand temple, his favourite idol is buried with him. This always being of gold or silver, the vaults are filled with immense treasures. The people imagine that the righteous have, in the other world, plenty of what they desire; but that the wicked suffer all the miseries of hunger and thirst. From this opinion, and not entertaining any very high idea of the morality or piety of their monarchs, they bury with them all kinds of eatables, great riches, several of their wives, officers, elephants, slaves, &c. lest they should fare worse in the other world than they did in this.

#### TONQUIN.

This kingdom, as well as others adjacent, formerly constituted a part of the Chinese empire; but the Chinese governor of the southern peninsula, containing Tonquin, to the northward, Cambodia and Siampa, to the southward, and Cochinchina, seized an opportunity, and erected the standard of independence, at the time of the Mogul invasion of China from Tartary. He and his posterity had their residence at Tonquin. In course of time, the Tonquinese governor erected also his government into a kingdom: but both acknowledged a nominal vassalage to the Chinese empire, and did homage at the Court of Peking. An observant voyager relates, that, in the gulf of Tonquin and the adjacent Chinese sea, the typhons are tremendous. "They are preceded," he says, "by very fine weather, a presaging cloud appears in the north-east, black near the horizon, edged with copper-colour on the upper part, fading into a glaring white. It often exhibits a ghastly appearance, twelve hours before the typhon bursts; its rage lasts many hours, from the north-east, attended with dreadful claps of thunder, large and frequent flashes of lightning, and excessive rains. Then it sinks into a dead calm; after which it begins again, with redoubled rage, from the south-west, and continues an equal length of time."

Cachao, the capital, is situated near the centre of the country, and is said to be built after the Chinese manner.

The bua's palace is a large edifice, and has a fine arsenal. The English have a very flourishing factory on the north side of the city.

The government of Tonquin is particular. The Tonquinese, as before observed, had revolted from the Chinese, which was attended by a civil war. A compromise at length took place, between the chief of the revolt and the representative of the ancient kings, by which the former was to have all the executive powers of the government, under the title of chonah, while the bun, or real king, should retain the royal titles, and be allowed some inconsiderable civil prerogatives, within his palace, from which neither he nor any of his family can stir, without permission of the chonah.

The Tonquinese are active and ingenious; friends to science, and courteous to foreigners, especially to commercial men. Their grandees are proud; their soldiers insolent; and the lower classes much addicted to pilfering, although they are severely punished, when detected. They are excellent mechanics, and fair traders, but are greatly oppressed by their king and his nobles.

The name of Confucius is held in the highest respect at Tonquin; but the natives pay adoration to images, to the horse, and the elephant. Their temples and pagodas are often no larger than may be necessary to accommodate the idol. Around those buildings are the cells of the priests, that attend to offer up the prayers of the devotees. The petition being delivered in writing, it is read aloud by the priest, before the idol, while the petitioner lies prostrate on the ground, in the attitude of the most humble supplication. The rich, however, seldom come to the pagoda, but perform their devotions in a part of their own houses, where one of their domestics officiates instead of the priest. When the petition has been read, it is burnt in a pan of incense, and the poor neighbours and dependants are called in, to partake of the entertainment which the master has provided for them; the practice of this hospitality being considered necessary to the procuring an auspicious regard to the prayers which have been offered.

They never undertake any thing of consequence without consulting an astrologer, and have their lucky and unlucky days. Every hour in the twenty-four is distinguished by the name of some animal; and the beast which marks the hour of a man's birth is always avoided by him.

Polygamy is allowed in Tonquin; and the husband may claim a divorce on the most trifling occasion; but he must restore the effects which the wife possessed at the time of marriage. The same indulgence is not allowed to the woman. A female, convicted of adultery, is thrown to an elephant, bred for the purpose, who, taking her up with his trunk, tosses her in the air, and, when she falls, tramples her under his feet, and crushes her to pieces. A man may sell his wives and children, which, in times of scarcity, the poor make no scruple of doing.

The funerals resemble those of the Chinese, in respect

to the procession and mourning; but here they burn the corpse, and deposit the ashes in an urn. Over the tombs of the rich they erect a lofty wooden tower, and the priest, ascending to the top of it, pronounces a funeral-oration, in praise of the deceased. This being concluded, he comes down, and sets the structure on fire, while the people, who attend the ceremony, are entertained, on the spot, with a feast provided for the occasion.

When a king dies, the royal corpse lies in state sixty-five days, during which his table continues to be served as when he was alive, the meat being distributed, every evening, among the priests and poor people. A splendid procession then commences, towards the burying-place of his ancestors, which, though but two days' journey distant, is seldom performed, on these occasions, in less than seventeen. The great officers are obliged to mourn three years, the gentry six months, and the common people three; and no public diversions are permitted for three years after the funeral.

### LAOS.

Few particulars are known respecting this state; as it is surrounded with forests and deserts, and difficult of access by water; but, by the newly-discovered river of Auan, the passage from Siam may probably be expedited. The soil is represented as fertile in rice; and Laos furnishes the merchants of Cambodia with the best benzoin and lacca. Exquisite musk is also brought from Laos, with some gold and rubies; and the rivers produce the freshwater mya, which yields pearls. The chief towns are Landjam and Tsiamaja. Sandepora is likewise added, in modern maps.

Du Halde has published a route from China to Siam, by land, in which some account is given of Laos. He describes the capital, called Mohang, to be of considerable extent, but only enclosed with a palisade.

The most recent account of this country seems to be that given by M. Turpin. He says, the name Laos implies a thousand elephants, and was derived from the great abundance of these animals. The climate is so temperate, and the air so salubrious, that men sometimes live to the age of a hundred years, in full health and vigour. The flat part of the country nearly resembles Siam; but the eastern bank of the river is more fertile than the western.

The ivory is beautiful; but the horn of the rhinoceros is preferred, and is preserved with superstitious attention, as it is thought to insure the happiness of the possessor. The fields supply food to numerous swarms of bees, and the wax and honey are excellent. Mines of tin, iron, and lead, are found in the mountains; but gold and silver are only sought in the sands of the rivers, and explored with small nets of iron.

ble the southern Chinese. They are said to be celebrated for the rectitude of their conduct, and fidelity to their promise; and, if a traveller be robbed, the nearest town or village is obliged to indemnify him for the damage sustained. On the other hand, they are indolent and luxurious, and addicted to the study of magic.

The military force is said to consist of five hundred thousand men; and it has been observed, that a numerous army might be raised of men who have lived a century. The people pass the bounds of oriental sobriety, eating daily four repasts of rice, fish, and the flesh of the buffalo. Marriages are easily contracted and dissolved; and the rich keep numerous concubines. A funeral is rather a festival; and a sum of money is deposited in the tomb, which the priests take care to circulate, after a short period.

The commerce of this country was formerly confined to Siam; and, after the irruption of the Birmans, it passed to Pegu, and has since been transferred to Cambodia. The Laosians boast, that they taught the Siamse the art of writing on the leaves of the palm-tree. The language and characters are said to be the same; but a Laosian cannot pronounce the letters *L* and *R*.

Their ancient worship is said to have been very pure, and directed solely to one God, the Creator of all, who was only to be pleased by the exercise of virtue, and not by sacrifices or ceremonies; but the commerce with China corrupted this purity of faith. They believe in regular renovations of the universe; and that our earth has attained the age of eighteen thousand years. Some of their ceremonies are like those of Tibet, and may have passed from the Nestorian Christians. They even sell dispensations and pardons to the rich, while the poor are condemned to perpetual misery.

### CAMBODIA.

This country, which is also called Camboge, is inclosed by mountains, on the east and west, and fertilized by a grand river, the Maykaung, or Makon, erroneously called the Japanese river. It is said, that this river begins to inundate the country in June. Near its mouth, it is full of low isles and sand-banks, so that the navigation is impeded, and there is no port nor town. The country is thinly peopled, and the capital, called Cambodia, consists only of one street, with a single temple. The most peculiar product is the substance styled gamboge, or rather Camboge gum, yielding a fine yellow tint. Ivory also abounds, with several precious woods; and the country is fertile in rice and animal food. There are many Japanese settlers, with Chinese and Malays; the latter of whom can scarcely be distinguished from the natives, who are of a dark yellow complexion, with long black hair.

9. VOL I.

The mountains produce fine rock-crystal, amethysts, jacinths, rubies, and topazes. Silk and ivory are common; and an ox, weighing five hundred pounds, does not cost above three shillings, while a hundred and forty pounds of rice may be had for the value of four pence.

The Cambodians are very expert in making white or painted dummies; and they have excellent carpets, besides a sort for the common people, which they call *bancals*, not unlike the plaids worn by the Highlanders of Scotland. They likewise weave, and work with the needle, rich hangings, coverings for the low chairs used by women of quality, and for their palanquins or litters; some of which are adorned with ivory and tortoise-shell, as are also their chess-boards, and other playing-tables. They also make beads, little idols, bracelets, necklaces, and other toys, of a very transparent crystal, which is found in their mountains.

The coasts, which extend about a hundred and forty leagues, only contain about five or six ports, where vessels can anchor with safety. The most celebrated one is opposite to Siam, and carries on a considerable trade in lacquer and elephants' teeth. There are many small islands between Cambodia and Siam, which render the navigation dangerous. The natives are mingled with Japanese, Malays, and Portuguese, the latter being a degenerate race, partly lapsed into idolatry; and the modesty of the women is far from being equal to their beauty. The Dutch were viewed with jealousy; and other nations have been disgusted from forming any lasting settlement in that country. Their religious creed partakes of the Mahometan voluptuousness; and the first class of priests has usurped the precedence over the monarch, who, in other respects, is despotic. He seizes on the property of his subjects; and the right of inheritance is violated by his caprice.

### SIAMPA.

This small maritime tract is situate to the south-east of Cambodia, from which it is separated by a ridge of mountains. Mr. Pennant says, the people of this country are called *Loyes*; and are large, muscular, and well-made, with a reddish complexion, nose rather flat, and long black hair. The king resides at *Feneri*, the capital, and is tributary to *Cochin-China*. Their junks are well-built, and are much employed in fishing. Turpin adds, that the people of Siampa are mild and affable, especially towards strangers, and live in a severe subordination. The creed of Mahomet is here mingled with that of Confucius; but the pretended followers of the Koran devour pork, and lend their concubines to strangers. The Chinese arrive annually with tea, porcelain, silk, and other articles, which they exchange for odoriferous woods and gold. The chief productions of the country are cotton and indigo.

2 C

## CHAPTER V.

## PERSIA.

**P**ERSIA is situated between forty-five and sixty-seven degrees of east longitude, and between twenty-five and forty-five degrees of north latitude. Its greatest length, from east to west, is about one thousand two hundred and eighty miles; and its greatest breadth, from north to south, is about one thousand one hundred and forty miles. It

*Situation, Extent, and Boundaries.*

is bounded by Circassia, the Caspian Sea, and Usbec Tartary, on the north; by India, on the east; by the Indian Ocean, and the Gulfs of Persia and Ormus, on the south; and by Arabia and Turkey, on the west.

*Divisions.*] The following are the provinces into which Persia is divided; together with their ancient names and principal towns:

Provinces.	Ancient Names.	Chief Towns.
Farsistan .....	Persis, or Persia Propria .....	Shirauz
Irac Agemi .....	Media .....	Ispahan
Aderbeizan .....	Media Atropatena .....	Taurus
Khusistan .....	Susiana .....	Suster
Mazanderan .....	Margiana .....	Ferabad
Khorasan .....	Margiana and Aria .....	Herat
Ghilan .....	Gela .....	Reshd
Sablestan .....	Bactriana .....	Bost
Schhirvan .....	Albania .....	Schamakie
Segestan .....	Arachosia .....	Zareng
Mekran .....	Gedrosia .....	Kidge
Laristan .....	.....	Lar
Kerman .....	Caramania .....	Kerman

*Climate and Soil.*] Those parts of the country which border upon Caucasus and Daghistan, and the mountains near the Caspian Sea, are cold, as lying in the neighbourhood of those mountains, which are commonly covered with snow. The air, in the midland provinces, is serene, pure, and exhilarating; but, in the southern parts, it is hot; and sometimes communicates noxious blasts to the interior.

The soil, in some parts, appears to be barren; and Chardin supposes, that not above one-tenth part was cultivated, even in the time. He adds, that the mountains are extremely arid, being mostly rocks, without wood or plants. They are, however, interspersed with valleys, sometimes sandy and stony, sometimes of a hard dry clay; both unproductive, if not well watered. Hence the chief industry of the Persian farmer is employed in watering his lands. The fertile climate of Shirauz, in the province of Farsistan, is one of the most agreeable in the world, the extremes of heat and cold being seldom felt. During the spring, the uncommonly beautiful flowers, of which they have a great variety, of the brightest hues and fragrancy, perfume the natural mildness of the air. The beauties

of nature are here depicted in their fullest extent, and the natural historian and botanist meet with ample scope for their favourite investigations; so that the inhabitants of Shirauz confidently assert the pre-eminence of their own city to any other in the world. In summer, the thermometer seldom rises above seventy-three degrees in the day-time, and at night generally sinks to sixty-two. Their autumn is the worst season of the year, the rains then beginning to fall, and the air being reckoned unhealthy.

*Rivers and Lakes.*] The noble streams of the Euphrates and the Tigris can scarcely, at any period, be considered as strictly Persian, though Ctesiphon, the capital of the Parthian monarchy, and Seleucia, stood on the latter river. The river of Ahwaz rises in the mountains of Elwend, and pursues a southern course, till one branch enters the Tigris, above its junction with the Euphrates, while the main stream flows into the estuary of these united rivers. This seems to be the Gyndes of Herodotus, now called the Zeindch, and, by the Turks, Kara-Sou, or the black river. The course of this stream, one of the most considerable in Persia, little exceeds four hundred British miles.

From the range of mountains on the north-east, several rivers, of short course, fall into the Persian Gulf, one of the most considerable being the Divrud, which joins the mouth of that gulf. The rivers of Mekran are of more considerable course, as the Krenk and Mekshid, which, when united, form the river Mend, so called from a town by which it passes. The Haur and the Araba are of trivial consequence.

To the west, the river of Tedjen, the ancient Ochus, flows into the Caspian; which also receives many small streams from the mountains of Mazanderan. D'Anville assigns a very considerable course to the river of Kizil Ozen, which he derives from the mountain of Elwend, not far to the north of Hamadan; so that, by a very winding course to the Caspian, its length doubles what is assigned in more recent maps. This river is the Mardus of antiquity, rising on the confines of Turkey, and falling into the sea below Langorod.

Farther to the north, the large river Aras, the ancient Amaxes, falls into the Kur, both rising in the Caucasian mountains, and pursuing a course of extreme rapidity.

Of the rivers in the central part of Persia, the most important is that which passes between Shiraz and Istakher, called the Bundamir. This celebrated river flows into a salt lake, called Baktegan, and which also receives a considerable stream from the north-east, called the Kuren. Between these two rivers a branch of the mountains of Elwend extends south-east; on the western side of which stand the ruins of Persepolis.

Among the lakes of Persia, the most considerable is the Aria Palus of antiquity. This large lake is in the western part of the province of Segestan, and is called, in the French maps, the lake of Zéré, from a village of that name near its western extremity; but, in the English, the sea of Durra, from another village, situated on a river, at the distance of twenty miles from the lake; the length is thirty leagues, by a day's journey in breadth; and the water is fresh, and abounds with fish.

On the north-west appears the lake of Urnia, so called from a town near its southern extremity. This lake is represented as about fifty miles in length, by about half the breadth, and is considerably impregnated with salt. The lake of Erivan, about one hundred and twenty miles to the north, is about twenty-five leagues in circumference, with a small isle in the middle: it abounds in carp and trout, and is the *Lychnites* of Ptolemy.

*Mountains.*] From the accurate description of Gmelin, it appears, that the Caucasian ridge of mountains extends to the west of Ghilan, and south of Mazanderan, till it expires in Corasan, on the south-east of the Caspian Sea.

The southernmost chain, of great height, is described, by Mr. Franklin, as running parallel with the Persian Gulf, north-west and south east, at about the distance of fifty miles.

A third range of mountains, of very great height, seems to continue, in the same direction with this last, to the south of the lake of Urnia, where it is connected with the Caucasian ridge.

A parallel ridge, on the west, called, by the Turks Aiagha Tag, is supposed to be the Zagros of the ancients, which separated Assyria from Media. This western chain seems to extend to the lake of Van, for Mount Ararat is represented as standing solitary, in the midst of a wide plain, and, from proximity, might rather be classed with the range of Caucasus.

Hetzardara, or the thousand mountains, form a branch on the north of Farsistan, and one part of it, which gives rise to the river of Ispahan, is called Koh Zerdel, or the yellow mountain.

A low range, called Meder, by D'Anville, passes north-east, through the heart of Kerman; while that country is divided from Mekran by a range in the same direction, called, by D'Anville, Kofez. Some other nameless ranges cross Mekran in the same direction; that nearest Hindoostan being called, by Rochette, the Lakhee Mountains.

Farther to the north, the mountains of Wulli extend from the neighbourhood of Shatzen, across to the lake of Vachind, and may thus be considered as forming one range with that on the north of Mekran, called Gebelabad, by La Rochette. This range, however, expires in the great desert to the south of Zarang.

*Vegetables.*] Rice, wheat, and barley, are almost the only kinds of grain growing in Persia. Their seasons are not the same in the north as in the south; for, when they are sowing in one part of the country, they are reaping in another; and, in some places, not more than three months elapse between seed-time and harvest. Their kitchen-gardens are well stocked with most of the roots and herbs known in Europe. They have not less than twenty sorts of melons; some of which are said to weigh eight or ten pounds. At the tables of persons of quality, they have them all the year, having a method of preserving them under ground. Cucumbers are much eaten by the common people. One sort has scarcely any seeds in it, and is eaten without paring or dressing, and not reckoned unwholesome. Of grapes they have several kinds, and some of these so large, that a single grape is a mouthful. The celebrated wine of Shiraz is made of a small black grape, without stones. Cherries here are but indifferent; but apples, pears, peaches, quinces, apricots, nectarines, and green-gages, are all very good, and in great plenty. The dates and pomegranates are also very delicious.

On the mountainous ridges are found the cypress, the cedar, and several other kinds of pines; while the lower hills and rocks are adorned with lime-trees, oaks, acacias

and chesnuts; the sumach, whose astringent wood is so essential to the arts of dying and tanning, grows here in vast abundance; and the manna ash-tree is not less common. The cotton-tree is common all over Persia; and they have another small tree, which yields a kind of silken down, used for quilting and stuffing of pillows. Poplars, of unusual size and beauty, and the weeping-willow, border the course of the streams, and the marshy tracts abound with a peculiar kind of rush, that forms the material of the fine Persian matting. The ornamental shrubs and herbaceous plants of this country are but little known; four of them, however, from their abundance and beauty, give an air of elegance to the country, superior to that in any other region; these are the jessamin, and the blue and scarlet anemone, in the thickets; and the tulip and ranunculus, in the pastures.

The Persian poppies are in great esteem, from the quantity and strength of the juice which they yield. They grow four feet high, in some places, and have white leaves. The juice is extracted from them, when they are ripe, by making little incisions in the head of the poppy. It is said to have such an effect on those who collect it, that they look as if they had been buried and taken up again, and their limbs tremble as if they had the palsy. The liquor thus drawn from them, in a little time, grows thick, and is made up into pills, which we call opium. The Persian bakers strew poppy-seed upon their bread, which inclines those who eat it to sleep, and is not reckoned unwholesome after their meals. The common people eat the seed almost at any time. Saffron grows plentifully in Persia; and assa-fœtida, which to us is the most offensive of all smells, is to the natives a refreshing perfume.

*Animals.*] As there is but little cover in the southern part of Persia, wild beasts are not numerous. In the woody parts there are lions, tigers, leopards, wild hogs, and jackalls; but the latter are so tame, that, Mr. Hanway says, whenever he encamped, they would run over his bed in the night, and, being fond of leather, he was afraid they would run away with his accoutrements; and they made such a barking and howling in the woods, that he could not rest for them.

Here are horses, mules, asses, oxen, buffaloes, and camels; but the latter, as beasts of burden, much excel all the rest, whether we consider the weight they carry, the dispatch they make, or the expence of keeping them. Of these camels there are several kinds: some have two bunches upon their backs, and others but one; and there is a third sort, engendered between a dromedary, which is a camel with two bunches, and a female with one, which are most esteemed, for they seldom tire, and will carry a prodigious weight. Those which travel between the Persian Gulf and Ispahan are of a smaller size, but they are almost as serviceable as the other, being swifter

of foot, and will gallop like a horse, whereas the other seldom go beyond a foot-pace. These swift camels are kept by the king and his nobles, to convey their women from place to place, and carry their baggage. They are usually adorned with embroidered cloths, and silver bells about their necks. A string of six or seven of them are tied together when they travel, and governed by one man. Neither bridle nor halter is used to hold them in, nor whips to drive them; but they are governed by the driver's voice, who usually sings to them as they travel. It is in vain to beat them, if they tire; they never go the better for it. When they are to take up their burden, the driver touches their knees, on which they lie down on their bellies, till they are loaded, groaning, however, and giving signs of uneasiness, under a sense of the fatigue which they are about to undergo. In travelling, they graze on the road-side, on weeds and thistles, with their burdens on their backs, and are sometimes fed with balls of barley-meal and chaff, made into a paste.

Oxen, asses, and mules, are also used indifferently for carrying passengers or burdens; and the land being ploughed by buffaloes or oxen, these beasts are seldom killed for food. The asses of Persia are much larger and swifter than those of Europe, and will perform a journey very well. The horses have fine foreheads, and are well-proportioned, light, and sprightly; but only used for the saddle. Though they are beautiful creatures to look on, they are neither so swift as the Arabian horses, nor so hardy as the Tartars; and the king has always a stud of the Arabian breed.

The sheep at Shirauz are of a superior flavour, owing to the excellence of the pasturage in that neighbourhood, and are remarkable for the fineness of their fleece. They have broad flat tails, as in Tartary and some other places, so large, that, Mr. Franklin says, he has seen some that weighed more than thirty pounds; but those which are sold in the markets do not weigh above six or seven pounds. They are remarkable, also, in some parts of Persia, for having several horns. "I have seen some," says Chardin, "with six or seven horns, some standing straight out of their forchæds; so that, when the rams engage, there is usually a great deal of blood spilt in the battle." The flesh of the Persian goats is very good; and their wool or hair is so fine, that great quantities of it are exported.

Tame and wild fowl in Persia are almost as numerous as in Europe. Turkeys have been imported into Ispahan, but do not thrive there. Pigeons they take the utmost care to increase, on account of their dung, with which they raise their melons. Their dove-cots are very large, of a round form, and handsomely built of brick; and of these, it is said, there are not less than three thousand in the city of Ispahan alone. Chardin observes, that the partridges are the largest and most excellent he ever

saw. The boobul, or oriental nightingale, enlivens the spring with its varied song. As to eagles, hawks, falcons, and other birds of prey, there is no country where they have more, or where they are better instructed to take the prey, than in Persia.

River-fish is scarce, and seldom eaten; but the Caspian Sea and the Persian Gulf furnish plenty of sea-fish, of almost every kind.

The interior of Persia is not much infested with insects, unless it be with swarms of locusts, which sometimes visit it: these fly in such numbers, as to look like a cloud, and darken the sky; and, wherever they alight, they destroy the fruits of the earth; but Providence has so ordained it, that there are certain birds, which, generally visiting the country about the same time, eat up the locusts, and so prevent the entire ruin of the crops.

*Minerals.*] The mineralogy of this extensive country seems neither various nor important, though the numerous mountains probably abound with unexplored treasures. The lead-mines of Kerman and Yezd produce the usual mixture of silver. In the northern provinces there are several mines of iron, but the metal is harsh and brittle. Copper is chiefly found in the mountains of Mazanderan, and near Casbin; but it is brittle, and requires to be mixed with that of Japan or Sweden.

There are two mines of turquoises; one at Nishapour, in Corasan, and another about four days' journey to the south of the Caspian, in the mountain called Feruzkoh. Pearls abound in the Persian Gulf, especially near the isles of Bahrain, on the Arabian side.

Chardin adds, that sulphur and nitre are found in the mountain of Demavend, which he places on the south of Hyrcania, or Mazanderan. Sometimes whole deserts are covered with sulphur, and others with salt, which, near Cashan, is remarkably pure.

*Medicinal Springs, Everlasting Fire, &c.*] The most celebrated mineral-waters are those of Baringe, about half a league from Tauris; and those of Seid Kent, about six leagues from the same city. These waters are sulphureous, and some of them boiling hot, whilst others are remarkably cold.

About ten miles from Assur, at the foot of a high mountain, on the north of Gambroon, there are several springs, both hot and cold, which are much resorted to, for the cure of rheumatic pains and cutaneous distempers; but they are only used for bathing, as the water, taken internally, operates as a powerful emetic. No person resides near these baths; but a few sheds have been erected in the neighbourhood, for the accommodation of invalids, who take care to furnish themselves with all other conveniences.

On the first Circassian mountain, lying on the south of the river Tereck, there is a well, about forty fathoms deep, from which a stream of boiling water falls into a stone

basin, and afterwards rushes down a precipice, near thirty fathoms, into the Tereck, in sufficient quantities to turn the wheel of a mill. Near this hill are seven springs of the same kind of water, and one which appears impregnated with alum, being so extremely acid and astringent, that it cannot be held long in the mouth. At a small distance are several pits, dug in the earth, containing salt, of the utmost purity and brightness, which dissolves instantaneously in the mouth, and leaves a very pungent sensation. Even in cold weather, the warmth of these wells produce the verdure and flowers of spring, near their borders.

The phenomenon called the *everlasting fire*, to which a sect of Indians and Persians, called Gauris, pay religious worship, has been thus described by an intelligent writer

"It is situated about ten miles from the city of Baku, in the province of Shirvan, on a dry rocky spot of ground. Here are several ancient temples, built with stone, and supposed to have been all dedicated to fire; and, among the others; there is a little temple, in which the Gauris now worship. Near the altar is a large hollow cane, from the end of which issues a blue flame, in colour and gentleness resembling a lamp, but seemingly more pure. The Indians affirm, that this flame has continued ever since the flood; and they believe that, if it were resisted or suppressed in that place, it would break out and rise in some other.

"At a short distance from this temple is a low cliff of a rock, in which there is a horizontal gap, two feet from the ground, near six feet long, and about three feet broad, out of which issues a constant flame, of the colour and nature already described. When the wind blows, it sometimes rises to the height of eight feet, but is much lower in calm weather.

"The earth round this place, for more than two miles, has this extraordinary property, that, by taking up two or three inches of the surface, and applying a live coal to it, the part so uncovered immediately takes fire, almost before the coal touches the earth. The flame makes the soil hot, but does not consume it, nor affect what is near it with any degree of heat.

"If a cane, or tube of paper, be set about two inches in the ground, closed with earth below, and the top of it touched with a live coal, a flame will immediately issue out, without consuming the tube, provided the edges be covered with clay. Three or four of these lighted canes will boil water in a pot, and are sometimes used to cook victuals. The flame may be extinguished in the same manner as that of spirits of wine. It smells sulphureous, like naphtha, but is not very offensive."

*Antiquities.*] The principal remains of antiquity in Persia, are the famous ruins of Persepolis, a city which was the residence of the ancient kings of Persia, and was

scarcely inferior to any city in the world in splendour and magnificence. The place is now called *Chilmanar*, or the forty pillars. It is situated about fifty miles north-east of *Shirauz*, at the north-east end of that spacious plain, where *Persepolis* once stood, and is generally supposed to be a part of the palace of *Darius*, who was conquered by *Alexander the Great*. It stands on a rising ground; and the adjoining mountains encircle it, in form of an amphitheatre. The ascent to the pillars is by a grand flight of steps, of blue stone, a hundred and four in number, thirty feet in length, and twenty inches broad; so that a horse may easily go up or down them. *Mr. Herbert* says, it was built upon a mountain of dark-coloured marble, and the steps hewn out of the solid rock; but those who have viewed it more accurately since, observe, that the steps are composed of large stones, fifteen or sixteen feet long, and of such a thickness, that six or seven steps are cut out of one stone; the whole being so artificially joined, that they appear to be but one piece.

The stair-case divides as you ascend, one flight winding to the right, and the other to the left, having a wall on each side, and a balustrade on the other. Afterwards both flights, or branches, turn again, and end at a square landing-place, whence you go into a portico of white marble, twenty feet wide. On it are carved, in bas-relief, two beasts, as large as elephants, but their bodies like horses, with the feet and tails of oxen. Ten feet farther stand two fluted columns, of whitish stone, about six feet high, besides their capitals and bases, and as thick as three men can fathom round. A little farther stand two pilasters, embellished with two sphinxes, of an immense size, ornamented with a profusion of bead-work. On the sides above are inscriptions, of an ancient character, which no one yet has been able to decipher. Beyond this portal is another flight of steps, leading to the grand hall of columns; on its sides are a variety of figures, in bas-relief, a kind of triumph, consisting of a great train of people, in distinct companies, some carrying banners, others offerings; after all is a car, drawn by several horses, with a little altar on it, from which fire seems to ascend. At the head of the stair-case is another bas-relief, representing a lion, seizing a bull, cut with great exactness; and close to this are other inscriptions, in ancient characters. On the top of the second stair-case is a square place, which has been surrounded with columns, to which the name of the forty pillars has been given. Although many ages have elapsed since the foundation of this building, fifteen of the columns yet remain entire; they are from seventy to eighty feet in height, and are masterly pieces of masonry; their pedestals are curiously wrought, and appear little injured by the hand of time; the shafts are fluted to the top, and the capitals are adorned with a profusion of frieze-work.

From this hall we proceed eastward, till we arrive at the remains of a large square building, the entrance to which is through a door of granite. Most of the doors and windows of this apartment are still standing; they are of black marble, and polished like a mirror: on the sides of the entrance are bas-reliefs of two figures, representing a man stabbing a goat: over another door is the representation of two men, at full length; behind stands a domestic, holding a spread umbrella. At the south entrance of this room are two large pillars, on which are cut four figures, dressed in long garments, holding in their hands spears, ten feet in length. Vast numbers of broken pillars, shafts, and capitals, are scattered over a considerable extent of ground, some of them of enormous dimensions. Indeed, every part of these ruins indicate their former grandeur, and, whilst viewing them, the mind becomes impressed with an awful solemnity.

There are the remains of other buildings, reaching up the sides of the mountain, equally magnificent and beautiful, with human figures cut on the walls, carrying bows and arrows, and spears in their hands, all of them with caps, in the form of turrets, which was the mode of head-dress among the ancient *Medes*. *Sir John Chardin* and *M. Le Brun* have given it as their opinion, that this was the burial-place of the ancient kings of *Persia*. The modern natives call this place the Assembly of King *Gemshedd*, and say, that prince used to visit it, with the nobles and great men of his court, in order to enjoy a delightful view of the adjacent country. In another place, nearly adjoining, a stone stair-case leads into a magnificent court, of a quadrangular form; several pedestals of pillars, and the remains of two grand portals, all of granite, are still visible, and the cornices of the portals are perfect. On many of the broken pieces of the pillars are ancient inscriptions. In several parts of this palace are stone aqueducts, cut under ground, eighty feet deep, and forty broad, to carry off the water that descends from the mountains.

The materials of which the ruins consist, are chiefly hard blue stone; but the doors and windows of the apartments are all of black marble, highly polished. One of the principal things, worthy admiration, is the immense strength of the foundation. The whole of the palace takes in a circumference of fourteen hundred square yards. The front is six hundred paces from north to south, and three hundred and ninety from east to west. The height of the foundation, in front, is, in several parts, from forty to fifty feet, and consists of two immense stones, laid together. It is much to be feared, that, in the course of a few centuries, earthquakes may destroy the columns and remaining apartments; but, whatever may be their fate, the foundation must endure, until the rock on which it is built shall be destroyed.

situated in a delightful plain, and almost surrounded by mountains. The streets are generally narrow and crooked, and either exceedingly dirty or dusty, not being paved. There are, however, some fine squares in the town, particularly the Meydan, or Royal Square, into which open two of the palace-gates. On the sides of this square, which is one-third of a mile in length, and more than half as broad, are buildings, much like those of Exeter Change, in London, a covered way, with shops on both sides, where every particular trade has a quarter assigned; and there is a second story, where mechanics have their working shops. There seems to be little difference between these Exchanges and ours, except that those of Ispahan have no windows, but large openings, at proper distances, to let in the light, and people ride through them, as along the streets. In the middle of the square there is a market for horses and cattle; and all manner of goods and eatables are exposed for sale. On that side of the square next the palace there is a handsome basin of water, shaded with trees; and some brass guns, taken from the Portuguese at Ormus, serve to make a show. At the south end of the square is a great mosque, and another on the east side, over against the principal gate of the palace. Several streets are arched over, which makes them dark, and this seems to be peculiar to the Persian towns; as is also, that their houses are at some distance from their shops. It is a common thing for a tradesman to go half a mile in a morning to the bazar, or market-place, where his shop is; and at night he locks up his valuable goods in chests and counters, and the rest are left packed up in the open square; and seldom is any thing lost, so careful are the watch appointed to guard the market-place, and so little is theft practised in this part of the world.

Foreign merchants lodge their goods in the public caravanseras, of which there are not less than fifteen hundred in the city of Ispahan. These are large buildings, erected by charitable persons, for the use of strangers, which serve them also instead of inns, for lodging and diet; but there is this difference between an inn and a caravansera, that in the last every one finds his own bedding and cookery, whereas in the first they have not that trouble. There are two things, however, that render a caravansera preferable to an inn: one is, that a person is not subject to extortion, but buys his provision at the best hand; and the other, that, let the merchant take up ever so many rooms, he is not disturbed in them, and pays but a trifle for ware-house and lodging, and, on the road, he pays nothing. Most of them are built on the same plan, and differ only in dimensions.

There are no taverns in Ispahan, but there are handsome coffee-houses in the principal parts of the town, where people meet, and converse on political subjects, though they have no printed newspapers. In such places

are amusements peculiar to the country, as the harangues of poets, priests, and historians, who hold forth, and get a crowd about them.

The palace, with the gardens belonging to it, takes up above three miles in compass. Over the two gates, which come up to the royal square, is a gallery, where the sophi, or king, used to sit, and see martial exercises performed on horseback. No part of the palace, where the court resides, reaches this square; but, having entered the principal gate, there is a hall, or court-room, on the left-hand, where the vizier and other judges administer justice on certain days; and, on the right, are rooms, where offenders are allowed to take sanctuary. From hence to the hall, where the king usually gives audience, is a handsome covered walk. It is a long room, beautifully painted, and supported by forty pillars, divided into three parts, one step higher than the other, on which the great officers stand, according to their rank. On the third ascent is the royal throne, raised about a foot and a half from the floor, and about eight feet square, on which is spread a rich carpet. Here the king sits, cross-legged, upon solemn occasions.

"Many fanciful things," says a respectable traveller, "have been related respecting the harem, or women's apartments, which travellers have never been admitted to see: some particulars, however, have been learned from the eunuchs and women, who frequent those apartments, and furnish the ladies with toys. From these we understand, that the women's quarter of the palace is the most magnificent, and the best furnished of the whole, the prince spending the greater part of his time here. It is said, also, that the economy of this inward palace is much the same with the outer; and that the women have their several posts and employments here, as the men have in the other; that there are stewards, secretaries, treasurers, guards, &c. all of the fair sex; whose cabals frequently embarrass and frustrate the best-concerted designs of the ministers without.

"In the harem there are three ranks of women; first, princesses born there; secondly, those by whom the king has any children, or who are his mistresses; and, thirdly, those whom he has never taken to his embraces, and many of whom he scarcely knows.

"In the royal harem are several distinct buildings, which have no communication with each other. When a king dies, those ladies, with whom he has conversed as wives, are shut up in a quarter by themselves, whence they are not permitted to stir out as long as they live, unless it be the mother of the succeeding prince, who has generally great influence in affairs, and almost a sovereign authority within the limits of the harem.

"The guards of the harem are composed of three different bodies. 1. The white eunuchs, who guard the

outer gate. These never come within sight of the women. 2. The black eunuchs. These are generally from the coast of Malabar. Their station is in the second court; and the oldest and most deformed of these are selected to attend the ladies, and carry messages; the rest are employed either in the gardens, kitchens, or other places, remote from the women's apartments. 3. The innermost guard is composed of women, commanded by some antiquated matron, who receives orders from the prince himself, and conveys his majesty's commands, by the eunuchs who attend, to the guards without.

"The ladies of one apartment are not suffered to visit those of another, without permission. This is to prevent quarrels among rival mistresses. Those who delight the king most with their singing, their dancing, or their wit, are sure to excite envy; and the king is not a little troubled, sometimes, with their contrivances to betray and supplant each other. When he is provoked, he will order one to be confined, another to be beaten, and a third, perhaps, to be degraded to the rank of a common slave. It is reported, also, that the greatest part of the royal infants are put to death as soon as born, to prevent their being too numerous. The king's mother has the direction of these matters; and her orders are executed without the least remorse. She is, as it were, the governess of all her son's mistresses and favourites: their fortune, and that of their children, seems to be entirely in her hands; and it is not easy for them, without her, to preserve the king's affection. The king is never formally married to any of his mistresses; but takes which of the ladies he pleases to his bed, without any ceremony. Those he is intimate with are but a small number. The others, indeed, sing, dance, and play before him, and contribute to his pleasures in another manner; but, from the distractions he meets with in a variety of consorts, he frequently fixes upon some one, who may properly enough be styled the queen of the harem.

"The ladies of the harem never visit out of the palace, but receive the visits of their female relations: and it is observed, in general, throughout Persia, that those of the greatest quality of that sex stir the least from home, scarcely ever going abroad, but on some extraordinary occasion. But, when they do go, their visits usually last seven or eight hours. They take with them their female slaves and eunuchs; and the husband usually sends a governante and eunuch of his own, to observe their conduct.

"As the ladies follow the king to his other palaces, or to camp, in time of war, they always travel in the night. A troop of cavalry usually marches a hundred paces before them, and another troop in the rear, uttering a cry, by which every male, more than seven years of age, understands he is to retire to a certain distance. The eunuchs, with their

batoons, also on horseback, march between the guards and the women; and, if any man is found in the way, or within the limits prohibited, he is put to death. If they march through a city, the men, in the streets through which they pass, and those adjoining, are all obliged to leave their houses, and fly to some other part of the town, as those of the villages are, for a league together, on the right and left of the road through which they are to march; and a detachment of dragoons is usually sent, half a day before, to drive them away. Muskets are fired, at short intervals, to give notice of their approach, and all who hear the report retire as fast as they can."

There are upwards of a hundred and fifty Mahometan mosques in Ispahan, covered with domes or cupolas, which, appearing through the trees, that are planted almost all over the town, afford an agreeable prospect: but the common buildings are so low, as scarcely to be discernable by one who takes a view of the town from without.

As no Christian is admitted within their mosques, it is not easy to meet with a particular description of them. Those who have seen the great mosque of Ispahan, in disguise, tell us, there is a gate leading to it, covered with silver plates. Through this there is a quadrangle, with a piazza on each side, where the priests lodge who belong to the mosque. In the centre is a large basin of water, where the people wash themselves before they enter the temple. In this square, opposite the great gate, are three large doors, which open into it. The whole building consists of five aisles, beautified with gold and azure. In the middle is the cupola, supported by four square pillars. The aisles on the sides are lower than the middle one, and borne up by thick columns of free-stone. Two great windows, towards the top of the middle aisle, give light to the whole mosque. On the left, towards the middle, stands a kind of pulpit, with stone steps to go up to it. There are no seats or pews, as in Christian churches, or any kind of imagery or pictures; but the floor is carpeted, and all persons put off their shoes on entering. The walls within are lined with white polished marble, to the height of fifteen feet. The building without is of stone, but painted with varnish-colours; and on the cupola is a tower, where the priests go up to summon the people to their devotion.

There are here a number of hummums, or bagnios; some of these are square buildings, but most of them round, built with white polished stone, and covered with painted tiles. The interior is divided into several recesses or chambers, some for pleasure, and others for sweating; and the floors are laid with black and white marble.

But what is particularly admired by foreigners, is the Charbag. This is a walk, about a hundred yards wide, and a mile long, extending from the city to the river. On

each side are middle, runs distance of basin, forming several persons walk are the with pleasure together, for received.

foreigners, is the dred yards wide, to the river. On

each side are planted double rows of trees; and, in the middle, runs a canal, not continued on a level; but, at the distance of every furlong, the water falls into a large basin, forming a cascade. The sides, both of the canal and basins, are lined with hewn stone, broad enough for several persons to walk a-breast. On each side of this walk are the royal gardens, and those of the grantees, with pleasure-houses at a small distance; and the whole, together, forms as agreeable a prospect as can be conceived.

This capital is said formerly to have contained a population of six hundred and fifty thousand souls; but it was often depopulated by Kouli Khan, during his wars; and when Mr. Hanway was there, in 1744, not above five thousand of its houses were inhabited.

SHIRAUZ lies about two hundred and twenty-five miles to the south of Ispahan. It is situated in a fertile valley, which is twenty-six miles long, and twelve broad, and is surrounded on all sides by mountains.

The city has six gates, each guarded by a hundred men, and four officers, who every morning and evening attend at the citadel, to pay their compliments to the khan, or king, or, in his absence, to the beglerbeg, or person next in rank. It is the duty of these guards to prevent all persons leaving the city without a pass; and, if any person, obnoxious to government, escapes, the officer's head answers for it. The gates are shut at sun-set, and opened at sun-rise, before which time no one can go out, or come in.

At the upper end of the city stands the citadel, built of burnt bricks, a square of eighty yards circumference, flanked with round towers, and encompassed with a dry fosse, of the same breadth and depth as that of the city. It is the royal residence, and serves, occasionally, as a state prison. Opposite to the citadel, in a large handsome square, is a gallery, where the khan's music, consisting of trumpets, kettle-drums, and other instruments, play regularly at sun-rise and sun-set. One side of this square leads to the great mosque, and the other to the Dewân Khâna, or chamber of audience, a very handsome building, situated at the upper end of a large garden, to which you are conducted through an avenue, planted on each side with a species of the sycamore-tree. The room is of an oblong form, with an open front, the inside, about one-third up the wall, lined with white marble, and the ceiling and other parts ornamented with a beautiful gold enamelled work, in imitation of lapis lazuli. There are several portraits in it, tolerably well executed. In front, there are three handsome fountains, with stone basins, constantly playing. In the great square, before the citadel, is the park of artillery, consisting of several pieces of cannon, mounted on bad carriages. Most of the guns (which are Spanish and Portuguese, excepting two English

twenty-pounders) are so dreadfully honey-combed, that they would certainly burst on the first discharge.

The great market is a covered street, about a quarter of a mile long, built entirely of brick, and roofed something in the style of the Piazzas, in Covent Garden. On each side are shops, in which a variety of goods are exposed to sale. There are also separate bazars, in Shirauz, for different companies of artificers, such as goldsmiths, workers of tin, dyers, carpenters, joiners, hatters, and shoemakers.

One quarter of the town is allotted to the Jews, who pay a heavy tax to government, and are obliged to make considerable presents. These people are more odious to the Persians, than those of any other religion; and every opportunity is taken to oppress, and extort money from them; the very boys in the street being accustomed to beat and insult them with impunity. The Indians have a earavansera allowed them in another quarter of the city, for which they are also under contributions.

Mr. Franklin, who got admission, in disguise, into the principal mosque, has given the following description of it: "It is of a square form: in the centre is a stone reservoir of water, for performing ablutions, previous to prayer. On the four sides of the building are arched apartments, allotted for devotion; some of the fronts of which are covered with china-tiles, others with a blue and white enamelled work. Within these recesses, on the walls on each side, are various sentences engraved from the Koran; and at the upper end of the square is a large dome, with a cupola at the top. It is lined throughout with white marble, ornamented with curious blue and gold artificial lapis lazuli, and has three silver lamps suspended from the centre of the dome. Here priests are constantly employed in reading the Koran. This mosque has detached apartments, with places for ablutions and other religious ceremonies; and, at a little distance, on the outside, are a range of handsome buildings, inhabited by mullahs, dervises, and other religious men."

In the centre of the city is a large building, called, by the Persians, Shah Cherauz, or the King Camp, and is considered as a place of great sanctity, being the mausoleum of the mother of one of their Imaums, or heads of their faith. It is a place of high antiquity; but the exact date of its foundation cannot be ascertained. The tomb of the celebrated poet Hafiz, about two miles from Shirauz, is of fine white marble. On the top and sides are select pieces from the poet's own works, most beautifully cut in Persian characters. During the spring and summer season, the inhabitants visit this spot, and amuse themselves with smoking, playing at chess, and other games, reading also the works of Hafiz, whom they esteem more than any of their poets, and whom they venerate almost to adoration. A most elegant copy of his works is kept

upon the tomb, for the inspection of all who go there. The principal youth of the city assemble here, and shew every possible mark of respect for their favourite poet, making plentiful libations of the delicious wine of Shirauz to his memory.

Not far from this tomb is a magnificent building, called *Hest Tun*, or *Seven Bodies*, erected in commemoration of seven dervises, who came from a great distance to reside in Persia, and took up their abode on this spot, and there continued till they all died, each burying the other successively, until the last was buried by the neighbours. This hall is lined one-third of the height with white Tauris marble, and the ceiling is ornamented with blue and gold enamel. It has some tolerable paintings, executed in the Persian style.

The tomb of Sadi, another of their famous poets, who flourished about six centuries ago, is also in being, though out of repair. It is situated at the foot of the mountains that border the valley of Shirauz. It is a large square building, at the upper end of which are two alcoves, or recesses in the wall. That on the right is the tomb of Sadi, just in the state it was in when he was buried: it is built of stone, ten feet long, and two and a half broad. On the sides are engraved many sentences in the old Nuskhi character, relating to the poet and his works. On the tomb is placed, for the inspection of all who visit it, a manuscript copy of his works, most elegantly transcribed. This place the people of Shirauz visit occasionally, as they do the tomb of Hafiz.

With respect to the present state of this city, we have the following account, in a quarto volume, recently published by Major Waring:

"Shirauz, I am apt to believe, will disappoint those who have imagined it a populous and noble city. It is worth seeing, but not worth going to see. The town is by no means so large as is reported: it is surrounded by a wall, tenable against cavalry, and has six gate-ways. Many of the streets are so narrow, that an ass, loaded with wood, stops your way, if you are on horseback; and the houses are generally mean and dirty. But we now see Shirauz to great disadvantage, the late king having destroyed an excellent stone wall, with very strong bastions, which was deemed, by the Persians, almost impregnable, and several of the best houses in the place; in his time, it was surrounded by a broad and deep ditch, which he filled up, on destroying the fort.

"Travellers, who visited Persia long before the ravages of time could have entirely defaced the marks of sumptuous edifices, speak neither of the extensive ruins nor splendid monuments of Shirauz. Olearius, who was in Persia in the year 1613, says, that it did not contain more than ten thousand houses; but that its ruins extended two miles. Herbert, who accompanied Sir Thomas Sherley

into Persia, in the year 1623, remarks, that the circumference was eight or nine miles; that there were fifteen mosques, one of which had two pillars, as high as St. Paul's. Dr. Fryer speaks of it, as containing some fine markets. Thevenot informs us, that its circumference is two hours' walk; and Tavernier calls it a mean, dirty place, which was once surrounded by a wall of mud, then fallen down.

"I should suppose the town to be about five miles in circumference, as it took me a little more than an hour to walk my horse round it. They have here a glass-house and a foundry, both worth seeing. The bottoms, which they blow, of glass, have a curious appearance to a stranger; they are ornamented in the inside with representations of trees, flowers, &c. and sometimes with small medallions. When the glass is just blown, they fix them in the bottom with small pinners; and so neatly are the pieces joined together, as to escape observation. Some of the artificers are ingenious able men; but their qualifications are actually misfortunes, as they are compelled to work for the principal people in the city, without the smallest hope of being recompensed for their labour, or being repaid for the expences they have incurred. This was really the situation of a very able gunsmith, who made pistols nearly equal to those in Europe.

"The Vakeel's bazar is a most noble work; it is built of brick, arched, and covered in, like Exeter-Change. It probably extends half a mile, and is, I should suppose, fifty feet wide. They have a story, that Kureem Khan, riding through it, soon after the work was completed, saw a nail driven into the wall, and, detecting the offender, caused his head to be struck off."

There are places in this city distinguished by the name of *Zoôr Khàna*, the house of strength, to which the Persians resort for the sake of exercising themselves. These houses consist of one room, with a floor sunk about two feet below the surface of the earth; and the light and air are admitted to the apartment by means of several small apertures, perforated in the dome. In the centre, is a large square terrace, or platform, of earth, well beaten down, smooth, and even; and on each side are small alcoves, raised about two feet above the platform, where the musicians and spectators are seated. When all the competitors are assembled, which is on every Friday morning, at day-break, they immediately strip themselves to the waist, on which each man puts on a pair of thick woollen drawers, and takes in his hand two wooden clubs, about a foot and a half in length, and cut in the shape of a pear; these they rest on each shoulder, and, the music striking up, they move them backward and forward with great agility, stamping with their feet at the same time, and straining every nerve, till they produce a very profuse perspiration. After continuing this exercise about half an

nour, the music is discontinued, and the wrestlers, in their clubs, exert themselves, and then they are allowed to rest. The king, or his representative, is present, and the wrestlers are rewarded according to their merit. The king, or his representative, is present, and the wrestlers are rewarded according to their merit. The king, or his representative, is present, and the wrestlers are rewarded according to their merit.

DERBEND, a city of antiquity, and of the Caspian Sea, is about three miles broad, and is situated on the west, up to the declivity; and is a strict propriety is no passage to mountains, which who have not a citadel, that is divided into the upper town, the citadel; and the garrison.

The walls of the city are twenty feet thick at top, having a double thickness of bastions.

The city-gate is paved with stones from the mountains. In this year that it was paved into Persia; and it tells us, that, on one side by the greatest part

hour, the master of the house, who is always one of them, and is distinguished by the appellation of *pehlwan*, or wrestler, makes a signal, on which they all leave off, quit their clubs, and, joining hands in a circle, begin to move their feet very briskly, in time with the music, which is all the time playing a lively tune. Having continued this for a considerable time, they commence wrestling; but, before this trial of skill begins, the master of the house addresses the company in a set speech, in which he tells the candidates, that, as they are all met in good fellowship, so ought they to depart; and that, in the contest they are about entering into, they should have no malice or ill-will in their hearts, it being only an honourable emulation, and trial of strength, in which they are going to exert themselves, and not a contentious brawl: he, therefore, cautions them to proceed in good humour and concord. This speech is loudly applauded, and the wrestling begins. The master of the house is always the challenger; and, being accustomed to the exercise, is generally the conqueror, by throwing each of the company two or three times successively. The spectators each pay a sum equal to three-pence English, for which they are refreshed with a pipe of tobacco, and coffee.

DEBEND, the capital of Shirvan, is a city of great antiquity, and the only place now standing on the shores of the Caspian Sea, which has anything to boast of. It is about three English miles long, but not more than half a mile broad, extending from the verge of the shore, due west, up to the foot of a lofty mountain, the whole on a declivity; and its natural situation is such, as to form, in strict propriety, the gate of Persia, on this side; for there is no passage to the westward, without going deep into the mountains, which are guarded by their proper inhabitants, who have not submitted to the Persian yoke. Here is a citadel, that mounts forty pieces of cannon. This city is divided into three parts, each part having its distinct wall; the upper town, which is half a mile square, constitutes the citadel; and no person can enter it but the soldiers of the garrison.

The walls of the middle town are about thirty feet high, twenty feet thick at the base, and from twelve to fifteen at top, having a breast-work, with port-holes, of considerable thickness. It is defended also by about six flanking bastions.

The city-gates are very strong, and have well-made arches, with sliding holes, to shoot arrows or throw down stones from. The streets are not regular, nor were they paved in 1746, though they had been so formerly. It was in this year that the Russian ambassador made his entry into Persia: and Mr. Van Mierop, who accompanied him, tells us, that, though many of the houses were supported on one side by the hills, numbers were fallen down; and the greatest part in ruins.

[*Manufactures and Commerce.*] The Persians equal, if they do not exceed, all the manufacturers in the world, in silk, woollen, mohair, carpets, and leather. In the fabrication of these articles, they unite fancy, taste, and elegance, with richness and neatness; and yet they are ignorant of painting; and their drawings are very rude. Their dyeing excels that of Europe. Their silver and gold laces, and threads, are admirable for preserving their lustre. Their embroideries and horse-furniture are not to be equalled; nor are they ignorant of the pottery and window-glass manufactures. On the other hand, their carpenters are very indifferent artists, which is said to be owing to the scarcity of timber in Persia. Their jewellers and goldsmiths are clumsy workmen; and they are ignorant of lock-making, and the manufacture of looking-glasses.

The commerce of the Persians, who have little or no shipping of their own, is carried on in foreign bottoms. That with the English and other nations, by the Gulf of Ormus at Gombroon, was the most lucrative they had; but the perpetual wars they have been engaged in have ruined their commerce. As the manufactures and silk of Ghilan are esteemed the best in Persia, Resched, on the Caspian, is one of the first commercial towns in this part of Asia, and supplies the bordering provinces with European merchandise.

[*Religion.*] The Persians are Mahometans, of the sect of Ali; for which reason the Turks, who follow the succession of Omar and Abu Bekr, call them heretics. Their religion is, if possible, in some things, more fantastical and sensual than that of the Turks; but, in many points, it is mingled with some Bramin superstitions. A comparison may be made between the Bramins and the Persian Gaurs, who pretend to be the disciples and successors of the ancient Magi, the followers of Zoroaster. Both of them are said to have held, originally, pure and simple ideas of a supreme Being: but the Indian Bramins and Persees accuse the Gaurs, who still worship the fire, of having sensualised those ideas, and of introducing an evil principle into the government of the world.

The long wars between the Persians and the Romans seem early to have driven the ancient Christians into Persia, and the neighbouring countries. Even to this day many sects are found, that evidently have Christianity for the ground-work of their religion. Some of them, called Soussees, who are a kind of quietists, sacrifice their passions to God, and profess the moral duties. The Sabean Christians have, in their religion, a mixture of Judaism and Mahometanism; and are numerous towards the Persian Gulf.

The Persians observe the fast during the month of Ramazan, (the ninth month of the Mahometan year), with great strictness. About an hour before day-light, they eat a meal, which is called *sehre*, and from that time, un-

til the next evening at sun-set, they neither eat nor drink any thing. If, in the course of the day, the smoke of a pipe, or the smallest drop of water, should reach their lips, the fast is deemed broken, and of no avail. From sun-set until the next morning they are allowed to refresh themselves. This fast, when the month Ramazan falls in the middle of summer, is extremely severe, especially to those who are obliged, by their occupations, to go about during the day-time; and is rendered still more so, as there are also several nights, during its continuance, which they are enjoined to spend in prayer. The Persians particularly observe two; the one being that on which their prophet Ali died, from a wound which he received from the hands of an assassin three days before; which night is the twenty-first of Ramazan, the day of which is called, by the natives, the Day of Murder. The other is the night of the twenty-third, in which they affirm that the Koran was brought down from Heaven, by the hands of the angel Gabriel, and delivered to their prophet Mahomet; for which reason it is denominated the Night of Power.

*Military Force.*] The Persian army consisted formerly of cavalry, and it is now thought to exceed that of the Turks. Since the beginning of the last century, however, their kings have raised bodies of infantry. The regular troops of both brought into the field, even under Kouli Khan, did not exceed sixty thousand; but, according to the modern histories of Persia, they are easily recruited, in case of a defeat. The Persians have few fortified towns; nor had they any ships of war, until Kouli Khan built some armed vessels; but, since his death, we hear no more of their fleet.

*Revenues.*] The king claims one-third of the cattle, corn, and fruits, of his subjects, and likewise a third of silk and cotton. No rank or condition exempts the natives of this country from severe taxations and services. The governors of provinces have particular lands assigned to them, for maintaining their retinues and troops; and the crown lands defray the expences of the court, the king's household, and the great officers of state. The water that is let into fields and gardens is subject to a tax; and foreigners, who are not Mahometans, pay each a ducat a head.

*Government, Laws, &c.*] The government of Persia is monarchical, and, in every branch of it, completely despotic.

The usual title of the king is *shah*, which is equivalent to that of emperor, in Europe. They add, also, to the king's titles, those of sultan and *cham*, which is that of the Tartar sovereign. To acts of state, the Persiau monarch does not subscribe his name; but oftentimes, in his patents, enumerates the several kingdoms or provinces under his dominion. His subjects address him as the most renowned of all men; the source of power, majesty, and glory; equal to the sun; Substitute of Heaven; Object

of all men's vows; Head of the most excellent religion; Prince of the faithful; Shadow of the Almighty; Father of victory; Lord of the revolutions of the world; Disposer of thrones and crowns. With these, or such like titles, petitions are given to the throne; but, when they speak to the king, they usually style him, The Lieutenant of God, or the "Prince through whom God dispenses his grace and favour to men." Those of the blood royal are styled *mizza*, which signifies the Son of a Prince. The second post in the government is that of the *divan bey*, whose office may be compared to that of our lord chief justice, and sometimes to that of our lord chancellor; but the administration of justice is committed to a *divan*, or council, which decides on all causes, civil and military, except when the king in person sits in judgment. The Divan Bey, or Lord, can command any cause to be removed to his tribunal, from any court in the kingdom. In the third rank, come the generals; and next the secretary of state, who registers the public acts, and has the care of the records. He appoints also a deputy, in every province of the empire, who transmits all affairs of consequence, to be laid before the ministry. The last great officer is the *mirab*, or lord of the water, who superintends the aqueducts. Every province has its *mirab*; for, in so dry a country, it is necessary all should have an equal share of water.

In every province of Persia there is a governor, who is often as despotic as a sovereign prince. Military causes are always tried by these governors, who, though they are accountable for all their actions, and have often their ears cut off, their noses slit, their backs beaten, or their feet bastinadoed, till the nails come off, seldom abstain from acts of violence and oppression.

The civil and canon laws of the Persians are blended together. Mahomet contrived this, in imitation of the Jewish law, especially the book of Leviticus, where the civil law and religious ceremonies are mingled together. According to the principle of the Mahometans, the same person bears the spiritual and temporal sword, and is both high-priest and king; he commands in war, and administers justice, explains the articles of faith, and regulates the ecclesiastical discipline, as the patriarchs did among the Jews. Justice is administered in Persia in a very summary manner, the sentence being always put into execution on the spot. Theft is generally punished with the loss of the nose and ears; and highway-robbery, by ripping up the belly of the criminal, in which situation he is exposed upon a gibbet, in one of the most public parts of the city, and there left until he expires in torment. The other punishments, in this country, are so varied and cruel, that humanity shudders at them.

*Language and Literature.*] The Turkish language is the most common in Persia, and prevails on the southern

parts of the country. The Persians were formerly in but little use of the Arabic, in knowledge.

The Persians are to the left of the Indian Ocean, and were formerly a powerful nation.

There is a great number of people of a humid constitution. Ferdusi and other Persian poets, who have been famous for their learning and learning, are mentioned in the pieces, both of the most famous and Nakhshabandi of a Parrot. Jami was a famous poet in the middle of the fifteenth century, and served at Osh.

posed, in a dissertation on various conditions of agreement. Of the species of the English language, that the poet has written the favours of his wit, a powerful motion from the purchase of a splendid admiration of mystic piety determined the fate of art.

At present the Persians are reduced to a number of judicious greatest esteem is at perpetual must be in the often defeats

The varied and cruel, ish language is on the southern

parts of the Caspian, as well as in those provinces which were formerly conquered by the Turks. The pure Persian is but little known, except in the southern parts, on the coast of the Persian Gulf, and the confines of Arabia, and particularly at Ispahan. Literary characters use the Arabic, in which is deposited the greatest part of that knowledge, for which the Persians were once distinguished.

The Persians write, like the Hebrews, from the right to the left; are neat in their seeds and materials for writing, and wonderfully expeditious in the art. The number of people employed on their manuscripts is incredible.

There is a manuscript at Oxford, containing the lives of a hundred and thirty-five of the finest Persian poets. Ferdusi and Sadi were among the most celebrated. The former comprised the history of Persia in a series of epic poems, which employed him nearly thirty years, and which have been styled "a glorious monument of eastern genius and learning." Sadi was a native of Shiraz, who flourished in the thirteenth century, and wrote many elegant pieces, both in prose and in verse. Shemseddin was one of the most eminent lyric poets that Asia has produced; and Nakhshab wrote, in Persian, a book called the "Tales of a Parrot," not unlike the Decameron of Boccaccio. Jami was a most animated and elegant poet, who flourished in the middle of the fifteenth century, and whose beautiful compositions, on a great variety of subjects, are preserved at Oxford, in twenty-two volumes. Hariri composed, in a rich and flowery style, a moral work, in fifty dissertations, on the vicissitudes of fortune, and the various conditions of human life, interspersed with a number of agreeable adventures, and several pieces of poetry.

Of the sprightly and voluptuous bard of Shiraz, the name and character are sufficiently known to Orientalists. The English reader, however, may be gratified by hearing that the poet Hafiz, here introduced to his notice, conciliated the favour of an offended emperor, by the delicacy of his wit, and the elegance of his verses; that the most powerful monarchs of the east sought, in vain, to draw him from the enjoyment of literary retirement, and to purchase the praises of his muse, by all the honours and splendor of a court; and that his works were not only the admiration of the jovial and the gay, but the manual of mystic piety to the superstitious; and the oracle which determined the councils of the wise, and prognosticated the fate of armies and of states.

At present, however, learning is at a low ebb among the Persians. Their boasted skill in astronomy is now reduced to a mere smattering in that science, and terminates in judicial astrology. The learned profession in greatest esteem among them, is that of medicine; which is at perpetual variance with astrology, because every dose must be in the lucky hour fixed by the astrologer; which often defeats the end of the prescriptions.

*Customs, Manners, &c.* The Persians, of both sexes, have, in general, good features, and a tolerably fair complexion, slightly tinged with olive; but those in the south, about Shiraz, and the provinces towards India, are of a dark brown. They are generally corpulent; with black hair, high forehead, aquiline nose, full cheeks, and a large chin, the form of the countenance being frequently oval. A Persian beauty is most esteemed when of middle stature, with long black hair, black eyes and eye-brows, long eye-lashes, fair complexion, with very little red, small nose, mouth, and chin, white teeth, long neck, small feet and hands, slender shape, and skin extremely smooth. The females, in the neighbourhood of Shiraz, are tall and well-shaped, and celebrated for their bright and sparkling eyes. This, however, is, in a great measure, owing to art; for they rub their eye-brows and eyelids with the black flour of antimony, which adds an incomparable brilliancy to their natural lustre. The men are strong and robust, and inclined to martial exercises, but they are particularly subject to disorders of the eyes. They generally shave the head; but the beard is sacred, and attended with great care.

In their dispositions, the Persians are quick, fiery, and very sensible of affronts; but they are not vindictive. They are of a sedentary turn, and delight in sitting still, and musing.

The better order of people, in Persia, are divided into two classes, the military and officers of state, and the merchants. The former, who receive a certain annual sum, which they are accustomed to expend, are very liberal, and seldom think of amassing any wealth for their posterity. The merchants, however, are always intent upon gain; it is the only subject which occupies their thoughts; and such is the ascendancy their penurious habits have gained over them, that they cannot forego an opportunity of the slightest advantage, though attended with disgrace and infamy. They have, in general, raised themselves to opulence, from a very small beginning; and the consequence is, that their penury has proportioned itself to their property. The military men are rapacious, and guilty of excessive meanness in their pursuit after money: but it must be confessed they are pleasing and entertaining companions; though not the least reliance is to be placed on their words or protestations. It is necessary to be guarded against their insidious offers; and, to be so, it is necessary to distrust all their declarations. They conceive it their duty to please; and, to effect this, they forget all sentiments of honour and good faith. They have but a faint notion of gratitude; for they cannot conceive that any one would perform an act of generosity without some sinister motive.

"The Persian dress," says Major Waring, "is admirably calculated either for a cold or hot climate. Their

limbs are under no restraint, and their clothes may be put on or thrown off in five minutes. The Persians are generally too poor to be fashionable; their dress, therefore, seldom varies, except in the colour of the robes. The Qajjars, however, preside over fashion; and every thing which is supposed to be neat or elegant, is called à la Qajjar. Their clothes may be easily described. The Zeer Janus are very light trowsers, made of silk; those worn in the hot weather, sometimes of flax; the shirt comes over the trowsers, and then the Urkbalig, which is made of ehintz, or fine shawls. The outside robe is made of various kind of cloths, some of which are very magnificent and expensive; the cap is made of the skin of the sheep of Tartary, which is very fine, and beautifully black. The merchants are prohibited from wearing either scarlet or crimson cloths, and also from using silver or gold buttons to their robes. The wearing of silks is interdicted by the Mahometan law, but they evade this, by mixing a very little cotton with them.

Although the Persians bathe frequently, they are a very dirty people. They rarely change their garments, and seldom before it is dangerous to come near them. "The Persian who accompanied me," says Major W. "slept in his clothes until we reached Kazroon, although it was the hottest season of the year; and I believe then was only induced to change his dress at my recommendation. It is thought nothing in Persia to wear a shirt a month, or a pair of trowsers half a year.

"A Persian soldier, armed cap-à-pie, is, of all figures, the most ridiculous. It is really laughable to see how they encumber themselves with weapons: their horses groan under the weight of their arms. These consist of a pair of pistols in their holsters, a single one slung round their waist, a carbine, or a long Turkish gun, a sword, a dagger, and an uncommonly long spear; for all their fire-arms they have separate ram-rods, tied about their persons, powder-horns for loading, others for priming, and a variety of cartouch-boxes, filled with different sized cartridges. If they are advancing, they may be heard a long way off. I should really suppose that their saddle and arms would weigh about eighty pounds, an enormous addition to the horse's burthen. Yet they consider themselves as light-armed troops, ridiculing the Turkish cavalry, who, they say, can take care of little else than their big boots and cap. The arms of the Persians are very good, particularly their swords, which are highly prized by the Turks."

The Persians are fond of riding, and very expensive in their equipages. They wear at all times a dagger in their sash, and linen trowsers. The collars of their shirts and clothes are open; so that their dress, upon the whole, is far better adapted for the purpose both of health and activity, than the long flowing robes of the Turks. Men of rank and quality wear very magnificent turbans; many of

them cost twenty-five pounds, and few under nine or ten. They have a maxim to keep their heads very warm, so that they never pull off their caps or their turbans, out of respect, even to the king. Some girls wear a stiffened cap upon their heads, turned up before, like a hunting-cap, with a heron's feather in it. Neither men nor women wear gloves, but their fingers are full of rings, as their arms are of bracelets. They wear necklaces of gold, or pearl, hanging down on the bosom, with a locket full of perfume.

When the women leave the house, they put on a cloak, which descends from the head to their feet, and their faces are concealed with oriental scrupulosity. The veil which they wear is sometimes worked like a net, or else two holes are made in the cloak for their eyes. It is curious to see a number of tall and elegant formed figures, walking in the streets, and presenting nothing to your view but a pair of sparkling black eyes, which seem to enjoy the curiosity they excite. The veil appears to be essential to their virtue; for, as long as they can conceal their face, they care not how much they expose the rest of their person.

In one point of dress, the Persians differ remarkably from the Turks; for, in Turkey, any person, who is not a descendant of the prophet, wearing the least green upon his garments, would, most probably, be stoned: whereas, in Persia, green is the general and favourite colour, even to their shoes.

The houses of persons of quality are generally built in the middle of a fine garden, and make little or no appearance in the streets. Nothing appears but a dead wall, with a great gate in the middle, and perhaps a screen, or wall, within the gate, to prevent persons looking in.

Their houses have but one floor, laid out as follows: in the front of the house stands the verandah, being a little piazza, open before, where they sit and transact their common affairs; beyond this is a large hall, eighteen or twenty feet high, used at great entertainments, or on any solemn occasions. On the farther side of the house is another verandah, with a fountain of water before it; beyond which runs a walk of fine trees, as there does also from the street to the house. At each corner of the hall is a parlour, or lodging-room, for it serves both purposes occasionally. Between these parlours, on the sides, there are doors out of the hall into an open square space, as large as the rooms are at the corners. In some palaces there is a handsome basin, and a fountain playing, in the middle of the hall, which contributes still more to its coolness. The walls of the houses are of considerable thickness, and the roof of the great hall is arched, and five or six feet higher than the other rooms about it. The roofs of the buildings, on every side of the hall, are flat, with a balustrade round them; and there is a pair of stairs

up to the top, day; sometime night. The king the right and left detached from another, except chimneys, but have a round and a foot and which a charred a thick board, smoke can get carpet, under and sit round, pipes under the carpets spread lean on; and at and a quilt or sheets. The Persians lie about little room. The hard cement, on that a carpet, three feet high, and the rest of the houses of plan, as much like The Persians noon, but the ancient Greeks boiled rice, various is disgusting to an abomination after it is dressed or fowls, is so fingers. The meats, fruits, cakes, hard and the repeat ne In their conversation and are perpetual their most favourite from the highest not the advantages fits arising from a retentive memory. They also delight and are fond of pleasures times do with great When a person supper; notwithstanding at nine or ten in the They discourse, away the time in v

up to the top, where the family walk in the cool of the day; sometimes they carry up a mattress, and lie there all night. The kitchens, and other offices, are at a distance, on the right and left, and all the rooms, except the hall, stand detached from each other, having no passage from one to another, except from the hall. There are some few chimneys, but, in general, instead of a chimney, the rooms have a round aperture, about four or five feet diameter, and a foot and a half deep, in the middle of the room, in which a charcoal fire is made, and the place covered with a thick board, or table, about a foot high, so close, that no smoke can get out; and over this table is thrown a large carpet, under which they put their legs in cold weather, and sit round, there being a passage for the smoke, by pipes under the floor. Their furniture consists only of carpets spread on the floor, with cushions and pillows to lean on; and at night a mattress is brought to sleep on, and a quilt or two to cover them, but very seldom any sheets. The Persians lie in their under garments. Servants lie about in any passage, on mats, and take up but little room. The floors are either paved or made up of a hard cement, on which they put a coarse cloth, and over that a carpet. The sides of the rooms are lined, about three feet high, with fine tiles, not unlike the Dutch tiles, and the rest of the wall painted, or hung with pictures. The houses of the inferior people are built on the same plan, as much like those described as they can afford.

The Persians eat twice or thrice a day, dining about noon, but the chief repast is the supper, as with the ancient Greeks and Romans. The most usual dish is boiled rice, variously prepared, and their manner of eating is disgusting to European delicacy; for as they esteem it an abomination to cut either bread, or any kind of food, after it is dressed, their meat, which is generally mutton or fowls, is so prepared, that they divide it with their fingers. The meal is enlarged with pot-herbs, roots and fruits, cakes, hard eggs, and sweetmeats. They speak little, and the repast never exceeds an hour.

In their conversation, the Persians aim much at elegance, and are perpetually repeating passages from the works of their most favourite poets, a practice universally prevalent, from the highest to the lowest; because those who have not the advantages of reading or writing, or the other benefits arising from education, are always ready, by the help of a retentive memory, to bear their part in conversation. They also delight much in jokes and quaint expressions, and are fond of playing upon each other, which they sometimes do with great elegance and irony.

When a person makes an entertainment, it is usually a supper; notwithstanding which, the guests generally come at nine or ten in the morning, and spend the whole day. They discourse, they smoke, eat sweetmeats, and pass away the time in various amusements. Women are occa-

sionally introduced, who sing, dance, and play, to divert the company. They have no wine. Their usual beverage is sherbet and water, cooled, in summer-time, with ice. The officers of the army will indulge with wine; and other persons drink, under a pretence of doing it for their health; but the chief of what is here made is drank by the Christians, or sent to the neighbouring countries. If a Persian receive a visit from a superior, he acts differently from the English custom of placing him on the right-hand, it being a mark of respect, in Persia, to place the visitor on the left-hand.

The following is a well-authenticated account of a Persian supper:

"When supper was brought in, a servant, with a bottle of water, and a napkin over his shoulder, went round to all the company, and poured water on each person's hands. The room of entertainment was supplied with light by one large candle or lamp, which burnt in the courtyard, and a single wax-light on the floor of the room, which was frequently snuffed with scissars into a small cup of water. A large salver and plate were set before each person, with minced meat, fruits, spices, and comfits; and China basins, filled with sherbet, both sweet and sour; also cakes, sprinkled with the seeds of poppies. As soon as the several dishes were served up, they all began without ceremony, and devoured the food with expedition. After supper, warm water was brought for each to wash in; and, when the conversation began, it was observed, that, when the oldest man in the room began to speak, though he appeared poor, every person regarded him with the greatest attention."

On occasions of congratulation or condolence, the Persians visit each other with great attention, which is a tribute of duty always expected from persons of inferior condition, especially if they are dependant. The guests are ushered into a large room, and served with coffee and tobacco: after some time, the master of the house enters, and his visitors, rising to receive him, continue standing, till he has passed through the whole company, and paid his respects to each; he then takes his seat, and, by signs, permits them to be also seated. If any visitor arrive after this ceremony is over, he creeps softly in, and remains standing with his feet close together, and his hands folded, till the master invites him, by a sign, to sit down. When the superior is the visitor, the ceremony is different: the host, in that case, goes to meet him at the threshold, and does not attempt to sit down, till he has seated his visitor on his left-hand.

Jealousy, which generally prevails in warm climates, is not unknown to the Persians; but, as these people believe that women were only created for their pleasure, and for the continuance of the species, and that there is no manner of occasion for them in the management of the

affairs of the world, or in business of any kind whatever, they suffer them to pass their lives in indolence and luxury. Accordingly, they are seen, almost all the day, lolling on carpets, with their little slaves rubbing and chafing them, which is the common amusement in the east. Sometimes they take opium, or smoke the Persian tobacco, which is so mild, that it may be taken several hours without creating the head-ache.

The Persians are not much addicted to gaming: indeed, many of them consider all games of chance to be unlawful; but there are those who play at cards, dice, tables, chess, and other games not in use among Europeans. The king, and persons of rank, occasionally divert themselves with the fights of wild beasts, as in India; and the common people are amused, at times, with tumblers, rope-dancers, and jugglers. They have, also, martial and rural amusements, of which hunting, coursing, and hawking, form a considerable part.

They have horse-races at Shirauz. The horses start, at least, at the distance of fifteen miles, and pursue a direct course to the post. No care is taken to level the ground; and, as it very often happens that more than twenty horses start together, accidents frequently occur. Purses of gold are given to the owners of the first, second, and third, horses.

When the sovereign and his nobles take the diversion of hunting, the country-people, for ten or fifteen leagues round, are ordered to drive all the wild beasts, and game, into a certain place, surrounded with strong nets, or fences; and, when thus inclosed, every one of the company shoots at which he pleases. They usually wait, however, till the men of the greatest rank come up, and discharge an arrow, after which every one shoots as fast as he can, there being a strange medley of deer, antelopes, wild hogs, wolves, foxes, and hares, all driven in a crowd together. But they know nothing of hounds, and hunting by scent; indeed, their country seems too dry for this kind of sport, even had they proper dogs. They frequently, however, train up panthers and leopards to hunt the game, or rather to surprise it: for these animals creep from one cover to another, till they can jump upon their prey.

Both singing and dancing are considered, in Persia, as disgraceful. People of rank will not suffer their children to learn either the one or the other; but they are left, almost entirely, to females of loose character. It is reckoned an indecency, in people of reputation, to sing, and a man, who should attempt it in company, would render himself contemptible.

There are no general posts in Persia; but, when any person has letters to send, he dispatches a shater, or running footman, who will travel a thousand miles in eighteen or twenty days, and not require more than two shillings a-day for his trouble. These persons carry with them a

bottle of water, and a little bag of provisions, and this serves them for thirty or forty hours. They generally leave the high-road, and cross the country the nearest way. There are families, which make this their only employment, and breed their children up to it, practising them to run from their infancy. The king, and all the nobility, have several of these shaters in their retinue; but, before a man can be admitted into the royal service, he must give sufficient proof of his ability, for he must run from the great gate of the palace to a place a league and a half from the city, twelve times in one day, and, each time, bring an arrow, which is delivered to him by those who stand at the end of the race, to shew he has run the whole course.

When the parents of a young man wish him to enter into the conjugal state, they look out amongst their acquaintance for a suitable match; they then go to the house where the female lives, whom they intend to demand. If the father of the woman approve, he immediately orders sweetmeats to be brought in, which is considered as a direct sign of compliance. After this, the usual presents, on the part of the bridegroom, are made, which, if the person be in middling circumstances, generally consist of two complete suits of apparel, of the best sort, a ring, a looking-glass, and a small sum in ready-money, which is to provide for the wife in case of a divorce. A quantity of household goods is also purchased, consisting of carpets, mats, bedding, utensils for dressing victuals, &c. The contract is witnessed by the cadi, or magistrate. On the wedding-night the bride is brought forth, covered from head to foot with a veil of red silk, or painted muslin; a horse is then presented for her to mount, which is sent expressly by the bridegroom; and, when she is mounted, a large looking-glass is held before her, by one of the bride-maids, all the way to the house of her husband, as an admonition, that it is the last time she will look into the glass as a virgin. A numerous procession follows; and the rejoicings upon this occasion generally continue eight or ten days. Men marry either for life, or for any determined time, in Persia, as well as through all Tartary; and all travellers or merchants, who intend to stay some time in any city, commonly apply to the cadi, or judge, for a wife during the time of their residence. The cadi, for a stated gratuity, produces a number of girls, whom he declares to be healthy; and he becomes surety for their honesty.

The ceremony of circumcision is generally performed within forty days from the birth of the child. With persons of rank this ceremony is uncommonly splendid. Mr. Franklin tells us, he was an eye-witness of the rejoicings made at Shirauz, in honour of the king of Persia's son, who was circumcised on the 27th of April, 1787.

vered market-places, were splendidly illuminated, particularly the grand bazar, which was adorned throughout with lustres of party-coloured lamps, suspended from the roof. The shops of the merchants, on each side, were decorated with silver paper, rich hangings, &c.; and the walls, to a considerable height, were covered with tapestry, looking-glasses, and paintings of the ancient kings of Persia and India, in the dresses of their respective countries. Bands of music and dancing-women were also constantly performing, throughout the different bazars, on scaffolds erected for that purpose; and the whole was a scene of festivity for seven days and as many nights.

"Among several ingenious things observable on this occasion, the sight presented at the arsenal was most worthy of attention. In the centre of this building, the armourers had suspended a brass mortar, of eight hundred pounds weight, by some hidden means, as nothing appeared to support it, except a number of coloured bottles, sticking to it, which seemed to keep it buoyant in the atmosphere. This was said to be effected by means of a wire passed from the roof of the arsenal to the mouth of the mortar; but, not being visible to the spectators, it produced a very agreeable effect. The decorations on this occasion cost the shop-keepers and tradesmen very considerable sums; as, besides the illuminations, they were obliged to make a handsome present to their sovereign, who gave a grand entertainment in the citadel; and the whole was concluded by a magnificent display of fireworks."

When a Persian of rank is declared, by his physicians, to be in extreme danger, a priest is summoned, who exhorts him to repentance and confession, and, at the approach of the last agonies, he reads some chapters from the Koran, and pronounces a few prayers: the neighbours and passengers are informed, by lamps or fires made in the terrace of the dying man's house, that their prayers are required for a departing soul. The moment he expires, the event is proclaimed by the loud cries and lamentations of his friends, who beat their breasts, rend their clothes, and tear their hair, at the same time making the most tender addresses to the dead corpse.

The magistrate is then informed of the death, who appoints proper persons, of the same sex as the deceased, to prepare the body for interment, which is performed by frequent ablutions; the operators taking the garments of the dead as a fee for their trouble.

The body being perfectly cleaned, the mouth, nose, and other passages, are stopped with cotton, and then it is wrapped in a sheet of the same, on which are written certain passages of the Koran, relating to the mortality of the body, and the immortality of the soul: the body is afterwards carried to the grave, with great parade, if it be a person of distinction: the face is uncovered, and turned to

the city of Mecca, and that side of the grave left hollow, from an opinion that, after interment, the body is reanimated, and undergoes a strict examination of angels, whose report is to determine its future destiny.

The relatives mourn only forty days; and, during the first ten, they visit the grave daily, carrying sweetmeats, fruits, and other provisions, which they leave for the use of the angels, who are supposed to attend the corpse. The relatives rend the air with renewed lamentations, and expostulate with the deceased on his premature departure; whilst the acquaintance employ themselves in offering consolation, and endeavouring to moderate their grief, by reminding them of the virtues of the friend they have lost, and the certainty of his enjoying infinite happiness in the regions of departed souls.

These visits are repeated on certain festivals, such as the anniversary of the birth-day of the deceased; and the ceremony, in some cases, is continued for several years. The mourning for a relation or a friend is denoted by a total negligence of dress, without any regard to the colour; during forty days they do not shave, and refuse to change their clothes. Widows generally extend the term of mourning; and though they are not prohibited from marrying again, it seldom happens that they take a second husband.

[*History.*] The Persian empire was founded by Cyrus, about five hundred and fifty-six years before Christ, and ended in the person of Darius, who was conquered by Alexander the Great. Alexander's empire was divided among his great general officers, whose descendants, in less than three centuries, were conquered by the Romans. The latter, however, never fully subdued Persia, and the natives had princes of their own, from Arsacides, called Arsacides, who more than once defeated the Roman legions. The successors of those princes survived the Roman empire itself, but were subdued by the famous Tamerlane, whose posterity were supplanted by a doctor of law, the ancestor of the Sophi family, and who pretended to be descended from Mahomet. His successors, from him sometimes called Sophis, proved, in general, to be a disgrace to humanity, by their cruelty, ignorance, and indolence; which brought them into such disrepute with their subjects, that Hussein, a prince of the Sophi race, who succeeded in 1694, was murdered by Mahmud, son and successor of the famous Miriweis, as Mahmud himself was by Esref, one of his general officers, who usurped the throne. Prince Thamas, the representative of the Sophi family, had escaped from the rebels, and, assembling an army, took into his service Nadir Shah, who defeated and killed Esref, and re-annexed to the Persian monarchy all the places dismembered from it by the Turks and Tartars, during their late rebellions. At last, the secret ambition of Nadir broke out, and, after assuming the name of Tha-

mas Konli Khan, pretending that his services were not sufficiently rewarded, he rebelled against his sovereign, made him a prisoner, and, it is supposed, put him to death.

This usurper afterwards ascended the throne, under the title of Nadir Shah. He made an expedition into Hindoostan, and carried off an amazing booty, in money, precious stones, and other valuables; but, it has been remarked that, he brought back an inconsiderable part of his plunder, losing great part of it, upon his return, by the Mahrattas and accidents. He next conquered Usbec Tartary; but was not so successful against the Daghiestan Tartars, whose country he found to be inaccessible. He vanquished the Turks in several engagements, but was unable to take Bagdad. The great principle of his government was, to strike terror into all his subjects, by the most cruel executions. His conduct became so intolerable, and particularly his attempt to change the religion of Persia to that of Omar, and strangling the chief priests who resisted, that he was considered insane, and he was assassinated in his own tent, by his chief officers, in the year 1747. From the death of Nadir till the settlement of Kerim Khan, the whole empire was in arms, and rent by commotions; different parties, in different provinces, struggling for power, and each endeavouring to render himself independent of the other, torrents of blood were shed, and the most shocking crimes were committed with impunity.

Kerim Khan Zand was a most favourite officer of Nadir Shah, and, at the time of his death, was in the southern provinces; Shiranz and other places had declared for him; and he found means, at last, after various encounters, with doubtful success, completely to subdue all his rivals; and, finally, to establish himself as ruler of all Persia. He was in power about thirty years; the latter part of which he governed under the appellation of Vakeel, or regent, for he never would receive the title of

Shah: he made Shiranz the chief city of his residence, in gratitude for the assistance he had received from its inhabitants, and those of the southern provinces. He died in the year 1779, in the eightieth year of his age, regretted by all his subjects, who esteemed and honoured him as the glory of Persia. His character is deservedly celebrated, for the public buildings which he erected, and the excellent police which he maintained, so that, during his whole reign, there was not in Shiranz a single riot productive of bloodshed: besides these merits, his aversion to severe punishments, his liberality and kindness to the poor, his toleration of different religions, his partiality for Europeans, and his encouragement of trade, together with his great military abilities and personal courage, rendered him not only beloved by his own subjects, but highly respected by foreign powers.

After the decease of Kerim Khan, his relation Zikea seized the throne; but his cruelties rendered him so odious, that he was soon murdered by the soldiers, who bestowed the sovereignty on Futtah, the son of Kerim. He was, soon afterwards, deposed by his uncle Sadick; who, in his turn, was taken prisoner and put to death by Ali Murad, another kinsman of Kerim Khan.

On the death of the conqueror, who was killed by a fall from his horse, Jaaffar Khan assumed the crown, but, being defeated by Akan, the latter retained possession of the provinces of Mazanderan and Ghilan, together with the cities of Ispahan and Tauris; while Jaaffar Khan held the city of Shiranz, and some of the neighbouring provinces.

In 1792, Akan Mahomed Khan assembled an army, and marched against Jaaffar, who was slain at Shiranz, in an insurrection; after which Akan became sole sovereign of Persia, except that part of the west included in the dominions of the Afghan sovereign of Cabrel and Caudahar.

## CHAPTER VI.

### ARABIA.

#### *Situation, Extent, and Boundaries.*

ARABIA is situated between twelve and thirty-two degrees of north latitude, and between thirty-five and sixty degrees of east longitude; and is about fourteen hundred miles in length, and twelve hundred and sixty in breadth. It is bounded by Asiatic Turkey, on the north; by the Euphrates, the Persian Gulf, and the Bay of Ormus, on the east; by the Indian Ocean, on the south; and by the Isthmus of Suez and the Red Sea, on the west.

*Divisions.* By the ancients, Arabia was simply divided into three parts: *Arabia Petraea*, or the Stony, a small province on the north of the Red Sea, between Egypt and Palestine, so called from its granitic rocks and mountains; *Arabia Deserta*, or the Desert, was the eastern part, so far as known to the ancients; and *Arabia Felix*, or the Happy, comprised the south-west, on the shores of the Red Sea. The modern divisions and subdivisions are as follow:

*Climate, So-*  
try lies under  
passes over Ar

*Climate, Soil, &c.*] As a considerable part of this country lies under the torrid zone, and the tropic of Cancer passes over Arabia Felix, the air is extremely sultry, and the country is subject to hot pestilential winds, like those on the opposite shores of Persia, which often prove fatal to travellers. The soil, in some parts, is nothing more than immense sands, which, when agitated by the winds, roll like the troubled ocean, and sometimes form mountains, by which whole caravans have been buried or lost. In these deserts, the caravans, having no tracts, are guided, as at sea, by a compass, or by the stars, for they travel chiefly by night. "Here," says Mr. Shaw, "are no pastures clothed with flocks, nor valleys standing thick with corn; here are no vine-yards or olive-yards; but the whole is a lonesome desolate wilderness, no otherways diversified than by plains covered with sand, and mountains that are made up of naked rocks and precipices. Neither is this country ever, unless sometimes at the equinoxes, refreshed with rain; and the intenseness of the cold in the night is almost equal to that of the heat in the day-time. But the southern part of Arabia, deservedly called the Happy, is blessed with an excellent soil, and, in general, is very fertile."

*Seas, Rivers, &c.*] Some writers are of opinion, that the Red Sea received its appellation from a kind of refulgence peculiar to its waters, being tinged with a red mineral earth, as also from its having red sands on its shores. Mariners have declared, that, through the turbulence of the waters, occasioned by the flux and reflux of the sea, the sand has been so agitated, as to appear of a red colour, of the strongest dye. The agitation prevented its subsiding to the bottom, which, of course, it must have done in still water. There are few rivers in this country,

except the Euphrates, which forms a boundary on the north-east.

*Mountains.*] The principal mountains of Arabia are Sinai and Horeb, lying to the east of the Red Sea, and those called Gabel-el-Ared, to the southward. What is called the Desert of Sinai is a beautiful plain, near nine miles long, and above three in breadth; it lies open to the north-east, but, to the southward, is closed by some of the lower eminences of Mount Sinai; and other parts of that mountain make such encroachments upon the plain, as to divide it into two parts. From Sinai may be seen Mount Horeb, where Moses kept the flocks of Jethro, his father-in-law, when he saw the burning-bush. On those mountains are many chapels and cells, occupied by the Greek and Latin monks, who, like their brethren at Jerusalem, pretend to shew the very spot where every miracle or transaction, recorded in scripture, happened.

Near this spot is erected the convent of St. Catherine, which belongs to the Greeks, and which the monks hold in great veneration. This convent is built on a descent. The walls and the arches, with the church, are the only ancient buildings. The latter is of coarse red granite. The walls are six feet thick, but some parts of them are in a ruinous state. The structure, upon the whole, is irregular, and composed of unburnt brick.

*Vegetables.*] As Arabia partakes of the joint advantages of hot and temperate climates, it produces the plants common to each. Some of the most beautiful flowering plants are the ipomœa paniculatum, or sea-daffodil, a flower of the finest white, and hibiscus, with a flower of the brightest red, and singularly large. Among the economical plants of Arabia are orache, which is used instead of soap; a particular kind of rush, wove into fine

carpets; the indigo shrub; the common kali; and many others.

The sandy plains of Arabia are almost destitute of trees, only a few palms, scattered here and there, relieve the eye in those extensive tracts. The hills, however, in some places, are covered with wood, and many of the trees are of a species unknown in Europe. The Arabs cultivate many of our fruits, which arrive at great perfection. They have several varieties of lemons and oranges; and many kinds of grapes, though they do not make them into wine. Several valuable fruit-trees have been likewise introduced from India, which are now naturalized in Arabia.

An Arabian tree, famous from the most remote antiquity, and yet little known, is that which produces the balsam of Mecca. This tree has no external beauty; and, what is most singular, its value is not known among the inhabitants of Yemen: they only burn its wood as a perfume. The Arabs, however, in the remote parts of the province of Hedjaz, collect the balsam, and bring it to Mecca, whence it is distributed over the Ottoman empire.

The *Althea lausonia incensis*, of Linnaeus, the leaves of which are so famous as a cosmetic, throughout the east, is a native of Arabia. With this the women stain their hands and feet, or at least their nails, and think that it increases their beauty.

Of the sensitive plant, there are several species in Arabia. One of them drops its branches whenever any person approaches, and seems as if it saluted those who courted its shade. This mute hospitality has so endeared the tree to the Arabs, that it is reckoned criminal to injure or cut it down. Another species preserves camels' milk from becoming sour, for several days; and the smoke of its wood destroys a worm, which fixes itself in the flesh of the human neck, and produces epileptic fits.

*Animals.*] The most useful quadrupeds in Arabia are camels and dromedaries, which are admirably adapted by Providence for traversing the dry and parched deserts of this country. But, of all the animals, it is well known that the Arabians put the greatest value on their horses. Of these they have two great branches, the *Kadschi*, whose descent is unknown, and the *Kochlani*, of which a written genealogy has been kept for a great number of years.

The *Kadschi* are not in higher estimation than our common European horses, and are used as beasts of burden; but the *Kochlani* are kept exclusively for riding, and are highly esteemed. They are certainly animals of great metal and perseverance; and they are amazingly swift, which constitutes their chief value with the Arabs.

These *Kochlani* are bred chiefly by the Bedouins, settled on the confines of Basra, Merdin, and Syria, in which countries the grandees will not condescend to ride horses of any other race. The utmost care is taken to keep the blood pure and uncontaminated; and the legiti-

macy of the progeny must be ascertained before sworn witnesses, who would think it the most heinous crime to prevaricate in respect to the descent of a horse.

The tender attachment which the Arabs feel towards these animals is strikingly illustrated in the following anecdote, extracted from the Rev. T. Smith's *Naturalist's Cabinet* :—

"The whole stock of a poor Arab of the desert consisted of a beautiful mare; this the French consul at Said offered to purchase, with an intention of sending her to Louis XIV. The Arab, pressed by want, hesitated a long time, but at length consented, on condition of receiving a very considerable sum of money, which he named. The consul wrote to France, for permission to close the bargain, and, having obtained it, sent the information immediately to the Arab. The man, so indigent as to possess only a miserable rag, a covering for his body, arrived with his magnificent courser; he dismounted, and, looking first at the gold and then steadfastly at his mare, heaved a deep sigh. 'To whom is it,' he exclaimed, 'that I am going to yield thee up? To Europeans! who will tie thee up close, who will beat thee, who will render thee miserable! Return with me, my beauty, my jewel! and rejoice the hearts of my children.' As he pronounced the last words, he sprang upon her back, and was out of sight almost in a moment."

There are two breeds of asses in Arabia: the one small and sluggish; the other large and spirited, and consequently highly valued.

Arabia contains abundance of domestic animals; as oxen, buffaloes, sheep, and goats; as well as those of the wild and savage kind; of which there are the rock-goat, the jackall, the hyena, the jerboa, and the panther, with wolves, foxes, and wild boars; but the most common carnivorous animal is a species of wild dog, somewhat resembling the fox, which the natives call *El Vayi*.

With respect to birds, tame fowls are plentiful in the fertile districts, and all sorts of poultry are bred in abundance. The pintado is not domestic, though very numerous in the woods. The pheasant is a native of Arabia, and abounds in the forest of Yemen. There are several species of pigeons; and grey partridges are found in the plains.

The aridity of the country is unfavourable for aquatic birds; however, there are plovers and some storks. Fowls that live on fish are pretty numerous on the coasts of the Red Sea; among the rest are pelicans, whose eggs are as large as those of a goose. The ostrich is sometimes seen in Arabia. Eagles, falcons, sparrow-hawks, and the Egyptian vulture, are among the rapacious birds of this country. The last is extremely servicable, by clearing the country of the carcases, which would soon become noisome and infectious in such a warm climate.

Among the reptiles is a little slender serpent, called the baltan, spotted with black and white, which is remarkably poisonous, the bite being deemed fatal, by the natives; but, from an account of an officer belonging to the East-India Company, who visited this country in 1790, it appears to have been cured by an English practitioner. He says, that one of the Arabs, who attended them on a journey, was bitten by a snake, which caused his leg to swell prodigiously; and, as the poison seemed to be rapidly mounting upwards, and the poor fellow was in great agony, the Arabs were apprehensive it would be attended with fatal consequences; but, luckily, one of the party, having practised physic in India, had the presence of mind to heat an iron ramrod, (having no proper surgical instrument,) and burnt the wounded part, quite to the bone, which prevented the direful effects of the poison, and, in a short time, with the assistance of medicine, effected a perfect cure.

*Minerals.*] Arabia contains mines of lead and iron, but the metal is brittle. There are also a variety of precious stones, as agates, cornelians, onyxes, and what is called the sardonyx. Niebuhr also observed pentagonal pillars of basalt, with bluish alabaster, selenite, and various spars. In a district of the province of Yemen there is a warm spring of mineral water.

*Antiquities.*] The principal antiquities in this country are the ruins of the city of Palmyra, situated in the wilds of Arabia Petraea. It is approached through a narrow plain, lined, as it were, with the remains of antiquity; and, opening all at once, the eye is presented with the most striking objects that are to be found in the world. The Temple of the Sun lies in ruins; but the access to it is through a vast number of beautiful Corinthian columns, of white marble. Superb arches, amazing columns, a colonnade, extending four thousand feet in length, terminated by a noble mausoleum, temples, fine porticos, peristyles, intercolumniations, and entablatures, all of them in the highest style, and finished with the most beautiful materials, appear on all hands, but so dispersed and disjointed, that it is impossible, from them, to form an idea of the whole, when perfect.

"Nothing but ocular proof," says a respectable writer, "could convince any man that so superb a city, formerly ten miles in circumference, could exist in the midst of what now are tracts of barren uninhabitable sands. Nothing, however, is more certain, than that Palmyra was formerly the capital of a great kingdom; that it was the pride, as well as the emporium, of the eastern world, and that its merchants dealt with the Romans, and the western nations, for the merchandise and luxuries of India and Arabia. Its present altered situation, therefore, can be accounted for only by natural causes, which have turned the most fertile tracts into barren deserts. The Asiatics

think that Palmyra, as well as Balbec, owes its origin to Solomon; and in this they receive some countenance from sacred history. In profane history, it is not mentioned before the time of Marc Antony; and its most superb buildings are thought to be of the lower empire, about the time of Gallienus: Odeuathus, the last king of Palmyra, was highly caressed by that emperor, and even declared Augustus. His widow, Zenobia, reigned, in great glory, for some time; and Longinus, the celebrated critic, was her secretary. Unwilling to submit to the Roman tyranny, she declared war against the emperor Aurelian, who took her prisoner, led her in triumph to Rome, and slew her principal nobility, and, among others, the excellent Longinus. He afterwards destroyed her city, and massacred its inhabitants. None of the Palmyrene inscriptions reach above the Christian era, though there can be no doubt but the city itself is of much higher antiquity. The emperor Justinian made some efforts to restore it to its ancient splendour, but without effect, for it dwindled, by degrees, to its present wretched state.

*Cities and Towns.*] "Arabia," says a modern geographer, "has been compared to a cloak of frize, laced with gold, the skirts alone presenting cities, and other marks of civilization, while the great mass of the country is possessed by wandering tribes. The most celebrated cities are Mecca and Medina; but, being sacred ground, the infidels are not permitted to approach; and we are obliged to trust to the inaccuracy and exaggeration of oriental writers.

"MECCA was known to the Greeks under the name of Macoraba, and has not, in the most flourishing period, exceeded the size and populousness of Marseilles. Some latent motive, perhaps, of superstition, must have impelled the founders in the choice of a most unpromising situation. They erected their habitations of mud or stone, in a plain, about two miles long and one mile broad, at the foot of three barren mountains: the soil is a rock; the water, even of the holy well of Zemzem, is brackish; and the pastures are remote from the city. The fame and spirit of the Koreishites, who reigned in Mecca, were conspicuous among the Arabian tribes; but their ungrateful soil refused the labours of agriculture, and their position was favourable to the enterprises of trade. By the sea-port of Gedda, at the distance only of forty miles, they maintained an easy correspondence with Abyssinia. The treasures of Africa were conveyed over the peninsula to Gerha or Katif, in the province of Bahrein, a city built, as it is said, of rock-salt, by the Chaldean exiles: and from thence, with the native pearls of the Persian Gulf, they were floated on rafts to the mouth of the Euphrates. Mecca is placed almost at an equal distance, a month's journey, between Yemen on the right, and Syria

on the left hand. The former was the winter, the latter the summer, station of her caravans. In the markets of Saana and Merab, in the harbours of Oman and Aden, the camels of the Koreishites were laden with a precious cargo of aromatics: a supply of corn and manufactures was purchased in the fairs of Bostra and Damascus; the lucrative exchange diffused plenty and riches in the streets of Mecca; and the noblest of her sons united the love of arms with the profession of merchandise."

The government of this holy city is vested in a sheref, who is a temporal prince; and his revenue is increased by the donations of Mahometan sovereigns.

At Mecca, the birth-place of Mahomet, is a mosque, the most magnificent of any in the Turkish dominions; its roof being elevated in the form of a dome, and covered with gold, with two beautiful towers at the end, of extraordinary height and architecture, which make a delightful appearance, and are conspicuous at a considerable distance. The mosque has a hundred gates, with a window over each, and the whole building within is decorated with the finest gildings and tapestry. The number of pilgrims, who annually visit this place, is almost incredible.

A merchant of Mecca made an observation on those saints, which, Niebuhr says, he was surprised to hear from the lips of a Mahometan. "The vulgar," said he, "must always have a visible object of fear and honour. Thus, at Mecca, oaths are addressed to Mahomet, instead of God: and, at Mocha, I would not trust a man who took the Supreme to witness the truth of what he was asserting; but I might the more safely depend on him who would swear by Schædeli, whose mosque and tomb are before his eyes."

At MEDINA, about fifty miles from the Red Sea, the way to which Mahomet fled when he was driven out of Mecca, and the place where he was buried, is a stately mosque, supported by four hundred pillars, and furnished with three hundred silver lamps, which are continually burning. It is called the "*Most Holy*," by the Turks, because it contains the coffin of their prophet, covered with a cloth of gold, over a canopy of silver tissue, which, by order of the grand signior, is annually renewed. Over the foot of the coffin is a rich golden crescent, curiously wrought, and adorned with precious stones. Thither the pilgrims resort, as to Mecca, but not in such numbers.

MOCHA, in the province of Yemen, is a large and populous city and sea-port, situated at the entrance of the Red Sea. The inhabitants are mostly Mahometans, but there are also great numbers of Jews, who reside in the suburbs. The city, which is surrounded by a wall, has four gates, and several towers, some of them mounted with cannon, and garrisoned by soldiers. The streets are spacious, and the houses, built of brick or stone, consisting of two stories, with terraces on the tops. The shops are

judiciously built for trade, and stored with all sorts of commodities. Here arrives, annually, the great ship *Mansouri*, sent by the grand signior, laden with the richest merchandise, and carrying back spices, silks, calicoes, and other valuable articles: caravans also arrive, every year, from Turkey and Egypt. The port of Mocha is formed by two slips of land, on each point of which is a fortress, at a distance of about three miles from each other.

ADEN is a considerable city, situated between the Persian Gulf and the Red Sea. The Arabs say, Aden is so called from its founder, the son of Saba, and grandson of Abraham. It is surrounded by mountains, the summits of which are fortified with cannon, and from which an aqueduct conveys water into a capacious reservoir, about half a mile from the city. Here are many handsome houses, with terraces on their tops, and the place is well secured by its advantageous situation and fortifications.

SANA is situated at the foot of Mount Nikkom, on which are still some ruins of a castle, which the Arabs suppose to have been erected by Shem, the son of Noah. The city-walls are built of brick, and have seven gates. Here are a number of mosques, and several palaces. Except in one palace, near the citadel, no glass windows are seen in this place; the houses, in general, have only shutters, which are opened or closed according to the state of the weather.

The Jews carry on a considerable trade here, and are the chief artisans. At one time they had fourteen synagogues at Sana, but one of them, who had been comptroller of the customs, falling into disgrace, drew a degree of persecution on his brethren. The Banians are not very numerous. They pay three hundred crowns a month for permission to live in the city, and, if they leave no immediate heirs, the whole of their property devolves to the imam.

*Government.*] Arabia is divided among numerous Imaums and Sheiks, an idea of whose government may be drawn from that of Yemen, which is thus described by Niebuhr. "The title of *Imaum*, implying Vicar of Mahomet, is ecclesiastic; and, among the Turks, implies a common priest, while the Mulla presides in a court of justice. But, among the Persians and Arabs, the title Imaum is of superior dignity, as the twelve Imaums, or genuine successors of the prophet, in Persia; while, in Arabia, the word is considered as synonymous with *Caliph* and *Emir El Mumenin*, or Prince of the Faithful. The inferior governments are conducted by Sheiks, a term merely implying old or venerable men."

The throne of Yemen is hereditary; and the Imaum, or Emir, is completely independent, acknowledging no superior in spiritual or temporal affairs. He possesses the prerogative of peace and war; but cannot be called despot, as he cannot deprive even a Jew or a Pagan of life,

but the cause of Sana, consistent. When commonly detitle so lax, as governors of birth, Walis, with the Turkish towns, without governor is so Hakim. In each those in Turkish; but, in priest. His army infantry and out in the end and the vessels.

but the cause must be tried before the supreme tribunal of Sana, consisting of several *cadis*, while he is only president. When an *emir* shews a despotic disposition, he is commonly dethroned. The next in rank are the *Fukis*, a title so lax, as seemingly only to denote gentlemen. The governors of districts are called *Dolas*; or, if superior in birth, *Walis*. The *Dola*, in some degree, corresponds with the Turkish *Pacha*. The chief magistrate of a small town, without a garrison, is called *Sheik*; as a superior governor is sometimes called *Emir*, and, in little villages, *hakim*. In each district there is also a *Cadi*; who, like those in Turkey, are judges of ecclesiastic and civil affairs; but, in Arabia, the prince himself is the high-priest. His army, in peace, is computed at four thousand infantry and one thousand cavalry; the soldiers being, as usual in the east, without uniforms. There is no navy, and the vessels, in general, are very rudely constructed.

*Manufactures, Commerce, &c.*] The manufactures of Arabia are of small importance, though the people are naturally ingenious and industrious. In all Arabia there are neither windmills nor watermills. Some muskets are made in the country, but they are mere matchlocks, of mean execution. At Mocha there is one glass-house; and there are, in Yemen, some coarse linen manufactures.

The Arabian intercourse with Hindoostan has greatly declined since the discovery of the Portuguese, whose superior skill and maritime force eclipsed the small vessels of the Arabs. From Yemen are exported coffee, aloes, myrrh, frankincense, scenna, ivory, and gold, from Abyssinia. The European imports are iron, steel, tin, and lead.

*Language and Literature.*] The language commonly spoken is the Arabic, which is likewise spoken, with some variation of dialect, over great part of the East. The pure old grammatical Arabic, which is said to be a dialect of the Hebrew, is taught in their schools, as Greek and Latin are amongst Europeans, and used by Mahometans in their worship; for, as the Koran was written in this language, they will not suffer it to be read in any other; they believe it to have been the language of paradise, and think no man can be a master of it without a miracle, as it consists of several millions of words.

Though it cannot be supposed that literature has made any very considerable progress in a country where manners are so simple, and emulation so rare, the Arabs are great admirers of poetry. Their early history records many instances of the estimation in which they held this art, even before the days of Mahomet; and their modern poets still cultivate this science, and are rewarded for excellence in it.

The best poets are among the Bedouins of *Dsjof*. A sheik of that country was, some years since, imprisoned at

Sana, who, observing a bird on the roof of a house, recollected the opinion of those pious Mussulmen, who think it meritorious to deliver a bird from a cage. He deemed himself equally entitled to liberty as the bird, and expressed this idea in a poem, which his guards learned by heart, and which, becoming generally known, at length reached the monarch's ears, who was so charmed with it, that he set the composer at liberty, though he had been guilty of various acts of robbery.

Education is not wholly neglected, and many of the common people can read and write, while those of rank employ preceptors to teach their children and young slaves. Near every mosque there is commonly a school, the masters, as well as the children of the poor, being supported by legacies. In the large towns there are many other schools, to which people of the middling class send their sons, who are taught to read, write, and cast accounts. The girls are instructed apart, by women.

In the chief cities are colleges for astronomy, astrology, philosophy, and medicine.

*Customs, Manners, &c.*] The Arabians are of a middle stature, thin, and of a swarthy complexion, with black hair and black eyes. Their dress is loose, long, and broad; they wrap it round them, and gird it with a sash: at night, amongst the common people, it serves them for a bed and coverlet. Their upper garment is generally wove in one piece: it has a cap for the head, is tight about the neck, and enlarges towards the bottom. This dress is only worn in cold and rainy weather; and under it and the garb that wraps entirely over the whole, some of them wear a long close-bodied waistcoat, without sleeves. Their sash, or girdle, is of worsted, and in it they stick their poniards, ink-horns, or badges of their rank. Their head-dress consists of several bonnets, either of cotton or woollen, round which is wrapped a large piece of muslin, with fringes of silk, and sometimes gold, hanging behind. The women wear a kind of short waistcoat and drawers, but sometimes they have only a piece of cloth wrapped round their loins. When they go out, they cover themselves with the same kind of garb as is worn by the men, so that there is very little to be seen of their faces. Some of the men go almost naked, in hot weather; others wear drawers and slippers, but no stockings. The women, in some parts, wear large veils, with rings, bracelets, and necklaces of false pearls, and sometimes, in addition to ear-rings, have a nose-ring. Their nails are stained red, and the feet and hands of a yellowish brown, with the herb called henna; the eye-lashes are darkened with antimony, and every art is exerted to render the eye-brows large and black.

The Arabs are moderate in their food, the common people having only a repast of bad bread, made from doura, a kind of millet, mixed with camel's milk, oil, or grease. Meat is little used, even by the rich, who deem it unhealthy in a

hot climate. Their favourite beverage is water or coffee, which they prepare like the Turks, by burning it in an open pan, and then bruising it in a stone or wooden mortar, which gives it a superior flavour to the common mode of grinding in a mill. In Yemen, however, it is rarely used, as it is supposed to heat the blood; but of the shells or husks of the coffee they prepare a liquor, in the manner of tea. The most distinguished Arabs use porcelain, from China, while the common people have earthen-ware. Spirituous liquors, though forbidden, are not unknown; and they sometimes smoke a plant, resembling hemp, which produces intoxication; tobacco is also smoked, either in the Turkish or Persian manner.

The Arabs retain several of the customs and manners mentioned in sacred and profane history. Upon meeting each other, they still use the primitive salutation of "Peace be unto you." Before the Mahometan conquest, the expression was, "God prolong your life." The inferiors, out of respect and deference, kiss the feet, knees, or garments, of their superiors; whilst the children and other kindred pay the same respect to their relations. The posture they observe in giving one another the salute, is laying the right-hand upon the breast; while others, who are, perhaps, more intimately acquainted, or of equal age and dignity, kiss the hand, head, or shoulder, of each other. At the feast of their Bayram, and other great solemnities, the wife compliments the husband by kissing his hand.

The vivacity of the Arabians makes them fond of company, notwithstanding their disposition to thoughtfulness. They frequent public coffee-houses and markets, and, when the villages lie at too great a distance, the country people meet in the open fields, some to buy or sell, and others to converse, or amuse themselves as spectators of the busy scene.

The Arabs are not quarrelsome, but, when any dispute happens to arise among them, they make a great deal of noise. They are, however, soon appeased, and a reconciliation is at all times instantly effected, if an indifferent person call upon the disputants to think of God and his prophet. The inhabitants of the east, in general, strive to master their anger. A boatman, in a passion, complained to the governor of the city of a merchant, who would not pay a freight due for the carriage of his goods. The governor always put off hearing him till some other time. At length he came and told his case coolly, and the governor immediately did him justice, saying, *I refused to hear you before, because you were intoxicated with anger, the most dangerous of all intoxications.*

The Bedouins, or Arabs of the Desert, are meagre, small, and of a tawny complexion; but it has been observed, that the sheiks and their attendants are taller, and more corpulent, than the common class. This difference

must be attributed to their food, with which the former are supplied more abundantly than the latter.

The inferior classes of these Arabs live in a state of habitual famine; for the usual quantity of food consumed by each individual does not exceed six ounces a day. A few dates, soaked in melted butter, with a little milk or curds, constitute their common food; to which they sometimes add a small quantity of coarse flour, or a little ball of rice. Meat is reserved for grand festivals; and they never kill a kid, but for a marriage or a funeral. In times of dearth, the poorer class do not disdain the most wretched kinds of food; but greedily devour locusts, lizards, rats, and serpents, broiled on a few briars.

The principal sheik in every tribe defrays the expenses of all who arrive at or quit his camp. Adjoining to his tent is a large pavilion, in which are held frequent assemblies of the Bedouin chiefs, to determine on encampments and removals, on peace and war, on the disputes with the Turkish governors, and the quarrels and litigations of individuals.

The poverty of the lower class is proportionate to that of their chiefs. All the wealth of a family consists of a few camels, some goats, and poultry, a mare, and her bridle and saddle, a tent, a lance, sixteen feet long, a crooked sabre, a rusty musket, a pipe, a portable mill, a leathern bucket, a small coffee-roaster, a pot for cooking, some clothes, a woollen mantle, and some glass or silver rings, with which the women decorate their legs and arms. If none of these be wanting, their furniture is complete.

Thus confined to the mere necessities of life, the Bedouins have as little industry as their wants are few. All their arts consist in weaving their clumsy tents, and in making mats and butter; their whole commerce is confined to the exchanging camels, horses, kids, and milk, for arms, clothing, rice, or corn, and money, which they hide in the earth; they have not a single idea of any science; and nothing is so uncommon, even among the sheiks, as to know how to read.

They are extremely fond, however, of reciting tales and histories, in the manner of the Arabian Nights' Entertainments.—In the evening they seat themselves at the threshold of their tents, with pipes in their mouths, and their legs crossed, and there sit in silent meditation, till one of them suddenly breaks forth with, "Once upon a time"—and continues to recite the adventures of some young sheik and female Bedouin: he relates in what manner the youth got a secret glimpse of his mistress, and became deeply enamoured; he minutely describes the lovely fair; boasts her black eyes, as large and soft as those of the gazelle; her arched eye-brows, resembling two bows of ebony; and her waist, strait and supple as a lance; he expatiates on her steps, light as those of the young filly, her eye-lashes blackened with antimony, her lips painted blue, and he

And, at length, after detailing his attempts to see his mistress, the obstacles of the parents, the invasion of the enemy, and the captivity of the young lovers, he terminates his tale by restoring them, united and happy, to the paternal tent.

The freedom enjoyed by the Bedouins extends even to their religion; for, although some of them, from policy, preserve the appearance of Mahometanism, their observance of its ceremonies is so relaxed, and their devotion has so little fervour, that they are generally considered as infidels, who have neither law nor prophets. They even make no difficulty of asserting, that the religion of Mahomet was not intended for them. "For," say they, "how must we make ablutions who have no water? How can we bestow alms who are not rich? Why should we fast in the Ramadan, since the whole year with us is one continual fast? And what necessity is there for us to make a pilgrimage to Mecca, if God be present every where?" In short, every individual acts and thinks as he pleases.

To this account we shall subjoin some additional observations on the manners and customs of the Arabs, for which we are indebted to the travels of the Abbé Poiret, through some parts of Arabia.

"How shall I describe," says our author, "the confused and contradictory ideas which arose in my mind, on the first view of these Arab hordes! I had approached within a short distance of thirty tents, and was preparing to go up to them, when I was informed that the plague had just made its appearance among them. The spot where I then stood was on the brink of a cool and limpid rivulet; bushes of laurel, myrtle, and roses, formed around me an agreeable shade; and the landscape, bounded by verdant hills, was animated with numerous herds, grazing at a distance. Whilst contemplating the beauties of this scene, about a dozen of the Arabs advanced suddenly towards me; and, I must confess, that their ferocious countenances excited an emotion of fear in my breast, that instantly dispelled all those ideas with which I had been so agreeably entertained; but my companions assured me there was no danger. As soon as they were near enough, I saluted them, after the oriental manner, and bade my interpreters request them to keep at a certain distance, on account of the contagion. With this they readily complied, and squatted down in a circle round us. They then asked, if I would have any milk, and, on my answering in the affirmative, two of them set out, and returned soon after, with each a basin full of it. I drank some of it, and, notwithstanding their fierce air, was sensible they gave me a kind reception. I therefore expressed my gratitude by signs, and distributed among them a small quantity of powder and shot, which they requested.

11. VOL. I.

"Forgetting the picture which had been drawn to me of their manners, I now endeavoured to persuade myself, that the nearer a man approaches to nature, the better he ought to be. I perceived, in these men, the patriarchs of antiquity, devoted entirely to the care of their flocks, and free from those numerous wants which have been created by luxury. I beheld men, to whom I was indebted for their hospitality; and, if I did not find in them the affected politeness of a European, I observed, at least, that rustic sincerity, which ought to reside in the man of nature.

"When I prepared to resume my journey, they accompanied me near half a mile; and, at parting, they wished me peace and happiness. Being informed of the meaning of these expressions, I repeated them very affectionately, and congratulated myself, that the first Arabic words I had pronounced served to express my gratitude."

Though half savage in appearance, the Arabs have certain signs, in all their tribes, to express friendship and respect. The most usual mode of salutation is, to put the right-hand on the breast, and to incline the head: in this posture two Arabs, on meeting, wish each other a good day, and enquire respecting the health and safety of their relations, flocks, &c. If they are particularly acquainted, they embrace reciprocally, and kiss each other's face and shoulders. When they accost any person of high rank, they kiss their hand in the most respectful manner, and sometimes kiss his clothes, placing one knee upon the earth.

In conversation, their gestures are graceful and expressive, their accent strong and sharp, and their voice particularly loud and sonorous. This custom of speaking loud may be easily accounted for, when we recollect that they have been habituated from their infancy to live in the open air, and to speak to one another at a great distance.

When they are unemployed, they usually sit squatting on the ground, with their fusée upright between their knees; for they never lay aside their arms, except when in their tents; and a fusée is considered as the most valuable inheritance that a father can leave to his son. In this manner they pass whole days, and consider themselves peculiarly happy, when they can thus abandon themselves to idleness.

Notwithstanding this aptitude to indolence, however, the Arabs are possessed of quick and violent passions, which often induce them to carry the desire of vengeance for injuries to its highest excess. Some tribes, in particular, are so extremely irritable, and jealous of their honour, that, if one chief says to another, with a serious air "Thy bonnet is dirty," or, "The wrong side of thy turban is out," nothing but blood can wash away the reproach; and not only the offender, but all the males of his family, must expect to be sacrificed on such an account.

Mr. Niebuhr relates a tragical instance of this vindic-

tive spirit, which happened in the vicinity of Barra, about twelve years before he commenced his travels in Arabia. — "A man of eminence had given his daughter in marriage to an Arab of another tribe. Shortly after the celebration of the nuptials, a sheik of an inferior tribe asked him, in a coffee-house, whether he were father to the handsome young wife of such an one, whom he named. The father, supposing his daughter's honour ruined, immediately quitted the company to stab her! At his return from the perpetration of this unnatural deed, he who had so indiscreetly put the question was gone. The exasperated Arab instantly went in search of him, and killed several of his relations, without sparing either his servants or cattle. Hereupon the offender offered a great sum to the governor to rid him of so furious an adversary; but both the threats and persuasions of the governor proved ineffectual with the man who had been offended, till, at length, it was agreed, that the offender should give him his daughter in marriage, together with a handsome portion: and, even after this agreement, the first aggressor durst never appear before his son-in-law."

The thirst for vengeance, likewise, discovers itself in the peculiar manner in which murder is prosecuted in several districts of Arabia: for here the relations of the deceased are at liberty either to accept a pecuniary compensation, or to require the murderer to surrender himself to justice, or to wreak their vengeance upon his whole family. In some places, indeed, it is deemed unlawful to accept money as an atonement for murder, which, by the laws of Arabian honour, can only be expiated by blood. They think little of delivering an assassin into the hands of justice; for this, they say, would be to deliver a family from an unworthy member, who merited no such favour at their hands. For these reasons, they rather revenge themselves upon the family of the murderer, and seek an opportunity of slaying its chief, whom they regard as being properly the person guilty of the crime, because it must have resulted from his negligence with respect to the conduct of those under his inspection. In the mean time, the judges secure the assassin, till he has paid a heavy fine; and, from this time, the two families are in continual apprehension; for no reconciliation can be effected: and there have been instances of such quarrels being occasionally renewed for upwards of forty years.

"An Arab of distinction," says Mr. Niebuhr, "who often visited us at Loheya, always wore both his poniard and a small lance; because, he told us, a man of his family had been murdered, and he was compelled to avenge the murder upon a man of the inimical family, who was then actually in the city, and carried just such another lance. He acknowledged to us, that the fear of meeting his enemy, and fighting with him, often disturbed his repose."

Marriage, among the Arabs, is simply a bargain concluded between the parents of the woman and the man who intends to espouse her. In order to obtain her, he has no occasion to win her affections, or merit her preference; for, if he presents a couple of fine cows, he is sure of a favourable reception. The parents take the cows, and deliver over their daughter to the suitor, who may keep her as long as he pleases, and afterwards dismiss her without any formality.

The grinding of corn, churning of butter, preparing the courcousan, &c. all belong to the women, but this is the easiest part of their employments; for, while their husbands pass the greatest part of their time in indolence, they are obliged to till and sow the earth, to cut wood, and frequently to carry both their tent and kitchen-furniture on their shoulders.

The following observations of Poiret, respecting the education of the Arabs, may, probably, be deemed amusing:—"I was much surprised," says this gentleman, "to find a public school in one of their *douares*; and my astonishment increased on finding it under the direction of a person who was blind. This Arab had collected in his tent about a dozen children, of both sexes, whom he taught to read and write. I remarked, that the countenances of the pupils bore no marks of weariness or disgust, which are too common in European seminaries; but, on the contrary, labour appeared to them like amusement. Their only book was the koran, which the master knew by heart, and, on that account, he was able to follow his scholars, and to point out their errors. They chaunted their lessons with good humour, and in a variety of tones; but, though this music was not very engaging, I saw with pleasure, that among these savage hordes, the infancy of man is not abandoned to merciless tyrants, who often destroy the expanding flowers of genius.

"Those who were most advanced, taught the younger pupils to write, under the direction of the master. Instead of paper, they had pieces of board, covered over with a kind of varnish, and a bit of reed, cut in a very rude manner, supplied the place of a pen; yet they wrote tolerably well, and with great expedition. When they had thoroughly learned their task, they washed their tablets, and received a fresh sentence from the koran.

"As soon as the usual time of their studies was expired, each of the children embraced the master, and retired, with many acknowledgments of his kind attention."

The children of the Arabs are almost entirely abandoned to nature: they are seldom caressed, and never beaten. Left to themselves, they engage in exercises suited to their age, gradually become inured to every species of hardness, and acquire the vigour and agility of their fathers. Familiar with every animal, they caress the sheep, play with the goat, and closely pursue the heifer,

which runs from them. The most ardent heat does not  
overpower them; and neither dampness nor cold seem to  
affect their constitutions. When scarcely able to walk,  
they accompany their parents to watch their flocks, mount  
on the back of the fiercest bull, and learn to manage the  
most untractable courser, without either spurs or bridle.

One of the first prejudices instilled into the breast of  
an Arabian child is an inveterate hatred against all Chris-  
tians; and this becomes so strengthened by age, that there  
are few individuals, who would not consider the assassi-  
nation of a Christian as a meritorious action. "I have  
been," says Poiret, "greatly harassed by the children,  
who flocked round me, as I approached the tents; and I  
was even obliged to put up with the grossest insults; for,  
if I had attempted to chastise any of them, their fathers  
would infallibly have taken their part, and have revenged  
an injury done by a dog to a servant of Mahomet."

"I have many times," adds the same writer, "seen  
some of the women, who had never met a Christian, shud-  
der when I appeared, and run from me, as if I had been  
a monster. By means of some little present, however, I  
always rendered them more tractable; and, when they be-  
came a little familiarised, they appeared utterly astonished  
at finding me like another man. They particularly ex-  
amined my gloves, which were green, supposing that to be  
the colour of my skin; and, when I pulled them off, they  
were in the utmost amazement. Every attempt to explain  
their utility was in vain; for as these people are acquainted  
only with the absolute necessities of life, they laugh at  
all superfluities."

The Arabs profess the faith of Mahomet; but they in-  
termix it with many of their own superstitious ceremonies,  
and seem to be utterly ignorant of its real spirit. They  
are tolerably strict in the observance of the enjoined fasts,  
prayers, &c.; but few of them abstain wholly from the  
tempting juice of the grape.

Those who are distinguished by the appellation of *pa-  
pas*, usually preside at marriages, funerals, &c.; and have  
chaplets of large beads, which they employ, like the Ro-  
man catholics, to count the number of their prayers; and  
every time they drop a bead from their fingers they ex-  
claim, "How great is God! There is but one God, and  
Mahomet is his prophet." They pronounce these words  
with a strong emphasis, as if struck with an awful sense  
of the majesty of the Deity; but their manners too often  
form a striking contrast with such ideas.

During the Ramadan, which continues one moon, they  
abstain from food, water, and smoking, till after sun-set.  
They also suffer their hair and beards to grow, and even  
affect to appear covered with filth and dirt.

On the succeeding festival of the Beiram, they dress  
themselves in their best apparel, shave their beards, and  
devote several days to diversions, feasting, and reciprocal

visits. The return of the new year is, also, a grand fes-  
tival, ushered in with entertainments, and consecrated to  
pleasure and hilarity.

Upon these occasions, the Arabs indulge themselves in  
a variety of extravagant follies, which have some resem-  
blance to a carnival. The most popular amusement con-  
sists in spreading the skin of a lion, or camel, over the shoul-  
ders of four men, who are concealed under a large carpet.  
This supposed animal is led along by a chain, while sever-  
al persons play on a tabor and flute; and others perform  
very grotesque dances. In this state they enter every house  
to which they can find admittance, followed by a concourse  
of children, who bear in their hands the figures of a lion  
and a camel.

The Arabs are, at present, unacquainted with any other  
physician than nature, or with any other remedies than  
those presented by ignorance and superstition; although this  
nation formerly gave birth to so many able men, who have  
been accounted the fathers of medicine. The European  
physicians, however, who sometimes visit them, are well  
received; and this character is the only one that can se-  
cure the life of a Christian.

It is a singular fact that these men, who are often in-  
sensible of a real indisposition, generally imagine them-  
selves unwell, when they see a physician. Eager to re-  
ceive assistance, and fearing to miss the opportunity, they  
examine their health so scrupulously, that there are few  
of them who do not express a wish for some physic, if it  
be only by way of a preventative. They have so much  
confidence in phlebotomy, that they consider it as a uni-  
versal remedy; and, for want of a surgeon, they often bleed  
themselves, in the following manner:

The person, who is chosen to perform the operation,  
begins with binding a bandage round the neck of his pa-  
tient till he is almost strangled; and, when the veins of the  
forehead appear swelled, he makes four or five incisions  
with a razor, and assists the effusion of the blood, by roll-  
ing a cylindrical piece of wood over the incisions. When  
the operation is finished, he washes the wounds, applies  
to them a little argillaceous earth, softened in water, and  
binds them up with a handkerchief. When an Arab is  
dangerously ill, he walks about as long as he can move;  
and, when his strength is utterly exhausted, he stretches  
himself on the earth, without taking off his clothes. Should  
he perceive his approaching dissolution, he turns his face  
toward the east, and calmly recommends his spirit into  
the hands of Mahomet.

When an Arab of distinction dies, his body is carefully  
washed, and wrapped in a winding sheet, of white cloth,  
which has been blessed by the principal imam at Mecca;  
it is then placed upon a kind of litter, and carried to the  
place of sepulture by the friends and relations of the de-  
ceased. While the men are employed in digging the

grave, the women sit down in a circle round the corpse, asking it various questions, and beseeching it to return and take up its abode among them. "Why," say they, "hast thou forsaken us? Did we not prepare thy courousan well? Alas! shall thy children behold thee no more? Ah! return again, and nothing shall be wanting to thee: but thou hearest no more, nor any longer canst return an answer to our words." These lamentations are extremely affecting; but a stranger is disgusted on seeing the mourners, a moment after, throw aside all appearance of grief, and talk or laugh together with the utmost indifference.

When the grave is finished, the body is deposited in it, on its side, with the face turned towards the east; and a kind of arch is formed over it with brambles, to prevent the earth from touching it. The grave is then filled up, and a quantity of large stones laid over it, to prevent savage animals from digging up the body; a kind of funeral flag is erected in the middle of these stones, and thus the ceremony concludes.

The nearest relatives and friends of the deceased go, at certain times, to visit the tomb, and partly uncover the body, in order to convince themselves, that the person has not returned to life; and, when they discover any sign of putrefaction, they renew their wailings and lamentations.

*History.]* The history of this country in some measure differs from that of all others; for, as the slavery and subjection of other nations make a great part of their history, that of the Arabs is entirely composed of their conquests, or independence. They are supposed to have descended from Ishmael, of whose posterity it was foretold, that they should be invincible, "have their hands against every man, and every man's hand against theirs." They are, at present, and have remained from the remotest ages, during the various conquests of the Greeks, Romans, and Tartars, a convincing proof of the divine truth of this prediction. Towards the north, and the sea-coasts of Arabia, the inhabitants are, indeed, kept in awe by the Turks; but the wandering tribes, in the southern and inland parts, acknowledge themselves the subjects of no foreign power, and do not fail to harass and annoy all strangers who come into their country. The conquests of the Arabs make as wonderful a part of their history, as the independence and freedom which they have ever continued to enjoy. These, as well as their religion, began with one man, whose character forms a very singular phenomenon in the history of mankind. This was the famous Mahomet, a native of Mecca, a city of that division of Arabia, which, from the luxuriance of its soil and the happy temperature of its climate, has ever been esteemed the most delightful region of the world, and distinguished by the epithet of Arabia the Happy.

Mahomet was born in the year 569, in the reign of Justinian II. emperor of Constantinople. Though descended of mean parentage, indigent, and illiterate, he was endued with a subtle genius, and possessed a degree of enterprise and ambition far beyond his station. In the early part of his life he had been employed by his uncle, Abuteleb, as a factor, and had occasion, in this capacity, to travel into Syria, Palestine, and Egypt. He was afterwards taken into the service of a rich merchant, upon whose death he married his widow, Khadija, and, by her means, came to be possessed of considerable property and of a numerous family. During his peregrinations into Egypt and the east, he had observed the vast variety of religious sects, whose hatred against each other was strong and inveterate, while, at the same time, there were many particulars in which the greater part of them were agreed. He carefully took advantage of these; by means of which, and by addressing himself to the love of power, riches, and pleasure, passions universal among men, he expected to raise a new system of religion, more general than any which had hitherto been established. In this design he was assisted by Sergius, a monk, whose libertine disposition had caused him to forsake his cloister, and engage in the service of Khadija, with whom he remained as a domestic, when Mahomet was taken to her bed. This monk was perfectly well qualified, by his great learning, for supplying the defects which his master laboured under, and which, in all probability, must have obstructed the execution of his design. It was necessary, however, that the religion they proposed to establish should have a divine sanction; and, for this purpose, Mahomet turned a calamity, with which he was afflicted, to his advantage. Being often subject to epileptic fits, he gave out, that these fits were traunces, into which he was miraculously thrown by the Almighty, whose will he was instructed to publish to the world. By this strange story, and by leading a retired and austere life, he easily acquired a character for superior sanity among his acquaintance and neighbours. And, when he thought himself sufficiently fortified by the number and enthusiasm of his followers, he boldly declared himself a prophet sent by God, not only to teach his will, but to compel mankind to obey it.

Mahomet did not lay the foundation of his system so narrow, as only to comprehend the natives of his own country. He proposed that the system he established should extend over all the neighbouring nations, to whose doctrines and prejudices he had taken care to adapt it. Many of the inhabitants of the eastern countries were at this time much addicted to the heresy of Arius, who denied that Jesus Christ was co-equal with God the Father. Egypt and Arabia were filled with Jews, who had fled into these corners of the world from the persecutions of the emperor Adrian, who threatened the total extinction of

that people. The other inhabitants of these countries were pagans. These, however, had little attachment to their decayed and derided idolatry; and, like men whose religious principle is weak, had given themselves over to pleasure and sensuality, or to the acquisition of riches, to be the better able to indulge in sensual gratifications, which, together with the doctrine of predestination, composed the sole principles of their religion and philosophy. The system of Mahomet was exactly suited to these three kinds of men. To gratify the two former, he declared that there was one God, who created the world, and governed all things in it; that he had sent various prophets into the world, to teach his will to mankind, among whom Moses and Jesus Christ were the most eminent: but the endeavours of these had proved ineffectual, and God had, therefore, now sent his last and greatest prophet, with a commission more ample than what Moses or Christ had been entrusted with. He had commanded him not only to publish his laws, but to subdue those who were unwilling to obey them; and, for this end, to establish a kingdom upon earth, which should propagate the divine law throughout the world; that God had denounced utter ruin and destruction against those who should refuse to submit to him; but, to his faithful followers, he had promised the spoils and possession of all the earth, as a reward in this life, and had provided for them hereafter a paradise of all sensual enjoyments; that the pleasures of such as died in propagating the faith would be peculiarly transcendent. These, together with the prohibition of drinking strong liquors, and the doctrine of predestination, were the capital articles of Mahomet's creed. They were no sooner published, than a great number of his countrymen embraced them with implicit faith. The apostate monk transcribed them, and composed a book, called the Koran, or Alkoran, by way of eminence, as we say the Bible, which means the book. The person of Mahomet, however, was familiar to the inhabitants of Mecca; so that the greater

part of them were sufficiently convinced of the deceit. The more enlightened and leading men entered into a design to cut him off; but Mahomet, getting notice of their intention, fled from his native city to Medina. The fame of his miracles and doctrine was, according to custom, greater at a distance; and the inhabitants of Medina received him with open arms. From this flight, which happened in the 622d year of Christ, the fifty-fourth year of Mahomet's age, and the tenth of his ministry, his followers, the Mahometans, compute their time; and the era is called, in Arabic, Hegira, or the flight.

By the assistance of the inhabitants of Medina, and of others, whom his insinuation and address daily attached to him, Mahomet brought over all his countrymen to an acquiescence in his doctrines. The speedy propagation of his system among the Arabians was a new argument in its behalf among the inhabitants of Egypt and the east, who were previously disposed to it. Arians, Jews, and Gentiles, all forsook their ancient faith, and became Mahometans. In a word, the contagion spread over Arabia, Syria, Egypt, and Persia; and Mahomet, from a deceitful hypocrite, became a powerful monarch. He was proclaimed king, at Medina, in the year 627; and, after subduing great part of Arabia and Syria, died in 632, leaving two branches of his race, both esteemed divine among their subjects. These were the caliphs of Persia and of Egypt; under the last of which Arabia was included. The former of these turned their arms to the east, and made conquest of many countries. The caliphs of Egypt and Arabia directed their ravages towards Europe, and, under the name of Saracens, or Moors, reduced the greater part of Spain, France, Italy, and the islands in the Mediterranean.

In this manner did the successors of that impostor spread their religion and conquests over the greatest part of Asia, Africa, and Europe; and they still give law to a considerable portion of mankind.

## CHAPTER VII.

### TARTARY.

**T**HIS extensive region, formerly known by the name of Scythia, was once the seat of an empire more powerful than that of Greece or Rome; but its inhabitants have sunk into degeneracy, and some of those provinces, where learning and the arts flourished, are now the scenes of complete barbarity. The country is, at present, divided into Chinese Tartary—Tibet—Independent Tartary—and Asiatic

Russia; each of which, for the sake of perspicuity, will be described under a distinct section

#### SECTION I.

##### CHINESE TARTARY.

*Situation, Extent, and Boundaries.*] Chinese Tartary, which has frequently sent forth its hordes to overrun the

arts and civilization of Europe, is situate between seventy-two and one hundred and forty-five degrees of east longitude, and between eighty-five and fifty-three degrees of north latitude; being about three thousand miles in breadth, and one thousand and eighty in length. It is bounded, on the north, by Asiatic Russia; on the east, by the Sea of Japan, and the Channel of Tartary; on the south, by China and Tibet; and, on the west, by Independent Tartary.

*Division.*] The only division of this country arises from the different tribes by which it is inhabited: of these, the principal are the Mandshurs, in the east; the Monguls, in the middle; and the Kalmucs, in the west. The country of the Mandshur Tartars, who are more immediately under the authority of China, has been divided into three great governments, Chin-yang, Kirin-oula, and Tsitchicar: which take their names from those of their chief towns. The Russians call the latter Daouria; from the Tajouri, who inhabit a great part of this district. To these may be added the peninsula of Korea, which has been for several centuries under the dominion of the Chinese.

*Face of the Country.*] A great part of this extensive country is a vast elevated plain, supported, like a table, by the mountains of Tibet on the south, and the Altaian on the north. This elevated level is intersected by several chains of mountains, and by the vast deserts of Cobi and Shamo, which have been supposed to be the same, the former being the Tartarian, and the latter the Chinese, name. To the west of this great country are the mountains of Belur Tag, the Imaus of the ancients, which separate the Chinese empire from Balk and great Bucharia, and the Kalmucs, subject to China, from the Kirguses of Independent Tartary.

*Soil and Agriculture.*] The soil of so extensive a country must be various; but it is most generally composed of black sand. Though the Mandshurs are, in general,averse from agriculture, the land does not appear wholly in an uncultivated state; and, from the accounts of some travellers, the industry of those who exert themselves in this useful employ is rewarded by a tolerable harvest of grain.

*Rivers, Lakes, &c.*] The Amur is among the largest rivers, pursuing an easterly course of about eighteen hundred and fifty British miles. It is the grand receptacle of the Mandshur streams, among which the most considerable is the Songari, which itself receives the large river Nouni. The Ili, which falls into the lake of Balkash, is noted in Tartaric history. The lakes of Balkash, or Tengis, and Zaizan, are of great extent, each about a hundred and fifty miles in length. Next is the Koko Nor, by some called Hoho Nor, or the Blue Lake, which gives name to a tribe of the Monguls.

*Vegetables.*] Little information has yet been obtained

of the vegetable productions of that part of Asia, including the extensive territories of Chinese Tartary. Neither variety nor abundance can be expected in these climates, the products of which are represented, by the few travellers who have visited them, as similar to those of the most northern parts of Germany, intermixed with some species that are found in Siberia.

*Minerals.*] The mineralogy of central Asia has been little explored. Gold is found both in the eastern and western regions; and the former are also said to produce tin. As Russian Daouria exhibits so many valuable substances, it is reasonable to conclude, that they equally abound in the Chinese territory, if similar skill and industry were exerted in their detection. The mineral waters, and uncommon appearances of nature, have been little investigated.

*Animals.*] Among the various animals of this country, the most remarkable are the wild horses and wild asses, which are very numerous. The horses and cattle are in great plenty, and sold at low prices. The *bos grunien*, of Linnaeus, or grunting ox, which inhabits Tartary, has a tail of uncommon beauty, full and flowing, of a glossy and silky texture. These tails are a considerable article of exportation from Tibet: the Indians fasten small bundles of the hair to a handle, which they use for fly-flaps; the Chinese dye tufts of it with a beautiful scarlet, to decorate their caps; and the Turks employ it as ornaments to their standards.

*Population.*] Of the population of these regions it is difficult to form any precise idea. As the numerous tribes subject to Russia are found, under splendid appellations, to present but a slender number of individuals, not exceeding two or three millions, it may, perhaps, be reasonable to infer, that amidst the wide deserts and barren mountains of central Asia there do not inhabit above six millions.

*Cities, Chief Towns, &c.*] CHIN-YANG, the capital of the whole country of the Mandshur Tartars, stands on an eminence, and is nearly nine miles in circumference. It contains a palace for the emperor, magazines of arms, and store-houses. Kirin, the chief town of the department of that name, is the residence of a Mandshur general, who is invested with all the powers of a viceroy: he has the inspection of the troops, and authority over all the mandarins. Ningouto, which is considered as the cradle of the present imperial family, is surrounded by a wooden wall, composed of plain stakes, driven into the earth, which touch each other, and are twenty feet high. Without this paradise there is another, of the same kind, which is three miles in circumference, and has four gates, corresponding to the four cardinal points.

The Monguls, properly so called, have no towns; but in the country of Little Bucharia, possessed by the Ka-

part of Asia, including Tartary. Neither varied in these climates, but, by the few traces similar to those of the intermixed with some

Ulan, the capital of the Tartars, stands on an island of small circumference. It is surrounded by a wall of gazettes of arms, and is the department of the Mandshur general, or viceroy: he has authority over all the Tartars, considered as the cradle of the Tartars, founded by a wooden wall, even into the earth, and is ten feet high. With the same kind, which has four gates, cor

have no towns; but are possessed by the Ka-

nuks, who were subjected by the Chinese in 1759, is the city of Cashgar, formerly the capital of a kingdom, nearly corresponding, in its limits, with Little Bucharina, and which still retains some trade.

*Government and Laws.]* The Mandshur Tartars are governed by viceroys, appointed by the emperor of China. The wandering tribes of Monguls are governed by khans, or particular princes, who are independent of each other, but all subject to the authority of the Chinese emperor. When the Mandshurs subdued China, they conferred certain titles on the most powerful of the Mongul princes, and assigned them revenues, but far inferior to those of the Mandshur lords at Peking. The emperor settled the limits of their respective territories, and gave them laws, according to which they are at present governed. These tributary khans have not the power of condemning their subjects to death, nor of depriving them of their possessions: the cases of death and confiscation are reserved for the supreme tribunal, established at Peking, for the affairs of the Monguls, to which every individual may appeal from the sentence of his prince, who is obliged to appear in person whenever he is cited.

*Army.]* It is probable that this part of the Chinese empire might muster a very numerous army; but, amidst modern tactics and weapons, little need be apprehended from a new deluge of Mongul barbarians. Besides, their interests are now so various and discordant, that, while the empires of Russia and China exist, they can only be regarded as connected with the policy of these powerful states.

*Trade.]* The principal trade of the Mandshur country consists in ginseng and pearls, found in the rivers which fall into the Amur. Excellent horses may also be classed among the exports. Cashgar was formerly celebrated for musk and gold. Korea also produces gold, silver, iron, beautiful yellow varnish, and white paper, ginseng, furs, and fossil-salt. The other towns are rather stations for merchants than seats of commerce.

*Religion.]* The religion most prevalent among the Tartars is that of Schamanism, or belief in one Supreme God, the Creator of all things, who loves all his creatures; who knows every thing, and is all-powerful; but who pays no attention to the particular actions of men, being too great for them to be able to offend him, or to do any thing that can be meritorious in his sight. The professors of this faith also maintain, that the Supreme Being has divided the government of the world, and the destiny of men, among a number of subaltern divinities, under his command and control, but who, nevertheless, generally act according to their own fancies; and, therefore, mankind cannot dispense with using all the means in their power for obtaining their favour. They likewise suppose, that, for the most part, these inferior deities detect and

punish premeditated villany, fraud, and cruelty. Women are considered as very inferior to men, and are thought to have been created only for their sensual pleasure, to people the world, and to look after household affairs; and, in consequence of these principles, they are treated with much severity and contempt.

*Language.]* The language of the Mandshurs is very copious, these Tartars being particularly nice with respect to the too frequent recurrence of the same sounds. It is said, likewise, to be very expressive, and has names, not only for the different species of dogs, but such as signify the age, colour, or qualities of a dog, whether he have long or short hair, large ears, or hanging lips, in all which, and many other cases, he has a distinct name. In like manner, a horse has a variety of names, signifying, in a single word, whether he be restive, easily frightened, with what pace he goes, &c. This language is written in characters which represent sounds and not things, like those of the Chinese. M. Langles, a member of the French Institute, has compiled a dictionary of the Mandshur language, which he pronounces to be the most learned and perfect of the Tartar tongues, though not written till the seventeenth century, when the emperor appointed some literati to design letters after those of the Monguls.

*Customs, Manners, &c.]* In such a vast extent of country there will, of course, be a considerable variety in the persons of the inhabitants, as well as in their manners and customs. M. Buffon has described them, generally, as having, even in their youth, large wrinkled foreheads, with thick and short noses, and very small eyes, sunk deep in the head; their cheek-bones are high, and the lower part of their face is very narrow; their chin is long and prominent, and their upper jaw falls in; their teeth are long, and distinct from each other; the eye-brows are thick, and cover a part of their eyes; the face is flat, the skin is tawny, and the hair is black; their bodies are of a middle stature, but strong and robust.

In speaking of the different tribes, we find, from the most authentic accounts, that the Kalmucs, who live in the neighbourhood of the Caspian Sea, between Muscovy and Great Tartary, are robust men, but extremely ugly and deformed. Their faces are so flat, that their eyes, which are very small, are situated four or five inches asunder. Their noses are so low, that, instead of nostrils, two holes are only to be seen. Their knees bend outwards, and their legs inward. After the Kalmucs, the Tartars of Daghestan hold the next rank in deformity. The Little Tartars, or those of Nogai, who live near the Black Sea, are not so ugly as the Kalmucs, though they resemble them in their general figure. Lastly, the Mongul Tartars, who conquered China, and were the most polished, though their features are less disagreeable, yet,

like all the other tribes, they have small eyes, large flat faces, thin black or red beards, short sunk noses, and a tawny complexion.

The Chinese have so strong a resemblance to the Tartars, that it is uncertain whether they are not of the same race: the most remarkable difference arises from a total disparity in their dispositions, manners, and customs. The Tartars are fierce, warlike, and fond of hunting: they love fatigue and independence, are hardy and brutally gross. But the manners of the Chinese are the reverse: they are effeminate, peaceable, indolent, superstitious, submissive, and very ceremonious.

The immense plains of Tartary have, in all ages, been inhabited by wandering tribes of hunters and shepherds, whose indolence refuses to cultivate the earth, and whose restless enterprising spirit disdains the confinement of a sedentary life. In general, they are a wandering sort of people; in their peregrinations, they set out in the spring, in large companies of several thousands, preceded by their flocks and herds. When they come to an inviting spot, they remain there till they have consumed its produce. They have but little money, except what they obtain from their neighbours, the Russians, Persians, or Turks, in exchange for cattle: with this they purchase apparel for their women. They have few mechanics, except those who make arms. They avoid all labour, as the greatest slavery; their only employment is tending their flocks, or hunting, and managing their horses. If they are angry with a person, they wish he may live in one fixed place, and work like a Russian. They are hospitable, particularly to strangers, who confidentially put themselves under their protection. They are naturally of an easy and cheerful temper, and seldom depressed by care and melancholy; and are so much delighted with their own country, that they conceive it impossible to traverse their plains without envying them their possession. "You have travelled a great way," said one of these Tartars to the Baron de Tott; "but did you ever before see a country like ours?"

A strong resemblance exists between some of the Tartars and some of the more northerly nations of North America, particularly in their treatment of the aged, and of those who are seized with disorders that are reckoned incurable: they make a hut for the patient near some river, in which they leave him, with a small quantity of provisions, and seldom think of visiting him again. On such occasions, they suppose they are doing their parents a kindness, by sending them to a better world. Among other tribes, however, filial affection, and a respect to the memory of their deceased parents, have ever been distinguishing traits. When Darius, king of Persia, invaded them with all his forces, instead of giving him battle, they retired, by degrees, till, at length, the Persian monarch

sent an ambassador, to demand where they proposed to conclude their retreat, and when they intended to begin fighting? To which they replied, "Since they had no cities or cultivated fields, for the defence of which they should maintain a warfare, he had only to proceed with his hostile army to the place of their fathers' monuments, when he should understand the manner in which they had been accustomed to engage an enemy."

The houses of the Tartars are no more than small tents, of an oval form. The palaces of the rich consist of wooden huts, of such a size that they may be conveniently fixed on large waggons, and drawn by a team of twenty or thirty oxen. They cover their habitations with felt, the parts of which they join so nicely, as to keep out the piercing blasts of the north wind; for the same purpose, they take great care to place the door of the tents, which is, in general, very small, facing the south. The flocks and herds, after grazing all the day in the adjacent pasture, retire, on the approach of night, within the protection of the camp.

The success of preventing the most mischievous confusion, in such a perpetual concourse of men and animals, has gradually introduced regulations among them, resembling some that are known among more civilised people. Each proprietor has his own mark, which is burnt into the thighs of the horses, oxen, and dromedaries, and painted with colours on the wool of the sheep. The latter are kept, in all seasons, near the owner's habitation; but the other animals, united in herds, are, towards the spring, driven to the plains.

At the approach of winter it is necessary to seek these herds, and drive them to their sheds. Accordingly, a Tartar provides himself with about six pounds of the flour of roasted millet, which is sufficient to last him thirty days, and then mounts his horse, which is remarkable for its swiftness, nor stops till the sun goes down, when he clogs the animal, leaves him to graze, sups on the flour, goes to sleep, awakes, and continues his route. He neglects not, however, to observe, as he rides, the mark of the herds he happens to see: these discoveries he communicates to the different Tartars he meets, who have the same pursuits, and, in his turn, receives such indications as may help to forward the object of his journey.

The Tartars are remarkably expert at pitching and removing their tents, to which they have been accustomed by their constant incursions upon the neighbouring nations: on this account they have neither house nor fixed residence; the camp includes their families, their friends, their companions, and their property: in their most distant marches they are still surrounded by all the objects that are valuable, familiar, and dear to their eyes.

The dress of the Tartars consists of a large shirt and drawers; their habits are commonly made of calico, or some

of a large shirt and  
e of calico, or some

other light stuff, which they mix with sheep-skin; and sometimes they wear entire garments of the same materials.

Red is the colour in the highest esteem with the Tartars; and although their chiefs and grandees are but meanly clothed in other respects, they seldom fail to have a scarlet robe for occasions of state. They would rather be without a shirt than a scarlet coat; and the women of quality do not think themselves well-dressed, if the scarlet garment is wanting. Those who are able to get them, wear coats of stuff or silk, above which they throw a fur-coat of sheep-skins; and, in time of war, they cover their head and body with iron net-work, the links of which are so close, that it is proof against any kind of weapons, except fire-arms.

As the Tartars neither sow nor reap, nor make hay for their cattle, so they live without bread, or any sort of vegetable, except their millet; and, in the winter, their cattle fare as other wild beasts. Their own food is flesh, especially that of horses; they eat also mutton, fish, wild fowl, and venison, but are not fond of beef or veal. They have plenty of milk, butter, and cheese; but mare's milk is the most esteemed by them, and from it they make a strong spirit, of which they are very fond.

The pastoral life, compared with the labours of agriculture and manufactures, is undoubtedly a life of indolence; and as the most honourable shepherds of the Tartar race devote on their captives the domestic management of the cattle, their own leisure is seldom disturbed by any servile duties. This leisure is usually spent in the exercise of the chase. The plains of Tartary are filled with a strong and serviceable breed of horses, which are easily trained for the purposes of war and hunting. The Tartars of every age have been celebrated as bold and skilful riders; and constant practice has seated them so firmly on horseback, that they have been supposed, by strangers, to perform the ordinary duties of civil life, to eat, to drink, and even to sleep, without dismounting from their steeds. They excel in the dexterous management of the lance; the long Tartar bow is drawn with a nervous arm, and the weighty arrow is directed to its object with unerring aim, and almost irresistible force. The vigour and patience, both of men and horses, are continually exercised by the fatigues of the chase; and the plentiful supply of game contributes to the subsistence, and even luxury, of a Tartar camp. But the exploits of the hunters are not confined to the destruction of the timid and innoxious animals: they boldly encounter the wild boar, excite the courage of the bear, and provoke the fury of the tiger, as he slumbers in the thicket. Where there is danger, they conceive there may be glory; and the mode of hunting, which opens the fairest field to the exertions of valour, is considered as the school of war. The general hunting-matches, the pride and delight of the

Tartar princes, compose an instructive exercise for their numerous cavalry. A circle is drawn, of several miles in circumference, to encompass the game of an extensive district, and the troops, that form the circle, regularly advance towards a common centre, where the animals, surrounded on every side, are exposed to the darts of the hunters. In this march, which frequently continues many days, the cavalry are obliged to climb the hills, to ford the rivers, and to wind through the valleys, without interrupting the prescribed order of their gradual progress. Upon every expedition, the Tartars have no regard either to bridges or boats; they no sooner come to a river than they plunge in with their horses, slide from their backs, and hold fast by the manes till they get over. And then, mounting again, they proceed. By frequently engaging in these hunting parties, they acquire the habit of directing their eye and their steps to a remote object; of preserving their intervals; of suspending or accelerating their pace, according to the motion of the troops on their right and left; and of watching and repeating the signals of their leaders, who study, in this practical school, the most important lesson of military art, viz. the prompt and accurate judgment of ground, of distance, and of time. To employ against a human enemy the same patience and valour, the same skill and discipline, is the only alteration which is required in real war; and the amusements of the chase serve as a prelude to the conquest of an empire.

As the Tartars have no need of more than their own families to guard their cattle, which are the whole of their riches, they have no desire to burden themselves with useless mouths; and, on that account, none, except the Khans, are allowed to have slaves. But the Mahometan Tartars frequently make war upon their neighbours, for the purpose of procuring slaves, whom they may sell. This practice prevails so much among the Circassian, Daghestan, and Nogay Tartars, that, when they cannot meet with grown people, they steal children to sell; and, if they cannot get any other, they make no scruple of selling their own, especially their daughters.

Among the articles of their domestic economy, we shall present the reader with the following fact, taken from the Memoirs of the Baron de Tott:—"I approached," says he, "a group of Tartars, assembled round a dead horse, which they had just skinned. A young man, about eighteen, who was naked, had the hide of the animal thrown over his shoulders. A woman, who performed the office of taylor with great dexterity, began by cutting the back of this new dress, following with her scissors the round of the neck, the fall of the shoulders, the semicircle which formed the sleeve, and the side of the habit, which was intended to reach below the knee. She proceeded in the same manner with the other parts, till the cutting out was finished; the man then, who had served as a mould,

crouched on his hams, while the several pieces were stitched together, so that, in less than two hours, he had a good brown bry coat, which only wanted to be tanned by continual wearing."

The respect paid by children to their fathers, who are considered as kings of their families, is very great; but they pay little attention to their mothers, unless they are under some particular obligation to them. They must mourn for a father many days, and, during that time, abstain from all sorts of pleasure. Nothing must be spared to render his funeral honourable; and they must pay their devotions at his tomb at least once a year, to recal to mind the obligations which they owe him.

It is the custom, among some of the Tartar nations, to burn their dead, and inter their ashes on an eminence, upon which they raise a heap of stones, and place on it little banners; but the greater part of the Pagan Tartars bury their friends, and with each his best horse and moveables, for his use in the other world. Others, however, throw their dead into open fields, to be devoured by the dogs, of which many run wild, and some are kept expressly for this purpose. If the bodies are thus devoured by any number exceeding six, they think honourably of the deceased; otherwise, he is a disgrace to his relations.

*History.]* The different tribes, who at present inhabit this extensive region, were formerly comprehended under the general name of Monguls, a warlike and formidable nation, whose sovereign, Jenghis Khan, about the thirteenth century, subjugated the greater part of the north of Asia, seized on China on the one hand, and invaded Hindoostan on the other. The Tartars retained possession of China about a hundred years, but were expelled in 1368. The fugitives took different routes; some went towards the Eastern Sea, and established themselves between China and the river Sagalian: the rest returned to their former country, where, intermixing with the Monguls that remained, they soon resumed their ancient manner of living. Those who settled towards the east, having found the country almost a desert, and without inhabitants, retained the customs which they had brought from China, and became known by the name of Mandshur, or Eastern Tartars. In 1644, these Tartars re-entered China, and established a sovereign of their own race on the throne; as we have already noticed in the history of China.

## SECTION II.

### TIBET.

*Situation, Extent, and Boundaries.]* This country is situate between seventy-five and a hundred and one degrees of east longitude, and between twenty-seven and thirty-five degrees of north latitude, extending fifteen hun-

dred miles in length, and five hundred in width; and is supposed to contain a surface of about three hundred and eighty-five thousand square miles. It is bounded, on the north and north-west, by the great desert of Cobij, in Tartary; on the east, by China; on the south, by the Burman empire; and, on the south-west and west, by Hindoostan.

*Divisions.]* Tibet is divided into three parts, Upper, Middle, and Lower. Upper Tibet chiefly comprises the province of Nagari, full of horrible rocks, and mountains covered with eternal snow. Middle Tibet contains the provinces of Shang, On, and Kiang; and the provinces of Lower Tibet are Takbo, Congo, and Kalung.

Many of these provinces are again subdivided: for instance, Nagari is considered as a kingdom of three departments, Sangkar, Pourang, and Tamo. Shang is, on the west, bounded by Nipal. The province of On contains Lassa, the capital of Tibet. Kiang is to the north-east of On; and is inhabited by mingled Tibetans, and Monguls in tents. Kalung is, in the south-east, bordering on the Birmans, and is divided into twelve departments.

*Climate, Soil, Produce.]* The climate of Tibet is extremely cold, in consequence of which the inhabitants are obliged to seek refuge in sheltered valleys, or amidst the warmest aspects of the rocks. In the temperature of the seasons, however, a remarkable uniformity prevails, as well as in their periodical duration and return. In Bootan, almost every part of the mountains and hills, which is coated with the smallest quantity of soil, is cleared and adapted to cultivation; but, in Tibet Proper, the nature of the soil prevents the progress of agriculture. Wheat, barley, and rice, are raised in Bootan.

*Face of the Country.]* Tibet, at first view, appears one of the least favoured countries under heaven, and, in a great measure, incapable of culture. It exhibits only rocky hills, without any visible vegetation; or extensive and arid plains, promising as little as they produce. Bootan, however, or the most southern part, has its mountains covered with verdure, and exhibits several forests of large and lofty trees.

*Rivers.]* The chief river of Tibet is the Sampoo, or Burrampootar, which, rising in the western region, from the same lofty mountains that gave source to the Ganges, proceeds, in an east and south-east direction, for about the space of a thousand English miles, to the confines of Tibet and Assam, where it bends to the south-west, and flows into the estuary of the Ganges, after a farther course of about four hundred British miles.

The Hoan Ho and Kian Ku of the Chinese also derive their origin from the eastern boundaries of Tibet. Of the other rivers little is known, but the great Japanese river of Cambodia, or Maykaung of Laos: that of Nou Kia, supposed to pass near Martaban into the Gulf of Pegu; and

the Irrawaddy, their sources styled the same, after a circuit of several hundred miles, fall on the Chupra, mountainous

at Nou Kia, sup-  
Gulf of Pegu; and

the Irrawady of this last country, are an believed to derive their sources from the mountains of Tibet, which may be styled the Alps of Asia. Nor must it be forgotten, that another large river, called the Sadjoo, or Gngm, which, after a course of about six hundred miles, and nearly parallel on the east with that of the Ganges, joins it near Chapra, also derives its spring from the lofty western mountains of Tibet.

*Lakes.*] These Alpine regions contain many lakes, the most considerable being represented under the name of Terkiri, about eighty British miles in length, and twenty-five in breadth. The Chinese Lamas have also depicted many other lakes in the northern parts of the country; where there really exists one very singular, which yields the tincal or crude borax.

*Mountains.*] Of the course and extent of the vast ranges of Tibetan mountains, there is no accurate geographical delineation. Those in the west and south seem to bend in the form of a crescent, from the sources of the Ganges to the frontiers of Asam, in a north-west and south-east direction. To the north of Sampoo a parallel and yet higher ridge seems to extend, the northern extremities abounding with large frozen lakes. The chief elevation appears to be central, to the south of the lake Terkiri.

*Forests.*] Bootan, the southern province of Tibet, abounds with forests, containing many European trees, though the oak be wanting; and several peculiar to Asia. Nipal, the adjoining province to the west, presents similar features. The high snowy mountains, which contain the sources of the Ganges, are, probably, barren of vegetation.

*Animals.*] In Bootan few wild animals are observable, except monkeys; but Tibet abounds with game of various descriptions. The horses, though very spirited, are of a small size; and the cattle are also diminutive. The sheep also are commonly small, with black heads and legs; the wool soft, and the mutton excellent. It is a peculiarity of the country, that the latter food is generally eaten raw. When dried in the frosty air, however, it is not disagreeable.

The goats are numerous, and celebrated for producing a fine hair, which is manufactured into shawls, and which lies beneath the exterior coarse coat. Nor must the singular breed of cattle be forgotten, called Yak, by the Tartars, covered with thick long hair; the tail being peculiarly flowing and glossy, and an article of luxury in the east, where it is used to drive away the flies, and sometimes dried for ornaments. These cattle do not low; but, when uneasy, make a kind of grunting sound, whence the breed is called the grunting ox.

The mask-deer delights in intense cold. This valuable animal has two long curved tusks, proceeding downwards from the upper jaw, which seem intended to dig roots,

his usual food. The figure of the body somewhat resembles the hog, while the hair approaches the quills of the porcupine. The mask, which is only found in the male, is formed in a little tumour at the navel; and is the genuine and authentic article so styled, being commonly black, and divided by thin entices.

*Minerals.*] There are some gold-mines in the northern parts of Tibet, which are the reserved property of the lama, and rented out to those who work them. The gold is not found in ore, but always in a pure metallic state, and only requires to be separated from the spar, flint, or stone, to which it adheres. When Mr. Hastings was governor-general of Bengal, he had a lump sent to him at Calcutta, about the size of a bullock's kidney, which was a hard flint, covered with solid gold; he caused it to be sawn asunder, and it was found throughout streaked with the purest metal. Great quantities of gold are also found in one of the principal rivers, as well as in most of the small brooks and torrents that flow down the mountains. It is used by the natives as a medium of commerce, and very considerable quantities are occasionally exported to other countries; yet it is a singular fact, that none of it is coined into money. There is a lead-mine, two days' journey from Teshoo Lamboo; and there are strong indications of copper.

The most peculiar product of Tibet, however, is tincal, or crude borax; concerning which Mr. Sanders gives the following information:

"The lake, from which tincal and rock-salt are collected, is about fifteen days' journey from Teshoo Lamboo. It is encompassed on all sides by rocky hills, without any brooks or rivulets near at hand; but its waters are supplied by springs, which, being saltish to the taste, are not used by the natives. The tincal is deposited or formed in the bed of the lake; and those who go to collect it dig it up in large masses, which they afterwards break into small pieces, for the convenience of carriage, exposing it to the air to dry. Although tincal has been collected from this lake for a great length of time, the quantity is not perceptibly diminished; and, as the cavities made by digging it soon wear out, or fill up, it is an opinion with the people, that the formation of fresh tincal is going on. They have never yet seen it in dry ground, or high situations; but it is found in the shallowest depths, and the borders of the lake; which, deepening gradually from the edges towards the centre, contain too much water to admit of their searching for the tincal conveniently; but from the deepest parts they bring rock-salt, which is not to be found in shallows, or near the bank. The waters of the lake rise and fall very little, being supplied by a constant and unvarying source, neither augmented by the influx of any current, nor diminished by any stream running from it. The lake, I was assured,

is at least twenty miles in circumference; and, standing in a very bleak situation, is frozen for a great part of the year. The people employed in collecting these salts are obliged to desist from their labour so early as October, on account of the ice. Tincal is used in Tibet for soldering, and to promote the fusion of gold and silver. Rock-salt is universally used for all domestic purposes in Tibet, Bootan, and Nipal."

*Natural Curiosities.*] To the north of Tassisdon is a singular rock, projecting over a considerable fall of water, and forming, in front, six or seven hundred angular semi-pillars, of a great circumference, and some hundred feet high. Among the mountains of Bootan is a waterfall, called Minzapcezo, which issues in a collected body, but descends from so great a perpendicular height, that, before it is received in the thick shade below, it is nearly dissipated, and appears like the steam rising from boiling water.

*Cities, Edifices, &c.*] Lahassa, the capital of Tibet, is situate in a spacious plain; the houses are not numerous, but they are built of stone, and are large and lofty.

The residence of Teeshoo Lama is, in fact, a large monastery, consisting of three or four hundred houses, inhabited by gylongs, a kind of priests; besides temples, mansoleums, and the palace of the sovereign pontiff, with the residences of the various subordinate officers, both ecclesiastical and civil, belonging to the court. It is included within the hollow face of a high rock, and has a southern aspect. Its buildings are all of stone, none less than two stories high, flat roofed, and crowned with a parapet, rising considerably above the rest. The palace of the Dalai Lama, the sovereign of Tibet, is about seven miles distant from the city.

"A Tibet village," says Mr. Turner, "by no means makes a handsome figure. The peasant's house is of a mean construction, and resembles a brick-kiln, in shape and size, more exactly than any thing to which I can compare it. It is built of rough stones, heaped on each other without cement, and, on account of the strong winds that perpetually prevail here, it has never more than three or four small apertures, to admit light. The roof is a flat terrace, surrounded with a parapet-wall, two or three feet high: on this are commonly placed piles of loose stones, intended to support a small flag, or the branch of a tree; or else as a fastening for a long line, with scraps of paper, or white rags, strung upon it, like the tail of a kite: this, being stretched from one house to another, is a charm against evil genii, as infallible in its efficacy as horse-shoes nailed upon a threshold, or as straws thrown across the path of a reputed witch."

*Government, Religion.*] The government of Tibet is intimately connected with its religion; both the civil and spiritual authority being in the hands of the lamas, of whom the chief, called the Dalai Lama, or grand lama,

is not only submitted to and adored by the Tibetians, but is also the great object of veneration among the various tribes of Tartars, who roam through the vast tract of continent which stretches from the banks of the Volga to Koren, on the sea of Japan. He is not only the sovereign pontiff, the vicegerent of the Deity on earth; but, as superstition is ever the strongest where it is most removed from its object, the most remote Tartars absolutely regard him as the deity himself. They believe him to be immortal, and endowed with all knowledge and virtue. Every year they come up, from different parts, to worship, and make rich offerings at his shrine: even the emperor of China, who is a Mandshur Tartar, acknowledges him in his religious capacity, and actually entertains, at a great expense, in the palace of Pekin, an inferior lama, deputed as his munio, from Tibet. The opinion of those who are reputed the most orthodox among the Tibetians is, that when the grand lama seems to die, either of old age or infirmity, his soul, in fact, only quits a crazy habitation to look for another yomger, or better, and it is discovered again in the body of some child, by certain tokens, known only to the lamas, or priests, in which order he always appears. In 1774, the grand lama was an infant, which had been discovered, some time before, by the Teeshoo Lama, who, in authority and sanctity of character, is next to the grand lama; and, during his minority, acts as chief. In the year 1783, the Teeshoo Lama was, in like manner, an infant, under the guardianship of a regent; and Mr. Turner, in his account of his embassy, has given a curious and interesting relation of a visit which he was permitted to make to him. "Teeshoo Lama," he tells us, "was, at that time, eighteen months old. He was placed, in great form, upon his musnud. On the left side stood his father and mother, and, on the other, the officer particularly appointed to wait upon his person. The musnud is a fabric of silk cushions, piled one upon the other, until the seat is elevated to the height of four feet from the floor; a piece of embroidered silk covers the top, and the sides also are decorated with pieces of silk, of various colours, suspended from the upper edge, and hanging down. Though the little creature," says our author, "was unable to speak a word, he made the most expressive signs, and conducted himself with astonishing dignity and decorum. His complexion was of that hue which, in England, we should term rather brown, but not without colour. His features were good, he had small black eyes, and an animated expression of countenance; altogether, I thought him one of the handsomest children I had ever seen."

There are, in this country, several monasteries, containing a great number of gylongs, or monks; who are enjoined sobriety, to forego the society of women, and confine themselves to the austere practices of the cloister. On the establishment of the monastery of Teeshoo Loo-

by the Tibetians, but among the various parts of the vast tract of country on the banks of the Volga to the north is not only the source of the Deity on earth; but, where it is most remote, the Tartars ascribe to him the knowledge and virtue of the gods of the various parts, to worship, and even the emperor acknowledges him as the deity who entertains, at a great distance, the inferior lama, deputed from those who are related to him.

The Tibetians is, that when of old age or infirmity, he is permitted to look for a sign of his discovery again in the tokens, known only to him, by which he always appears. The lama, which had been the sign of the Teeshoo Lama, who, is next to the grand lama, is chief. In the year 1750, in the manner, an infant, and Mr. Turner, in a serious and inquisitive manner, was permitted to make a sign, "was, at that time, in great form, upon his father and mother, particularly appointed to be a fabric of silk until the seat is elevated on the floor; a piece of the sides also are of various colours, suggesting down. Though I was unable to speak signs, and conducted decorum. His coming to England, we should colour. His features and an animated expression. I thought him one of the best seen."

The Tibetians is, that when of old age or infirmity, he is permitted to look for a sign of his discovery again in the tokens, known only to him, by which he always appears.

bo were reckoned no less than three thousand seven hundred of these gyilongs. There are also many nunneries, containing nuns, or nuns; and the strictest laws exist to prevent any woman from even accidentally passing a night within the limits of a monastery, or a man within those of a nunnery.

"The religion of Tibet," says Mr. Turner, "seems to be the schismatical offspring of that of the Hindoos, deriving its origin from one of the followers of that faith, a disciple of Boodh, who first broached the doctrine which now prevails over the wide extent of Tartary. It is reported to have received its earliest admission into that part of Tibet bordering upon India, which, from hence, became the seat of the sovereign lamas; to have traversed over Mandshur Tartary, and to have been ultimately disseminated over China and Japan. Though it differs from the Hindoo in many of its outward forms, yet it still bears a very close affinity to the religion of Brahma, in many important particulars.

"The same places of popular esteem, or religious resort, are equally respected in Tibet and in Bengal: Prang, Cash, Dergeen, Sangor, and Juggernaut, are objects of devout pilgrimage; and I have seen loads of the sacred water, taken from the Ganges, travelling over the mountains, upon the shoulders of men, whom enthusiasts have deemed it worth their while to hire, at a considerable expence, for so pious a purpose.

"As far as I am able to judge respecting their ritual or ceremonial, however, it differs materially from that of the Hindoos. The Tibetians assemble in chapels, and male together, in prodigious numbers, to perform their religious service, which they chant in alternate recitative and chorus, accompanied by an extensive band of loud and powerful instruments; so that, whenever I heard these congregations, they forcibly called to my recollection a Roman Catholic mass.

*Manufactures and Commerce.*] The principal manufactures of Tibet are shawls and woollen cloths. The exports, which go chiefly to China and Bengal, consist of gold-dust, diamonds, pearls, coral, musk, rock-salt, tin-cil, woollen cloths, and lamb-skins; in return for which are imported, from China, silks, satins, gold and silver brocades, tea, tobacco, and furs, of various kinds; and, from Bengal, the productions of that country, and a variety of English commodities and manufactures.

*Language and Literature.*] The language of Tibet is as same as that spoken on the western frontiers of China. The literature is chiefly of the religious kind; the books being sometimes printed with blocks of wood, on narrow slips of paper, fabricated from the fibrous root of a small shrub. In this practice the Tibetians resemble the Chinese; while the Hindoos engrave their works, with a steel stylus, upon the recent leaves of the palm-tree, affording

ing a fibrous substance, which seems indestructible by vermin. The printed and formal letters are called the *nehen*; while those of business and correspondence are styled *umün*. The Tibetians appear to have made considerable progress in civilization; but the sciences continue in a state of imperfection.

*Customs, Manners, &c.*] The Tibetians are of shorter stature than their southern neighbours, and of a less robust make; their complexions, also, are fairer, and some of them have even a ruddiness in their countenances, which is unknown in the other climates of the east. Mr. Boyle observes, that they are of a mild and cheerful temper, and that the higher ranks are polite and entertaining in conversation, in which, however, they never mix any flattery or fulsome compliments.

The common people are generally dressed in coarse woollen stuffs, of their own manufacture, lined with such skins as they can procure; but the higher orders wear European cloth, or China silk, lined with the finest Siberian furs. The Dalai Lama is usually clothed in a mapped kind of red woollen stuff, with a yellow cap, and a sort of tiara, resembling a bishop's mitre.

Their chief food is the milk of their cattle, prepared into cheese or butter, or mixed with the flour of a coarse barley, which is the only grain their sterile soil produces. They have no want, however, of animal food, and are well furnished with rice and wheat from the adjacent countries.

Polygamy, at least in our acceptation of the word, is not practised in Tibet; but it exists in a manner more repugnant to European ideas. It consists in a plurality of husbands, which is firmly established by law; and degrees of consanguinity are not considered as any obstacle to the marriage. A woman, for example, may marry all the brothers of one family, and her children are divided among them. Notwithstanding such brothers having one wife in common, they generally live in great harmony with her, though little dissensions will sometimes arise.

The Tibetians expose their dead bodies within walled areas, which are left open at the top, and have passages at the bottom, to admit birds, dogs, and beasts of prey; no other funeral-rites are performed, but such as tend to facilitate the destruction of the body by the voracious animals, which seem invited to devour it. Some bodies are conveyed, by the friends of the deceased, to the summit of some neighbouring hill, where they are disjointed and mangled, that they may become a more easy prey to carnivorous birds. The bodies of the sovereign lamas are, however, deposited in shrines, which are ever considered as sacred: those of the inferior priests are burnt, and their ashes preserved in little hollow images of metal.

*History.*] The temporal government of Tibet has not been always in the possession of the lamas: as it appears that, in the year 1624, the country was governed by a se

cular sovereign, named Tsang-pa-han, who was a zealous protector of the Christian religion, and seemed greatly inclined to embrace it. The Tartar history of the same period corroborates this circumstance; for it relates, that this prince despised the lamas, and sought every opportunity to destroy their religion. The Dalai Lama, being highly incensed at not receiving the homage of Tsang-pa-han, formed a league with the Tartars of Kokonor, who, under a prince, named Kouchi, entered Tibet, at the head of a powerful army, attacked Tsang-pa-han, defeated him, and took him prisoner, and, some time after, caused him to be put to death. To this Tartar prince the Dalai Lama was indebted for his sovereignty over all Tibet; for, far from appropriating to himself the fruits of his victory, Kouchi declared himself a vassal of the supreme chief of his religion, and satisfied with receiving from him the title of khan, which he had never before enjoyed. This prince, to continue his protection to the Dalai Lama, and secure to him the undisturbed possession of his new acquisitions, fixed his residence in the neighbourhood of Lassa. His sons had no great inclination to return to a country which their father had abandoned, but followed his example, and remained in Tibet.

In 1642, the Dalai Lama sent ambassadors to Tsongte, father to the first emperor of the present dynasty of the Mandshur Tartars, threw himself under his protection, and paid him tribute. Ten years after, the Dalai Lama himself went to Peking, and did homage to the emperor; he was loaded with honours, received a golden seal and magnificent presents from the emperor, and was confirmed in his title of Dalai Lama.

In 1693, the emperor Kanghi, being desirous of honouring the type, or minister of the Dalai Lama, declared him a prince, and granted him a golden seal. This minister, however, was far from being faithful to the interests of the emperor; he, on the contrary, secretly betrayed them to the ambitious views of Kaldan, the chief of the Eluts, who was the declared enemy of the Mandshur Tartars. He even endeavoured to persuade the grand lama not to go to Peking, when called thither by the emperor; and, when the Dalai Lama died, he concealed his death. At length, however, all these intrigues were discovered, in 1705 and the chief of the Tartars of Kokonor caused this perfidious minister to be put to death. Kanghi, informed of the crimes which he had committed, approved of the punishment inflicted on him, and sent some of the grandes of his court to Tibet, to govern that country in conjunction with the Tartar prince, on whom he lavished many rich presents. He afterwards appointed a new Dalai Lama, who was the sixth who had borne that title.

In 1714, Tshongkar, chief of the Eluts, made an irruption into Tibet, and carried away a great quantity of

gold, silver, precious stones, silks, and other valuable things. The Tartar prince, who endeavoured to resist the invaders, was killed in battle, many of the lamas were put to the sword, and the monastery at Pootala was reduced to ashes. The Dalai Lama made application to the court of China for succours, and the emperor immediately sent a powerful army to his assistance, which drove the Eluts out of the country, re-established the Dalai Lama in his authority, and reinstated the other lamas in their pagodas or monasteries.

In 1702, the mountaineers of Nipaul invaded and ravaged Tibet, plundering the monasteries of their treasures, and robbing the mausolea of their lamas. The emperor of China, however, as soon as he had received information of this attack, sent an army to protect and avenge the lama. The Nepalese were defeated, and could only obtain peace on condition of becoming tributary to China, and making a full restitution of all the plunder they had carried off. The Chinese, at the same time, established military posts on the frontiers of Tibet, which prevent all communication between that country and Bengal, as the Chinese guard them with their accustomed jealousy and caution, and the approach of strangers, even of the natives of Bengal and Hindoostan, is strictly prohibited.

### SECTION III.

#### INDEPENDENT TARTARY.

*Situation, Extent, and Boundaries.* Independent Tartary is situate between thirty-one and fifty-two degrees of north latitude, and between fifty-five and seventy degrees of east longitude; being about fifteen hundred miles in length, and eight hundred and fifty in breadth; and it is computed to contain a surface of five hundred thousand square miles. It is bounded by Asiatic Russia, on the north; by the mountains of Belur, on the east; by Persia and Hindoostan, on the south; and by the Caspian Sea and the Uralian Mountains, on the west.

*Divisions.* Independent Tartary consists of extensive tracts, inhabited by the Kirguisian Tartars; the country of Kharism, and Great Bucharia, inhabited by the Ubec Tartars. Great Bucharia is divided into the provinces of Fergana, Sogd, Vash, Kottan, Balk, Gaur, and Khilan.

*Climate, Soil, &c.* The climate is moderate, the heat, even of the southern provinces, being tempered by the high mountains, capped with perpetual snow. The face of the country presents a great variety; but, though there are numerous rivers, hills, and mountains, there seems to be a deficiency of wood. Near the rivers, the soil is so exuberant, that the grass sometimes exceeds the height of a man; and, in some parts, industry is shewn in the cultivation of rice and other grain.

*Rivers, Lakes, &c.*] The chief rivers of Independent Tartary are the Amu and the Sirr. The former is the ancient Oxus, and, near its source, is called the Harrat. The Amu rises in the mountains of Belur, more than two hundred British miles north-east from Badakshan. The whole course of this noble river surpasses that of the Tigris, being, probably, not less than nine hundred miles. It abounds with fish, of various sorts.

Besides numerous tributary streams, three remarkable rivers join the Amu; the Sogd, or river of Samarcand; the Morgab; and the Kizil Daria, or Red River, the longest and most considerable stream, and of which a branch seems to flow, apart, into the Aral.

The Sirr, or river of Shash, also rises in the mountains of Belur, and falls into the eastern side of the sea of Aral, after a course of about five hundred and fifty miles. The course of the Sirr is chiefly through the desert of Burzuk; and it is doubtful if it be joined by the Sarasu, a large river from the north; so imperfect is the geography of these regions.

The most considerable lake is the Sea of Aral. If this lake ever joined the Caspian, it was probably only by a strait, as between them are plains of great elevation, and, according to some, even mountains; but there may have been a strait in the direction of a salt-lake to the north-east of Port Iscander. The lake Tengis Palkati is near a hundred and forty British miles in length, by half that breadth, being the largest lake in Asia, after the seas of Aral and Baikal. The lakes in the country of the Kirguses are of less importance.

*Mountains.*] The mountains of Belur exhibit a grand Alpine chain, perpetually covered with snow. The chief branches proceed towards the west; for on the east is the high central plain of Asia, full of deserts. The chain of Belur, the ancient Imaus, proceeds nearly north and south, and is continued by the mountains of Alak, on the north of Little Bucharia, which joins the great Bogdo, the highest mountain in central Asia.

*Minerals.*] In the south-east of Independent Tartary, the mountains contain gold, silver, and a peculiar production, called the *balay*, or pale rose-coloured ruby; also lapis lazuli. In the tenth century, before the native industry had expired under long oppression, Fergana produced sal ammoniac, vitriol, iron, copper, gold, and torquises. In the mountain of Zarka there were springs of naphtha and bitumen, and a stone that takes fire, and burns much like coal. In the country of Setrushtel, D'Anville's Orushina, there was a cavern, whence a vapour arose, which, in the night, seemed fiery, and from which sal ammoniac was procured.

*Cities, &c.*] SAMARCAND, the capital of Great Bucharia, is situate on the southern bank of the river Sogd, which, at the distance of above a hundred miles, after

washing the walls of Bokhara, passes through a considerable lake, and is supposed to join the Oxus, or Amu.

We have not any recent account of this once-celebrated capital; but it seems greatly to have declined since the time of Tamerlane. At the beginning of the last century, Samarcand was fortified with ramparts of turf, the houses being mostly constructed of hardened clay, though some were of stone, from quarries in the neighbourhood. The khan of great Bucharia commonly encamped in the adjacent meadows, the castle being almost ruinous. The rich vale of Sogd produced such abundance of exquisite grapes, melons, pears, and apples, that they were sent to Persia, and even to Hindoostan.

BOOKHARA, when resorted to by the English agents, in 1741, was represented as an extensive and populous town, standing on a rising ground, with a slender wall of earth; the houses, in general, were constructed of clay, but the mosques of brick. The inhabitants manufactured soap and calico, and the chief products were cotton, rice, and cattle. They received rhubarb and musk from the Kalmucs; and, from Badakshan, lapis lazuli, and other precious stones. There was gold and copper coin; and, after Nadir Shah took this city, the Persian and Indian silver became common. The inhabitants were civilized, but perfidious. In the tenth century, it was distinguished by the manufacture of fine linen.

ZOUF, which is also called Gaur, from the province of which it is the capital, is now subject to the kingdom of Candahar; and Bamian, in the same province, must have shared the same fate. The latter city was remarkable for numerous images, and other monuments, carved in the adjacent mountains. Anderab is the chief city of Tokarestan; near a pass through the mountains of Hindoo Koh, strictly guarded by the khan of Balk. In the neighbourhood of this city were rich quarries of lapis lazuli.

BADAKSHAN is situate on the river Amu, or Harrat, and, in the last century, belonged to the khan of Samarcand; and, being secluded in a branch of the Belur Alps, was used as a state-prison for rivals or insurgents. Badakshan was small, but well-built and populous; and its inhabitants were enriched by the gold, silver, and rubies, found in the neighbourhood, and the grains of gold and silver abounding in the torrents, which descend from the mountains, when the snow melts in the beginning of summer. Several caravans, for Little Bucharia and China, pass by this city; but others prefer the route by Little Tibet, on the eastern side of the mountains.

*Antiquities.*] These consist of the ruins of edifices, erected by Zinghis Khan, Tamerlane, and their successors. Remains of ditches and ramparts are frequently met with, which either surrounded small towns, now quite demolished, or were designed for the defence of camps, forts, or castles, the vestiges of which are often to be

discovered. Many of them are still in tolerable preservation. In the uncultivated tracts, occupied by the Kirguses, are many relics of opulent cities. Some gold and silver coins have likewise been found, with several manuscripts, neatly written, which have been carried to Petersburg. In 1720, there was found in Kalmie Tartary a subterraneous house of stone, some urns, lamps, and earrings, an equestrian statue, an image of an oriental prince, with a diadem on his head, two women seated on thrones, and a roll of manuscripts, which was sent by Peter the Great to the Academy of Inscriptions at Paris, and proved to be in the language of Tibet.

*Religion.*] The religion of almost all the Tartars of these countries is the Mahometan, according to the tenets of the sect of the Sunnis.

*Learning.*] The reader may be surprised to find this article in an account of the Tartars; yet nothing is more certain, than that, under Zinghis Khan and Tamerlane, and their early descendants, Astracan, and the neighbouring countries, were the seats of learning and politeness, as well as of empire and magnificence. Modern luxury falls short of that exhibited by those princes; and some remains of their taste in architecture are still extant, but in spots so desolate, that they are almost inaccessible. The encouragement of learning was the first care of the prince, and it was generally cultivated by his principal grandees. They wrote in the Persian and Arabic tongues. The name of Ulug Beig, the grandson of the great Tamerlane, is well known to astronomers; and Abulgazi, the khan of Kharism, wrote the history of his country. Samarcand was a celebrated university for eastern science; and, even in the last century, was still a flourishing school for Mahometan literature.

*Government.*] Each horde of these Tartars has its particular khan, except the middle, which has what they call a sultan, who was subordinate to the khan of the lesser horde, and whose election was confirmed by the Russian government.

Their laws are few, but founded on the Koran and the usages of their ancestors. Starchans, or elders, are set over the ulusses, and the khan's decision is the last appeal. A murderer, for two years after the commission of the crime, is at the mercy of the relations of the person slain; who, if they can lay hold of him in that time, may put him to death; if he escapes, and is inclined to return home, he may purchase that permission, by paying a hundred horses, a slave, and two camels, to the family of the deceased. In lieu of horses, he may give sheep, five sheep being equivalent to one horse. He that kills a woman, an infant, or a slave, pays half the foregoing fine, as, also, any one that makes a woman miscarry; but, in all these cases, the relations and friends of the culprit endeavour to make as good a bargain as they can with the injured party, who

generally remits a part of the penalty. Maiming a man is reckoned as half-murder. For a thumb cut off, the criminal pays a hundred sheep; the little finger is valued at twenty. The loss of the ears is such an abomination, that a man without them, though he should have lost them in the most innocent manner, would not be endured. Whoever commits a robbery on his countrymen, restores nine times the value. None are allowed to take an oath in their own cause; and, if the accused can get no brother or friend to swear for him, he is proceeded against as guilty.

*Trade.*] The Kirguses trade with the Russians, and exchange their horses, cattle, and sheep, for manufactures, principally clothing and furniture. Arms, of every kind, are refused them by the Russians; and, therefore, they procure them, by barter, from Great Bucharia, and the southern parts of the country.

*Customs, Manners, &c.*] The Kirguses, who inhabit the northern part of this country, live in tents, and lead a wandering life. They consist of three hordes, called the great, lesser, and middle horde, each of which has its particular khan. They reside also in portable huts, which they remove, from time to time, to different places in search of pasturage for their flocks and herds. They have horses, camels, cattle, sheep, and goats; and, it is asserted, that some individuals, in the middle horde, have ten thousand horses, three hundred camels, three or four thousand cattle, twenty thousand sheep, and more than two thousand goats. They have flat noses, small eyes, a sharp, but not a fierce look, and a frank and prepossessing air. The decoration of their horses employs them almost as much as that of their persons; they have generally elegant saddles, handsome housings, and ornamented bridles. They are great eaters; and men, women, and children, all smoke, and take snuff, the latter of which they keep in little horns fastened to their girdles. The wealthy and indigent live perfectly in the same manner, and are distinguished only by the train that accompanies them in their cavalcades, and the number of huts that surround their quarters.

They take as many wives as they can steal or pay for; "and many," says Tooke, "keep concubines, who are treated, in every respect, like wives, their children also being reputed legitimate. The moderate price for a marriageable girl, to be taken as a first wife, is about fifty horses, twenty cows, a hundred sheep, or a few camels, or else, a slave, with a cuirass, or coat of mail. The poorer sort find wives at a cheaper rate, and the rich pay much dearer. The second wife of a married man costs much more than the first, and the third and following still more. Common people, of course, are obliged to be contented with one wife, and think themselves very well off if they can get that one, as they are often under the necessity of stealing

a nunnery.

"The religion of Tibet," says Mr. Turner, "seems to  
be the schismatical offspring of that of the Hindoos, de-  
riving its origin from one of the followers of that faith,  
a disciple of Boodh, who first branched the doctrine  
which now prevails over the wide extent of Tartary. It  
is reported to have received its earliest admission into that  
part of Tibet bordering upon India, which, from hence,  
became the seat of the sovereign lamas; to have traversed  
over Mandschur Tartary, and to have been ultimately dis-  
seminated over China and Japan. Though it differs from  
the Hindoo in many of its outward forms, yet it still bears  
a very close affinity to the religion of Brahma, in many  
important particulars.

"The same places of popular esteem, or religious re-  
sout, are equally respected in Tibet and in Bengal: Praag,  
Cashi, Dergeen, Sangor, and Juggernaut, are objects  
of devout pilgrimage; and I have seen loads of the sacred  
water, taken from the Ganges, travelling over the moun-  
tains, upon the shoulders of men, whom enthusiasts have  
deemed it worth their while to hire, at a considerable ex-  
pence, for so pious a purpose.

"As far as I am able to judge respecting their ritual  
or ceremonial, however, it differs materially from that of  
the Hindoos. The Tibetians assemble in chapels, and  
unite together, in prodigious numbers, to perform their  
religious service, which they chant in alternate recitative  
and chorus, accompanied by an extensive band of loud  
and powerful instruments; so that, whenever I heard these  
congregations, they forcibly called to my recollection a Ro-  
man Catholic mass.

*Manufactures and Commerce.*] The principal manu-  
factures of Tibet are shawls and woollen cloths. The ex-  
ports, which go chiefly to China and Bengal, consist of  
gold-dust, diamonds, pearls, coral, musk, rock-salt, tin-  
cal, woollen cloths, and lamb-skins; in return for which  
are imported, from China, silks, satins, gold and silver  
brocades, tea, tobacco, and furs, of various kinds; and,  
from Bengal, the productions of that country, and a va-  
riety of English commodities and manufactures.

*Language and Literature.*] The language of Tibet is  
as the same as that spoken on the western frontiers of China.  
The literature is chiefly of the religious kind; the books  
being sometimes printed with blocks of wood, on narrow  
slips of paper, fabricated from the fibrous root of a small  
shrub. In this practice the Tibetians resemble the Chi-  
nese; while the Hindoos engrave their works, with a steel  
stylus, upon the recent leaves of the palm-tree, afford-  
ing a fibrous substance, which seems indestructible by  
vermin. The printed and formal letters are called the  
*uchen*; while those of business and correspondence are  
styled *umin*. The Tibetians appear to have made consi-  
derable progress in civilization; but the sciences continue  
in a state of imperfection.

*Customs, Manners, &c.*] The Tibetians are of shorter  
stature than their southern neighbours, and of a less ro-  
bust make; their complexions, also, are fairer, and some  
of them have even a ruddiness in their countenances, which  
is unknown in the other climates of the east. Mr. Boyle  
observes, that they are of a mild and cheerful temper, and  
that the higher ranks are polite and entertaining in conver-  
sation, in which, however, they never mix any flattery or  
fulsome compliments.

The common people are generally dressed in coarse  
woollen stuffs, of their own manufacture, lined with such  
skins as they can procure; but the higher orders wear Eu-  
ropean cloth, or China silk, lined with the finest Siberian  
furs. The Dalai Lama is usually clothed in a napped kind  
of red woollen stuff, with a yellow cap, and a sort of tiara,  
resembling a bishop's mitre.

Their chief food is the milk of their cattle, prepared in-  
to cheese or butter, or mixed with the flour of a coarse  
barley, which is the only grain their sterile soil produces.  
They have no want, however, of animal food, and are well  
furnished with rice and wheat from the adjacent countries.

Polygamy, at least in our acceptance of the word, is  
not practised in Tibet; but it exists in a manner more re-  
pugnant to European ideas. It consists in a plurality  
of husbands, which is firmly established by law; and de-  
grees of consanguinity are not considered as any obstacle  
to the marriage. A woman, for example, may marry all  
the brothers of one family, and her children are divided  
among them. Notwithstanding such brothers having one  
wife in common, they generally live in great harmony with  
her, though little dissensions will sometimes arise.

The Tibetians expose their dead bodies within walled  
areas, which are left open at the top, and have passages  
at the bottom, to admit birds, dogs, and beasts of prey:  
no other funeral-rites are performed, but such as tend to  
facilitate the destruction of the body by the voracious ani-  
mals, which seem invited to devour it. Some bodies are  
conveyed, by the friends of the deceased, to the summit  
of some neighbouring hill, where they are disjointed and  
mangled, that they may become a more easy prey to car-  
nivorous birds. The bodies of the sovereign lamas are,  
however, deposited in shrines, which are ever considered  
as sacred: those of the inferior priests are burnt, and their  
ashes preserved in little hollow images of metal.

*History.*] The temporal government of Tibet has not  
been always in the possession of the lamas: as it appears  
that, in the year 1624, the country was governed by a se-  
2 M

cular sovereign, named Tsang-pa-nan, who was a zealous protector of the Christian religion, and seemed greatly inclined to embrace it. The Tartar history of the same period corroborates this circumstance; for it relates, that this prince despised the lamas, and sought every opportunity to destroy their religion. The Dalai Lama, being highly incensed at not receiving the homage of Tsang-pa-nan, formed a league with the Tartars of Kokonor, who, under a prince, named Kouchi, entered Tibet, at the head of a powerful army, attacked Tsang-pa-nan, defeated him, and took him prisoner, and, some time after, caused him to be put to death. To this Tartar prince the Dalai Lama was indebted for his sovereignty over all Tibet; for, far from appropriating to himself the fruits of his victory, Kouchi declared himself a vassal of the supreme chief of his religion, and satisfied with receiving from him the title of khan, which he had never before enjoyed. This prince, to continue his protection to the Dalai Lama, and secure to him the undisturbed possession of his new acquisitions, fixed his residence in the neighbourhood of Lassa. His sons had no great inclination to return to a country which their father had abandoned, but followed his example, and remained in Tibet.

In 1642, the Dalai Lama sent ambassadors to Tsongte, father to the first emperor of the present dynasty of the Mandshur Tartars, threw himself under his protection, and paid him tribute. Ten years after, the Dalai Lama himself went to Peking, and did homage to the emperor; he was loaded with honours, received a golden seal and magnificent presents from the emperor, and was confirmed in his title of Dalai Lama.

In 1693, the emperor Kanghi, being desirous of honouring the tyra, or minister of the Dalai Lama, declared him a prince, and granted him a golden seal. This minister, however, was far from being faithful to the interests of the emperor; he, on the contrary, secretly betrayed them to the ambitious views of Kaldan, the chief of the Eluts, who was the declared enemy of the Mandshur Tartars. He even endeavoured to persuade the grand lama not to go to Peking, when called thither by the emperor; and, when the Dalai Lama died, he concealed his death. At length, however, all these intrigues were discovered, in 1705 and the chief of the Tartars of Kokonor caused this perfidious minister to be put to death. Kanghi, informed of the crimes which he had committed, approved of the punishment inflicted on him, and sent some of the grandees of his court to Tibet, to govern that country in conjunction with the Tartar prince, on whom he lavished many rich presents. He afterwards appointed a new Dalai Lama, who was the sixth who had borne that title.

In 1714, Tchongkar, chief of the Eluts, made an irruption into Tibet, and carried away a great quantity of

gold, silver, precious stones, silks, and other valuable things. The Tartar prince, who endeavoured to resist the invaders, was killed in battle, many of the lamas were put to the sword, and the monastery at Pootala was reduced to ashes. The Dalai Lama made application to the court of China for succours, and the emperor immediately sent a powerful army to his assistance, which drove the Eluts out of the country, re-established the Dalai Lama in his authority, and reinstated the other lamas in their pagodas or monasteries.

In 1702, the mountaineers of Nipaul invaded and ravaged Tibet, plundering the monasteries of their treasures, and robbing the mausolea of their lamas. The emperor of China, however, as soon as he had received information of this attack, sent an army to protect and avenge the lama. The Nipalese were defeated, and could only obtain peace on condition of becoming tributary to China, and making a full restitution of all the plunder they had carried off. The Chinese, at the same time, established military posts on the frontiers of Tibet, which prevent all communication between that country and Bengal, as the Chinese guard them with their accustomed jealousy and caution, and the approach of strangers, even of the natives of Bengal and Hindoostan, is strictly prohibited.

### SECTION III.

#### INDEPENDENT TARTARY.

*Situation, Extent, and Boundaries.*] Independent Tartary is situate between thirty-one and fifty-two degrees of north latitude, and between fifty-five and seventy degrees of east longitude; being about fifteen hundred miles in length, and eight hundred and fifty in breadth; and it is computed to contain a surface of five hundred thousand square miles. It is bounded by Asiatic Russia, on the north; by the mountains of Belur, on the east; by Persia and Hindoostan, on the south; and by the Caspian Sea and the Uralian Mountains, on the west.

*Divisions.*] Independent Tartary consists of extensive tracts, inhabited by the Kirghisian Tartars; the country of Kharism, and Great Bucharia, inhabited by the Usbec Tartars. Great Bucharia is divided into the provinces of Fergana, Sogd, Vash, Kottan, Balk, Gaur, and Khilan.

*Climate, Soil, &c.*] The climate is moderate, the heat, even of the southern provinces, being tempered by the high mountains, capped with perpetual snow. The face of the country presents a great variety; but, though there are numerous rivers, hills, and mountains, there seems to be a deficiency of wood. Near the rivers, the soil is so exuberant, that the grass sometimes exceeds the height of a man; and, in some parts, industry is shewn in the cultivation of rice and other grain.

*Rivers, Lakes, &c.*] The chief rivers of Independent Tartary are the Amu and the Sirr. The former is the ancient Oxus, and, near its source, is called the Harrat. The Amu rises in the mountains of Belur, more than two hundred British miles north-east from Badakshan. The whole course of this noble river surpasses that of the Tigris, being, probably, not less than nine hundred miles. It abounds with fish, of various sorts.

Besides numerous tributary streams, three remarkable rivers join the Amu; the Sogd, or river of Samarcand; the Morgab; and the Kizil Daria, or Red River, the longest and most considerable stream, and of which a branch seems to flow, apart, into the Aral.

The Sirr, or river of Shash, also rises in the mountains of Belur, and falls into the eastern side of the sea of Aral, after a course of about five hundred and fifty miles. The course of the Sirr is chiefly through the desert of Burzuk; and it is doubtful if it be joined by the Sarasu, a large river from the north; so imperfect is the geography of these regions.

The most considerable lake is the Sea of Aral. If this lake ever joined the Caspian, it was probably only by a strait, as between them are plains of great elevation, and, according to some, even mountains; but there may have been a strait in the direction of a salt-lake to the north-east of Port Iscander. The lake Tengis Palkati is near a hundred and forty British miles in length, by half that breadth, being the largest lake in Asia, after the seas of Aral and Baikal. The lakes in the country of the Kirguses are of less importance.

*Mountains.*] The mountains of Belur exhibit a grand Alpine chain, perpetually covered with snow. The chief branches proceed towards the west; for on the east is the high central plain of Asia, full of deserts. The chain of Belur, the ancient Imaus, proceeds nearly north and south, and is continued by the mountains of Alak, on the north of Little Bucharja, which joins the great Bogdo, the highest mountain in central Asia.

*Minerals.*] In the south-east of Independent Tartary, the mountains contain gold, silver, and a peculiar production, called the *balay*, or pale rose-coloured ruby; also lapis lazuli. In the tenth century, before the native industry had expired under long oppression, Fergana produced sal ammoniac, vitriol, iron, copper, gold, and torquoises. In the mountain of Zarka there were springs of naphtha and bitumen, and a stone that takes fire and burns much like coal. In the country of Setrushteh, D'Anville's Orushna, there was a cavern, whence a vapour arose, which, in the night, seemed fiery, and from which sal ammoniac was procured.

*Cities, &c.*] SAMARCAND, the capital of Great Bucharja, is situate on the southern bank of the river Sogd, which, at the distance of above a hundred miles, after

washing the walls of Bokhara, passes through a considerable lake, and is supposed to join the Oxus, or Amu.

We have not any recent account of this once-celebrated capital; but it seems greatly to have declined since the time of Tamerlane. At the beginning of the last century, Samarcand was fortified with ramparts of turf, the houses being mostly constructed of hardened clay, though some were of stone, from quarries in the neighbourhood. The khan of great Bucharja commonly encamped in the adjacent meadows, the castle being almost ruinous. The rich vale of Sogd produced such abundance of exquisite grapes, melons, pears, and apples, that they were sent to Persia, and even to Hindoostan.

BOKHARA, when resorted to by the English agents, in 1741, was represented as an extensive and populous town, standing on a rising ground, with a slender wall of earth; the houses, in general, were constructed of clay, but the mosques of brick. The inhabitants manufactured soap and calico, and the chief products were cotton, rice, and cattle. They received rhubarb and musk from the Kalmucs; and, from Badakshan, lapis lazuli, and other precious stones. There was gold and copper coin; and, after Nadir Shah took this city, the Persian and Indian silver became common. The inhabitants were civilized, but perfidious. In the tenth century, it was distinguished by the manufacture of fine linen.

ZOUF, which is also called Gaur, from the province of which it is the capital, is now subject to the kingdom of Candahar; and Bamian, in the same province, must have shared the same fate. The latter city was remarkable for numerous images, and other monuments, carved in the adjacent mountains. Andcrab is the chief city of Tokarestan; near a pass through the mountains of Hindoo Koh, strictly guarded by the khan of Balk. In the neighbourhood of this city were rich quarries of lapis lazuli.

BADAKSHAN is situate on the river Amu, or Harrat, and, in the last century, belonged to the khan of Samarcand; and, being secluded in a branch of the Belur Alps, was used as a state-prison for rivals or insurgents. Badakshan was small, but well-built and populous; and its inhabitants were enriched by the gold, silver, and rubies, found in the neighbourhood, and the grains of gold and silver abounding in the torrents, which descend from the mountains, when the snow melts in the beginning of summer. Several caravans, for Little Bucharja and China, pass by this city; but others prefer the route by Little Tibet, on the eastern side of the mountains.

*Antiquities.*] These consist of the ruins of edifices, erected by Zinghis Khan, Tamerlane, and their successors. Remains of ditches and ramparts are frequently met with, which either surrounded small towns, now quite demolished, or were designed for the defence of camps, forts, or castles, the vestiges of which are often to be

discovered. Many of them are still in tolerable preservation. In the uncultivated tracts, occupied by the Kirguses, are many relics of opulent cities. Some gold and silver coins have likewise been found, with several manuscripts, neatly written, which have been carried to Petersburg. In 1720, there was found in Kalnue Tartary a subterraneous house of stone, some urns, lamps, and earrings, an equestrian statue, an image of an oriental prince, with a diadem on his head, two women seated on thrones, and a roll of manuscripts, which was sent by Peter the Great to the Academy of Inscriptions at Paris, and proved to be in the language of Tibet.

*Religion.*] The religion of almost all the Tartars of these countries is the Mahometan, according to the tenets of the sect of the Sunnis.

*Learning.*] The reader may be surprised to find this article in an account of the Tartars; yet nothing is more certain, than that, under Zinghis Khan and Tamerlane, and their early descendants, Astracan, and the neighbouring countries, were the seats of learning and politeness, as well as of empire and magnificence. Modern luxury falls short of that exhibited by those princes; and some remains of their taste in architecture are still extant, but in spots so desolate, that they are almost inaccessible. The encouragement of learning was the first care of the prince, and it was generally cultivated by his principal grantees. They wrote in the Persian and Arabic tongues. The name of Ulug Beig, the grandson of the great Tamerlane, is well known to astronomers; and Abulgazi, the khan of Kharism, wrote the history of his country. Samarcand was a celebrated university for eastern science; and, even in the last century, was still a flourishing school for Mahometan literature.

*Government.*] Each horde of these Tartars has its particular khan, except the middle, which has what they call a sultan, who was subordinate to the khan of the lesser horde, and whose election was confirmed by the Russian government.

Their laws are few, but founded on the Koran and the usages of their ancestors. Starchans, or elders, are set over the ulusses, and the khan's decision is the last appeal. A murderer, for two years after the commission of the crime, is at the mercy of the relations of the person slain; who, if they can lay hold of him in that time, may put him to death; if he escapes, and is inclined to return home, he may purchase that permission, by paying a hundred horses, a slave, and two camels, to the family of the deceased. In lieu of horses, he may give sheep, five sheep being equivalent to one horse. He that kills a woman, an infant, or a slave, pays half the foregoing fine, as, also, any one that makes a woman miscarry; but, in all these cases, the relations and friends of the culprit endeavour to make as good a bargain as they can with the injured party, who

generally remits a part of the penalty. Maiming a man is reckoned as half-murder. For a thumb cut off, the criminal pays a hundred sheep; the little finger is valued at twenty. The loss of the ears is such an abomination, that a man without them, though he should have lost them in the most innocent manner, would not be endured. Whoever commits a robbery on his countrymen, restores nine times the value. None are allowed to take an oath in their own cause; and, if the accused can get no brother or friend to swear for him, he is proceeded against as guilty.

*Trade.*] The Kirguses trade with the Russians, and exchange their horses, cattle, and sheep, for manufactures, principally clothing and furniture. Arms, of every kind, are refused them by the Russians; and, therefore, they procure them, by barter, from Great Bucharia, and the southern parts of the country.

*Customs, Manners, &c.*] The Kirguses, who inhabit the northern part of this country, live in tents, and lead a wandering life. They consist of three hordes, called the great, lesser, and middle horde, each of which has its particular khan. They reside also in portable huts, which they remove, from time to time, to different places in search of pasturage for their flocks and herds. They have horses, camels, cattle, sheep, and goats; and, it is asserted, that some individuals, in the middle horde, have ten thousand horses, three hundred camels, three or four thousand cattle, twenty thousand sheep, and more than two thousand goats. They have flat noses, small eyes, a sharp, but not a fierce look, and a frank and prepossessing air. The decoration of their horses employs them almost as much as that of their persons; they have generally elegant saddles, handsome housings, and ornamented bridles. They are great eaters; and men, women, and children, all smoke, and take snuff, the latter of which they keep in little horns fastened to their girdles. The wealthy and indigent live perfectly in the same manner, and are distinguished only by the train that accompanies them in their cavalcades, and the number of huts that surround their quarters.

They take as many wives as they can steal or pay for. "and many," says Tooke, "keep concubines, who are treated, in every respect, like wives, their children also being reputed legitimate. The moderate price for a marriageable girl, to be taken as a first wife, is about fifty horses, twenty cows, a hundred sheep, or a few camels, or else, a slave, with a cuirass, or coat of mail. The poorer sort find wives at a cheaper rate, and the rich pay much dearer. The second wife of a married man costs much more than the first, and the third and following still more. Common people, of course, are obliged to be contented with one wife, and think themselves very well off if they can get that one, as they are often under the necessity of stealing

her from some of the neighbouring nations. The Kalmuc women are the most sought after by the Kirguses, conceiving that nature has endowed them with singular advantages, and that they preserve the marks of youth longer than the women of other nations; inasmuch that the rich are very willing to marry them, if they can be prevailed on to embrace Muhometanism: on the contrary, they hold the Persian women in so little estimation, that they give such as they take in marriage to their slaves. The espousals consist in a public declaration of the agreement made between the contracting parties, and then a priest repeats a prayer. The evening before, a woman is sent for to shave off part of the bride's hair, and, on the day of marriage, she is carried in a carpet to the bridegroom's tent, and the wedding celebrated in a hut built on purpose by the bride's father.

Previous to consummation, also, the girl is carried about on a carpet to her companions, to take leave of them, in which ceremony she is attended by several others, singing all the way. The rejoicings usually continue for several days, during which nothing is thought of but eating and drinking, dancing, singing, chatting, wrestling, horse-racing, and shooting at a mark. At the two last-mentioned diversions, considerable bets are made, and the new-married couple give prizes to the conquerors, of apparel, trinkets, and sometimes horses. On breaking up the festivities, the guests make presents of cattle and other things to the married pair. Such as have more than one wife, give each a separate *jourt*, or tent, where she brings up her children after her own inclinations. The more children they have, the happier they esteem themselves, and are the more honoured by their husbands; whilst such as prove barren are so little thought of, that the husband often makes them the servants of those who increase his family.

The Usbec Tartars, who inhabit the southern part of this country, resemble the other Tartarian tribes, except that they are in general more spirited and industrious. They are addicted to predatory warfare, and frequently make sudden incursions into the Persian provinces, on which occasions the women bear arms, and accompany their husbands to the field. Many of these Tartars reside in tents in the summer, but take up their abode in the towns and villages in winter. Those of Balk are the most civilized, and carry on a considerable trade with Persia and Hindoostan. The native Bucharians are of a fairer complexion than the Usbecs, and of a more peaceable disposition.

*History.*] Usbec Tartary was once the seat of a more powerful empire than that of Rome or Greece. It was not only the native country, but the favourite residence, of Zinghis Khan and Tamerlane, who enriched it with the spoils of India, and the eastern world.

The former, about the year 1200, made himself master

of those regions which form, at this day, the Asiatic part of the Russian empire; and his son, Batou Sagin, conquered southern Russia, and peopled it with Tartar colonies, which are now confounded or blended with the Russians. It was not until the time of Ivan III., who ascended the Russian throne in 1462, that the Russians were able to throw off the galling yoke of the Tartars. Ivan repeatedly defeated them, subdued the kingdom of Kasan, and other provinces, and made his name respected through all the neighbouring countries.

When the vast dominions of Zinghis Khan fell into pieces, under his successors, in the sixteenth century, the Mongul and Tartar borders, who had formed one empire, again separated, and have since continued distinct.

#### SECTION IV.

#### ASIATIC RUSSIA.

*Situation, Extent, and Boundaries.*] The Russian dominions in Asia are situate between thirty-seven and one hundred and ninety degrees of east longitude, and between fifty and seventy-eight degrees of north latitude, extending about five thousand three hundred miles in length, and one thousand eight hundred in breadth, and containing a surface of three millions six hundred and fifty thousand square miles. Its boundaries are the Asiatic Ocean, on the north; the seas of Kamtschatka and Ochotsk, on the east; Chinese and Independent Tartary, Persia, and Turkey, on the south; and Russia in Europe, on the west.

*Climate and Seasons.*] "In Asiatic Russia," says a modern geographer, "the climate extends from the vine at the bottom of Caucæus, to the solitary lichen on the rocks of the Arctic Ocean. Through the greater part of Siberia, the general climate may more justly be regarded as frigid than temperate; being, in three quarters of the country, on a level with that of Norway and Lapland, untempered by the gales of the Atlantic. To the south of the sea of Baikal the climate parallels that of Berlin and the North of Germany, so that the finest and most fertile regions in middle Asia belong to the Chinese. The chains of high mountains, which form the southern boundary of these provinces, also contribute to increase the cold; and the sea of Baikal is commonly entirely frozen from December till May. The finest climate in these eastern parts seems to be that of the province around Nershinsk. The change of the seasons is very rapid; the long winter is almost instantaneously succeeded by a warm spring, and the quickness and luxuriance of the vegetation exceed description."

*Face of the Country, Soil, and Agriculture.*] The northern and eastern parts of this region present vast marshy plains, covered with almost perpetual snow, and

# RUSSIAN EMPIRE.

permeated by enormous rivers, which, under masses of ice, pursue their dreary way to the Arctic Ocean. Even the central parts of Siberia seem destitute of trees, vegetation being checked by the severe cold of so extensive a continent. Towards the south there are vast forests. The sublime scenes around the sea of Baikal are agreeably contrasted with cultivated fields and gardens. Even in the south, the rivers have acquired the size of the Danube and the Rhine, and they are navigable, with safety, for a great extent.

Many parts of Siberia are totally incapable of agriculture; but in the southern and western districts the soil is remarkably fertile. In some parts barley yields more than twelve fold, and oats twenty fold. Black-wheat, in the black light mould, is apt to run into stalk, but, sown in the poorest spots, it yields from twelve to fifteen fold. Exclusive of winter-wheat, most of the usual European grains thrive in southern Siberia. The best rhubarb abounds on the banks of the Ural, or Jaik, in the southern districts, watered by the Yenissei, and in the mountains of Daouria.

*Rivers, Lakes, &c.* The chief rivers of this country are the Obi, the largest in the Russian empire, the length of its course being one thousand nine hundred miles; and the Yenissei, which has a course of about one thousand seven hundred and fifty miles. Both terminate in the Frozen Ocean. The other principal rivers are the Irtysh, which falls into the Obi; the Lena; the Angora, which falls into the Yenissei; the Argun, the boundary of the Russian and Chinese territory; the Selenga, and the Yaik.

In the southern parts of Siberia, near the confines of Chinese Tartary, is the lake of Baikal, three hundred and fifty miles long, and about fifty broad. It is encompassed on all sides by high mountains; and, in one part, it throws up an inflammable sulphureous liquid, which the neighbouring peasants burn in their lamps. Its water, at a distance, appears of a sea-green colour, but is perfectly fresh, and so clear that objects may be plainly seen at the depth of several fathoms. The neighbouring rustics call it the *Holy Lake*, and they imagine, that, when storms happen on it, they will be preserved from all danger by complimenting it with the title of *Sea*. When it is frozen over, people travel upon it in the road to China, but they must be very sharp shod, in order to tread safely on the ice, which is exceedingly smooth. Notwithstanding the ice is sometimes two ells thick, there are some open places in it, to which tempestuous winds will often drive the unfortunate passengers, who, in that case, must inevitably perish. This lake contains several small islands, and the borders are frequented by sables and civet-cats.

The Altai is another famous lake in Siberia, said to be ninety miles long, and fifty broad, with a rocky bottom; though some geographers assert, that it is only eighteen

miles long, and about twelve miles broad. These different calculations, however, may be accounted for; by considering, that the water of this lake, as well as of the rivers which run in through the adjacent places, only rises in the middle of summer, when the snows on the mountains are melted by the sun.

About ten miles from Nikuschkin is a remarkable sulphur lake, situated between two high mountains. It is an oblong basin, overgrown with birches, about four hundred and twenty feet long, and three hundred and forty broad. Its aspect is frightful, and its steek may be smelt at the distance of three miles. It has no perceptible motion, and never freezes. A visible thick vapour rises from its surface; yet the water is so clear, that its depth might be discerned, if it were not for the black and greasy soil which forms its border. Some attempts have been made to discover the origin of the sulphur; but these have all proved fruitless.

From the top of the neighbouring mountains issues a sulphureous spring, which runs down into the lake, and deposes a sediment, resembling a white and thick pulp. The continuation of this stream forms the remarkable river, called the White-Water River, which, as it proceeds from the lake, is about six feet deep, and between fourteen and twenty-eight feet broad. In this channel the water has the appearance of thin curds, but in some places the surface has a fine strain, like that seen upon limy waters; and all the matter which the water deposits is evidently mixed with limy particles.

Upon one of the Iuderskoi mountains is a large lake, which may be justly classed among the wonders of nature. Dr. Pallas observes, that it is apparently about ten miles in circumference, has many bays, and resembles an extensive plain, glittering with snow, and encompassed with heights, which seem to be above the level of the river Jaik. The water is so saturated with salt, that large cubic grains are constantly forming upon the shore, when not prevented by wet weather, and its borders seem to be literally sowed with salt. Indeed, from the constant evaporation of the lake, the surrounding earth is covered with a crust of salt, which is of a pure white, and, when broken, exhibits an extraordinary crystallization, in irregular bodies; and, underneath this crust, lies a loose grey salt, which the Cossacks gather in little waggons, and wash with salt water on the spot, till it loses its grey colour.

*Mountains.* The mountains of Asiatic Russia are the Uralian chain, which divides it from Russia in Europe; the mountains of Caucasus; those of Altai, called, by the Chinese, the Golden Ridge; and those of Nerzhinsk, or Russian Daouria.

*Animals.* These are camels, dromedaries, rein-deers, bisons, bears, wolves, and all other land and amphibious animals that are common in the northern parts of Europe.

The horses are hardy; but, as old, they are there is a horse, and some tall, under which he was shod or fry of them to a shod can into his carries them

parts of Europe.

The horses are of a good size for the saddle, and very hardy; but, as they run wild till they are five or six years old, they are generally very obstinate. Near Astracan there is a bird, called, by the Russians, babu, of a grey colour, and something larger than a swan: he has a broad tail, under which hangs a bag, that may contain a quart or more; he wades near the edge of a river, and, on seeing a shoal or fry of small fishes, spreads his wings, and drives them to a shallow, where he puts as many of them as he can into his bag, and then going ashore, he eats them, or carries them to his young.

The forests of Siberia are well stocked with a variety of animals, some of which are not to be found in other countries. These supply the inhabitants with clothes; and, at the same time, furnish them with commodities for an advantageous trade. Siberia may be considered as the native country of black foxes, sables, and ermines, the skins of which are superior to those of any part of the world.

*Metals and Minerals.*] Siberia contains mines of gold, silver, copper, iron, lead, jasper, and lapis lazuli. Asiatic Russia also produces sulphur, adam, sal ammoniac, vitriol, and nitre, in abundance.

*Natural Curiosities.*] Among these may be enumerated the extensive desert levels, called Stepps, which extend several hundred miles, with no appearance of a mountain, and scarcely of a hill. They contain, in some places, salt-lakes, and, in others, productive tracts, capable of cultivation.

On the borders of the river Sok is an asphaltos spring, on the steep declivity of a mountain, overman with birch trees, whose soil is a fat and black earth. This spring forms a reservoir, about a yard wide, which is not only constantly full, without any agitation, but also overflows, and forms a little brook. The water never freezes, even in the most rigorous season; and when it is covered with snow, the bituminous vapours soon make an opening, though the water possesses no extraordinary degree of warmth. The surface of this well is covered with a black asphaltos, which has the appearance and consistency of thick tar, and, as often as it is taken off, will gather again in a few days. The neighbouring peasants use this bituminous water as a remedy for all infections, and ulcerous complaints of the mouth and throat.

On the banks of the river Jurnsen, is a steep woody mountain: but on three of the highest parts are several bare reddish spots, which are constantly burning. On the eastern side, this mountain seems to be about a hundred fathoms in perpendicular height. It has burnt on this side only for the last three years, and that with less violence than in the middle height, the whole southern side being burnt out, for the subterraneous fires have existed almost twelve years. A Baskirian gave Dr. Pall-a the following account of this singular phenomenon: "About

eleven or twelve years ago, a tall pine-tree, that stood at the bottom of the middle part of the mountain, was fired by lightning, which consumed the very roots of the tree, and gradually penetrated the body of the mountain. Since that time it has burnt inwardly, without any interruption; but in such a manner that the fire has ceased at the bottom, and yet is far from having reached the top. The trees and bushes, which formerly covered the southern side, were all consumed to a considerable extent, and the fire also communicated to an adjacent spot, on the western side; but that is now extinguished, and the place is overgrown with a variety of plants."

The stone, of which this mountain consists, especially in the spots which are burnt out, is partly a reddish slate, and partly a soft stone, divided into thin layers, between which there seems to have been some other matter, now reduced to ashes. In many places is found a yellow ochre iron-stone; and, at the bottom of the eastern part, is a great quantity of red friable marble. The burning spots are full of large clefts, whence a hot vapour rises continually. During stormy and gloomy nights, red thin flames rise to a considerable height, but there is no sulphureous smell; the exhalation communicating no other sensation than a suffocating heat, like that which issues from a hot glowing oven after the embers have been cleared out. It is said, that no snow ever lies on this mountain, that the soil is always clothed with verdure, and that many of the plants which grow upon it may be seen in flower through the whole winter.

*Antiquities.*] At Kasimof, about a hundred and thirty miles from Moscow, are some handsome remains of Tartarian buildings, which ought to be preserved for the admiration of posterity. On an elevated spot in this neighbourhood stands a high circular tower of a ruined temple, composed of hewn free-stone, which appears to have been taken out of a quarry, at eight miles distance. Here, also, were a triumphal arch, with gothic ornaments and Arabic inscriptions, an oblong square-built mansion, and a mausoleum, near the common burial-ground. But the triumphal arch has been demolished and converted into a lime-kiln; and the mansion, supposed to have been the residence of a Tartarian prince, has likewise been levelled with the ground.

The mausoleum of the klans is an oblong square-sided building, composed of free-stone, and ornamented round the top with a cornice. The western end contains a small closet, which seems to have been designed for private devotion, according to the custom of the Mahometans; and the other part has a vault, with several tomb-stones. The length of the building, from east to west, is rather more than forty-seven English feet, the breadth, from north to south, about twenty-six, and the height near sixteen feet.

The great vault is about twenty-one feet wide, seventeen

broad, and twelve feet high. The northern wall has two windows, and the eastern wall but one, which seem to have been formerly grated with iron-bars. On the ground, within the walls, are eight hillocks, about seven feet long, and covered with stones. At the head of each was erected a tomb-stone, five or six feet high, shaped off at the top in an obtuse angle, and ornamented with flowers, stars, and Arabic inscriptions: but only two of these stoues are now standing.

On the eastern side of the village Bulgarian, are many curious pieces of antiquity: the most remarkable of which is a tower, about eighty-four feet high, built with hewn free-stone, and in tolerable preservation. It has a winding stair-case, consisting of seventy-two steps, each step twelve inches and three quarters high. The entrance is on the south, and has a strong iron hinge remaining, on which the door formerly hung.

At some distance, towards the south-west, stands a small square building, of free-stone, the vaulted roof of which is fallen in on one side. The entrance is in the west front, and on each side is a false window. This place is supposed to have been wholly devoted to purposes of devotion.

On the southern side of the village are some vestiges of a more extensive edifice, which the peasants call "the town-house." The square division of rooms appear, from their foundations, to have been entrances from without, but not to have had any communication with the central apartments, and, also, not to have been higher than the second story. There are three small rooms in the eastern front, two larger ones in the southern, and an oblong one in the western. In the northern corner is an oblong foundation, which touches the principal building only at its angle, and the northern front, where the entrance is, exhibits no appearance of side-rooms.

At the distance of about seven hundred feet is another ancient and strong built edifice, of remarkable architecture. Its northern part is built on a foundation of limestone, with large Tartarian bricks; its entrance is on the east; and in the side-walls are several apertures to admit the light. It is divided, by a cross wall, into a square antichamber, and an oblong saloon, the latter of which communicates with the principal part of the building. Its greatest space is divided into four closets, between which is a broad passage, built in the form of a cross, and lighted by a small window on each side, and an octagonal skylight in the roof. The corner closets are exactly square, and have their doors in the angle, leading into the cross passage. At the southern end of this building is an addition of three rooms, the smallest of which has no entrance nor opening, except a breach into the south-eastern corner of the centre building. Under this is a vault and a subterraneous passage from the southern wall; but, as a

part of the vault is broken in, a descent is rendered impracticable.

The district of the Beltirs, between the mountains and the low grounds of the Abakan, is covered with several old tombs and monuments, of an extraordinary size and appearance. Among these graves, which are surrounded with a square wall of granite rock, and paved within, like a flat earth hillock, are many stones, ornamented with human faces, roughly sculptured; and these, as well as other stone images on the stepps of the Jenisei, have been evidently erected long before the time of the Kirghese.

About a mile and a half above the habitation of the Beltir chief, stood two narrow stones, seven feet high, flat on both sides, and truncated; but these now lie along upon the ground. On the upper end of each is a rough representation of a human face; and on one of them are the figure of a dromedary, and a ghastly image of a child.

On the right edge of the stone, which the Beltirs call *Kusi Tasch*, or man-stone, is carved a man on horseback, with a lance before him; and a little higher is represented a bent bow and arrow. The figures on the opposite edge are rendered undistinguishable by the ravages of time; but on the top may be discerned a lance, with a triple flag, and, below these, are some square lines, and the representation of a boat.

At a considerable distance from these stones, on the west side of a large tomb, stands a piece of granite rock, about the height of a man, and edged in such a manner at the top, that its point and carved side turn eastward to the tomb. Near the point of this granite is a large female face, much more relieved than those on the other stones, but considerably worn and decayed by time; and, on the same side, are some square lines and carved figures. This piece of rock is known among the heathen Tartars of the district, by the name of "the big woman," and is frequently invoked for success in sable-hunting.

About a mile and a half higher up the Abakan is a monument, which Dr. Pallas pronounces the finest of all Siberian antiquities. This is a tomb, four fathoms high, and a hundred and fifty paces in circumference, raised upon an eminence, so as to be seen at a great distance. Four other tumuli, lying on the north-west and south-west, form a triangle with the great one; in the opening of which, three square-sided sand-stones are so placed, that their flat sides face the north and south, each stone standing about four feet from the other. On the edge of one of these is a very long but distinguishable face, which the Tartars call "the little woman;" and the flat side of the stone is ornamented with some drawings. A very large stone, standing on the west of the largest tumulus, has many figures on the south-side, which seem to be either Tartarian hieroglyphics or inscriptions.

It has been observed, that all the monuments about the

uments about the

Abakan are similar in their external appearance, and seem to have been tombs of the same nation. The only difference is, that some have the ground flat within the square walls, and others raised; but this may probably be a mere distinction of rank. The granite-stones, which border these graves lie along, with one edge upon the ground, none being placed upright, excepting those at the north-east, south-east, and south-west angles; in some of the graves, the space within the walls is divided into two or three parts, by rows of stones, one of which is generally larger and more elevated than the rest.

Professor Pallas tells us, that he ordered one of these tumuli to be opened; but no regular coffin was found, only a mixture of decayed bones of several bodies, which had been placed with the legs towards each other. These relics were found at the depth of four feet and a half, together with some broken pieces of earthen vessels, several large basins, and a bead, of a greenish enamelled substance.

*Cities, Chief Towns, &c.* ASTRACAN, situate on an island, formed by the river Volga, near its entrance into the Caspian Sea, is a large and populous city, containing about seventy thousand inhabitants. It is about a league in circumference, and surrounded by a wall. It contains twenty-five Russian churches, and two convents, and is the seat of a Greek bishop. The Armenians, Lutherans, Roman Catholics, and even the Hindoos, have also their places of worship.

ORENBURG, the capital of the government of Ufa, was built in 1738, by order of the empress Anne, at the conflux of the Or and Ural; but, that situation being found inconvenient, the inhabitants were removed, and the town built lower down on the Ural, in 1740. It is now a place of considerable trade.

Tomsk, the chief town of the province of that name, in the government of Tobolsk, is a place of considerable trade, and contains about two thousand houses, and eight thousand inhabitants. Yakutsk, which gives name to a province in the government of Irkutsk, stands on the river Lena; it contains about five or six hundred wooden houses, and is defended by a wooden fort.

Tobolsk, the capital of Siberia, is situate at the confluence of the Irtysh and the Tobol. It consists of two towns, called the upper and the lower town, and contains about fifteen thousand inhabitants. It has a tolerably strong fortress. To this city are sent the Russian state-prisoners, who are banished into Siberia.

Bolchetskoistrog, which has the title of capital of Kamschatka, and is the residence of the governor, contains about five hundred houses, pretty regularly built.

Irkutsk, the capital of the government of that name, situate on the Angara, near the lake Baikal, contains several churches, and other edifices, of stone, and about

twelve thousand inhabitants; it is also a place of considerable commerce, the caravans, which trade between Russia and China, passing through it.

*Religion.* The Grecian system of the Christian faith, which is embraced by the Russians, has made an inconsiderable progress in their Asiatic possessions. Many of the Tartar tribes, in the south-west, are Mahometans; and others follow the superstition of Dalai Lama: but the more eastern Tartars are generally addicted to a system chiefly founded on the self-existence of matter, a spiritual world, and the general restitution of all things. They even believe that the gods themselves arose from the general mass of matter and spirit. Their epochs of destruction and restitution somewhat resemble those of the Hindoos. While common souls immediately receive their final decree, the virtuous become wandering spirits, who are purified by transmigration, so as also to become gods. Between men and gods are the spirits of the air, who direct sublunary affairs, and all the trifles so important to man, but beneath the most remote attention of the gods. The infernal regions chiefly contain those who have offended the priesthood. This system is intimately connected with that of the Dalai Lama, and is so widely diffused, that some have asserted it to be the most prevalent system of the globe.

The archiepiscopal see of Tobolsk is the metropolitan of Asiatic Russia in the north, and that of Astracan in the south. There is another see, that of Irkutsk and Ner-shink, and perhaps a few others of recent foundation.

*Population.* The population of Siberia cannot be computed at above three millions and a half; so that Europe can, in future, have little to apprehend from the Tartaric swarms. Small Russian colonies have been established in several of the distant provinces and isles. The political importance and relations of this part of the Russian empire relate principally to China and Japan.

*Language and Literature.* The language of all these original nations are radically different; and, among the Tunguses, Monguls, and Tartars, there are some slight traces of literature: and not a few manuscripts in their several languages. The history of the Tartars, by Abulgasi, is a favourable specimen of Tartaric composition. The late emperor of China ordered many of the best Chinese works to be translated into the Mandshur language, which, having an alphabet, may be more easily acquired than the original. In the Mongul language there are also many books, written in the various countries to which their wide conquests extended.

*Manufactures and Commerce.* At Astracan there are manufactures of leather and isinglass; and a considerable trade is carried on in salt, produced, in great quantities, from the salt-lakes and marshes in the vicinity of the Caspian Sea; as also in fish, procured from the same sea.

The principal trade of Siberia is in furs, and other furs, which are purchased with avidity by the Chinese; who, in return, bring tea, silk, and other commodities.

The Tartar citizens of Kazan, Orenberg, and other governments, carry on commerce, exercise several trades, and have some manufactories. Their manner of dealing is chiefly by way of barter; coin is very rarely seen among them, and bills of exchange never. They are not, in general, very enterprising; but, as they extend their connections by partners and clerks, many of them carry on a great deal of business, which their parsimonious way of life renders very lucrative. At Kazan, they make a trade of preparing what is called, in England, Morocco leather. The villages of these people comprehend from ten to one hundred farms. Most of them also contain tanners, shoemakers, tailors, dyers, smiths, and carpenters.

*Customs, Manners, &c.* The inhabitants of Asiatic Russia are composed of many different nations, principally Tartar tribes, some of whom now live in fixed houses and villages, and pay tribute like other subjects. Formerly they were not admitted into the Russian armies, but of late years they have been found to make excellent soldiers. Other Russian Tartars retain their ancient habits, and live a wandering life. Both sides of the Volga are inhabited by Tchernises and Morduars, a peaceable and industrious people. The Bashkirs are likewise fixed inhabitants of the tract that reaches from Kazan to the frontiers of Siberia. The wandering Kalmucs occupy the rest of the tract to Astracan and the frontiers of the Usbeks; and, in consideration of certain presents, which they received from the sovereigns of Russia, they serve in their armies without pay, but are apt to plunder equally friends and foes.

The character of the Tartars of Kazan may serve for that of all the Mahometan Tartars. Few of them are tall; but they are generally straight and well-made, have small faces, with fresh complexions, and a sprightly and agreeable air. They are haughty, and jealous of their honour, but of very moderate capacity. They are sober and frugal, dexterous at mechanical trades, and fond of neatness. The Tartarian women are of a wholesome complexion, rather than handsome, and of a good constitution: from their earliest infancy they are accustomed to labour, retirement, and submission. The Tartars of Kazan take great care of the education of their children. Their youth are taught to read and write, and are instructed in the Arabic tongue, and the principles of their religion. Even the smallest village has its chapel, priest, and schoolmaster; though some of these priests and teachers are not much skilled in the Arabic language. The best Tartarian academies in the Russian empire are those of Kazan, Tobolsk, and Astracan, which are under the direction of the gagouts, or high-priests. It is not uncommon

to find small collections of historical anecdotes, in manuscript, in the huts of the peasants; and their merchants, besides what those little libraries contain, are pretty extensively acquainted with the history of their own people, and that of the circumjacent states. Such as choose to make a progress in theology, enter themselves into the schools of Bucharia, which are more complete than the others.

Of the Kalmuc Tartars, Mr. Tooke says, "They are, for the most part, raw-boned and stout; their visage is so flat, that the skull of a Kalmuc may easily be known from that of any other man. The eyes too are smaller, and the corners of them flatter, than among the Europeans; They have thick lips, a small nose, and a short chin; and their beard is scanty, and appears late. Their teeth are even and white, their complexion a reddish brown, and their knees always stand outwards, like a bow, which proceeds from their manner of sitting on their ankles, and their being almost constantly on horseback. The women are of the same shape and make with the men, only that their complexion is very clear, and of a wholesome white and red. According to some travellers, one might be led to suppose, that all the faces of the Kalmucs are deformed and frightful; but this is not the case. There are, among both sexes, many round and pleasant faces, some whose features are so regular, that they would not want admirers in any European city; though it seems a characteristic of this people, that the corners of their eyes and eye-brows have a slant direction, and the bridges of their noses are short and flat. Full-grown men have a strong and large beard, but they leave only a whisker turned up on their upper lip, and a tuft upon the under one. Old persons, and especially priests, leave a whisker, and let the hair grow over the corners of the mouth, on the lower lip, underneath the chin, and about the neck. The rest of the face is kept clear, by plucking it, and cutting it with scissors and rough knives."

The Kalmucs are remarkable for their hospitality, candour, and a certain gaiety which never leaves them; but they are charged with indolence, want of cleanliness, and knavery. A love of idleness, indeed, is common to all nations who lead an unlimited, careless, and pastoral life; but their filthiness may be ascribed, as in the lower classes of the French, more to their education and volatility than to sloth; for the Kalmuc women perform their domestic offices with great industry. As to their mental faculties, their knowledge is certainly much limited; but they have a good natural understanding, which might be easily cultivated and improved, if their way of living and natural sprightliness were not insuperable obstacles. Though generally choleric, they live in tolerable harmony among themselves, and are very sociable, wishing to share every thing that can be enjoyed, and never keeping any thing to

themselves alone. When eating, drinking, or smoking to-  
bacco, every one present must be a partaker; and if, for  
example, there should be but one tobacco-pipe, they must  
all use it by turns. If one be presented with tobacco,  
fruit, or other eatables, he will divide it with his friends,  
or those who are next him; or, if a family have made a  
provision of milk, to make brandy of, they will call in their  
neighbours to help to consume this blessing.

The dress of the common people seldom consists of  
any thing but sheep and other skins, and felts, which they  
throw over them in the rain, by way of cloak. The better  
class of men wear an upper garment, like that worn by  
the Poles, except the sleeves, which are close and narrow,  
and an under-garment, buttoned all the way down, and  
bound close to the body.

The women would be scarcely distinguished from the  
men, if it were not for their head-dress, and, in this, mar-  
ried women differ from the maidens. The heads of the  
men are commonly clipt close, leaving only a long tuft of  
hair behind, in the centre of the crown, which those of  
distinction generally braid into two or three tresses: the  
tribe of Torgouts wear, both summer and winter, a small  
round cap, bordered with fur: that of the Sjungorians  
commonly wear a summer-hat, covered with felt, just like  
those of the Chinese, except its being smaller, and having  
a flatter brim. All wear, upon the crown, a large spread-  
ing fringe, which hangs down under the cap. A Kalmuc's  
ears, like those of the Tartars, stand at a distance from  
his head, and the cap comes down to the root of the ears.

The hair of their boys is shorn from their infancy; but  
girls run about, like furies, with bewildered locks. At the  
age of ten or twelve, however, when a Kalmuc lady is  
marriageable, her hair is platted in as many tresses as she  
pleases, and wound round the head. When a girl is mar-  
ried, these tresses are undone, and the hair is braided into  
two large ones only, which hang down in tails over both  
shoulders. The ordinary class of women, whilst at work,  
put theirs into a linen bag. The caps of wives and maidens  
are partly the same, except that the lower class wear them  
only when they go out, or are well-dressed. It is a round  
flat cap, bordered with fur, and covers only the upper  
part of the head. Women of distinction wear higher  
caps, of a richer silk stuff, with a broad brim, turned up  
before and behind, and lined with black velvet. They seem  
fond of spreading, on the tops of their caps, a broad  
fringe, that hangs down on all sides. Ear-rings are uni-  
versally worn by the women.

The dwellings of the Kalmucs are like those huts, made  
of felts, common in all Asiatic regions, and well known  
in Russia; they are called *joints*. The skeleton of these  
felt huts consists first of wattled hurdles, formed, thirty  
inches thick, by seven or eight different pieces, seven feet  
long and five broad, placed one upon another, and fas-

tened together, in a kind of pannel, with willow rods; se-  
veral of these pannels are set up in a circular form, and  
joined at the ends with hair ropes, or bands, forming the  
circumference of the tent. The door is made in the same  
manner, but not so thick, and ornamented with a border:  
ropes serve instead of hinges, by tying the piece that  
forms the door to the hurdle next it. Three long willow  
poles are then set up, with a ring on the top, made of  
wicker, to form the roof; through which ring the ends of  
a great number of poles are put, the other end fixed in  
the hurdles below, and fastened with strings. This being  
neatly executed, the whole is painted red. The skeleton,  
now completed, is covered with felts, or a cloth made of  
wool, united without weaving, large enough to cover it, and  
fastened on with cords wound round it. In winter, all is  
closed; but, in summer, the sides are left open, by throw-  
ing aside the covering. In very cold weather, they lay  
over the whole tent an additional covering of felts and  
mats, binding them on as before. The part within the  
ring at the top is left open for a chimney; but, as a shel-  
ter from the wind and rain, some cross circular pieces  
are fixed over it, on which they occasionally throw a felt,  
on the windward side, and, when the fire is burnt out  
within, they cover the whole aperture, to keep the hut  
warm.

Domestic labour falls exclusively upon the women; the  
men taking no other pains than to build and repair their  
tents, the rest of their time being spent in hunting, at-  
tending their flocks, or in idleness or amusement. It is  
the women's business to milk the cattle, mares, and ewes,  
and prepare the hides, to do the needle-work, and every  
other domestic occupation. They also knead, with their  
hands, camel, horse, and cow dung; make flat cakes of the  
composition, and dry them in the wind for fuel. When  
the master of a house means to go abroad, it is the duty  
of his wife to saddle his horse, and bring him to the door.  
In short, the women have so much to do, that they are  
seldom seen idle.

They have commonly more horses than horned cattle,  
and mares' milk is what they like best, for, being made  
sour, it contains such a spirit, that, if a person drink two  
or three of their large bowls full, it will almost intoxicate  
him. The ewes and mares will not give any milk, unless  
the calf or colt be present: on this account, colts and  
calves are kept almost the whole day about the tents, staked  
down to a particular spot of ground with long ropes, and  
are suffered to suck only at night. Their mothers will  
feed, naturally, not far from them; of course, they have  
them always at hand. They milk the mares every hour,  
and each yields about the seventh part of a gallon, or a  
moderate bottle full of milk; but the cows are milked only  
twice or three times a-day. Before milking, the mother  
is led to its young one; and, as soon as it begins to suck,

some one pushes it away, and the milk flows freely; with the cows, it is sufficient to shew them their calves, and, should they die in the birth or afterwards, they will stuff the skins, and tie them up among the rest, in order to shew them to the cows in milking-time; but the mares are not so simple, and they are under a necessity of acting cautiously with these, lest it should make them stubborn, and refuse their milk entirely.

Fresh mares' milk is much more fluid than the milk of cows, but, on account of a little alkaline taste, is not so pleasant; yet, if they turn it with cleanliness, it has a more delicate vinous flavour. It yields hardly any cream; of course, it is not fit for butter, but it is richer in fermenting particles. In winter, when they have but little mares' milk, they content themselves with cows' milk, which is much less spirituous, and, when turned sour, has a more disagreeable taste. In order to turn the milk, they pour it gradually into large vessels, which, in winter-time, are set near the fire, either above or under ground. As they distil a spirit from this sour milk, they sometimes turn it with a little of this spirit, if they have any, or can borrow it from their neighbours, and sometimes with a little of the sour milk which they find in the stomachs of the lambs they kill. Milk designed for distillation they do not take any cream from, but beat it about now and then with a stick, as they do in making butter; or, as the milk is collected in summer in leathern bottles, they shake it well twice a day; and this will turn it.

They make a kind of cheese from ewes' milk, which they eat, in winter, with butter. Indeed, this is the only use they make of ewes' milk, deeming it unfit for distillation. To make butter from cows' milk, they boil it well, turn it sour in the course of one day, beat it with a butter-staff, and pour it into a bowl, when the oil of the butter will swim on the surface, which they skim off, and keep in leathern vessels.

The Kalmucs are never at a loss for meat in the summer, as they can procure it in abundance, either by hunting, or from such of their cattle as die a natural or accidental death; but they rarely slaughter their own cattle. Badgers, marmots, and rats, are their peculiar dainties. They account the beaver, also, to be wholesome food, unless it be too fat. Besides these animals, they eat wild horses, wild goats, wild boars, and all sorts of birds, even the largest bird of prey; yet they abhor the flesh of wolves, saying it is bitter. When they have plenty of meat, in summer, they will cut it into narrow slices, dry it in the sun, or, in rainy weather, over a smoking fire, within their tents, and lay it up for winter and travelling provisions. "Even the chiefs and first people among them," says Mr. Tooke, "will feed upon cattle that have died of distemper and age, and, let the flesh stink ever so much, they will eat it without disgust. For this reason, in every horde,

the flesh-market has the appearance of a lay-stall of carion. Bread and groats they purchase from the Russians; for, as they eat but little, they seldom cultivate any land, or sow any corn. There are certain roots, also, which they eat, as the knots of the sage-tree, which they call *hodmon*. After drying it, and reducing it to powder, they boil it into a pulp with milk. They eat, also, the chichling-vetch, which they boil with their meat; and also the roots of a sort of sun-flower. Instead of tea, which they boil in the Mongolian fashion, with milk and butter, the common people gather, on the deserts, a kind of small liquorice, which they boil with salt and milk; they are great lovers of mead and braudy; and both sexes smoke tobacco at an enormous rate.

Besides the profession of arms and the care of their flocks, it is the department of the men to assist in manufacturing their felts. Having sheered their sheep in spring and summer, with sharp knives, they spread the wool out on an old felt, or mat, on which it is well-beaten, by ten or twelve persons sitting round it, till all the dust is out. It is then equally spread upon a felt, the exact size of the one that is to be made, and, in spots where they want to vary it in colour, they place, over the first layer of wool, died wool of those colours. This done, they carefully roll up the whole together, and tie it tight with hair-cords, then all the people present sit down in two rows, opposite to each other, take the rolled felt between them, and raise it to their knees, throwing it from their knees again on the ground with all their strength, and continuing this for some hours. This unites the wool into a body; and, when they think it is sufficiently matted, they unroll it, and repair, with the hand, any defects that appear in it.

The principal arms of the Kalmucs are lances, arrows, and bows; the latter are made of different kinds of wood, but chiefly of the plane-tree. They have a variety of arrows, some short, made wholly with wood, with a knob at the end; with these they kill small animals and birds; others are light, with small points; and some, intended for war, have a strong iron point. All these arrows are winged with feathers, taken from the tail of the eagle, as the wing-feathers are apt to carry the arrow out of its direction. They are contained in certain divisions in a quiver, and hung on the right side of the saddle; the bow, in a scabbard on the left side. The more opulent Kalmucs have fire-arms. Such as are well-armed wear breast-harness, like those of the oriental nations, consisting of net-work, made of iron and steel rings, which they get in barter for their horses. Their full armour consists of a round helmet, with an iron net-work, that hangs down round the neck upon the shoulders, but only as low as the eye-brows on the face; a coat of mail, with sleeves to the wrist, covering the back of the hand, with a slip fastened be-

tween the fingers; and two arm-harnesses, extending from the elbow to the wrist, and buckled on the outside of the arm.

The iron-work used for their arms is made among themselves. There are also a kind of petty jewellers among them, who make ornaments for the women, and embellish tea-pots with silver figures of animals and hoops. Their tools are very simple. Their bellows consists of a leather bag, with a pipe, fixed between two boards, which they extend and press together.

Many of the Kalmucs betroth their children, not only in their earliest infancy, but even before they are born: this betrothing is, however, conditional, that such a one has a boy, and such a one a girl. The young couple are united at fourteen years of age, or later. Prior to the wedding, the bridegroom agrees with the girl's father, as to the portion he is to have with her, which consists in a certain number of horses and cattle; and the father of the young man, in return, presents the bride with a new white felt tent, some household furniture, bed-clothes, and ornamented feet-pillows, covered with cotton or silk, and laced. The gelling, or priest, is consulted, with respect to the day of marriage, and he searches, by astronomical calculations, for a propitious one. The new tent is then erected; the bride, with her parents and relations, goes to the bridegroom, who, with the gelling, accompanies them to the tent, where he reads some few prayers, and orders the bride's tresses to be undone, and braided, in the manner of married women, into two tails. He next takes the caps of the married couple, retires with them without the tent, smokes them with frankincense, and offers a prayer. He then returns to the couple, blesses them, gives the caps to some of the persons present, to put them on the bride and bridegroom's head, and the ceremony concludes with a feast.

At the nuptials of princes, great entertainments are given. A large banquet is prepared, and those who carry the eatables to table, which are served up in large wooden vessels, are preceded by a herald, or carver, on horseback, splendidly dressed, having over his shoulders a long tippet of fine white linen, and his cap trimmed with black fur. On the wedding-day, all the priests read prayers, and the day is concluded with a variety of amusements.

The customary diversions of this people consist in horse-racing, in which the girls bear a part; shooting with the bow for wagers; wrestling, in which they strip themselves to their trowsers; hearing the maidens sing; pantomime dances, and music, performed by the girls, who play on the lute, the kit, a kind of hurdy-gurdy, and the pipe. The subjects of their songs are the fabulous stories of gigantic chivalry, heroic tales, and amorous ditties; but their melody is harsh and dismal. The Kalmucs also play at chess, cards, &c.

When a Kalmuc dies, the gelling is made acquainted with the moment in which the spirit of the deceased departed; and he ordains the manner in which, and to what district, the corpse is to be carried. There are six different modes of burial; one is to lay the corpse, naked, in the open field, with the head towards the east, and the body in a sleeping position, supporting the head with the right arm. At the head, on both sides, and also at the feet, they stick poles into the ground, on the top of which are fastened square pieces of stuff, written over with Tongusian prayers, which resemble flags, and are called prayer-flags. The second mode is to carry the corpse to some adjacent wood, dressed in the dress of the country. In both the above cases the body is left to be devoured by wild beasts, by which process, they suppose, the soul continues its transmigration. The third way is to throw the body into the water; this they do with children; the fourth, to bury it; the fifth, to cover it with a heap of stones; and the sixth, to burn it. In the first five modes, in which they bury the common people, and lower order of priests, they stick one flag as near the body as they can, burying with them the weapons of the deceased, and some few presents. Besides these prayers of the dead, a kind of mass is read by the priest for the deceased, by order of the parents, agreeably to the hour in which he died. These masses continue forty-nine days; at the expiration of which, three prayer-flags are given to the parents by the gelling, which they also stick near the corpse, and then leave it, without any further notice. Some, however, will continue the masses longer. From the hour of departure, they judge whether the deceased were a good or a wicked man; and, if the body remain unmolested by beasts of prey, they consider it as an ill omen.

Burning the dead is only practised for priests, princes, and a few persons of superior sanctity. The ashes of such bodies are carefully collected, mixed with frankincense, and sent to the Dalai Lama, at Tibet, who sends word back into which paradise the new-born soul is arrived through the fire, without being metamorphosed into an animal. In order to burn them, a vaulted oven is built, with holes, in one of which the body, full dressed, is laid upon a bench with three feet. The fire blazes out of the oven, and is fed with the fat of the body till it is entirely consumed.

The Nagai Tartars, of which there are many tribes, are represented as the remainder of the Mongolian race, and a powerful nation, but so reduced by the vicissitudes of war during a century past, as scarcely to deserve that appellation.

These people are low of stature, but rather corpulent; they have olive complexions, large faces, small eyes, and tolerable features. The dress of the men is composed of sheep-skins, with the wool outwards; their caps are of

various shapes; but those worn in general are small and round: they are made of lamb-skins, and so constructed as to cover the head only as far as the ears. The younger women wear Circassian caps; and those who are married adopt the custom of wearing the veil.

There are some tribes among these people who live in valleys, eight or ten fathoms deep, which intersect the plains from north to south, and which are more than ninety miles long, though but half a quarter of a league wide. Muddy rivulets run through the middle of them, on the borders of which are tents, intended to give shelter, during winter, to their numerous flocks and herds. A Tartarian tent, in many parts, resembles a large kind of hen-coop. The paling is in a circular form, and over this a door opens at the top. A felt of camel-hair envelopes the whole; and a piece of this felt is thrown over the hole in the centre, which serves to give vent to the smoke.

These Tartars, according to the custom generally prevalent in Asiatic Russia, purchase their wives. A dower, with the wealthy, consists of twenty or thirty mares, two stallions, fully equipped, a complete suit of armour, and a musket and sabre, which are presented to the wife's father on the day of marriage.

In their marriages they are not very delicate. Little or no difference is made between the child of a concubine or slave and that of the wife; but, among the heads of tribes, the wife's son is always preferred to the succession. After a wife has arrived at the age of forty years, she is employed in menial duties, and must attend the young wives, who succeed to her place.

These Tartars are a wandering people. They set out on their peregrinations in the spring, in great numbers, preceded by their flocks and herds. They have little money, except what they get from their neighbours, the Russians, Persians, or Turks, in exchange for cattle: with this they purchase cloths, silks, stuffs, and other articles of apparel, for their women. They have few mechanics, and avoid all labour as the greatest slavery. If they are angry with a person, they wish he may live in one place, and work like a Russian.

The pleasures of hawking, hunting, and coursing, are their chief delight: and their chiefs frequently form hunting parties, attended by numbers of *mirzas*, or noblemen. They depart for the chase with arms and baggage; and the amusement lasts several days. Camps are formed every night. A body of troops follow the *serasker*, or commander-in-chief of the army: and sometimes these parties of pleasure serve as pretexts for more serious expeditions.

Hospitality is a virtue by no means unknown to these people. On the arrival of a stranger at any town or village, it is customary for the inhabitants to stand at their doors, as if desirous of inviting him to enter. Having made choice of his temporary residence, the inhabitants

go into their houses, and the stranger is shewn into an apartment, into which the wife and daughter of the host enter, both with their faces uncovered; the first carrying a basin and a pitcher, and the second a napkin, for the purpose of washing. They then set before him their best cheer, with an assurance of his being heartily welcome. According to their own declaration, they consider the exercise of hospitality as a benefit, and, therefore, if any one should constantly enjoy that advantage, he would make others jealous; but they do not permit of any means which might determine the choice of travellers. Their eagerness to come to their doors is only to prove that their houses are inhabited. Their uniformity preserves an equality, and no one has a chance of procuring a guest superior to another. They are of opinion, that it is equally their duty and pleasure to assist a stranger in distress; and that, exercising hospitality, and following the dictates of humanity, they fulfil the law of Mahomet, according to the sum and substance of the koran.

There is a tribe of the Nagais, called Kendure Tartars. When Professor Pallas first visited these parts, he found this tribe in their felt tents, or huts, similar to those already described; but, in his second visit, he observed that they had varied their form. The mode in which they were first constructed, was similar to that adopted by the Nagai tribes in general; but they seem to have derived the latter from some other nation, probably the Kalmucs, whose habitations are constructed with more art, and better adapted to the purposes of accommodation, being so made as to be disjoined and altered at pleasure. Each opulent Tartar family, belonging to those wandering tribes, has generally two tents, one for the accommodation of visitors, and the other set apart for their females; besides which, in proportion to the number of the family, they generally have one or more covered two-wheeled chariots, for the use of their wives and daughters. These carriages are painted of diversified colours; and on the front is commonly fixed a chest, covered with tapestry, for conveying their best apparel from place to place. They have also two-wheeled carts, which are loaded with their tents and baggage. The moveables of each family proceed on their journey, and in regular order. The hut is placed on the axletree of the carriage, in which the mistress of the family always goes before the caravan. The flocks and herds are conducted by servants on horseback, and each species of cattle moves in a separate drove. When the tents are pitched, on the spot fixed for a temporary abode, a coverlet is raised on a long moveable pole, to the windward of the aperture that lets out the smoke, in order to promote its ascent from the tent.

The dress of the women and girls of this nation is peculiar to themselves, as will appear from the following description: "The girls wear a sort of red cap, made of

The tents,

the rim of trees, in the form of a bee-hive, and adorned with pieces of tin. Corals and small pieces of coin are hung round this head-dress. The gown is composed of diversified silk-stuff, with long narrow sleeves, and is ornamented, from the breast to the waist, with tassels of tin or silver, buttons, little bells, and rings. A strap or cord is worn over the left shoulder, to which is attached a tin case, containing amulets, and frequently a large shell. The women are very awkward figures: in summer, they dress in an upper gown, of an uniform colour, wear long white cloth on the head, and over it a fur-cap. In the perforated right nostril is a ring, ornamented with corals, pearls, or precious stones.

The Samoiedes were made tributary to the Russian empire so early as 1525; whereas the other nations of Siberia were not conquered till the seventeenth century. They inhabit all the northern districts of Russia and Siberia, as far as to the Jenisea; but, within this district, they are divided into many tribes, different even in their dialects.

The persons of the Samoiedes are thus described by Mr. Tooke: "The men are about five feet high. They seem all of a heap, have short legs, a large head, flat nose and face, large mouth and ears, small black eyes, pendant lips, and little feet, little or no beard, and black coarse hair. The women are shorter than the men, and have a more slender shape. It may be said of these people, on the whole, that a pretty female amongst them is as extraordinary as a fine man. Their breasts are small and flat, and their maturity very early; many of them being mothers at twelve years of age, and sometimes at eleven; but they are not very prolific, and after thirty years of age seldom bear children.

"Some of the men shave their heads partially, some wholly, and some not at all. Some wear but one whisker on one side, and others on both sides. The women's dress is singular: they always go bare-headed and bare-faced; their hair is braided into two tresses, which hang down behind, and are never opened. In their ears they wear short pendants of beads. The breast and back-pieces of their garments are made of the furs of young rein-deer, and the rest of pieces of cloth, sewed together; the whole bordered with fur, and made to lap over before, and there tied with a girdle. Instead of a breast-pin, they have a large iron ring, on which both ends of the girdle are tied. They also wear breeches, of dyed rein-deer skins. In this dress the Samoiede women remain day and night, but the men sleep without any clothes; and, but for these breeches, would be quite naked."

During three parts of the year they live in caves, and make subterraneous passages, for the purpose of visiting each other. Their light they derive from lamps, fed by foetid fish-oil.

The tents, in which they live the three summer-months,

in form resemble a bee-hive, and are covered with the skins of the game they kill.

Each Samoiede keeps his own rein-deer, and he and his family generally watch them themselves. These animals are chiefly employed to transport their tents and effects, on sledges, which measure about eight feet in length and about four in breadth, and turn up before, in the manner of a skuit. The rein-deer have a pleasing appearance in harness, holding their heads so high, that their horns almost touch their backs. The wild rein-deer furnishes the Samoiede with every necessary he wants, viz. food, roofs, spades, which they make of the horn, clothes, and sinews for thread, &c. When they live near the sea, they have sufficient subsistence from the sea-bears that come on shore, dead whales, thrown up by the waves, and other animals, which they eat indiscriminately. Dogs, cats, ermines, squirrels, and snakes; in short, whatever they can kill, or find dead: nothing comes amiss to them. They sometimes fish in the gulf and lakes, with small nets, and ropes made of willow. In autumn they hunt ice-foxes, which are not only caught by the men in traps, and sometimes pursued, but even dug out of their holes, by the women, and killed. There are wealthy Samoiedes, who, for the sake of fishing, will take up their summer-abode on the river Oby, and leave the care of their flocks to their children and shepherds; yet, when the time of hunting approaches, will return to their old way of living. These people are very dexterous at catching what is called the sea-dog. It is done by crawling upon the ice after the animal, with a large hook and line, throwing the hook to a convenient distance, when the animal, in endeavouring to avoid the snare laid for it, generally fixes himself in it. The creature, however, though thus hooked, jumps sometimes into the sea, with such force and violence, as to drag the man into the sea after him. From the sea-dog is extracted an oil, and the flesh is eaten by the natives.

The Samoiede women are generally treated with great severity. They have every domestic and laborious business to perform, and are quite slaves to their husbands. In their huts, a staff is erected behind the fire, the limits of which the wife dares not pass, for they deem the fire sacred, and think a woman going round it would profane it. To do her domestic work, if she wants to go from one side of the hut to the other, she must go round about; for the Samoiedes superstitiously believe that, if a woman were at liberty to go about the whole tent, a wolf would certainly devour a rein-deer the same night.

When a Samoiede wishes to take a wife, he looks for one equal to himself in rank and property. Having appointed a person, from among his friends, to transact the business, the negociator waits upon the father of the

maiden, and enquires whether the young man can have her. If the father accept the proposal, the negotiator settles the price to be paid, which generally consists of a variety of clothes, household necessities, rein-deer, and other matters purchased from the Russians. As soon as this is paid, it is settled when the bride shall be ready to give her hand. On the day appointed, the bridegroom waits on his bride, with a number of strange women, to fetch her, and, after some forms, the marriage-rites are performed.

When these people assemble upon any joyous occasion, they divert themselves with fighting, and running over certain limits. They also dance with their wives, by couples, in circles, throwing themselves into a variety of attitudes, and making a number of grimaces, all to musical measure; and often, for want of music, will keep time by snorting, and other nasal sounds, in which the women bear a chorus.

When an individual of this nation dies, they dress the body in as many of its new clothes as they can put on, laying what is left about the corpse, and put the head into a boiler, from an opinion that, after the head is decayed, the soul will there remain: they then wrap the body in the cover of a tent, of rein-deer skins, bind it round with ropes, and drag it out, not at the door, but from under the covering of the tent, which they raise for the purpose; for they think, if it be taken through the door, the deceased will return, and soon fetch away some other of the family. When brought to the place of interment, if in summer, they dig a very shallow pit, not above eighteen inches deep, cover the corpse with wild bushes, and then throw the ground upon it. In winter, they erect a hut, with timber and bushes, place the deceased in it, give him an axe, knife, bow and arrows, tobacco, a pipe, spoon, and cups, and then leave him. The rein-deer that drew the corpse are killed, and put, with all their furniture, into the grave. Opulent persons kill, also, all those rein-deer with which the deceased used to hunt; and the whole, in winter, are covered with straw; in summer, with moss and straw.

During the interment, they send for a magician, who has recourse to the drum, and puts on a particular kind of robe, ornamented with figures, on iron plates. His business is, to persuade the spirit of the dead not to molest those he has left behind him, nor to fetch them away, but to leave his lucky hunting days to his relations. At these times, a rein-deer is sacrificed, and dressed on the spot; but neither the wife nor husband of the deceased is at liberty to eat out of the common boiler, without being first purified, by washing and smoking themselves with castor. Should a Samoiede pass the grave of a near relative, even ten years afterwards, he must sacrifice a rein-deer, in memory of the deceased, and eat it with his at-

tendants, leaving the head and horns upon the grave. The name of the deceased is no more to be mentioned, but by allusion or circumlocution; he that would pronounce the name, would become a declared enemy of the relations; but the same name may be revived in the second or third generation.

Mourning for the dead consists in not tying up their fur-boats, nor girding their bodies with willows, letting the hair go dishevelled for some time, and afterwards braiding it, for life, into three tresses, letting the third hang on one side over the ear.

The Ostiac Tartars are, in general, of a middle stature, not very strong, and particularly thin and lean. Their faces are disagreeable, pale, and flat, without any characteristic form. The ruddy and light-coloured hair, that hangs about the head of the men, renders them still more ugly. They are timorous, superstitious, and simple, but otherwise have a tolerable share of good-nature. They are, from their youth, laborious, being obliged to put up with a troublesome and bad way of living; but, as soon as they find themselves a little above indigence, they are slothful, especially the men; and, in their whole domestic management, very filthy and disgusting.

To strangers the Ostiaks are very hospitable, and do not know how to pay sufficient honour and respect to their guests. If they have any rein-deer, they will kill one immediately, and set before their friend the tongue, brains, and breast, boiled in their way, which they consider as the greatest delicacies. After the meal, they will make their guest such a present as they can afford, without expecting any return.

The dress of both sexes consists chiefly of the skins of animals, and furs, which they prepare themselves. The more opulent wear shirts; but the common people wear their leathern coats next their skin. The mens' dress is first a narrow under fur, with sleeves, which scarcely reach half-way to the loins, having a hole above to put the head through, close behind and before. This is commonly made with the skin of a rein-deer fawn, which drops in spring, and is put on, instead of a shirt, with the hair inwards. The most usual upper-fur, or garment, which is worn also in summer, when the weather is cold, consists of a rein-deer skin, sewed together, and worn with the hair inwards. It is almost like the former, except that behind the opening, through which the head passes, hangs a hood, which is occasionally thrown over the head. They generally border the hood and seams of the garment with dog's-skin, and it is often worn, in summer, without the under fur. In winter, they wear a fur over both, and also a cap, made of long-haired rein-deer skin. In summertime, those who wish to appear finer than ordinary, make themselves a garment of several pieces of cloth, of various colours, without lining, and bordered with a white

dog's skin, close of the men, they wear sl deer, and o same animal together for tending to p

dog's skin, or the tails of ice-foxes. The common breeches of the men are made of dyed rein-deer skins, cut to sit close on them, but do not reach the knees. On their legs they wear short stockings, made of the fawn of the rein-deer, and over these boots, made of the foot-skin of the same animal: the parts between the hoof are fastened together for the sole of their boots, being more solid, and tending to prevent them from slipping on the snow.

The women wear, next the skin, a kind of bed-gown, made of fur, and open all the way before: it is not very wide, yet sufficiently so to lap over and tie together. This is the only garment they wear: they take care to keep it close before, but are not permitted to wear a girdle. In summer they go bare-footed, but in winter, at home, they wear stockings, like the men; their hair is braided into two tresses, behind, which hang down the back, and are tied together by a string. Added to this, the more opulent fasten on the hair, behind, two long strips of cloth, which reach to the joint of the knee, and are decorated with brass and copper-plates, representing little horses, rein-deer, fish, and other figures. Those that have not much hair, wind a piece of cloth about their heads, which crosses behind, and hangs down the back in two long strips. Both men and women wear long pendants in their ears, of coloured beads, strung on a wire or string; and several men wear rings in their ears. As soon as any one enters their tent, whether strangers or relations, the women cover their heads with a linen veil, and will not be unveiled, even before their own mother.

Among the women, it is reckoned an ornament to mark the back of the hands, and the fore-part of the arm, with various bluish figures and points; for this purpose, they draw the figure they mean to mark upon their skin with soot, and prick it with needles till it bleeds; in so doing, the puncture given with the needle leaves a blue speck, and the figure, being so pricked all over, remains on the skin. Men only prick on their hands that sign by which they are registered in the tax-book, and which is considered, by other tribes unskilled in writing, as their signature in law.

Whilst the other wandering tribes may be properly styled shepherds, the Ostiaks may be called a nation of fishermen; for fishing, during the whole summer, and in part of the winter, is their chief occupation. Hunting and bird-catching are occasional employments. Such being the life of an Ostiak, it is naturally unsettled; of course, in summer-time, they move their habitations to places most adapted for fishing; but have settled habitations in winter, to which they annually return.

A summer-tent, among these people, is made without much trouble; the birch-bark, which covers it, is carried with them in boats, made of hollow trees, enlarged with boards fastened on them, as are also the poles with which they form their tents; these poles are set close together,

in form of pyramids, and covered with the bark. In these boats they go, with their wives and children, and all that belong to them.

For their winter-abodes, they select elevated and dry spots, on the banks of the neighbouring rivers. Here they build, with young timber, regular square huts, similar to a Russian house, but low, sometimes half under ground, and without a roof, instead of which, they cover the top with turf and leaves, leaving only a square air-hole, which they cover, in winter, with a transparent piece of ice. On each side of this house is an open passage, fenced in, where they keep their superfluous furs and necessities. Such huts are inhabited by more than one family; and the place, within the walls, is divided into as many apartments as there are families. Though narrow and confined, the mother must put up with one room, for the children and the whole family, who do their work before a small fire. Those mothers who have infants have a cradle, made of birch-bark, before their house, and fill it with any bruised rotten wood they can find, which serves the infant as a bed. The cradle is covered with a piece of fur, fastened to it by strings. The beds of such as are grown up are made, on the bare ground, with rein-deer furs and hay; except in such rooms where there are benches to lie on.

"It is almost impossible," says a respectable author, "to describe the extreme filthiness of this nation. Washing of hands is unknown among them, except when the women open a fish, or take it out of the boiler, at which time they wash off the filth, and dry their hands in the furs. Men and animals eat out of the same vessel, which is never cleaned. As their hair swarms with vermin, the most filthy of all their actions is that of the women, at their leisure, picking such vermin from their husbands' heads, and killing them, with all possible calmness, between their teeth. But the rich Ostiaks, from imitation, are become so cleanly, as to make a kind of soap, because what the Russians use is too scarce and dear, and not strong enough to clean their hands. This soap is made by putting a good quantity of sharp ashes into a kettle of water, and pouring, by degrees, fish-fat into the lye, which they boil together till it settles and becomes soap. They then take it out in pieces, tie it up in rags, and, when they wash their hands, squeeze it like a sponge. One reason of the filthiness of the common Ostiaks is, that the women have too much domestic business on their hands, and are considered, by their husbands, rather as slaves than consorts. The wife erects the tent, pulls it down, dresses the victuals, dries and mends her husband's clothes, and serves him in every thing; and, when the husband returns from hunting or fishing, she must clean and dress the fish. The men take nothing on themselves but the business of fishing and hunting."

During the summer-season they have such an abundance of fish, that they eat nothing else, and they seldom think of boiling or roasting them, but cut off the flesh, as it comes fresh out of the water, sauce it with its blood, which flows plentifully from about the tail, when pricked with a needle; and take one long slice after another into their mouths, cutting the bits very skilfully below their lips. In winter they are fond of raw frozen fish, and are imitated in this by the neighbouring Russians, who eat it so as a preservative against the scurvy. Fresh fish is only boiled for guests, and what they leave the family eats; and, on such occasions, they plunge their filthy hands into the kettle, up to their elbows. In winter they make a soup, or fish-broth, and put flour in it, and eat it with large spoons. Eating with a knife is held ominous of unsuccessful fishing.

In autumn, when the first snow falls, they hunt elks and rein-deer; and he that kills makes a feast for his friends. The kidneys, lights, and other soft parts, are eaten raw; part of the flesh is boiled, and the rest smoked. In winter, the Ostiaks travel in their snow-shoes far into the deserts and forests, and do not return for some months, drawing their food with them on small sledges. Their hunting weapons are all sorts of arrows, some with a fork-like point, others with bone points, and others clubbed at the end, to kill small animals. If they kill large animals in any great number, they flay them, bury the flesh in the deep snow, in a spot which they can find again, and fetch it, at some other time, with rein-deer or dogs. They will eat the flesh of bears, foxes, squirrels, and dead carcasses, without disgust. When an Ostiak is exposed to severe cold, pain, and hunger, he has recourse to tobacco, which does him great service: so that they are very fond of smoking and taking snuff.

The dances of the Ostiaks are entirely national; and their ridiculous attitudes may be aptly compared to a burlesque pantomime. They divert themselves thus at their entertainments, and particularly when they have obtained a quantity of brandy, by barter, from the Russians. The men only dance, the women are merely spectators; and it requires no small adroitness, strength, and agility, for they always dance till they are in a perspiration. In these dances they represent the proceedings of their ancestors, in chase of a variety of animals and birds, and even in fishing. Sometimes they imitate the conduct and walk of the most singular animals and birds, and satirise the gait of their neighbours, all in musical cadence, while the player varies, according to the different imitations. They represent the chase of the sable, the manners of the crane and elk, and the flight and preying of the mouse-hawk, the manner of the Russian women washing themselves, and other entertaining subjects. The most difficult representation is that of the crane; when the dancer

squats down, hides himself in a fur, the collar of which he fastens round a long stick, which at top resembles the head of a crane, and thus squatting, and almost bent double, he dances, and imitates, with the stick, all the motions of a crane. At the representation of the elk, the music imitates the several actions of the animal, walking, trotting, and galloping; and the dancer makes all the grimaces of that animal, when he is throwing about his eyes in search of the huntsman. Their most favourite dances are satiric representations, and they are fond of ridiculing particular persons, in extemporaneous songs.

With respect to marriage, those Ostiaks, who adhere still to paganism, take as many wives as they can afford. It is legal among them to marry their brother's widow, their step-mother, or step-daughter, and other relations. They are fond of marrying sisters of other families, and believe that men's marrying with a wife's sister brings good luck; and, by doing this, they pay the father only half the price first paid; but they hold it sinful and disgraceful to marry relations of the same name; yet they attend only to the male line. If a woman have married into another family, and borne a daughter, the brother of the mother, or his children, may legally marry that daughter. In short, all marriages are legal, if only the father of the bride and bridegroom are of different families. Their marriage forms and ceremonies are similar to those of the Samoiedes.

Previous to their subjugation by the Russians, the Ostiaks had princes among them, whose dignity was hereditary. Some of their posterity are still in being, but not much respected; living, in the manner of the common people, by their labour. If any dispute happens among the people, it is generally settled by arbitration; but, if the cause is brought before any Russian court of judicature, it is adjusted by the evidence of the parties, and the following oath is usually administered. A wooden idol being brought, the defendant is reminded of the danger of taking a false oath, and constrained to cut off the idol's nose, with an axe or knife, and injure it otherways; during this, he must repeat, after the interpreter, the following words: "If I do not speak the truth in this cause, let my nose be cut off in the same manner; let me be hewn in pieces by an axe; let the beasts of the forests tear me; and every misfortune come upon me!" By the same oath the witnesses are sworn; and, out of superstitious fear, will rather confess they are in the wrong, than expose themselves to the punishment of their gods. If they are to swear allegiance to a new sovereign, they are assembled in little circles, an axe is placed in the middle, with which a bear, or bear-skin, has been cut in pieces; and each person is presented with a bit of bread, on the point of a knife; during this he is to take the oath of allegiance, as follows: "If I do not remain faithful to the emperor, to the end of

my life; if I leave my country to be torn by the axe out of this done, their zeal, with obligations, among most of

This done, they kneel down about a bear's skin, and lay hold of it with their teeth, biting it; and many, to shew their zeal, will tear out the hairs with their teeth. Similar obligations, on oath, are customary, with a bear's skin, among most of the tribes in Siberia.

The blindest idolatry is still the reigning religion of many of the Ostiaks. Those who, among their magicians, profess paganism, have their idols at home; which are clumsily-carved puppets, with a human face, clothed with rags, and put in the best corner of the tent. Before each idol they place a small wooden box, in which the worshipper presents his god with little presents, and keeps always for him a horn full of snuff. They industriously smear the idol's mouth with fish-fat, and render him every honour, in their way. Some Ostiaks have deified pieces of logwood, little boxes, and other things they have bought from the Russians. Such things they decorate in the best manner they can, with rings and ribands, and worship them, as others do their wooden puppets. It is truly laughable to see the effects of a Russian traveller taking out, at night, when they are all asleep, the tobacco from the horn, and leaving the horn in its place; the simple Ostiak, in such a case, supposes that the idol has taken all the snuff, is surprised at it, and thinks that he must certainly have been hunting. It can scarcely be credited, that such a people could be so blind and ridiculous, as to knock down the idol from its place, and break it in pieces, by various methods, when they are in trouble, and the god will not succour them; though they held the idol in the greatest veneration before. They also deify, in a certain manner, their deceased relations; making wooden images to represent some dead person they respected, and set, at their remembrance-meals, their portion before them. Women, that loved their husbands, will take these puppets to bed at night, dress them, and never omit placing some victuals before them, when they take their own meals.

Particular spots of ground are set apart for the purpose of sepulture. A corpse is never kept long; but he who dies in the morning is commonly interred at noon. Their graves are made, generally, only two feet deep; because, in most places, the frozen ground is too hard to be dug into deeper. The deceased is dressed in his best clothes, according to the season of the year, is put on a bench, and all things near him which he used; for instance, his knife, axe, tobacco-horn, &c. except his flint and fire-steel, which are only given to the dead carved in wood. The relations and neighbours of the deceased assemble in his jourt, and deplore him with great howling. The women sit together, with their faces veiled, and the

men stand lamenting over the body. Instead of a coffin, they bring a little boat, whose fore and hind parts are cut off, put the deceased, with all his things, into it, and carry him to his grave. Men are borne by men, and women are carried by women only, to the place of interment, which is usually on some eminence. In the latter case, the corpse is followed by some men to dig the grave, and is interred with shrieks of woe. The corpse of a man is followed by three of the best rein-deer he possessed, dressed and harnessed to sledges, and led on by men. As soon as the body is interred, and covered with earth, they put a cord round the hind legs of the deer, which two men pull, whilst four others run them through the bodies, on all sides, with pointed poles. At the funerals of the rich, they kill many more rein-deer, putting slings about their necks and feet, and beating them about the back with poles, till they drop down dead. These animals, sacrificed to the deceased, remain on the grave; their housings are laid on a kind of scaffold, made over it with bushes, and the sledges are placed slanting up against it. Near the grave they dress a funeral-meal; and, when those who attend are satisfied, they carry the remainder home, and divide it among the neighbours, in remembrance of their deceased friend.

The Jakuti, one of the most considerable of all the pagan nations in Siberia, comprising, in ten tribes, thirty or forty thousand persons, are wholly subject and tributary to Russia. They have an idea of a Supreme Being; but the image they form of him is of hideous aspect: it has a big head, and large eyes of coral. They place it in a tree, and cover it with furs. Once a year they assemble together, and sacrifice horses, &c. to this image, sticking up the horses' heads all round the tree. Then, sitting down in a circle, they drink of a liquor, which they call *cumises*, and get intoxicated with it. They also throw some of the liquor into the air, and into a fire which they light on the occasion. This ceremony is performed in the spring, and is their new year's offering.

Their usual food is horse-flesh, which they devour with equal avidity, whether fresh or putrid. They are particularly fond of the use of tobacco, which they procure from the Russians.

Their habitations resemble those of the Samoiedes, excepting that their summer-huts are in the form of a sugar-loaf, covered with the bark of trees, and curiously wrought with horse-hair. The dead are generally left on the spot where they expire, and the survivors seek a new habitation.

The Bratski Tartars inhabit the vicinity of the Lake Baikal; and many of them attain to a considerable knowledge in mechanics and agriculture. Venison and horse-flesh constitute the chief part of their food; but the latter, in general, has the preference. They breed great

numbers of horses, as well as other cattle, by which means many of them obtain considerable property.

The Brabinski, who inhabit the vast desert of Barba, live still farther to the westward. In the summer, they remove to the banks of the rivers. Their winter habitations, like those in general of these northern climes, are low in the earth, and the roofs, which are raised about two or three feet, are covered with rushes or the skins of animals. As the dreary desert of Barba is void of fountains or rivers, the common drink of the inhabitants is melted snow. They also drink mares' milk, in common with the Tartars in general.

The Tungusi consist of various tribes, spread through different parts of Siberia, and are of the old Scythian race. They are divided into three classes, viz. the Koumi Tungusi, or those who use horses; the Oleni Tungusi, or those who use rein-deer; and the Sabatschi Tungusi, or those who make use of dogs. They are of middle stature, and tolerably good countenance. Their sight and hearing are remarkably good; but their organs of smelling and feeling are rather defective.

Both sexes of the Sabatschi Tungusi, who take up their residence between the Lena and the Penchinska Ocean, go naked in summer-time, except having a small piece of skin round their waists. In winter, they are clothed with deer-skins. They believe in a superintending Providence, but reverence idols of their own construction. They hang their dead upon the branches of trees, and burn the bones as soon as the flesh rots off, or is devoured by animals.

These people are acquainted with almost every tree and stone within the circuit of their usual perambulations, and they can describe a course of some hundred miles by the configuration of the trees and stones they meet with, and can enable others to take the same route by such descriptions. They also discover the tracks of the game by the compression of the grass or moss. They learn foreign languages with ease, are alert on horseback, good hunters, and dexterous at the bow.

The Tschutski are thus described by Captain Cook: "They were robust and well-proportioned; not any women or children of either sex were observed, nor any aged persons, except one man, whose head was bald; and he was the only one who bore no arms: the others seemed to be select men, and rather under than above the middle age. The elderly man had a black mark across his face, which was not perceived in any others. All of them had their ears perforated, and some of them had glass-beads hanging to them. These were the only fixed ornaments seen about them, for they wore none to their lips. The dress of these people consisted of a cap and frock, a pair of breeches, boots, and a pair of gloves, all made of the skins of deer, dogs, seals, and other animals, extremely well dressed, some with the hair or fur on, and others

without it. The caps were made to fit the head very close; and, besides these caps, which most of them wore, some hoods were obtained from them, made of dogs' skin, and large enough to cover the head and shoulders. Their hair was apparently black; but their heads were either shaved, or their hair cut close off, and none of them wore any beads."

These people have their winter and summer habitations: the former are like a vault, the floor of which is sunk below the surface of the earth. One of them, examined by Captain Cook's people, was of an oval figure, about twenty feet in length, and twelve in height; the framing, consisting of wood and the ribs of whales, judiciously disposed, and bound together with smaller materials of the same kind. Over this framing, a covering of strong coarse grass was laid, and that again was covered with earth; so that, on the outside of the house, it had the appearance of a little hillock, supported by a stone wall, of the height of three or four feet, which was built round the two sides and one end. At the other end of the habitation the earth was raised sloping, to walk up to the entrance, which was by a hole in the top of the roof, over that end. The floor was boarded; and under it was a sort of cellar, in which was seen nothing but water. At the end of each house was a vaulted room, which was supposed to be a store-room, over which stood a kind of sentry-box or tower.

Their summer huts were of a tolerable size, and brought to a kind of point at the top. Slight poles and bones, covered with the skins of sea-animals, composed the framing. The inside of one being examined, there was a fire-place just within the door, where a few wooden vessels were deposited, all very dirty. Their bed-places were close to the side, and occupied about one half of the circuit: some degree of privacy seemed to be observed; for there were several partitions made with skins. The bed and bedding consisted of deer-skins, and most of them were dry and clean.

Their arrows are pointed either with stone or bone, but very few of them are barbed. Their spears are of iron and steel, and embellished with carvings and inlaying of brass, and of a white metal. A leathern quiver, slung over the left shoulder, serves to contain arrows: and some of these quivers are exceedingly beautiful.

The Kamshadales resemble the other inhabitants of Siberia in most instances, excepting that their visages are somewhat shorter, their mouths larger, and their cheeks fuller. Their hair is dark, their eyes are hollow, and the remarkable swarthinness of their complexion is attributed to the power of the sun reflecting from the snow; to obviate the effects of which, those who are obliged to be in the woods, cover their faces with a kind of netting; for this refraction injures not only the complexion, but the eye-

sight. The circumstance into the course of ten years.

In their dress, they are all of a piece, and there is no triumph. They retire to some place; if it appears that they murder their assailants, they sell their general, executed, and comb their hair and troughs, afterwards.

sight. They are uniformly below the middle stature; a circumstance which has been attributed to their entering into the conjugal state at the early age of thirteen or fourteen years.

In their disposition the Kamschadales are timid and pusillanimous, and, from an innate kind of stupidity, they seem to despise life. They never attack an enemy openly, unless constrained, but steal privately to their habitations, and there exercise the most horrid barbarities, cutting them in pieces, and even tearing out their entrails, with savage triumph. When they hear of the approach of a foe, they retire to some mountain, and fortify it as strongly as possible; if it appear that the enemy is likely to get the better, they murder their wives and children, and then encounter their assailants with the utmost fury; and, when overpowered, sell their lives as dearly as possible. They are, in general, exceedingly slovenly, neglecting to wash themselves, comb their hair, or cut their nails. They eat out of bowls and troughs, with their dogs, nor do they even wash them afterwards.

The dress of the Kamschadales consists of the skins of various animals, with the fur outwards. They wear, in general, two garments, the sleeves of the outer reaching down to their knees. They have boots of dog or deer-skin, with the hair innermost; also a fur-cap, or hood, which serves to cover the head in bad weather. The dress of the men and women is nearly the same. The coat, or rather waistcoat, of the latter sits close to their bodies, and is decorated with slips of red, blue, and yellow cloth, and sometimes riband or woollen list. A kind of petticoat is joined to this waistcoat, that comes half way down the leg. The women let their hair grow much longer than the men.

There are, however, distinctions in their classes, and particularly those of the women, some of which are gay and pleasing. There is the common dress, composed of ordinary materials; the holiday dress, rather more decorated; and the grandest dress, consisting of a loose robe of white nankeen, gathered close round the neck, and fastened with a silk collar. A short jacket, without sleeves, is worn over this, consisting of different coloured nankeens; and they have petticoats, made of a slight Chinese silk. Their shifts, which are also made of silk, have sleeves descending to the wrists; and their heads are bound with coloured silk handkerchiefs, which entirely conceal the hair of the married women; but the unmarried ones place the handkerchief under the hair, permitting it to flow loosely down the shoulders.

Their habitations are of three kinds; the first adapted to the winter, the second to the summer, and the third of Russian introduction, and inhabited chiefly by the opulent. The winter-habitations, called *jourts*, are under ground, to the depth of about six feet. They are covered with

grass or earth, and sometimes with skins of the animals they have killed in the field, which, being undressed, emit a most nauseous stench. Some of the huts, indeed, are covered with mats, and also lined with them. There is a cavity in the centre, which serves the purposes of chimney, window, and entrance. They pass in and out by means of a pole, with notches just deep enough to rest the toe upon. They have platforms, made of boards, raised about six inches from the ground, which they use as seats, and on which they repose, after strewing them with mats or skins. Near one corner is the fire-place; and the opposite side is set apart for the reception of provisions and culinary utensils. It is to be observed, that several families live together in one *jourt*.

Their summer-habitations, called *balagans*, are built on the surface of the earth, and constructed with more regularity than the *jourts*. They are raised on pillars about thirteen feet high from the surface, with beams thrown across them, on which is fixed a floor, with a roof rising from each side to a central point. It is found necessary to raise the summer-habitations to this height, to secure the inhabitants from the danger of wild beasts. The *balagans* have two doors, opposite to each other, and they ascend to them by the same kind of poles as they use in the *jourts*. The lower part, which is entirely open, is set apart for the purpose of drying fish, roots, vegetables, &c.

The log-houses, introduced by the Russians, are here called *isbas*. They are raised upon long timbers, piled horizontally; the ends are let into each other, and seem filled up with moss. The roof slopes like that of a European cottage, and is thatched with coarse grass or rushes. There are three separate apartments in them. The first runs the whole width and height of the habitation, and is appropriated to the reception of the more bulky articles, such as sledges, harness, and domestic utensils. The next is the middle and most commodious apartment, furnished with benches, for the purposes of eating and repose. The last is the kitchen, half of which is taken up by the fire-place, and so contrived in point of situation, as to convey heat to that and the middle apartment at the same time. In each apartment are two small windows. The beams and boards are smoothed, as well as possible, with a hatchet, and these, from the effects of the smoke, become very black and shining.

A town is called, by the natives, an *ostrog*, and consists of the three several habitations described; but the *balagans* are most numerous. European voyagers observe, that they never met, in the course of their travels in this country, with any kind of habitation detached from a town or *ostrog*.

"The marriage-ceremonies of the Kamschadales," says an intelligent writer, "are as singular as many other of their customs. When a man fixes his attention upon a

female, he binds himself to the service of the parents for a limited time, at the expiration of which he either obtains their consent to marry her, or a requital for his services upon dismissal. If he obtain consent, they proceed to the nuptial-ceremonies, which consist in the bridegroom's stripping the bride of her clothes, which are purposely bound so fast with straps, girdles, and other ligaments, as to render it a very difficult task to accomplish his design. The bride is assisted against his efforts by the interposition of several women, notwithstanding which, he persists in his purpose, till her exclamations bring them all upon him, and he is subjected to very rough treatment, and exhibits several tokens of their indignation. At length the bride, moved with pity for his situation, and the women abating of their fury, the man gains his point, and, retiring to a short distance, is called back, in a plaintive tone, by the bride, who confesses his conquest over her. Here ends the ceremony; and the happy pair, the ensuing day, proceed to the habitation of the husband. In the course of a week they pay a visit to the parents of the wife, the relations of both parties are assembled, and the marriage is celebrated with great festivity. Some men marry three wives, who generally live together in an amicable manner. When the women go abroad, they veil their faces; and, if they meet a man, and cannot get out of the way, they turn their backs to him till he has passed by."

When one of the natives seeks the friendship of another, he invites him to his hut, which is made very hot for his reception, and he no sooner enters, than both strip themselves naked. The master of the hut then sets before his guest great plenty of his best provisions; and, while he is eating, throws water upon red-hot stones, till the heat of the place becomes insupportable. The visitor strives to bear it, and to eat up all the provisions, while the master of the hut endeavours to oblige him to complain of the heat, and to desist from eating. He eats nothing himself, but is allowed even to leave the hut, though the visitor is not suffered to stir, till he confesses he is overcome. They usually eat so much at these feasts, that for two or three days they can scarcely move, or bear the sight of victuals. At length the visitor, being unable to eat any more, purchases his dismissal with presents of clothes, dogs, or whatever the master of the hut likes, and, in return, receives others of no value. But, if the man, who has obtained this advantage over his friend, does not soon return the visit, the guest pays him another, and then it is his turn to make him such presents as he is able.

The law of retaliation is strictly observed in Kamschatka. If a man takes away the life of another, the relations of the deceased avenged themselves upon the murderer. Theft is punished by depriving the thief of his fingers.

Some of the Kamschadales have a shocking custom,

not only of neglecting the burial of their dead, but giving their carcases to the dogs, absurdly alledging, that, as the deceased are thus devoured by dogs, they will ensure to themselves a pleasant carriage in sledges drawn by fine dogs in the other world. This horrid practice, however, does not now prevail universally, some having the humanity at least to leave the dead in their hut, and go in quest of a new habitation. They always throw away the clothes of the deceased, from a persuasion, that whoever should wear them would soon meet with a similar fate.

Their entertainments and amusements are various. Sometimes one village entertains another, either upon account of a wedding, or their having had particular success in hunting and fishing. The master of the hut endeavours to make his guests sick with eating, and sometimes gives them a liquor, made of a large mushroom, prepared with the juice of a willow, which intoxicates them in so strange a manner, that they commit a thousand extravagancies; and, if the dose be too large, it sometimes proves fatal.

The mirth of the women consists in jesting and singing. At first they begin to sing very low, giving a gentle motion to their hands; but, by degrees, they raise their voice, and increase their motion, till they are out of breath. Their only musical instrument is the flute, upon which they play very indifferently. A stranger no sooner comes to Kamschatka, than they give him a new name, and, at their entertainments, mimic all his actions. They have also professed buffoons; but their wit is highly indecent. Their dances are very singular, the principal aim in these performances being to represent the clumsy gestures of the bear, which the inhabitants of this country have frequent opportunities of observing in various situations.

"The Kamschadale dances," says M. de la Perouse, "can only be compared to those of the *convulsionnaires*, at the famous tomb of St. Medard; the dancers having occasion for nothing but arms and shoulders, and scarcely for any legs at all. The Kamschadale females, by their convulsions and contracted motions, inspire the spectators with a painful sensation, which is still more strongly excited by the mournful cry that is drawn from the pit of their stomachs, and which serves as the only music to direct their movements. Their fatigue is such during this exercise, that they are covered with perspiration, and lie stretched out upon the floor, without the power of rising. The abundant exhalations that emanate from their bodies perfume the whole apartment with a smell of oil and fish, to which European noses are too little accustomed to find out its fragrance. As the dances of all these nations have ever been imitative, and, in fact, nothing but a sort of pantomime, I asked what two of the women, who had just taken such violent exercise, had meant to express. I was told they had represented a bear-hunt. The woman, who rolled on the ground, acted the animal; and the other, who

kept turning round her, the hunter; but, if the bears could speak, and see such a pantomime, they would certainly complain of being so awkwardly imitated."

One of the principal diversions of the natives is that of bear-hunting, which is followed about sun-set. Having found out the track of the animals, and fixed upon a convenient spot for concealment, the huntsmen put their firelocks in a proper direction. They afterwards kneel, or lie down, as circumstances may require, and, having their bear-spears in readiness, wait the arrival of their game. On the discharge of the piece, the enraged animal makes immediately towards the place whence the sound and smoke issue, and furiously attacks his adversaries. If he should not happen to fall, and they have not sufficient time to reload their pieces, they immediately prepare to receive him upon their spears, their safety depending, in a great measure, on their giving him a mortal stab as he advances towards them. Should he parry the thrust, and break in upon his opponents, the conflict becomes dreadful; and it is seldom that the loss of a single life will satisfy the beast's revenge.

The Kamschadales always travel in sledges. The length of the body of the sledge is about four feet and a half, and the breadth twelve or fourteen inches. It is made in the form of a crescent, of light tough wood, fastened together with wicker-work; and those of the principal people are elegantly stained with red and blue, the seat being covered with furs or bear-skins. It has four legs, about two feet in height, resting on two long flat pieces of wood, of the breadth of five or six inches, which extend a foot beyond the body of the sledge at each end. These run up before, somewhat like a skait, and are shod with the bone of some sea-animal. The carriage is ornamented at the fore-part with tassels of coloured cloth and leather thongs. It has a cross-bar, to which the harness is joined; and links of iron, or small bells, are suspended from it, which, by the jingling, are supposed to encourage the dogs. They seldom carry more than one person at a time, who sits sideways, with his feet on the sledge, having his baggage and provisions in a bundle behind him. The usual number of dogs employed in drawing this carriage is four, though sometimes they use five. The reins, being fastened to the collar, instead of the head, have no great command, and are, therefore, usually hung upon the sledge, the driver depending principally upon the obedience of the animals to his voice. Great care and attention are consequently used in training up the leader, which frequently becomes very valuable, on account of his steadiness and docility; the sum of forty rubles, or ten pounds, being no unusual price for one of them. The rider has also a crooked stick, answering the purpose both of whip and reins, with which, by striking in the snow, he can regulate the speed of the dogs, or even stop them at pleasure.

When they are inattentive to their duty, he often chastises them, by throwing it at them. The dexterity exhibited in picking this stick up again is very remarkable, and is the most difficult and necessary manœuvre in the exercise of their profession; for, if a driver should happen to lose his stick, the dogs immediately discover it, and unless their leader be both steady and resolute, they will instantly set off full speed, and never stop till their strength is exhausted, or till the carriage is overturned and dashed to pieces.

In the winter-season the dogs are fed on the offals of dried and stinking fish; and even this miserable food is withheld from them a day before they set out on a journey, and they are not permitted to eat a morsel of any thing till they arrive at the end of it. They are frequently kept fasting two entire days, in which time they will perform a journey of great extent. During the preparation for the journey, and the lashing of the baggage upon the sledges, these animals make a horrid howling; but, when they are yoked and ready for travelling, they set up a cheerful yelp.

The dressing of the skins of seals, beavers, dogs, &c. constitutes part of the employment of the Kamschadale. The mode is, first to wet and spread them out; then, with stones fixed in wood, to scrape off all the fat; they then rub them with caviare, roll them together, and tread on them; afterwards they scrape them again, and repeat the first part of their process, till the skin is thoroughly cleaned and rendered soft. In the summer the men are occupied in collecting the necessaries of life, and laying up a store for the ensuing winter's provision. The women are employed in making shoes, sewing clothes, dyeing skins, and making glue of the dried skins of fishes, and particularly of the whale.

Though many of these people adopt the Russian manners, despise the custom of their country, and have been instructed in the Christian religion by the Russian missionaries, they have, in general, a very imperfect idea of the Supreme Being, and think he can neither dispense happiness nor misery. They believe that the woods and burning mountains are inhabited by evil spirits, to which, from motives of fear, they make considerable offerings, and some of them have idols in their huts; while others reverence some particular animals, from which they apprehend danger.

The *Cossacks*, who have lately made so considerable a figure in military history, are distinguished into three tribes, known by the places where they made their first settlements; though all of them speak the same language, profess the same religion, and live under the same form of government. They were originally Polish peasants, who, being formed into a militia, were posted in the Ukraine, to oppose the incursions of the Tartars; but

finding themselves oppressed by their own lords, they turned their arms against them. In the first engagement they were defeated, and several of them fled to the banks of the Don or Tanais, at that time entirely uninhabited, where they established a colony. In 1637, they were joined by a considerable number of their countrymen, and soon after attacked and reduced the town of Asoph; but, on the approach of the Turkish army, were obliged to abandon that place, having first reduced it to ashes. Their next step was to put themselves under the protection of the Russians, and they built a town, which they called Circasky, on an island in the Don. Their settlement extended itself with surprising rapidity: thirty-nine towns, situated on both sides the river, from Rybna to Asoph, being built and peopled by them in a few years. They enjoy their own laws and customs, being exempt from tribute; neither do they furnish recruits, but, when summoned by the emperor of Russia, they appear in arms at their own expense. Though their country is fruitful they sow very little corn, subsisting chiefly on fish, flesh, and fruits; and their wealth consists in cattle, horses, camels, and dromedaries. They surpass the Russians in the neatness of their dress and houses, profess the Greek religion, and delight in war.

The internal government of the Cossacks is military and democratic. The captains and officers of the nations choose a chief, termed Hetman, who always resides at Circaska, and holds his authority during life; but he must first be confirmed by the emperor. His power extends over the other towns of the nation, each of which is formed into a commonwealth, governed by its own hetman, who is chosen every year, and is accountable to the chief hetman at Circaska.

The Asiatic Cossacks are composed of part of the Don Cossacks, the Grebin Cossacks, and some other tribes, who, retiring from those who inhabited the south borders of Siberia, settled upon the Wolga, and are dependent upon Russia.

The Cossacks are usually mounted on a very little, but well-bred horse, which can walk at the rate of five miles an hour with ease, or, in his speed, dispute the race with the swiftest. With a short whip on his wrist, armed with a lance, a pistol in his girdle, and a sword, the horseman never fears a competitor in a single combat; but irresistibly attacks every opposing squadron in the field.

Those who have not seen the achievements of the Cossacks may, perhaps, hesitate to credit their superiority in cavalry attacks; but what body, armed with sabres, can resist a lance, projecting six feet beyond the horses' heads, sustained by the firmest wrist, and impelled with the activity of the race-horse? The Cossack is not first armed with a lance when he proceeds to war, or when he attains to manhood; it is the toy of his infancy, and

the constant exercise of his youth: so that he wields it, although from fourteen to eighteen feet in length, with the address and freedom that the best swordsman in Europe would use his weapon.

Their manner and way of living are perfectly free and unconstrained. Young people are continually amusing themselves with a variety of sports, and the old are not a little addicted to drinking and idleness. The female sex are not at a loss to give themselves pleasure and delight, as much in intrigue as in dress. The latter no ways differs from that worn by the Russians, except in the high collars of their shirts, and the form of their caps, which stand up straight in the front, are round and flat at top, and commonly very richly embroidered. That worn by the men is the common Cossack dress. There are among them some people of knowledge and good manners, and, about the river Jaik, are practised in politeness and cleanliness, which arise from their intercourse with foreign merchants. They were formerly very uncivilised, and had some very cruel customs. A creditor was authorised to seize his debtor, tie a rope about his left-arm, and lead him about publicly, or treat him as ill and contemptuously as he pleased, till his debt was paid, either by friends or by alms. But, as the right-arm is used among Popish Cossacks to make the sign of the cross, should the creditor tie his debtor's right-arm by mistake, he incurs a punishment for so doing, and loses all claim to the debt. When a wife has given her husband offence, he is at liberty to dispose of her by sale, at any of their public meetings, and the price paid is often but a trifle.

On all solemnities, both of church and state, the people assemble about the court-house, and are treated with bread, fish, and brandy.

Within the hall, the regalia being removed, the tables are spread with all sorts of strong liquors, dried fish, rue, or caviare, and bread, when the sovereign's health is drank by the hetman and starchins, officers of state.

Their courtship and nuptials deserve to be noticed. From the very day of a solemn betrothing, which is done with many ridiculous circumstances, to the day of marriage, which is seldom sooner than twenty weeks, all the young maidens of the bride's acquaintance assemble every evening at her house, and divert themselves with singing and dancing. During this time the bridegroom is authorised to take a husband's liberties with his bride, but with some secrecy. Before the wedding, the bridegroom presents her with a complete female-dress; and she, in return, presents him with a cap, boots, and shirt. When the nuptial-ceremony is over, the bride returns to her house from the church in an open waggon. Behind her sit her mother and the bride-maid, their fingers full of rings, and holding out on each side a piece of linen, to hide the bride's face from the spectators. Before the

waggon walks the bridegroom, with his father and relations. Behind ride several, among whom is one carrying, at the end of a long pole, like a flag, a piece of stuff, striped with several colours, such as is worn by the Circassian women, by way of petticoat; and it is strange that the women of this district do not wear it likewise. The nuptials are next celebrated with dancing and singing, and mostly in the streets. Tartarian dances are frequent at such festivals; and there are many young people who perform the varied and innumerable motions of the body with great strength and wonderful agility.

They have among themselves shoe-makers, smiths, carpenters, &c.; and never suffer strangers of these denominations to settle among them. Some of the Cossack women make camblets, of different goodness and value: the most common sort is very durable and cheap; and they manufacture some of so superfine a quality, as not only to rival the camblets of Brussels, but would excel them, were it not for the defect common to all their drapery and stuff, that of being made in very small and narrow pieces. The Tartarian name of these stuffs is *armak*, and seems to have been invented by the Kirguses, whose women manufacture a coarse kind of camblet.

Breeding of cattle is one of the principal occupations of the Cossacks. Their horses live, both summer and winter, on the heaths, and never fare better, till when taken up to hard labour. The dry ground gives them a fine hard hoof, and renders shoeing unnecessary. On account of their breeding of cattle, many of the Cossacks have enclosures, or cattle-yards, on those parts of the heaths where there is the best pasture. Such Tartars as keep great flocks of sheep wander about with tents, made of felts; but the Russians erect wicker-huts, where they gather their sheep at night, and plaster these huts with mud. They drive large herds of cattle from the Jaik to the Volga, and transport great quantities of hides and tallow to those towns, where there are a great number of tanneries and soap-manufactories.

Another favourite branch of employ is hunting foxes, wolves, beavers, and wild boars. The season for this is the first three winter-months, when they are tracked in the snow: and they follow this business closely, especially when they have had an unsuccessful fishery. But the chief employment of the Cossacks, about the river Jaik, is fishing, wherein they are regulated by many customary laws. They fish but four times a year in that river, and only three of these seasons they consider of any importance. The first principal time is in January, when they fish with hook; the second is in May, and continues till June; the third, and least considerable, is the autumnal season, in October, and they finish in the beginning of December, with nets, which they set under the ice.

The brave Don Cossack, who arrived in London, in 14.

VOL. I.

the spring of 1813, attended by Captain Bock, a Cossack officer, was in the fifty-fourth year of his age; his name was Alexander Wittischendst; and he had been allowed to retire from the service nearly fifteen years, with a pension, the reward of his courage and good conduct. When he heard of the invasion of his country by the French, he quitted his retirement, and voluntarily enrolled himself and his two sons in defence of native independence. He was dressed in the Cossack costume, with a large pistol stuck on his left side, a musket slung behind him, and a pike, upwards of ten feet long, shod with sharp iron.

His stature was about six feet; his make robust and manly; his features better, and his countenance, though rough and soldier-like, more expressive and gentle than the ideas that have generally been formed respecting his nation. His long and grey beard was very formidable, adding much to the power of his eyes, which, though light in colour, beamed forth above this grisley edge with much fire and fierceness. His hair, less grey than his beard, flowing unconfined and unadorned, was combed back over his neck, about the length of six inches, but on the forehead it was cut short. His dress consisted of a blue jacket and loose trowsers, of coarse cloth, with shoes very broad and round at the toes, as if designed to allow free action to his feet, on which he stood remarkably straight and firm. His hand was uncommonly broad in its spread, though his fingers were not long, and he managed his arms, consisting of a pistol, a musket, a sabre, and a long pike, with wonderful address and ease, and carried them without the least appearance of being encumbered by their weight, or inconvenienced by the length of his pike and musket.

This gallant veteran was sent over expressly for the purpose of gratifying British curiosity with a sight of one of those warriors who had done so much towards the deliverance of Europe.

On Wednesday, April the 14th, 1813, he appeared at the Royal Exchange, attended by the Lord Mayor, the city officers, &c. The crowd assembled to view this brave stranger was immense; and the huzzas were cordial and continued: he afterwards went up to the Mansion-House; and, in the evening, was introduced to their Royal Highnesses the Dukes of Sussex and Kent, at the Freemasons' Tavern, at a meeting of the Masonic Charity: and, on the 18th of the same month, he appeared in Hyde Park, mounted on a charger, belonging to Colonel Herries, with his pike, and equipped in his perfect military attire: he was received with very great marks of respect, by thousands of spectators.

Since the conclusion of peace, the British public have been gratified by a sight of the Hetman of the Cossacks, the victorious general Count Platoff, who acted a most prominent part in all the late Russian campaigns. It is

almost needless to add that he has been received with enthusiasm wherever he has made his appearance.

The following anecdotes of this celebrated warrior are too interesting to be passed over in silence:

After the battle of Zecherk, the French general sent a message to General Platoff, to request an armistice, in order that they might bury their dead. To this request Platoff answered, that, as the weather was so cold, there was no probability of any inconvenience arising from their being above ground, and that he should give himself no uneasiness about their interment; but hinted to them, to keep all such frivolous messengers in their camp, unless they wished to increase the number of their dead.

In the field of Preuss Eylau, when the cuirassiers had made their desperate charge on the Russian centre, and passed through an interval, the Cossacks instantly bore down on them, speared them, unhorsed them, and, in a few moments, five hundred and thirty Cossacks reappeared in the field, equipped in the spoil of the slain. So again, after the battle of Eylau, when Buonaparte brought forward an immense mass of cavalry, to overwhelm the Russian rear-guards, commanded by Prince Bragration and by Platoff, the Hetman of the Cossacks, the latter, before they passed the bridges of the river which flowed behind them, and to which they had to descend, saw the impending danger, and began to press back in confusion. Platoff checked, but found the disorder increasing: he immediately sprang from his horse, exclaiming to the Cossacks, "Let those that are base enough abandon their Hetman." The corrected lines paused. He gradually moved; with a waving hand kept back those who trespassed; sent his orders with calmness; reached the town in order; halted at the bridge until every man had passed; destroyed it, and, still on foot, proceeded on the other side of the town, struggling ankle-deep through the heavy sand; nor could the most tremendous cannonade, and the incessant fire of the French battalions crowning the opposite heights, and who commenced their volleys as they formed successively, accelerate his pace, or induce him to mount his horse, until the object was attained, and superior duty called him to the direction of other operations. His mien, his venerable and soldier-like appearance, his solemn dignity of manner, combined with the awful incidents of the scene to render this one of the most imposing and interesting sights that could be witnessed.

After the close of the campaigns of 1806-7, the King of Prussia was so grateful for his services, that he felt anxious for some further distinction for him, he having already received both the red and black Eagle; in fact, he had exhausted all the honours for military achievements. On this occasion, the late amiable Queen of Prussia most graciously discovered the compliment that would be most gratifying to him, and presented him, with her own hand,

with a beautiful heron's plume. Platoff received it with enthusiasm, and with the most grateful emotion; but supplicated, on his knee, permission that his wife might wear it on solemn occasions, "as he should contemplate it with suitable veneration, when borne by one who was more worthy than himself of the honour."

At the treaty of Tilsit, when the French generals sent to request leave to present their compliments to him in person, he sent answer, that "there might be peace between his sovereign and Buonaparte, but no civilities between him and them;" and immediately gave orders for his sentinels not to admit any Frenchman within his lines.

At the commencement of the late war, Platoff, in consequence of an insult offered him by the Corsican tyrant, issued a proclamation, in which he promised any man who brought him the body of Buonaparte, dead or alive, the sum of twenty thousand rubles, and, as a further reward, his daughter, the fair Miss Platoff, in marriage. Unfortunately, however, she did not obtain a husband; although she had as near a chance of a wedded life as any person; if it be true that, as the Cossacks entered a house in pursuit of Buonaparte, he jumped out of a window, and by that means evaded his vigilant pursuers.

*History.]* The Russians, though they had made some incursions into the interior parts of Asia as early as the middle of the fifteenth century, under the reign of John Basilides, had no fixed establishment there till nearly the middle of the sixteenth, when Trogonoff, a Russian merchant of Archangel, having found means to open a trade for furs with Siberia, the czar then on the throne, Ivan Vassilievitch II., to whom he disclosed the nature of his connexions, promised him protection; and, in 1558, assumed the title of Lord of Siberia. Soon after, Yermac, a chief of the Don Cossacks, being compelled, by the progress of the Russian conquests, to submit, or seek some distant place of refuge, retired, with a number of his followers, into Siberia, where, having defeated the Tartar khan of Siberia, he seized his capital, and made it his residence; but, finding himself too weak to preserve his conquests, he applied to Russia for succours and protection, and sent a deputation to do homage to the czar, as his sovereign. In the course of two or three years after, almost all the Cossacks were killed in repeated battles, and Yermac himself was drowned in attempting to leap into a boat. The Russians, however, after many conflicts, secured to themselves the possession of this extensive country; and, by the middle of the seventeenth century, had advanced to the river Amur, where they built some forts, which occasioned hostilities between them and the Chinese, who destroyed the Russian forts. These disputes were terminated by the treaty of Nerzhinsk, concluded in 1689, by which the Argoon was made the boundary of the Russian and Chinese territories. The limits of the former were

In the late war the Don Cossacks rendered themselves particularly conspicuous; and the following letter from General Field-Marshal Prince Kutsoff, of Smolensko, to his eminence Ambrosius, the metropolitan of Novogorod and St. Petersburg, dated January the 4th, 1813, will afford a proof of the veneration which they entertain for their religion; and the very high estimation in which their valour was deservedly held by the Russian commander:

"Bestow your benediction on this present, offered by our warriors to the Giver of Victory. The brave Don Cossacks restore to God the treasure plundered from his temples. They have entrusted me with the duty of transmitting to your eminence this silver, once the ornament of the images of the saints—afterwards the prey of barbarous robbers—and, at length, wrested from their gripe by the brave Don Cossacks. The leader of this corps of Cossacks, Count Mutwei Iwanowitsch Platoff, all his brave warriors, and myself, wish that this plate, which in weight amounts to forty puds, shall be made into images

of the four evangelists, and adorn the church of the mother of God of Kusan, in St. Petersburg. All the necessary expenses of casting these holy images we take on our account. Your eminence will have the goodness to order that able artificers may be employed to fulfil the pious wish of our warriors, by casting these images of the Holy Evangelists, which they offer in their zeal for the temple of God. As soon as you shall inform me what the expense will be, I will remit you the money. It appears to me, that these images would be appropriately placed close to the door of the sanctuary, and before the great communion-table, that they may strike the eye of the devout, when they enter the temple. On the pedestal of each of the images must be engraven the following inscription: "The zealous offering of the corps of Don Cossacks." Hasten to erect in the temple of God this monument of battle and victory, and, while you erect it, say, with thankfulness to Providence, "The enemies of Russia are no more: the vengeance of God has overtaken them on the soil of Russia; and the road they have gone has been strewn with their bones, to the utter confusion of their frantic and proud ambition."

## CHAPTER VIII.

### JAPAN.

#### *Situation, Extent, and Boundaries.*

THE Japanese empire may, in some degree, be compared with the United Kingdom of Great Britain and Ireland; as forming a grand insular power, near the eastern extremity of Asia, similar to that of the British Isles near the western extremity of Europe.

This empire extends from the thirtieth to the forty-first degree of north latitude; and, according to the most recent maps, from the thirty-first to the one hundred and forty-second degree of east longitude from Greenwich. Besides many smaller isles, it presents two considerable ones in the south-west, that of Kiufin and that of Sikokf. But by far the most important island is that of Nipon, to the north-east of the former. The geography of Kämpfer has been corrected by recent voyagers, according to which the length of Kiufin, from north to south, is about a hundred and forty British miles, the greatest breadth about ninety. Sikokf is about ninety British miles in length by half the breadth.

The grand isle of Nipon is in length, from south to north-east, not less than seven hundred and fifty British

miles; but is so narrow in proportion, that the medial breadth cannot be assumed above eighty, though in two projecting parts it may double that number. These islands are divided into provinces and districts.

To the north of Nipon is another large isle, that of Jesso, which, having received some Japanese colonies, is generally regarded as subject to Japan; but, being inhabited by a savage people, it is rather considered as a foreign conquest than as a part of this civilized empire.

*Climate, Soil, &c.]* The heat, during the summer-months, is extremely violent, and would be insupportable, were not the air cooled by the sea-breezes; and the winter is equally severe, particularly when the wind blows from the north to north-east. Thunberg observes, that the greatest degree of heat at Nagasaki was ninety-eight degrees in the month of August; and the severest cold in January thirty-five degrees; but the season he spent there was unusually mild. The weather is changeable throughout the year; and there are heavy falls of rain, especially in the rainy months, which begin about Midsummer. Thunder is very frequent; and tempests, hurricanes, and earth

quakes, are visitations to which the inhabitants are so much accustomed, that they pay little attention to them, unless they happen to lay villages and towns in ruins. They then have recourse to extraordinary acts of worship; and sometimes even proceed to offer human victims, to propitiate their deities.

The soil of Japan is naturally sterile; but, in consequence of the infinite pains that are taken to improve it, and the advantages of its climate, it is rendered sufficiently fertile, and produces abundant crops.

*Vegetables.*] Among the vegetable productions of Japan are rice, wheat, barley, and beans. With the barley they feed cattle; the fine wheat they convert into cakes; and of two kinds of beans, they grind one into meal, to boil for eating, and with the other make a sort of preserve for deserts. They have also many other species of grain. They have various flowers and herbs; and their tea is esteemed particularly excellent. A great number of camphire-trees grow near the hot-springs, which resemble laurels, and bear purple or black berries. The cedars of this country are excellent, and many other trees, as platanus, &c. some of which, when cut asunder, exhibit admirable figures of birds, beasts, landscapes, &c. Of these are made many curious pieces of furniture, which, when polished, have a fine effect.

No country presents stronger proofs of agricultural skill and industry, and yet neither rewards nor encouragements are necessary. Husbandmen are considered as the most useful class of citizens, and they are treated accordingly. They neither groan under oppressions, nor do they labour for others. The taxes indeed are heavy, but they are paid in kind; and the farmer is at full liberty to cultivate the soil in that manner which he conceives will be most advantageous to him.

*Animals.*] Among the quadrupeds of this country the principal are buffaloes, elephants, oxen, horses, and deer, together with many wild beasts, that yield very valuable furs. The horses, though small, are uncommonly swift, and extremely beautiful. Neither sheep nor goats are found in this extensive country, the latter being deemed mischievous to cultivation, while the abundance of cotton and silk recompense the want of wool. Swine are also deemed pernicious to agriculture; and the few that appear were probably introduced by the Chinese. There are but few cows; nor do the natives either use their flesh or milk, but employ them only in ploughing and drawing carts. A few dogs are kept from motives of superstition, and cats are favourites of the women; but foxes, which inhabit some parts of the country, are considered as incarnate demons. Hens and ducks are domesticated, chiefly on account of their eggs. The ducks are remarkable for their size, shape, and beauty, as are the nightingales for their melody.

Near the river Miaco were seen a great number of pelicans, which built their nests in pine-trees, all along the road.

There is here a species of white ant, which, though pleasing to the eye, is very mischievous; for they pierce, with their little snouts, every thing they come near, except metal and stone, and gradually damage all kinds of goods, if not prevented from approaching them, by strewing the adjacent place with salt, which these little insects abhor. The beetles make an agreeable kind of humming noise, which gradually rises to a pretty high note. But the night-fly exceeds all the other insects for its beauty. The body is about three inches long, round, and finely shaped. It has four wings; two close to the body, which makes a very brilliant appearance, by means of the lustre of the blue and gold streaks with which they are tinged; and two above these, whose transparency not only admits of the others being seen through them, but even adds to their brilliancy. Sea and river-fish are found in Japan, in great abundance and variety.

*Minerals, &c.*] Gold is found in several parts of Japan; but, that it may not lose its value by being too plentiful, it is prohibited to dig more than a certain quantity; and none can be exported, either in bullion or in coin. The richest gold-mine is situated in the largest of the Nipon islands, near Sado. The next most valuable is in Suruga. Considerable quantities of this precious metal are also extracted from cupreous pyrites, dissolved by brimstone. Silver seems to be less plentiful than it was formerly; and it is more esteemed, according to the comparative value, than gold, which is so much more abundant.

*Rivers, Lakes, &c.*] The rivers of Nipon have not been delineated with much care. Among the few named are the Nogata and the Jedogawa, which passes by Osaka, where it is crowned with several bridges of cedar, from three hundred to three hundred and sixty feet in length. The river Ojingawa is one of the largest and most dangerous in the country, though not subject, like the others, to swell during the rainy season. Finsigawa is also a large and rapid river, as is that called Sakgawa. The largest river, however, seems to be the Jodo, which flows in a south-west direction from the central lake of Oitz. This lake emits two rivers, one towards Miaco, the other towards Osaka. It is said to be fifty Japanese leagues in length, each about an hour's journey on horseback; and the breadth is very considerable.

*Mountains, Volcanoes, Whirlpools, &c.*] The principal mountain in Japan is that of Fusi, covered with snow almost throughout the year. Many of the mountains are overgrown with wood, and some are richly cultivated.

Japan is remarkable for its volcanic mountains: particularly near Firando, there is a small rocky island, that has been humming and trembling for many centuries; and at a

land, that has  
ies; and at a

small distance from the coast is another, which has thrown out lava, and other combustible matter, at different intervals, for several ages. On the summit of a mountain, in the province of Figo, a perpetual flame continually issues. Sometimes a black smoke, accompanied by a very disagreeable stench, is observed to issue from the top of a famous mountain, called Feri. This mountain is said to be nearly as high as the pike of Teneriff; and its top is perpetually covered with snow. Unsen is a large, though not very high, mountain, near Tinabra; its top is constantly bare, and of a whitish colour, from the sulphur upon it; and its smoke may be discerned at the distance of several miles. The earth is, in several places, burning hot, and is so loose and spongy, that, except on a few spots, where trees grow, one cannot walk over it, without being in continual fear from the crackling hollow noise perceived under foot. Its sulphureous smell is so strong, that, for the space of many miles round, there is not a bird to be seen; and, when it rains, the water is said to bubble up, and the whole mountain to appear as if boiling.

On the coast of Japan there are two remarkable and dangerous whirlpools. One, near Simabara, is, at high-water, even with the surface of the sea; but the tide no sooner begins to ebb, than, after some violent turnings, it suddenly sinks to the depth of fifteen fathoms, swallowing up, with great force, the ships, boats, and whatever comes within its reach, dashing them to pieces against the rocks at the bottom, where they sometimes remain under water, and at others are thrown out again, at several miles distance. The other, which lies near the coast of the province of Kijnokuni, rushes with a loud boisterous noise about a small rocky island, which, by the violence of the motion, is kept in a perpetual trembling. But, though this has a very formidable appearance, it is esteemed less dangerous than the other; for, its noise being heard at a considerable distance, it may easily be avoided.

*Cities and Towns.*] JEDDO, the capital of the Japanese empire, and the residence of the kubo, or emperor, is situated on a bay in the south-east side of the island of Nipon. It is in the form of a crescent, and intersected, in almost every street, by canals of water, shaded on each side with rows of trees. These canals not only serve as ornaments to the city, but are of great utility in case of fire, as they both afford a ready supply, and stop the progress of the conflagration. The city is not surrounded by walls, but has a strong castle to defend it. The river Tonkag supplies the castle-ditch, and, being divided into five streams, has a bridge over each. The principal of these bridges is the standard from which all the roads, posts, and distances, in the empire are taken. As the city of Jeddo is very large, so it is also proportionally populous, on account of the vast number of strangers that flock to it from all parts of the country. Towards the streets there are

always either work-shops or ordinary sale-shops. The former are generally screened from the view of passengers in the street by a cloth, so that the artisans cannot be seen; but the sale-shops exhibit patterns of their respective commodities.

The imperial palace is a most noble building, comprising many streets, courts, pavilions, guard-houses, gates, draw-bridges, gardens, canals, &c. It is surrounded by three high walls, and as many deep ditches, with large intervals between each; and the water is conveyed from one ditch to another by subterranean pipes, so that they are always equally full. These walls have eight or nine stately gates opposite to each other, and between every two gates there is first a level piece of ground, and then an ascent by steps into certain outworks, with another area beyond them, where a thousand men may be drawn up on any emergency; so that the avenues to the imperial apartments are sufficiently secured. In the space between the first and second wall live the princes, chief nobility, and governors of the provinces, in stately edifices, according to their rank and office; and the ornaments and furniture within are answerable to their external appearance, it being esteemed a mark of respect to the monarch to strive to excel one another in the riches and splendor of their houses and furniture. Between the second and third wall live the emperor's relations and principal counsellors, each in separate apartments, or rather palaces, extremely grand and beautiful. In the centre of all, within the third enclosure, are the imperial apartments, consisting of a great number of spacious halls, chambers, and offices, for the emperor, his wives, and attendants, all of them richly furnished. These apartments are three rows of buildings, nine stories high, formed on the top like pyramids, and crowned with large gilded dolphins. The ceilings of the halls and chambers are plated with gold and silver, curiously wrought, and enriched with a variety of precious stones. The hangings are of the richest silk, flowered with silver and gold, pearl, and other embellishments. In the hall of audience, where the emperor receives ambassadors, there is a throne of massy gold, set with large gems. The roof, which is very lofty, is also plated with gold, richly enamelled with curious figures and landscapes, and supported by stately gilded columns. The gardens behind the apartments are laid out in an elegant taste, and are most agreeably diversified with terraces, canals, fish-ponds, water-works, and other ornaments. Nor must we omit to mention the noble theatre in the area before this inner court, where plays are frequently acted for the diversion of the imperial family. Upon the whole, this amazing palace, which is five or six miles in circumference, looks like a populous and opulent city within itself, inhabited by princes and nobles, and by the eldest sons of all the great men of the empire, who are educated there, and kept as pledges of their fathers' fidelity.

The temples at Jeddo are very numerous and splendid, particularly that of Amida, one of their principal deities, which is almost covered with gold. The statue of that deity is on horseback, placed on a magnificent altar, covered with plates of the same metal; and the housings of the horse are also embroidered and enriched with pearls, diamonds, and other gems. Nothing can be more frightful however, than the figure under which he is represented; and, indeed, many idols of the Japanese are formed in the most monstrous shapes imaginable.

As fires are very frequent, the utmost vigilance is used to lessen or prevent the danger. One watch is kept in Jeddo to announce the hour, and another expressly for the prevention of fires.

This city is under the direction of two governors, who rule alternately for the space of one year. Under these are inferior officers, who have the direction of particular districts or wards; and subordinate to these are the *ottomas*, who have each the care of a particular street.

Miaco, the ancient metropolis of the empire, is situated on a pleasant and extensive plain, on the southern coast of the island of Japan, being surrounded at some distance by mountains, which give a pleasing and romantic prospect to the whole, particularly as the circumjacent country, between the city and the mountains, and the mountains themselves, are covered with temples, sepulchres, and monasteries, and embellished with a variety of orchards, gardens, groves, cascades, and purling streams.

This fertile plain is watered by three considerable rivers, which unite their streams in the centre of the city, where a magnificent stone-bridge facilitates the communication between the upper and the lower town. Here are established many beautiful manufactures in velvets and silks, wove with gold and silver, and in most kinds of metals. Here the coin is struck and stamped, and the celebrated Japanese copper is smelted, refined, and manufactured.

The emperor having discontinued his residence here, the city of Miaco has greatly declined; so that, according to the best authorities, it does not, at present, contain above a hundred thousand persons. The universities, colleges, monasteries, and temples, are very magnificent; but the private houses are but two stories high, built of wood, and covered with clay, or thatched. Neatness, however, is united with simplicity; and every trade or calling has its particular district.

The palace of the Dairi is situated on the north part of the upper town: it contains a small garrison, is six hundred yards in length, has a tower in the centre, and is surrounded by two ditches, the one dry, the other full of water, and abounding with the most delicious fish. So extensive is this palace, that it might be deemed a city of itself. It is enclosed by magnificent walls, flanked with stately towers, and surrounded with a double ditch. It

contains twelve capital streets, in the centre of which are the royal apartments, superbly gilt, elegantly furnished, and adorned with gardens, orchards, pavilions, terraces, groves, &c.

Of all the religious structures, which are numerous here, that of Daibud is not only the largest, but the most remarkable. This temple stands on ninety-six pillars, and has several lofty, but narrow, entrances. The body of the pile consists, as it were, of two stories, which run into each other, and consequently have a double roof, the uppermost of which is supported by painted pillars, about six feet in diameter.

The image of the idol Daibud, which stands in the middle of the temple, is calculated to strike the spectator with terror. This image is in a sitting posture, and raised about two yards from the ground, with its legs placed before it, in the Indian manner. The ears are pendulous, the hair short and curling, the shoulders naked, the body covered with a wrapper, the right arm elevated, and the left laid edgewise against the belly. So enormous is the magnitude of this symbolical representation of the greatness of the deity, that six men may sit on the palm of its hand.

The emperor, who cannot personally visit this temple, annually sends an ambassador in his stead; and all his subjects, of every rank and condition, are bound to take a pilgrimage hither at least once in their lives; though many, from a principle of devotion, go frequently.

OSAEGA is deemed the chief sea-port in the empire. It is nearly fifteen miles in circumference, contains many elegant houses, and some palaces, belonging to the nobility. The river Jegodawa washes the town, and, by means of different canals cut from it, refreshes all the principal streets. The citadel is of considerable extent, and tolerably strong. Across the river are many fine bridges of cedar, which preserve a communication with the different parts of the town.

Two officers command here: one has the superintendence of the castle, and the emperor's treasures, stores, and customs; the other presides over the garrison. But the city itself has a governor of its own, who has the regulation of all civil affairs. The houses are covered with a kind of yellow earth, which gives the roofs an elegant appearance. The mode of announcing the hour of the night, by the watchmen, is very singular: an hour after sunset, they beat a drum; the succeeding hour is signified by striking on a brazen bowl; and the hour subsequent to that by ringing a bell: the next hour, they begin again with the drum, proceed to the bowl and bell, and so continue the whole night, using the three instruments alternately. In all other parts of the empire, however, the hour is told by beating with two wooden cylinders against each other.

CANGOXIMA, remarkable for being the spot on which the Portuguese first landed, is a sea-port. It lies in thirty-one degrees forty-two minutes north latitude, and one hundred and thirty-three degrees sixteen minutes east longitude. A strong castle is built on a rock in the harbour, and a light-house on another very high rock in the harbour. A good garrison is kept here, and many stately temples adorn the city.

NAGASAKI, the nearest city to the Dutch factory, is one of the five towns called Imperial; and, on account of its foreign commerce, is one of the most bustling in the empire. It belongs separately to the secular emperor; he appoints a governor in his name, who is annually changed; but, after the expiration of a year, generally returns to his post; so that, in fact, there are two governors, one in office, and the other out. The town is surrounded, on the land side, by high mountains, that slope off gradually towards the harbour, which is generally full of shipping. The island of Dezima, which the Dutch rent for a factory, may be considered merely as a street belonging to Nagasaki. It has a communication with it by a bridge, and, at low water, is only separated from it by a ditch.

*Roads, &c.]* The roads in Japan are broad, and furnished with ditches to carry off the water. They are generally kept in good repair; but before the Dutch make their annual journey to the capital, they are fresh strewn with sand, and every species of filth is removed. In hot and dusty weather they are also watered. Their sides are frequently planted with hedges, of various kinds: among the rest, Thunberg found the tea-shrub, very commonly used for this purpose.

Mile-posts are set up, which not only indicate the distance, but also point out the road; and, in fact, not any thing is omitted that can contribute to the security and accommodation of the traveller, which might be expected among a people far advanced in civilization. The roads of Japan, however, when once made, cost little to keep them in a perfect state of repair. No wheel-carriages, for pleasure, are known in this empire; and travellers either go on foot or on horseback, unless they are of high rank, when they are carried in cangos, or norimons.

The cango is a square kind of close box, approaching the shape of a sedan-chair, but destitute of its elegance or convenience.

The norimons are made of thin boards and bamboo canes, in form of an oblong square, with windows before and on each side. Over the roof runs a long edged pole, by which the chair is supported on the bearers' shoulders. It is so large, that a person may sit or lie in it at his ease, and is richly adorned. The number of porters are in proportion to the rank of the person, and they alternately relieve each other. They generally sing some air in concert, which regulates their pace.

Travellers on foot wear out their shoes in this country very fast, and as easily replace them. They are made of plaited rice-straw, and are sold, at a very low rate, in every village, even the most inconsiderable. Hence shoe-making forms the employment of numerous hands. Even the horses are shod with straw, instead of iron. They are tied above the hoof with strings of the same materials; and, in slippery roads, are extremely convenient, though they cannot be very durable.

*Language and Literature.]* The Japanese language is written, like the Chinese, in straight lines, upwards and downwards, but the letters are quite different, and the language, on the whole, so dissimilar, that those two neighbouring nations cannot understand each other without an interpreter. The Chinese language, however, is much read and written at Japan, and is used by the learned in particular. Thunberg, with great difficulty, made some progress in the current tongue of this country, and even formed a vocabulary of some of its most usual colloquial terms.

In literature, the Japanese yield to few of the oriental nations. They consider house-keeping, or domestic economy, as an indispensable science; and, next to this, every Japanese is versed in the history of his country. Astronomy is cultivated, but has not arrived at much perfection. They survey with tolerable accuracy; and their maps are as exact as their imperfect instruments will permit. The art of printing is ancient, but they use blocks, not moveable types, and only impress one side of the paper.

*Religion.]* The religion of Japan is Polytheism, united with the acknowledgment of a Supreme Creator. There are two principal sects. The first acknowledge a Supreme Being, far above the worship of man; whence they adore the inferior deities, as mediators. They believe that the souls of the virtuous have a place assigned to them immediately under heaven; while those of the wicked wander in the air, till they expiate their offences. They abstain from animal-food, detest bloodshed, and will not touch a dead body.

Although the professors of this religion believe that their gods know all things, and that, therefore, it is unnecessary to pray to them, they have both temples and stated holidays. Their temples consist of several different apartments and galleries, with windows and doors in front, which can be taken away and replaced at pleasure, according to the custom of the country. The floors are covered with straw-mats, and the roofs project so far out every side, as to overhang an elevated path, in which people walk round the temple. In these temples no visible idol is exhibited, nor any image designed to represent the Supreme Invisible Being: though they sometimes keep a small image in a box, representing some inferior divinity, to whom the temple is consecrated. In the

centre of the building is frequently placed a large mirror, made of cast metal, well polished, which is intended to remind those that come to worship, that, as their personal blemishes are faithfully portrayed in the mirror, so the secret blemishes of their hearts lie open to the penetrating eyes of the gods.

The priests are either secular or monastic; the latter alone are entrusted with the mysteries. There are likewise several orders of monks and nuns, as in the Roman Catholic system; though the festivals and modes of worship are very cheerful, for they regard the gods as beings who solely delight in dispensing happiness. Besides the first day of the year, and three or four other grand festivals, the first day of the month is always observed as a holiday.

The doctrine of their philosophers and moralists partakes of the Epicurean, though it acknowledges, that the purest source of pleasure is a virtuous life. This sect does not allow inferior gods, temples, nor religious ceremonies.

Some Jesuit missionaries arrived in Japan in the year 1549, and their successors continued to diffuse their doctrine till 1638, when, among other persecutions, thirty-seven thousand Christians were massacred; and, in 1590, upwards of twenty thousand are said to have perished. The pride and avarice of the Portuguese, together with the vain ambition of the Jesuits, who endeavoured to introduce themselves into the governing councils of the nation, first conspired to render odious the religion which they professed, and afterwards to produce this melancholy catastrophe; the existence of the Christian faith being, through such perversion, found incompatible with that of a state otherwise universally tolerant. Since that memorable epoch, Christianity has been held in the greatest detestation; and the cross, with its other symbols, are annually trampled under foot.

This ceremony is performed for the purpose of imprinting on every one an abhorrence of the Christian doctrine, and of the Portuguese, who attempted to propagate it, and at the same time to discover whether any remains of it are left among the Japanese. The trampling is performed in such places as were formerly most frequented by the Christians.—In the town of Nagasaki it continues four days: after which the images, which are made of copper, and are about twelve inches in length, are carried to the adjacent places, and laid by till the following year. Every one, except the governor and his train, even the smallest child, is obliged to be present at this ceremony; and overseers are appointed to superintend the due observance of this horrid custom. Adults walk over the images, from one side to the other, and children in arms are put with their feet upon them.

*Government.]* The government is, at present, vested in

the kubo, or secular emperor, who is sole monarch of the country; but, till near the end of the seventeenth century, the dairis, or spiritual monarchs, held the supreme authority, being appointed by the high ecclesiastical court, according to the laws of succession. Yet, occasionally, this appointment has been changed; which has involved the country in many civil wars. The ecclesiastical dignities were of six orders; some belonging to particular offices, others merely honorary. The secular prince is accustomed to confer, with the consent of the dairi, two honorary ranks, equivalent to our noblemen and knights. The ecclesiastical court is chiefly occupied with literary pursuits, the dairi residing at Miaco, where his court remains, though not in its former splendour.

The senators and ministers of state appear at court every day, and dispatch all public affairs, by the emperor's directions. These are maintained at a considerable expense, and receive great honour from the inferior nobles. Their authority and power depend upon the emperor's pleasure; and, though all the affairs of the kingdom pass through their hands, yet they never venture to propose any advice, but such as they know will be agreeable to the sovereign.

Every governor of a province is responsible for his administration, his family remaining at the emperor's court, as hostages; and he is obliged to make an annual appearance in person, the journey being performed with great pomp, and accompanied with valuable presents. The emperor derives his principal revenue from his own estate, consisting of five inferior provinces and some detached towns. Each prince enjoys the revenues of his government, with which he supports his court and military force, repairs the roads, and defrays the civil expenses. The princes of the first dignity are styled Daimio, those of inferior rank Sionio. They are generally hereditary; but the Sionios are not only obliged to leave their families at the capital, but to reside there themselves during half the year.

The emperor never pays more than one visit to any of his nobles, of which three years' notice is given; and during the whole of this time preparations are constantly making, with great care and expense: every thing is adorned with his arms, and never after used, but preserved with great devotion, in remembrance that the emperor once condescended to eat in that house.

*Laws.]* The laws of Japan are rigidly, though impartially, administered: the parties themselves appear, and the cause is determined without delay. When a gentleman, or soldier, is condemned to die, he is allowed to destroy himself; whereas citizens, merchants, and meaner persons, suffer by the common executioner. Almost every crime, however small, is punished with death, fines being considered as a partiality to the rich; but the sentence of death must be signed by the privy-council at Jeddo. If murder

be perpetrated but sometimes are involved more or less the means of Dealing in the traffic of executing with a painful mode by way of Theft and murder. P

eddo. If murder

be perpetrated in a town, not only the murderer himself, but sometimes his relations, dependents, and neighbours, are involved in the calamity, accordingly as they have been more or less accomplices in the crime, or have neglected the means of preventing its perpetration.

Dealing in contraband goods is death without mercy; and the punishment extends to every individual concerned in the traffic, both buyer and seller. The general mode of executing the sentence of the law is by decapitation with a scimitar, in prison; though crucifixion, and other painful modes of death, are sometimes exhibited in public, by way of terror.

Theft and gaming are esteemed no less crimes than murder. Parents and relations are made answerable for the crimes of those whose moral education they ought to have superintended. The police is excellent, there not only being a chief magistrate of each town, but a commissary of each street, elected by the inhabitants, to watch over property and tranquillity. Two inhabitants, in their turn, nightly patrol the street; the one to announce the hour, the other expressly for the prevention of fire.

The best proof that the laws are salutary is, that few crimes are committed, and few punishments are inflicted. A brief code is posted up in every town and village, in large letters, on a spot surrounded with rails.

*Population.* The population of the Japanese empire, like that of other Asiatic states, can only be estimated from conjecture; but it is generally admitted, that the number of inhabitants is surprising. Jeddo and Miaco are equal in size to any cities in the world; the former, which is the capital, is said to be sixty-three British miles in circumference. Many of the villages are three-quarters of a mile in length; and some so long, that it requires several hours to walk through them; and these large villages frequently occur in very short distances. Kämpfer says, that the number of people daily travelling on the highway is inconceivable, and that the great roads are sometimes more crowded than the most frequented streets of European capitals. Some estimate may be formed, by supposing the population of Japan to equal that of China, in proportion to its extent; and the former country being about one-tenth part the size of the latter, the population will be about thirty millions.

*Army, Navy, &c.* The Japanese are naturally good soldiers, the character of the people being singularly brave and resolute; but, as they inhabit nothing but islands, they are seldom at war; they, nevertheless, keep a large standing army. Varenus, the geographer, has, from the best authorities, estimated the regular forces maintained by the princes and governors at three hundred and sixty-eight thousand infantry, and thirty-eight thousand cavalry; while the kubo, or emperor, maintains a hundred thousand foot, and twenty thousand horse, thus constituting in the whole

a force of four hundred and sixty-eight thousand infantry, and fifty-eight thousand cavalry.

The military weapons of Japan consist of bows, arrows, scimitars, halberts, and guns. Their bows are very large, and their arrows long. Firelocks are not in common use in the army; they are chiefly possessed by persons of consequence, and are always displayed in their apartments on an elevated stand. They have a few cannon at Nagasaki, and at the imperial palace at Jeddo. These seem to have been formerly taken from the Portuguese, and are only used in saluting. The scimitar is the chief weapon, and is constantly worn by every person above the rank of a peasant. This weapon is about a yard in length, somewhat inclining to a curve, and has a broad back. The blade is of admirable temper, and the oldest are always most valued. They are far preferable to the tal-teros, and will cut a large nail without turning the edge. According to the Japanese accounts, they will cleave a man asunder from head to foot. The hilt is furnished with a round and substantial guard, without any bow, and is full six inches long. The scabbard is thick and rather flat, and sometimes covered with the finest shagreen, lacquered.

The navy, like that of the other oriental powers, is almost unworthy of notice. The Japanese vessels are open at the stern, so that they cannot bear a boisterous sea. Captain King observes, that those which he saw off their coast could not have endured the violence of the storm, when the sea ran as high as the oldest mariner on-board ever remembered to have seen it. They had only one mast, on which was hoisted a quadrangular sail, extended aloft by a yard, the braces of which worked forwards. Three pieces of black cloth came half way down the sail, at an equal distance from each other.

M. de la Prouse, being off the coast of Japan, in 1787, discovered two Japanese vessels, one of which is thus described by that intelligent navigator:

"This vessel, which was about a hundred tons burthen, had a single high mast in the middle, and which appeared to be only a parcel of small masts united by copper hooks and mouldings. The sail of it was linen, the breadths of which were not sewed, but laced lengthwise. This sail appeared very large, and two jibs, with a spritsail, composed the remainder of her suit. A small gallery, of three feet in breadth, projected from both sides of this vessel, and extended along her gunwale from the stern to about two-thirds of her length. She had beams upon her stem, which projected, and were painted green. The boat, placed athwart her bows, exceeded the breadth of the vessel by seven or eight feet, which had, in other respects, a common sheer, a flat poop, with two small windows, very little carved work, and did not resemble the Chinese junks in any thing but the manner of fastening the rudder with cords. Her side-gallery was only raised two or three feet

above her water-line, and the extremities of the boat must touch the water in rolling. Every thing made me think that these vessels were not destined to go any distance from the coasts, and they could not be safe in a high sea during a squall of wind: it is probable, the Japanese have vessels for the winter, better calculated to brave the bad weather. We passed so near to this vessel, that we observed even the countenances of individuals. They had a small Japanese white flag, on which were words, written vertically. The name of the vessel was on a kind of drum, placed at the side of the ensign-staff."

The Japanese pleasure-boats, which are intended only for the navigation of lakes, rivers, &c. are finely gilt, carved, and otherwise adorned with the most curious and superb embellishments.

*Revenues.*] The revenues of this empire are minutely stated by Varenus, according to princes and provinces; the sum total being two thousand eight hundred and thirty-four tons of gold, in the Flemish mode of computation; and taking the ton at only ten thousand pounds sterling, the amount would be twenty-eight millions three hundred and forty thousand pounds sterling, besides the provinces and cities which are immediately subject to the emperor. These revenues are not, however, to be considered as national, being only yielded in coin to the various princes. The emperor, however, besides the large revenues of his provinces, has a considerable treasure in gold and silver, disposed in chests, containing a thousand taels, each being nearly equal in value to a Dutch rix-dollar, or about four shillings and four pence English.

*Manufactures.*] Some of the manufactures are carried to the highest degree of perfection in Japan. They work extremely well in iron and copper; their silk and cotton manufactures equal, if not excel, the productions of other oriental countries.

Lackering in wood, especially their ancient workmanship, surpasses every attempt at imitation by other nations. They make use of the finest firs and cedars, and cover them with a varnish, prepared from the rhus vernix, which grows every where in abundance. This varnish oozes out from the tree, on its being wounded, and at first is about the consistence of cream, but afterwards grows thicker. It is of such a transparent nature, that, when it is laid, pure and unmixed, on boxes and other pieces of furniture, every vein of the wood may clearly be seen through. This lacquered work is also embellished with gold and silver flowers and figures. Old works of this kind, in good preservation, fetch a very high price, as it seems they neither emboss nor colour so well now as in former ages. The porcelain is here deemed equal, if not superior, to that of China. Their swords display incomparable skill, and paper is fabricated here from the bark of a species of mulberry.

As the intercourse of the Japanese with foreigners is extremely limited, the greatest part of their commerce must be among themselves. "Their inland trade, however, is very flourishing, and in every respect free and uncontrolled. The harbours are covered with coasting vessels and boats, and the high roads are crowded with travellers, transporting their wares from one place to another. Large fairs are also held in different places, to which there is a great concourse of people. The trade with China is the most important, consisting of raw silk, sugar, turpentine, drugs, &c.; while the exports are copper in bars, lackered ware, &c.

Both the Dutch company and individuals are prohibited from exporting from hence Japanese coin, maps, charts, and books, at least such as are relative to the country; and all sorts of arms, particularly their scimitars.

*Customs, Manners, &c.*] The inhabitants of Japan are stout, and very active, although their strength is not equal to that of the northern inhabitants of Europe. The men are of the middling stature, and, in general, not very corpulent. They are of a yellowish complexion, sometimes bordering on brown, and sometimes on white. The lower class of people are sun-burnt, and consequently brown; but ladies of distinction, who seldom go out in the air without being covered, are perfectly white. Their eyes have not that rotundity, which those of other nations exhibit; but are oblong, small, and sunk deep in the head; in consequence of which, these people have almost the appearance of being pink-eyed. In other respects, their eyes are dark brown, or rather black; and the eye-lids form, in the great angle of the eye, a deep furrow, which makes the Japanese look as if they were sharp-sighted, and discriminates them from other nations. Their eye-brows are also placed somewhat higher. Their heads are, in general, large, and their necks short; while their hair is black, thick, and shining, from the use they make of oils. Their noses, though flat, are yet rather thick and short.

The character of this people must of course display great diversity; but their virtues far preponderate over their vices; and even their pride is useful, as it prevents them from stooping to the mean tricks of the maritime Chinese.

Nothing imported by the Europeans escapes their curiosity. They seek information concerning every article; and their questions are generally repeated till they become troublesome. Physicians are regarded with great respect, on account of their supposed learning, and they are consulted as oracles.

Frugality is said to have its peculiar abode in Japan; it is a virtue admired, as well in the emperor's palace as in the meanest cottage. It makes those who possess but little contented, and it prevents the abundance of the rich from overflowing in voluptuousness. Hence scarcity

and famine are unknown; and, though the state is exceedingly populous, yet there is scarcely a necessitous person to be seen.

Though a plurality of wives is allowed, yet one only is acknowledged, the others being merely considered as concubines. Marriages are conducted by the parents or relations; and the wife is under the absolute disposal of her husband, the laws allowing no claim whatever, in case she incurs his displeasure. Hence, though the women are not confined, examples of infidelity rarely occur. In case of separation, the wife is condemned to the ignominy of having her head always shaved. The marriage-ceremony is performed before an altar, on an elevated situation near the town, by the bride lighting a torch, from which the bridegroom kindles another.

The dress of the Japanese is perfectly national and uniform. From the monarch to the most obscure subject, it has not undergone variation, from caprice, fashion, or any other cause, for the space of two thousand five hundred years.

It consists universally of long and wide gowns, of different lengths, according to sex or situation, and of different degrees of fineness, according to the circumstances of the wearer. The men seldom wear more than two or three of them at once; but the women have often thirty or forty, all so thin, as not to weigh more, collectively, than four or five pounds. These gowns are fastened round the body by a belt.

Men of high rank, besides these long gowns, have a short half-gown, worn over the other, and made of a thin gauzy stuff. This is tied with strings at the top and bottom, and is sometimes green, but more frequently black. Their breeches are manufactured of a species of hemp, and are left open on the sides to two-thirds of their length. They depend to the ankles; and at the back part of them is a thin triangular piece of board, covered with the same stuff, which sticks up just above the band. These breeches are sometimes striped with brown, or green, but more commonly they are black. Drawers are seldom used but on journeys, and by soldiers, who wear short or tucked-up gowns, that they may run with the greater speed. The complimentary dress is worn above the common gown. It consists of two pieces, made of one and the same kind of stuff. The undermost piece is the above-described breeches, made of a blue stuff, painted with white flowers. The uppermost piece is a frock, like the half-gown, thrown back over the shoulders.

Stockings are unnecessary, because the night-gowns descend to the ankles; however, cotton-stuff spatterdashies are sometimes used. The Japanese never enter their houses with their shoes on, but always leave them at the door.

The mode in which this people dress their hair is pec-

uliar to themselves. The men shave the whole of the head, down to the nape of the neck, leaving, however, some on the temples, which, being greased and turned back, is tied with that remaining behind at the top of the head, with several rounds of white string, made of paper. This is strictly attended to, and the head shaved daily. Priests, physicians, and youths before the age of maturity, are the only persons who are exempted from this custom. The former shave their heads all over; and boys suffer their hair to grow, till such time as their beards begin to appear.

No females have their hair cut off, except such as have separated from their husbands. They besmear their hair with oil and mucilaginous substances, and put it close up to the head, on all sides, in a neat and simple manner, or else spread it out on the sides like wings. After this, the ends are fastened together round a knob, at the crown of the head. Single women and maid-servants are frequently distinguished from the married by these wings. Just before the knob, a broad comb of lacerated wood, or tortoise-shell is stuck. They also sometimes wear other ornaments of tortoise-shell or flowers.

Neither hats nor caps are used by the Japanese, except on journeys, when they wear a conical hat, made of a species of grass, and tied on with a string. Some few women, also, when travelling, wear a sort of cap, interlaced with gold; but a parasol is their usual protection from the solar beams, or the rain.

The houses in Japan are generally constructed of wood and plaster, and white-washed on the outside, so as to resemble stone. They have no partition-walls, but only sliding frames, which are made of lacerated wood, and covered with thick painted paper. The roofs are covered with thick tiles, and occasionally with the bark of trees or chips of woods. The floors are always spread with mats. The ceilings and walls are usually papered with various colours, and sometimes highly embellished with gold and silver. The room which serves as a kitchen has no other fire-place than a square aperture, which is frequently in the middle of the room, and lined with a few stones. The smoke ascends through a hole in the roof. The windows are formed of a semi-transparent paper, which renders the houses rather gloomy and dull. Nor is the general style of architecture, in this country, either elegant or convenient.

The furniture is as simple as the style of building. Here are neither sofas, beds, tables, nor chairs. To the greatest part of those conveniences the Japanese are perfect strangers. Their soft floor mats serve them at once for chairs and beds. A small table, about twelve inches square, and four in height, is set down before each person in company, at every meal. A soft mattress, stuffed with cotton, is frequently spread upon the mats, when the hour of rest approaches.

Fans are universally used by both sexes; and on these they have often their route marked, when they go a journey. Though they have not mirrors to decorate the walls of their apartments, at the toilette the ladies use plates of copper and zink, highly polished, which answer the same purpose.

The food of the Japanese comprises not only such articles as are wholesome and nutritive, but take in almost the whole animal and vegetable kingdoms. The meat that is served up in every dish is cut into small pieces, well boiled and stewed, and mixed with agreeable sauces.

Women do not eat with the men, but by themselves. Rice supplies the place of bread, and is boiled with every kind of provisions. Miso-soup, boiled with fish and onions, is the customary food of the common people. Fish and fowls are very plentiful, and eaten in abundance.

The beverage of this people consists entirely of tea and sakki. Wines and distilled liquors they can scarcely be prevailed on to taste. Sakki is a kind of fermented liquor, prepared from rice. It is tolerably bright, and not a little resembles wine, though its taste is somewhat singular, and not very palatable. When fresh, it is of a whitish colour, but, from lying in wooden casks, it becomes brown. This liquor is vended in every tavern, and is used to promote hilarity, as well as at meals. Tea is in such universal use, that no person of any rank undertakes a journey, without a servant to carry his tea-equipage. The tea-shrub is indigenous here, and is met with most frequently on the borders and margins of cultivated lands, or on such mountains and downs as are incapable of being cultivated to better advantage.

The year is measured in Japan by lunations, so that some have twelve, and others thirteen months; consequently, the termination and commencement of the year are not on the same day, nor always in the same month. Day and night, taken together, are divided into twelve hours only; and the whole year through they regulate themselves by the rising and setting of the sun. The hour of six they reckon at sun-rise, and the same at sun-set, so that noon and midnight are always at nine. Time is measured by burning matches, twisted like ropes, and divided by knots.

Though gravity forms the general character of this nation, they have, nevertheless, their pleasures, their sports, and festivities. Some of these are connected with their religion; others may, in many respects, be compared to European plays or interludes.

Of those which have a relation to their religious belief, the lantern-festival, or feast of lamps, is one of the most remarkable. It is celebrated towards the end of August, and lasts for three days. The Japanese call it Bang; and it was originally instituted in memory and honour of the

dead, who, they believe, return annually to their kindred and friends, on the first afternoon of these games, where they remain till the second night, on which they are again sent away.

To welcome them on their arrival, they hang a number of lamps round the tombs, on bamboo-stakes; and, when the souls of the deceased are to take their leave, they fabricate a small vessel of straw, filled with lights, which they carry, at midnight, in procession, with music and loud cries, and launch it on the waves, where it is left to be consumed or swallowed up.

Dr. Thunberg had an opportunity of seeing plays acted several times, both in Nagasaki and afterwards on his journey to the imperial court at Osaka. The actors are always dressed in a very grotesque manner, so that a stranger would be apt to imagine, they exhibited themselves to frighten, rather than to entertain, the audience. Their gestures are equally uncount and extravagant; and the plots are of a piece with the acting. In short, the dramatic performances of Japan can, in no respect, be put in competition with those of Europe. But they have the same effect, and answer the same purpose every where, to amuse the idle and frivolous, and to fill the pockets of the players.

Among the games played by the Japanese, is one called *siobuts*, or the game of the goose. In playing this they make use of a thick checkered paper, with different figures delineated on each square. A die being thrown, each person marks his chance on the representations in the square.

Cards are by no means a favourite diversion in this country, and, indeed, they are prohibited, though sometimes used in secret. They are fifty in number, formed of thick stiff paper, two inches long, and one or more wide, black on one side, and dissimilarly marked on the other. They lay them in different heaps, with the stake at top, and then turn up a card to see who has won.

When the Japanese wish to show the Dutch extraordinary respect, they entertain them with a band of female-dancers. These are generally young damsels, who twist and twine their bodies in a variety of forms. Their steps are regulated by music, and they are all provided with a vast number of gowns, which they strip off one after the other, till a dozen or more are left hanging from their girdle.

The usual holidays in Japan are the first day of every month, when they rise early in the morning, dress themselves in their best attire, and pay their respects to their friends and superiors, wishing them joy of the new month. This custom has been universally observed from very remote ages. The full of the moon, or the fifteenth day, is another holiday, on which people resort to the temples in greater numbers than on the first. The third festival

is of less consequence than the day before.

Besides these, there are many more; the first of the year is a day of festivity; the second is set apart for the second month; the fourth, on the fifth, on the making unwearying business in the Japanese, joyful and happy benignity and

The third festival

is of less consequence, and falls on the twenty-eighth, or the day before the new moon.

Besides these monthly festivals, they celebrate five more; the first and principal of which is New Year's Day. The country, at this time, is given up to pastime and festivity; and, indeed, the whole of the first month is set apart for pleasure, throughout the whole empire. The second annual festival falls on the third day of the third month; the third, on the fifth day of the fifth month; the fourth, on the seventh day of the seventh month; and the fifth, on the ninth day of the ninth month. All these, making uneven numbers, are reckoned unlucky days, and no business is undertaken on them, but they are spent in mirth and mutual congratulations. It is a maxim among the Japanese, that the gods take delight in seeing mankind joyful and happy; and, in this respect, they honour their benignity and other amiable attributes.

The Japanese either burn their dead or bury them in the earth. The former seems to have been the most ancient practice, though it is now less prevalent than the other, except for persons of distinction. The ashes are carefully collected, and, after some time, are buried in the earth.

Both men and women follow the corpse in norimons, together with the family of the deceased, and a numerous train of priests. After one of the priests has sung the eulogy of the dead, he thrice waves a burning torch over the corpse, and the pile is then set on fire by the relations, who also throw upon it clothes, arms, victuals, money, sweet herbs, flowers, and other things, which they suppose will be of use to the deceased in the other world. When a prince or grandee dies, there are commonly ten or twenty youths of his household, and such as were his greatest favourites, who put themselves to a voluntary death, at the place where his body is burned; and their ashes are generally deposited in a magnificent sepulchre.

*History.]* The early records of Japan are so perplexed with incoherent relations, and involved in ambiguity, that they merit little attention. Their historians, also, instead of adverting to the political and moral character of their monarchs, have confined themselves to tedious and uninteresting details of their descent, names, births, succession, &c.; to recapitulate which would conduce neither to profit nor entertainment. We shall, therefore, reduce the

whole, as abstracted from their own chronicles, to a very narrow compass.

The monarchs of Japan appear to have been famous for longevity; and three of them in particular lived from the age of a hundred and thirty-seven to a hundred and forty-nine years. Sin-nu, the founder of the Japanese monarchy, began his reign six hundred and sixty years before Christ. In the seventieth year of his reign he instituted a form of government, established laws, civilized the people, taught them chronology, and other arts and sciences, divided time into years, and years into months and days, secured the crown to his posterity, and, having reigned seventy-nine years, died in the one hundred and forty-ninth year of his age.

Some of their monarchs have signalized themselves by their military exploits; one was ranked upon that account as more than mortal, and might be considered as the Mars of the Japanese, as was his mother the Bellona of her country.

Another monarch, named Taycho, though of mean extraction, displayed singular resolution in the total subjection of the petty princes, by which he quelled that spirit of rebellion which was formerly prevalent in the empire. He expelled the Portuguese from Japan, prohibited their ever after trading with his subjects, and began the first persecutions against the Christians, of which there were once great numbers, in different parts of the empire. The cause of this was said to be the opposition of the priests, in not allowing them a plurality of wives, and the persuasion of the Dutch, who told them, that the emperor would become a slave to the pope.

This persecution was carried on with such horrid cruelty, that, in the space of four years, no less than twenty thousand five hundred and seventy persons were cruelly massacred. In the two succeeding years, however, after the places of worship had been shut, and the public profession of Christianity prohibited, the Jesuits, by their private endeavours, made twelve thousand proselytes; and, when any of these were detected, they not only absolutely refused to abjure the Christian faith, but readily submitted to death, and suffered martyrdom with astonishing constancy. Indeed, the persecution continued forty years, reckoning from its commencement, in the reign of Taycho, with unremitting cruelty, before Christianity could be totally exterminated.

## CHAPTER IX.

## ORIENTAL ISLANDS.

**T**HE groupe properly distinguished by this appellation consists of Ceylon, Borneo, Macassar, the Philippines, the Moluccas, the Sunda Islands, Nicobar, and Andaman; each of which demands a separate description.

## SECTION I.

## CEYLON.

*Situation, Extent, &c.*] This island is situate between five degrees thirty minutes, and ten degrees sixteen minutes of north latitude, and between seventy-nine degrees forty minutes, and eighty-two degrees forty-five minutes of east longitude; at the distance of about one hundred and ninety miles from the continent of India. It is generally supposed to be about two hundred and sixty miles in length, one hundred and fifty in breadth, and nearly nine hundred miles in circumference.

*Climate, Soil, &c.*] Ceylon is one of the most pleasant and fertile islands in the Indies; and the air is much more temperate than could be expected, from its vicinity to the Line. Being exposed on all sides to the sea-breezes, the climate is cooler than that of Hindoostan, and far more wholesome than Batavia. The mountainous parts are woody, but the plains are exceeding fertile; springs, meandering streams, and rivers, water the whole; but the latter, in general, are so rocky, as not to be navigable. The variation of the seasons, and the winds which occasion the monsoons, are much the same as on the coast of India. The northern corner of the island is the most unproductive, on account of its deficiency with respect to rivers, rivulets, &c.; but the other parts are amazingly fertile, being plentifully supplied with water, and enjoying periodical rains, which always proceed from the southward, but are prevented from reaching the northern district by a lofty chain of mountains.

*Vegetable Productions.*] Ceylon produces all the fruits that are known in India, either on the continent or in the islands; hence it is called the "Garden of the East," and "Paradise of the Indies." Grapes, in particular, are found in perfection during nine months in the year. The mangoes here resemble nectarines, and are, when ripe, either red, white, or green: they are delicious, when preserved, and make an admirable pickle. It also produces ginger, pepper, sugar, mulberries, palms, cardamums,

cotton, and areka-trees; figs, originally planted by the Portuguese, long-pepper, melons, various sorts of nan-goes, onions, garlic, &c.

The fine spice we call cinnamon is the bark of a tree, growing plentifully in Ceylon, and the best sort is brought from thence. By an account given in the Philosophical Transactions, there appear to be several species of the cinnamon-tree, though some are not easily distinguished from each other. That which yields the best cinnamon has leaves like those of the lemon-tree, bears white fragrant blossoms, and a yellowish fruit, not unlike an acorn, which has neither the smell nor taste of the bark, but yields, when boiled, an oily juice, that hardens to the consistence of tallow, and is not only used by the Ceylonese, both internally and externally, for several disorders, but also for candles.

The young leaves of this tree are red, and, if rubbed between the hands, yield an odour more like that of cloves than that of cinnamon. These, by distillation, afford an oil, of a bitterish taste, resembling oil of cloves, to which a little oil of cinnamon has been added.

The inhabitants of this island extract from the root of the cinnamon-tree, by incision, a liquor that smells like camphor, and gradually coagulates into white grains. This species of camphor is also obtained by distillation from the bark of the root, dried, bruised, and immersed in water. The physicians of Ceylon use this distilled liquor with success, administering a spoonful of it, at proper intervals, as a sudorific, in malignant fevers.

The cinnamon-tree must grow a certain number of years before the bark is fit to be taken off; but the best sort ripens two or three years sooner than the other trees, which is owing to the difference of the soil they grow in. Those, for instance, where the soil is a fine white sand, will be ready in five years' time, whereas those that stand in a wet soil must have seven or eight years before they are ripe enough. Those trees, likewise, that grow in the shade are later on that account; and, for the same reason, the bark of such trees has not that agreeable taste which is observed in those that grow in a white sandy soil, where, with a little wet, they stand exposed to the sun.

The bark is rather of a bitterish taste, somewhat astringent, and smells like camphor; for, by the heat of the sun the camphor is rendered so thin and volatile, that it rises up, and mixes with the juices of the tree, where it

undergoes a small fermentation; and then, rising still higher between the substance of the wood and the thin inner membrane of the bark, it is at last so effectually diffused through the branches and leaves, that the least trace of it is not to be perceived. Mean time the thin glutinous membrane between the bark and the substance of the wood attracts the purest and most agreeable particles of the juice, leaving the thick and gross ones, which are pushed forwards, and serve to nourish the branches, leaves, and fruit.

To confirm the truth of what has been said, our author observes, that, if the bark be fresh taken off, the juice remaining in the tree has a bitterish taste, not unlike that of cloves; but, on the contrary, if the inner membrane of the bark be tasted when just taken off, it will be found most exquisitely sweet, whereas the outer part of the bark differs very little in taste from that of the common trees, which shows that all its sweetness is owing to the inner membrane. When the bark is laid in the sun, in order to be dried and convolved, this oily sweetness of the inner membrane diffuses itself through the outer part of it, and impregnates it so strongly, as to make it a commodity which is justly admired for its aromatic taste and fragrancy.

The betel, so much chewed in Asia, grows on a small shrub; the leaves resemble those of ivy, and are naturally of a green colour; but the natives whiten them by artificial means, without impairing their virtues; the flavour is very pleasant, and the scent aromatic. In preparing the quid or pill for chewing, they take a piece of chalky earth, or a kind of lime, about as big as a pea, which they mix with a fourth part of the areka-nut, wrap the whole in three betel-leaves, and chew it when they think proper. Till a person is accustomed to this chewing, it occasions a dizziness and stupefaction, like tobacco; but, when grown familiar, it is much more agreeable.

Ceylon likewise produces the root-tree, whose branches hang to the ground, and take fresh root; and the talipot-tree, which is as high as the mast of a ship, but without any branches or leaves, except at the summit. The top is, therefore, cut off, and used as an umbrella, or soldier's tent; it is very strong and light, and will fold like a fan. Here are several species of grain, that are converted either into bread or oil; the most singular of which is the tanna, celebrated, not only for its goodness, but for yielding a thousand-fold.

*Animals.*] In the island of Ceylon are vast numbers of buffaloes, elephants, monkeys, bears, tigers, and jackalls. The island is particularly famous for its elephants, on account of their prodigious bulk, and the beauty of their ivory; and they are so numerous, as to do incredible damage to the husbandmen, by breaking their trees, and eating or trampling down their corn. Hence the country people are obliged to watch those fields that lie near the woods every night, and they are not secure of their corn even

when it is placed in their yards. It is with great difficulty that, with lighted torches, and making a great noise, they can frighten them away. The tigers and bears are far less troublesome; for they do no damage to the corn, and seldom attack people without provocation.

The Ceylonese not only make use of fire to drive away the wild beasts, but also to take deer, elks, &c. with which their woods abound. Two men go into a wood in the night-time, one of whom carries on his head an earthen vessel, in which a fire is made of sticks and a kind of rosin; and in one hand he has a staff, to which eight musical bells are fastened. The other man goes behind, with a spear in his hand; and, whilst the deer stands gazing at the light, and listening to the sound of the bells, the spearman advances, and runs him through the body. They have another method of killing deer, or other game, which is practised by those who are masters of a gun. They make a frame, large enough to screen their body, which they cover with boughs of trees, and, advancing behind this frame, they easily get near enough to fire at their mark, the birds or deer having no suspicion of danger, as seeing nothing but the green branches.

Besides elephants, tigers, and other quadrupeds, there is a sort of bear in Ceylon, called the ant-bear, from his eating certain ants, called wain, of which there are great numbers in that island. In order to deceive them, the bear lies down near the little nests they build, as if he were dead, lolling out his tongue as far as he can, upon which multitudes of ants presently fix themselves, and the bear draws in his tongue and swallows them; and then putting out his tongue again, he soon catches more, continuing so to do till he has satisfied his hunger. The nests or habitations of these ants are very curiously formed, according to the accounts of travellers, being built in little hills, and consisting of vaults and arches of the finest clay, and so strong as not to be easily demolished.

This island abounds with a variety of fowl, particularly wild peacocks, and green parrots, which are very numerous. A species of the latter, called the macaw, is of the size and colour of a black-bird; and speaks very plain, when taught, as does also another species, which is of a very beautiful gold colour.

One of the finest birds of the country is of the size of a sparrow, and as white as snow, except its head, which is black, with a plume of feathers standing erect; and the tail is a foot long. There are others of a deep yellow, but in every other respect like the former: neither of them have any musical notes.

Sea and river-fish are found here in great variety and abundance.

Among the insects of this country the most remarkable are the ants, which throw up large hills, four or five feet in height and two or three in diameter: these they arch

in an admirable manner, and fill them with all kinds of grain, for their winter subsistence.

Of these insects a most interesting description has been given by Mr. Henry Smethman, in the Philosophical Transactions for 1781. According to this account, the works of these little creatures surpass those of the bees, wasps, and other animals, as much as those of the most polished European nations excel those of uncultivated savages; and even with respect to man, his greatest works, the boasted pyramids, fall, comparatively, far short, even in size alone, of the structures raised by these industrious insects. The labourers among them employed in this service are not a quarter of an inch in length; but the structures which they erect rise to ten or twelve feet above the surface of the earth. Supposing, therefore, the height of a man to be six feet, our author calculates, that the buildings of these insects, relatively to their size and that of a man, may be considered as raised to nearly five times the height of the greatest Egyptian pyramid. And it may be added, that, with respect to the interior construction, and the various members and dispositions of the parts of the building, they certainly appear to exceed every work of human construction.

The most curious parts of these structures are the royal apartments, nurseries, magazines of provision, arched chambers, and galleries, with their various communications; the ranges of Gothic-shaped arches, projected, and not formed by mere excavation, some of which are two or three feet high, but which diminish rapidly, like the arches of aisles in perspective; the various roads, sloping staircases, and bridges, consisting of one immense arch, and constructed to shorten the distance between the several parts of the building, which would otherwise communicate only by winding passages.

The economy of these insects appears to have been very minutely observed by an ingenious author, who informs us, that there are three distinct ranks or orders among them, constituting a well-regulated community. These are, first, the *labourers*, or working insects; next, the *soldiers*, or fighting class, which do no kind of labour, and are much larger than the former; and, lastly, the winged or perfect insects, which may be called the *nobility* of the state; for they neither labour nor fight, being scarcely capable even of self-defence. These only are capable of being elected *kings* or *queens*; and Providence has so ordered it, that they emigrate within a few weeks after their elevation to the sovereignty, and either establish new kingdoms, or perish within a day or two.

The first order, the working insects, are most numerous, being in the proportion of a hundred to one of the soldiers. In this state, they are only about a quarter of an inch long, and so extremely small, that twenty-five of them will scarcely weigh one grain.

The second class, or soldiers, have a very different form from the labourers, and have been, by some authors, supposed to be the males, and the former neuters; but they are, in reality, the same insects as the foregoing, only they have undergone a change of form, and approached one degree nearer to the perfect state. They are about half an inch long, and equal in bulk to fifteen of the labourers.

The third order, or the insect in its perfect state, varies its form still more than ever. The head, throat, and belly differ almost entirely from the same parts in the labourers and soldiers; and, besides this, the animal is now furnished with four large transparent wings, with which it is, at the time of emigration, to wing its way in quest of a new settlement. These are equal in bulk to two soldiers, and about thirty labourers; and, by means of the wings, with which they are furnished, they roam about for a few hours, at the end of which time they lose their wings, and become the prey of innumerable birds and reptiles: while scarcely one pair out of many millions of this unhappy race get into a place of safety, and lay the foundation of a new community.

The few fortunate pairs who survive this annual destruction are casually found by some of the labourers, and are elected kings and queens of new states. By these industrious creatures the king and queen elect are immediately protected and enclosed in a chamber of clay, where the business of propagation soon commences. Their voluntary subjects then busy themselves in constructing nurseries, or apartments, entirely composed of wooden materials, and seemingly joined together with gums. Into these they afterwards carry the eggs produced from the queen; and here the young are attended, after they are hatched, until they are able to shift for themselves.

From the many singular accounts given of the police of these insects, we shall mention one respecting the different functions of the labourers and soldiers, or the civil and military establishments in this community, on an attempt to explore their nests.

On making a breach in any part of the structure with a hoe or pick-axe, a soldier immediately appears, and walks about the breach, as if to see whether the enemy be gone, or to examine whence the attack proceeds. In a short time he is followed by two or three others, and soon afterwards by a numerous body, who rush out as fast as the breach will permit, their numbers increasing as long as any one continues to batter the building. During this time they are in the most violent bustle and agitation; while some of them are employed in beating with their forepaws upon the building, so as to make a noise that may be heard at three or four feet distance. On ceasing to disturb them, the soldiers retire, and are succeeded by the labourers, who hasten in various directions, towards the breach, each with a burden of mortar in his mouth, ready

tempered.

tempered. Though there are millions of them, they never stop nor embarrass each other; and a wall gradually rises that fills up the chasm. A soldier attends every six hundred or thousand of the labourers, seemingly as a director of the works; for he never touches the mortar, either to lift or carry it. One, in particular, places himself close to the wall which they are repairing, and frequently makes the noise above mentioned, which is constantly answered by a loud hiss from all the labourers within the dome; and, at every such signal, they evidently redouble their puce, and work as fast again.

The work being completed, a renewal of the attack constantly produces the same effects. The soldiers again rush out, and then retreat, and are followed by the labourers, loaded with mortar, and as active and diligent as before. "Thus," says our author, "the pleasure of seeing them come out to fight, or to work, alternately, may be obtained, as often as curiosity excites, or time permits; and it will certainly be found, that the one order never attempts to fight, nor the other to work, let the emergency be ever so great. The obstinacy of the soldiers is very remarkable: they fight to the last extremity, disputing every inch of ground so effectually, as often to drive away the negroes, who are without shoes, and make Europeans bleed plentifully through their stockings."

Serpents and leeches are very numerous in Ceylon, and very dangerous, as the natives go bare-legged; but, as much as possible to prevent them from biting, they rub their legs and feet with a composition of ashes, salt, and lemon-juice.

*Minerals.*] Though Ceylon abounds with mines of gold, silver, and other metals, none are permitted to be worked but those of iron; and such as produce precious stones are all monopolized by the sovereign. The cat's-eye, which has a variety of fine colours, and requires no polishing, is the favourite gem; though their rubies, sapphires, topazes, hyacinths, turquoises, &c. are some of the finest in the universe. The mountains likewise produce crystal, brimstone, saltpetre, &c.

*Pearl-Fishery.*] Ceylon is celebrated for its pearl-fishery, which commonly begins, on the north-west shore, about the middle of February, and continues about two months; the village of Condatchy is then crowded with a mixture of thousands of people, of different colours, countries, casts, and occupations, with numerous tents and huts, and bazars and shops; while the sea presents many boats, hastening to the banks, or returning with the expected riches. The divers are chiefly Christians or Moslems, who descend five or ten fathoms; and remain under water about two minutes, each bringing up about a hundred oysters in his net. These precious pearls are formed like the coats of an onion, around a grain of sand, which serves as a nucleus, the animals covering it with glutinous

matter, to prevent disagreeable friction; and even those formed in the shell seem produced by similar exertion to cover some rough part; but these are darker and bluer than genuine pearls. The yellow or gold-coloured pearl is most esteemed by the natives; and some are of a bright red lustre; but the dull grey, or blackish hue, are most valuable.

*Antiquities.*] On the west and south coasts of Ceylon there are several curious antiquities, of which an interesting account has been communicated to the public through the medium of the Asiatic Researches. The substance of that account we take the liberty to lay before our readers:

"In the vicinity of Biligam, about ten miles north of Matura, is a figure of the Contta Rajah, sculptured on a rude block of granite, about thirty feet high. Opposite to this stone, and about twenty feet distant, is another of nearly the same size; and the intervening ground is worked away to a hollow, on which it is necessary to be placed, to have a full view of this figure, which is cut out of the stone in relief; but the whole is sunk in a hollow, scooped out, so that it is thus defended from injury on the sides. The figure is about fourteen feet high, with a full round visage, long nose, and mild aspect; but it has no beard, nor any of the usual marks of the Hindoo casts. The head-dress is high, and seems decorated with jewels; the arms are ornamented with bracelets; a belt seems girded high above the waist; and a ring is distinctly seen on the little finger of the left hand. The neck is encircled by a collar; ornaamental drops seem to depend from the ears; and the lower drapery is fringed with a sort of tassels.

"On the spot," says our author, "I was told that this was the figure of an ancient prince, called *Contta Rajah*, from a cutaneous disorder he had been troubled with; and that his statue was placed here, in memory of his being the first who had taught the inhabitants the use of the cocoa-nut, which now constitutes a principal part of their food. At Matura the tradition was told much to the same purpose, but with more amplification of circumstances. They described him as the son of a foreign prince, who, labouring under a sort of leprosy, was landed on the coast, and left to shift for himself; when he was cured by the aid of a holy recluse residing in these woods, and by the milk of the cocoa-tree: returning home to his native land, he recounted his wonderful cure, and was sent back with rich presents, to reward the holy man, whom they found no more. In memory of these events the statue was set up. Whatever degree of credit may be due to this story, the name of the *Contta Rajah* seemed to be familiar to all ranks, and is certainly connected with some historical event."

Being desirous of seeing a Cingalese temple, at a place called Villigaan, our author was conducted, by a winding road, to a small eminence, enclosed at the top by a low

trikingly portrayed.

"Proceeding thence, by an easy ascent, we cross the ruins of a wall, probably the enclosure of the grand temple, marked by several pillars and upright stones; but no sculptures are visible till we reach the Cingalese temple, in the front of which stands the inner portal of a Hindoo temple, consisting of two upright stones, supporting a cross one, all carved on one side, with ornaments similar to those of the interior parts of the pagodas on the coast. The centre of the cross-stone is occupied by a fierce fantastic head, the sides by a running border of foliage, and the basement supported by figures, in a correspondent style.

"To the left of the Cingalese buildings are some more ruins, evidently the remains of other temples. The steps leading up to the raised floors are decorated with heads of elephants, carved out of stones, placed on either side;—an ornament frequently seen in Hindoo temples, as the entrances of Egyptian buildings were usually ornamented with figures of the sphinx.

"Near this is a deep well, across the mouth of which is placed a flat granite-stone, with a perforation of six inches square through its centre, between the prints of two feet, raised on the stone: the figure occupying the rest of the stone is scooped out to the depth of two feet. This well was probably enclosed within some of the buildings now no longer existing; but its use does not appear. The cross-stone is too heavy to be easily moved, and occupies too much room, to admit of water being drawn from it for any common use: the figures carved on it indicate some connection with the *lingam*, and may consequently give us an idea of the object of worship.

"On narrowly examining these remains, little doubt remained in my mind that this was the site of an ancient Hindoo temple, on the ruins of which the Cingalese building was raised, at a much later period."

The head man of the village, being questioned respecting these ruins, confessed that he could give no account of their origin; but proposed to conduct our author to another old temple, about three-quarters of a mile distant. Here they found a small square pagoda, built of hewn stone, flat roofed, with one door, and having no spire, pillars, nor arches: it had no sculpture, except some mouldings about the door, and the pediment-conices; nor did any image, altar, or hieroglyphic decoration appear, to show the object of worship: from its exact similarity, however, to some of the small stone pagodas in the Carnatic, there can be little doubt of its origin.

At Deogamme our author met with another temple of Boodhoo, which was erected on a flat space, cut out of the side of a swelling emience, and had nothing remarkable in the style of building, being a square house, with a tiled sloping roof, and a covered gallery running round it; so that the double story of sloping roofs gives it the air of those

edifices which may be frequently seen in Chinese paintings. In the interior apartment the image of Boodhoo was seen reclining, in the same attitude as at Biligam, illuminated by lamps, and strongly perfumed with flowers. The walls were covered with paintings, representing the history of the deity, and several commodious houses were built near it, for the residence of the priests.

Having received intimation of an ancient inscription on a rock in this neighbourhood, our author proceeded in quest of the place, attended only by one peasant, who undertook to show him the way; and, after walking smartly for an hour and a half through the woods, he came to a huge block of stone in the channel of the river, about fifty yards from the banks, and surrounded by water, but nothing like an inscription appeared on it. After some time, however, some of the villagers conducted our author back to a field, where he found another large block of the same kind of stone, but of a black colour, which it had probably received from its long exposure to the weather. The higher part of it was about fourteen feet high; and, on a low projection of about twenty feet from this, the villagers pointed out some vestiges of characters, rudely carved, and of unequal sizes. "They were so corroded," says our author, "by time and the effects of the air, that I should have found considerable difficulty in making them out, had it not been suggested that some lime-water traced on the hollow characters, would render them legible on the dark ground of the stone: by tracing them in this manner, I was enabled to sketch out the appearance of the whole with tolerable exactness. But of the causes of engraving it here, or of the history of the place, I could get no account from the natives, except some incoherent traditions of its being formerly struck by lightning, whence it is called *Pelmucallu*, or split-stone."

At Calanec, about six miles north-east of Columbo, are two temples of Boodhoo, which were visited by Mr. Harington, on the 7th of February, 1797. "The images," says our author, "are of stone, representing a man in a sitting posture; the right leg supporting the left; the right arm and breast uncovered; and the left side and the waist covered with a folding vest, the end of which hangs down before. The complexion is fair; but no conclusion can be drawn from this, as two images in the two temples at this place differ considerably in these respects, one having a fair round face, the other darker and more oval. Both appear to have long pendulous ear-rings, and their heads are crowned with a sort of tiara, somewhat resembling five fingers joined to each other.

"In one of the temples three images of the above description were enclosed in a glass-case, which the officiating priest readily opened, to satisfy my curiosity, and allowed me to approach as near as I wished, without even desiring me to take off my shoes. as is usually required in

other parts of India. Before the glass-case, which extended the whole length of the temple, stood a wooden table; on which are daily presented oblations of flowers, fruit, or money. From the surrounding representations of devotees, the *lotos* appears to be the favourite flower of the god; and I also observed the *keyosa* and *gool-acheen*, two of the most fragrant flowers in India. Images of Boodhoo, and some other deities, are painted on the walls and roof of this temple; but chiefly Boodhoo, sitting or sleeping, and his devotees bearing each a *nagisur* flower; with sixteen sketches, said to represent the sixteen temples, or monuments, of this description, on the island of Ceylon.

"The idol temple I am now describing, is called a *veehar*, or college, and consists of one small apartment, of an oblong square, composed of common brick and mortar materials, with a tiled roof. It is said to have been built time out of mind, but, from its structure, cannot be very ancient. I saw nothing peculiar in its exterior, and have nothing further to remark on its interior, but that it contained a lamp, said to be kept perpetually burning, and a curtain, that is occasionally drawn across the middle of the apartment."

On each side of the entrance, enclosed in recesses, are two large statues, the door-keepers of the god; and several others are sculptured round, bearing a club, and crowned with a high tiara. In the passage, which leads from the above-mentioned temple to a second of the same construction, are two gigantic figures, cut in alto relievo, and said to represent two attendants of the local deity.

The second temple contains a single figure of Boodhoo, in a sitting posture, and somewhat larger than those already noticed. A large elephant's tooth, presented by the king of Candia, is fixed in the ground, near this image, and a small elephant, of brass, forms the ornament of a lamp-stand.

Both the above structures stand on an eminence, surrounded by trees, and by a low wall, which also encloses a third building, called *Daghope Wahunsee*. This building is a solid mass of earth and brick-work, about sixty feet high, and shaped somewhat like a dome, with a cupola above. The inside is a mound of earth, and is said to contain twenty images of Boodhoo, buried below it. At the foot of the eminence is the house of the priests, who have been appointed to officiate at the ceremonies performed at this place daily at noon, and annually at a great festival, when numbers of pilgrims are said to assemble here.

The temple at Oogulbodda is an oblong square building, with a veranda, supported by square brick-pillars, and covered with leaves of the cocoa-nut tree. At a small distance, on the east side, is a triple-roofed building, constructed in form of a pigeon-house, in which the precepts of Boodhoo are read to his votaries, at festivals and other

times of assembly. The *teechar*, besides two large figures of door-keepers, and various historical and mythological paintings, contains a colossal statue of Boodhoo, composed of earth and cement, in a sitting posture, or rather reclining on his lotos throne; his head resting on a pillow, and supported by the right arm, while the left is extended on the thigh of the same side. He has the same tiara, ear-rings, and curled hair, as the other images already described; and, with no unpleasant aspect, is painted of an azure brown complexion. Before this figure stands the principal altar, covered with a variety of brass figures, flowers, &c.

At the north end of the temple is another figure of Boodhoo, in a sitting posture; having, on each side, two tigers and two alligators; and, over the head, a fabulous animal, called *kimis*, with three large teeth in front, and two on each side of the mouth. But it seems that these ornamental figures have no connection with the character or history of Boodhoo; but should have been placed on the outside of the temple, had there been room. Two figures on each side of this image, with chowries in their hands, are said to be Veeshnu, in attendance upon Boodhoo: "but I have some doubt," says our author, "of the accuracy of this information, as, at the south end of the temple, where there is a third image of Boodhoo, in a standing posture, there is likewise a statue evidently of Veeshnu, of black hue, and crowned with a high tiara, which bears no emblem of attendance." There are several other images of Boodhoo in this temple, but they have no peculiar characteristics.

[*Towns.*] The town of CANDY, in the centre of the island, is of small size and consequence, and only distinguished by a palisade and a few temples. It was taken by the Portuguese in 1590; but no recent traveller appears to have visited it.

COLUMBO, the chief town of the Portuguese, Dutch, and English possessions, is a respectable place, and well fortified; the residence of the governor is elegant. The name of Columbo seems indigenous, as well as that of Ngimbo, a fortress a few miles to the north of this capital.

On the east of this city is the highest mountain in Ceylon, called Adam's Peak, from a tradition of the natives, that Adam was created and buried here. It is steep and craggy, and of a conical figure. On the summit there is a smooth stone, bearing the impression of a large human foot, which the natives affirm to have been made by Adam. These occasions them to pay a great adoration to it; and, at the commencement of every year, vast multitudes clamour up to it, notwithstanding the ascent is so difficult, that iron-spikes and chains have been fixed to the rock, in order to facilitate their climbing. In another part of the mountain there is a lake, which the natives, with equal gravity,

TRINCOMALE has a noble harbour, which opens at the mouth of the Mowil Ganga, the Ganges of Ptolemy's large map of Taprobana; and is defended by a strong fortress. This harbour is of great consequence to the English, because there is not any on the eastern coast of Hindoostan; and it has been suggested that, in case of a revolution, to which all human affairs are subject, this island might afford an extensive asylum, where the British name and commerce might be perpetuated.

MATURA, on the southern side of Ceylon, was a Dutch factory, near the most southern promontory called Dondra, where excellent kinds of cinnamon were collected; and varieties of precious stones abound in the vicinity. Not far to the west of Matura is Gallec, near a point so called, a handsome town, strongly fortified, on the projecting angle of a rock.

*Manufactures.*] There are but few manufactures carried on in this island; but the natives seem not unskilled in the common works in gold and iron. The Dutch ships used to sail from Gallee, laden with cinnamon, pepper, and other spices: nor must pearls and precious stones be forgotten among the articles of export. The Columbo-wood, a bitter in recent use, receives its name from the capital; but its native country or district seems still unknown.

*Religion.*] The religion of Ceylon is the ancient worship of Boodh, whose images appear with short and crisped hair, because it is fabled that he cut it with a golden sword, which produced that effect. The worship of Boodh is supposed to have originated in Ceylon; and thence to have spread to ancient Hindoostan, to exterior India, Tibet, and even to China and Japan. Such are the traditions in Siam, Pegu, &c. which suppose that Boodh, probably a deified philosopher, flourished about five hundred and forty years before the Christian era: and as the Boodhis, in general, shew a prodigious superiority of good sense to the visionary Brahmins, their accounts deserve more credit than the idle dreams and chronology of the Pundits. Others, however, suppose that the worship of Boodh originated in exterior India.

*Government, &c.*] The island of Ceylon was formerly divided into nine monarchies; but, at present, it is under the dominion of one king, whose court is kept in the centre of the island, at a place called Digligy-Neur. The palace is but meanly built, though the gates are large, stately, and finely carved; and the window-frames made of ebony, and inlaid with silver. His elephants, troops, and spies, are numerous, and his concubines many. He assumes great dignity, and demands much respect, which his subjects readily pay him, as they imagine that all their kings are immediately upon their demise turned into gods.

He expects that Christians should salute him kneeling and uncovered, but requires nothing more of them. His revenue consists in the gifts and offerings of his subjects. His palaces are built upon almost inaccessible places, for the greater security. No bridges are permitted to be erected over rivers or streams, or good roads to be made, to render the country as impassable as possible. None are allowed to approach his palace without a passport, stamped on clay.

*Military.*] The troops are hereditary, and carry, as weapons, swords, guns, pikes, bows, arrows, &c. They are subtle, but not courageous; and will not engage an enemy, but, by surprise, and when there is some manifest advantage in their own favour. It is so difficult to penetrate into the inland parts, and all the passes are so well guarded, that even the Dutch themselves are unacquainted with great part of the island.

*Penal Laws.*] All the male Cingulays are allowed to command those who are within hearing to assist them upon any emergency in the apprehension of delinquents. Criminals are frequently impaled alive, or have stakes driven through their bodies. Some are hung upon trees, and many are worried by dogs, which are so accustomed to this horrid butchery, that, on the days appointed for the death of criminals, they, by certain tokens, run to the place of execution. But the most remarkable criminal punishment is by the king himself, who rides an elephant, trained up on purpose, while the beast tramples the unhappy wretch to death, and tears him limb from limb.

There are other modes of punishing, by fines and imprisonment, at the discretion of the judges. When the fine is decreed, the officers seize the culprit, wherever they meet him, strip him naked, (his clothes going as part of payment,) and oblige him to carry a large stone, the weight being daily increased by the addition of others that are smaller, till the money is either paid, or the debt remitted.

A creditor will sometimes go to the house of his debtor, and very gravely affirm, that, if he does not discharge the debt he owes him immediately, he will destroy himself. This so greatly terrifies the other, that he instantly musters all the money he can, even sells his wife and children, not to be deficient, and pays the sum demanded. This is owing to a law, which specifies, if any man destroys himself on account of a debt not being discharged, the debtor shall immediately pay the money to the surviving relations, or forfeit his own life, unless he be able to redeem it by the payment of a very large sum to the king.

Women must not be beaten without permission from the king; but they may be made to carry heavy baskets of sand upon their heads, as long as the punisher pleases, which is much more dreadful to them than the severest flagellation. The circumstances of the children depend upon those of the mother; for, if the mother is a free

woman, they are free; but, if she be a slave, they are always vassals.

*Customs, Manners, &c.*] The inhabitants of Ceylon are composed of Dutch, Portuguese, Moors, Malabars, and a mongrel breed of all four; but the natives, who reside in the interior, are called Cingulays, or Cinglasses. These are of two classes, the Cingulays, properly so called, who are rather a civilized people; and the Vaddans, who live in the woods, and are quite wild. The first are well-made, have regular features, are very active, ingenious, hardy, and temperate; but they are crafty and treacherous. Old people let their beards grow long, and wear a cap, like a mitre; but the people in general wear a waistcoat, either of blue or white calico, and another piece of calico about the middle, tied round with a sash. The higher orders wear ornamental weapons, such as a hanger, with an enamelled hilt, and a scabbard finely embossed. The women grease their hair with oil of cocoa-nuts, and comb it down behind. They wear a flowered waistcoat, and calico apron, and adorn themselves with ear-rings, bracelets, necklaces, rings on their toes and fingers, and a girdle of silver wire.

The Vaddans live without civil government, are excellent archers, and their principal business is to kill and dry venison. When they have expended or spoiled their arrows, and want new ones, they go towards the house of a smith in the night, and hang up a quantity of venison, with a leaf fashioned into the form and size of the arrow's point they want, by way of pattern: if the smith makes the arrows as they would have them, and leaves them in lieu of the venison, they reward him with more deer's flesh; but, if he neglects them, they are sure to do him a mischief. To preserve flesh against a time of scarcity, they rub the inside of a hollow tree with a quantity of honey, filling it with flesh, and closing up the aperture with clay, which preserves it as effectually as if it were salted.

The habitations of the Cingulays, or more civilized natives of Ceylon, consist of low houses, built with sticks or canes, daubed over with clay, and covered with thatch. Cane bedsteads and stools, and a few China plates, brazen and earthen vessels, for dressing food or to serve as lamps, are the whole of their furniture. The men undress themselves, and sleep between two mats; the women and children lie upon the floor on a single mat, but keep their clothes on. But what is the most extraordinary in so warm a climate, they keep a fire burning all night.

At their meals, they use spoons and ladles, but neither knives nor forks. The husband sits down to meals alone, the wife being obliged to wait upon him with the utmost obsequiousness; and when he has done, she presumes to sit down with her children. Like some other Asiatics, they do not touch their drinking vessels with their lips, but hold them at a distance, and pour the liquor into

their mouths. They are, in general, so addicted to the use of both betel and tobacco, that they even smoke and chew in the night-time; and, when they are perfectly intoxicated, sing till they fall asleep.

Previous to the marriage-ceremony, the man sends a friend to purchase the woman's clothes, which she freely sells for a stipulated sum. In the evening he carries them to her, and in the morning appoints the day of marriage, on which he provides an entertainment, of two courses, for the friends of both parties. The feast is held at the bride's house, when the young couple eat out of the same dish, tie their thumbs together, sleep together that night, and, on the ensuing morning, depart for the bridegroom's habitation. They are permitted to part from each other whenever they please; but, if there are any children, the man is obliged to maintain the boys, and the woman the girls. They are so fond of availing themselves of this law, that some have been known to change a dozen times before they have entirely suited their inclinations.

Inferiors salute their superiors by bowing their bodies and extending their arms, with the palms of their hands upward; but persons of rank only extend one hand. The salutation of the women is by clapping their hands together, and then carrying them closed to their foreheads.

The begging class of Cingulays are mountebanks: the men beat a drum, the women dance, and both exhibit a variety of whimsical tricks. They are prohibited by law from touching the waters in wells or springs, and must use none but what is procured from rivers or ditches. If a nobleman or gentleman commit high treason, he is put to death, and his wives and daughters are delivered to some of these beggars, which is looked upon in so disgraceful a light, that they frequently destroy themselves, to avoid any connection with persons esteemed so despicable.

## SECTION II.

### BORNEO.

*Extent and Boundaries.*] Prior to the discovery of New Holland, Borneo was considered as the largest island in the world. It is about seven hundred miles in length, and four hundred and eighty in breadth; it is bounded by the Philippine Islands on the north; by Macassar, on the east; by Java, on the south; and by Sumatra, on the west.

*Climate.*] Considering the situation of the country, the air is tolerable, particularly in those parts next the coast, which are refreshed every morning by cooling breezes from the sea. These parts, however, are very unhealthy, as they lay on a flat for many hundred miles, and are annually overflowed. When the waters retire, a stinky slime is left on the surface of the earth, which the sun shining

upon with perpendicular rays, occasions thick fogs, that afterwards turn to rain, with cold chilling winds. Great numbers of frogs and other vermin are also left on the mud, which, being destroyed by the heat of the sun, produce an intolerable stench.

The dry season begins in April, and continues till September, during which time the wind is easterly between the south coasts of Borneo and the island of Java; but from September to April, the winds are westerly, attended by violent storms of rain, thunder, and lightning. These storms are so continual, especially on the south coast, that it is thought very extraordinary to have two hours fair weather in the course of twenty-four.

*Minerals.*] In the rivers, particularly that of Succadanea, are found excellent diamonds; and great quantities of gold-dust are gathered from the sands. The loadstone is found here; and there are also mines of iron and tin, which are said to be excellent in their qualities.

*Vegetables.*] This island produces musk, aloes, pepper, cinnamon, and other spices; also various kinds of fruits, and excellent timber, with cotton-shrubs, canes, and rattans; and an abundance of rice.

*Animals.*] The quadrupeds of Borneo are oxen, buffaloes, horses, deer, and goats; besides which there are several sorts of wild beasts, as elephants, bears, tigers, monkeys, baboons, &c. Among the birds may be enumerated various kinds of parrots and paroquets, one of which is called *luree*, and is admired for its beauty. Edible birds' nests are here in abundance. During the time of the western monsoons, the sky is frequently darkened with bats, which fly in prodigious numbers. They are called, by some, *flying-cats*, and in colour, shape, and smell, resemble a fox, though not so large; but their wings, when extended, are not less than six feet from the tip of the one to that of the other.

*Cities, Towns, &c.*] The city of Borneo, on the north, Passeer on the east, Succadanea on the west, and Banjar Masseen on the south, are the principal places of trade on this island. The last of these is the most considerable, on account of the river Banjar, which is so commodious as to admit ships of the greatest burthen. This river runs, from north to south, above half through the island, and towards its mouth is nearly two miles broad. Its banks are planted with thick groves of evergreens; and one branch of it is called the China River, from the Chinese junks constantly passing it.

The towns and factories to which the Europeans trade are built on floats of timber on the river; each town consists of one long street; and, to secure them from being carried away by the stream, posts are driven into the ground near the shore, to which they are fastened with cables made of rattans. Each house consists only of one floor, divided into different apartments, according to the

number of the family: the sides of the building, are made of split bamboo, and the roof is covered with leaves of trees: the walls are made high, for the benefit of the air, and from their tops hang coverings, that reach within five feet of the logs, and are made in a sloping form, to keep off the scorching heat of the sun. The floats are made of large logs of wood; and the houses are so light in their construction, that a considerable part of the float is seen above the surface of the water.

*Government.*] The interior of this island is divided into several petty kingdoms, each of which is governed by a rajah or king. The natives pay great homage to these princes, and it is difficult for a stranger to get access to them. The only means to effect this is by complimenting them with some valuable present; for avarice is their darling passion; and the stranger will be treated with respect in proportion to the present he makes.

The mountaineers live independent of any of these kings; they are divided into different clans, under their respective chiefs, and are subject to a government peculiar to themselves. They are seldom seen, as they live in woods and forests, where they are so secure, that it would be difficult to attack them; and they are so savage, that an attempt would, in all probability, be attended with the most fatal consequences. Their arms are a dagger, and a trunk, about seven feet long, through which they shoot poisoned darts, made of brass, and barbed on each side. Their dress consists only of a piece of cloth wrapped round the waist, and a rag about their heads.

*Commerce.*] The Dutch possess the principal parts on the coast of this island, and are masters of the best ports, and most valuable articles in traffic: but there are many creeks about the island, where others have free commerce without molestation. As this country produces a great variety of articles, whose value is more estimable to other nations than to the Dutch, numbers of foreigners resort here for those commodities that are best adapted to the trade of their own nation. The Chinese and Japanese come here for spices; the Malaysans for gold; and those from India in search of diamonds. As the Dutch reckon the pepper, cloves, and cinnamon of Borneo inferior to those of the other spice-islands, so they suffer them to be sold without interruption. The natives are supplied by the Dutch with the manufactures of India, in exchange for which they receive gold, diamonds, and other valuable commodities.

Pepper, gold, precious stones, and gum, called dragon's blood, which is said to be finer here than in any other part of the world, are the principal articles purchased by the English merchants.

The European imports consist of guns, pistols, gunpowder, sheet-lead, iron and steel bars, nails of different sizes, hangers, knives, and other cutlery-ware, boots, made

of red leather, spectacles, looking-glasses, clock-work, calamancoes, and various sorts of linens.

*Customs, Manners, &c.]* The natives of Borneo may be divided into two classes, differing as well in their persons and dress, as in their customs and religion. Those who inhabit the sea-coast are Mahometans, and called Banjareens, from the town of Banjar, to which most nations resort, to purchase the various commodities of the country. They are rather low in stature, and of a swarthy complexion, but, on the whole, very proportionably made. The common people have no other covering than a small piece of linen fastened round the waist; but the better sort wear a kind of waistcoat, made of silk, or European cloth, over which they throw a loose garment, that reaches to the knees. They also wear a pair of drawers, but have neither shirt, shoes, nor stockings. Their hair is tied up in a roll, and covered with a piece of muslin or calico; and, when they go abroad, they always carry a dagger with them.

The women are smaller than the men, and their features much more delicate; their complexion is also much fairer; and, contrary to the mode of most Indian women, they walk very upright, and step with a graceful air. They are very constant after marriage, though apt to bestow favours with great freedom when single; but, however indiscreet they may have been in this point, no person is permitted to reproach them for faults committed previous to their marriage.

Pagans, as well as Mahometans, allow a plurality of wives and concubines. They generally attain to longevity, which is attributed to their frequent use of the water; for both men and women bathe in the rivers once in the day; from which practice they are very expert in swimming.

Rice constitutes the principal article of their food; but with it they eat venison, fish, and fowl. Persons of rank are served in vessels made of gold or silver; but the poorer sort use dishes made of earth or brass. They all sit cross-legged at their meals, upon mats or carpets. Both sexes chew betel and areka, and are very fond of smoking tobacco, with which they often mix opium, made into pills, after being boiled in water, till it comes to a consistency. The whole company usually smoke out of the same pipe: the master begins, and, after having smoked two or three whiffs, he gives it to the person nearest him, from whom it passes round till it comes to the master again.

Their principal diversions are dancing and comedies, which are performed after the oriental mode. Their rural sports are shooting at a mark and hunting. They travel chiefly in the night, on account of the coolness of the air at that time: the common people usually go in covered boats; but the better sort travel by land, on elephants and horses.

Their mode of salutation consists in lifting the hands to the head, and bending the body. When they appear before their superiors, they raise their hands above the forehead; and, if before a prince, they prostrate themselves on the ground, and retire backwards on their knees.

The Banjareens, in burying their dead, always place the head to the north, and throw into the grave several kinds of provisions, from a superstitious notion that they may be useful in the other world. They fix the place of interment out of the reach of the annual inundation; and the mourners, as in Japan and China, are dressed in white, and carry lighted torches in their hands.

Those who inhabit the interior of the island are taller, and much more robust, than the Banjareens. They are called Byajos, and are pagans in their religion. Their complexion is more swarthy than the inhabitants of the coast; and their time is chiefly employed in hunting and attending their cattle. They go almost naked, having only a small piece of linen fastened round the waist; they paint their bodies, and smear them with fetid oil. Some of them are very fond of having large ears, to obtain which they make holes in the soft parts of them when young: to these holes are fastened weights, about the breadth of a crown-piece, which continually pressing on the ears, expand them to an immoderate length. The better sort pull out their fore-teeth, and place artificial ones in their stead, made of gold: but their greatest ornament consists in a number of tigers' teeth, which are strung together, and worn about the neck.

As they suppose most of their distempers to arise from the malice of some evil demon, when a person is sick, instead of applying to medicine, they make an entertainment, of various kinds of provisions, which they hold under some conspicuous tree in a field: these provisions, which consist of rice, fowls, fish, &c., they offer for the relief of the person afflicted; and, if he recover, they repeat the offering, by way of returning thanks for the blessing received; but, if the patient die, they express their resentment against the spirit, by whom he is supposed to have been afflicted. They know nothing of astronomy; and, when an eclipse happens, they think the world is going to be destroyed. They likewise know little of arithmetic; and their only method of calculating is by parallel lines and moveable buttons on a board. To the use of physic they are also entire strangers.

### SECTION III.

#### MACASSAR.

*Extent and Division.]* This island, which lies under the equator, is divided from Borneo by the Straits of Macassar; as it is by the ocean from the Molucca Islands,

on the east; and the Philippines, on the north. Its ex-  
tent, from north to south, is upwards of three hundred  
miles; and, in the broadest part, it is near two hundred  
and forty. It is divided into six provinces, the principal  
of which are, Macassar, on the south, and the Celebes,  
on the north-west. But, as all the other provinces are  
subject to these two, the island is sometimes called by  
the name of one, and sometimes by that of the other.

*Climate and Productions.*] As the climate is both hot  
and moist, it is consequently unhealthy, except at the  
time of the northern monsoons. The western part of  
the country lies low and flat, but the southern part is very  
high. In the rivers is found gold-dust, which is washed  
down in the sands, from the neighbouring hills, by the  
great torrents of water that sometimes fall after excessive  
rains. Here is great plenty of various kinds of vegetables,  
all excellent in their qualities; the rice in particular is said  
to be much superior to that cultivated in any other part of  
the Indies.

*Cities.*] The chief city, Macassar, is situated on the  
banks of a river of the same name, near the south-west  
corner of the island. Here the Dutch have a very strong  
fort, mounted with a great number of cannon, and the  
garrison consists of about eight hundred men.

In general, the streets of the city are very long and  
spacious, and planted on each side with trees. The mosques  
and houses of people of quality are built with stone, but  
those of the common class are of wood, and elevated upon  
pillars, the tops of them being covered with palm or co-  
coa-leaves. Here are large markets, for the sale of pro-  
visions and other commodities. The markets are open  
every morning and evening, before the rising and setting  
of the sun. The provisions are brought to market and  
sold by women only; for if a man were to be seen in that  
character, he would be treated with the greatest contempt.  
The inhabitants of this city were formerly estimated at  
one hundred and sixty thousand men, able to bear arms;  
but, since the Dutch deprived them of their trade, great  
numbers have forsaken it: and the other towns and villages,  
which were proportionably populous, have been greatly  
deserted, for the same reason.

Jampanam, the principal place on this island, exclusive  
of the city of Macassar, is situated about fifteen miles to  
the south of Macassar River. This was the first place  
of any importance taken by the Dutch, who have a good  
fort here, and there is as commodious an harbour as any  
to be met with in the Indian seas.

*Government.*] These islanders were the last enslaved by  
the Dutch, who could not effect a conquest till after a very  
long and expensive war, in which were employed almost  
all the forces they had, at that time, in India. The Dutch  
first joined the natives to oppose the Portuguese, who  
made an attempt to subdue this island; but the latter being

soon conquered, the Dutch immediately took sole posses-  
sion of it.

Assemblies are held at particular times on affairs that  
concern the general interest, and the result of their deter-  
minations becomes a law to each state. When any con-  
test arises, it is decided by the governor of the Dutch co-  
lony, who presides at this diet. He holds a watchful eye  
over these different sovereigns, and keeps them in perfect  
equality with each other, to prevent any one from aggran-  
dizing himself to the prejudice of the company. The  
Dutch have disarmed them all, under pretence of hinder-  
ing them from injuring each other; but, in reality, with a  
view only to keep them in a state of subjection.

*Laws.*] These people are so little addicted to infamous  
practices, or litigious disputes, that they have neither at-  
torneys or bailiffs. If any difference arise, the parties  
apply personally to the judge, who determines the matter  
with expedition and equity. In some matters of a criminal  
nature they are permitted to do justice to themselves.  
If a man detect another in the commission of adultery,  
murder, or robbery, he has a right to execute justice him-  
self, by taking the life of the culprit.

*Commerce.*] The only foreigners permitted to trade with  
this island are the Chinese, who bring hither tobacco, gold-  
wire, china, and unwrought silks; in return for which they  
take opium, spirituous liquors, gum, and linens. They get  
but little gold from hence, but great quantities of rice, wax,  
slaves, and tripam, a species of mushroom, which the  
rounder and blacker, the more excellent it is esteemed.  
The customs bring in upwards of eighty thousand livres  
to the company; but they obtain a much larger profit from  
their trade, and the tenth part of the territory, which they  
hold in full right of sovereignty.

*Customs, Manners, &c.*] The natives are of a short sta-  
ture, and of a light olive complexion: they are so fond of  
having flat noses, that they practise methods in their in-  
fancy to obtain that distinguished form, with as much la-  
bour and attention as the Chinese women endeavour to ac-  
quire small feet. Neither men nor women wear any co-  
vering on their heads; but their hair, which is of a fine  
shining black, is ingeniously tied up, and from it hang curls  
that lay gracefully on the neck and shoulders. The men  
ornament their hair with jewels, but the women do not:  
the latter only wear a gold chain round their necks. Both  
sexes, however, dye their nails red, and their teeth either  
black or red, both of which they consider as very material  
ornaments. The lower class of people wear a loose gar-  
ment made of cotton, which reaches below the knees, but  
none use either shoes or stockings. The women have a  
garment, made of muslin, with straight sleeves, that button  
at the wrists, besides which they wear a kind of drawers,  
made of cotton, that are fastened round the waist and reach  
to the ankles. The garments of the better sort are made

of scarlet cloth, or brocaded silk, with large buttons of solid gold. They have likewise a very handsome sash, made of silk, and richly embroidered.

Their houses, which are small, but very neat, are chiefly built of ebony, and other wood, of variegated colours. They are elevated on pillars, on account of the rainy season, which continues from November till March. They have but little furniture, except the necessary utensils for dressing their provisions; but what they have is always kept exceeding clean; and to prevent the house being made filthy, they have vessels to spit in, when they chew betel or smoke tobacco.

The diet of the common people consists principally of rice, herbs, roots, and fish, and their usual beverage is water or tea: the better sort eat flesh and poultry, the former being generally beef or kid, which are both exceeding fine, and they drink tea, coffee, and chocolate, the latter of which they get from the Philippine Islands: they also use palm-wine, arrack, and other spirituous liquors. They have but two meals a day, one in the morning and the other about sun-set, the latter of which is the principal: in the intermediate space they refresh themselves by chewing betel and areka, or smoking tobacco, intermixed with opium. They sit cross-legged on the floor at their meals, and have very low tables for their provisions, which are set on them in plates or dishes, made of wood; but they use neither knives, forks, nor spoons.

Both sexes are rendered active by a custom practised during their infancy. Every day their nurses rub them with oil, or water just warm; and these unctions encourage nature to exert herself with the most extensive freedom. Male infants are taken from the breast when a year old, their parents having an opinion that if they sucked longer it would greatly prejudice their understandings. When they are five or six years old, children of any distinction are entrusted to the care of some relation or friend, that their courage may not be weakened by the caresses of their mothers, and a habit of reciprocal tenderness. They do not return to their parents till they arrive at the age of fifteen or sixteen, when the law allows them to marry; but this is a liberty they seldom use till they are thoroughly versed in the exercise of arms.

In general the men are very robust, and naturally so courageous, that they are esteemed the best soldiers in India; for which reason they are frequently hired into the service of other princes. But they often degrade their courage by acting as freebooters, attacking vessels with incredible desperation, and often with lances, or arrows, poisoned with the juice of a tree or shrub, called *uphas*.

They formerly lay under the imputation of cannibalism, and being so steeled against the feelings of humanity, that they refused alimentary assistance to Captain Cartaret's

crew, in 1762, though employed on a voyage of discovery, and reduced to the utmost distress.

The husband, on marriage, receives no other portion with his wife than the presents she received before the ceremony, which, as soon as the priest has performed, the new-married couple are confined in an apartment by themselves for three successive days, having only a servant to bring them such necessaries as they may have occasion for; during which time their friends are entertained, and great rejoicings made at the house of the bride's father. At the expiration of the three days, the parties are set at liberty, and receive the congratulations of their friends; after which the bridegroom conducts the wife home, and each apply themselves to business; he to his accustomed profession, and she to the duties of housewifery.

Funeral-ceremonies are performed here with great decency; to secure which, the meanest persons make provision while in health, by assigning a certain sum to defray the incidental expenses. As soon as a person is dead, the body is washed, and, being clothed in a white robe, is placed in a room, hung with white, which is scented with the strongest perfumes. Here it generally continues for three days, and, on the fourth, it is carried on a palanquin to the grave, preceded by the friends and relations, and followed by the priests, who have attendants that carry incense and perfumes, which are burnt all the way from the house to the grave. The body is interred without a coffin, there being only a plank at the bottom of the grave for it to lie on, and another to cover it; and, when this last is placed, the earth is thrown in, and the grave filled up. If the person be of distinguished quality, a handsome tomb is immediately placed over the grave, adorned with flowers; and the relations burn incense, and other perfumes, for forty days successively.

#### SECTION IV.

#### THE PHILIPPINE ISLES.

This large groupe was discovered by Magellan, in 1521, who called them the Archipelago of St. Lazarus: they were afterwards denominated the Philippines, in honour of Philip II. of Spain, but they are sometimes called the Manillas.

The principal of these islands is Manilla, which is situated in fifteen degrees of north latitude, and is nearly four hundred miles in length, and above one hundred and eighty in breadth.

The city of Manilla, built upon the shore of the bay which bears its name, and which is more than twenty-five leagues in circumference, lies at the mouth of a river that is navigable as far as the lake from which it derives its source, and is delightfully situated. All the necessaries

All the necessaries

of life are to be procured there in the greatest abundance; and at an excellent market; but European manufactures bear an excessive price.

The population of this city is estimated at thirty thousand persons, among which there are not more than a thousand or twelve hundred Spaniards; the rest are Mulattoes, Chinese, or Indians, who cultivate all the arts, and are employed in every species of industry.

The neighbourhood of Manilla is peculiarly pleasant; a beautiful river flows by it, branching into different channels, the two principal of which lead to the famous lake of Bahia, which is seven leagues within the country, bordered by more than a hundred Indian villages, situate in the midst of a highly fertile territory.

The Spaniards, in general, quit their town-houses after the Easter holidays, in order to pass the summer, which is intensely hot, in the country. There has been no attempt made to embellish a country, which has no need of the assistance of art. A neat house, built on the water's edge, with very convenient beds, without avenues or gardens, but shaded by a few fruit-trees, constitutes the dwelling of the most opulent citizens.

Some streams, in which gold-dust is found, and the adjacent situation of the Spice-Islands, without doubt, were the temptations which led to the settlement of the Philippines; but the produce has not been adequate to the hopes which were entertained of it. The enthusiasm of religion succeeded to the motives of avarice; great numbers of religions, of every order, were sent thither, to preach up the Romish tenets, and so abundant was the harvest, that the different islands soon contained eight or nine hundred catholics. Had this zeal been enlightened, the conquests of the Spaniards could not have been more firmly established, than by the adoption of this system, and the settlement would have been productive of great utility to them; but, while making them nominal Christians, they forgot to render them citizens. The people were divided into parishes, and subjected to the most absurd practices; every sin and every fault is still punished with whipping; the non-attendance at prayers or mass is noted down, and the punishment is inflicted on the men or women, by order of the curate, at the church-door. The holidays, the religious societies, and particular devotions, consume much of their time, and, as in hot climates the imaginations and feelings are more active than in those of moderate temperature, masked penitents are seen, in passion-week, dragging chains in the streets, their waist and legs surrounded with a girdle of thorns, receiving, at every station, in front of the church-doors, or before the oratories, several strokes of discipline, and submitting to the most rigorous penances.

The most unenlightened society cannot conceive a more absurd system of government than that which has directed

these colonies for upwards of two centuries. The port of Manilla, which should be open to all nations, has, within a few years, been shut against Europeans, and only open to some Moors, Americans, and Portuguese of Goa. The governor is entrusted with the most despotic power. The judges of the courts, who ought to moderate it, are destitute of power, when opposed to the will of the representative of the Spanish government; he can, in reality, if not of right, receive or confiscate the merchandise of strangers, whom the hopes of advantage had drawn to Manilla, and who would not run the risk of coming thence, but from the expectation of very great profit, which is, in fact, attended with the most ruinous consequences to the consumers.

There is not the smallest particle of liberty here; monks and inquisitors direct the consciences of the people; spies overlook all temporal concerns, and the governor connives at the most atrocious actions. A conversation, or a walk into the interior of the island, are within the pale of his jurisdiction and authority; in a word, this, though the finest and most delightful country in the world, is certainly the last that a man, who loves liberty, would wish to inhabit.

The most galling distinctions are established and maintained with the most rigorous severity. The number of horses harnessed to carriages is fixed for every rank of persons; those who have the greatest number take precedence; and the single caprice of a great officer may detain in a line behind his carriage all those who have the misfortune to be travelling the same road. So many vices in this government, and so many vexations resulting from it, have not yet entirely destroyed the advantages of the climate; the peasants still display an air of happiness, which is not generally to be observed in our European villagers: their houses, shaded by fruit-trees, which grow without cultivation, are peculiarly neat. The tax which every head of a family pays is very moderate; it is limited to five reals and a half, including in it the rights of the church, which the nation gathers; all the bishops, canons, and priests, are paid by government; but they have established voluntary perquisites, which amply compensate the smallness of their stipends.

The passion of this people for smoking tobacco is so excessive, that there is hardly a moment in the day, in which a man or woman is without a segar in the mouth; even children, in their earliest infancy, contract the habit. The tobacco in the island of Manilla is the best in Asia; every one cultivates it round his house for his own consumption, and the few foreign vessels, which had permission to land at Manilla, transported it into every part of India. But, of late years, a prohibitory law has been proclaimed; the tobacco of every individual has been forced from him, and the cultivation of it confined to particular districts, where it is raised for the benefit of government.

In consequence of such oppressions, M. de la Perouse remarks, that, at the time of his visit, insurrections threatened every part of the island; troops were employed to suppress them. An army of custom-house officers was kept on foot to prevent smuggling, and to compel the consumers to apply for it to the national officer; several had been massacred, but the tribunals inflicted speedy vengeance for their deaths, passing judgment and sentence on the Indians with much fewer formalities than other citizens. M. de la Perouse was of opinion, that an enemy, having a design of conquest, would find, the moment they set foot on the island, and brought with them weapons, an army of Indians ready to enlist under their orders. The bay of Manilla is open to every kind of vessel, and can only be defended by shipping, so that, in an expedition against this country, there must be a decided superiority of naval force. The fortifications of the places, though regular, and kept in good repair, could only retard a few days the capture, which has no chance of relief from Europe, or elsewhere. Besides, the garrison is far from numerous; in time of peace, it is limited to a single regiment of infantry, consisting of two battalions, each composed of a company of grenadiers, and eight companies of fusiliers, forming together thirteen hundred effective men. This is a Mexican regiment; all the soldiers are the colour of Mulattoes, and, in point of skill and valour, they are said to be not inferior to European troops. These are besides two companies of artillery, commanded by a lieutenant-colonel, and each of them composed of eighty men, whose officers are a captain, lieutenant, ensign, and supernumerary; three companies of dragoons, forming a squadron of one hundred and fifty horse, commanded by the oldest captain of the three; also a battalion of twelve hundred militia, in former times raised and paid by a very rich Chinese of half-blood, named Tuasson, who was ennobled. All the soldiers of this corps are Chinese of half-blood: they perform the same duty in the place as the regular troops, and, during the time of their service, receive the same pay; but they would be but a weak aid in time of war. If occasion required, eight thousand militia could be raised in a very short time, divided into provincial battalions, and commanded either by Creole or European officers. Each battalion has a company of grenadiers, extremely well disciplined, and allowed, by the Spaniards themselves, to be in no respect inferior to European troops.

M. de la Perouse declares, that the picture which might be drawn of Manilla, in a few years time, would be very different from that of its present state, if the Spanish government would adopt a better constitution for the Philippines. The land is equal to the raising of the most valuable productions. Nine hundred thousand individuals, of both sexes, in the island of Luconia, might be encour-

aged to cultivate it: the climate will allow the produce of ten crops of silk in a year, while that of China rarely produces two. In addition to these considerations, it may be observed, that cotton, indigo, sugar-canes, and coffee, grow without the trouble of cultivation, under the footsteps of the inhabitants, who despise them. Every circumstance promises, that their spaces would not be at all inferior to those of the Moluccas; an absolute liberty of commerce for all nations would ensure a sale that would encourage the cultivation of them all; a moderate duty on all articles exported would be sufficient, in a very few years, to defray all the expenses of government; the liberty of religion, with a few privileges granted to the Chinese, would soon draw into this island an hundred thousand inhabitants, from the eastern provinces of their empire, which the tyranny of the mandarins drives away from it.

The Spanish sovereignty in the Philippines, from many circumstances we have detailed, evidently appears to be little more than nominal. They have a few presidencies in the land of Mindanao, but their limits are not more extensive than those of Oran and Ceuta, on the coast of Africa.

CAVITE, situate about three leagues to the south-west of Manilla, was formerly a very considerable place; but at the Philippines, as in Europe, the large towns, in a great measure, drain the small ones. M. de la Perouse found only the commandant of the arsenal, a contador, two lieutenants of the port, the commandant of the place, about one hundred and fifty men in the garrison, and a proportionate number of officers attached to the corps. All the other inhabitants are Mulattoes, or Indians employed at the arsenal, and, with their families, which are very numerous, form a population of about four thousand persons, divided between the city and the suburb Saint Roche. There are only two parishes here, and three convents of men, each occupied by two ecclesiastics; although thirty might be conveniently accommodated there. The Jesuits formerly possessed a very handsome house here, which the commercial company, afterwards established by the Spanish government, has taken into its own hands. The whole place seems little else than a heap of ruins; the old stone-houses are either abandoned or occupied by Indians, who never repair them, and Cavite, once the second town of the Philippines, is reduced to a paltry village.

Next in size and importance to Manilla is *Mindanao*, a beautiful and fertile island. It is governed by a sultan, subordinate to whom are several petty governors, who rule over various districts. The monarch, when he goes abroad, is carried in a palanquin, and has a strong guard to attend him, who are armed with lances, swords, and bayonets. The chief trade of this island is to Manilla and Borneo: and the Dutch come from the Moluccas to purchase of them rice, tobacco, bees-wax, &c.

Mindanao the islands, and a hundred east longitude not admit that do cover their bottom river, unless being about wooden pillars, and them, the Philippines, divided, by palace is such high iron cannon, and it.

Mindanao, the capital, is situated on the south side of the island; in six degrees twenty minutes north latitude, and a hundred and twenty-three degrees fifteen minutes east longitude. It is watered by a small river, that will not admit ships of any considerable burden; and those that do come up to the city are greatly in danger of having their bottoms destroyed by worms, which abound in that river, unless they are well sheathed. The city is square, being about a mile each way. The houses are built upon wooden pillars, near twenty feet high, with ladders to ascend them, according to the usual fashion of building in the Philippines: they consist but of one floor, but are divided, by partitions, into many apartments. The sultan's palace is supported by one hundred and fifty pillars, and is much higher than any other house in the city, having iron cannon in the hall, and a broad fixed staircase to ascend it.

The other Philippine Islands are Philippina, St. John, Bohol, Layta, Paragon, Mindora, Tandaya, Sebu, Panay, Baglas, or Isle of Negroes, Xolo, and Masbate; but as all these islands partake in general of the advantages, and are subject to the same oppressions as we have stated under the head of the principal island, Manilla, it would be superfluous to enumerate them. We shall only observe, that among this groupe is the small isle of Maetan, where the renowned navigator Magellan was slain. M. de la Perouse, who visited several villages in the vicinity of the city of Manilla, speaks of the inhabitants as affable, hospitable, and honest; and remarks, that, though the Spaniards mention, and even treat, them with contempt, he found that the vices, which they impute to the Indians, ought in justice to be attributed to the government they have established among them; it being well known, that the avidity for gold, and the spirit of conquest, with which the Portuguese and Spaniards were animated during two centuries, caused adventurers from those nations to overrun the different seas and islands of the two hemispheres, from the sole hope of meeting with that valuable metal: and it appears evident, from the weakness of the Spanish government, that it does not possess power sufficient to protect the commerce arising from the fertility of the soil, or conduce, in any essential degree, to the interest of the inhabitants of these islands.

### SECTION V.

#### THE MOLUCCAS.

These islands are called Moluccas, from the word *moluc*, signifying *head*, and referring to their situation at the head or entrance of the Archipelago of St. Lazarus. They are denominated Spice-Islands, from their abundance in spices, particularly nutmegs and cloves. They lie

between five degrees of north, and seven degrees of south latitude, and extend from one hundred and twenty-one to one hundred and thirty degrees of east longitude.

The principal of these are the Banda Isles, all of which produce nutmegs; and Ternate, Amboyna, Gilolo, Bouru, and the Maldive Islands, which mostly produce cloves.

#### BANDA ISLES.

The Banda Islands, or those which produce the nutmegs, lie near each other. Banda, the principal of them, is about twenty miles long and ten broad. Besides the large forests of nutmeg and clove-trees, which grow spontaneously, and require no cultivation, the soil is fertile in a variety of delicious fruits. The island is in the shape of a crescent, and the concavity of it forms an excellent bay, near which stands the principal town. Several brooks, which flow from a small mountain, water the whole country, and render it very pleasant.

The island of Banda is divided into three districts: the religions are Muhometanism and Paganism. The natives have ships of some force, containing a few cannon in each; and use bucklers, back and breast plates, as defensive, and carbines, darts, lances, scimitars, &c., as offensive weapons. The men are very indolent, and oblige the women not only to do all the domestic drudgery, but to cultivate the land. They have three harvests in the year, but make fruit a principal part of their diet.

The Dutch have a fort at the western part of the island, erected upon the top of a mountain, and ascended to by three hundred and twenty-four stone steps. At the foot of the mountain stands a negro town, the principal factory of the Dutch being at Nera, which is well fortified, as are all the landing-places in the island; and the whole are under the direction and superintendence of a governor and council. The imports into this and the other Banda Islands are gold-chains and coins, enamelled and damasked sword-blades, guus, China-ware, broad-cloths, velvets, damasks, flannels, &c. The exports are spices and fruits.

#### TERNATE.

Ternate, though inferior in size to some of the other Moluccas, is deemed the principal, both by the Dutch and natives, as the Dutch make it the head seat of their government, and the chief sultan of these islands, the place of his residence.

This island produces an abundance of cloves, admirable almonds, delicious fruits, a few goats, and some poultry; but not rice, or any other grain; for the excessive heat, which is requisite to ripen spices, and meliorate fruit, parches the earth, so as to render it incapable of bearing wheat, barley, or rice; for here the sun is

seen in all his splendor and power, and his influence is so great, that his rays penetrate through the pores of the earth, and warm the soil to a considerable depth beneath the surface.

As a substitute for bread, the natives use the pith of a tree called sago, whose salubrious qualities are well known in Europe. This excellent tree is not only of utility with respect to its medicinal virtues, and for yielding them bread, but it affords them, likewise, drink, clothing, and shelter; for, by incision, a liquor is drawn from it, that exceeds most wines: the leaves, being a kind of cotton, the smaller are converted into garments, and the larger used to thatch their houses.

Most of the houses on this island are built of cane; some few of the better sort, indeed, are of timber. With respect to their furniture, a mat serves them instead of a bed, chair, and table; for they eat, drink, sit, and sleep, on it. This, and a pot to dress their victuals, a hatchet to cut their wood, and a calabash to hold their water, make the whole catalogue of their household utensils: their windows are not glazed, nor are their doors secured by locks. They wear silk or calico, and all persons make their own garments, the king and grandees excepted. Their fuel consists of odoriferous woods, and even their smiths use nothing in their forges but almond-shells. The king resides at Malaya, a little town, fortified with a mud-wall; but the suburbs, in which the Dutch factory have a fine garden, are pretty large, and well inhabited by blacks. The palace is but a trivial building; but the gardens belonging to it are very pleasant, and contain an aviary, filled with a great variety of beautiful birds.

The chief quadrupeds are goats, deer, and hogs. Many of the birds are of distinguished beauty, particularly the king-fisher, clothed in scarlet and mazarine blue, and called, by the natives, the goddess. Ternate also produces parrots, which are handsomer, and speak more distinctly, than those of the West-Indies; but the most remarkable of the feathered race in this island is the bird of Paradise, which is justly deemed the most beautiful bird in the universe. The head is like that of a swallow, but the bill considerably longer; the body is small, but the plumage displays such admirable colours, as are inconceivably pleasing to the eye.

The Boa serpent is sometimes found here of the length of thirty feet, and, by its power of suction and constriction, is said to be capable of devouring small deer.

The sultan of Ternate has great power, which extends to a part of Papua, whence he receives a tribute of gold, amber, and birds of Paradise. Captain Forrest, in the account of his voyage from Balambangan to New Guinea and the Moluccas, states the number of the militia, furnished by the respective territories of the sultan of Ternate, as amounting to ninety thousand seven hundred men;

nor was the naval force inconsiderable. The largest of the *proas*, or small ships, are about the burden of ten tons; on each side are singular frames, like wings, on which the rowers are placed, yet these vessels move with great velocity through a smooth sea.

There is a volcano on this island, which casts out a sulphureous fire, three months in the year, and sometimes does great mischief. There is an account of its dreadful devastations, in a letter from a merchant at Batavia, from which it appears, that, during his residence in that city, more than a hundred shocks of earthquakes were felt, some of which were so violent, that they seemed to threaten the destruction of the whole island. The burning mountain, after a dreadful explosion, threw out hot stones, cinders, and lava, in abundance; and, some time after, the earth was never still for three hours; the mountain seemed all on fire, and the most dreadful storm of thunder and lightning fell in every part of the island, which threw the inhabitants into such a consternation, that they ran from one part to another for shelter, but none was to be found; the sea was so dreadfully boisterous, that destruction there seemed inevitable; and, on the land, the earth opened and trembled under them, as if the whole island were going to be annihilated; but, at length, a calm was restored, and the inhabitants were delivered from their dreadful apprehensions.

#### AMBOYNA.

The island of Amboyna was discovered by the Portuguese, about the year 1515, but not taken possession of till 1564. It was conquered by the Dutch about 1607. This isle is about sixty British miles in length; and, on the west side, there is a large bay, which divides it into two branches, or peninsulas. On the eastern side there is another bay, with an harbour, where the Portuguese erected their chief fortress, called Victoria.

The face of this island is beautiful and woody; mountains and verdant vales being interspersed with hamlets, and enriched by cultivation. The clove-tree grows to the height of about forty or fifty feet, with spreading branches and long pointed leaves. In deep sheltered vales some trees will produce thirty pounds annually, the chief crop being from November to February. The soil is, in general, very fertile, producing fruit of various kinds, and vegetables in general in great abundance; but the air is unwholesome.

The town of Amboyna, the capital of the island, stands near the south-west extremity, and is neatly built: the houses, on account of the frequent earthquakes, seldom exceed one floor; but the state-house is an edifice of two stories. It contains, at present, above fifty Protestant churches; and many of the natives, who have been sent over to Holland for education, officiate as clergymen and

When Amboyna was seized by the English, it was found, with its dependencies, to contain forty-five thousand two hundred and fifty-two persons, of which twenty-seven thousand eight hundred and thirteen were Protestants, the rest Mahometans, except a few Chinese and savages.

### GILOLO.

The island of Gilolo is of considerable extent, but of an irregular form. The length is about two hundred and thirty British miles, the breadth seldom above forty. The shores are low: the interior rises to high peaks, perhaps of granite, and it seems doubtful whether banks of coral can, as conceived, ever constitute a lasting isle, though they may form low and perishable ones, or enlarge those already fixed on the usual basis. Gilolo is said to have been once governed by one sovereign; but the sultans of Ternate and Tidore seem now to share this large isle betwixt them, the former possessing the northern part, with Mortay, Bakian, Motir, and some Celebesian isles, and part of Papua; while the sultan of Tidore holds the southern part, with Mycol and some other isles. One of the chief towns is Tartanay, situated on a small promontory of the eastern quarter, faced with precipices, so as to be only accessible by ladders. This isle abounds with oxen, buffaloes, goats, deer, and wild hogs; but the sheep are few. It produces also the beautiful crowned pigeon mentioned by Dampier. These birds strike hard with their wings, on which there is a kind of horn appendage.

The bread-fruit is frequent in Gilolo, with the sago-tree; and there are probably cloves and nutmegs. The natives are industrious, particularly in weaving; but their exertions are suppressed by Batavian jealousy.

### BOURO.

Bouro, situate in two degrees thirty minutes south latitude, and one hundred and twenty-five degrees thirty minutes east longitude, is about seventy-five miles in length, and thirty in breadth. The Dutch have a strong fort here, though the island is perfectly secure, from the singularity of its coast, which rises in a high ridge, and encompasses the whole, as with a wall. It contains some prodigious high mountains, but is very fertile, producing cloves, nutmegs, cocoa-trees, bananas, piñany, green ebony, beans, peas, potatoes, tobacco, Indian wheat, lime-trees, herbs, flowers, &c. Among the beasts are the civet-cat, and a singular kind of roe-buck, whose flesh is very delicate, and the curious hog called babirousa. The natives are black, and go entirely naked till they are twelve years of age, at which period they tie a piece of cloth round their waists, and never wear any other garments. They are Mahometans and Pagans, but, upon the whole,

have very little sense of religion. When a relation dies, they seem very sad, till the corpse is interred, and then they appear merry to an excess; but do not forget to make a sepulchre of stone and clay, to cover the grave of the defunct. The next day after the women are delivared of children in this island, they go about their ordinary work, while the men indulge themselves in bed, and pretend to be very ill. Instead of a cradle, they put their infants in a kind of net-work hammock, which they hang upon a peg, whenever they are too busy to dandle it in their arms.

### THE MALDIVE ISLANDS.

[*Situation and Extent.*] The Maldives were the first islands discovered by the European navigators on their arrival in the Indies. They form, as it were, an oblong enclosure of small, low, regular isles, around a clear space of sea, with very shallow water between each. They are situated about five hundred miles from Ceylon, and reach from one degree south, to seven degrees of north latitude. They extend about six hundred miles in length, and are upwards of one hundred in the broadest part.

[*Climate and Soil.*] As these islands lie so near the equinoctial on both sides, they are, of course, exceeding sultry. The nights, however, are tolerably cool, and produce heavy dews, that are refreshing to the trees and vegetables. The winter commences in April, and continues till October, during which there are heavy rains and strong westerly winds; but no frost. The summer begins in October, and continues six months, during which time the winds are easterly, and, as no rain falls, the heat is excessive.

[*Vegetables.*] The Maldivé Islands are generally fertile, and, in particular, produce great quantities of millet, and another grain much like it, of both which they have two harvests every year. They have also several kinds of roots that serve for food, particularly a sort of bread-fruit, which grows wild, and in great abundance. The woods produce excellent fruits, as cocoas, citrons, pomegranates, and Indian figs.

[*Animals.*] The only animals for food are sheep and buffaloes, except a few cows or bulls that belong to the king, and are imported from the continent; but these are only killed on particular festivals.

Domestic poultry is scarce, but they are well supplied with wild fowl, which are caught in the woods, and sold at very low prices. They have also plenty of wild pigeons, ducks, rails, and birds resembling sparrow-hawks.

The sea produces most kinds of fish, great quantities of which are exported from hence to Sumatra. Among the fish is one called a *cowrie*, the shells of which are used in many parts of the Indies instead of coin; and these are the same as those known in England by the name of blackmoors' teeth.

There is a very dangerous sort of snake, that frequents the borders of the sea. The inhabitants are also greatly pestered with rats, dormice, emmets, and other sorts of vermin, which are very destructive to fruit, and other perishable commodities; for which reason they build their granaries on piles in the sea, at some distance from the shore.

*Government and Dignity of the Monarch.]* The government here is absolute monarchy, as every thing depends on the king's pleasure. His residence is situated in the centre of the other islands, and is about five miles in circumference. The king has here a magnificent palace, in which his beds are hung, like hammocks, between two pillars, ornamented with gold; and, when he lies down, he is rocked to sleep by his attendants. His usual dress consists of a coat, made of fine white cloth or cotton, with white and blue edgings, fastened with buttons of solid gold: under this is a piece of embroidered tapestry, that reaches down to his heels, and is fastened with a large silk-girdle, fringed, and a great gold-chain before, with a lock, formed of the most precious and valuable stones. He wears a scarlet cap on his head, which is a colour so esteemed, that no other person dare presume to use it. This cap is laced with gold, and on the top of it is a large gold-button, with a precious stone. The grandees and soldiers wear long hair, but the king's head is shaved once a week. He goes bare-legged, but wears sandals of gilt copper, which must not be worn by any other person, except those of the royal family.

When he goes abroad, his dignity is particularly distinguished by a white umbrella, which no other persons, except strangers, are permitted to use. He has three pages near his person, one of whom carries his fan, another his sword and buckler, and a third a box of betel and areka, which he almost constantly chews.

When the queen goes abroad, all the women, in their respective districts, meet her with flowers, fruits, &c. She is attended by a great number of female-slaves, some of whom go before, to give notice to the men to keep out of the way; and four ladies carry a veil, of white silk, over her head, that reaches to the ground. She and her ladies frequently bathe in the sea, for the convenience of which they have a place on the shore, close to the water, which is enclosed, and the top of it covered with white cotton.

The principal part of the nobility and gentry live in the north parts of this island, for the convenience of being near the court: and so much is this division esteemed, that, when the king banishes a criminal, he is thought to be sufficiently punished by being sent to the south. The king's guards consist of about six hundred, who are commanded by his grandees; and he has considerable magazines of armour, cannon, and several sorts of ammunition. His revenue consists chiefly of a number

of islands, appropriated to the crown, with certain taxes on the various productions of others; in the money paid to purchase titles and offices, and for licenses to wear fine clothes. All the ambergris found in this country is also the property of the king; and so narrowly is it watched, that whoever is detected in converting it to his own use, is punished with the loss of his right-hand.

Each province has a governor, who is both a priest and a doctor of the law. He not only presides over the inferior priests, and is vested with the management of all religious affairs, but he is likewise entrusted with the administration of justice, both in civil and criminal cases. These governors are, in fact, so many judges, and make four circuits every year, throughout their respective jurisdictions.

*Penal Laws.]* The punishments for crimes are various: if a man be murdered, the wife cannot prosecute the criminal; but if the deceased have left any children, the judge obliges him to maintain them till they are of age, when they may either prosecute or pardon the murderer. The stealing of any thing valuable is punished with the loss of a hand; and for trifling offences they are banished to the southern islands. An adulteress is punished by having her hair cut off, and those guilty of perjury pay a pecuniary fine. Notwithstanding the law makes homicide death, yet a criminal is never condemned to die unless it is expressly ordered by the king: in which case he sends his own soldiers to execute the sentence.

*Manufactures and Commerce.]* The natives are naturally ingenious, and apply themselves with great industry to various manufactures, particularly the making of silk and cotton; and they are cautious and shrewd in trading. The principal exports consist of cocoa-nuts, cowries, and tortoise-shell; the last of which is exceedingly beautiful, and not to be met with in any other place, except the Philippine Islands. The articles imported are iron, steel, spices, china, rice, &c. all of which are engrossed by the king, who sells them to his subjects at his own price.

These islands are happily situated for producing mutual commerce to the respective inhabitants: for though the thirteen provinces are in the same climate, and all of them very fertile, yet they produce such different commodities, that the people in one cannot live without what is found in another. The inhabitants have likewise so divided themselves, as greatly to enhance this commercial advantage; for all the weavers live in one island, the goldsmiths in another, &c. In order, however, to make the communication easy, these artificers have small boats, built high on both sides, in which they work, sleep, and eat, while sailing from one island to another to expose their goods to sale; and sometimes they are out a considerable time before they return to their fixed habitations.

*Coin.* The current coin is silver, and of one sort only, called *lorrins*, each of which is about the value of eight pence. It is about two inches in length, and folded, the king's name being set upon the folds in Arabic characters. They sometimes use the shells of cowries instead of small change, twelve hundred of which make a *lorrin*; but, in their own markets, they frequently barter one thing for another. Their gold and silver are all imported from abroad, and are current here by weight, as in many other parts of the Indies.

*Customs, Manners, &c.* The natives are very robust, of an olive complexion, and tolerably well-featured. The women are fairer than the men, and, in general, agreeable in disposition.

The dress of the common people is only a piece of cotton fastened round their waist, except on festivals, when they wear cotton or silk jerkins, with waistcoats, the sleeves of which reach only to the elbows. The better sort tie a piece of cloth between their legs and round their waist, next to which they have a piece of blue or red cotton cloth, that reaches to the knees. Within a girdle, on the left side, they keep their money and betel, and on the right side a knife. They set a great value on this instrument, from its being their only weapon; for none but the king's officers and soldiers are permitted to wear any other.

The women wear a coat of cotton or silk, that reaches from the waist to the ankles, over which they have a long robe of taffety or fine cotton, that extends from the shoulders to the feet, and is fastened round the neck by two gilt buttons. Their hair is black, which is esteemed a great ornament; and, to obtain this, they keep their daughters' heads shaved till they are eight or nine years of age, leaving only a little hair on the forehead, to distinguish them from the boys. They wash their heads and hair in water, to make it thick and long, and let it hang loose, that the air may dry it; after which they perfume it with an odorous oil. When this is done, they stroke all their hair backwards from the forehead, and tie it behind in a knot, and the whole is ornamented with a variety of flowers.

The habitations of the common people are built of cocoa-wood, and covered with leaves, sewed one within another. But the better sort have their houses built of stone, which is taken from under the flats and rocks in the following manner: Among other trees in this island is one called *candou*, which is very soft, and, when dry and sawed into planks, much lighter than cork. The natives, who are excellent swimmers, dive under water, and, having fixed upon a stone fit for their purpose, they fasten a strong rope to it: after this they take a plank of the *candou*-wood, which, having a hole bored in it, is put on the rope, and forced down quite to the stone: they then run a number of other boards, till the light wood rises up to the top, dragging the stone along with it. By this contrivance the na-

tives got up the cannon and anchors of a French ship that was cast away here in the beginning of the last century.

The Maldivians are in general very polite, particularly those on the Island of Male, which is the principal of the groupe; but they are very libidinous, and fornication is not considered as a crime; neither must any person offer insult to a woman that has been guilty of misconduct previous to marriage. Every man is permitted to have three wives, if he can maintain them.

In their diet, they are very abstemious; their principal food consisting of roots, made into meal, and baked. They sit cross-legged at their meals, in the same manner as in other oriental countries. The floor on which they sit is covered with a fine mat; and banana-leaves supply the want of a table-cloth. Their dishes are chiefly of china, all vessels of gold and silver being prohibited: they are made round, with a cover, over which is a piece of silk, to keep out the ants. They take up their victuals with their fingers, and in so careful a manner as not to let any fall; and if they have occasion to spit, they rise from the table and walk out. They do not drink till they have finished their meal, for they consider that as a mark of rudeness; and they are very cautious of eating in the presence of strangers.

Though they profess the religion of Mahomet, they retain many Pagan customs; for when crossed at sea, they pray to the king of the winds; and in every island there is a place where those who have escaped danger make offerings to him, of little vessels, made for the purpose, into which they put fragrant woods, flowers, and other perfumes, and then turn the vessel adrift to the mercy of the waves. Such are the superstitious notions they have of this airy king, that they dare not spit to the windward, for fear of offending him: and all their vessels, being devoted to him, are kept extremely clean.

Their mosques are neat buildings, made of stone, and well cemented: each of them is situated in the centre of a square, and round them they bury their dead. The mosque has three doors, each ascended by a flight of steps. The walls within are wainscotted, and the ceiling is of wood, beautifully variegated. The floor is of polished stone, covered with mats and tapestry, and the ceiling and wainscoting are firmly joined, without either nails or pegs. Each mosque has its priest, who, besides the public duties of his office, teaches the children to read and write the Maldivian language. He also instructs them in Arabic, and is rewarded for these services by the parents.

Those who are very religious go to the mosque five times a day; and, before they enter it, they wash their feet, hands, ears, eyes, and mouth; nor will they neglect doing this on any occasion whatever. Those who do not choose to go to the mosque, may say their prayers at home; but if they are known to omit doing one or the other, they are treated with the greatest contempt.

They keep their sabbath on the Friday, which is celebrated with great festivity, and the same is observed on the day of every new moon. They have likewise several other festivals in the course of the year.

When two persons design to enter into the conjugal state, the man gives information of his design to the governor, who asks him, if he is willing to have the woman proposed: on his answering in the affirmative, the parents are interrogated, as to their consent: if they approve of it, the woman is brought forward, and the parties are married in the presence of their friends and relations. A woman cannot part from her husband without his consent, though a man may divorce his wife.

On the death of any one, the corpse is washed by a person of the same sex, of which there are several in each island appointed for that purpose. After this is done, it is wrapped up in cotton, with the right hand placed on the ear, and the left on the thigh. It is then laid on the right side in a coffin of candou-wood, and carried to the place of interment by six relations or friends, and followed by the neighbours, who attend without being invited. The grave is covered with a large piece of silk or cotton, which, after the interment, becomes the property of the priest. The corpse is laid in the grave with the face towards Mahomet's tomb; and, after it is deposited, the grave is filled up with white sand, sprinkled with water. In the procession, both to and from the grave, the relations scatter shells for the benefit of the poor, and give pieces of gold and silver to the priest, in proportion to the circumstances of the deceased. The priest sings continually during the ceremony; and, when the whole is over, the relations invite the company to a feast. They inclose their graves with wooden rails; for they consider it as a sin for any person to walk over them; and they pay such respect to the bones of the dead, that no person dare touch them, not even the priests themselves. They make little difference in their habits on these occasions; the mourners only go bare-headed to the grave, and continue so for a few days after the interment.

If a person die at sea, the body, after being washed, is put into a coffin, with a written paper, mentioning his religion, and requesting those who may meet with the corpse to give it decent interment. They then sing over it, and, after having completed their ceremonies, they place it on a plank of candou-wood, and commit it to the waves.

### SECTION VI.

#### SUNDA ISLANDS.

The Sunda chain comprises Java, Timor, and Sumatra, with some other islands of inferior note.

#### JAVA.

This island is situate between one hundred and two and one hundred and thirteen degrees of east longitude, and between five and eight degrees of south latitude; being about seven hundred miles in length, and two hundred in breadth. It is bounded, on the north, by the Island of Borneo; on the east, by the Straits of Bally; on the south, by the Indian Ocean; and, on the west, by the Straits of Sunda.

*Animal and Vegetable Productions.* The island of Java produces goats, sheep, hogs, buffaloes, and horses. The horse, which is said to have been met with here, when the country was first discovered, is a small animal, being seldom above thirteen hands high. The horned cattle of this country are different from those of Europe; the flesh is extremely lean, but of a very fine grain. Both the Chinese and the natives feed on the buffalo; but the Dutch will neither taste the flesh or the milk, from an idea, that they are productive of fevers. The sheep have long pendulous ears, and their flesh is tough and ill-tasted.

Formerly this island produced no kind of spices but pepper, and the quantity which the Dutch bring annually from thence is very considerable; but the quantity used in the country is very small, as the people there give the preference to Cayenne pepper. The inhabitants are very fond of nutmegs and cloves, but they bear too high a price to be much in use, as the trees which produce them are all become Dutch property.

*Cities, &c.* The most distinguished city in this island is Batavia; of which the following account has been given by Sir George Staunton, secretary to Earl Macartney's embassy to the emperor of China:

"The city of Batavia, situated amidst swamps and stagnated pools, independent of climate and inattention to cleanliness, is, perhaps, one of the most unwholesome places in the universe. The morning sea-breeze ushers in noxious vapours, and the meridian sun deleterious miasmata. The wan and languid appearance of the people, and the obituary of the public hospitals, which recognized nearly a hundred thousand deaths within the last twenty years, are melancholy proofs of the assertion.

"The acknowledged unhealthiness of Batavia, notwithstanding the inducement of a rapid acquisition of fortune, discourages Europeans from going thither, if, by any possible means, they can remain comfortably at home. This accounts for the reposterous unfitness with which offices and professions are filled and personated. There were two men in the place, originally barbers; the one acted as clergyman, the other as physician. The season which contributes most to health, or rather which retards the progress of death, is from March to November. The sea-breeze commences about ten o'clock in the morning, and remains till about four in the afternoon; a calm then suc-

ceeds till about except a few in from which tin breath of wind the thermome gree; but, in

in the morning, and  
; a calm then suc-

ceeds till about eight, when the land-breeze sets in, and, except a few intervening calms, is stationary till day-break; from which time till about ten o'clock there is scarcely a breath of wind. During the Lion's stay in Batavia road, the thermometer was from eighty-six to eighty-eight degrees; but, in the town, it was two degrees higher.

"The fortifications of Batavia, which, at first view, seem to imply great strength, would not, in Europe, be considered as formidable: and it should be observed, that one of the counsellors of the Indies, who had exerted his military talents to guard the settlement from external attacks, declared, that their chief dependence was upon the havoc which the climate and noxious air of the atmosphere were likely to make upon the enemy's forces."

"The troops on the establishment were twelve hundred Europeans, of whom eleven hundred were infantry, the rest artillery. There were, besides, three hundred volunteers of the town, not disciplined, formed into two companies. The irregulars consisted of enrolled natives of Java, who were never embodied, and of Chinese, in all very numerous. Add to this, every person, who becomes a settler at Batavia, is compelled to take up arms in its defence."

"The castle is constructed of coral-rock, and the town-wall partly of dense lava, from the mountains in the centre of the island, not unlike that of Vesuvius. There is no stone of any sort discovered for miles behind the city of Java. The marble and granite, used here in various edifices, are conveyed thither from China, in vessels called junks: these sail from the ports of the provinces of Canton and Fokien, and are mostly laden with tea, silks, and porcelain."

The citadel, where the governor has his palace, commands the town and suburbs, which are inhabited by natives of almost every nation in the world; the Chinese residing in this island are computed at one hundred thousand; but twenty thousand of that nation were barbarously massacred, without even the smallest offence being proved upon them, in 1740. The massacre was too unprovoked and detestable to be defended even by the Dutch, who, when the governor arrived in Europe, sent him back to be tried at Batavia: but he never has been heard of since.

About eighty miles east of Batavia is Cherbon, a place of considerable extent, and where the Dutch have a factory. The country is very fertile, and produces most kinds of provisions, particularly rice. The inhabitants are under the dominion of four great lords, called sultans, one of whom is particularly attached to the Dutch, and, for that reason, is distinguished from the rest by the name of the company's sultan.

Near Cherbon are a splendid tomb and mosque, ranked amongst the most magnificent antiquities of the

east. Thunberg mentions several volcanoes, one of which had overwhelmed with ashes a great number of coffee plantations.

Batam, which was once the metropolis of a great kingdom, is the principal place of commerce at the western part of this island. It stands in a plain, at the foot of a mountain, whence issues a river that divides itself into three streams, one of which runs through the town, and the others surround it. It is twelve miles in circumference; and, before it was reduced by the treachery of the Dutch, (who first joined the natives against their king, and then stripped the latter of all regal power,) was very populous, well fortified, and contained several elegant buildings and palaces. At this time it is a ruinous place, inhabited only by the poorest people.

*Customs, Manners, &c.* "The Dutch settlers in this place, acquiring wealth and influence under the company, neglect their former habits of industry and temperance, and too often sacrifice health, and sometimes life, to indolence and voluptuousness; convivial pleasures, in particular, are carried to excess. In many respectable houses, fish and flesh are served with tea and coffee for breakfast; very soon after this, claret, madeira, gin, Dutch small beer, and English porter, are placed in the portico of the great hall; and pipes and tobacco are served to every guest, with which they are occupied, with little interruption, till near the hour of dinner, which is one o'clock.

"Just before dinner, each guest is served with a bumper of Madeira wine, as a whetter or bracer: two men-slaves attend for this purpose. Afterwards enter three female slaves: one holds a silver jar, containing water, to wash with; a second, an empty silver basin, with a cover, to receive the water after having used it; and a third has towels to wipe the hands with. Other female slaves wait at table, which is covered with a variety of dishes; but, with stomachs so cloyed, little is received into them except liqueurs. A band of musicians, all slaves, play at a small distance during the repast. Coffee immediately succeeds dinner; and soon after they retire to bed, consisting only of a mattress, bolster, pillow, and a chintz counterpane, but no sheets; and the night-dress, consisting of a muslin cap and a long loose gown, is put on. If he be a bachelor, a female slave attends to fan him during his sleep. About six, they rise and dress, drink tea, take an airing in their carriage, and form parties to spend the evening.

"The morning-meetings are seldom attended by the ladies. Most of these are descended from Dutch settlers, and their education has by no means been neglected. The features and contour of their faces are European, but their complexion and character Javanese. The tint of the rose is an alien to the cheek, while pale languor overspreads the countenance. When at home, they are mostly clothed, like their slaves, in a red checkered gown of cotton, de-

seending to the ankles, with long wide sleeves. The colour of their hair is mostly black, worn in plaits or tresses, fastened with a silver bodkin on the top of the head, like the peasants of Switzerland; they wear no head-dress, and their hair is occasionally polished with the oil of the coconut, and decorated with chaplets of flowers.

"Diseases of the teeth, which prevail in the northern parts of Europe, are strangers to the native Javanese, who principally subsist on vegetable food; but so capricious is mankind with regard to taste, that what would appear disgusting, if not disgraceful, to a European, black teeth, is with them considered as the standard of beauty: accordingly, they sedulously paint their teeth all black, of the deepest hue, the two anterior ones in the middle excepted, and these they cover with gold-leaf; the operation is repeated as often as is necessary to keep them in that state, and they compare those to monkeys, who preserve them in their natural colour.

"When abroad on morning-visits, out on airings in their carriages, or engaged in parties on evenings, they dress splendidly, in gold and silver-spangled muslin robes, with their hair adorned with a profusion of jewels. They are not solicitous to mould the shape from fancied elegance, at the expense of ease, neither are they guided by any standard of fashion.

"Every native lady takes abroad with her a female slave, handsomely dressed, who, on her mistress being seated, sits before her on the floor, holding in her hand a gold or silver box, containing a pungent masticatory. It is compounded of areca-nut, cardamom-seeds, pepper, tobacco, and slacked lime, rolled within a betel-leaf, and is in general use among the ladies.

"If, when at public assemblies, the ladies feel themselves incommoded by heat, whether occasioned by their dress or not, they withdraw, and change their costly robes for a loose attire. The younger gentlemen follow the example, and substitute white jackets, often with diamond buttons, for their heavy formal vestments.

"The members of the government have always combined their personal gratification with the eastern policy of striking vulgar minds with reverential awe, by assuming external and exclusive distinctions. They alone, for instance, are privileged to wear abroad crimson velvet; to them only one of the city-gates is opened; their carriages have distinguished heraldic ornaments, and others, meeting them, must stop and pay them homage. They certainly do succeed in maintaining absolute power, not only over the natives of the country, but likewise over the slaves imported into it, and the Chinese attracted thither in the hope of gain.

"The native Javanese were formerly governed by as many petty kings as there were large towns, but their number has been diminished. At present, the sultan of

Mataram rules to the east, and the king of Bantam to the west, while nearly the whole coast and effective power are in the hands of the Dutch.

"The Mahometan princes, being all despots, do not rule in the hearts of their subjects. According to Dutch accounts, the tyrannic sway of the emperor is supported by prodigious armies throughout his territories, and by a very considerable female guard about his person. These heroines are trained to a domestic, as well as to a military life, among whom many, from mental accomplishments, are the companions as well as attendants of his Imperial Majesty.

"The island of Celebes, to the eastward of Borneo, and some other eastern islands, supply Java with slaves; and though a change of masters may not have generally aggravated their condition, yet some among them, who, before they were made captives, lived in a state of independence, have been known to take offence on the slightest occasions, and to avenge themselves by assassination. Under this apprehension it is, that female slaves are preferred in Batavia, for every use to which they can be applied; and their number, of course, exceeds that of the males. The method of wreaking their revenge is this: in order to possess themselves of artificial courage, they swallow a more than ordinary dose of opium, which soon renders them frantic and desperate. In this state, they not only stab the objects of their hatred, but, in their frenzy, sally forth, and assail, in the same manner, every person they meet, till self-preservation renders it duty to destroy them. Indeed such is the moral turpitude of mankind, that instances are not more frequent among the slaves than among the free natives of the country, who, without prudence to guide them in the ordinary affairs of life, or fortitude to bear them up against its common accidents—from the anguish of losing their friends, or their money, or property—madly adopt the same remedy, and produce the like dreadful effects.

"The Javanese appear, however, to have the highest veneration for such of their ancestors as have paid the debt of nature. A cemetery is appropriated for their remains, and they spare no expense in erecting monuments to their memory. The head of every family, not a pauper, has a separate vault; and when a Chinese of respectability dies, the melancholy event is announced to the surviving relatives. The body of the deceased is washed and perfumed; and, after putting on its best apparel, it is seated in a chair, before which the wives, children, and relations, prostrate themselves, and weep bitterly. A table, spread with fruit and various dishes, with a desert, is laid before the corpse, and wax-figures are placed on each side, as its attendants. On the third day, the corpse is put into a coffin, and placed in one of the best apartments hung round, on this occasion, with white linen, the colour

of their mourning; and the room; and the white linen, token of sorrow heard to bewail. "On the day and the corpse and solemnity, ing images of images of various the priests, and then the corpse of the deceased crutches, as if erect. The sons, dressed in coarse white linen, stand near the coffin, and manifest every token of sorrow, while the mother and female relatives are heard to bewail behind a curtain.

"On the day of interment the whole family assembles, and the corpse is conveyed to the grave with great pomp and solemnity. In the first procession are persons bearing images of men and women, relatives of the family, images of various animals, wax-tapers, &c. Next follow the priests, accompanied with instruments of music; and then the corpse, borne upon a bier, attended by the sons of the deceased, clothed in white, and inclining upon crutches, as if unable, from sorrow, to support themselves erect. The female relatives are carried in chairs, encircled with white silk, to conceal them from view; but their lamentations are uttered aloud; and other women, trained to mimic sorrow, are hired to howl, shriek, and groan, as is the custom in some parts of Europe."

### TIMOR.

Timor extends almost north-east and south-west, and is situated between one hundred and twenty-four and one hundred and twenty-eight degrees of east longitude. It is upwards of two hundred miles in length, and more than fifty in breadth, and is divided into several principalities or kingdoms. It has not any navigable rivers or harbours; yet there are several bays, where ships may ride, at some seasons of the year, with the greatest safety, as the shore is good, and free from either rocks or shoals. The Dutch and Portuguese have factories on this island; but that of the latter is the most considerable.

The island is very fertile, and produces a variety of valuable articles, particularly cocoa-nuts, which grow here in great abundance. There are also several sorts of trees that make excellent timber for ship-building; and in some parts of the island are sandal-wood and cotton-trees.

The Malayaa and a corruption of the Portuguese are the most general languages used by the inhabitants of this island, but the natives have a language of their own.

The fort belonging to the Dutch here is called Concordia, situated on a rock near the sea, between two and three miles from the south-east point of the island. Bat the place where the principal trade is carried on is Porta Nova, situated at the east end of the island, and where the Portuguese governor usually resides. This town, with that of Concordia, belonging to the Dutch, were some years ago attacked by a pirate, who plundered and destroyed several of the buildings.

### SUMATRA.

*Situation, Extent, and Boundaries.*] This island is situated in the Indian Ocean, between ninety-three and one

hundred and four degrees of east longitude, and five degrees thirty minutes of north latitude. It is bounded, on the north, by Malacca; on the east, by Borneo; on the south-east, by Java; and, on the west, by the Indian Ocean. It is long and narrow, extending in a direct line from the north-west to the south-east, and is about seven hundred and fifty miles in length, and one hundred and seventy-five in breadth. It is the first of the islands that form the Great Archipelago of the East, the entrance of which is, as it were, blocked up by this island and Java, which form a barrier, separating the Indian from the Chinese Ocean, with this exception, that, in the centre, between the two islands, there is an opening, which appears as if purposely designed to admit a free passage, for the advantage of commerce. This opening is called the Straits of Sunda, the south part of which is the north of Java, and the north point is the south of Sumatra. These two are about six leagues asunder, between which ships pass directly to Batavia or China, without touching at the Indies.

*Face of the Country, Soil, &c.*] A chain of mountains runs through the whole island. Mount Ophir, immediately under the equinoctial line, is thirteen thousand eight hundred and forty-two feet above the sea, only yielding about two thousand feet to Mount Blanc. This seems almost the only Asiatic mountain which has been accurately measured; and it is not improbable, that the northern mountains of Tibet, and even those of Caucasus, would be found greatly to exceed the highest Alps, the mountains being probably on as great a scale as the rivers and other features of that immense continent. The soil of this island is generally a stiff reddish clay, covered with a layer of black mould, the source of perpetual verdure; but three-quarters of the isle, especially towards the south, present an impervious forest. On the west, between the mountains and the sea, there are large swamps; but even here the face of the country is remarkably broken and uneven. There seem to be many mines of gold, though mostly neglected; and the copper is mingled with that metal. There are excellent ores of iron and steel; and tin is one of the chief exports, being principally found near Palimbang, on the eastern shore.

*Animal and Vegetable Productions.*] The horses of Sumatra are small, but well-made and hardy: the cows and sheep are also diminutive, the latter probably from Bengal. Here are also found the elephant, innocos, hippopotamus, tiger, bear, otter, porcupine, deer, wild hog, civet-cat, and many varieties of the monkey. The Buffalo is employed in domestic labour. Among birds, the Sumatran pheasant is of distinguished beauty. Of the vegetable productions, the most abundant article is pepper, which is produced by a creeping plant, resembling a vine. The white pepper is procured by stripping the outer husk

from the ripe grains. Camphor is another remarkable product, being found in the tree in a concrete crystallization: camphor-oil is the product of another kind of tree. Benzoin is the gum or resin of another tree; and cassia, a coarse kind of cinnamon, is found in the central parts of the country. Rattans are exported to Europe as walking-canes. There are three kinds of cotton, the annual, the perennial or shrub, and the silk-cotton, which is to be met with in every village. This is, to appearance, one of the most beautiful raw materials the hand of nature has presented. Its fineness, gloss, and delicate softness, render it, to the sight and touch, much superior to the labour of the silk-worm; but, owing to the shortness and brittleness of the staple, it is esteemed unfit for the reel and loom, and is only used for the purpose of stuffing pillows and mattresses. It grows in pods, from four to six inches long, which burst open when ripe. The seeds resemble the black pepper, but are without taste. The tree is remarkable from the branches growing out perfectly straight and horizontal, and being always three, forming equal angles at the same height. The diminutive shoots likewise grow flat, and the several gradations of branches observe the same regularity to the top. Coffee-trees are universally planted, but the fruit is not excellent. The ebony-tree abounds in the forests; and the banian-tree spreads, as usual, to a vast extent, as it drops roots and fibres from certain parts of the boughs.

*Language, &c.* Besides the Malay, several languages are spoken on this island, which seem, however, to have a manifest affinity among themselves. The Rajang and Batta are the chief internal languages, written in characters totally distinct; a singular circumstance, and which seems to overturn the ideas concerning the supposed difficulty in the invention of alphabets.

*Cities, &c.* **ACHEN**, the capital of the kingdom of that name, which comprehends the whole northern part of the island, is situate on a plain, about five miles from the sea, one thousand miles south-east of Fort St. George, in India, and about four hundred and fifty miles north-west of the city of Malacca. The harbour, which is capable of containing any number of the largest vessels, is commanded by a spacious fortress, encompassed by a ditch, well fortified, according to the Indian manner, and mounted with cannon. There are seven gates belonging to the city, besides which there are other redoubts and fortifications in the adjacent marshes.

Achen contains about eight thousand houses, which are built on posts, two feet above the ground, on account of the great rains that sometimes inundate the city. The floors and sides are made of split bamboos; and they are covered with reeds, cocoa, or palmetto-leaves. They are chiefly divided by palisades, except in two or three particular streets, set apart for trade, and one that is particu-

larly inhabited by the Chinese. The Europeans live as near each other as they can, in a long street near the river.

**BENCOOLEN**, a settlement belonging to the English, but chiefly inhabited by people of other nations, is situated in one hundred and three degrees of east longitude, and three degrees ten minutes of south latitude. The adjacent country is mountainous and woody; and, in some parts, are volcanoes. The air is very unwholesome, and the mountains are generally covered with thick clouds, that burst in storms of thunder and rain. The soil is a fertile clay, and the chief produce is grass; but, near the sea, it is all a morass. The natives build their houses on bamboo pillars; but the English build their's with timber, not only from their being in want of stone, but on account of earthquakes, which very frequently happen in this part of the island.

**SILLABAR** is an English settlement, situated about fifteen miles from Bencoolen, where they constantly keep a detachment from Marlborough Fort. The town is tolerably large, and before it is a convenient harbour; but it has not any building that demands particular attention.

**PRAMAN** is situated nearly opposite to Padang, about one hundred miles north-west of Indrapour. It is very populous, and plentifully supplied with most kinds of provisions. The natives carry on a considerable trade in gold with the inhabitants of Manimcabo. The Dutch had a factory here for some years, but were, at length, driven from it by the king of Achen.

**BARROS**, one of the most considerable places on the west coast, belonging to the king of Achen, is situated on a fine river, nearly in the centre between Ticow and Achen. The Dutch and English, as also the inhabitants of the coast, buy up the camphor here, in order to carry it to Surat and the Straits of Sunda.

*Customs, Manners, &c.* Of the inhabitants of Sumatra, no account had been given by any Englishman till the year 1778, when Mr. Charles Miller, son of the late botanical gardener, published an account of the manners of a particular district, in the sixty-eighth volume of the Philosophical Transactions. These were the Battas, a people who reside in the interior parts of the country, and differ from all the other inhabitants in language, manners, and customs. They are described as eating the prisoners whom they take in war, and hanging up their skulls, as trophies, in their houses. Our author observes, however, that human flesh is generally eaten by them in *terræren*, and not as common food, though they prefer it to all other, and speak with peculiar rapture of the palms of the hands and soles of the feet.

In 1785, Mr. Marsden, who had been secretary to the president and council of Fort Marlborough, published a very interesting history of Sumatra, in which he divides the inhabitants into Malays, Achenese, Battas, Lampoons, and

ough, published a  
which he divides the  
as, Lampoons, and

Rejangs; but takes the latter as his standard of descrip-  
tion, with respect to their persons, manners, customs, &c.  
They are rather below the middle stature, and of a pro-  
portionable bulk; their limbs, in general, are slight, and  
particularly small at the wrists and ankles; and, upon the  
whole, they are gracefully formed. Their hair is strong,  
and of a glossy black; but the men are beardless, great  
pains being taken to render them so when boys, by rubbing  
their chins with a kind of quick lime. Their complexion  
is properly yellow, wanting the red tinge that constitutes  
a copper or tawny colour. The females are, in general,  
very ordinary, and many of them really disgusting; yet  
among them are some, whose appearance is strikingly  
beautiful. Some of the mountaineers are observed to have  
swelled necks or goitres, but they attempt no remedy for  
these wens, which are consistent with the highest health.

The customs of the Sumatrans permit their having as  
many wives as they can purchase, or can afford to main-  
tain; but it is extremely rare that an instance occurs of  
their having more than one; for the dictates of frugality are  
more powerful with them than the irregular calls of appe-  
tite, and make them decline an indulgence, from which  
their law does not restrain them. Their rites of marriage  
consist simply in joining the hands of the parties, and  
pronouncing them man and wife, without much ceremony,  
except an entertainment, which is given upon the occasion  
by the father of the bride. Mothers carry their children,  
not on the arm, but straddling on the hip, and usually  
supported by a cloth, which ties in a knot on the opposite  
shoulder. The Sumatran children are not confined by any  
swathing or bandage; and, being suffered to roll about the  
floor, they soon learn to walk and shift for themselves.  
When cradles are used, they are commonly suspended from  
the roofs of the huts.

These islanders are so extravagantly fond of cock-  
fighting, that a father on his death-bed has been known to  
desire his son to take the first opportunity of matching a  
cock for a sum equal to his whole property, under a blind  
conviction of its being invulnerable. When a cock is kill-  
ed, or overcome, his antagonist must have sufficient spirit  
left to peck at him three times, on his being held up to him  
for that purpose, or it becomes a drawn battle; and some-  
times an experienced cocker will place the head of his  
vanquished bird in such an uncouth situation as to terrify  
the other, and render him unable to give this proof of  
victory.

The Achenese differ considerably in their persons from  
the rest of the Sumatrans, being taller, stouter, and of a  
darker complexion. They appear not to be a genuine  
people; but are supposed to be a mixture of Battas, Ma-  
lays, and Moors, from the western parts of India. In  
their dispositions they are more active and industrious than  
their neighbours; they possess more penetration and suga-

city; and, as merchants, they deal upon a more liberal and  
extensive foundation. They are justly famed for their skill  
in navigation; and employ a variety of vessels, according  
to the voyages they undertake, and the purposes for which  
they design them. The river is generally covered with  
fishing sampans or canoes, which go out to sea with the  
morning-breeze, and return in the afternoon full laden.  
Having no convenient coins, they usually make their pay-  
ments in gold-dust, and for that purpose are all provided  
with scales or small steelyards. They carry their gold  
about them, in pieces of bladder; and often purchase to so  
small an amount, as to make use of grains or seeds for  
weights.

The religion of these people is Mahometanism; and,  
having a great number of mosques and priests, its forms  
and ceremonies are observed with the utmost strictness.  
They have ever been remarkable for the severity with which  
they punish crimes, and there is no commutation admitted,  
as is established in the southern countries. There is great  
reason, however, to suppose, that the indigent alone smart  
under the rod of justice, the nobles being secured from  
retribution by the number of their dependants. Petty  
theft is punished either by suspending the criminal from a  
tree, with a heavy weight tied to his feet, or by the am-  
putation of a finger, a hand, or leg, according to the na-  
ture of the theft. House-breaking and robbery on the  
highway are usually punished by drowning, and afterwards  
exposing the offender's body on a stake; but, if the rob-  
bery be committed on an inn or priest, the criminal is  
burnt alive. When a man is convicted of adultery, he is  
delivered up to the friends and relations of the injured hus-  
band, who take him to a large plain, and, forming them-  
selves into a circle, place him in the middle; a large wea-  
pon, called *gadoobong*, is then delivered to him by one of  
his family; and, if he can force his way through those  
who surround him, he is not liable to farther persecution;  
but it more commonly happens, that he is soon cut to  
pieces; and, in that case, his relations bury him as they  
would a dead buffalo, refusing to admit the corpse into  
their house, or to perform any funeral-rites.

The sovereignty of Achen is hereditary; and the king  
usually employs a guard of one hundred Sepoys about his  
palace. "The grand council of the nation," says Mr.  
Marsden, "consists of the king, four *ooloballangs*, eight  
of a lower degree, who sit on his right-hand, and sixteen  
*cajoorangs*, who sit on his left. At the king's feet sits a  
woman, to whom he communicates his commands; which  
she imparts to an eunuch, and he to an officer, who pro-  
claims them aloud to the assembly. There are also pre-  
sent two other officers, one of whom has the government  
of the market, and the other the superintendence of exe-  
cutions.

All matters relative to commerce, and the customs of

the port, come under the jurisdiction of a *shabandar*, who performs the ceremony of giving the licence for trade, by lifting a golden-hafted dagger over the head of the merchant; without which no person must presume to land his goods. Presents, the value of which are become pretty regularly ascertained, are then sent to the king and his officers. If the stranger be an ambassador, the royal elephants are sent to carry him and his letters to the monarch's presence, which is done with a great deal of ceremony. After this interview, he is conducted to a separate building, where he is entertained with the delicacies of the country; and in the evening he returns, surrounded by a prodigious number of lights.

### SECTION VII.

#### NICOBAR ISLANDS.

*Extent, Productions, &c.*] The Nicobar Islands are three in number; the largest of which is called Carnicobar, and is about fifteen miles in circumference. They produce cocoa and areka-trees, with yams and sweet potatoes; and the edible birds' nests, so highly esteemed in China, are here found in abundance. The only quadrupeds are swine and hogs. The principal traffic is in cocoa-nuts, of which one hundred are bartered for a yard of blue cloth.

*Customs, Manners, &c.*] Of the inhabitants of the Nicobar Islands, but little authentic information has been given to Europeans. We are enabled, however, to lay before our readers some interesting particulars, which have been communicated to the Asiatic Society by Mr. G. Hamilton and Lieutenant Colebroke.

"The natives of Carnicobar are low in stature, and of a copper complexion, with a cast of the Malay features, but very well made, and remarkably strong and active. The men cut their hair short, and wear nothing but a narrow strip of cloth about the waist. The women have their heads shaved quite bare, and wear no other covering than a short petticoat, made of dry grass, which reaches about half-way down the thigh, and bears some resemblance to the thatching of a house. Such of them as have received presents of cloth-petticoats from the ships, commonly tie them round immediately under their arms. The ears of both sexes are pierced when young; and, by inserting plugs of wood, or appending heavy shells, they contrive to render them extremely wide. They are naturally disposed to gaiety and feasting, and are very fond of sitting at table with Europeans, of whose viands they eat most voraciously. They do not appear to be very partial to wine, but will drink bumpers of arrack, till they are completely inebriated. When a feast is held at any of their villages, every person that chooses goes uninvited, for they are utter strangers to ceremony.

At these feasts they devour immense quantities of pork, and this they eat almost raw, giving it only a hasty grill over a quick fire. Their hogs are extremely fat, being fed upon cocoa-nuts and sea-water; indeed, all their domestic animals are fed upon the same. They have, also, abundance of small fish, which they strike very dexterously with lances; wading into the sea about knee-deep, and frequently killing a very small fish at the distance of ten or twelve yards. They roast a fowl by running a piece of wood through its body, and holding it over a brisk fire until the feathers are burnt off, when they deem it ready for eating, without any other preparation. Their usual beverage is cocoa-milk, or a liquor called *soura*, which oozes from the cocoa-tree after cutting off the young sprouts or flowers. This they suffer to ferment before it is used, and then drink it by sucking it slowly through a small straw, which is held to add considerably to its intoxicating quality.

"After a repast, the young men and women usually dress themselves out with leaves, and begin dancing, while the old people sit in a circle round them, drinking *soura* and smoking tobacco. The dancers, while performing, sing some of their tunes, which are tolerably harmonious, and to which they keep very good time. Of musical instruments they have only one kind, and that the simplest that can be imagined. It is a hollow bamboo, about two feet and a half long, and three inches in diameter, along the outside of which there is stretched from end to end a single string, made of the threads of split cane, and the place under the string is hollowed out to prevent it from touching. This instrument, which is played upon in the same manner as a guitar, produces but few notes; the performer, however, generally contrives to make it sound harmoniously, and sometimes accompanies it with his voice.

"The habitations of the Carnicobarians are generally built upon the beach, in villages of fifteen or twenty houses each, and each house contains a family of about twenty persons. These dwellings are raised upon wooden pillars, about ten feet from the ground: they are of a circular shape, and, being covered with thatch, bear a striking resemblance to bee-hives, particularly as they have no windows; the entrance is through a trap-door, where the family mount by a ladder, which is drawn up at night. This mode of building is intended to secure the houses from snakes, rats, &c. and for that purpose the pillars are bound round with a smooth kind of leaf, that prevents animals from crawling up them; and, besides this, each pillar has a broad flat piece of wood near the top of it, the projecting of which effectually stops the progress of such vermin as may by chance have passed the leaf. The flooring consists of thin strips of bamboo, laid at such distances as to leave free admission for light and air; and the interior of each house is neatly finished, and decorated with fish and lances, nets, &c.

"The most of this people are averse to distant villages, and he is hungry or he helps himself without taking he has business here is so very of his house, door, but leaves without the leave.

"Their language is most others, the stop, or catch in intercourse with general, the bar.

"It is said that although they worship him from high pole is erected from it, which at a distance.

quantities of pork, but only a hasty grill, extremely fat, being indeed, all their diet.

They have, also, like very dexterous, without knee-deep, and the distance of ten running a piece of over a brisk fire may deem it ready for

Their usual beverage, *soura*, which oozes from the young sprouts of the tree before it is used, and though a small strain, intoxicating quality, women usually dress in dancing, while the drinking *soura* and the performing, singly harmonious, and musical instruments simplest that can be about two feet and a half, along the outside and a single string, the place under the drum touching. This in the same manner as a performer, however, harmoniously, and ce.

Nicobarians are generally ten or twenty houses, each of about twenty upon wooden pillars. They are of a circular shape, and hear a striking note, they have no window, where the family sit up at night. This is the houses from the pillars are bound together, but prevents animals from passing. Each pillar has a hole in it, the project of such a wooden roof. The flooring is of such distances as to be dry; and the interior is decorated with fish

"The most remarkable qualities in the disposition of this people are, their total neglect of compliment, and their aversion to dishonesty. A Carnicobarian travelling to a distant village, upon business or amusement, passes through many towns, in his way, without speaking to any one: if he is hungry or tired, he goes into the nearest house, where he helps himself to what he wants, and sits till he is rested, without taking the least notice of any of the family, unless he has business or news to communicate. Theft or robbery is so very rare amongst them, that a man, going out of his house, never takes away his ladder, nor shuts the door, but leaves it open for any body to enter that pleases, without the least apprehension of any thing being stolen.

"Their language has a sound entirely different from most others, their words being pronounced with a kind of stop, or catch in the throat, at every syllable. By frequent intercourse with strangers, however, they have acquired, in general, the barbarous Portuguese, so common over India.

"It is said that the Carnicobarians have no idea of God, although they believe in the existence of the devil, and worship him from sentiments of fear. In every village a high pole is erected, with long strings of rattans hanging from it, which is supposed to keep the malevolent spirit at a distance. When they see any signs of an approaching storm, they imagine that the devil intends them a visit, upon which many superstitious ceremonies are performed. The people of every village march round their own boundaries, and fix up, at different distances, small sticks, split at the top, into which they put a piece of cocoa-nut and the leaf of a certain plant. But whether this is designed as a peace-offering to the devil, or a charm to keep him away, cannot be easily ascertained.

"When a man dies, all his live-stock, hatchets, fishing-lances, &c. are buried with him, and his death is mourned by the whole village; a custom which, however singular in its nature, prevents all disputes about the property of the deceased among his relations. It is also customary for the wife to suffer the amputation of a joint from one of her fingers, or to have a deep notch cut in one of the pillars of her house.

"I was once present," says Mr. Hamilton, "at the funeral of an old woman. When we went into the house which had belonged to the deceased, we found it full of her female relations; some of whom were employed in wrapping up the corpse in leaves and cloth, and others tearing to pieces all the cloth which had belonged to her. In an adjacent house, the men of the village, with a great many others from the neighbouring towns, were sitting, drinking *soura*, and smoking tobacco. In the mean time two stout young fellows were busy digging a grave in the sand near the house. When the women had done with the corpse, they set up a most hideous howl, upon which the people began to assemble round the grave, and four men

went up into the house to bring down the body: in doing this they were much interrupted by a young man, son of the deceased, who endeavoured with all his might to prevent them; but, finding it in vain, he clung round the body and was carried to the grave along with it: there, after a violent struggle, he was turned away, and conducted back to the house. The corpse being now put into the grave, all the live-stock which had been the property of the deceased, consisting of about half a dozen hogs and as many fowls, was flung in above it; a man then approached with a bunch of leaves, fastened to the end of a pole, which he swept two or three times gently along the corpse, and then the grave was filled up. During the ceremony, the women continued to utter the most horrible cries imaginable. A few days afterwards, a kind of monument was erected over the grave, with a pole upon it, from which some strips of cloth, of different colours, were suspended.

"There seems to subsist among these islanders a perfect equality. A few persons, from their age, have a little more respect paid to them; but there is no appearance of authority one over another: their society seems bound rather by mutual obligations; the simplest and best of all ties."

As the natives of Nancowry and Comarty have the same customs, manners, &c. as the rest of the Nicobarians, we shall only state, in addition, an extraordinary ceremony which they annually perform in honour of the dead.

"On the anniversary of this festival," says Mr. Colebrooke, "their houses are decorated with garlands of fruits, flowers, and branches of trees. The people of each village assemble, dressed in their best attire, at the principal house in the place, where they spend the day in a convivial manner; the men, sitting apart from the women, smoke tobacco, and intoxicate themselves, while the latter are nursing their children, or employing themselves in preparation for the mournful business of the night. At a certain hour of the afternoon, announced by striking the *gong*, the women set up the most dismal howls and lamentations, which they continue, without intermission, until sun-set, when the whole party get up, and walk in procession to the burying ground. When arrived at the place, they form a circle round one of the graves, when a stake, planted exactly over the head of a corpse, is pulled up. The woman who is nearest of kin to the deceased then steps out from the crowd, digs up the skull, and takes it up with her hands. At sight of the bones her strength seems to fail her: she shrieks and sobs alternately, and tears of anguish fall abundantly on the mouldering object of her pious care. She clears it from the earth, scrapes off the festering flesh, and laves it plentifully with the milk of fresh cocoa-nuts; after which she rubs it over with an in-

fusion of saffron, and wraps it carefully in a piece of new cloth. It is then deposited again in the earth, and covered up, the stake is replanted, and hung with the various trappings and implements belonging to the deceased; and the whole night is spent in going from grave to grave, and repenting these dismal and disgusting rites.

"On the next morning the ceremony is concluded by an offering of several fat swine, when the sacrifice made to the dead affords an ample feast to the living. The people besmear themselves with the blood of the slaughtered hogs; and some, more voracious than the rest, eat the flesh raw. They have various ways, however, of dressing their meat, but always eat it without salt. A kind of paste, made of the *mellori*, serves them for bread, and they always finish their repast with copious potatoes of *souria*.

"The Nicobareans," continues our author, "are hospitable and honest, and are remarkable for a strict observance of truth, and for a most punctual adherence to their engagements. Such crimes as robbery and murder are unknown in these islands; but the people do not want spirit to revenge their injuries, and will fight resolutely, if attacked or unjustly dealt with. Their only vice seems to be inebriety; but even in their cups they are commonly jovial and good-humoured. Sometimes, however, it happens at their feasts, that the men of different villages fall out, and then the quarrel is sure to become general. In these cases they terminate their differences in a pitched battle, where the only weapons used are long sticks, of a hard and knotty wood: with these they drub one another most heartily, until, no longer able to withstand each other's fury, they mutually put an end to the combat.

"These islanders are so sensible of the scanty population of their country, that they endeavour to increase it by inviting, and even seducing, some Malabars, or Bengalese, to remain amongst them, and of these there are in almost every village some to be found, who may be easily distinguished from the natives, by their figure, features, and complexion. They are usually encouraged to stay by grants of land, with plantations of arecas and cocoa-trees; and, after a certain number of years, they are permitted to make choice of a female companion.

"They entertain a very high opinion of such as are able to read and write; and firmly believe that all Europeans, by this sole qualification, are able to control the winds, direct the appearance of the planets, and perform all the supposed wonders of divination.

"The different changes of the moon are productive of great festivity among the Nicobareans, for on these occasions their huts are fancifully decorated with branches of palm and festoons of plantain-leaves; and the day is entirely devoted to singing, dancing, and drinking.

"The idea of years, months, and days, is totally un-

known to them, as they reckon by moons only, of which they number fourteen, that is, seven at each monsoon. At the fair season, or the commencement of the north-east monsoon, they sail in large canoes to Carnicobar, called by them *Champaloon*. The object of this little voyage is trade; and for fowls, hogs, ureen, and coron, the produce of their own island, they receive in exchange, canoes, spears, ambergris, tortoiseshell, &c.

"Few diseases are known among them, except a swelling of the legs, known, in the west of India, by the name of the *Cochin leg*, from the place where it generally prevails. This endemic disease seems to result chiefly from ill-chosen and badly-prepared diet, or bad choice of habitations, and an extremely indolent life. The small-pox visits them occasionally, but not of the confluent kind; and they are sometimes attacked by fevers and cholics. When a person falls sick, he is immediately removed to the house of a priest, or conjurer, who invariably orders the patient to be laid in a supine posture for some time, and friction, with some oily substance, is to be repeatedly applied to the upper part of his body: the use of internal remedies seems to be either unknown or utterly disregarded."

Their superstition, in many particulars, is very remarkable; one instance of which we shall lay before our readers.—Some of the natives, having begun to fabricate earthen pots, died soon afterward; and the cause being attributed to this new employment, it has never been resumed; for they prefer going fifteen or twenty leagues to purchase such articles, rather than expose themselves to an undertaking which they firmly believe to be attended with the most fatal consequences.

### SECTION VIII.

#### ANDAMAN ISLANDS.

*Extent, Productions, &c.* The island called the Great Andaman is about one hundred and forty miles in length, but not more than twenty in the greatest breadth; indented by deep bays, and intersected by vast creeks and inlets, one of which passes quite through the island, and is navigable for small vessels. The soil is chiefly a black mould, and the forests, which are pretty extensive, contain some valuable trees, as ebony and the bread-fruit. The only quadrupeds are wild hogs, monkeys, and rats; but the sea yields an abundance of excellent fish, particularly oysters.

*Customs, Manners, &c.* The Andaman Islands are inhabited by a race of men the least civilized in the world, and approaching nearer to a state of nature than any people we read of. Their complexion is extremely dark, their stature generally low, and their aspect remarkably uncouth. Their limbs are ill-proportioned, their bellies prominent, and their noses flat. They have also woolly heads, in

which respect they differ from all the various tribes inhabiting the continent of Asia or its islands. Both sexes go entirely naked, except on some occasions, when the women wear a sort of fringe round their waist; and even this is intended merely for ornament.

It is said that the men are remarkably crafty and revengeful; and frequently express their aversion to strangers in a loud and threatening tone, exhibiting many signs of defiance, and expressing their contempt by the most indecent gestures. At other times they appear quiet and docile, with the most insidious intent. They will even affect to enter into a friendly conference, and receive, with a show of humility, any articles that may be presented to them; but on a sudden they will utter a hideous shout, and treacherously discharge their arrows at the unsuspecting visitant. On the appearance of a vessel, they frequently lie in ambuscade among the trees, and send one of their gang to allure the strangers on shore; and, if the crew happen to land without arms, they immediately rush out from their lurking-places and attack them. In these skirmishes they are said to display great resolution, and have sometimes been known to plunge into the water, and discharge their arrows while in the act of swimming.

Their mode of life appears degrading to human nature, for, like brutes, their time is chiefly spent in quest of food, and, as their lands are totally uncultivated, they subsist entirely upon what they can pick up or kill. In the morning they daub their woolly heads with red-ochre, and rub their skins with mud, to prevent the annoyance of insects. The women bear the greatest part of the drudgery, in collecting food: repairing to the reefs, at the recess of the tide, to pick up shell-fish: while the men are hunting in the woods, or wading in the water to shoot fish with their bows and arrows. In their excursions through the woods, a wild hog sometimes rewards their toils, and affords them a more substantial repast. They usually broil their meat on small bamboos, adjusted in form of a gridiron, but use no salt, nor any other seasoning.

Upon some occasions they display a considerable share of vivacity in conversation, and are remarkably fond of singing and dancing. Their language is rather smooth than guttural; and their melodies, which are in the nature of recitative and chorus, are not displeasing. They usually dance in a ring, each alternately slapping and kicking his own posteriors. Their salutation is performed by lifting up one leg, and striking with their hand upon the lower part of the thigh.

Their huts may be considered as the rudest attempt to

procure shelter from the weather. Three or four sticks are fixed in the ground, and fastened together at top in form of a cone; over which a sort of thatch is formed with branches and leaves of trees; an opening is left on one side, just large enough to creep into, and the ground beneath is strewn with dried leaves, that supply the want of beds. In these wretched hovels are frequently found the skulls of wild hogs, suspended from the roofs.

They use rafts, made of bamboos, to transport themselves across their harbours, or from one island to another; and they have also a few canoes, hollowed out of the trunks of trees, by means of fire and instruments of stone, but they have no iron in use among them, except such utensils as they have procured from the European mariners who have lately visited their islands, or from the wrecks of vessels formerly stranded on their coasts. Their bows are remarkably long, and of a peculiar form; their arrows are headed with fish-bones, or the tusks of wild hogs; and they also use a kind of shield. Of their implements for fishing, and other purposes, we cannot give a particular description. It appears, however, that hand-nets, of different sizes, are used in catching the small fry; and a kind of wicker-basket serves to deposit whatever articles of food they can pick up.

With respect to the origin of these people, nothing satisfactory has ever been laid before the public. A story has, indeed, been related of a crew of African slaves, of both sexes, having been cast away at the Andamans; and that, having murdered their masters and fellow-passengers, they spread themselves over, and populated the country. But this story does not appear to have been well authenticated. Some authors have accused them of being cannibals; but this charge has never been fully proved, although, from their cruel disposition, great voracity, and cunning modes of lying in ambush, there is reason to suspect, that, in attacking strangers, they are frequently impelled by hunger; as they invariably put to death the unfortunate victims who fall into their hauls, and the bodies of some whom they have killed have been found mangled and torn. It would, indeed, be difficult to account for their unrelenting hostility to strangers without believing them to be men-eaters, unless the above-mentioned story of their origin be true; in which case they might probably retain some tradition of having once been in a state of slavery, and might therefore wage perpetual war with those whom they suspected of wishing to enslave them again.

A British settlement has been recently formed on the Greater Andaman, and some convicts have been sent thither from Bengal.

## CHAPTER X.

## FORMOSA, ANIAN, AND THE ISLANDS BELONGING TO ASIATIC TURKEY.

## SECTION I.

## FORMOSA.

*Situation, Extent, and Climate.*

**T**HIS beautiful island is situated nearly opposite to the province of Fo-kien, in China, and is computed to be two hundred and sixteen miles in length, from north to south, and about seventy miles in the broadest part. Its longitude from Pekin is from three degrees twenty minutes to five degrees forty minutes east, so that, when the sun is almost vertical over it, the climate is rather hot; but this is far from being disagreeable, as the heat is greatly mitigated by the situation of the island, which is so elevated as to receive the most agreeable advantages from the cooling breezes of the sea.

*Vegetables.]* That part of the island possessed by the Chinese produces great quantities of different kinds of grain, especially rice; and its fertility is increased by the numerous rivers with which it is watered. As great a variety of fruits are to be found upon it as in any other part of the Indies, particularly oranges, cocoas, bananas, ananas, guavas, &c. Also several kinds of those produced in Europe, as peaches, apricots, figs, grapes, and chesnuts. They have likewise a sort of melon, which is of an oblong form, and much larger than those of Europe: it contains a white or red pulp, and is full of a fine juice, very grateful to the taste.

*Animals.]* There are but few wild beasts on this island, and those seldom seen, as they chiefly inhabit the interior parts, which are very mountainous, and seldom resorted to by the inhabitants. They have some horses, oxen, sheep, goats, and hogs. They have but few birds, the principal of which is the pheasant; but the rivers produce great plenty of various kinds of fish.

*Chief City.]* The capital city, which is in the possession of the Chinese, is called Taywan. It is large and populous, and carries on so extensive a trade, that it is little inferior to some of the most opulent in China. It is plentifully supplied with all kinds of provisions, either of its own product, or commodities brought from other countries, as rice, cotton, sugar, wine, tobacco, and dried venison; the latter of which is greatly admired by the Chinese, and considered as the most delicious food. They have likewise all kinds of fruits, medicinal herbs, roots, gums, &c. with plenty of linen, silk, and cotton, of various sorts.

The houses are, in general, very small, and are built of clay, covered with thatch. The streets are long and spacious, and the buildings on each side have awnings, that join in such a manner as to cover the street; but these are only used during the hot months, to keep off the excessive heat of the sun. Some of the streets are nearly three miles in length, and between thirty and forty feet broad. These streets are chiefly occupied by dealers, whose shops are furnished with all kinds of goods, ranged and displayed to the greatest advantage. The shops appear very brilliant, and many people walk in the streets merely to gratify themselves with the sight of so great a variety of the richest commodities.

The city is not defended either by walls or fortifications; but it has a good garrison of horse and foot, consisting of ten thousand men, who are principally Tartars. These are commanded by a lieutenant-general, two major-generals, and a number of inferior officers, who are at liberty to relinquish their situation, after having served three years, or sooner, if occasion should require.

The harbour is tolerably good, and sheltered from the winds; but the entrance to it is dangerous for ships of burthen, the bottom of it being rocky, and the water not above ten feet deep at the highest tides.

As the coasts about this island are very high and rocky, and have neither havens nor sea-ports, it is almost impossible to effect an invasion. Taywan is the only bay in the whole island where ships of any bulk can approach, and this is situated at the mouth of a river so narrow, and defended by such high rocks and forts on each side, that no enemy could possibly enter it without being repulsed.

*Government.]* The government of each town or borough is confined to itself. Three or four of the most ancient, who are known to be men of integrity, are appointed as judges over the rest, who determine all differences; and he who refuses to submit to the decision is banished; nor can he either return, or be admitted into any other town; so that he is obliged to finish his days without ever again participating of the enjoyments of society. The inhabitants of this island pay an annual tribute to the Chinese, which consists of certain quantities of grain, the tails and skins of stags, and other productions of the country.

*Population, Language, &c.]* M. de la Perouse, who was off this island in 1787, relates, that the easternmost part

of Formosa is ledge the sovereign part is extremely pressed and barely ready to emigrate rigators receive gone over to this account to five l contains fifty t borious and ind advantage to the that the conque quence to Britain of the vast cons in a manner, ren respect to France any great import of the natives c smallest resembl that kind of pau versal, is by no motion of the he the affirmative, h cally opposite.

of each town or bo-  
rder, or four of the most  
of integrity, are ap-  
pointed to determine all differ-  
ences. The decision is  
either admitted into  
the country to finish his days  
in the enjoyment of so-  
ciety, and pay an annual tri-  
bute of certain quantities  
of goods, and other produce.

la Perouse, who was  
the easternmost part

of Formosa is inhabited by natives, who do not acknow-  
ledge the sovereignty of the Chinese, and that the western  
part is extremely populous, because the Chinese, op-  
pressed and harassed in their native country, are always  
ready to emigrate. From the information the French na-  
vigators received, it appears, that the settlers who have  
gone over to this island, since its conquest by the Chinese,  
amount to five hundred thousand, and that the chief town  
contains fifty thousand inhabitants; and, as these are la-  
zorious and industrious, their numbers are not of any dis-  
advantage to the conquerors. M. de la Perouse thought,  
that the conquest of Formosa would be of more conse-  
quence to Britain than to any nation in Europe, on account  
of the vast consumption of tea in that island, which has,  
in a manner, rendered them tributary to China; but, with  
respect to France, he did not consider it as an object of  
any great importance. It is remarked, that the language  
of the natives of this island is not only destitute of the  
smallest resemblance to that of the Europeans, but even  
that kind of pantomimic language, which is deemed uni-  
versal, is by no means better understood by them; and a  
motion of the head, which, amongst Europeans, denotes  
the affirmative, has, among them, a signification diametri-  
cally opposite.

*Customs, Manners, &c.*] The natives of this island are,  
in general, of a low stature, have large mouths, and are  
very swarthy in complexion. They have a very high fore-  
head, and are altogether greatly disproportioned; for the  
body is very short, the neck small, and the arms and legs  
remarkably long.

Their dress consists only of a rough piece of cloth, tied  
round the waist, and reaching to the knees; but they adorn  
their bodies with the figures of trees, flowers, animals, &c.  
in doing which they undergo such violent pain, that only  
a small part of the operation can be performed at one  
time; so that it will take some months before the whole is  
completed. These embellishments are only permitted to  
such as have distinguished themselves either by feats of  
activity or courage. The better sort avoid the punishment  
of obtaining these ornaments, by using the hair of animals,  
intermixed with silk, and embroidered with gold and sil-  
ver. They have all liberty to ornament their arms and  
legs, which they do with the greatest profusion. On their  
heads they wear a kind of coronet, the top of which is  
terminated by a plume, made of the feathers of cocks or  
pheasants. In short, the whole of their ornaments, with  
the awkwardness of their shape, form together a very whim-  
sical appearance.

As the climate of the northern part is less temperate  
than the southern, the inhabitants are better clothed, their  
dress consisting of the skins of beasts, particularly stags,  
which they kill in hunting. This garment is very uncouth  
in its form, being shaped like a vestment worn by priests,

18. VOL. I.

and without sleeves. They wear a kind of bonnet on their  
heads, made of the leaves of bananas, and adorned with  
coronets, placed one above another, in the form of a py-  
ramid: the whole is fastened with locks of hair of different  
colours, and the top of it is terminated by a plume of  
feathers.

In the northern part, the houses are built after the man-  
ner of the Chinese; but those of the south are mean cot-  
tages, made of earth and bamboo, covered with straw,  
and so close together, that they are only separated by a  
very slight partition. Their customs in both parts are the  
same. They have neither chairs, tables, benches, or beds.  
Instead of the latter, they use the leaves of trees, which  
they spread on the floor, and lay themselves down without  
any sort of covering. They dress their victuals in a kind  
of chimney, or stove, placed in the centre of the room,  
and are filthy in their manner of eating. They have nei-  
ther dishes, spoons, or knives; so that when the provision  
is dressed, it is laid on a piece of wood, or mat, and they  
pull it to pieces with their fingers. They do not take  
much pains in dressing their meat, for the less it is done  
the better they like it; and some of them admire it most  
when it is so raw, as barely to have felt the effects of the  
fire.

Their food chiefly consists of boiled rice, which they  
eat instead of bread; and the flesh of sheep and goats, and  
game, which they sometimes catch in the woods, by shoot-  
ing them, or running them down: the latter is the most  
common method; for their agility is so great, that they  
will even outrun the swiftest horse.

Their weapons are bows and arrows, which they use  
with such dexterity, that they will kill a pheasant flying, at  
an amazing distance.

In their marriages, little ceremony is observed. When  
a man fixes on any object that he wishes to be his wife, he  
goes several days together with music, which he plays for  
some time before the door; but he is not permitted to  
enter the house. If the object of his affections approve  
of him, she comes out, and they agree upon terms, which  
being made known to their parents, the marriage-feast is  
prepared, and the friends of each party are invited. The  
feast consummates the marriage, after which, instead of  
the wife going home with her husband, he continues in  
his father-in-law's house, and provides as well for him as  
for himself, during the remainder of his life.

Their manner of treating the dead before interment is  
very singular. When a person dies, they lay him on a  
kind of scaffold, made of bamboo, which they place over  
a slow fire for nine days, after which they wrap the corpse  
in a mat, and lay it on a higher scaffold, covered with a  
pavilion, made of shreds of silk, cloth, &c. Here it re-  
mains for two years, at the expiration of which they dig  
a large hole in the ground, and bury it. Each of these

ceremonies is accompanied with feasting, music, dancing, &c.

*History.*] About the beginning of the last century, this island was in the possession of the Japanese, but they were supplanted by the superior policy of the Dutch, who, having found means to introduce themselves, erected a small town and a castle, which they called Zealand, situated on so advantageous a spot, that it was impossible for any ship to enter it, of whatever force, without being repulsed. The Japanese, either offended at the great progress the Dutch had made, or not finding the advantages they expected, soon quitted the island, and left the Dutch in sole possession of it, after which the latter erected other fortifications opposite to their new fort, and raised such other defences, as made them complete masters of the island. But the Dutch, with all their policy, continued on the island but a few years; for one of the Chinese generals, (a man of an enterprising genius,) being defeated by the Tartars, who were then at war with the Chinese, fixed his views on Formosa, formed a resolution of ejecting the Dutch, and establishing a new kingdom on the island.

This he effected, and, having afterwards acknowledged submission to the emperor, the island has ever since been subject to the government of China. In 1782, Formosa was visited by a tremendous hurricane, and the sea rose to such a height as to pass over a great part of the island; but the Chinese emperor caused the damages to be repaired at his own expense.

## SECTION II.

### ANIAN, OR HAINAN.

This island, great part of which also belongs to the Chinese, is of considerable extent, and some of the towns are very populous. On the southern part of the island is a fine port, the bay of which is nearly twenty feet deep. There is also another very convenient port on the northern part, the entrance to which is defended by two small forts, though the depth of water does not exceed twelve feet. Here the barks frequently come from Canton with various commodities, in exchange for which they take several kinds of minerals, the natural produce of the country; for in some parts of the island there are gold and silver mines, also mines that produce the lapis lazuli, which the natives of Canton use in painting the blue porcelain. Between the two forts that defend the entrance of the northern fort is a large plain, on which are several handsome Chinese sepulchres.

The isles of Leoo-keoo, between Formosa and Japan, constitute a little civilized kingdom, tributary to China. These isles are said to be thirty-six in number, but very inconsiderable, except the chief, which is properly called

Leoo-keoo; by the Chinese accounts, the length of it is about one hundred and twenty-five British miles, nearly twice the extent which is assigned in recent maps. These isles were discovered by the Chinese in the seventh century; but it was not till the fourteenth that they became tributary to China. The emperor Kiang-hi, about A. D. 1720, ordered a temple to be erected to Confucius in the chief island, with a literary college. The language is said to differ from that of China or Japan; but the civilization seems to have proceeded from the latter country, as the Japanese characters are commonly used. The people are mild, affable, gay, and temperate; and the chief products are sulphur, copper, and tin, with shells, and mother-of-pearl.

## SECTION III.

### ISLANDS BELONGING TO ASIATIC TURKEY.

The principal islands in the Archipelago considered as belonging to Asiatic Turkey are Mytilene, Scio, Samos, Cos, and Rhodes.

The Asiatic Islands belonging to the Turks are scattered about this Archipelago, so called from the Greek words *archos* and *pelagos*, the first signifying chief, and the latter a sea, this being the chief sea in these parts. Through the oppression of the Ottoman government, they maintain but little of their former opulence and importance. We shall describe them in order as follows:

### MYTILENE.

Mytilene, the ancient Lesbos, is about sixty miles from Tenedos, and nearly eight from the continent of Asia. It is about forty miles in length, but its greatest breadth does not exceed twenty-four.

This island once contained several cities, renowned for their fertility and opulence; but scarcely are the remains of many of them to be seen at present, some having been destroyed by earthquakes, and others having fallen a prey to the oppression of the Romans.

Mytilene, the metropolis, was not more famed for the fertility of the circumjacent country, and the uncommon magnificence of its buildings, than for the number of considerable personages to whom it gave birth. Among these were Pittacus, one of the seven Grecian sages; Alcæus, the lyric poet; Sappho, the celebrated poetress; Terpander, the musician; Hellaucius, the historian; Callians, the critic; and many other eminent characters. Indeed, Mytilene was deemed so much the seat of the Muses, and the centre of politeness, that Aristotle resided in it two years, for the express purpose of enjoying the elegant conversation of its inhabitants.

The city, after having revolted from the Athenians, was greatly injured by the Peloponnesian war. It was subse-

quently destroyed by famous Julius Cæsar, who signaled his restored it to its former adorned it with its own name, called it fertile, and was in great abundance of life. The wine celebrated by the voluptuous

Lesbos is, said to be any thing to be of excellence: yet the several harbours, the ancient capital of the island, has a strong castle.

The trade of grain, fruit, cheese, and ants are common; the vines are here in great stores, which attract the pirates that frequent the neighbourhood. The governor is a cadet of the family of the monarch by an ancient

Scio, the ancient capital, is in length, but its greatest breadth does not exceed twenty-four. The island is mountainous, and the soil is fertile, producing corn, wine, oil, &c. The fertility is much improved by the fertility of the soil. The wine is celebrated for its excellence. The men are brave, and the women are beautiful. The time lost by the rebellion, or gallantry, is a considerable loss. A considerable harbour is bad, and the trade to and coming from the place; and a Turkish merchant-ships, a Scio, the capital, is elegant, and has a great number of houses with red and green roofs, and greatly embellished. It is two miles in length, and has beautiful gardens. The Greek Church, and the churches and monasteries

quently destroyed by the Romans; and, at its siege, the famous Julius Cæsar made his first campaign, and greatly signalized his courage. Being afterwards rebuilt, Pompey restored it to its ancient franchises. The emperor Trajan adorned it with many elegant structures, and, from his own name, called it Trajanopolis. This island is very fertile, and was celebrated by the ancients for producing, in great abundance, all the necessaries and delicacies of life. The wine, in particular, is excellent, and as much celebrated by physicians for its salubrity, as admired by the voluptuous for its admirable flavour.

Lesbos is, at present, but thinly peopled, and scarcely any thing to be seen but the fragments of its former magnificence: yet there remain some small villages, and several harbours, particularly Castri, built on the ruins of the ancient capital, which is situated on the east side of the island, has an excellent port, and is defended by a strong castle.

The trade of this island consists principally of wine, grain, fruit, cheese, butter, pitch, &c.; and the inhabitants are computed at about twenty thousand. The houses are low and meanly built, and the people poor. Magazines are here kept, to furnish the Turkish galleys with stores, which are employed by the Porte to cruise against the pirates that infest some of these islands. The governor is a cadi; but the troops on the island are commanded by an aga of the Janisaries.

## SCIO.

Scio, the ancient Chios, is about thirty-six British miles in length, but only about thirteen in medial breadth. This island is mountainous and rocky, yet the plains produce corn, wine, oil, honey, fruits, and gums; though the fertility is much impeded by a scarcity of water. The country is fertile and populous, and the inhabitants opulent. The wine is celebrated by Horace, and retains its ancient fame. The men are well-made, the women handsome, and both sexes so much inclined to mirth, that they think all the time lost which is not employed in singing, dancing, revelling, or gallantry.

A considerable commerce is carried on here; but the harbour is bad, and indeed dangerous; yet the ships going to and coming from Constantinople rendezvous at this place; and a Turkish squadron is kept here to protect the merchant-ships, and annoy the pirates.

Scio, the capital, is a handsome city. The houses are elegant, and have spacious terraces, and windows glazed with red and green glass. The Venetians took it in 1694, and greatly embellished it, but lost it the year following. It is two miles in circumference, and environed by several beautiful gardens. The inhabitants are chiefly of the Greek Church, or Roman Catholics, and have several churches and monasteries, which remain unmolested by

the Turks, who likewise permit them openly to profess their religion.

The citadel was erected by the Genoese, in order to defend the entrance of the harbour. It is guarded by a Turkish garrison. The esplanade, or space between the citadel and first houses of the town, was formed by the Venetians, who, for that purpose, demolished all the houses in the vicinity of the castle. On the esplanade, which presents a most pleasing appearance, there is a fine fountain, in the Turkish style. The whole forms a very beautiful view. Part of the citadel appears to the left of this picturesque scene. About two leagues from the city, in the midst of the mountains, is a convent, very considerable for its vast revenues.

It is to be observed, that Scio was one of the seven cities that contended for the honour of having given birth to Homer, and their coin formerly was stamped with his image.

The whole island contains thirty villages, three hundred churches, and about sixty thousand inhabitants. In time of peace, it is governed by a cadi; but, in war, a hashaw is sent from Constantinople to take upon him the supreme command.

## SAMOS.

Samos is about thirty miles in length, and ten in breadth, and is the see of an archbishop. It was formerly a commonwealth, and is naturally so fertile, that, when Greece was at the summit of her glory, it was deemed of as much importance as any of the islands of the Archipelago. The trade at present consists of several sorts of wines, a superior kind of onions and garlic, fine earthenware, raw silk, oil, honey, saffron, fruits, drugs, minerals, emery, ochre, black dye, &c. Notwithstanding the natural richness of this island, the natives are so much oppressed by the Turks, and plundered by the pirates, who infest the coast, that they are in general miserably poor. The inhabitants are about twelve thousand, principally Greeks. The capitation-tax which they pay amounts to about six thousand four hundred crowns, and the customs are farmed at ten thousand more. The governor, who is an aga of the Janisaries, collects about as much again for himself, and makes himself likewise heir to every Greek who dies without male issue; taking money, house, goods, and every thing but the garden, which is left to the possession of the daughters.

The chief town, Samos, is now reduced to a mean village; and, to add to its wretchedness, the pirates frequently plunder it; but it still exhibits some noble fragments of its ancient splendour, and particularly some vestiges of the temple of Juno.

This island is celebrated in history for having given birth to the philosopher Pythagoras. The city of Samos was

formerly very magnificent, as we may judge from its ruins.

### COS.

Cos is about twenty-four miles in length, by three or four in breadth; but has been little visited by modern travellers. Pliny styles it a most noble isle; and from it was first derived the name and substance of the whetstone. It is now covered with groves of lemon-trees, and there is an oriental plane-tree, of vast size. The chief trade is in oranges and lemons.

Cos, the capital, is spacious, well built, and strongly fortified: it is situated on the eastern coast, and was formerly famous for a superb temple of Esculapius, as the island itself was for the birth of the celebrated Hippocrates, whose house is still shewn in the town of Harangues.

### RHODES.

Rhodes is about thirty-six miles in length, by fifteen in breadth. This island has been long famed in history, under various names, and its inhabitants very early were deemed a maritime people. When attacked by the Greeks, the Rhodians called in the Romans to their assistance; who, according to their usual custom, drove away the enemy, and repaid themselves for their trouble, by seizing the country and the property of the natives; after which it underwent various revolutions. It was taken by the Venetians in 1124. The Turks conquered it in 1283, but were driven out of it by the knights of St. John of Jerusalem, in 1308; however, Soliman the Magnificent attacked it with an army of two hundred thousand men, and three hundred ships, and took it, January 1st, 1523, after the Rhodians had lost upwards of ninety-three thousand of their men, and the Turks a much greater number. After this misfortune, most of the Rhodians quitted their country; so that the island became very much depopulated: but the Turks showed so great a respect to the knights of Rhodes, that they suffered them to keep their houses, effects, coats of arms, statues, inscriptions, &c. and granted very considerable privileges to such as would come and settle there, which drew back some of the Rhodians, and many of the Greeks; so that Rhodes, at present, is as populous and flourishing as Turkish tyranny will permit any place to be in the Ottoman territories. The metropolis of Rhodes is called by the same name, and was always esteemed a place of considerable strength. At present, though its former splendour is much decayed, it is a handsome city, and a good sea-port; the situation, at the side of a hill, is delightful; it is about three miles in circumference, fortified by a triple wall and castle, though they are but in bad repair; the streets are wide and well-paved, particularly that of St. John, which is paved with beautiful marble. The houses are built in

the Italian taste, and the markets well supplied with all kinds of provisions. It has two harbours, a large one for ships of all nations, and a smaller for the Turkish galleys only, a squadron of which are always kept here to cruise against the Maltese ships. This port is shut up every night with a chain, and near it is a fine piazza, adorned with stately trees, at the extremity of which are the arsenal and dock. The church of St. John is converted into a mosque. Many other churches, the palace formerly belonging to the grand master, the houses of the knights, &c. are still magnificent fabrics.

This city was formerly celebrated for the learning and politeness of its inhabitants, and the numerous academies for various arts and sciences, which were kept open at the public expense; but, at present, literature meets here with the same treatment that it does in most other parts of the Turkish dominions.

Here was erected the celebrated Colossus, one of the wonders of the world, to the honour of Apollo, or the sun. This prodigious statue was made of brass, about one hundred and twenty-three feet in height, and proportionably large in every part. It stood astride over the haven, so that ships could sail in and out between its legs. In one hand it held a light-house, and in the other a sceptre; and its head represented a golden sun. The distance between the two feet was one hundred yards; and two men could scarcely, with extended arms, embrace its thumb. After having stood sixty-six years, it was overturned by an earthquake; and though the Rhodians collected, from the various Grecian states, a prodigious sum to defray the expenses of repairing it, yet the money was embezzled, and the image was suffered to lay on the ground for the space of eight hundred and ninety-four years, when the Saracens took the city, and sold it as old brass to a Jew, who loaded nine hundred camels with it; the whole weight being 720,000 lb. avoirdupois. This wonderful work was made by Clares, a native of Rhodes, who was twelve years in completing it. Just on the spot where the feet stood, a castle on one side, and a tower on the other, were erected, and are standing at present.

The modern Christian inhabitants of this island are very poor, and are not suffered to live within the walls of the city. The principal manufactures are soap, tapestry, and camblets; but the city is a mart for all the commodities and productions of the Levant; yet Rhodes is kept merely in opposition to the Christians, as it does not remit any thing to the grand-signor, the Turkish bashaw being allowed the whole of its revenues, for his own maintenance, and that of the galleys and the garrison.

Along the southern shore of Asia Minor there are some small isles, but they are of no moment, when compared with the large and celebrated island of

## CYPRUS,

which is about one hundred and sixty British miles in length, and about seventy at its greatest breadth. It was long possessed by the Ptolemies of Egypt, till it fell under the Roman power; when it remained a portion of the Byzantine empire, till it was usurped by a Greek prince; who was expelled by Richard I. of England. This monarch bestowed the kingdom of Cyprus on the house of Lusignan, as a compensation for the loss of the throne of Jerusalem. In the fifteenth century the heiress of the house of Lusignan resigned this isle to the Venetians; but, in 1570, it was conquered by the Turks, who still continue in possession of it.

The soil produces all kinds of grain, wines, oil, sugar, cotton, honey, saffron, wood, metals, minerals, plants, drugs, flowers, &c. It was formerly populous and opulent, but, at present, is but poor and thinly inhabited, which is chiefly owing to the tyranny of the Turkish government, and the swarms of locusts, with which it is infested. The wool and cotton manufactures are the best in the east, but the silk is very indifferent. The inhabitants were formerly deemed the most lewd and debauched people in the universe; and, according to the most authentic accounts, their inclinations are as depraved as ever; but the Turkish government obliges them to act with an outward appearance of decency. The present inhabitants are chiefly Greeks, who dress after the Italian fashion, but retain their own religion and customs. The people of this island were converted to Christianity by St. Paul and St. Barnabas, the latter of whom was a native of Cyprus. It gave birth to the poet Asclepiades, Xenophon, Zeno, Apollonius, Epiphanius, and several other great men. Cyprus has no considerable rivers, but some famous mountains, particularly Olympus, on which, at the distance of every league, there is a Greek monastery, and a fountain,

said to be erected by the Empress Helena, the mother of Constantine the Great.

The principal places in Cyprus, at present, are the following: Famagusta, or Arsinoë, is an elegant city, and good sea-port, pleasantly situated, and defended by two forts: it is enclosed, on two sides, by a ditch and double wall, well fortified, and, on the other two, by the sea. The Turks are sensible of the importance of this place, and, contrary to their usual custom, keep the fortifications in excellent repair. The Greeks and other Christians are permitted to keep shops here in the day-time, but are not allowed to sleep in the city, which is, however, a bishop's see, subject to the metropolitan of Nicosia.

Though the above is the most important place, yet Nicosia is deemed the metropolis of Cyprus. This city, which is delightfully situated in the centre of the island, was formerly the seat of the Cyprian monarchs. It was then nine miles in circuit, but is now dwindled to three. It is, however, still a beautiful town, of a circular form, surrounded by walls, defended by a deep ditch, and well-fortified. It formerly contained forty thousand houses, and several noble palaces; but many of the first, and all the latter, are fallen to decay, or have been pulled down.

Cerenes, the ancient Ceraunia, is almost in ruins, though formerly a strong and populous place. People depart from hence to the continent as the nearest port. The Palace of Peace, a magnificent edifice, formerly belonging to the knights, is near the city; and at about nine miles distance there is a Greek monastery; the monks of which have cells along the sea-coast, where they deposit the fish which they are employed to catch for the use of the brotherhood.

Paphos, now called Baffa, is situated on the western coast of the island. St. Paul in this city converted its governor, Sergius, and struck the necromancer Barjesus with blindness. Though much decayed from its former glory, it is still a bishop's see, and a good sea-port town.

## CHAPTER XI.

## AUSTRALASIA.

AUSTRALASIA, according to the statement of Mr. Pinkerton, comprises the following countries:

1. The central and chief land of New Holland, with any isles which may be discovered in the adjacent Indian Ocean, twenty degrees to the west, and between twenty and thirty degrees to the east, including particularly all the large islands that follow:

18. VOL. I.

2. Papua, or New Guinea.

3. New Britain and New Ireland, with the Solomon Isles.

4. New Caledonia, and the New Hebrides.

5. New Zealand.

6. The large island called Van Diemen's Land, recently discovered to be separated from New Holland by a strait, or rather channel, called Bass's Strait.

3 G

## SECTION I. NEW HOLLAND.

*Extent, Soil, Rivers, Climate, &c.*] New Holland has generally been considered as the largest island in the world. Some persons, however, have disputed, whether the name of *island* can be properly applied to a country of such vast extent, or whether it ought not rather to be denominated a *continent*.

Its length, from east to west, is about forty-three degrees of longitude, in the medial latitude of twenty-five degrees, which is about two thousand seven hundred British miles; and the breadth, from north to south, extends from eleven to thirty-nine degrees, being twenty-eight degrees, or one thousand nine hundred and sixty miles.

The soil immediately around Sydney Cove is sandy, with here and there a stratum of clay; but the produce does not seem to be very luxuriant. The principal difficulty hitherto experienced in clearing the ground arises from the size of the trees, which is said to be so enormous, that twelve men have been employed for five days in grubbing up a single one.

From the first discovery of this continent the extreme scarcity of fresh water has been mentioned by every navigator. None had been fortunate enough to enter the mouth of any navigable river, such as might be expected in a country of equal extent. The settlers about Port Jackson found enough for the ordinary purposes of life; but Captain Tench informs us, that when he left the country, towards the end of 1788, there had been no discovery of a stream large enough to turn a mill. Since that time, however, Governor Phillip has been more successful, as appears by a letter of his to Lord Sydney, dated February 13, 1790.

After having visited Broken Bay several times, with boats, a river was found, which has since been traced, and all those branches explored which afforded any depth of water. This river, distinguished by the name of Hawkesbury, is from three hundred to eight hundred feet wide, and appears navigable for the largest merchant-ships as far up as Richmond Hill; but there it becomes very shallow, and divides into two branches; on which account, Richmond Hill is called the head of the river. As after heavy rains, however, the water sometimes rises thirty feet above its level, it would not be safe for ships to go up so far; but, fifteen or twenty miles below it, they would lie in fresh water, and be perfectly safe. The country about Broken Bay is, at first, high and rocky; but, up the river, it becomes more level, the banks being covered with timber, and the soil a light rich mould, supposed to be very capable of cultivation. The other branches of this river are shallow, but probably run many miles up into the country.

Richmond Hill is the most southerly of a large range of hills, which run to the north, and probably join the mountains nearly parallel to the coast, from fifty to sixty miles inland. The soil of this hill is good, and lies remarkably well for cultivation. The prospect from the top is very extensive, the whole circumjacent country forming a level covered with timber.

Between Richmond Hill and a break in the mountains, that separates Lansdown and Camarthen Hills, there is a flat of six or seven miles; in which the Hawkesbury has been supposed to continue its course, though the river cannot be seen, on account of the timber with which the ground is every where covered, where the soil is good. Six miles to the south of Port Jackson is a small river, and twenty to the west is one more considerable, which probably runs into the Hawkesbury. As far as this river has been explored, the breadth is computed at from three to four hundred feet. It is called the *Nepean*, and, like the Hawkesbury, sometimes rises thirty feet above its level. A party who crossed this river attempted to reach the mountains, but found it impossible, probably for want of provisions. After the first day's journey, they met with a succession of deep ravines, the sides of which were frequently so inaccessible, that in five days they could not proceed farther than fifteen miles. When they turned back, they supposed themselves to be twelve miles from the foot of the mountains.

The climate of New Holland does not appear to be disagreeable; for the heat is never excessive in summer, nor is the cold intolerable in winter. Storms of thunder and lightning frequently occur; but these are common to all warm countries: and it has been supposed that, were the country properly cleared and inhabited, these would, in a great measure, cease. A shock of an earthquake has likewise been felt; but these natural calamities are incidental to some of the finest countries in the world. It is not yet known whether there are any volcanoes.

*Minerals.*] Metals of various kinds appear to abound in the vicinity of Sydney Cove; but the want of some scientific person to describe and arrange these natural productions was sensibly felt among the first settlers. A convict, who had formerly worked in a lead-mine, positively affirmed that the ground which he had been clearing contained a large quantity of that ore; and copper was supposed to lie under some rocks, which were blown up in sinking a cellar. Stone has been found in this neighbourhood, of three different kinds: one equal to that of Portland, a second sort similar to sand-stone, and a third containing a mixture of iron. Good clay for bricks is also produced near Sydney Cove; and from a piece of fine clay, imported to England, the ingenious Mr. Wedgwood caused a medallion to be modelled, representing Hope encouraging Art and Labour, under the influence of Peace,

to pursue the

to pursue the means of giving security and happiness to the infant settlement. The following beautiful lines, in allusion to this medallion, were written by Dr. Darwin, and entitled

THE VISIT OF HOPE TO SYDNEY COVE.

Where Sydney Cove her hild bosom swells,  
Courts her young navies, and the storm repels,  
High on a rock, amid the troubled air  
Hope stood sublime, and wav'd her golden hair;  
Calm'd with her rosy smile the tossing deep,  
And with sweet accents charm'd the winds to sleep;  
To each wild plain she stretch'd her snowy hand;  
High waving wood, and sea encircled strand.  
"Hear me," she cried, "ye rising realms! record  
"Time's opening scenes, and Truth's unerring word.—  
"There shall broad streets their stately walls extend,  
"The circus widen, and the crescent bend;  
"There ray'd from cities o'er the cultur'd land,  
"Shall bright canals and solid roads expand.—  
"There the proud arch, Colossus like, bestride  
"Yon glittering streams, and bound the chafing tide;  
"Embellish'd villas crown the landscape scene,  
"Farms wave with gold, and orchards blush between.—  
"There shall tall spires and dome-capt towers ascend,  
"And piers and quays their massy structures blend;  
"While with each breeze approaching vessels glide,  
"And northern treasures dance on every tide!"  
Here ceas'd the nymph—tumultuous echo's roar,  
And Joy's loud voice was heard from shore to shore—  
Her graceful steps descending press'd the plain,  
Her Peace, and Art, and Labour, join'd her train.

*Vegetables.* The most beautiful new genus of plants hitherto found in New Holland has been destined, by Linnaeus, to transmit to succeeding ages the name of Sir Joseph Banks, who first discovered it in his voyage round the world. It is, in fact, one of the finest genera with which we are acquainted. It seems there are four species of *Banksia*, specimens and seeds of which have been sent over to England; but we shall merely notice the *Banksia serrata*, which is the most magnificent of the genus. The trunk is thick and rugged; the leaves are alternate, standing thick about the ends of the branches, narrow, obtuse, and strongly serrated; their colour is a bright green on the upper surface, but beneath they are opaque and whitish, with a strong rib running through their middle. A large cylindrical spike of flowers terminates each branch; but most of these flowers are abortive, a few only in each spike yielding ripe seed. The capsules are covered with thick down.

The peppermint-tree (so called from the near resemblance between the essential oil drawn from its leaves and that obtained from the peppermint which grows in England) generally grows to the height of a hundred feet, and is above thirty feet in circumference. The bark is perfectly smooth, like that of poplar.

The red gum-tree is very large and lofty, generally exceeding the size of an English oak; but the wood is so

extremely brittle, and contains such a quantity of resinous gum, that it is of little use, except for fuel. On making incisions in the trunk of this tree, very considerable quantities of red resinous juice may be obtained, sometimes even more than sixty gallons from a single tree. This juice, when properly dried, becomes an astringent gum resin of a red colour, nearly resembling that known in the shops by the name of  *kino*, and for all medical purposes quite as efficacious.

The yellow resin-tree is about the size of an English walnut-tree. Its trunk grows pretty straight for about fourteen or fifteen feet; after which it branches out into long grassy leaves. From the centre of these leaves arises a single stem, eighteen or twenty feet in height, nearly resembling a sugar-cane, and terminating in a spiral spike, somewhat like an ear of wheat. This stem, being very strong and light, is used by the natives for making spears and fiz-gigs, which are commonly pointed with bone.

But the most valuable part of this plant seems to be its resin, the properties of which are not inferior to those of the most fragrant balsams. This resin, which exudes spontaneously from the trunk, and is frequently dug out of the soil at the root of the tree, is at first a yellow fluid, but, when inspissated in the sun, it acquires a solid form. When thrown upon hot coals, it emits a scent nearly resembling that of a mixture of benzoin and balsam of tolu. It is perfectly soluble in spirits of wine, but not in water, nor even in essential oil of turpentine, unless it be digested in a strong heat. With respect to its medicinal qualities, it has been found in many cases to be a good pectoral, and very balsamic.

The tea-tree of New Holland is a small shrub, thickly set with branches. The bark is full of longitudinal fissures; and the leaves are about three-quarters of an inch in length, marked with longitudinal ribs, and full of resinous spots, which contain an aromatic essential oil.

*Animals.* The kangaroo, which appears to be of the opossum kind, is the largest animal hitherto seen in New Holland, and its conformation is peculiarly singular. This quadruped has a small head, neck, and shoulders; the body gradually increasing in thickness towards the rump. The head is oblong, formed like that of a fan, and tapering from the eyes to the nose: the end of the nose is naked, and the upper lip divided. The nostrils are wide and open, but the aperture of the mouth is small.

This animal commonly lurks among the grass, and seems to feed entirely upon vegetables. It goes on its hind legs, making use of the fore feet only for digging, or bringing its food to its mouth. It is very timid, shy, and inoffensive; and flies from man by amazing leaps, springing over bushes seven or eight feet high, and going progressively from rock to rock. It always carries its tail at right

angles with its body, when in motion; and, when it alights, often looks back. In the account of Governor Phillip's Voyage, we are told, that these animals are sometimes seen feeding in herds of about thirty or forty, and that one is always observed to be apparently on the watch at a distance from the rest.

"It has been reported," says Mr. White, "by some convicts, who were out one day with a large Newfoundland dog, that the latter seized a very large kangaroo, but could not preserve its hold. They observed, that the animal effected its escape by the defensive use it made of its tail, with which it struck its assailant in a most tremendous manner. The blows, indeed, were applied with such force and efficacy, that the dog was bruised in many places till the blood flowed. It was remarked, that the kangaroo did not seem to make any use of its teeth or fore-feet, but fairly beat off the dog with its tail, and escaped before the convicts could get up to secure it."

The kangaroo may now be considered as, in some measure, naturalized in England; several of the species having been kept for some years in the royal domains at Richmond; which, during their residence there, have produced young ones, and seem likely to succeed very well in this country; though, by confinement and alteration of food, they may probably lose many of their natural habits, and exhibit less of that bounding vivacity, by which they are so peculiarly distinguished in New Holland.

The kangaroo-rat is so called from the colour of its hair and the resemblance of its visage to that of the rat; but the general shape of its body is very similar to that of the kangaroo, both in respect to the shortness of the fore-legs, and the peculiar construction of the hind ones.

The spotted opossum of New Holland is in length, from the nose to the end of the tail, about twenty-five inches, of which the tail takes up about nine or ten. The general colour of the animal is black, inclining to brown beneath; the neck and body spotted with irregular roundish patches of white: the ears are pretty large, and stand erect; the visage is pointed, and the muzzle furnished with long slender hairs; the fore, as well as hind legs, from the knees downward, are almost naked, and ash-coloured. On the fore-feet are five claws, and on the hinder ones four and a thumb without a claw; the tail, for about an inch and a half below the root, is covered with hairs of the same length as those on the body; but from thence to the end, it is furnished with long ones, like those of the squirrel.

The countenance of this animal is somewhat like that of a fox; but, in manners, it approaches more nearly to the squirrel. When inclined to sleep, or to remain inactive, it generally coils itself up in a round form; but, when eating, or on the watch, it sits almost erect, throwing its tail behind it. When irritated, it sits still more erect on

its hind legs, or throws itself upon its back, uttering a loud and shrill cry.

The vulpine opossum is, in its general shape, somewhat like the common fox, but considerably less. The upper parts of the body are of a grisly colour, arising from a mixture of white and dusky hairs, with a rufous yellow tinge, the head and shoulders partaking most of this last colour. The hair round the eyes is blackish; and above the nostrils are several black whiskers, about four inches in length. All the under parts of the body are of a tawny buff colour, deepest on the throat, where the hairs are rust-coloured toward the bottom. The legs are much shorter in proportion than those of a fox.

The flying opossum of New Holland is a beautiful species, and clothed with fur of the most exquisite texture, appearing on the upper part of the body, at first sight, of a glossy black; but, on a nicer inspection, it is found to be mixed with grey: the under parts are white, and on each hip is a tan-coloured spot, about the size of a shilling; at this part the fur is thinnest, but at the root of the tail it is so rich and close, that the hilt cannot be felt through it. The formation of the feet is nearly similar to that of the vulpine opossum. The fur is continued to the claws, and on each side of the body is a broad flap or membrane, as in the flying squirrel, which is united to the fore and hind legs.

The wha tapoa roo is about the size of a racoon, of a dark grey colour on the back, becoming rather lighter on the sides, and terminating on the belly in a rich brown. The coat is of two kinds, a long hair, and a kind of fur; but it appears that even the long hair, at the roots, is of the fur kind. The head is short, the ears broad, and the eyes rather prominent.

The tapoa-tafa has much the appearance of a martin-cat, but is hardly so long in the body, in proportion to its size. The hair resembles that of a rat, both in texture and colour; but towards the insertion of the tail, it is of a lighter brown, forming a broad ring round it. The head is flat in front, and broad across, particularly between the eyes and ears; the nose is peaked, and projects beyond the teeth, which makes the upper jaw appear considerably longer than the under one: the nose is furnished with whiskers, which begin near the muzzle, by small short hairs, but gradually become longer as they approach the eyes.

The spotted martin is about the size of a large polecat, and measures eighteen inches from the tip of the nose to the insertion of the tail; the tail itself being nearly of the same length. The general colour of the fur is black, marked all over with irregular blotches of white: the tail has an elegant appearance, and tapers gradually to a point. This animal is most commonly found in the neighbourhood of Port Jackson.

The dog of in height, and head is formed and erect; and from about one-fourth of the upper part of the body towards the hind fore-part of the tail is of a less degree than

A female of Mr. Neper from much of the most very savage nature. It laps growling, when body like bristles eager after its prey or chickens, ravages its fierceness and animals much being put to it, and would have some one been leap over the back worrying one to that the creature out assistance: both deer and sheep.

The New Holland common species higher on its legs not very different the horny appendage this species, is to neck is also covered fore-part of the feathers as the head and neck a turkey.

back, uttering a loud

general shape, somewhat less. The colour, arising from the mixture of hairs, is a rufous blackish; and the whiskers, about four of the body are of the throat, where the legs are of a fox.

It is a beautiful species, of an exquisite texture, and, at first sight, of a soft and silky appearance, it is found to be white, and of the size of a shag. At the root of the hair cannot be felt, it is nearly similar to the fur is continued to the tail, which is united to the

The dog of New Holland is rather less than two feet in height, and about two feet six inches in length. The head is formed like that of a fox; the ears are short and erect; and the muzzle is furnished with whiskers, from about one to two inches in length. The general colour of the upper parts is a pale brown, growing lighter towards the belly: the inner part of the fore-legs and the fore-part of the hinder-ones are white, as are also the feet. The tail is of a moderate length, rather bushy, but in a less degree than that of the fox.

A female of this species was sent over as a present to Mr. Nepean from Governor Philip. It is said to possess much of the manners of the domestic dog, but is of a very savage nature, and not likely to change in this particular. It laps like other dogs; but, instead of barking or growling, when irritated, it erects the hairs of its whole body like bristles, and seems perfectly furious. It is very eager after its prey, and seems particularly fond of rabbits or chickens, raw, but will not eat dressed meat. From its fierceness and agility, it has the advantage of other animals much superior in size; for a very large fox-dog being put to it, in a moment it seized him by the loins, and would have put a period to his existence, had not some one been at hand. With the utmost facility it can leap over the back of an ass, and was once very near worrying one to death, having fastened on it so firmly, that the creature was not able to disengage himself without assistance: it has, likewise, been known to run down both deer and sheep.

The New Holland cassowary differs materially from the common species, and is a much larger bird; standing higher on its legs, and having a longer neck. The bill is not very different from that of the common cassowary, but the horny appendage, or helmet, on the top of the head, in this species, is totally wanting; the whole of the head and neck is covered with feathers, except the throat and fore-part of the neck about half way, which are not so well feathered as the rest; whereas in the common species the head and neck are bare and carunculated, like those of a turkey.

The plumage consists of a mixture of brown and grey, and the feathers are somewhat curled or bent at the ends in the natural state: the wings are so short as to be useless for flight, and could scarcely be distinguished from the rest of the plumage, were it not for their standing out a little. The long spines which are seen in the wings of the common sort are in this not observable, nor is there any appearance of a tail.

The duck-billed platypus is a new and extraordinary genus, discovered in New Holland. Sir Joseph Banks had in his possession two specimens, which were sent over by Governor Hunter, and only a few others have as yet arrived in England.

18. VOL. I.

The length of this curious animal from the tip of the beak to the end of the tail is thirteen inches, of which the beak occupies one inch and a half. The head is rather small, and the mouth bears a near resemblance to the beak of some broad-billed ducks, that it is not without minute examination that we can persuade ourselves of its being the real snout of a quadruped. The body is depressed, and is somewhat like that of an otter in miniature: it is covered with a thick soft fur, of a moderately dark brown above, and whitish beneath. The legs are very short, and terminate in a broad web, which on the fore feet extends to a considerable distance beyond the claws: on the fore feet are five claws, straight, strong, and sharp pointed; and on the hind feet are six curved ones; the interior of which is sent much higher than the rest, and resembles a strong sharp spur.

The specimens of this animal hitherto sent to England, have been deprived of their intestines, and for the most part ill preserved. Mr. Home, however, examined one belonging to Sir Joseph Banks, which had been kept in spirits, and was tolerably perfect. He discovered, that although the beak, when cursorily examined, had such a striking resemblance to that of the duck, as to induce a supposition that it was calculated for the very same purposes; yet, when all its parts were carefully reviewed, it evidently differed in a variety of circumstances. This, it appears, is not the animal's mouth, but is merely an appendage projecting beyond it.

From the general form of this animal, we are led to suppose, that it burrows in the banks of rivers, or underground, and that its food consists of aquatic plants and animals. But the structure of it is such as not to enable it to take firm hold of its prey: when the two marginal lips are brought together, the animal may have a considerable power of suction, and in this manner it probably draws food into its mouth.

The Pennantian parrot is a very beautiful bird, frequently seen in the vicinity of Port Jackson, and corresponding in most particulars with the creature of the same name described by Mr. Latham, in the supplement to his "General Synopsis of Birds." The general colour of the plumage is scarlet; the bill of a bluish horn-colour; and the chin and the base of the under mandible covered with rich blue feathers. The back is black, variegated with crimson: the wings are blue, the middle part much paler than the rest; the tail is black, except the extremities of the feathers, which are of a pale hoary blue. The common length of this bird is about sixteen inches.

The wattled bee-eater is about the size of a missel-thrush, but much larger in proportion. The plumage, for the most part, is brown, the feathers long and pointed, and each feather marked with a streak of white down the middle. From the gape of the bill, a broad streak of

silvery white passes under the eye; and beneath this, on each side of the throat, hangs a pendulous wattle, about half an inch long, and of an orange-colour. The tail is wedge-shaped, like that of a magpie, and the feathers tipped with white.

The white-fronted heron of New Holland is little more than half the size of the common species. The general colour of the plumage is a bluish ash, inclining to lead-colour. The top of the head is black, and a little crested. The forehead, chin, and throat, are white, passing downwards, and terminating in a point on the middle of the neck before. On the lower part of the neck, the feathers are long and loose, and of a cinnamon-colour; all the under parts of the body also incline to this colour, but are much paler.

The laced lizard of New Holland is a very elegant species, about forty inches in length from the nose to the end of the tail. The general shape is slender, and the ground-colour of the skin on the upper part is a bluish black, curiously marked with yellow; in some parts this colour is prettily mottled, like some kinds of lace-work; in others, striped in various directions. The under parts are yellow, crossed with single bars of black on the throat, and with double clouded ones on the belly. This beautiful lizard is commonly found in the vicinity of Port Jackson, where it is considered as perfectly harmless.

The ribboned lizard is a very elegant species, about six inches and a half in length, and distinguished by a number of parallel stripes, disposed longitudinally throughout the whole upper part of the body; and the remainder is of a pale ferruginous colour. In some varieties a tinge of this colour is also visible on the back: the lower part of the body is of a yellowish white; the tail is perfectly round, of a considerable length, and gradually tapers to the extremity.

The white-jointed spider of New Holland, unless seen in the utmost state of perfection, cannot easily be distinguished. This species is particularly remarkable for the lucid surface of its throat and legs, the latter of which are furnished with several long moveable spines, that may be either elevated or depressed at pleasure. The eyes are eight in number, and are arranged in the same order as those of the great American spider. The general colour is a pale brown. The orifice at the top of each fang is rendered visible by a magnifying glass of two inches focus; so that this spider is evidently of the number of those which poison their prey before they destroy it.

Several other sorts of spiders and scolopendras are found in New Holland; but the most remarkable insects seen by Captain Cook were the green ants. These little animals form their habitations by bending down the leaves of trees, and gluing the ends of them together, so as to form a sort of purse. Though the leaves here alluded to

are as broad as a man's hand, they perform this feat by main strength, thousands of them holding down the leaves, while multitudes of others apply the glutinous matter. Captain Cook's people ascertained this curious fact, by sometimes disturbing them at their work; in which case the leaf always sprung up with an elasticity which they could not have supposed such minute insects were capable of overcoming. For this curiosity, however, the Europeans smarted pretty severely; as thousands of their little enemies instantly revenged themselves, by their stings, for the interruption they had met with.

Another species of ants barrow in the root of a plant, which grows on the bark of trees like mistletoe, and is commonly as big as a large turnip. When this is cut, it appears intersected with innumerable winding passages, filled with these little animals; notwithstanding which, the vegetation of the plant suffers no injury. These are about the size of the small red ant: they do not give pain by their stings, but produce an intolerable itching by crawling about upon the skin.

Another sort, which do not molest in any manner, resemble the white ants of the East-Indies. They construct nests, three or four times as big as a man's head, on the branches of trees; the outsides being composed of some vegetable matter along with a glutinous substance. On breaking the outer crusts of these hives, innumerable cells appear, swarming with inhabitants, in a great variety of winding directions, all communicating with each other, and with several other nests upon the same tree. They have also another house, built on the ground, generally at the root of a tree: this is formed like an irregularly sided cone, sometimes more than six feet high, and nearly as much in diameter. The outside of these habitations is of well-tempered clay, about two inches thick; and within are the cells, which have no opening outward. One of these is their summer and the other their winter dwelling, communicating with each other by a large avenue, leading to the ground, and by a subterraneous passage. It must also be observed, that the ground-structures are proof against rain, which those on the branches are not.

*Customs, Manners, &c.*] There are but few individuals among the natives of New Holland, who can be said to be tall, and still fewer who are well made. Their arms, legs, and thighs, are, for the most part, remarkably small and thin, which is probably owing to the poorness of their living; as the fineness of the climate and their constant exercise might otherwise have rendered them more muscular. Their complexion does not seem to be uniform; for some of them, even when cleansed from smoke and filth, are nearly as black as the negroes of Africa, while others exhibit only a copper or Malay colour. Their heads are generally covered with black hair: some indeed have been

are but few individuals and, who can be said to ill made. Their arms, part, remarkably small o the poorness of their mate and their constant over them more nauseous- tem to be uniform; for from smoke and filth, of Africa, while others flour. Their heads are some indeed have been

seen with hair of a reddish cast, but, being unaccompanied by any variety of complexion, this might be rather the effect of some outward application, than its natural appearance. They have remarkably flat noses, sunk eyes, thick lips, and wide mouths; but their teeth are perfectly white and regular, and the features of some of them are very agreeable. Many of them, however, have prominent jaws; and Mr. Collins tells us of one man, who, but for the faculty of speech, might have passed for an orang-outang. "He was remarkably hairy; his arms appeared of an uncommon length; and in his whole manner he seemed to have more of the brute, and less of the human species, about him than any of his countrymen." The same gentleman makes mention of a female dwarf, who, when she stood upright, measured only four feet two inches. None of her limbs seemed disproportioned, nor were the features of her face unpleasant; but the other natives appeared to make her an object of merriment.

Both sexes frequently rub their bodies over with fish-oil, in order to defend themselves from the effects of the air and the bites of musquitoes; but the oil, together with the perspiration from their bodies, produces, in hot weather, a most disagreeable odour; and some of them may be seen with the entrails of fish frying in the solar rays upon their heads, till the oil literally runs down their faces. Their hair is usually daubed with yellow gum, which serves to fasten their favourite ornaments, such as the front-teeth of the kangaroo, the jaw-bones of large fish, pieces of wood, feathers, human teeth, and the tails of their dogs. The natives inhabiting the southern shore of Botany Bay divide their hair into small parcels, each of which is matted together with gum, and formed into lengths, somewhat like the thrums of a mop. On certain occasions they ornament their bodies with red and white clay, using the former when preparing for combat, and the latter for the amusement of dancing. The fashion of these ornaments depends upon each person's taste and ingenuity. In general their arms, thighs, and legs, are marked with wavy lines; but some of them add a large white circle round each eye, and draw a line over every rib; so that they exhibit a most ghastly figure. Both sexes have scars upon the breast, back, and arms, which have been cut with broken pieces of shell, and kept open till the flesh has grown up between the sides of the incision and formed a large seam. This singular operation is performed at an early age, and, until they advance in years, the scars look large and full; but on some of the old men they are scarcely perceptible.

On some occasions, the men thrust a bone or reed, through the cartilage of the nose, which, together with their black bushy beards, tends to give them a very grotesque appearance. The bone commonly used for this purpose is the small bone in the leg of the kangaroo, and

has been humourously termed, by English mariners, "the sprit-sail yard."

Many of the females have their noses perforated in this manner, and are likewise subjected to a mutilation of the first two joints of the little finger on the left-hand. The operation is performed at an early age, and is usually done by some slight ligature, which is tied round the joint till the circulation of the blood is destroyed, and the finger mortifies and drops off. This was formerly supposed to have constituted some part of their marriage-ceremonies; but the European settlers were convinced of their mistake in this particular, by seeing great numbers of mutilated children; and, after some time, they learned, that these joints of the little finger were supposed to be in the way, when the natives wind their fishing-lines over the hand. It also seems to be considered a mark of honour.

Between the ages of eight and sixteen, the boys receive certain qualifications, by losing one of the front teeth. This curious ceremony occurred twice during the residence of David Collins, Esq. in New Holland, and, at the second operation, he was enabled to attend during the whole of the time. From that gentleman's interesting account we have taken the liberty to extract the particulars of the ceremony:

"On the 25th of January, 1795," says Mr. Collins, "we found that the natives were assembling for the purpose of performing this ceremony. Several youths, well known among us, never having submitted to the operation, were now to be made men. Pe-mul-uy, a wood native, and several strangers, came in; but the principals in the operation not being arrived, the intermediate nights were to be passed in dancing. Among them we observed one man painted white to the middle, his beard and eye-brows excepted; and others were distinguished by large white circles round the eyes, which rendered them as terrific as can well be imagined. In the evening of the 2d of February the rest of the party arrived, among whom were the operators, who appeared to have been impatiently expected by the other natives. They were painted after the manner of the country, were mostly provided with shields, and all armed with clubs, spears, and throwing-sticks. The place selected for this extraordinary exhibition was at the head of Farm Cove, where a space had been prepared, by clearing it of grass, stumps, &c.: it was of an oval figure, the dimensions of it twenty-seven feet by eighteen, and was called Yoo-lahng.

"When we arrived at the spot, we found the party from the north shore armed, and standing at one end of it; at the other we saw a party, consisting of the boys who were to be given up for the purpose of losing each a tooth, and their several friends who accompanied them. They then began the ceremony. The armed party advanced from their end of the ground with a song, or rather shout,

peculiar to this occasion, clattering their shields and spears, and raising a dust with their feet, that nearly obscured the objects around them. On reaching the farther end of the yoo-lahng, where the children were placed, one of the party stepped from the crowd, and, seizing his victim, returned with him to his party, who received him with a loud shout, placing him in the midst, where he seemed defended, by a grove of spears, from any attempts that his friends might make to rescue him.

"In this manner the whole were taken out, to the number of fifteen; when they were seated at the upper end of the yoo-lahng, each holding down his head, his hands clasped, and his legs crossed under him. In this position, awkward and painful as it must have been, we understood they were to remain all night; and that, until the ceremony was concluded, they were neither to look up, nor take any refreshment.

"The carrahdis now began some of their mystical rites. One of them suddenly fell upon the ground; and, throwing himself into a variety of attitudes, accompanied with every gesticulation that could be extorted by pain, appeared to be at length delivered of a bone, which was to be used in the ensuing ceremony. During this apparently painful process, he was encircled by a crowd of natives, who danced around him, and sang vociferously; while one or more beat him upon the back, until the bone was produced, and he appeared to be freed from his pain. He had no sooner risen from the ground, exhausted, drooping, and bathed in sweat, than another threw himself down with similar gesticulations, who went through the same ceremonies, and ended also with the production of a bone, with which he had taken care to provide himself, and to conceal it in his girdle.

"It being now perfectly dark, we quitted the place, with an invitation to return early in the morning, and a promise of much entertainment from the ensuing ceremony. We left the boys sitting silent, and in the position before described, in which we were told they were to remain until morning.

"On repairing to the place soon after day-light, we found the natives sleeping in small detached parties; and it was not until the sun had risen that any of them began to stir. We observed, that the people from the north shore slept by themselves, and the boys, though we heard they were not to be moved, were also lying by themselves at some distance from the yoo-lahng. Towards this, soon after sun-rise, the carrahdis and their party advanced in quick movement, one after the other, shouting as they entered, and running twice or thrice round it. The boys were then brought to the yoo-lahng, holding down their heads, and clasping their hands. On their being seated in this manner, the ceremonies commenced, the principal performers in which appeared to be about twenty in num-

ber, and all of the tribe or Cam-mer-ray. The exhibitions now performed were numerous and various; but all of them in their tendency pointed toward the boys, and had some allusion to the principal act of the day, which was to be the concluding scene of it.

"In the first part of the ceremony, the boys remained sitting at the head of the yoo-lahng, while those who were to be the operators paraded several times round it, running upon their hands and feet, and imitating the dogs of the country. Their dress was also adapted to this purpose; for the wooden sword stuck in the hinder part of the girdle, which they wore round their waist, did not, when they were crawling on all fours, look much unlike the tail of a dog curled over his back. Every time they passed the place where the boys were seated, they threw up the sand and dust on them with their hands and feet. During this ceremony, the boys sat perfectly still and silent, never once moving from the position in which they were placed, nor seeming in the least to notice the ridiculous appearance of the carrahdis and their associates. We understood that, by this ceremony, power over the dog was given to them, and that it endowed them with whatever good or beneficial qualities that animal might possess.

"Two stout natives now appeared, one carrying on his shoulders a kangaroo, made of grass, and the other carrying a load of brush-wood. Various other natives were seated at some distance, singing, and beating time to the steps of the two loaded men, who seemed almost unable to move under the weight of the burden which they carried on their shoulders. Halting every now and then, and limping, they at last deposited their load at the feet of the young men, and retired from the yoo-lahng, as if excessively fatigued by what they had done. By this offering of the artificial kangaroo, was implied the power that was now given them of killing that animal; and the brush-wood might probably be intended to represent its haunt.

"At the conclusion of this scene, the boys were left seated at the yoo-lahng for about half an hour, during which time the actors went down into an adjacent valley, where they fitted themselves with long tails made of grass, which they fastened to the hinder part of their girdles, instead of the wooden swords, which were now laid aside. Being equipped, they put themselves in motion as a herd of kangaroos, now jumping along, then lying down and scratching themselves, as those animals do, when basking in the sun. One man beat time to them with a club on a shield, while two others, armed, attended them all the way, pretending to steal upon them unobserved, and spear them. This was emblematical of one of their future exercises, the hunting of the kangaroo.

"On the arrival of this curious party at the yoo-lahng, they passed by the boys, as the herd of kangaroos, and then, divesting themselves of their artificial tails, each

man caught up a boy, and, placing him on his shoulders, carried him off in triumph toward the last scene of this extraordinary exhibition.

"After walking a short distance, the boys were let down from the shoulders of the men, and placed in a cluster, standing with their heads inclined on their breasts, and their hands clasped together. Some of the party disappeared for about ten minutes, to arrange the figure of the next scene, about which they appeared to observe a greater degree of mystery than in either of the preceding ceremonies. Being, at length, desired to come forward, we saw, on the left, the boys, and those who attended them: fronting these were two men, one seated on the stump of a tree, bearing another man on his shoulders, both with their arms extended; behind these were a number of bodies lying with their faces towards the ground, as close to each other as they could lie, and at the foot of another stump of a tree, on which were placed two other men in the same position as the preceding.

"As the boys and their attendants approached the first of these figures, the men who formed it began to move themselves from side to side, lolling out their tongues, and staring as wide with their eyes as they could open them. After this mummery had continued a few minutes, the men separated for them to pass, and the boys were led over the bodies lying on the ground. These immediately began to move, writhing, as if in agony, and uttering a mournful sound, like distant thunder. Having passed over these bodies, the boys were placed before the second figures, who went through the same series of grimaces as those who were seated on the former stump; after which the whole moved forward.

"At a little distance, the whole party halted; the boys were seated by each other, while opposite to them were drawn up, in a half-circle, the other party, now armed with spears and shields. In the centre of this party stood the native, who had throughout taken the principal part in the business. He held his shield in one hand, and a club in the other, with which he gave them, as it were, the time for their exercise. Striking the shield with the club, at every third stroke the whole party poised and presented their spears at him, pointing them inwards, and touching the centre of his shield. This concluded the ceremonies previous to the operation; and it appeared significant of an exercise which was to form the principal business of their lives, viz. the use of the spear.

"They now commenced their preparations for striking out the tooth. The first subject they took out was a boy of about ten years of age; and he was immediately seated on the shoulders of another native, who sat on the grass. The bone was now produced, which had been pretended to be taken from the stomach of the native the preceding evening: this, being made very sharp and fine at one

end, was used for lancing the gum; and, but for some such precaution, it would have been impossible to have got out the tooth without breaking the jaw-bone. A throwing-stick was now to be cut, about eight or ten inches from the end; and to effect this much ceremony was used. The stick was laid upon a tree, and three attempts to hit it were made before it was struck. The wood being very hard, and the instrument a bad tomahawk, it took several blows to divide it; but three feints were constantly made before each blow. When the gum was properly prepared, the operation began: the smallest end of the stick was applied as high up on the tooth as the gum would admit, while the operator stood ready with a large stone, apparently to drive the tooth down the throat of his patient. Here their attention to the number three was again manifest; for no stroke was actually struck, until the operator had thrice attempted to hit the throwing-stick. They were full ten minutes about this first operation, the tooth being, unfortunately for the boy, fixed very firm in the gum. It was, however, at last, forced out, and the sufferer was taken away to a little distance, where the gum was closed by his friends, who also equipped him in the style he was to appear in for some days. A girdle was tied round his waist, in which was stuck a wooden sword; his head was wound round with a ligature, in which were stuck some slips of the grass-gum tree; the left hand was placed over the mouth, which was to be kept shut; he was on no account to speak, and for that day he was not to eat.

"In like manner were all the others treated, except one, a pretty boy, about eight or nine years of age, who, after suffering his gum to be lanced, could not endure the pain of more than one blow with the stone, and, breaking from them, made his escape.

"During the whole of the operation, the assistants made the most hideous noise in the ears of the patients, sufficient to distract their attention, and to drown any cries they could possibly have uttered; but they made it a point of honour to bear the pain without a murmur.

"Some other peculiarities, however, were observed. The blood that issued from the lacerated gum was not wiped away, but suffered to run down the breast, and fall upon the head of the man on whose shoulders the patient sat, and whose name was added to his. I saw them several days afterwards, with the blood dried upon their breasts. They were also termed *Ke-bar-ra*, a name which has reference in its construction to the singular instrument used on this occasion, *ke-bah*, in their language, signifying a rock or stone.

"Ben-nil-long's sister, and Da-ring-ha, Cole-be's wife, hearing me express a great desire to be possessed of some of the teeth, procured three of them for me, one of which was that of Nau-bar-ray, Cole-be's relation. I found that

they had fastened them to pieces of small line, and were wearing them round their necks. They were given to me with much secrecy and great dread of being observed, and with an injunction that I should never let it be known that they had made me such a present, as the Cam-mer-ray tribe, to whom they were to be given, would not fail to punish them for it; and they added, that they should tell them the teeth were lost. Nan-bar-ray's tooth Da-ring-ha wished me to give to Mr. White, the principal surgeon of the settlement, with whom the boy had lived from his being brought into it, in the year 1789, to Mr. White's departure; thus gratefully remembering, after a lapse of some years, the attention which that gentleman had shown to her relative.

"Having remained with them while the operation was performed on three or four of the boys, I went into the town, and returned after sun-set, when I found the whole equipped and seated on the trunk of a tree. It was then that I received the three teeth, and was conjured by the women to leave the place, as they did not know what might ensue. In fact, I observed the natives arming themselves; much confusion and hurry was visible among them; the savage appeared to be predominating; perhaps, the blood they had drawn, and which was still wet on the heads and breasts of many of them, began to make them fierce; and, when I was on the point of retiring, the signal was given, which animated the boys to the first exercise of the spirit which the business of the day had infused into them, and they rushed into the town, every where, as they passed along, setting the grass on fire, and driving before them men, women, and children, who were glad to get out of their way. They were now received into the class of men, being privileged to wield the spear and club, and to oppose their persons in combat. They might now also seize such females as they chose for wives.

"All this, however, must be understood to import that, by having submitted to the operation, having endured the pain of it without a murmur, and having lost a front tooth, they received a qualification which they were to exercise whenever their years and their strength should be equal to it."

The sight of the New Hollanders is peculiarly fine; and, indeed, their existence sometimes depends upon the accuracy of it, for a short-sighted person would be utterly incapable of defending himself from their spears, which are thrown with equal force and velocity. There are also but few personal deformities among them. Some few have been met with who were lame, and assisted themselves with sticks, but the lameness of such persons might probably have been occasioned by wounds, or accidents from fire, the latter of which frequently happen, through the carelessness of the women. Children are said to be frequently injured by fire, whilst the mother lies fast

asleep by their side; and one instance is recorded of a fine little girl, who had two of its toes burnt off, and the sinews of one leg contracted, by falling into a fire, out of her mother's arms, while they were both asleep.

The natives on the sea-coast subsist principally upon fish, which the men usually catch with fiz-gigs, and the women with hooks and lines. The fiz, which is made of the wattle, and has a joint in it, fastened by gum, is from fifteen to twenty feet in length, and armed with four barbed prongs, the barb being a piece of bone, secured by gum. The lines used by the females are made of the bark of a small tree; and their hooks are made of mother-of-pearl oysters, which are rubbed on a stone until they assume the proper shape.

Whilst employed in fishing, the women usually beguile the time with a song, and they may be frequently seen in their canoes, chewing muscels or cockles, which they spit into the water, as a bait. At other times they are busily engaged in procuring a collection of the large worms and grubs which inhabit the trunk of the dwarf gum-tree: these insects, when divested of antennae, legs, &c. they devour with surprising avidity, and appear to find a peculiar relish in them.

Those natives, however, who reside in the interior of the country, and on the banks of rivers, are obliged to seek a different subsistence, and to exert greater abilities in procuring it; as appears from the fatigue and hazard which they frequently undergo in climbing the tallest trees, after the opossum, flying squirrels, and other animals. Their traps for catching birds or beasts are wide enough at the entrance to admit an ordinary-sized man, but taper away gradually to the end, and terminate in a small wickered grate. The earth is thrown up on each side, and the whole constructed of weeds, rushes, and brambles, so well secured, that an animal, once within it, cannot possibly liberate himself. It is supposed, that the prey is hunted and driven into these toils, and that, being forced to the grated end, it is there dispatched with spears. By the sides of lagoons the natives frequently excavate holes, and cover them over with grass, in such a manner, that a bird or beast stepping on it must inevitably fall in, and, from its great depth, be unable to escape.

Marriage-ceremonies are unknown among the natives of New Holland, and even the prelude to cohabitation is an act of violence of the most brutal nature. The women are generally selected from a tribe with whom the men desirous of taking wives are at enmity. Secrecy is necessarily observed, and the destined victim is stolen upon in the absence of her protectors. Having been first stupefied with blows, inflicted with clubs or wooden swords on the head, back, and shoulders, she is dragged through the woods by one arm, with a degree of violence, which one might suppose would either break or dislocate it;

the ravisher safety to his so constantly game or exercise injured female only retaliate venient opportunity from their native fishers, and indeed, they quit them bony, and inland and, indeed, they gamy throughout ever, that there The women the virtue of cl let, will induce of these tempt same girls, who conceal the reward of them appeared the English see they are perfect During the none but female receive any actual are of a reddish complexion of assisted by the moment of their new-born babe of soft bark; but it is removed to its little legs as soon catches hold. the ravisher being only anxious to convey his prize in safety to his own party. This savage act of violence is so constantly practised, that even the children make it a game or exercise of amusement; and the relations of the injured females never attempt to resent the outrage, but only retaliate by a similar method, when they find a convenient opportunity. The women, thus barbarously forced from their natural relations, become the wives of their ravishers, and are incorporated into the same tribe, and but seldom quit them for others. On the banks of the Hawkesbury, and inland, all the men are said to have two wives; and, indeed, there seems to be many instances of polygamy throughout the country. It seldom happens, however, that there are children by both wives.

The women do not appear to pride themselves upon the virtue of chastity; as a loaf of bread, a shirt, or a blanket, will induce them to give up all claim to it, when either of these temptations is held out by an European: yet the same girls, who are thus easily led astray, are anxious to conceal the rewards of their guilty compliance; and some of them appear extremely reserved, when seen naked by the English settlers, although, among their own people, they are perfectly indifferent about their appearance.

During the time of parturition, these people suffer none but females to be present; nor does the sufferer receive any actual assistance. Their infants, when first born, are of a reddish hue, but this soon gives place to the dark complexion of the parents; a change which is, no doubt, assisted by the smoke and dirt in which, from the first moment of their existence, these children are nurtured. A new-born babe is carried about for a few days on a piece of soft bark; but as soon as it has acquired a little strength, it is removed to the mother's shoulders, where it sits with its little legs across her neck, and, taught by necessity, soon catches hold of her hair, to preserve itself from falling. Parents begin early to decorate their children after the custom of the country. As soon as the hair of the head can be taken hold of, fish-bones and the teeth of various animals are fastened to it with gum: their little limbs are also ornamented with white clay; and the females suffer the mutilation of the little finger before they have quitted their seat on the mother's shoulders.

In about five or six weeks the child receives a name, which is generally taken from some bird, beast, or fish, and is given without any ceremony. At an early age, the females wear a sort of girdle, made of the hair of the opossum, from the middle of which hang some small uneven lines, from 7 to five inches long, made of the same materials.

Among the juvenile exercises of this people, the most important one seems to be that of managing the spear, to which the boys are accustomed from their earliest infancy. They begin by throwing reeds at each other, and are soon

very expert both in the offensive and defensive use of their little weapons. Another favourite amusement is that of throwing up a ball, and passing it from one to another. They also provide themselves with small sticks, and range themselves in a row, when the one at the upper end rolls a ball along the front of his companions, each of whom endeavours to strike it as it passes.

When admitted into the class of men, by the ceremony of losing one of their front-teeth, the youths of New Holland quickly assume an air of consequence, and embrace every opportunity of availing themselves of their new privileges, and bringing all their faculties into action. The procuring of subsistence appears to be but a secondary business with them; the dexterous management of their weapons, agility in either attack or defence, and an intrepid contempt of pain, seeming to hold the first rank in their employments. It is with pain we add, that the unhappy females frequently bear on their heads traces of the superiority of the males, which the latter liberally bestow almost as soon as they find strength in their arms to imprint the mark. Some of these unfortunate beings have more scars upon their heads, cut in every direction, than can be easily counted; and their condition altogether is so wretched, that a humane European, on seeing a female child borne on its mother's shoulders, can scarcely forbear breathing a wish for its death. The women, however, are said to mingle in all the contests of their brutal tyrants, and indeed it has been generally found, in tracing the causes of their quarrels, that the women were at the head of them. One of these contests, which was opened by a female, is thus described by Mr. Collins:—

"We had been told for some days of the natives making great preparations for a fight, and heard that they had chosen a clear spot near the town for their purpose. The contending parties consisted of most of our Sydney acquaintance, and some natives from the southern shore of Botany Bay. We repaired to the spot an hour before sunset, and found them seated opposite each other on a level piece of ground between two hills. As a prelude to the business, we observed our friends, after having waited some time, stand up, and each man, stooping down, take water in the hollow of his hand, which he drank. An elderly woman, with a cloak of opossum-skins on her shoulders, and provided with a club, then advanced from the opposite side, and, uttering much abusive language, ran up to Cole-be, who was on the right, and gave him what I should have considered a severe blow on the head, which, with seeming contempt, he held out to her for that purpose. She went through the same ceremony with the rest, who made no resistance, until she came up to a very fine boy, who stood on the left. He, not admiring the blows that his companions received, struggled with her, and, had he not been very active, I believe she would

have stabbed him with his own spear, which she wrested from him. The men now advanced, and gave us many opportunities of witnessing the strength and dexterity with which they threw their spears, and the quickness of sight which was requisite to guard against them. The contest lasted until dark, when throwing the spear could no longer be accounted fair, and they beat each other with clubs, until they left off by mutual consent. In this part of the contest many severe wounds were given, and much blood was drawn from the heads of each party; but nothing material happened while they had light enough to guard against the spear."

The *wo-mer-ra*, or throwing-stick, used by the New Hollanders, is about three feet long, with a hook at one end, and a shell at the other. This is held, with the spear, in the right hand, the fingers of which are placed two above the throwing-stick, and two between it and the spear. After considering the distance from the object to be thrown at, the spear is discharged with astonishing force, the throwing-stick remaining in the hand.

Of these instruments there are two sorts; the one called *wo-mer-ra* is armed with the shell of a clam, which the natives use for the same purposes as an European employs a knife; the other has no shell, but is rounded at the end, and serves to dig the yams and fern-roots out of the earth. There are also several kinds of spears, some of which are only pointed, some have one or more barbs, shaped out of the solid piece of wood of which the spear is made; and others are armed with pieces of broken oyster-shell for four or five inches above the point. Of shields there are but two sorts; the one called *e-lee-mong*, which is cut from the bark of the gum-tree; and the *ar-rah-gong*, which is formed of solid wood, and hardened by fire. There are several varieties of clubs, some of which are of very large dimensions; and there is another instrument, called the *ta-war-rang*; it is about three feet in length, and has three sides, in one of which is the handle, hollowed by fire; the other sides are rudely carved with waved lines, and the instrument is principally used in dancing; being struck upon, for that purpose, with a club. The *mo-go*, or stone-hatchet, is sometimes used as a weapon of hostility, though generally applied to more peaceful purposes. The stone is found in the shallows near the head of Hawkesbury River; and a handle being fixed round the top of it with gum, the under part is rubbed to an edge, fine enough to divide the bark of such trees as the canoes and hunters' huts are constructed with, and even the shields, which are cut from the body of the tree itself.

The mode of retaliating an injury among these people is extremely singular, as will appear from the following anecdote, related by Mr. Collins:—"A native, of the name of *Bur-ro-wan-nie*, had, some time before, been

beaten by two natives of the tribe of *Gwe-a*, at the head of Botany Bay. One of these being fixed on, he was, in return, to be beaten by *Bur-ro-wan-nie*; and, for this purpose, a large party attended, over night, at the head of the stream, near the settlement, to dance; at which exercise they continued from nine till past twelve o'clock. The man, who was to be beaten, danced with the rest until they ceased, and then laid himself down among them to sleep. Early in the morning, whilst he was yet on the ground, and apparently asleep, at the foot of a tree, *Cole-be* and *Bur-ro-wan-nie*, armed each with a spear and a club, rushed upon him from among some trees. *Cole-be* made a push at him with his spear, but did not touch him, while *Bur-ro-wan-nie* struck him, with his club, two severe blows on the hinder part of his head. The noise they made, if he was asleep, awakened him, and, when he was struck, he was on his legs. He was perfectly unarmed, and hung his head in silence, while *Cole-be* and his companion talked to him. No more blows were given, and *Ben-nil-long*, who was present, wiped the blood from the wounds with some grass. As a proof that *Bur-ro-wan-nie* was satisfied with the redress he had taken, we saw him afterwards walking in the town with the object of his resentment, who, on being asked, said, *Bur-ro-wan-nie* was good; and, during the whole of the day, wherever he was seen, there also was this poor wretch, with his breast and back covered with dried blood; for, according to the constant practice of his countrymen, he had not washed it off. In the evening I saw him with a ligature fastened very tight round his head, which certainly required something to alleviate the pain it must have endured."

A man, who has shed the blood of his fellow-creature, is compelled to expose his person to the spears of all who choose to throw at him, and upon such occasions the ties of friendship and consanguinity are considered as of no avail. On the demise of a person, also, the friends of the deceased are punished, as if the death had been occasioned by their neglect; and this singular custom is sometimes carried farther than can be reconcilable with any sentiment of humanity.

In cases of assassination, the injury may be revenged either on the murderer or any of his relations; and it sometimes happens that the most innocent objects become the victims of blind resentment; as will appear from the following circumstance:—"One of the natives having been killed by a man named *Wat-te-wal*, the widow was obliged, by the custom of her country, to avenge her husband's death. Accordingly, meeting with a little girl, who was distantly related to the murderer, she took her into a retired place, and beat her so barbarously with a club and a pointed stone, that her head was cut in six or seven places, and in the course of a few days she expired. This little victim was

greatly beloved, peaceable and inoffensive, and requested that she should be fed at the camp, as the natives, to whom she was pressed little, was not averse to her sacrifice.

Another instance of what may follow, is related of a native named *Bone-da*, a friend of the natives, who, after having been in the country for several months, died, and was terminated by a spear in the jaw. We were present at this occasion; and saw him, after having been killed, lying on his back, with his head towards the east, and his arms extended to the sides. After that time, the natives, belonging to the *Rose Bay*, had that, early in the morning, seized upon a large quantity of his goods, each gave him a blow on the head, with a bare. The sister of the deceased, who was at the hospital, saw the nature of the wound, and, doubting, he was dead, on being interrogated, weep nor cry. *Ki-yah*, when the body was treated him in this manner, but would eat, drink, or sleep. "Three or four days after, he appeared upwards. *Bone-da*, came in with his head, given him, and his youth nor old, these sanguinary customs. In all the contests, the point of honour is attempted to take, and throwing the spear, self with a shield. conduct, when opportunity will sometimes steal murder them whilst. Some time before the death of the Botany Bay, *Car-ru-ey*, and carried his relation *Cole-be*, Accordingly they saw him lay asleep, and

his little victim was

greatly beloved in the adjacent town, on account of her peaceable and quiet deportment, and had frequently requested that the very widow who now murdered her might be fed at the officer's hut where she herself resided. The natives, to whom this circumstance was mentioned, expressed little or no concern at it, and the child's death was not avenged, being considered as an expiatory sacrifice.

Another instance is related by Mr. Collins, to show what may follow where a native dies a natural death. "Bone-da, a fine youth, who lived at my house for several months, died of a cold, which had settled in his face, and terminated in the mortification of his upper and lower jaws. We were told that some blood must be spilt on this occasion; but six weeks elapsed before we heard of any thing having happened in consequence of his decease. After that time, however, we heard, that a large party of natives, belonging to different tribes, being assembled at Rose Bay, had spent a night in dancing and feasting; and that, early in the morning, two of the relatives of Bone-da seized upon a lad, named Tar-ra-bil-long, and with a club each gave him a wound on his head, which laid the skull bare. The sister of Bone-da also had her share in the bloody rite, and pushed at the unoffending boy with a doo-ull, or short spear. He was brought into the town, and placed at the hospital; and though the surgeon pronounced, from the nature of his wounds, that his recovery was rather doubtful, he was seen walking about the day following. On being interrogated about the business, he said, he did not weep nor cry out like a boy, but like a man named Ki-yah, when they struck him; and that the persons who had treated him in this manner were no longer his enemies, but would eat, drink, or sit with him as friends."

"Three or four days after this, a grey-headed man, apparently upwards of sixty years of age, who was related to Bone-da, came in with a severe wound in the back part of his head, given him on account of the boy's decease; neither youth nor old age appearing to be exempted from these sanguinary customs."

In all the contests hitherto seen among these people, the point of honour has been rigidly observed; no one ever attempting to take an unfair advantage of his adversary, nor throwing the spear at him, until he could cover himself with a shield. Yet, notwithstanding this honourable conduct, when opposed to each other in the field, they will sometimes steal upon their enemies at midnight, and murder them whilst asleep.

Some time before Mr. Collins quitted the country, a native of the Botany Bay district had seduced the wife of one Car-ru-ey, and carried her off; for which the husband and his relation Cole-be resolved to take an ample revenge. Accordingly they stole upon the ravisher one night, while he lay asleep, and stabbed him with their spears; but the

wounds did not prove mortal; and, on his recovery, he demanded satisfaction. A day being appointed, he brought with him a large party of natives from the southern shore of Botany Bay; and the yoo-lahng, formerly used for the ceremony of tooth-drawing, was the place of rendezvous.

At night, they all amused themselves with dancing; the two parties, however, did not mix together, but one side waited whilst the other concluded their dance. Car-ru-ey seemed apprehensive of the event not proving favourable to him; for, perceiving an officer there with a musket, he strenuously urged him, if any thing should happen to him, to shoot the Botany Bay fellows: the women, also, seconded this request, and observed, that some of the opposite party had resolved to kill Car-ru-ey. Some other firearms being brought forward, the strangers appeared extremely uneasy, until assured that they were merely intended for the security of the spectators.

About ten o'clock in the forenoon, Car-ru-ey and Cole-be appeared seated at one end of the yoo-lahng, each armed with a spear and throwing-stick, and provided with a shield. Here they sat for some time; but, on one of their opponents getting up, they arose and stood upon their guard. Some of the spears, which were thrown at them, they picked up, and threw carelessly back to their adversaries, and others they returned with extraordinary violence. The affair was over before two o'clock, and, what was very remarkable, no person was wounded.

These people have great difficulty in procuring fire, and are, therefore, seldom seen without it. The process of procuring it is attended with great labour, and is performed by fixing the pointed end of a cylindrical piece of wood into a hollow made in a plane, the operator twirling the round piece swiftly between his hands, sliding them up and down till fatigued; he is then relieved by one of his companions, who are seated in a circle, and assist in turn, until fire be procured.

Such of the natives as live on the sea-coast, being compelled to subsist principally upon fish, are very subject to a disorder which is called djee-ball, and nearly resembles the itch. In the year 1791, this distemper raged with such violence, that there was not a single native, man, woman, nor child, that approached the English settlement, but was covered with it.

In 1789, they were afflicted with a disorder which raged among them with all the virulence of the small-pox. The numbers that it swept off, by their own accounts, were almost incredible. "At that time," says Mr. Collins, "a native was living with us: and, on our taking him down to the harbour to look for his former companions, those who witnessed his expressions and agony can never forget either. He looked anxiously around him in the deficient coves we visited: Not a vestige on the sand was to be found of human foot; the excavations in the rocks were

filled with the putrid bodies of those who had fallen victims to the disorder; not a living person was any where to be met with. It seemed as if, flying from the contagion, they had left the dead to bury the dead. He lifted up his hands and eyes in silent agony for some time; at last, he exclaimed, 'All dead! All dead!' and then hung his head in mournful silence, which he preserved during the remainder of our excursion. Some days after, he learned that the few of his companions who survived had fled up the harbour, to avoid the raging pestilence; and when some of them were brought into the town, covered with eruptions, he fell a victim to his own humanity." That this dreadful scourge was the small-pox, there can scarcely be any doubt, as the persons seized with it were affected exactly like Europeans who have that disorder, and many that recovered bore evident marks of it on their faces.

As a proof of the sad depopulation occasioned by this disorder, Ben-nil-long informed Mr. Collins, that his friend Cole-be's tribe being reduced, by its effects, to three persons, they were under the necessity of uniting with some other tribe, not only for their personal protection, but to prevent the extinction of their tribe. It is a remarkable fact, however, that, notwithstanding the town of Sydney was at this time filled with children, many of whom visited the sick natives, not one of them caught the disorder.

The quickness with which these people recover from wounds is really surprising, and some of them have even been known to get the better, in a short time, of a fractured skull. That their skulls should often be fractured is no subject of astonishment, when we consider that their clubs seem to be applied solely to the head. Women, who are struck with this formidable weapon, always fall to the ground; but this seldom happens to the men, though the blows are, in general, more severe. Whenever they feel a violent pain, they have recourse to a tight ligature, which stops the circulation of the blood, and eases the part immediately affected.

No traces of religion can be discovered among the natives of New Holland; for it is certain that they do not worship either sun, moon, or stars; that, however necessary fire may be to them, it is not an object of adoration; and that they have no veneration for any particular beast, bird, or fish. Nor does it appear that any object, either substantial or imaginary, impels them to the commission of good actions, or deters them from the perpetration of crimes. They have, indeed, some dark notions of a future state; but these are in no sense connected with religion, having no influence whatever on their lives and manners. When interrogated as to what becomes of them after their decease, some replied, that they went beyond the great water; but the major part intimated that they ascended to the clouds. "Conversing with Ben-nil-long," says Mr. Collins, "after his return from England, where

he had obtained some knowledge of our manners and customs, I wished to learn what were his ideas of the place whence his countrymen came, and led him to the subject by observing, that all the white men in the settlement came from England. I then asked him, where the black men came from? He hesitated.—Did they come from any island? His answer was, that he knew of none; they came from the clouds; and, when they died, they returned thither. He wished to make me understand, that they ascended in the shape of little children, first hovering in the tops and branches of trees; and mentioned something about their eating, in that state, their favourite food, little fishes.

The young natives who reside in the English settlements of Port Jackson are very fond of going to church on Sundays, although they know not for what purpose a congregation is then assembled. They will frequently take a book, and imitate the clergyman's gestures and manner, secretly exulting in their talents of mimicry, for which they expect the applause of many of the auditors.

It has been observed, that, in order to exalt these people at all above the brute creation, it is indispensably necessary to prove, that they knew the distinction between right and wrong, as well as between the good and bad qualities of food; because, although their senses might inform them of these latter qualities, the knowledge of right and wrong could only proceed from reason. It must certainly be acknowledged, that they had no distinction in terms for these qualities, the same words implying what was good and bad, and right and wrong. But in the use of these terms, instances have frequently occurred to describe the sensations of the mind, as well as of the senses: thus, when any European has been punished or reproved for mal-treating them, they have invariably expressed their approbation, by saying that it was *bood-yeer-re*, or right; but when interrogated respecting the practice of cannibalism, they always expressed great horror at the mention, and said it was *wee-ree*. Midnight assassinations, though too frequently practised, they condemned in the same manner, but applauded acts of kindness and generosity. These few examples may suffice to establish the assertion, that they are naturally capable of distinguishing between good and evil: but this knowledge certainly never extended beyond the affairs of human life, not leading them to suppose that the practice of either virtue or vice had any relation to their future happiness.

Though destitute of all notions of religion, these people have many superstitious fancies and practices; and Mr. Collins observes, that the *car-rah-dys* may be properly styled their high-priests of superstition; for they not only act a principal part in the tooth-drawing scene, which has been already described, but their assistance is usually implored by the sick and dying; and Governor Phillip once

Jay met with a person of this description, who, with much gesticulation and mummerly, pretended to extract the barbs of two spears from Cole-he's side, which never had been left there; or, if they had, required rather the aid of a knife than any incantations to extract them; Cole-he, however, was satisfied with the car-rah-dy's efforts to serve him, and thought himself perfectly relieved.

A remarkable instance of their superstition occurred among some of the colonists belonging to a boat that was lying wind-bound in the lower part of a harbour. These men had procured some shell-fish, and during the night were preparing to roast them, upon which one of the natives shook his head, and exclaimed, that the wind for which they were waiting would not rise, if they roasted the fish. This assertion was treated with contempt; but on the wind actually proving contrary, the Europeans, in their turn, gave an instance of superstition, by abusing the native, and accusing him as the author of their detention.

Another curious instance is related of a female native, who resided at the clergyman's house in the settlement, but paid occasional visits to the lower part of the harbour. From one of these excursions she returned extremely ill; and, on being interrogated respecting the cause, she said, that the women of Cam-mer-ray had watered a path which they knew she must pass; and that, when she first complained of indisposition, they told her, exultingly, what they had done. Not recovering, though bled by the principal surgeon, she underwent a curious and superstitious operation, in which the operator suffers more than the patient. She was seated on the ground, with one of the lines worn by the men passed round her forehead once, taking care to fix the knot in the centre of her forehead; the remainder of the line was taken by another girl, who sat at a small distance, and with the end of it fretted her lips until they bled copiously, the patient supposing all the time that the blood came from her own head, and passed along the line until it ran into the girl's mouth, whence it was discharged into a small vessel, half filled with water. This singular operation is termed the *be-an-ny*, and is performed exclusively by females.

These people hold an opinion, that, by sleeping at the grave of a deceased person any one may be freed from all future apprehensions respecting apparitions; as the spirit of the deceased will visit the sleeper, seize him by the throat, and take out his bowels, which, however, will be carefully replaced. They acknowledge, that very few persons choose to encounter the darkness of the night, the solemnity of the tomb, and the visitation of the spirit of the deceased; but they affirm, that all who are so hardy immediately become car-rah-dys, and that all who exercise that profession have gone through this awful ceremony. They are much afraid of thunder and lightning, but imagine that, by breathing hard and chanting some particular

sentences, they can dispel it. To the shooting of a star they attach a considerable degree of importance; and Mr. Collins mentions a girl, who, on an occasion of this kind, appeared greatly agitated, and predicted that some evil would befall all the white men and their habitations.

The disposal of the dead in this country varies according to the age of the deceased; for the young people are consigned to the grave, and those who have passed the prime of life are burnt. Mr. Collins having attended on both occasions, we shall present our readers with an extract from that gentleman's interesting description of the death and interment of a native, named Ba-loo-der-ry.

From being one day in apparently perfect health, he was brought in on the morrow extremely ill, and attended by Ben-nil-long, whom we found singing over him, and using those means which superstition pointed out for the recovery of his friend's health. Ba-loo-der-ry lay extended on the ground, apparently in great pain, while Ben-nil-long applied his mouth to those parts of the body which he thought were affected, breathing strongly on them, and appearing to treat his patient with much friendship and attention. Next morning he was visited by a car-rah-dy, who threw himself into various contortions, applied his mouth to different parts of the patient's body, and, at length, after appearing to labour much, spit out a piece of a bone, about an inch and a half long, which he had previously procured. Here the farce ended, and Ba-loo-der-ry's friends took the car-rah-dy with them, and entertained him with such fare as they had to give. The sick man was at this time in the English hospital; but his friends, thinking he might be better with them, placed him in a canoe, and prepared to take him to the north shore; but, whilst they were carrying him over he expired. This was immediately announced by a violent clamour among the women and children, and Ben-nil-long coming into the town soon afterward, it was agreed between him and the governor that the corpse should be interred in the governor's garden.

"In the afternoon it was brought over in a canoe, and deposited in a hut at the bottom of the garden, several natives attending, and the women and children lamenting and howling most dismally. The body was wrapped up in the jacket he usually wore, and some pieces of blanket were tied round it with bines. The men were all armed, and, without any provocation, two of them had a contest with clubs, whilst a few blows passed between some of the women. Spears were also thrown, but evidently as part of a mere ceremony, and not with an intention of doing injury to any one. At the request of Ben-nil-long, a blanket was laid over the corpse, and Cole-be sat by it all night.

"They remained tolerably silent till about one o'clock in the morning, when the women began to cry, and con-

tinued for some time. At day-light, Ben-nil-long brought his canoe to the place, and, cutting it to a proper length, caused the body to be placed in it, with a spear, a fiz-gig, a throwing-stick, and a line, which the deceased had worn round his waist. Some time was taken up in adjusting all this business, during which the men were silent, but the women and children uttered the most dismal lamentations. The father stood alone and unemployed, a silent observer of all that was doing about his deceased son, and a perfect picture of unaffected sorrow.

"Every thing being ready, the men and boys all assisted in lifting the canoe from the ground, and placing it on the heads of two natives, named Collins and Yow-war-re. Some of the assistants had tufts of grass in their hands, which they waved backwards and forwards under the canoe, while it was lifting from the ground, as if they were exorcising some evil spirit. As soon as it was fixed on the heads of the bearers, they set off, preceded by Ben-nil-long and Wat-te-wal, towards the point of the cove where Ben-nil-long's hut stood. Mau-go-ran, the father, attended them, armed with his spear and throwing-stick, while Ben-nil-long and Wat-te-wal had nothing in their hands but tufts of grass, which they waved about, sometimes turning and facing the corpse, at others waving their tufts among the bushes. When they fronted the corpse, which was carried head-foremost, the bearers made a motion with their heads from side to side, as if endeavouring to avoid the people who fronted them. After proceeding thus to some distance, Wat-te-wal turned aside from the path, and went up to a bush, into which he seemed to look very narrowly, as if searching for something, and waving about the tufts of grass he held in either hand; but his search proving fruitless, the attendants all turned back, and went on in a quicker pace than before. On drawing near the spot where the women and children were sitting with the other men, the father threw two spears towards them, but they fell short, as he evidently intended. Here Ben-nil-long took his infant child in his arms, and held it up to the corpse, the bearers turning away their heads to avoid it. The reputed brother of the deceased, a very fine boy of about five years of age, was then called for, but he came forward very reluctantly, and was presented in the same manner as the other child. After this, they proceeded to the governor's garden.

"At the grave some delay took place, for, unfortunately, it was found to be too short; but, after some time, it being completed according to their wishes, one of the natives levelled the bottom with his hands and feet, and strewed some grass upon it, after which he stretched himself at his length in it, first on his back, and then on his right side. Ben-nil-long having earnestly requested that some drums might be ordered to attend, two or three marches were beat whilst the grave was preparing; Ben-

nil-long highly approving, and pointing first to the deceased and then to the sky, as if there was some connection between them at that moment. When the grave was ready, five or six men got in with the corpse; but, being still rather too short, the ends of the canoe were cut, in doing which the bines were loosened, and the corpse, being exposed to view, appeared to be in a putrescent state. At length, however, every thing was adjusted, and the grave was filled in by the natives and some of the colonists.

"On laying the body in the grave, particular care was taken to place it in such a position that the sun might look on it as he passed, Ben-nil-long and Cole-be taking their observations for that purpose, and cutting down every shrub that could be supposed to obstruct the view. The deceased was placed on his right side, with his head towards the north-west.

"The native Yow-war-re appeared to have much to do in this ceremony. When the grave was covered in, and laid up round, he collected several branches of shrubs, and placed them in a half-circle on the south side of the grave, extending them from the foot to the head. He also laid grass and boughs on the top of it, and crowned the whole with a large log of wood, on which, having previously strewed it with grass, he laid himself at his length for some minutes, with his face towards the sky. Every rite being performed, the party retired, some of the men first speaking to the women in a menacing tone, and telling a girl who was present not to eat any fish or meat that day. Cole-be and Wat-te-wal were painted red and white over the breast and shoulders, and, on this occasion, were distinguished by the title of *Moo-by*, and we understood that, while so distinguished, they were to be very sparing in their meals.

"They enjoined us on no account to mention the name of the deceased, a custom they rigidly attended to themselves, whenever any one died: and, in pursuance of this custom, Nan-bar-ry, one of whose names was Ba-boder-ry, actually relinquished that, and adopted another name."

On the death of Ben-nil-long's wife, her husband resolved to burn her corpse, and requested Governor Philip, the judge-advocate, and the principal surgeon of the settlement, to attend him on that solemn occasion. He was also accompanied by Collins, Ca-ru-ey, Car-rang-arang, his sister, and one or two other females.

A spot having been chosen for the construction of the funeral-pile, and the ground having been excavated to the depth of three or four inches, the part turned up was covered with a layer of small sticks and light brushwood; larger pieces were then placed on each side of these, and so on till the pile rose to the height of three feet; the ends and sides being formed of large dry wood, while the

middle consisted of smaller sticks, and was covered with grass. Some of the natives, who were present, placed near the pile, and the fuel being kindled, the pile, and signifi-

On the following day, the European gentlemen, together, and attended by any of the natives, in silence, the last duties of the deceased, raked the pile, and laid his body on a piece of bark, and a European grave-digger, smoothing every thing, and attending to the pile, each side of the pile, covered the top of the pile, and had so well considered the friends, asking, gratified with the

middle consisted of small twigs and branches thrown to-  
gether. Some grass was now strowed over the pile, and  
the deceased, covered with an old blanket, was placed on  
it, with the head towards the north. A basket, with a  
fishing apparatus and some other small articles, was also  
placed near the body, and some large logs of wood being  
laid over it, the pile was kindled by one of the attendants.  
The fuel being thoroughly dry, it was quickly enveloped  
with flames, and the widower pointed out to his English  
friends a black smoke, which arose from the centre of the  
pile, and signified that the corpse was already consuming.

On the following day, Ben-nil-long invited some of the  
European gentlemen to see him rake the ashes of his wife  
together; and they accompanied him to the spot, unat-  
tended by any of the natives. He preceded them in so-  
lemn silence, speaking to no one until he had performed  
the last duties of a husband. Having, with the end of his  
spear, raked the calcined bones and ashes together in a  
heap, he hid his weapon on the ground, and formed, with  
a piece of bark, a tumulus that might have done credit to  
a European grave-digger, carefully laying the earth round,  
smoothing every little inequality, and paying a scrupulous  
attention to the exactness of its shape and proportion. On  
each side of the tumulus he placed a log of wood, and  
covered the top of it with the piece of bark with which he  
had so well constructed it. He then turned to his English  
friends, asking, "if it was good?" and appeared highly  
gratified with their approbation.

"His deportment," says Mr. Collins, "on this occasion,  
was solemn and manly; an expressive silence marked his  
conduct throughout the scene; whilst we attended him as  
silently, and with close observation. He did not suffer  
any thing to divert him from the business he had in hand,  
nor did he seem in the least desirous to have it quickly  
dispatched, but paid this last rite with an attention that  
did honour to his feelings as a man, as it seemed the re-  
sult of an heart-felt affection for the object of it, of whose  
person nothing now remained but a piece or two of calc-  
ined bone. When his melancholy work was ended, he  
stood for a few minutes with his hands folded over his  
bosom, and his eye fixed upon his labours, in the attitude  
of a man in profound thought. Perhaps, in that small  
interval of time, many ideas presented themselves to his  
imagination. His hands had just completed the last ser-  
vice he could render to a woman who, no doubt, had been  
useful to him; one to whom he was certainly attached;  
and one who had left him a living pledge of some moments  
at least of endearment. Perhaps, under the heap which  
his hands had raised, and on which his eyes were fixed, his  
imagination traced the form of her whom he might for-  
merly have fought for, and whom he now was never to  
behold again. Perhaps, when turning from the grave of  
his deceased companion, he directed all his thoughts to

19.

VOL. I.

the preservation of the little one she had left him; and,  
when he quitted the spot, his anxiety might be directed to  
the child, under an idea that he might one day see his Ba-  
rang-a-roo revive in his little motherless Dil-boong."

A few months after the celebration of Ba-rang-a-roo's  
funeral, Cole-be's wife fell a victim to a consumption,  
brought on by suckling a little girl, who was at her breast  
when she breathed her last. This circumstance led to the  
discovery of a curious but dreadful custom, which obtains  
among the natives of New Holland. The mother died in  
the town, and, when she was taken out for interment, her  
body was carried to the door of every house she had  
been accustomed to enter during the latter part of her ill-  
ness, the bearers observing the same ceremonies as were  
used at the funeral of Ba-loo-der-ry. When the corpse  
was deposited in the grave, the father himself placed the  
living child in it, and threw upon it a large stone, as a sig-  
nal for the grave to be filled up by the natives. This ex-  
traordinary business was performed so suddenly, that the  
English gentlemen who were present had not time suffi-  
cient to prevent it; and, on their speaking about it to  
Cole-be, he endeavoured to justify the inhuman act, by  
asserting, that as no woman could be found to nurse the  
child, it must have suffered a worse death, had it not been  
interred with its mother.

The language of this people is very grateful to the ear,  
being, in many instances, both expressive and sonorous;  
but, with the exception of one or two instances, it has no  
analogy with any other known language. The dialect  
spoken near the settlement of Sydney is not only entirely  
different from that left us by Captain Cook of the people  
with whom he had some intercourse near Endeavour River,  
but also from that spoken by those natives who live at Pon  
Stephens and on the banks of the Hawkesbury. A sensi-  
ble difference may be perceived on hearing the same word  
sounded by two people; and, in fact, they have some  
times been observed to differ from themselves, substituting  
the letter *b* for *p*, and *g* for *c*, and *vice versa*. In their  
alphabet they have neither *s* nor *v*; and some of their let-  
ters would require a new character, to ascertain them pre-  
cisely.

From the various circumstances that have been related  
in the preceding pages, a tolerable idea may be formed of  
the general character and disposition of the natives of  
New Holland. They are revengeful, jealous, cunning,  
and courageous. Their midnight assassinations cannot be  
justly attributed to want of bravery, but rather result  
from the diabolical spirit of revenge, which thus expects  
to make surer of its object than when fairly opposed man  
to man in the field.

The unshaken fortitude with which they endure pain  
and the cheerfulness with which they always accept a chal-  
lenge, are indubitable proofs of their not wanting courage.

They disclaim all idea of superiority that is not personal, as will appear from the following circumstance: Ben-ni-long had a shield, made of tin, and covered with leather, presented to him by Governor Phillip; but, on his taking it with him down the harbour, the people of the north shore district immediately seized and destroyed it, deeming it unfair for any individual to cover himself with a guard so superior to the shields of his opponents.

They are evidently susceptible of friendship, and capable of feeling sorrow; but this latter sensation they are not in the habit of encouraging for any considerable time. While the funeral ceremonies were performing for Ba-loo-der-ry, tears were seen to stream down the sable cheek of the afflicted father; but in a little time these were dried up, and the old man's countenance indicated nothing but the lapse of many years which had passed over his head.

As they never think of making provision for the morrow, except at a whale-feast, they generally eat as long as they have any thing left, and, when satiated, stretch themselves out in the sun, where they sleep till hunger or some other cause rouses them again into action. There is, in fact, a great degree of indolence in their dispositions, and this is frequently indulged at the expense of the weaker sex; for whilst the men are enjoying a tranquil slumber, the women are often compelled to sit in their canoes; exposed to the burning heat of the solar rays, chanting their usual song, and inviting the fish beneath them to take the proffered bait; knowing that, unless they procure a sufficient meal for their tyrants, they will have but a rude reception on their landing.

It is probable they might have been honest previously to their being visited by Europeans; but from the colonists they frequently pilfer such things as they cannot otherwise obtain. And it is a remarkable fact, that they have often stolen articles, of which they could not possibly know the use. Mr. White, once being among a crowd of natives in the lower part of the harbour, had his pocket picked of a small case of instruments; but the thief, being observed, was immediately pursued, and compelled to restore his prize. It is worthy of observation, that at this time the English settlers were little acquainted with the natives, and, therefore, the depredator could not have known the contents of the case. Most probably, he considered it as a personal ornament; and Mr. Collins is of opinion that, could he have been watched to his retreat, he would have been seen to lay the case on his head, the place to which at first every thing given these people was usually consigned.

Their talent for mimicry is very great; and it is a favourite diversion even with the children to imitate the peculiarities in any one's gait, which they will generally perform with complete success.

That they are not strangers to the practice of false-

hood is sufficiently obvious from the words truth and falsehood being found in their language; but, independent of this, they have very often afforded proofs of being adepts in the arts of lying and evasion. Thus, when the colonists appear to disbelieve any of their tales, they will insist with much earnestness on the truth of their assertions; but, when speaking of other natives, they will strive as anxiously to make it appear that they have told lies.

Their knowledge of astronomy is confined to the names of the sun and moon, a few stars, the milky way, and the magellanic clouds. Of the rotundity of the earth they have not the smallest conception, but imagine that the sun returns over their heads during the night to the quarter whence he begins his course in the morning.

With respect to government, the natives about Port Jackson, Broken Bay, and Botany Bay, appear to live in that state which must have been common to all men, previous to their uniting in society and acknowledging some regularly constituted authority. They are distributed into families, the head or senior of which exacts compliance from the rest. Each family, also, has a particular place of residence, from which its distinguishing name is derived.

In the early intercourse between the natives and the English colonists, the latter, on meeting with families to whom they were unknown, were always accosted by the person who appeared to be the senior of the party; whilst the women, youths, and children, stood at a distance. The word which in their language signifies father, was invariably applied to their old men; and, when they perceived the authority which the English governor held, and the obedience he exacted, they addressed him by the distinguishing appellation of *be-anna*, or father. Their conferring this title solely on him, notwithstanding they perceived the authority of masters over their servants, affords an indisputable proof that those of their countrymen who enjoyed that distinction also held the authority of a chief.

When any of these happened to come into the settlement, they were pointed out to the Europeans with an eagerness of manner that plainly intimated they were considered as persons of consequence. There is, however, another acceptance of the word *be-anna* among the natives; for it is frequently applied to men who have not any children of their own. This singular circumstance having induced the gentlemen of the colony to make some enquiries, they were informed, that in case a father should die, the nearest of kin, or some deputed friend, would take the care of his children; and, for this reason, the children styled them *be-anna*, though in the life-time of their natural parent. "Here," says Mr. Collins, "if the reader pauses for a moment to consider the difference be-

tween the general name of the natives, whose duties to the humane principle are compared with the shame, at seeming to be inferior in the race of humankind, which has hitherto been the case.

The same general name of each tribe, by adding the name of residence. The name of Gwea, and the name of Gwea, on the shore of Port Jackson, is the name of the tribe of the harbour.

Cam-mer-ray. "we heard Ben-ni-long knew them, and who could oblige them directed. The most numerous of the tribes, and that a ordinary personage."

"To the tribe of the natives, and extraordinary of the members of the tribe of all such as are of this privilege place; and there is a view over all the tribes. Many contests, and they are not until the end of the year, it was impossible to influence which appearance gave the tribes."

These are all the tribes that could ever be seen. The deference paid to the chief of each tribe, derived entirely from numbers; but Mr. Collins is of opinion that the superiority was maintained by the founding of the tribes. The tribe of exacting obedience which the tribes must have been in obedience which their superiority authority, which has continued."

It is almost impossible to find the habitations of the natives. The woodman is constantly in the middle, and

ords truth and false-  
hood, independent of  
the possibility of being adepts  
in the arts, when the col-  
lectors of their tales, they will  
be able to distinguish the truth  
from the falsehood of their asser-  
tions, they will be able to tell  
that they have told

Mr. Collins, "if the  
the difference be-

tween the general conduct of our baptismal sponsors (to  
whose duties this custom bears much resemblance) and  
the humane practice of these uncivilized people, will not  
the comparison inflame his cheek with something like  
shame, at seeing the enlightened Christian so distanced  
in the race of humanity by the untutored savage, who has  
hitherto been the object of his pity and contempt?

The same gentleman informs us, that the distinguishing  
name of each tribe or family in New Holland is formed  
by adding the monosyllable *gal* to the name of their place  
of residence. Thus, the southern coast of Botany Bay is  
called Gwea, and the people who inhabit it are known by  
the name of Gwea-gal; and those who live on the north-  
ern shore of Port Jackson are called Cam-mer-ray-gal, that  
part of the harbour being distinguished by the name of  
Cam-mer-ray. "Of this last tribe," says Mr. Collins,  
"we heard Ben-nil-long and other natives speak (before  
we knew them ourselves) as of a very powerful people,  
who could oblige them to attend wherever and whenever  
they directed. We afterwards found them to be by far  
the most numerous tribe within our knowledge. It so  
happened that they were also the most robust and mus-  
cular, and that among them were several of those extra-  
ordinary personages called *car-rah-dys*."

"To the tribe of Cam-mer-ray also belongs the exclu-  
sive and extraordinary privilege of exacting a tooth from  
the members of other tribes inhabiting the sea-coast, or  
of all such as are within their authority. 'The exercise of  
this privilege places these people in a particular point of  
view; and there can be no doubt of their decided superi-  
ority over all the tribes with whom we are acquainted.  
Many contests, or decisions of honour, have been de-  
layed until the arrival of these people; and, when they  
came, it was impossible not to observe the superiority  
and influence which their numbers and their menacing ap-  
pearance gave them over the other tribes.'"

These are all the traces of government or subordination  
that could ever be discovered among the New Hollanders.  
The deference paid to the tribe of Cam-mer-ray may have  
been derived entirely from their superior strength and  
numbers; but Mr. Collins seems of opinion, that this su-  
periority was maintained for a length of time prior to the  
founding of the European settlement; and that the privi-  
lege of exacting a tooth from the young men of other  
tribes must have been of long standing, and coeval with the  
obedience which was paid to them: "hence," says he,  
"their superiority partakes something of the nature of an  
authority, which has the sanction of custom to plead for its  
continuance."

It is almost impossible to conceive any thing more rude  
than the habitations of these people. The hut of the  
woodman is constructed of the bark of a single tree, bent  
in the middle, and placed on its two ends on the ground,

affording shelter to only one miserable tenant. But, on the  
coast, the huts are made of several pieces of bark, about  
eleven feet in length, and from four to six in breadth, set  
up so as to form an acute angle, somewhat resembling  
cards set up by children. The fire is always made at the  
mouth of the hut, rather within than without; and the  
interior, in general, is the nastiest place that can be ima-  
gined. Besides these bark huts, the natives frequently  
make use of natural excavations in the rocks, always  
taking the precaution to choose such as lie out of the  
reach of wind and rain. At the mouths of some of these  
excavations the soil abounds with shells and other manure,  
which have proved a valuable resource to the English  
colonists, the shells being easily converted into lime, and  
the other parts serving for the improvement of the  
gardens.

In the above-mentioned huts and caves the natives lie  
down indiscriminately, men, women, and children toge-  
ther, and appear to possess under them much the same  
enjoyments as are found by the wild beast in his den,—  
shelter from the weather, and (if not disturbed by external  
enemies) the comfort of sleep.

We have already observed that midnight murders are not  
unfrequent in this country; and it may be added, that the  
extreme soundness with which the natives sleep invites  
jealousy, or revenge for other injuries, to arm the hand of  
the assassin. One instance of this kind, related by Mr.  
Collins, is too remarkable to pass unnoticed.

Yel-lo-way, a native who seemed to be endowed with  
more humanity than the rest of our friends, having pos-  
sessed himself of Noo-roo-ing, the wife of Wat-te-wal, he  
was one night murdered in his sleep by the latter, who  
could not brook the decided preference given by Noo-  
roo-ing to his rival. This murder Wat-te-wal afterwards  
atoned for in his own person, his life being taken by Cole-  
be, one of Yel-lo-way's friends, who stole upon him in  
the night, and murdered him while asleep. It is parti-  
cularly worthy of observation, that Cole-be found an in-  
fant lying in Wat-te-wal's arms, whom he carefully re-  
moved before he thrust the fatal spear into the father's  
heart.

Conscious of the danger they ran in the night, from the  
prevalence of these assassinations, the natives earnestly  
requested the gentlemen of the colony to give them pup-  
pies of their spaniel and terrier breeds; and it appears  
that now not a family is without one or more of these little  
watch-dogs, which they consider as invaluable guardians.

#### *Historical Account of the English Colony in New Holland.*

For a series of years, those unhappy beings who had  
forfeited a right to enjoy the blessings of society in their  
own country, and yet whose crimes did not merit capital

punishment, were transported to the British plantations in America. But, after the unfortunate contest between the American colonists and the mother-country, which terminated in the independence of the former, it became necessary for British convicts, not sentenced to die, to be employed in some way that might make them sensible of the crimes they had committed, and, at the same time, free the community from the dread of their future depredations. Banishment to the coast of Africa was generally found to be a harsher sentence than death itself, and the hulks on the Thames were but ill adapted to improve the abandoned, or prevent a repetition of crime. Penitentiary houses were found equally inefficacious to answer, at once, the purposes of punishment and reformation. Government, therefore, projected the scheme of establishing a colony of convicts on the coast of New Holland; and preparations were made for carrying it into immediate execution.

Captain Phillip, of the navy, was appointed commodore of the voyage, and governor of the new colony; and the fleet began to rendezvous about the middle of March, 1787. It consisted of the *Sirius* frigate, Captain John Hunter; the *Supply*, armed tender, Lieutenant H. L. Ball; the *Golden Grove*, *Fishburn*, and *Borrowdale*, store-ships; and the *Scarborough*, *Lady Penrhyn*, *Friendship*, *Charlotte*, *Prince of Wales*, and *Alexander*, transports.

As this was a voyage of uncommon length, and its object was not of a temporary nature, a considerable time was necessary to equip and provide the ships, and to make such arrangements as might prevent miscarriage or avoidable danger. Besides the usual complement of sailors, a party of two hundred and twelve marines, including officers, were distributed in the different vessels, to keep the convicts in awe; and these marines had twenty-eight wives and seventeen children allowed to accompany them. The whole number of convicts amounted to eight hundred and twenty-eight, of whom five hundred and fifty-eight were males.

Governor Phillip, having hoisted his flag on-board the *Sirius*, as commodore, gave the signal to weigh on the 13th of May, 1787, and was accompanied to some distance by the *Hyæna* frigate, to carry back dispatches, if necessary.

The wind having wafted them along at a great rate, on the 20th the *Hyæna* returned, and brought intelligence, that the convicts in the *Scarborough* had formed a plan for getting possession of that ship, which the officers had timely detected and prevented. This, however, was the only attempt of the kind made during the voyage; for, when the convicts found themselves at a distance from their native shores, they gave up all thoughts of liberty, and yielded to their fate.

On their arrival at Teneriffe, the crew and convicts were

indulged with every article of food that could tend to promote health, and remove disease; and the judicious plans of Captain Cook were invariably observed during the voyage, and, in general, with the best effects. It cannot, indeed, be said; that the mortality was so small, in proportion to the numbers, as under that able navigator; for numbers of the convicts were advanced in years, and their constitutions had been previously broken by dissipated habits, or the effects of a long confinement.

They spent a week at this place, during which time the governor of the Canaries paid the most polite attention to the English officers, and exerted himself to render their visit agreeable. But finding vegetables less plentiful than they expected, they weighed anchor on the 10th of June, and in eight days they came in sight of the Cape Verde Islands, whence the fleet steered for St. Jago. Unfavourable winds, however, were likely to prevent their getting into the harbour; and, that no time might be lost, the governor altered his plan, and proceeded directly to Rio de Janeiro.

They had already suffered some inconvenience from heat, attended by heavy rains: but, before they reached the equator, contrary to what might reasonably have been looked for, the temperature became more moderate, and the crews happily continued in tolerable health.

On the whole, the weather was very propitious, and they made such progress that, on the 5th of August, they came to an anchor off the harbour of Rio de Janeiro.

As soon as the viceroy was informed of the nature of Governor Phillip's commission, he gave orders that military honours should be paid him; and the officers, in general, were indulged with permission to visit all parts of the city, and even to make excursions into the country, without the prying vigilance of guards.

Provisions of every kind are so excessively cheap here, that the men were liberally victualled at less than four pence a head per day, including meat, rice, vegetables, and firing. Wine was not plentiful at that season; but a considerable quantity of rum was laid in; and such seeds and plants were procured as appeared adapted to the climate of New Holland. And, lest bread should become scarce, one hundred sacks of cassada were purchased as a substitute. This root is very generally used for bread in the tropical climates, and proves wholesome and nutritious. In its crude state it is highly poisonous; but by washing, pressure, and evaporation, becomes not only innocent but salubrious.

Though no time was lost in expediting the necessary business, a month elapsed before they were ready for sailing. At length, on the 4th of September, they weighed anchor, and, passing the fort at the mouth of the harbour, interchanged a salute of twenty-one guns.

Having again set forward on their destined voyage, they

were favoured with progress to the Cape, any events worthy

It was the 13th Bay, at the Cape, and supplies were to be procured particularly in the year, False Bay is generally preferred.

While engaged in fleet arrived. The

were favoured with such propitious weather, that their progress to the Cape of Good Hope was unproductive of any events worthy of being recorded.

It was the 13th of October when they arrived in Table Bay, at the Cape. Here they took in their final refreshments, and supplied themselves with such necessaries as were to be procured. Table Bay is a very unsafe station, particularly in the winter-months; and, at that season of the year, False Bay, on the south-east side of the Cape, is generally preferred, as being more secure.

In the space of a month, no less than five hundred animals, of different kinds, were procured and put on board the fleet, and an equal stock of other necessaries was laid in, but at a high price. The country, indeed, had recently suffered from a dearth; and this naturally increased the difficulty of obtaining an adequate supply at any price.

On the 12th of November, they again set sail; but, owing to contrary winds, they found themselves no farther advanced than eighty leagues on the 25th of that month. At this time Governor Phillip went on board the Supply, in hopes of reaching Botany Bay before the rest of the fleet arrived, and of gaining time to explore the country, that a debarkation might take place without delay. Major Ross, the commandant of marines, went on board the Scarborough, and with that ship, the Alexander, and Friendship, reputed the best sailers, had orders to proceed, and to leave the rest of the convoy under the care of Captain Hunter.

From the date of this arrangement to January 3, 1788, the weather was very favourable, and the winds wafted them on with little impediment. The Supply, indeed, turned out but an indifferent sailer to what had been expected; however, she performed this voyage of seven thousand miles in fifty-one days.

The governor having landed at Botany Bay, on the 18th, an interview with the natives took place. They were all armed; but, seeing Governor Phillip approach alone, and without weapons, they returned his confidence, by laying down their arms. Amity was soon established, which happy effect was owing to the personal address of the governor. His orders, indeed, enjoined the utmost attention to conciliate the affection of the natives; and his own humane conduct rendered it delightful for all persons to obey him.

He now proceeded to examine the bay; but it was found, in every respect, less eligible than had been represented, both in itself, and in the surrounding country, which was low and swampy. He then reconnoitred Point Sutherland; but to this part of the harbour ships could not approach, nor was the soil more tempting than before.

While engaged in this necessary business, the whole fleet arrived. The Supply had not so much outailed the

other ships, as to give the governor the time he expected. The last division arrived only two days later than himself.

Finding Botany Bay unfit for the intended settlement, he resolved to examine Port Jackson, which lay about three leagues to the northward; and here all difficulties were found to be at an end. The port was deep and secure; and, after exploring the different coves, he fixed on one which had the finest spring of water, and in which ships could anchor close to the shore. This he named Sydney Cove, in honour of the noble lord of that title, who was then in administration.

Soon after the boats arrived at Port Jackson, another party of the natives made their appearance. They were armed with lances, and, at first, shewed an hostile disposition; but, by gentle means, they were prevailed on to lay aside their suspicions, and to accept some presents. One of them, who appeared to hold the authority of a chief, shewed very singular marks of confidence in the strangers, and, at the same time, much resolution. He singly attended the governor, went to a part of the beach where the men were boiling their meat, examined the contents of the pot, and, seeing himself separated from his friends, advanced to a party of marines, and, by his gestures, seemed to threaten revenge, if any advantage should be taken of his defenceless situation.

In examining a different part of the harbour, the Europeans fell in with about twenty of the natives, who, fearless and unarmed, approached to view the boats, and afterwards joined them at dinner.

Having sufficiently explored Port Jackson, and found it replete with conveniences, the governor determined to hesitate no longer, and immediately issued his orders for the whole fleet to proceed to this place.

That Botany Bay should be highly extolled by Captain Cook, may be easily accounted for. He had no views of a permanent residence, and consequently did not scrutinize its advantages. The land has certainly a picturesque effect, and the ample harvest of botanical curiosities it furnished, might entitle it to the commendation of the scientific; but something more than beauty of appearance and philosophical riches were to be regarded, in a place where a permanent settlement was to be established.

The debarkation being completed at Sydney Cove, the ground was immediately cleared for an encampment, and store-houses and other temporary buildings were begun. The labour attending this was very considerable; for the whole coast was covered with wood; and, though on this spot the trees were less thick, and not much encumbered with underwood, yet their magnitude was such, as to render the felling, and removal of them afterwards, a very arduous task, had the convicts been more active workmen than they really were.

In the evening of the 26th, the British colours were

displayed on shore, under which his majesty's health was drank with much glee. The bustle of business succeeded, and, till the end of the first week in February, all was hurry and exertion.

The materials and frame-work of a temporary residence for the governor had been brought from England; and this was speedily erected. Hospital-tents were also fitted up with all the speed that the exigency of circumstances began to demand. During the passage from the Cape, the fleet had been tolerably healthy; but, soon after landing, the dysentery prevailed, and the scurvy broke out with its most virulent symptoms. In the former complaint, however, a red gum, produced in the country, was found very efficacious.

February commenced with a violent storm of thunder and rain, during which the lightning shivered a tree, under which was a sheep-pen, and five of these animals were destroyed by its effects.

Some part of the shores of the noble harbour of Port Jackson presented a promising soil for cultivation; but, intent solely on providing the best and earliest accommodations for the colonists, the governor used all possible expedition in fixing the settlement at the head of Sydney Cove, where landing the stores was easy, and carriage unnecessary.

By assiduous application, they made such rapid progress, that by the 7th of February, a spot being previously cleared, and the whole colony assembled, the governor began to assume his powers. To give all due solemnity to the proceedings, the military were drawn up under arms; the convicts stationed apart, and the principal officers surrounded the governor. Mr. Collins, the judge-advocate, then read the royal commission, by which Arthur Phillip was constituted captain-general and governor in chief of the territory, from latitude ten degrees thirty-seven minutes south, to forty-three degrees thirty-nine minutes along the coast, and of all the interior country as far as one hundred and thirty-five degrees of east longitude from Greenwich, including the adjacent islands in the Pacific, within the above latitudes. The act of parliament establishing the courts of judicature were next read; and lastly, the patents under the great seal, empowering the persons named to act, whenever it should be found requisite. Major Ross of the marines was appointed lieutenant-governor; and a triple discharge of musketry concluded this preliminary ceremony.

Governor Phillip then advanced, and, addressing the military, thanked them for their commendable conduct hitherto; and then, turning to the convicts, explained to them the nature of their present situation and future prospects. He represented that, by the lenity of the laws, their lives had been preserved, and that on their subsequent behaviour it would depend to gain a re-establish-

ment of the rights and advantages of civil society. To proper conduct and commendable exertion, he told them, they had every inducement; and, on the other hand, he reminded them, that in such a small community their crimes could not escape detection nor punishment. All that mercy could do for them had already been experienced, and against future offences the laws would be enforced with rigour. But, while his duty obliged him to hold out the terrors of punishment, he should deem it his felicity to grant every encouragement to the meritorious. As a bar against profligacy of manners, he strongly recommended matrimony, and promised every countenance to such as should enter into that state, and evince a readiness to conform to the laws of morality and religion. He concluded with expressing an earnest desire to promote the happiness of the colony over which he was placed, and to render the settlement both honourable and useful to the mother-country.

This harangue was received with universal applause; and it had, at least in some measure, the desired effect for, in a few days, fourteen marriages took place among the convicts.

The company being dispersed, the governor proceeded to review the troops; after which he gave a dinner to the officers; and the first evening of his entry upon the offices of his government was spent in festivity, amidst reiterated wishes for its prosperity.

As February advanced, the rains began to fall with augmented violence, and the necessity for procuring shelter became very urgent. To the carpenters, all the convicts of that profession were added, and one hundred more of them as labourers, to expedite their temporary buildings; yet it was some months before they were finished, or the governor could leave his first house, which was neither impervious to wind nor rain.

Captain Cook having discovered an island in latitude twenty-nine degrees south, longitude one hundred and sixty-eight degrees ten minutes east; which he named Norfolk Island, and spoke of in terms of high commendation, a party was sent out in the Supply, about the middle of February, to settle there. To be superintendent of this subordinate colony, the governor appointed Lieutenant King, of the Sirius, an officer of approved merit and fidelity. As the island was uninhabited, this gentleman had only six marines, under a subaltern officer, a midshipman, a surgeon, two men who understood the cultivation and dressing of flax, and nine male and six female convicts. Due regulations were established for the conduct of this enterprise; and every precaution was taken to render this small colony equally happy and secure.

The governor had not been long established at Sydney Cove before he found that many individuals under his care were so lost to all sense of right and wrong, and so

regardless even of life itself, that they could not be re-  
strained from offences against their countrymen, or kept  
from exposing themselves to the natives. Lenient mea-  
sures having repeatedly proved ineffectual, a criminal court  
was convened, in which six of the convicts were con-  
demned to die. One of the most daring was executed the  
same day, another was pardoned, and the remainder were  
banished to a small island within the bay, where they were  
kept on bread and water. These people had been con-  
victed of frequently robbing the stores, notwithstanding  
they had a liberal allowance of provisions.

On the second of March, the governor set out in the  
long-boat and cutter, to examine the coast. He pro-  
ceeded first to Broken Bay, about eight miles to the north-  
ward of Port Jackson. Here he fell in with a few of the  
natives, who appeared friendly; and, passing a bar, sailed  
up an extensive branch of water, which terminated in a  
large lagoon. The land in the upper part of this branch  
was low and swampy.

Crossing the bay, he sailed up the south-west branch,  
which he also found very extensive, and sufficiently deep  
for ships of any burthen; but the incessant rains prevented  
him from taking an accurate survey. The land here seemed  
to possess more elevation than at Port Jackson, and was  
well wooded. Large trees appeared on the very summits  
of the mountains, inaccessible to man. A third branch  
presented a very fine piece of water, which the governor  
named Pitt Water, in honour of the then premier. This  
was found deep and very extensive. Some situations in  
the vicinity appeared admirably adapted for agricultural  
improvements.

In exploring a part of Broken Bay, the boat found  
some difficulty in landing, which being observed by two  
of the natives, an old man and a youth, they appeared  
solicitous to render the strangers any assistance, and ran  
and fetched some fire to warm them. As it rained hard,  
the old man beckoned two of the officers to a cave, which  
he entered himself, and invited them to follow; but his  
motives being suspected, though probably without reason,  
they declined his invitation. He afterwards, however,  
showed his friendly intention; and in a short time, when  
the governor came to the same spot, he entertained him  
with a dance and a song. Several presents were given to  
this sociable savage, which he received with apparent satis-  
faction; but he soon found means to steal a spade, and was  
caught in the fact. The governor, thinking it necessary  
to evince his displeasure, pushed him away in seeming  
anger, and pointed to the spade as the cause. This at  
once destroyed their harmony. The old man instantly  
seized a spear, and, advancing to the governor, seemed  
determined to strike; but seeing his threats occasioned no  
alarm, he desisted from the attempt. His courage, how-  
ever, was eminently conspicuous for when he meditated

the assault, the governor was not alone. Next day the old  
man repeated his visit, in company with several of his  
countrymen; but, to convince him of his fault, he was  
little noticed, while his companions were presented with  
various articles.

Having thus gained some partial knowledge of the  
country and inhabitants, the governor returned to the set-  
tlement by sea, though it was his intention to have pro-  
ceeded by land, had not the incessant rains rendered this  
unpleasant.

On the 19th of March, Lieutenant Ball, in the Supply,  
arrived from Norfolk Island, which the detachment had  
reached on the 29th of February; but were five days be-  
fore they could find a proper landing-place for the stores  
and provisions. This island being completely environed  
by rocks, it is difficult even for a man to get on shore.  
However, at length they found a proper station, and the  
commandant wrote a very favourable account of his new  
territory.

In his passage to Norfolk Island, Lieutenant Ball dis-  
covered an uninhabited island, in latitude thirty-one de-  
grees thirty-six minutes south, which he named after Lord  
Howe. On examination, the shores were found to abound  
in turtle, but to furnish no good anchorage. Part of this  
newly discovered island rises to a great height, and may be  
seen at a considerable distance.

To facilitate the cultivation from Norfolk Island, a far-  
ther detachment was sent out from Port Jackson, con-  
sisting of an officer and eight marines, twelve male, and  
ten female convicts. But from this digression we must  
return to the settlement at Sydney Cove.

During the month of March, some of the transports  
were unloaded and discharged; and the rest were conse-  
quently detained, till the store-houses were completed to  
receive the cargoes.

On the 15th of April, the governor set out on another  
excursion into the country, attended by several officers  
and a party of marines. They landed at Shell Cove, near  
the northern entrance of the harbour, and, after some  
time, arrived at a large lake, where they observed a black  
swan, which, though proverbially rare in other countries,  
is not uncommon here. It is a very beautiful species: the  
wings are edged with white, and the bill is tinged with red.

So many swamps and bogs impeded their progress in  
this quarter, that it was three days before they got to firm  
ground. Almost all the morasses are occasioned by the  
overflowing of the springs; and nothing more fully evinces  
the improvements that civilization and agriculture intro-  
duce, than the contemplation of such scenes, where hu-  
man labour and ingenuity have never been exerted to re-  
claim the soil. In process of time, it is highly probable  
that corn may wave, and cattle feed, on those very spots  
which at first were almost impassable.

Behind these low marshy grounds, they came to rocks and barren tracts. The hills, however, were covered with flowering shrubs; and, at the distance of fifteen miles from the sea-coast, they had a charming view of the mountains in the interior. The various ridges obtained the appellations of Carmarthen, Landsdown, and Richmond Hills. It appeared probable that a considerable stream flowed between those mountains; but the stock of provisions being spent, it was deemed advisable to return without further examination.

The governor made another tour of the country soon after, landing in a different part of the harbour. At first they had open country; but in a short time arrived at thickets, which rendered their passage, in that direction, impracticable. They were now obliged to keep close to the banks of a small creek, by which means they passed the cover, and for the three succeeding days pursued a westward course. The country was delightfully fine, for the most part champaign, or rising into gentle eminences, which had a very beautiful and picturesque appearance. The trees seemed to grow at considerable intervals, and were entirely free from underwood.

On the 5th day they reached the top of an ascent, from which they had a prospect of Carmarthen and Landsdown Hills. This landscape was so beautiful, that the governor called it Bellevue. Being still, as they conjectured, about thirty miles from the mountains, which they purposed to reach, and being furnished with no more than six days provisions, it was again found necessary to return.

Prepossessed with a belief, that the knowledge of the country would well repay them for further attempts at exploring it, another expedition was projected, in which it was determined, if possible, to reach Landsdown Hills, where they thought it probable they might fall in with a river of such magnitude as would facilitate their communication with the inland parts; but the indifferent health of the governor, who had been injured by sleeping on the damp ground, delayed the prosecution of the journey.

The country last explored appeared so well calculated for cultivation, that it was resolved to send a detachment to settle there as soon as circumstances would permit. But though the soil was naturally so fertile, it was matter of astonishment how the natives could procure subsistence, as they were ignorant of the means of deriving any advantages from local situations, however propitious. Yet the appearance of temporary huts proved, beyond a doubt, that these parts were frequented by the natives. Near one of the huts the bones of a kangaroo were discovered, and a piece of a root, resembling that of the fern-tree, was picked up, which seemed to have been recently chewed. None of the inhabitants, however, were seen in these excursions; they either fled at the approach of the strangers, or concealed themselves.

It was seldom found that the Europeans could proceed a quarter of a mile without seeing trees that had been on fire. As violent thunder-storms are not unfrequent, some of these might have been fired by the lightning; but it is certain that the natives never are at the trouble of extinguishing a fire they have once kindled, so that it either communicates its flames to the tree, or accidentally goes out.

On his return from this expedition, Governor Phillip had the mortification to find, that five ewes and a lamb had been killed very near the camp, in the middle of the day. This accident was conjectured to have been occasioned by the dogs of the natives; but the real cause was never known. The loss, however, was serious, as it could not be easily replaced.

In the beginning of May, three of the transports which had been cleared sailed for China; and the Supply was sent out to Lord Howe's Island for turtle, in hopes of checking the scurvy, which had now made a rapid progress among the colonists.

By this time, with great labour and assiduity, eight or ten acres had been cleared, and sown with barley and wheat. Such was the first agricultural attempt, in a country where, we are now told, volunteer settlers are likely to make a competent fortune, in a few years, by the tillage of the ground alone.

On the 25th of May, the Supply returned, but had failed of procuring any turtle. She had met with rough weather, and had sustained some damage, but not of great importance.

About this time one of the convicts, who had strayed to some distance in search of vegetables, returned dangerously wounded, and reported that one of his associates, who had gone out on the same errand, had been wounded in the head, and carried off. A shirt and hat, both pierced with spears, were afterwards found in one of the huts of the natives; but no further intelligence could be procured. It is highly probable that the convicts had been the original aggressors, though this was strenuously denied by the person who made his escape.

On the 30th of May, two men, employed in collecting rushes for thatching, were found dead. One of them had four spears in his body; but the other exhibited no external marks of violence. These victims of their own indiscretion had been seen with a canoe, which they had taken from one of the fishing stations. Such misfortunes were feelingly lamented by the governor, as they frustrated his humane plan of conciliating the affections of the natives, and establishing a friendly intercourse with them.

The tools of the deceased rush-cutters being carried away, the governor thought they might lead to some discovery, and, therefore, went out with a small party, and landed at the spot where the men had been killed; but

after traversing the country for twenty miles, he arrived at Botany Bay, without even procuring a sight of any of the natives. Here, however, his party perceived about twenty canoes engaged in fishing; and when the fires were made, and preparations set about for encamping during the night, it was supposed that some of the people would have joined them, but none appeared. Next morning, though fifty canoes were drawn up on the beach, not an individual was to be seen.

The governor had now resolved to return; but, as he was proceeding along the sea-coast, he fell in with a numerous party of the inhabitants, near the mouth of a cove, and was within a few yards of them before they were perceived. The natives were armed, and one of them advancing seemed to warn the English to retire; but when Governor Phillip stepped forward to meet him alone and without weapons, he assumed a friendly confidence.

In a few minutes they were surrounded by more than two hundred men; but no signs of treachery were perceived, nor any wish to take advantage of the superiority of numbers. The moment friendship was offered, they laid down their weapons, and joined the party in the most amicable manner. Numbers of women and children were afterwards brought down by the men, and accepted such presents as were given them.

Among these people nothing was observed that could point them out as being concerned in the murder of the rush-cutters; and the governor had a fresh proof of the propriety of his conduct in treating them with a certain degree of confidence; for, had he hesitated a moment in shewing a friendly disposition, a rencounter must have ensued, and the consequences might have been fatal.

An old man, seeing the English purposed to advance, made signs that he would go before them. Having ascended a hill, he called out, holding up both his hands, the usual expression of amity, to signify to his countrymen in the next cove that friends were coming. The governor, however, did not descend to that cove, where he saw about forty men assembled. The cause of such numbers being collected was unknown; for it was calculated that they constituted a very considerable portion of the inhabitants of a great extent of coast.

In crossing the hills, on their way to Port Jackson, smoke was seen on the top of Landsdown Hills, a proof that the country was inhabited so far back, which was calculated to be fifty miles from the sea.

On a farther investigation of the fate of the rush-cutters, there appeared reason to suppose, that one of the natives had been murdered, and several wounded, before the fatal catastrophe took place. The governor, therefore, offered emancipation to any convict who should discover the aggressors; but nothing farther transpired.

His majesty's birth-day was kept with due festivity, and

all the convicts were indulged with a remission from labour. At sun-rise the ships of war fired a royal salute, and at noon the marines, being drawn up, saluted with three volleys. At sun-set the same honours were repeated by the ships, and bonfires threw a lustre on the night. That every person might participate in the general joy, the four convicts, who had been banished to a small island in the centre of the harbour, received a free pardon; and it is probable there was not a heavy heart among them in this distant part of his majesty's dominions.

On the 22d of June, a slight shock of an earthquake was felt, which lasted only two or three seconds. The governor, at first, took it for the report of guns fired at a great distance; but the real cause was soon discovered.

Two days after, a convict, who had been guilty of a robbery, absconded; but soon after returned, as he found it impossible to subsist in the woods. He said, that one of the natives gave him a fish, and made signs for him to go away; that afterwards he fell in with a party of the natives, who would have roasted him; but that he fortunately made his escape. He even pretended to have seen a human body lying on the fire; but little credit could be given to such authority.

With more semblance of truth, he reported that the inhabitants were in great distress for food, and that he had seen four of them apparently perishing of hunger, who made signs for something to eat. This man was tried for his offence, pleaded guilty, and suffered with another criminal.

An account of the state of the colonists' health being delivered in, on the last day of June, by the surgeon, it was found that eight marines and eighty-one convicts and children had died from the time of embarkation; that thirty-six of the military were under medical treatment, and sixty-six of the convicts. He farther stated, that fifty-two convicts were unfit for labour, from old age or infirmities. Many of the sick, however, were in a convalescent state.

When they first landed, the chief care of the governor was to erect temporary accommodations on the spot that presented itself as freest from impediments. No regularity could be expected; but the idea of convenience, united to order, was soon at liberty to expand; and, by degrees, large spaces were opened, lines marked, and a plan drawn out for future operations. The lines of streets and public buildings were now traced, in such a situation as to admit of a free circulation of air, the convenience of water, and other comforts which are requisite in a permanent settlement.

The first huts were of perishable materials, being chiefly constructed of the soft wood of the cabbage-palm, or even of posts, wattled and plastered. But barracks and huts were afterwards formed of more durable materials.

When matters were settled in the immediate vicinity of

Sydney Cove, the governor sent a small detachment to cultivate the ground at the upper end of Port Jackson, which in one of his excursions he had found so well adapted for that purpose, and which has since obtained the appellation of Rose-Hill.

After various unimportant transactions, though uniformly beneficial to the interest of the infant colony, the natives, who had always been treated with the greatest indulgence, as far as the authority of the governor could prevail, but whose entire confidence it was found impossible to gain, made an attempt to wrest by force what certainly did not belong to them. On the 9th of July, a fishing party of the English having drawn the seine, the natives violently seized the greatest part of the fish, while a more numerous body of them stood with their spears ready poised. The cockswain very prudently permitted them to satisfy themselves, and thus hostilities were prevented. Orders had been given to allow the natives a share of whatever might be caught when they were present; and, till this time, they had been apparently well satisfied with what had been voluntarily given them. It was now considered that hard necessity, and the resentment they felt for the encroachments made on their fishing stations, might probably drive them to this desperate act; and, therefore, no notice was taken of the aggression; but a stronger force in future was always sent with the boat, which tended to prevent a repetition of the injury.

About the middle of July, the governor went out with a small party to examine the land between Port Jackson and Broken Bay. In this quarter, many hundreds of acres were free from trees, and in a state favourable to cultivation. Proceeding as far as Pitt Water, he saw several of the natives, but none of them joined him. When the party, however, returned to the boats, they found about sixty men, women, and children, assembled there. In this society some hours were spent in a peaceful and amicable manner; but, though the natives did not appear uneasy in the company of the English, they always manifested satisfaction when they were about to leave them.

Soon after his return from this excursion, Governor Phillip set out again to explore the coast towards Botany Bay. In this journey, few of the inhabitants were seen, but many proofs were observed of the distresses they laboured under from a scarcity of food. In the summer-season they shewed a dainty taste in fish, rejecting some kinds with disdain; but now a young whale, which had been driven on the coast, had been greedily devoured by them. They barely scorched the outside of their fish before they ate it; and they prepared the fern-root in a similar manner.

The first day of the year 1789 was marked as a holiday, by a suspension of all kinds of labour, and by hoisting the royal colours at the fort. But it was much to be lamented,

that of all the numbers at that time in the colony, there were only two hundred and fifty employed for the public in cultivation; many were engaged in carrying on the public works, such as stores, wharfs, houses, &c.; a very considerable number were precluded by age or infirmities from working in the public grounds; and the civil establishment, the military, women, and children, filled up the catalogue of those unassisting in cultivation. The idleness of the convicts was, also, justly complained of; and some of them remained so firmly attached to those nefarious practices for which they had been banished their native country, that exemplary punishments became indispensably necessary, and the most fatal consequences frequently resulted from their going among the natives, in direct opposition to the governor's orders.

About the middle of February, Sydney Cove was, for the first time, left without a ship; a circumstance which forcibly drew the attention of the principal settlers to the peculiarity of their situation. The *Sirius* was gone to the Cape of Good Hope for supplies, the arrival of which was very precarious; and the *Supply*, having sailed to look after a dangerous reef in an unknown sea, was liable to draw upon herself the very calamity which she was seeking to instruct others to avoid. Should any misfortune have happened of so serious a nature as to render the preservation of this little vessel necessary to the salvation of the colony, how deeply must every one have been concerned in her welfare. We cannot, therefore, be surprised on hearing, that reflection on the bare possibility of miscarriage rendered every person anxious during her absence from the infant settlement. Towards the end of this month, two of the barracks, which had been nearly twelve months in hand, were completed; a brick house was also begun, on the east side, for the commissary, and preparations were made for laying the foundation of a guard-house.

The month of March was ushered in by some unfortunate accidents. Sixteen of the convicts, chiefly brick-makers, quitted their employment, and, having armed themselves with stakes, set off towards Botany Bay, in order to revenge, upon such natives as they should meet, the treatment which one of their companions had received at the end of the last month. However, they fell in with a larger party than they expected, and were soon repulsed, one of their number being killed and six others wounded. This unfortunate affair being mentioned in the settlement, the governor sent out an armed party, who found the body of the man that had been killed lying naked in the road to Botany Bay: they also found a boy who was dreadfully wounded, and had been stripped by the natives. The party, after burying the deceased convict, returned with the boy; and the other wounded people were, in the mean time, carried to the hospital. A severe punishment was afterwards inflicted on the misguided men, who had fla-

grantly broken the same time, two directions, in order to act of violence had. About this time repeatedly broke.

In the beginning of the year, the natives, who had been discovered, in the beach, great numbers. The cause of the was brought to the to be the small-pox.

The *Supply* had, and, on the 6th of Good Hope, ment, and a twelfth party: this supply of the vessel, every part of the *Sirius* had been were immediately casks for its reception of a new but pal labour of the.

Shortly after the Hill, the governor's due south, that if any person, for returning, should a chance of reaching fore this measure out in search of the missing, and though different directions.

The anniversary with every possibility belonging to fired three volleys, twenty-one guns cove; and the governor in his new house, son.

In the ensuing the settlement at found residing in excellent regulations erected in a small store; and so other side of the street where a small house superintendent.

grantly broken through every order and restriction; and, at the same time, two armed parties were sent out in different directions, in order to convince the natives that their late act of violence had not intimidated or alarmed the settlers. About this time also six persons suffered death, for having repeatedly broken into and robbed the public stores.

In the beginning of April, the people who were employed in or about the harbour, reported that they daily discovered, in the excavations of the rocks, and upon the beach, great numbers of the dead bodies of the natives. The cause of this mortality was unknown, until a family was brought to the settlement, and the disorder appeared to be the small-pox.

The Supply had returned safely from Norfolk Island, and, on the 6th of April, the Sirius arrived from the Cape of Good Hope, with a quantity of flour for the settlement, and a twelve-month's provisions for her ship's company: this supply proved extremely welcome, and the return of the vessel seemed to diffuse new life throughout every part of the colony. As the flour brought by the Sirius had been packed in bags at the Cape, the coopers were immediately employed in setting up and preparing casks for its reception on shore; and this, with the erection of a new hut for the smiths' work, formed the principal labour of the convicts during this month.

Shortly after the settlement was established at Rose Hill, the governor went out with some people in a direction due south, and caused a visible path to be made; that if any person, who had strayed beyond his own marks for returning, should cross upon this path, he might have a chance of reaching this settlement. A little time before this measure was adopted, two soldiers, who had gone out in search of the sweet-tea plant, were reported to be missing, and though parties were immediately sent out in different directions, all search proved ineffectual.

The anniversary of his majesty's birth-day was observed with every possible distinction; for the first time the artillery belonging to the colony were discharged, the marines fired three volleys, which were followed by a discharge of twenty-one guns from each of the ships of war in the cove; and the governor entertained the officers at dinner in his new house, of which he had recently taken possession.

In the ensuing month, Governor Phillip paid a visit to the settlement at Rose Hill, where the convicts were found residing in very good huts, and apparently under excellent regulations. A barrack for the soldiers was erected in a small redoubt, in which also stood the provision store; and some ground had been opened on the other side of the stream of water which ran into the creek, where a small house had been erected for the use of the superintendent.

The commission of burglaries, robberies, and other

offences, in the settlements of Sydney and Rose Hill, had now become so frequent, that it appeared indispensably necessary to form some plan which might effectually put a stop to these growing evils. Various measures having proved ineffectual, one of the convicts presented to the judge-advocate a proposal for establishing a night-watch, to be chosen from among the convicts, with authority to secure all persons of that description who should be found at a distance from their huts after a certain hour. This proposal being laid before the governor, and the plan properly digested, the first foundation of a police in New Holland was laid on the 8th of August. The following outlines of the plan may probably be acceptable to the reader.

The settlement was divided into four districts, over each of which were placed one principal and two subordinate watchmen. These, being selected from among such of the convicts as had borne a good character since their landing, were authorised to patrol at all hours of the night; to visit such places as might be deemed requisite for the discovery of any trespass or misdemeanor; and to secure all persons that might appear to be concerned therein. They were exhorted to use their utmost exertions to trace out offenders, on receiving accounts of any depredation; and, in addition to their night duty, they were to take cognizance of such convicts as practised gaming, or either sold or bartered their clothes or provisions, and report such persons for punishment. All the occurrences of the night were to be faithfully reported to the judge-advocate, and the military were enjoined to assist the watch in any case of emergency. The persons appointed for watchmen were each furnished with a short staff, to distinguish them during the night, and to denote their office in the colony; and they were instructed not to receive any stipulated remuneration from any individual for the conviction of offenders, but to expect that negligence or misconduct in the discharge of their duty would be punished with exemplary severity. The men promised fidelity and diligence, and entered with a confidence of success upon the office which they had voluntarily offered to undertake.

The institution of the night-watch was soon found to be of great utility, as the commission of crimes evidently became less frequent, and many incorrigible offenders were brought to justice, who might otherwise have escaped with impunity. The detestation in which the patrols were held by their fellow-convicts, afforded a sufficient proof of their assiduity in searching for offences; and it might have been justly asserted, that many streets in the British metropolis were neither so well watched nor so securely guarded as the rising town of Sydney.

Governor Phillip having frequently expressed a wish to have one or two of the natives within the settlement, that, by becoming acquainted with their language, a more am-

cable intercourse might be opened, a boat was repeatedly sent down the harbour, but without success. At length, the master and the first lieutenant of the *Sirius* fortunately secured two natives, both men, and brought them safely to the settlement. Through the medium of some children, to whom they were well known, they were assured that no injury was intended to their persons. But the measures which were taken to keep them in a state of security, were so disagreeable to the elder of the two, that he privately resolved to attempt an escape; and the negligence of his attendants having given him the desired opportunity, he fled into his native woods, carrying with him the fetter which had been rivetted to his ankle. His companion intended to have joined him in his flight, but the delay of a few moments frustrated his design, and he was secured in the very juncture of bidding adieu to his captivity.

In the month of December the harvest was got in; when it appeared that the cultivated land at Rose Hill had produced upwards of two hundred bushels of wheat, thirty-five bushels of barley, and a small quantity of oats and Indian corn; the whole of which was intended to be reserved for seed. The spot of ground at Sydney, which was commonly called the governor's farm, had been sown only with barley, and produced about twenty-five bushels.

A more complete knowledge of the interior of New Holland was anxiously desired by the English colonists; but the different employments in which all hands had been necessarily engaged had hitherto precluded the possibility of making any material researches. Governor Phillip had, indeed, penetrated as far as Richmond Hill, between fifty and sixty miles inland; but, beyond that distance, the country was totally unknown and unexplored.

Lieutenant Dawes, with a small party, set out in the course of this month, (December,) with a design to reach the western mountains from the banks of the fresh-water river, first discovered by Captain Tench, and supposed to be a branch of the *Hawkesbury*. But the adventurers returned from their excursion on the ninth day, having met with nothing, after quitting the river, but ravines that were nearly inaccessible; yet, notwithstanding the toil and danger of travelling through such a country, they had, by computation, proceeded within eleven miles of the mountains.

Early in the year 1790, a number of convicts were sent to Norfolk Island; and, in the beginning of March, the governor directed his attention, in a particular manner, to the regulation of the people who were left at Sydney, and to the preservation of the stock in the colony. For these purposes he visited the different huts and gardens which were now become vacant, distributing them to such convicts as were either in miserable hovels, or destitute of any shelter at all. By this arrangement, indeed, the sons of indolence found themselves provided for by the labour of

the industrious; but they were at the same time assured, that unless they kept in due cultivation the gardens which were now bestowed upon them, they would be turned out from the comforts of a snug hut, to live under a rock or a tree. That they might have time for this purpose, the afternoon of Wednesday, and the whole of Saturday in every week, was given to them. Similar regulations were made at Rose Hill: the garden-grounds were enlarged; those convicts who were in bad huts were removed to better ones, and every measure was taken which seemed likely to stimulate them to industry.

The colony had for some time been distressed by a scarcity of provisions; and when the *Supply* returned from Norfolk Island, a general consternation was diffused by the sad account of the loss of the *Sirius*, which happened in the following manner:—Captain Hunter was extremely fortunate in having a short passage to Norfolk Island; and the soldiers, and a considerable part of the convicts, were directly landed in Cascade Bay. Bad weather, however, immediately ensued, and, continuing for several days, the provisions could not be sent on shore, so high was the surf occasioned by it. This delay, together with a knowledge that the provisions on the island were very inadequate to the additional numbers that were now to be victualled, rendered the captain particularly anxious for the landing of the provisions. The bad weather had separated the *Sirius* from the *Supply*; but, meeting with a favourable slant of wind, Captain Hunter gained the island from which he had been driven, and stood for the south end of Sydney Bay, where he found the *Supply*; and, on its being signified by signal from the shore, that the landing might be effected with any boat, he brought to the windward part of the bay, with the ship's head off the shore, got out the boats, and loaded them with provisions.

When the boats had put off, it being perceived that the ship settled very much to leeward, the tacks were got on board, and every sail set that was possible to get her free from the shore: but it appeared that she could not weather the reef off the south-west end of the bay, the wind having unfortunately shifted two points. The ship was then thrown in stays, which she missed, being with great difficulty wore clear of the breakers, and brought to the wind on the other tack, when every sail was again set. Finding that she still drifted fast upon the shore, another attempt was made to stay her; but, being out of trim, it did not succeed. All the sheets and halliards were then ordered to be let fly, and an anchor to be cut away; but, before it reached the ground, she struck with violence on the reef, very soon bulged, and was irrecoverably lost. Her officers and people, however, were all fortunately saved, being dragged on shore, through the surf, on a grating.

This sad catastrophe was no sooner announced at Sydney,

than a general all the officers, mine on what ingly, after mably necessary low: the week and a half of fl and one pound was to be issu lony, except ch were only to his sible exertion beuefit; every rious practice o to be put in provisions in store.

The inevitable labour was alm ceed, and the marked on their of June, every c heart enlivened, be the Lady Ju brought by this nature. than a general melancholy prevailed in the settlement, and all the officers, civil and military, were assembled to determine on what measures must now be adopted. Accordingly, after mature deliberation, it was declared indispensable necessary to reduce still lower what was already too low: the weekly ration was to be no more than two pounds and a half of flour, two pounds of pork, one pint of peas, and one pound of rice, for each person. This allowance was to be issued to all descriptions of people in the colony, except children under eighteen months of age, who were only to have one pound of salt meat. Every possible exertion was to be made in fishing for the public benefit; every effort was to be used to prevent the nefarious practice of robbing gardens; and every measure was to be put in practice that could save any of the salt provisions in store.

The inevitable consequences of a dearth soon ensued; labour was almost suspended for want of energy to proceed, and the hardships of the people were strongly marked on their dejected countenances. But, on the 3d of June, every countenance was suddenly cheered, and every heart enlivened, by the arrival of a vessel, which proved to be the *Lady Juliana* transport from London. The news brought by this ship, however, was of a very distressing nature. It appeared that she had sailed in July, (ten months from the time of her arrival,) with two hundred and twenty-two female convicts on board; and that in the month of September following his majesty's ship *Guardian*, commanded by Lieutenant Riou, also sailed from England, having on board, with what was in the *Lady Juliana*, two years' provisions for the settlement; a supply of clothing for the marines, a large quantity of sails and cordage; several chests of medicines; fifteen casks of wine; a quantity of bedding and blankets for the hospital; and an ample supply of unmade clothing for the convicts; with a large assortment of tools and agricultural implements. A quantity of live-stock was also taken on board at the Cape of Good Hope, and a garden completed, which had been prepared under the direction of Sir Joseph Banks, and contained nearly a hundred and fifty fruit-trees. But, on the 23d of December, this richly-freighted vessel unfortunately struck against an island of ice, and received so much injury, that the greatest part of her cargo was obliged to be thrown overboard, to prevent her from immediately sinking. The stock, consisting of horses, cows, sheep, goats, and deer, was all killed; the beautiful garden destroyed; and the vessel herself saved only by the interposition of Providence and the prudent conduct of the commander.

When the female convicts were disembarked, and the stores landed, it appeared that twenty casks of flour were utterly spoiled. This was a serious loss to the colony, when only four pounds of flour could be allowed to each

man for seven days. In a short time, however, they were effectually relieved from their distress by the safe arrival of the *Justinian* store-ship from England; when all things seemed getting into their former train: the full ration was ordered to be issued, and the drum for labour was to beat, as usual, at one o'clock in the afternoon.

In the course of a few days arrived the *Surprise*, the *Neptune*, and *Scarborough*, transports, laden with convicts; but it was a sensible mortification to the gentlemen of the colony, that most of the prisoners in these ships were in a pitiable situation, many of them labouring under the complicated diseases of the scurvy and dysentery, and others yielding to the sad effects of a violent fever. Several of these unfortunate beings died in the boats, as they were rowing on shore, and even those who did not require medical assistance appeared extremely emaciated. The sick, however, were landed with all possible expedition; and wine and other necessaries were distributed among those who appeared to stand in need of such comforts.

Shortly after the landing of the convicts, the governor laid down the lines of a regular town at Rose Hill. The principal street was to be about sixty-eight yards wide, and to extend one mile, commencing near the landing-place, and running in a westerly direction to the foot of an eminence, on which his excellency designed to erect a small house for his own residence whenever he should visit the settlement. On each side of this street were to be erected a number of huts, capable of containing ten persons each, at the distance of twenty yards from each other; and a certain proportion of ground for gardens was to be allotted in the rear. Meanwhile the labouring convicts at Sydney were employed in erecting a new brick store-house, discharging the transports, and forming a road from the town to the brick-kilns.

During the general consternation occasioned by the late scarcity of provisions, Ben-nil-long (the native whom we have already mentioned as secured at government-house) found means to make his escape; and since that time nothing worthy of notice had occurred among the other natives. In the beginning of September, however, the amicable intercourse which the governor had always laboured to open with these people was purchased by a circumstance which seemed at first to threaten the colony with a very serious loss.

One morning, on hearing that Ben-nil-long had been seen at Broken Bay, and had sent him, as a present, a piece of a whale which was then lying on the beach, Governor Phillip immediately went down in a boat, and landed at the place where the whale was lying; and here he not only saw Ben-nil-long, but Cole-be also, who had escaped from government-house soon after his capture. It appeared that the few months Ben-nil-long had been away had so altered his person, that the governor, until joined

by Mr. Collins and Lieutenant Waterhouse, did not perfectly recollect his features. Several articles of wearing-apparel were now given to the savages, and Ben-nil-long requested the governor to return in two days with more clothes; and also with some hatchets or tomahawks.

The cove was nearly filled with natives, drawn together by the attraction of a whale-feast; and it being observed, during the conference, that twenty or thirty of these people were drawing themselves into a circle round the governor and his unarmed companions, it was proposed to retire gradually to the boat, where some of the Europeans laid on their oars, to be ready in case of accident. At this juncture, Ben-nil-long, who had already presented several natives by name, pointed out one, whom the governor stepped forward to meet, and, in token of friendship, held out both his hands towards him. The savage, not understanding this civility, but supposing that he designed to seize him as a prisoner, immediately fixed a spear on his throwing stick, and darted it at the governor with such force, that it entered a little above his collar-bone, and the barb of it came through on the other side. Several other spears were thrown, but happily without effect. The spear was then broken by Mr. Waterhouse; and whilst the governor was leading down to the boat, his attendants landed with their arms, but of four muskets which they took on shore, one only could be discharged. Extraordinary exertions were now made to reach the settlement, which was five miles distant; but in the course of two hours the governor was safely conveyed to his house, and the spear extracted without shewing any alarming symptom. On the tenth day, indeed, his excellency was so far recovered as to repeat his visit to the cove; but he now took the precaution of being attended by several officers well armed. Ben-nil-long asserted, that he had severely beaten the aggressor; and added, that his throwing the spear at the governor was entirely the effect of his fear, and done from the impulse of self-preservation. These assurances were graciously received by the governor; and a considerable quantity of fish was distributed among the natives, in order to convince them that no animosity was retained on account of the late accident.

In the beginning of October, Ben-nil-long and three of his companions paid a visit to the settlement; and the welcome reception they met with inspired them with such confidence, that their visit was soon repeated, and, after a little time, Ben-nil-long intreated the governor to build him a hut at the eastern extremity of Sydney Cove. This request was cheerfully granted, and an effectual opening was consequently made to the long desired intercourse between the natives and the gentlemen of the colony.

Early in July, 1791, the colonists heard, with great satisfaction, that the English government had resolved on

sending out convicts at two embarkations in every year, at which time provisions were also to be sent, that the settlement might not again be reduced to the melancholy situation from which it had been lately relieved. It was also reported that a cargo of grain might be expected from Bengal, and a transport, with live-stock, from the north-west coast of America.

About the same time, the convicts, whose terms of transportation had expired, were collected, and informed that such of them as wished to become free settlers should receive every encouragement; that those who did not, were to work for their provisions, stipulating that their labours should be continued for twelve or eighteen months certain; and that such as preferred returning to England, were at liberty to follow their inclinations whenever they could procure a passage, but that they were not to expect any assistance on the part of government to that end. The wish, however, for returning to their native country appeared to be the prevailing idea, as very few gave in their names as settlers, and none were found willing to labour for a stipulated time.

In the month of September, a public seal was received from England, to be affixed to all instruments drawn in his majesty's name; and also a commission under the great seal, empowering the governor for the time being, to remit, either absolutely or conditionally, the term for which convicts should have been, or might be hereafter, transported. In determining the device for the seal of the colony, attention had been evidently paid to its local and peculiar circumstances. On one side were his majesty's arms, with the royal titles in the margin; on the reverse, a group of convicts landing at Botany Bay, and received by Industry, who (surrounded by a bale of merchandise, a bee-hive, a shovel, and a pick-axe) appears releasing them from their fetters, and pointing to a town, rising on the summit of a hill, and oxen ploughing the adjacent land.

The month of April, in 1792, commenced with a dreadful sick-list, and with death, making rapid strides among the convicts; and, notwithstanding every possible exertion, the mortality was not much decreased till the beginning of June. The public works at Sydney and Paramatta, and the new town at Rose Hill, went on but slowly. At Sydney, however, the workmen finished a tank, capable of containing seven thousand nine hundred and ninety gallons of water, with a well in the centre fifteen feet deep. Brick huts were erecting for the convicts, in room of the miserable hovels which had been put up at their first landing, and many of which were found to interfere with the new streets now laying out. At Paramatta, a foundation for an hospital was laid, a house erected for the master-carpenter, and roofs prepared for the different huts which were building in various directions.

In September it was determined to begin the new bur-

rocks in the vicinity of Sydney Town. For the private soldiers there were to be five buildings, each one hundred feet by twenty-four in front, and connected by a slight wall. At each end were to be two apartments for officers, seventy-five feet by eighteen, each apartment containing four rooms, with a passage of sixteen feet. Kitchens, and other convenient offices, were to be erected in the rear, and a considerable portion of garden-ground laid out at the back.

Towards the end of November, Governor Phillip, in consequence of ill health, signified a determination of returning to England, and, on the 10th of December, he went on board the Atlantic, and relinquished a charge in the execution of which he had manifested a zeal and perseverance that must ever reflect the highest honour upon his name. Indeed, we cannot adduce a more convincing proof of the love and respect which this gentleman's conduct had ensured, than by stating that two of the natives, Ben-nil-long and Yem-mer-ra-wan-nie, voluntarily determined to accompany him to England.

The government of the colony now devolved upon Francis Grose, Esq. the lieutenant-governor. This gentleman had no sooner assumed the government, than he issued out the following order, for regulating the mode of carrying on the duty at Parramatta:

"All orders given by the captain who commands at Parramatta, respecting the convicts stationed there, are to be obeyed; and all complaints or reports that would be made to the lieutenant-governor when present, are, in his absence, to be communicated to Captain Foveaux, or such other captain as may be doing duty with the detachment."

By this order the military was substituted for the civil officer. Formerly, all complaints had been laid before the civil magistrate, who, in the governor's absence, punished such slight offences as required immediate cognizance; and all orders and directions respecting the convicts went through his hands.

The military power had hitherto been considered as necessary only for the protection of the stores, and the discharge of such duties as belonged immediately to their profession, without having the smallest share in the civil government of the colony; but, as it was provided by his majesty's commission, that, in case of the death or absence both of the governor and lieutenant-governor of the territory, the officer next in rank on service in the colony should exercise the functions of a governor until further instructions should be received from England, Mr. Grose thought proper to publish the above order, placing the captain commanding the detachment at Parramatta, in the direction of the civil duties of that settlement.

Similar regulations took place at Sydney, where it was ordered, that the captain of the day should report to the

commanding officer, all convict prisoners, stating the author and cause of their confinement. And, after a few days, this order was enforced by another, which directed, that all enquiries by the civil magistrate should, in future, be dispensed with, until the lieutenant-governor had given directions on the subject; and the convicts were not upon any account to be punished without his especial order.

Early in the month of July, 1793, the Rev. Mr. Johnson, having long lamented the want of a proper place for the performance of divine worship, began one under his own direction, and chose the situation for it at the back of the huts on the east side of Sydney Cove. The front was seventy-three feet by fifteen; and, at right angles with the centre projected another building, forty feet by fifteen. The edifice was constructed of strong posts, wattles, and plaister, and the roof was to be thatched. This building was soon completed, and divine service was performed in it for the first time on the 25th of August. Upon this occasion the worthy clergyman lamented that the urgency of public works had prevented any undertaking of the kind before, and had thus thrown it upon him: he declared that his only motive in coming forward upon the business, was that of establishing a place, where public worship might be performed without the congregation being exposed to the inclemency of the weather; and he added, that although the uncertainty of a place where they might attend had hitherto prevented many from assembling for the purposes of devotion, he now hoped the attendance would be full whenever he preached there.

The town of Sydney had increased considerably by the ensuing Christmas; about a hundred and sixty huts, and five barracks having been added since the departure of Governor Phillip. Some of these huts were tolerably large, and, to each of them, upwards of fourteen hundred bricks were allowed for a chimney and floor.

Among the various conveniences now enjoyed in the colony, we must notice the introduction of passage-boats; which, for the benefit of settlers and others, were allowed to go between Sydney and Parramatta. These were the property of convicts, whose terms of transportation had expired. Each person availing himself of these conveniences was charged one shilling for his passage; luggage was paid for at the rate of one shilling per hundred weight, and the entire boat might be hired for the sum of six shillings.

It soon appeared that the permission given to officers to hold lands had proved of very considerable benefit to the colony. They were liberal in their employments of people to cultivate those lands; and they had exerted themselves so arduously, that it appeared nine hundred and eighty-two acres had been cleared by them since the permission had been granted. Mr. Alt, having taken a survey in

April, 1794, reported that there had been cleared, since Governor Phillip's departure, two thousand nine hundred and sixty-two acres and one quarter; which, added to seventeen hundred and three acres and a half that were cleared at that time, made a total of four thousand six hundred and sixty-five acres and three quarters of cleared ground. It must also be observed, that, in the short period of fifteen months, the officers, civil and military, had cleared more than half the quantity of ground that had been cleared by the government and the settlers from the establishment of the colony to the date of Governor Phillip's departure.

On the 25th of October, the *Surprise* transport arrived from England, having on board sixty female and twenty-three male convicts, some stores and provisions, and three settlers for the colony. By this vessel advice was brought that Governor Hunter, with two ships, intended to be employed in procuring cattle for the colony, might be expected to arrive in about three months. It was also stated, that the two natives in England were in good health, but they had made very little improvement in the English language.

On the 15th of December, the lieutenant-governor and his family went on board the *Dædalus*, to return to England, and with him embarked Mr. White, the principal surgeon of the colony; the Rev. Mr. Bain, the chaplain; Mr. Laing, assistant-surgeon of the settlement; three soldiers, two women, and nine men. The master of the transport had permission to ship twelve men and two women, whose term of transportation had expired.

Previous to the lieutenant-governor's departure, such convicts as were confined in the cells, or who were under orders for punishment, were set at liberty; several small portions of land were granted to such soldiers as had made application for them; and some leases of town lots were given.

The direction of the colony, during the absence of the governor and lieutenant-governor, devolving upon the officer highest in rank then in the colony, Captain William Paterson took the oaths prescribed by his majesty's letters patent for the person who should so assume the government of the settlement. But as this officer was in expectation of the early arrival of Governor Hunter, he made no alteration in the mode of carrying on the various duties of the settlement now entrusted to his care.

The new governor arrived on the 7th of September, 1795; but he did not assume the exercise of his authority until the 11th, when his majesty's commission was publicly read by the judge-advocate, all descriptions of persons being present. His excellency, in a very appropriate speech, declared the expectations he had from every one's conduct, delicately touching on that of some persons who had been lately transported for seditious prac-

tices, and strongly urging the necessity of a general unanimity in support of his majesty's government. He was afterwards sworn in by the judge-advocate, and received a complimentary address from the civil and military officers of the settlement.

The governor, knowing the importance of being thoroughly acquainted with the state of the colony, ordered a general muster to be taken by the commissary; appointing different days at Sydney, Parramatta, and the Hawkesbury, that correct accounts might be easily obtained of the number and distribution of all persons in those districts, the military excepted; and, at the same time, he declared his intention of going in person to inspect the state of the different farms. He exhorted all persons holding lands in cultivation to plant with Indian corn as much of them as might not at that time be under any other grain; urging them not to let the proper season pass by, as the grain recommended to their attention formed an essential article.

Early in the ensuing month the report of this muster was laid before the governor; and, after mature deliberation, his excellency deemed it advisable to make some regulations in the assistance afforded by government to settlers, and others holding grants of land. The officers occupying lands were permitted to retain the men allowed by lieutenant-governor Gröse; viz. ten for the business of agriculture, and three for domestic purposes. Although this number far exceeded what had in England been thought necessary, the governor was unwilling to reduce it, whilst he saw the ground planting with Indian corn, and knew that a wheat-harvest was approaching. He felt it his duty, however, to explain that a reduction must take place, as government could not be expected much longer to maintain and clothe those men who tilled the ground, and at the same time pay for the produce of their labours, particularly when every public work was likely to stand still for want of labourers. To the settlers who arrived in the *Surprise* he allowed five male convicts; to the superintendants, constables, and store-keepers, four; to settlers from free people, two; and to settlers from prisoners, one.

The attention of the natives in the vicinity of the settlement was now principally engrossed by Ben-nil-long, who had returned from England with Governor Hunter. On his first landing, he behaved with a polished familiarity towards his sisters and other relations; but to his acquaintance he appeared remarkably distant and consequential. He declared, in an authoritative tone, that he should no longer suffer them to fight and murder each other, as they had done; but that he should introduce peace among them, and teach them to love one another. He also desired that, when they visited him at Government-house, they would endeavour to be more cleanly in their persons, and less coarse in their manners; and he appeared highly

offered in the indeleacy of his sister, who, hearing of his arrival, came in such haste from Botany Bay, with a little nephew on her back, that she left all her habiliments behind her.

Ben-nil-long had certainly been very observant of the English manners; and it was obvious, on his return, that he had no desire to renounce the habits and comforts of the civilized life which he had so readily adopted. He conducted himself with great propriety at table, particularly in the observance of those little attentions which are chiefly practised in the company of females; and although he frequently laid his clothes aside when about to visit his countrymen, his dress appeared to be an object of no small concern to him.

Immediately on his arrival he enquired after his wife, and found her living with another man, named Carruey; but, on his producing a rose-coloured jacket and petticoat, and a bonnet of the same colour, she deserted her paramour. In a few days, however, she returned to Carruey; and Ben-nil-long, after giving his rival a sound beating, declared his intention of looking out for another wife.

Some imperfect accounts having been received of the existence of some cattle which were lost in 1788, two of the convicts resolved to ascertain the truth of these reports, and endeavour to discover the place of their retreat. On their return from their first excursion, they affirmed they had seen them; and a subsequent report proved so satisfactory, that the governor resolved to go in person to that part of the country where they were said to have been found. Accordingly, he set off from Parramatta, attended by a small party; and, after travelling two days, and crossing the river Nepean, he actually fell in with a fine herd of cattle, about forty in number, grazing in a pleasant and fertile pasturage. The day being far advanced, he determined to pass the night in the neighbourhood, hoping, in the morning, to be gratified with a sight of the whole herd. A supposition was now started of their being cattle produced from what had been formerly brought from the Cape of Good Hope. The governor was anxious to ascertain the truth of this suggestion, and accordingly he desired his attendants, next morning, to endeavour to get near enough to kill a calf. This they found to be impracticable; for, whilst they were lying in wait for the whole herd to pass, they were furiously attacked by one of the bulls. This animal, however, was fortunately killed, and completely answered the desired purpose; for he had all the marks of the Cape cattle when full grown, such as wide spreading horns, a moderate rising between his shoulders, and a short thin tail.

After a little reflection, the question how these cattle strayed to this part of the country appeared easy of solution. The few that were lost in 1788 might travel without interruption, in a western direction, until they reached

the banks of the Nepean, and, by fording that river, they would come at once into a fertile and irriguous country, from which they could have no incitement to remove. It was a circumstance equally important and gratifying to have in the woods of New Holland a thriving herd of wild cattle. Some proposals were made for bringing them into the settlement; but it was considered that, if these should be sacrificed on any temporary emergency, the benefit would be but small to the colony; whereas, if permitted to remain undisturbed for a few years longer, they might prove sufficient for the inhabitants of the country, and, perhaps, not only for their own consumption, but also for exportation.

On the 20th of June, 1796; the governor, with a few attendants, undertook a second excursion to this part of the country, and he saw the cattle ranging as before, though not exactly in the same spot; and he had the satisfaction to observe that their numbers had increased, as ninety-four were at this time counted.

The frequent commission of the most daring crimes, together with the turbulent and dissipated behaviour of the convicts, having recently called aloud for redress, the governor resolved, in the month of September, to enforce the most rigid discipline, and to construct a capacious log-prison at each of the towns of Sydney and Parramatta. It being indispensably necessary that these should be erected as speedily as possible, he called upon every settler, officer, and housekeeper, to furnish a certain number of logs for this purpose; and he had, in a very short time, the pleasure of seeing materials brought in much faster than the carpenters could put them together. In the course of the ensuing month, Ben-nil-long, who had returned to all his native habits, claimed the protection of the governor from several of his countrymen, who, he affirmed, had, under the false pretence of punishing him for murder, laid an ambush in the brick-fields near the town of Sydney, with a view to kill him. Governor Hunter accordingly sent him to the place, with some of the military, where he explained to his countrymen, that he was not guilty of the crime laid to his charge; and that the soldiers were sent with him, as a proof that the governor would not suffer him to be ill-treated on any false pretence; but that he was resolved to drive every native from Sydney who should presume to attempt it. This threat had the desired effect, and the fears of Ben-nil-long soon subsided.

In the month of January, 1797, the governor resolved to visit that part of the settlement which was situated on the banks of the Hawkesbury. Accordingly he set off, with a party of officers, to Broken Bay, where he sailed up the river till he arrived at some farms, which had been recently evacuated, in consequence of the depredations that the owners had been exposed to from several parties.

of natives. The ground in the vicinity was now carefully examined, to see if it would admit such a number of settlers as might be sufficient for the purposes of mutual assistance and protection; but it was found inadequate to that end.

The governor and his attendants now proceeded up the river to Richmond Hill, on the summit of which a large smoke was made at noon, and at the same time a similar smoke was made on Prospect Hill, to ascertain the relative situation of the two hills. This bearing, which was thirty-five degrees south-east by compass, gave, with the latitude observed in each, a distance of eighteen miles between the hills in a direct line.

Towards the end of the month, the governor made an excursion to Botany Bay, in order to explore George's River as far as practicable, and to examine the soil upon its banks, which he found to be of good quality, and considerable extent. This river, which was observed to run in a westerly direction about twenty-five miles from Botany Bay, was highly picturesque, and many of its branches were navigable for small craft for at least twenty miles up; and some of its creeks reached within a short distance of Prospect Hill.

The convicts and other people belonging to the crown were employed during the month of March in a variety of works, at different places. At Sydney, a gang was employed in making bricks, where also the log-prison and a large granary were erecting. All the public brick edifices were likewise undergoing a repair, such as the barracks, officers' dwellings, store-houses, &c. At Toongabbe, upwards of a hundred men were employed in agriculture; and at Parramatta a considerable number of stone-masons and carpenters were engaged in preparing materials for a windmill.

Early in the month of June, Governor Hunter paid a visit to the settlement at Parramatta, for the purpose of examining that part of the country which he intended to cultivate on the public account, and to observe how the convicts, who had been recently sent thither, were provided for.

The ground proposed to be cleared on the public account was not more than two miles and a half from Parramatta, and most charmingly situated with respect to fresh water, having a chain of excellent ponds in its vicinity. The deputy-surveyor having accompanied the governor, a spot was marked out for the erection of the necessary buildings; and the whole received the name of Portland Place, in honour of his grace the Duke of Portland.

Towards the latter end of this month, the new prison was completed at Sydney, and enclosed with a strong and high fence. This building was eighty feet in length: the sides and ends were constructed of strong logs, a double row of which formed each partition. The floor and the

roof were of the same solid materials, over which was a coat of stiff clay, eight inches deep, and the roof, besides, was thatched. The whole was divided into twenty-two cells, and in the prison-yard was a distinct brick building for debtors, fenced off from the felons' side by a strong and high paling.

The beginning of December was marked by a circumstance which gave rise to much conversation in the town of Sydney, and excited much commotion among the natives. Two of these people, Cole-be and Ye-ra-ni-be, having had some misunderstanding, met and attacked each other in the town. For some time they fought without gaining any advantage; but, on closing on each other with their clubs, Ye-ra-ni-be's shield fell from his hand, and, while stooping to take it up, his antagonist struck him on the head, and treacherously repeated the blow, whilst he was in that defenceless situation.

Conscious that this behaviour would ensure him the appellation of coward, and that the most serious consequences might result from the death of his opponent, Cole-be thought proper to abscond for some time. Meanwhile Ye-ra-ni-be was constantly attended by some of his male and female acquaintance, particularly by his two friends, Collins and Mo-roo-bra. One night, when a dismal song of lamentation had been sung over him, his male friends suddenly started up, and, seizing their weapons, rushed out, fully determined on revenge. As they knew pretty well where to meet with Cole-be, they gave him a severe beating, but would not kill him until the fate of their friend should be decided.

Six days after the affray between Cole-be and Ye-ra-ni-be, the latter died, and his body was interred next day by the side of the public road, below the military barracks.

Cole-be, finding that he must either submit to the trial usual on such occasions, or remain in continual dread of assassination, resolved, at length, to come forward, that the business might be settled one way or the other. Having intimated this resolution, he repaired, on a certain day, to the place of rendezvous, and it is highly probable that he would have expiated his offence with his life, had it not been for the interposition of the military, before whose barracks the affair took place; for, although extremely active in the use of the shield, he was soon overpowered by his enraged assailants, and, sinking beneath their spears, was on the point of receiving his death-wound, when his friends, the soldiers, lifted him from the ground, and carried him into the barracks.

Ben-nil-long, the particular friend of Cole-be, was present on this occasion, but it was supposed that he did not intend to take any part in it; but, when the soldiers rushed in to save the life of his friend, his conduct became utterly inexplicable; for, on a sudden, he chose to be in a rage

with something, and with such tremendous through his back, and navel. He was then it became necessary to prevent the mischief white people, and to military.

It was a singular fact, the least gratitude for received, had now become savage. As it was so reprimanding him for to walk about armed, declare that it was for governor, whenever a last outrage had rendered colonists; and as the comforts in the settlement under the idea that all of an individual, it was soon receive that punishment.

Notwithstanding this, been exposed to for the of the latter appeared to prosecute their revenge 1798, Mo-roo-bra, and Cole-be, made an attempt to take away his life. wounds he had lately resistance, and, after he fell down apparently they were quitting him immediately returned nervous behaviour so e snatched up a spear, a Mo-roo-bra. The wound proved mortal; and then to submit to the usual gallantry and agility, he thigh, once through the

In the month of June to Ben-nil-long, who had the gentlemen of the colony some of her countrymen of the Botany Bay of a lad, named Nann, occasioned much violence lations of the sufferers Ben-nil-long. The fellow who had wounded Nann him so severely, that

with something, and threw a spear at one of the soldiers with such tremendous force, that it immediately passed through his back, and came out at his belly, close to the navel. He was then dragged away, boiling with rage, and it became necessary to confine him during the night, both to prevent the mischief with which he threatened the white people, and to save him from the resentment of the military.

It was a singular fact that this man, instead of evincing the least gratitude for the numerous attentions he had received, had now become a most insolent and troublesome savage. As it was sometimes utterly impossible to avoid reprimanding him for his ill behaviour, he had been known to walk about armed, and he had even the audacity to declare that it was for the express purpose of spearing the governor, whenever an opportunity should offer. His last outrage had rendered him altogether detestable to the colonists; and as the natives, who had received many comforts in the settlement, were now afraid of appearing under the idea that all might be punished for the crime of an individual, it was supposed that Ben-nil-long would soon receive that punishment which he had long deserved.

Notwithstanding the severe trial which Cole-be had been exposed to for the death of Ye-ra-ni-be, the friends of the latter appeared to consider themselves still bound to prosecute their revenge: and in the month of January, 1798, Mo-roo-bra, and some other natives, meeting with Cole-be, made an attack upon him, with a determination to take away his life. Cole-be, not yet recovered of the wounds he had lately received, was unable to make much resistance, and, after receiving several blows on the head, he fell down apparently lifeless; but Mo-roo-bra, as they were quitting him, perceived him attempt to rise, and immediately returned to finish his butchery. This ungenerous behaviour so exasperated another native, that he snatched up a spear, and threw it with all his force at Mo-roo-bra. The wound inflicted by this weapon soon proved mortal; and the native who threw it was compelled to submit to the usual trial; in which, notwithstanding his gallantry and agility, he was speared twice through the thigh, once through the leg, and once in his right-hand.

In the month of July, a young woman, nearly related to Ben-nil-long, who had resided from her infancy among the gentlemen of the colony, was inhumanly murdered by some of her countrymen; and, about the same time, a native of the Botany Bay district ran a spear through the body of a lad, named Nan-bar-rey. These circumstances occasioned much violence on the part of the friends and relations of the sufferers, among whom were Cole-be and Ben-nil-long. The former happening to meet the man who had wounded Nan-bar-rey, revenged his treatment of him so severely, that he died of his wounds the next

morning. In consequence of this, Ben-nil-long was attacked by two men; and, after he had defended himself for some time with equal address and agility, one of the savages slipped behind, and threw a spear into his side with such force, that it penetrated seven inches into the cavity of his body, and, from its direction, was supposed to have wounded his intestines. However, by the care and attention of his European friends, he was soon recovered; and, on hearing that a body of the southern natives had offered battle to those of Sydney, for the purpose of revenging the death of the young man who had slain Nan-bar-rey, he appeared and fought as the friend of Cole-be.

The beginning of the new year, 1799, was marked by a drought and suffocating heat, which proved highly detrimental to cultivation: and the month of March was ushered in by an accident, which, though not so ruinous as the drought to the colony at large, proved very destructive to the settlers in the vicinity of the Hawkesbury. That river, in the course of a few hours, rose to the height of fifty feet above its common level, and with such force as to bear down every thing before it. The government storehouse was swept away, with all the provisions that it contained; hogs, poultry, and the domestic effects of the people, were hurried away by the torrent; and many of the inhabitants were taken from the ridges of their houses, by a few boats, just in time to save their lives: for most of the dwellings were completely inundated, and the whole country appeared like an extensive lake.

This was a very serious calamity, and rendered particularly distressing by the settlers being unprepared for any thing of the kind. No cause had appeared, either at or near the settlement, to indicate an approaching overflow of the river. It is highly probable, however, that a heavy fall of rain had taken place in the interior of the country, among the mountains; and that, in consequence of the long drought, it had not been any where absorbed, but had run down the sides of the hills, filling all the branches of the river; which, from its serpentine form, could not give vent so fast as the waters rushed in. It was generally expected, however, that this inundation would eventually prove beneficial to the grounds it had overflowed, and that the luxuriance of their subsequent productions would amply repay the losses which the sufferers had sustained.

In the evening of the 4th of June, which had been observed as his majesty's birth-day with every demonstration of loyalty and cheerfulness, the weather became extremely tempestuous, and continued for three days blowing a violent gale from the southward, attended with a deluge of rain, which occasioned some considerable damages to the new buildings erected by government, and, in particular, the new mill at Sydney was so much injured, that it be-

came necessary to pull it down, and to lay the foundation a second time.

For some time the gale subsided, but, about the middle of the month, it returned from the southward with increased violence, and attended by another deluge of rain. The south side of the church-tower was entirely destroyed, though the clock fortunately escaped; the new Government-house at Parramatta received some material injury; and, in short, the ravages of the storm were so great, that the settlement was thrown back nearly twelve months in several public works, which were just on the eve of being completed. To add to the distress of the governor and his friends at this juncture, some very serious inconveniences were likely to result from an unproductive harvest, from an exhausted store in the important articles of clothes and bedding, and from the immoral and indolent habits of the greater part of the colonists. Some great exertions, however, were immediately made to remedy the misfortunes occasioned by the tempestuous weather, and it was hoped that most of them would be surmounted by the end of the year.

In the month of July, a general muster was made of all the inhabitants in the settlement; and the governor himself collected from the settlers an account of their respective farms and cultivated lands. This he did with a view of transmitting the exact state of the colony to the British government; and from the result of his laborious investigation it appeared, that there were two thousand five hundred and forty-four acres and a half in wheat, and nine hundred and seven acres for maize, in the district of the Hawkesbury; five hundred and thirty-eight acres in wheat, and three hundred and sixty-five acres and a half for maize, in the Sydney districts; and one thousand two hundred and fifty-nine acres and a half in wheat, and six hundred and sixty-three acres and a half for maize, in the district of Parramatta: making a grand total of four thousand three hundred and forty-two acres and a half in wheat, and one thousand nine hundred and thirty-six acres for maize, in the three principal districts of the settlements.

At the Hawkesbury the greatest quantity of land cultivated by any individual, who had from a convict become a settler, were fifty-one acres, of which forty-six were sown with wheat. A man, who had been left in the care of some ground which a Mr. Hogan had purchased in 1796, had, at this time, two hundred, and an agent of the commissary had nearly three hundred acres in wheat. There were but few sheep in this district, and only about two hundred and forty goats. Hogs, however, were very numerous, there being nearly two thousand remaining after all the slaughter which had recently taken place among them. The fertility of the district had induced about a hundred and eighty persons to become landholders; and it is probable that, when they shall have learned to place their dwelling-houses

and barns at a proper distance from the river, to secure them from the effects of a sudden inundation, their exertions will be amply remunerated.

The settlers in Parramatta had less ground in cultivation, and were fewer in number, than those in the vicinity of the Hawkesbury. Among the individuals who had devoted their principal attention to the rearing of stock, we cannot omit mentioning a man of the name of Elliot, who, having resolutely withstood every temptation to sell them, had, at this time, no less than a hundred and sixteen sheep, all derived from one ewe, which had been given to him by Governor Phillip in the year 1792. We have also to add that George Barrington, whose uniform good conduct had induced the governor to put him in a respectable office, was now possessed of fifty-five goats, thirteen sheep, and two mares, and had nearly twenty acres of land in cultivation. The number of settlers in this district was one hundred and four.

The quantity of ground under cultivation in the neighbourhood of Sydney was considerably less than in either of the other districts; a circumstance which seems to have been owing to the inferiority of the soil near the coast to that of the interior. The number of settlers, at the time alluded to, was only seventy-one, and the greatest portion of land cultivated by any individual did not exceed thirty-three acres. With respect to the live-stock, there were about thirty-eight sheep, two hundred and ninety goats, and three hundred and sixty hogs. It is necessary to observe, however, that the farms and stock of the civil and military officers were not included in this statement.

In the beginning of April, the governor made an excursion from Prospect Hill to a settlement which he had established on the banks of George's River. Having previously examined the country between Parramatta and that river, he now traced it in another direction, and had the pleasure of finding it equally favourable to cultivation with what had been before observed. The settlers appeared to be doing extremely well, and had not suffered any molestation from the natives. From thence he went down the river to Botany Bay, and then proceeded by land to Sydney, between which places the ground was covered with a profusion of flowering heath.

On the 24th of September his excellency resolved to make another excursion in quest of the wild cattle. Accordingly, having quitted Parramatta, and crossed the Nepean, he and his party traversed a new tract of country, which was not only beautiful to the eye, but admirably adapted for cultivation.

On their arrival at the Cow-pasture plains, they fell in with about twenty head of cattle, which were so extremely fierce, that had it not been for their dogs, the Europeans would probably have been attacked. These dogs having been set at the cattle by some of the party, the ani-

imals were dismayed at the sight of a bull-calf, about six months old, bellowed so loudly that it was deemed expedient to shoot him. This was accordingly done. The natives themselves upon veal, which was common in New Holland. On quitting the party crossed the river and proceeded to a formerly done, and proceeded to a mountainous country, but was not adapted for cultivation or pasturage. They found the country remarkably well watered, and most luxuriant grass.

In the beginning of November the settlers were nearly ready for the rearing of their appearance, particularly in the district where the stalks were literally covered with ears of corn that were, perhaps, the most fertile countries. But no crop was reaped after harvest. About the middle of the month a violent storm of thunder and rain, accompanied by a shower of hail from the south, fell off the trees, and uttering a noise of many voices, the city of Sydney, though it was not far from that place. A heavy shower of rain took place at the Hawkesbury, and the wheat, and destroyed the crops. These destructive storms, however, did not recommence on the 20th, and continued till the 25th; when, to increase the misery of young caterpillars were seen in the maize.

About ten o'clock of the night the log-prison at Parramatta was utterly consumed. The prisoners were rescued from the flames, and many of the exertion, were most miserable. There was a hundred feet in length, and with much labour and expense, it was the first time that such a circumstance had happened in the settlement; the gaol at Sydney was in the same infamous manner by fire, and surely have been lost to civilization and humanity.

About the middle of January the settlers at the Hawkesbury resolved to shoot two of their associates, and to inform them that they were to be shot for the purpose, and in a manner that the inhuman settlers now began to do. They drove the poor boys into

mals were dismaysed at the appearance, and made off; but a bull-calf, about six months old, being detained by the dogs, bellowed so loudly for the herd to return, that it was deemed expedient to shoot him through the head. This was accordingly done, and the whole party regaled themselves upon veal, which was at this time a rare dish in New Holland. On quitting the Cow-pasture plains, the party crossed the river again, higher up than they had formerly done, and proceeded for about four miles over a mountainous country, but well calculated either for cultivation or pasturage. They then crossed a tract of level country, remarkably well watered, and clothed with the most luxuriant grass.

In the beginning of November, the wheat-crops, which were nearly ready for the reaper, wore a most promising appearance, particularly in the district of the Hawkesbury, where the stalks were literally bowed down by the finest ears of corn that were, perhaps, ever beheld in the most fertile countries. But no crop could ever be relied on till after harvest. About the middle of the month there came on a violent storm of thunder and lightning, attended with a shower of hail from the south-east, which beat all the fruit off the trees, and utterly destroyed many in the vicinity of Sydney, though it was not felt more than two miles from that place. A heavy storm of wind and rain also took place at the Hawkesbury, which beat down much of the wheat, and destroyed one end of the public store. These destructive storms, having subsided for a few days, recommenced on the 20th, and continued almost incessantly till the 25th; when, to increase the public distress, myriads of young caterpillars were found destroying the young maize.

About ten o'clock of the night preceding Christmas-day, the log-prison at Parramatta was wilfully set on fire, and utterly consumed. The prisoners were with difficulty rescued from the flames, and many of them, in spite of every exertion, were most miserably scorched. This building was a hundred feet in length, and had been constructed with much labour and expense. This, however, was not the first time that such a circumstance had occurred in the settlement; the gaol at Sydney having been destroyed in the same infamous manner by a set of wretches, who must surely have been lost to every sense of feeling and common humanity.

About the middle of January, 1800, some of the settlers at the Hawkesbury resolved to revenge the murders of two of their associates, and accordingly fixed on three unoffending young natives, who resided among them. Having informed them that they thought they could find the guns belonging to the white men, they were dispatched for that purpose, and in a short time brought them in. The inhuman settlers now began their work of vengeance. They drove the poor boys into a barn, where they tied

their hands behind their backs, and then stabbed them in several places, until two of them sunk lifeless under their hands. The third, making his escape, jumped into the river; and although he could only use his feet in swimming, yet, under this disadvantage, and with the murderers of his companions repeatedly firing at him, he actually reached the opposite bank, and soon joined his countrymen.

The governor was no sooner apprised of this infamous murder, than he sent to the place, where the two unfortunate boys were found dreadfully mangled and buried in a garden. The guilty settlers were immediately taken into custody; and the subsequent evidence brought before the court having fully established the perpetration of their crime, they were pronounced "*guilty of killing two natives*;" but, as some doubts were entertained respecting the light in which *natives* were to be held, the court applied to the governor for such information as he could furnish upon the subject. Accordingly, his excellency sent them the orders which from time to time had been given respecting these people, and a copy of an article in his majesty's instructions, which, in strong and direct terms, places them under the protection of the British government, and enjoins that, if any of them should be wantonly destroyed, or unnecessarily molested in the exercise of their several occupations, the offender or offenders should be brought to punishment, according to the degree and nature of their offence. Notwithstanding this communication, however, the court were still divided in their sentiments respecting the nature of the offence; and, instead of passing sentence of death, a special reference was made to his majesty's minister, and the monsters, who had so wantonly embued their hands in innocent blood, were admitted to bail! It was natural to suppose that the other natives would be highly incensed at seeing the prisoners return to their farms without receiving any sort of punishment; and indeed some of them loudly threatened to burn the crops, as soon as an opportunity should offer. "Fire," as Mr. Collins justly observes, "in the hands of a body of irritated and hostile natives, might, with little trouble to them, ruin the prospect of an abundant harvest; and the present circumstance proved that they were not ignorant of having this power in their hands; though, as it fortunately happened, they did not put their threats in execution."

It having been for some time observed that a number of idle and suspicious persons were strolling about the town of Sydney, at improper hours of the night, and much property having been recently stolen, the centinels on duty were enjoined not to suffer any persons to pass their posts after ten o'clock at night, unless they could give the counter-sign; in which case the centinel was to detain them until the relief came round, and then, if the corporal should not be perfectly satisfied with the account they might give of themselves, they were to be taken to the guard-house

until liberated by proper authority. The patrol of constables were also directed to be particularly strict in their rounds, and to apprehend all suspicious persons whom they might meet with during the night.

In the month of March, some accounts of an alarming nature were received from the districts of George's River and the Hawkesbury. The weather had, unfortunately for the maize, been extremely bad for three weeks, the wind blowing a heavy gale, accompanied with torrents of rain, which soon swelled the rivers beyond their banks, laying all the adjacent lands completely under water. By this unexpected accident the prospect of an abundant maize-harvest was utterly destroyed, and every other work was of necessity suspended, to prepare the ground a second time for wheat. To expedite this important business, all descriptions of people were required to give their assistance; and all idle persons, who were wandering about the colony, were ordered to be apprehended, and, if found unwilling to work at a reasonable hire, they were to be compelled to labour for the public.

About the beginning of May, several officers were induced to suspect that some person, who had recently arrived from Ireland, had not left behind them those principles which had occasioned their transportation, but were carrying on seditious correspondences, and holding unlawful meetings. This being reported to the governor, he held a council with four military gentlemen and the several magistrates of the district; and, after mature deliberation, it was resolved to make a general search among the persons suspected, in all parts of the colony at one hour, and to secure all their papers. This plan seems to have been the best that could have been devised, and it was accordingly put in execution on the 15th of the month; but nothing was found which could furnish the smallest proof of the supposed sedition.

Next day, a convict, who had endeavoured to propagate a report that a great number of pikes had been fabricated, and privately sunk in a certain part of the harbour, was examined before some of the magistrates; when he declared that he knew nothing of what he had asserted, as he was intoxicated at the time. Notwithstanding this prevarication, the magistrates ordered him to be severely punished, as he must certainly have had some mischievous design in attempting to spread such a report among the convicts.

In the course of a few days, an information was laid against one Harold, a Popish priest, who was said to have been concerned in some seditious conversations; but, from the secrecy with which, it is probable, the business might have been conducted, the magistrates could not discover any thing by which he could be eliminated. The governor, however, deemed it necessary, in consequence of his conjectures to extract the seeds of the late acts against

illegal assemblies and seditious correspondence, and to publish them in the form of a proclamation, that none might plead ignorance of the existence of such laws. The proclamation was accordingly published in the usual manner, and it was also read in church after the performance of divine service on a Sunday morning.

About this time it appeared, that some proposals had been made, and a correspondence entered into between the secretary of the Bengal government and a gentleman who had been employed as the private agent of the officers of the settlement, relative to the transportation of Indian criminals to New Holland. It was proposed by the government of Bengal to victual and maintain their convicts for one year after their landing, after which they were to be supported by the settlement. Such a description of people might certainly have proved very useful to the colony, and, in all probability, would be more manageable than the convicts from England or Ireland: but no step could be taken in this matter until the approbation of his majesty's ministers could be obtained.

In order to check, as far as possible, that encouragement which had been too long given by settlers and others to the vagrants who infested the different districts, the governor thought proper to order that, when any one wished to travel from one place to another, he was to apply to a magistrate for a pass, in which the business he was going on was to be specified; and all persons found without such written permission were to be apprehended, and obliged to answer for their wilful disobedience. About the same time, a proclamation was read in the church, preparatory to issuing a process of outlawry against the numerous house-breakers, sheep-stealers, and other public depredators, who still continued their nefarious practices, notwithstanding all the recent efforts of government. The various orders, also, which had been issued respecting a due observance of the Sabbath, had been so little regarded, that, on the 25th of August, it was judged necessary to give out a new order, pointing out the duties of the superintendants, overseers, and constables, in this particular instance; and warning them, that a further neglect on their part would occasion their immediate dismissal from their respective situations.

About this time, information was received of the death of a young man, named Wilson, who, whilst a convict, and after the period of his transportation had elapsed, preferred the life of a vagabond to that of an industrious man. He had spent the greatest part of his time in the woods, and was sometimes suspected of having excited the natives to commit depredations on the settlers. In consequence, however, of a proclamation from the governor, he surrendered himself, and, on promising to amend his conduct, he was allowed to accompany such parties as made occasional excursions into the woods and, at other times,

to shoot kangaroos his principal amusement.

Sensible that more than those who were upon their merits to persuade them, even persuaded him as her son. He commanded respect for his appropriating station against her, thrusting a spear when it was too savages might be the cause of injuries, complete revenge.

In the beginning of the year, it was calculated, that the seditious practices of themselves of the forwardness, and Hereupon a committee of the course of their son Harold, the R. apprehended than founded on facts; to cover several humiliated and concealed the course of his countrymen, and the committee adjudged.

Harold, however, of discovering the buried in the ground after the most strict of it, nothing like they were sunk in the where all research appeared with an Irish produce in support been transported for not involve himself on a man to fabricate a barn-door; but the position to allow any design to alarm the tendency that he alone the facts, might some importance in. to shoot kangaroos and birds, the latter of which formed his principal subsistence.

Sensible that the wood natives were much less acute than those who reside upon the sea-coast, he presumed upon their mental imbecility, and had sufficient influence to persuade them that he had once been a black man, and even persuaded a credulous old woman to acknowledge him as her son. His superior powers, for some time, commanded respect, mingled with a kind of awe; but, on his appropriating a young female to his own accommodation against her will, her friends took an opportunity of thrusting a spear through his body; thus convincing him, when it was too late, that however deficient these poor savages might be in reasoning faculties, they were susceptible of injuries, and knew perfectly well how to take a complete revenge.

In the beginning of September, fresh rumours were circulated, that the prisoners, lately sent from Ireland for their seditious practices, had formed a plan for possessing themselves of the colony; that their arms were in great forwardness, and their plan of attack nearly arranged. Hereupon a committee of officers was appointed, who, in the course of their investigations, saw occasion to imprison Harold, the Romish priest. This man was no sooner apprehended than he confessed that the late reports were founded on facts; and, at the same time, he offered to discover several hundreds of pikes, which had been fabricated and concealed since his arrival in the colony. In the course of his confession, he implicated several of his countrymen, and these having accused several others, the committee adjudged them all to be deserving of punishment.

Harold, however, was never able to fulfil his promise of discovering the pikes. At first he affirmed they were buried in the ground belonging to a certain settler; but, after the most strict search had been made in every part of it, nothing like a pike could be found. He then said they were sunk in the lower part of the harbour, but even there all research proved equally fruitless. He then tampered with an Irishman to make a few, which he might produce in support of his assertion; but the man, having been transported for dealing in pikes, declared he would not involve himself a second time. At length, he prevailed on a man to fabricate a single pike out of an old hinge of a barn-door; but this bore too evidently the marks of imposition to allow any credit to his tale. There was certainly no design to alarm the government, and this man, by pretending that he alone, by virtue of his office, could come at the facts, might probably hope to render himself of some importance in the colony.

In consequence of these alarms, it was deemed expedient to increase the armed force of the colony, and accordingly a certain number of the most respectable inha-

bitants formed themselves into two volunteer associations, of fifty men each, and received the appellation of the "Sydney and Parramatta Loyal Associated Corps." Each was commanded by a captain, with two lieutenants, and a proportionate number of non-commissioned officers. The whole were properly supplied with arms and ammunition, and their alarm-post was fixed at the front of Government-house.

It having been previously reported, that coal had been discovered upon the banks of George's River, the governor now visited the place in person, and, on minute examination, he found many indications of the existence of that useful fossil, of which a vein was afterwards discovered on the west side of Garden Island Cove.

Towards the end of the month, the governor, having determined to return to England, and having left the direction of the colony in the hands of the lieutenant-governor of Norfolk Island, who happened to be on the spot, embarked, with several other gentlemen, in his majesty's ship *Buffalo*.

The governor's embarkation afforded a striking proof of the general respect and veneration which he had ensured himself among the decent and rational members of the colony, by his humane and lenient administration. The road to the wharf was completely lined on each side with troops, and he was accompanied thither by all the officers of the civil and military departments, and by a great concourse of the inhabitants, who exhibited every possible mark of attachment to his person, and regret for his departure.

At this period there were four thousand six hundred and sixty-five acres of wheat, two thousand nine hundred and thirty acres of maize, and eighty-two acres of barley, in cultivation, besides a considerable quantity of garden-ground, occupied by potatoes, vines, &c. It appears, however, from the most respectable authority, that the poverty of the settlers, and the exorbitant wages demanded for labour, caused much land to be unemployed this year. Some of the inferior farmers, also, were almost ruined by the prices which they were compelled to pay for such necessities as they required from those who had been long in the habit of monopolizing every article brought to the settlement for sale.

As it was utterly impossible to put a stop to this infamous practice without the positive interference of the British government, several representations were made to his majesty's ministers; and, at length, they appeared to have gained some attention, as, in several of the last arrivals from England, a variety of articles, consisting of agricultural implements, stores, and clothing, had been consigned to the governor, to be retailed for the use of the colonists; and it was understood that this system was, in future, to be adopted in all the vessels laden with con-

viets or stores to New Holland. With respect to the livestock in the colony, there were, at Governor Hunter's departure, sixty horses, a hundred and forty-three mares, three hundred and thirty-two bulls and oxen, seven hundred and twelve cows, four thousand and seventeen hogs, six thousand one hundred and twenty-four sheep, and two thousand one hundred and eighty-two goats.

By subsequent dispatches it appears, that the quantity of salt provisions remaining in store in the beginning of the year 1801 was so inconsiderable, that the governor deemed it necessary to send his majesty's ship the Porpoise to Otaheite, for the purpose of salting pork for the colony; and, as it was indispensably necessary to send thither a quantity of salt for this purpose, he fortunately was enabled to buy about fifteen tons from the master of a whaler, which happened to put in from one of the Cape de Verd Islands.

On this voyage the Porpoise sailed in the month of May, and her commander, Lieutenant Scott, was furnished with a letter from the governor to the king of Otaheite, intreating him to protect and assist Mr. Scott in the execution of the business entrusted to his care; and urging him to extend his favour to such of the English missionaries as were still on the island. It was particularly pointed out to him, that such conduct would certainly conciliate the esteem of his Britannic majesty. Mr. Scott was also provided with a quantity of such articles as were likely to excite the admiration of the people he might have to deal with; and, for a present to his Otaheitean majesty, he took a handsome mantle, and some other articles of dress, decorated with red feathers, together with six muskets and a quantity of ammunition.

Meanwhile, accounts being received of the union between Great Britain and Ireland, that event was celebrated, on his majesty's birth-day, with every demonstration of loyalty and cheerfulness; and the governor embraced that opportunity of liberating several of the seditious Irishmen who had been in confinement. On this day, also, the new union flag was, for the first time, displayed in New Holland.

About this time some great encouragements were held forth to promote the growth of wool, fit for the purpose of manufacturing; as it appeared that three hundred and six yards of blanketing had been made from what had been produced in the year 1800, from the flocks belonging to government and to individuals. It is also particularly worthy of notice, that four hundred and seventy-two yards of flax had been manufactured into linen in the short space of five months.

Having thus given a brief account of the foundation and gradual increase of the British colony in New Holland, we shall dismiss the subject by observing, that, on the 30th of June, 1801, there were in the settlement five

thousand five hundred and forty-seven persons of all descriptions, including seven hundred and seventy-six children. And at Norfolk Island the whole number of persons was nine hundred and sixty-one; making a grand total of six thousand five hundred and eight persons.

## SECTION II.

### PAPUA, OR NEW GUINEA.

This country was discovered, in 1528, by Alvaro de Saavedra, a Spanish captain, who called it New Guinea, as being opposite on the globe to Guinea in Africa. Roggewein, a Dutchman, coasted the north part in 1722; and the navigator who next touched here was Captain Carteret; but he had only a distant intercourse with the inhabitants. Captain Cook made the coast of this island in September, 1770, in latitude six degrees twelve minutes south, and longitude one hundred and thirty degrees east. And to him we are indebted for the following account of the country and its inhabitants.

"When we arrived on the coast of New Guinea, on the 30th August, we made many attempts to get near enough to go on shore, but without success; and having now lost six days of fair wind, at a time when we knew the south-east monsoon to be nearly at an end, we began to be impatient of farther delay, and determined to run the ship in as near to the shore as possible, and then land with the pinnace, while she kept plying off and on, to examine the produce of the country and the disposition of the inhabitants. Being within about three or four miles off, and in three fathoms water, we brought to. The pinnace being hoisted out, I set off from the ship with the boat's crew, accompanied by Mr. Banks, who also took his servants, and Dr. Solander, being in all twelve persons, well armed: we rowed directly towards the shore, but the water was so shallow, that we could not reach it by about two hundred yards; we waded, however, the rest of the way, having left two of the seamen to take care of the boat. Hitherto we had seen no signs of inhabitants at this place; we, therefore, thought it necessary to proceed with caution, lest we should fall into an ambuscade, and our retreat to the boat be cut off. We walked along the skirts of the wood; and, at the distance of about two hundred yards from the place where we landed, we came to a grove of cocoa-nut trees, which stood upon the banks of a little brook of brackish water. The trees were of a small growth, but well hung with fruit; and near them was a shed or hut, which had been covered with their leaves, though most of them were now fallen off: about the hut lay a great number of the shells of the fruit, some of which appeared to be just fresh from the tree. We looked at the fruit very wishfully, but not thinking it safe to climb

we were obliged to leave it, without tasting a single nut. At a little distance from this place we found plantains and a bread-fruit tree, but it had nothing upon it; and having now advanced about a quarter of a mile from the boat, three savages rushed out of the wood with a hideous shout, at about the distance of a hundred yards; and, as they ran towards us, the foremost threw something out of his hand, which flew on one side of him, and burnt exactly like gunpowder, but made no report; the other two instantly threw their lances at us; and, as no time was now to be lost, we discharged our pieces, which were loaded with small shot. It is probable that they did not feel the shot; for, though they halted a moment, they did not retreat; and a third dart was thrown at us.

"As we thought their farther approach might be prevented with less risk of life than it would cost to defend ourselves against their attack, if they should come nearer, we loaded our pieces with ball, and fired a second time: by this discharge it is probable that some of them were wounded; yet we had the satisfaction to see that they all ran away with great agility. As I was not disposed forcibly to invade this country, either to gratify our appetites or our curiosity, and perceived that nothing was to be done upon friendly terms, we improved this interval, in which the destruction of the natives was no longer necessary to our own defence, and with all expedition returned towards our boat. As we were advancing along the shore, we perceived that the two men on board made signals that more savages were coming down; and, before we got into the water, we saw several of them coming round a point, at the distance of about five hundred yards: it is probable that they had met with the three who first attacked us; for as soon as they saw us they halted, and seemed to wait till their main body should come up. We entered the water, and waded towards the boat; and they remained at their station, without giving us any interruption. As soon as we were aboard, we rowed abreast of them, and their number then appeared to be between sixty and a hundred. We now took a view of them at our leisure: they made much the same appearance as the New Hollanders, being nearly of the same stature, but having their hair more bushy: like them, also, they were all naked; but we thought the colour of their skin was not quite so dark; this, however, might, perhaps, be merely the effect of their not being quite so dirty. All this while they were shouting defiance, and letting off their fires by four or five at a time. What these fires were, or for what purpose intended, we could not imagine: those who discharged them had in their hands a short piece of stick, possibly a hollow cane, which they swung sideways from them, and we immediately saw fire and smoke, exactly resembling those of a musket, and of no longer duration.

"This wonderful phenomenon was observed from the  
21. VOL. I

## A S I A.

ship; and the deception was so great, that the people on board thought they had fire-arms; and, in the boat, if we had not been so near that we must have heard the report, we should have thought they had been firing volleys. After we had looked at them attentively some time, without taking any notice of their flashing and vociferation, we fired some muskets over their heads: upon hearing the balls rattle among the trees, they walked leisurely away, and we returned to the ship. Upon examining the weapons they had thrown at us, we found them to be light darts, about four feet long, very ill made of a reed or bamboo-cane, and pointed with hard wood, in which there were many barbs. They were discharged with great force; for though we were at sixty yards distance, they went beyond us; but in what manner we could not exactly see: possibly they might be shot with a bow; but we were in general of opinion, that they were thrown with a stick, in the manner practised by the New Hollanders.

"The land here, like that in every other part of the coast, is very low, but covered with a luxuriance of wood and herbage that can scarcely be conceived. We saw the cocoa-nut tree, the bread-fruit, and the plantain-tree, all flourishing in a state of the highest perfection; though the cocoa-nuts were green, and the bread-fruit not in season; besides most of the trees, shrubs, and plants, that are common to the South Sea Islands, New Zealand, and New Holland.

"Soon after our return to the ship, we hoisted in the boat, and made sail to the westward, being resolved to spend no more time upon this coast, to the great satisfaction of a very considerable majority of the ship's company. But I am sorry to say, that I was strongly urged by some of the officers to send a party of men ashore, and cut down the cocoa-nut trees, for the sake of the fruit. This I peremptorily refused, as equally unjust and cruel. The natives had attacked us merely for landing upon their coast, when we attempted to take nothing away; and it was, therefore, morally certain, that they would have made a vigorous effort to defend their property, if it had been invaded; in which case, many of them must have fallen a sacrifice to our attempt, and, perhaps, also some of our own people. I should have regretted the necessity of such a measure, if I had been in want of the necessities of life; and certainly it would have been highly criminal, when nothing was to be obtained but two or three hundred of green cocoa-nuts, which would, at most, have procured us a mere transient gratification. I might indeed have proceeded farther along the coast, to the northward and westward, in search of a place where the ship might have lain so near the shore as to cover the people with her guns when they landed; but this would have obviated only part of the mischief; and, though it might have secured us, it would probably, in the very act, have been fatal to the natives.

As the two countries lie very near each other, and the intermediate space is full of islands, it is reasonable to suppose that they were both peopled from one common stock: yet no intercourse appears to have been kept up between them; for if there had, the cocoa-nuts, bread-fruit, plantains, and other fruits of New Guinea, which are equally necessary for the support of life, would certainly have been transplanted to New Holland, where no traces of them are to be found. The Author of the "*Histoire des Navigations aux Terres Australes*," in his account of La Maire's voyage, has given a vocabulary of the language that is spoken in an island near New Britain; and we find, by comparing that vocabulary with the words which they learnt in New Holland, that the languages are not the same. If, therefore, it should appear that the language of New Britain and New Guinea are the same, there will be reason to suppose, that New Britain and New Guinea were peopled from a common stock, but that the inhabitants of New Holland had a different origin.

A more recent account of this island is that of Captain Forrest, who visited it in 1775. The design of the voyage he undertook, in the Tartar galley, was to forward what the Honourable East-India Company had recommended, to settle at Balambangan, an island situated near the promontory of Borneo, in consequence of intelligence received, that cinnamon, cloves, nutmegs, pepper, and clove-bark, might be introduced into Balambangan with facility.

"When we arrived on the coast of New Guinea," says this writer, "on the 27th of January, some of the natives, in their boats, brought us abundance of excellent fish, also turtle, which the Mahometans I had on board would not eat. They also brought us limes, and small lemons. We stood on towards Dory Harbour, and, off the mouth of the bay, a boat with two Papua men came on board, and after having conversed with our linguist at a distance, and being satisfied we were friends, they hastened on shore, as I suppose, to tell their countrymen; for, in a short time, many of the Papua men came on board, and were perfectly easy and familiar. As soon as the ship was at anchor, I fired some swivel-guns; the grown people did not regard this, or seem frightened, but the boys and girls ran into the woods.

"One night a Papua boat came near the shore, and alarmed the large tenement opposite to which we lay; the strangers being in search of their wives and children, who had taken to the woods from a neighbouring village when we were there. In the boat were about twenty persons. Tuan Hadjee, a Mahometan of rank, who accompanied me on this voyage, wanted me to fire upon them, which I would by no means do: in the morning the mistake was cleared up, and they went away satisfied. Soon after, a boat came off with fifteen Papua men: some of them spoke a little of the Malayan language. Others set off

in their canoes to fetch provisions. They were those to whom I had advanced cloth. They left their wives and children under the care of some of the old men. In each boat was generally a small fox-looking dog.

"We lost out of our shed a china jar; but, on my complaining to a Papua man about the theft, it was next day put in its place. Two boats brought some sago, plantains, &c. for their families: they were unwilling to dispose of any of them. They also brought some birds of Paradise, which I purchased from them.

"Some of our people found a nutmeg-tree, not a hundred yards from our shed-house. We cut it down, but the fruit was not ripe; it was just such a tree as I found and cut down at an adjacent island; and the people of Dory said there were many such trees about the country; at the same time they did not seem to know that the nutmeg was an object of consequence, and regarded it no more than any wild kind of fruit that is of no general use; whereas, on the plantain, the cocoa-nut, the pine-apple, and bread-fruit of two sorts, they set a proper value. They allowed that to the eastward many nutmegs were gathered; but I could not learn what was done with them, or to whom they were sold. I was, therefore, inclined to go farther down the coast; but Tuan Hadjee objected to it, as he did likewise to making any inland excursion, to visit a people called the Haraforas.

"The Papua people did not seem willing that we should have any intercourse with the Haraforas, who, it seemed, were kept under by the Papuas. When I asked any of the men of Dory why they had no kalavansas, which articles they were continually bringing from the Haraforas, I learnt, after many interrogatories, that the Haraforas supplied them with these articles, and that the Papua people do not give goods for these necessaries every time they receive them; but that an ax or chopping-knife given once to a Harafora man renders his lands or his labour subject to an eternal tax of something or other for its use; such is the value of iron: and a little way farther east, I was told, they often use stone-axes, having no iron at all. If a Harafora man loses the instrument so advanced to him, he is still subject to a tax; but if he breaks it, or wears it to the back, the Papua man is obliged to give him a new one, or the tax ceases. The Papua men generally build their houses on trees, to which they ascend, with great agility, by a long notched stick, and often pull their ladder after them, to prevent the intrusion of followers. I was, however, glad to find, before we sailed, that the people of Dory were convinced we meant them no harm, and that we did not intend to entrap them, or carry them off, as is sometimes done by the Mahometans of the Moluccas, who, I was told by Tuan Hadjee, fit out vessels with no other design.

"The promontory of Dory, the sea-coast of which ex-

tends about four grounds every where like Malay country, but it differs in that it is very easy to travel. The country about there is good ground, fertile, being so cloudy seem always country hitherto.

"Of vegetable kind, the cocoa-nut, the natives hold them to be hogs, dogs, &c. Dory afforded us which I got there could procure, except "The birds of curiosity of specimens were denominated were called "the Liuty, on this coast seasons in flocks, bird-line, after which on, as they are that the account of mainly on the wing to the custom of male, is without fault taken. They themselves with great has not been yet of these birds for the speculation of fish on the coast turtles here are in agriculture.

"The Papua men round their heads, three feet, and, when they stuck their converging teeth, with sticks, in a direction design to make it their hair with feathers pierced, in which of the women such as that of the in stuff, that comes resembles a coarse kind of saddle, and up behind, in general, com-

y the Mahometan  
Tuan Hadjee, fit  
coast of which ex-

tends about fourteen leagues, is of a middling height; the  
grounds every where ascend gradually. It may be said,  
like Malay countries in general, to be covered with wood;  
but it differs in one respect; there being no underwood,  
it is very easy travelling under the shade of the lofty trees.  
The country abounds with small fresh-water rivulets, and  
there is good grass, but in no large tracts. It is very tem-  
perate, being so near the mountains of Arsak, where the  
clouds seem always to settle; so that it is by far the best  
country hitherto visited on the voyage.

"Of vegetable productions in this country, are the plan-  
tain, the cocoa-nut, the pine-apple, the bread-fruit of two  
kinds, and the nutmeg, which last, as before observed,  
the natives hold not in any estimation. The quadrupeds  
are hogs, dogs, and wild cats. - I saw no domestic ones.  
Dory afforded us neither fowl nor goat. A little wild hog,  
which I got there occasionally, was all the refreshment I  
could procure, except fish, greens, and fruit.

"The birds of Paradise, which so much excite the  
curiosity of speculatists, are found in New Guinea. They  
were denominated "Birds of the Sun." By some they  
were called "the Birds of God." To an island, called  
Linty, on this coast, the birds of Paradise come at certain  
seasons in flocks, and, settling on trees, are caught with  
bird-lime, after which their bodies are dried with the fea-  
thers on, as they are seen in Europe. It appears further,  
that the account of these birds having no legs, being con-  
stantly on the wing, and living on the air, which gave rise  
to the custom of cutting off their legs when offered to  
sale, is without foundation. The natives kill them as soon  
as taken. They have formidable bills, and defend them-  
selves with great resolution. But what they subsist on  
has not been yet discovered. There are six distinct spe-  
cies of these birds, and they have afforded great scope  
for the speculation of naturalists. There are various kinds  
of fish on the coast, and particularly the albacore; and  
turtles here are in great plenty, so that the natives neglect  
agriculture.

"The Papua men wear their hair bushed out so much  
round their heads, that its circumference measured about  
three feet, and, where least, two feet and a half. In this  
they stuck their comb, consisting of four or five long di-  
verging teeth, with which they combed their frizzling  
locks, in a direction perpendicular from the head, as with  
design to make it more bulky. They sometimes adorned  
their hair with feathers. The women had only their left  
ear pierced, in which they wore small brass rings. The  
hair of the women was bushed out also, but not quite so  
much as that of the men. The men, in general, wore a  
skin stuff, that comes from the cocoa-nut tree, and re-  
sembles a coarse kind of cloth, tied forward round the  
middle, and up behind, between the thighs. The women  
wore, in general, coarse black Surat bastas round their

middle, not as a petticoat, but tucked up behind like the  
men, so that the body and thighs were almost naked.  
The boys and girls go entirely so.

"The people to the eastward of Dory bore the nose,  
and wear ear-rings. They are fond of glass and china  
beads of all colours: both sexes wear them about the  
wrists, but the women only at the left ear.

"As to the disposition of these people, I have the  
greatest reason to think it was fierce and hostile; although  
they are reputed to deal honestly with the Chinese, who  
trade with them, and advance them goods for several  
months before the returns are made.

"Near the place where we anchored stands one of their  
great houses, which is built on posts, fixed several yards  
below high-water mark, so that the tenement is always  
above water, a long stage, supported by posts, going from  
it to the land, just at high-water mark. The tenement  
contains many families, who live in cabins on each side of  
a wide common hall, that goes through the middle; it has  
two doors, one opening to the stage towards the land, the  
other in a large stage towards the sea, supported likewise  
by posts, in rather deeper water than those that support  
the tenement. On this stage the canoes are hauled up,  
and from this the boats are ready for a launch at any time  
of the tide, if the Harafors attack from the land; if they  
attack by sea, they take to the woods. The married people,  
unmarried women, and children, live in these large tene-  
ments, which have two doors; the one to the long narrow  
stage that leads to the land, the other to the broad stage  
which is over the sea, and on which they keep their boats,  
having outriggers on each side. A few yards from this sea-  
stage, if so it may be called, are built, in still deeper  
water, and on stronger posts, houses where only bachelors  
live. At Dory are two large tenements of this kind, about  
four hundred yards from each other, twelve or six on a  
side.

"The cabins in these tenements are miserably furnished;  
a mat or two, a fire-place, an earthen pot, with perhaps  
a china plate or basin, and some sago-flour, constitute  
the whole apparatus. As they cook in each cabin, and  
have no chimney, the smoke issues at every part of the  
roof; so that, at a distance, the whole roof seems to smoke.  
The natives have a method of stuffing the intestines of the  
turtle with the yolk of its eggs. So filled, they roll it up in  
a spiral form, and roast, or rather dry it, over a slow fire:  
it proves then a long sausage. They have a species of  
green, about an inch and a half long, and a quarter of  
an inch broad: it breaks short, being thick, and has a  
salt taste when eaten raw. It becomes very palatable with  
oil and vinegar, and proves very good when boiled.

"In one of the houses I visited, I saw the women  
sometimes making mats, at other times forming pieces of  
clay into earthen pots; with a pebble in one hand to put

into it, whilst they held in the other hand also a pebble, with which they knocked, to enlarge and smooth it. The pot, so formed, they burnt with dry grass, or light brushwood. I have often observed the women, with an axe, or chopping-knife, fixing posts for the stages, while the men were sauntering about idle. Early in a morning, I have seen the men setting out in their boats, with two or three fox-looking dogs, for certain places to hunt the wild hog, which they call *ben*. A dog they call *naf*. Among small islands, the wild hogs often swim in a string from one island to another, the hog behind leaning his snout on those before, so that the sportsmen kill them with ease.

"The Papuan men are exceeding good archers, and some of their arrows are six feet long. The bow is generally of bamboo, and the string of split rattan.

"They purchase their iron tools, chopping-knives, axes, blue and red baftas, china-beads, plates, basins, &c. from the Chinese. They also trade in slaves, ambergris, tortoise-shells, small pearls, birds of Paradise, and many other kinds of dead birds, which the Papna men have a particular method of drying. At Krude and the islands adjacent, though iron is almost unknown, great quantities of tortoise-shell may be procured, and, indeed, every where on this coast; but it requires time to collect it, and the merchant must advance the commodities of barter. The Chinese cheat, but are seldom cheated by, the Papuans. There were slaves offered me for sale, which I might have had very cheap; but, being crowded on board, I did not choose to purchase them. If I had, several would have expected the same indulgence. The slaves had the gristle between the nostrils pierced with a piece of tortoise-shell, and were natives of New Guinea, at some distance to the east of Dory.

"In one of the cabins I entered, two of the women were humming a tune, on which I took out a German flute, and played; they were exceedingly attentive, all work stopping instantly as I began. I then asked one of the women to sing; she complied, and the air she sung was melodious, and of a species much superior to Malay airs in general, which dwell long on a few notes, with little variety of rise or fall. I observed that the children did not snatch, or seem too eager to receive, but waited patiently, and modestly accepted what I offered, lifting their hands to their heads."

"Their courtship and marriage-ceremonies are attended with very little formality. The bachelors, if courting, come freely to the common hall, and sit down by their sweethearts. The parents or friends of the women call out at a distance, Well, are you agreed? If they agree before witnesses, they kill a cock, which is procured with difficulty, and then it is a marriage. Their funeral-ceremonies are as concise. We found on the island, close by the beach, a Papua burial-place, rudely built of coral

rock. On it was laid the wooden figure of a child, about eight years old, represented completely clothed. A real skull was put into the upper part, on which ears were cut in wood."

**SECTION III.**  
**NEW BRITAIN.**

To the north of New Guinea is New Britain, which is situate in four degrees of south latitude, and one hundred and fifty-two degrees nineteen minutes of east longitude from Greenwich. It was supposed to be part of an imaginary continent till Captain Dampier found it to be an island, and sailed through a strait which divides it from New Guinea. Captain Carteret, in his voyage round the world, in 1767, found it was of much less extent than it was till then imagined to be, by sailing through another strait to the north, which separates it from a long island, to which he gave the name of New Ireland. There are many high hills in New Britain, and it abounds with large and stately trees. To the eastward of New Britain, and in both the above straits, are many islands, most of which are said to be extremely fertile, and to abound with plantains and cocoa-nut trees.

M. Bougainville represents the natives of this island as entirely black, with frizzled woolly hair; and, in their persons, they were tall, active, and robust. The hair of these savages was painted red, and some white; some were adorned with feathers, ear-rings made of the seed of some herb, or circular plates depending from their necks; others had the nose pierced, and rings run through it; but the general ornament was a bracelet made of the half of a shell. The French could only procure from the natives a few yams. No European had ever yet any friendly intercourse with the inhabitants of this island.

**SECTION IV.**  
**NEW IRELAND.**

New Ireland and the Solomon Islands were supposed, by Dampier, to be sailed round its northern coast, to be a part of New Britain. That navigator called the most southern point of it Cape St. George, which, together with Cape Orford, in New Britain, were thought to be the two points that formed a deep bay, which he called St. George's Bay. But Captain Carteret, who sailed round it in 1767, found it to terminate in a narrow channel, to which he gave the name of St. George's Channel. This island is a long narrow slip of land, lying north-west and south-east, in extent about eighty leagues. The harbour, called by Captain Carteret English Cove, lies in

latitude five degrees south, longitude one hundred and fifty-seven degrees nineteen minutes east. There is another harbour, about four leagues to the westward, which he named Carteret Harbour.

The crew of the Swallow, who at that time were, in general, perishing with sickness, obtained relief from some cocoa-nuts found upon this island, as they did also from some rock-oysters and cockles, which they procured from the rocks at low water.

tain, which is n- one hundred and t longitude from of an imaginary, s it from New round the world, at than it was till another strait to island, to which re are many high large and stately ain, and in both ost of which are d with plantain

The upper part of the tree which bears the cocoa-nut is called the cabbage. This is a white, crisp, juicy, substance; it tastes somewhat like a chesnut; but, when boiled, is superior to the best parsnip, and is, perhaps, the most powerful antiscorbutic in the world. For every one of these cabbages which were obtained, they were forced to cut down a tree, which was done with great regret; but this depredation on the parent stock was unavoidable. These almost expiring navigators likewise received great refreshment from the fruit of a tall tree, that resembles a plum, and particularly that which, in the West-Indies, is called the Jamaica plum.

The shore about this place is rocky, and the country high and mountainous, but covered with trees of various kinds, some of which are of an enormous growth. Among others, the nutmeg-tree was found in great plenty. Captain Carteret gathered a few of the nuts, but they were not ripe. They did not appear to be the best sort, but he imputes that to their growing wild, and being too much in the shade of taller trees. The woods abound with pigeons, doves, rooks, parrots, and a large bird, with a black plumage, which makes a noise somewhat like the barking of a dog.

The only quadrupeds seen on this island by the crew of the Swallow were two of a small size, which were supposed to be dogs; they were very wild, and ran with great swiftness. Here were seen centipedes, scorpions, and a few serpents of different kinds.

The country appeared mountainous, the soil light, yet producing several kinds of fine timber-trees. The pepper-tree is said to be common. Here was found a very extraordinary insect, about three inches long; almost every part of its body was of such a texture as to appear like a leaf, even when closely viewed. Each of its wings forms one half of a leaf; and, when the two are closed together, it appears like an entire leaf. The under side of its body resembles a leaf of a more dead colour than the upper one. It has six legs, of which the upper joints are likewise similar to parts of leaves. Several shocks of an earthquake were felt here, which lasted about two minutes, and were very distinctly noticed on board, as well as on shore.

Captain Carteret was in so enfeebled a state of body, as to be prevented from attending circumstantially to a

description of the country. However, in English Cove he took possession of it for his Britannic Majesty, and nailed upon a high tree a piece of board, faced with lead, on which was engraved an English union, with the name of the ship and her commander, the name of the cove, and the time of her coming in and going out of it. M. de Bougainville touched here about a year after, and gave it the name of Port Prassin. He found part of Captain Carteret's inscription, which seemed to have been taken down and defaced by the natives.

Captain Carteret found the natives of New Ireland very hostile, having lances headed with flint. Their faces were streaked with white, and their hair daubed with powder of the same colour. They are black, and said to be woolly headed, but without the thick lips or flat nose of the negro. Some of the canoes of New Ireland were ninety feet in length, formed out of a single tree. Bougainville also visited this country, and observed here the pepper-plant, while among the numerous birds was the great crowned pigeon.

A more ample description is unnecessary, as these countries are far from being completely discovered. The same observation must be extended to what are called the Solomon Islands, which appear to have been discovered by Mendana, who sailed from Lima to the westward in 1575.

The Solomon Islands, as laid down in Mr. Arrowsmith's chart of the Pacific, may be considered as a large groupe, extending from Lord Anson's Isle, or the Bouka of Bougainville, in the north-west of the isle called Egmont, by Carteret, in the south-east. Some of the islands towards the centre seem of considerable size, particularly in length. If these be the Solomon Isles of the Spaniards, it is asserted that they are rich in gold. Some of the natives were of a copper colour, others of a deep black, with a wrapper of linen around the waist, while the neck was ornamented with little beads of gold. The canoes were small, two being commonly fastened together. In baskets of palm-leaves they carry a kind of bread, made of roots.

## SECTION V.

### NEW CALEDONIA.

This island was called New Caledonia, by Captain Cook, in consequence of his having discovered it in 1774, after many fruitless endeavours to learn from the natives the Indian name. It is probable that it was not known by one general name, as it has been represented as the largest island that has been discovered in the Southern Pacific Ocean, New Zealand and New Holland excepted; extending from nineteen degrees thirty-seven minutes to twenty-two degrees thirty minutes of south latitude; and

from one hundred and sixty-three degrees thirty-seven minutes to one hundred and sixty-seven degrees fourteen minutes of east longitude. Its length is computed to be eighty-seven leagues, in the direction of north-west and south-east; but its breadth, in any part, does not exceed ten.

The discovery of this island by Captain Cook is thus related:—

"We had hardly got to an anchor before we were surrounded by a great number of the natives, in sixteen or eighteen canoes, most of whom were without any sort of weapons. At first they were shy of coming near the ship; but in a short time we prevailed on the people in our boat to get close enough to receive some presents. These we lowered down to them by a rope, to which, in return, they tied two fish, that stunk intolerably, as did those they gave us in the morning. These mutual exchanges bringing on a kind of confidence, two ventured on board the ship; and, presently after, she was filled with them, and we had the company of several at dinner in the cabin. Our peas-soup, salt beef, and pork, they had no curiosity to taste; but they ate of some yams, which we happened to have yet left, calling them *oobee*. This name is not unlike *oofee*, as they are called at most of the islands, except Mallicollo. We found these people spoke a language new to us. The men, like all the nations we had lately seen, were naked, except such a wrapper as is used at Mallicollo. They were curious in examining every part of the ship, which they viewed with uncommon attention. They had not the least knowledge of goats, hogs, dogs, or cats. They seemed fond of large spike-nails and pieces of red cloth, or indeed any other colour; but red was their favourite.

"I went on shore with two armed boats, having with us one of the natives, who had attached himself to me. We landed on a sandy beach, before a vast number of people; many of them had not a stick in their hands; consequently we were received with great courtesy, and with the surprise natural for people to express at seeing men and things so new to them. A chief appeared, who had been seen in one of the canoes in the morning. His name, we learnt, was Teabooma; we had not been on shore above ten minutes before he called for silence. Being instantly obeyed by every individual present, he made a short speech; and soon after another chief, having called for silence, made a speech also. It was pleasing to see with what attention they were heard. Their speeches were composed of short sentences; to each of which two or three old men answered by nodding their heads, and giving a grunt, significant, as I thought, of approbation. It was impossible for us to know the purport of these speeches; but we had reason to think they were favourable to us, on whose account they doubtless were made. I kept my

eyes fixed on the people all the time, and saw nothing to induce me to think otherwise. We heard the crowing of cocks, but saw none. Some roots were baking on a fire, in an earthen jar, which would have held six or eight gallons, nor did we doubt its being their own manufacture. I found that we were to expect nothing from these people, but the privilege of visiting their country undisturbed; for it was easy to see they had little else than good nature to bestow.

"Next morning we were visited by hundreds of the natives, some coming in canoes, and others swimming off, so that before ten o'clock our decks, and all other parts of the ship, were quite full. My friend brought me a few roots; but all the others came without eatables. Some few had with them their arms, such as clubs and darts, which they exchanged for nails, pieces of cloth, &c.

"The watering party, and a guard, under the command of an officer, were sent on shore; and soon after a party of us went to take a view of the country. As soon as we landed, we made known our intentions, by signs, to the natives, and two of them, undertaking to be our guides, conducted us up the hills by a good path. In our route we met several people, most of whom turned back with us; so that, at last, our train was numerous. Some we met who wanted us to return; but we paid no regard to their signs, nor did they seem uneasy when we proceeded. At length we reached the summit of one of the hills, from which we saw the sea in two places, between some advanced hills, on the opposite or south-west side of the land. This was an useful discovery, as it enabled us to judge of the breadth of the land, which, in this part, did not exceed ten leagues.

"The plain or flat land, which lies along the shore, appeared from the hills to great advantage; the winding streams which ran through it, the plantations, the little straggling villages, the variety in the woods, and the shoals on the coast, so variegating the scene, that the whole might afford a picture for romance. If it were not for those fertile spots on the plains, and some few on the sides of the mountains, the whole country might be called a dreary waste. The mountains and other high places are, for the most part, incapable of cultivation, consisting chiefly of rocks, many of which are full of mounds. The little soil that is upon them is scorched and burnt up with the sun; it is, nevertheless, coated with coarse grass, and other plants, and, in some places, with trees and shrubs. The country, in general, bore great resemblance to some parts of New Holland, under the same parallel of latitude; several of its natural productions seeming to be the same, and the woods being without underwood, as in that country. The reef on the coast, and several other similarities, were obvious to every one who had seen both countries. We observed all the north-east coast to be covered with

REMARKS ON NEW CALEDONIA.

shoals and the Isle of Having made choosing to road different

"They set face. Recruited by all have no notice it, by adding seen it done.

"A fish be watering-place after my return thing like a suspicion of operation of time, that it were dressed, tasted. About ourselves seized mess all over feeling; nor bodies, of such full of water, We each of us which gave us pigs brought from entrails, was for board, and saw stand it was most abhorrence do this when the chased.

"Next day I acquainting me, the present, consisting I sent him, both young, but white; but the English fox. I the originals of the officer returned me that the chief that it looked like before he would for him; but, as lost in an excess.

"In order not drew a line on the and they were they observed; and

shoals and breakers, extending to the northward, beyond the Isle of Balabea, till they were lost in the horizon. Having made these observations, and our guides not choosing to go farther, we descended the mountains by a road different from that by which we ascended.

"They set fire to the grass, &c. which overrun the surface. Recruiting the land by letting it lie fallow is observed by all the nations in this sea. But they seem to have no notion of manuring their ground, or of renovating it, by adding to it a better soil: at least, I have no where seen it done.

"A fish being struck by one of the natives near the watering-place, my clerk purchased it, and sent it to me after my return on board. It was of a new species, something like a sun-fish, with a large, long, ugly head. Having no suspicion of its being of a poisonous nature, we ordered it to be dressed for supper; but, very luckily, the operation of drawing and describing took up so much time, that it was too late, so that only the liver and roe were dressed, of which the two Mr. Forsters and myself tasted. About three o'clock in the morning, we found ourselves seized with an extraordinary weakness and numbness all over our limbs. I had almost lost the sense of feeling; nor could I distinguish between light and heavy bodies, of such as I had strength to move; a quart pot, full of water, and a feather, being the same in my hand. We each of us took an emetic, and after that, a sweat, which gave us much relief. In the morning one of the pigs brought from the other islands, which had eaten the entrails, was found dead. When the natives came on board, and saw the fish hang up, they gave us to understand it was not wholesome food, and expressed the utmost abhorrence of it; though no one was observed to do this when the fish was to be sold, or after it was purchased.

"Next day I received a message from the officer, acquainting me that Teabooma, the chief, was come with a present, consisting of a few yams and sugar-canes. In return I sent him, amongst other articles, a dog and bitch, both young, but nearly full grown. The dog was red and white; but the bitch was all red, or the colour of an English fox. I mention this, because they may prove the originals of their species in that country. When the officer returned on board in the evening, he informed me that the chief came, attended by about twenty men, so that it looked like a visit of ceremony. It was some time before he would believe the dog and bitch were intended for him; but, as soon as he was convinced, he seemed lost in an excess of joy, and sent them away immediately.

"In order not to be too much crowded, our people drew a line on the ground, and gave the others to understand they were not to come within it. This restriction they observed; and one of them soon after turned it to

his own advantage. For happening to have a few coconuts, which one of our people wanted to buy, and he was unwilling to part with, he walked off, and was followed by the man who wanted them. On seeing this, he sat down on the sand, made a circle round him, as he had seen our people do, and signified that the other was not to come within it, which was accordingly observed.

"As Teabooma, the chief, had not been seen since he got the dogs, and I wanted to lay a foundation for stocking the country with hogs also, I took a young boar and sow with me in the boat, and went up to the mangrove creek to look for my friend, in order to give them to him; but not finding him, I offered them to a grave old man, thinking he was a proper person to entrust them with; but he shook his head; and he, and all present, made signs to take them into the boat again. When they saw I did not comply, they seemed to consult with one another what was to be done; and then our guide told me to carry them to the *arekee* or chief. Accordingly I ordered them to be taken up, and we were conducted by him to a house, wherein were seated, in a circle, eight or ten middle-aged persons. I and my pigs being introduced, with great courtesy they desired me to sit down. In the mean time, two men, having left the company, soon returned with six yams, which were presented to me. I then took leave, and went on board.

"I observed some cultivated land, regularly laid out, planted with taro or eddy-root, yams, sugar-canes, and plantains. The taro plantations were watered by little rills, continually supplied from the main channel at the foot of the mountains, whence these streams were conducted. They have two methods of planting these roots; some are in square or oblong patches, which lie perfectly horizontal, and sink below the common level of the adjacent land; so that they can let as much water on them as they think necessary. Others are planted in ridges about three or four feet broad, and two to two and a half high. On the middle or top of the ridge is a narrow gutter, along which is conveyed, as above described, a little rill; that waters the roots planted on each side of the ridge. The taro or eddy-root is very wholesome food, and the tops make good greens, and are eaten as such by the natives. On these plantations, men, women, and children, were employed.

"On a large tree, which stood close to the shore near the watering-place, I had an inscription cut, setting forth the ship's name, date, &c. as a testimony of our being the first discoverers of this country; as I had done at all others at which we had touched, where the ceremony was necessary. We then took leave of our friends, and returned on board, when I ordered all the boats to be hoisted in, in order to be ready to put to sea.

"The French ships under the command of Admiral

D'Entrecasteaux, on leaving Cape Diemen, in New Holland, in 1792, directed their course to New Caledonia, in order to explore the south-west coast of that island. On their approach to it, the weather was remarkably tempestuous, so that it became necessary to use the utmost caution to keep the two ships at a little distance from each other, but near enough to acquaint one another of the danger into which they might fall on this coast, lined with shoals, all of them unknown to navigators.

"During the night," says the writer of this narrative, "the currents had carried us nearer to the reefs we thought we had weathered. We were standing in for the land, when the day fortunately broke, and shewed us all the danger of our situation. Surrounded by shoals, there remained but very little room to ply in. We in vain attempted to tack, each effort served only to bring us nearer the reef. We saw the ship drifting on the rocks, where the sea, ready to swallow us up, rose to a prodigious height. Already each of us was casting his eye on the object which he might seize hold of, in order to escape from an almost inevitable death: in short, destruction stared us in the face, when, by a fortunate, though unexpected, event, an attempt to tack succeeded, and it was with inexpressible joy that we saw the ship standing away from this dangerous coast.

"Next day we stood in for the land, hoping to discern some inlet that might permit us to anchor under the shelter of a barrier, against which the sea was breaking in a tremendous manner; a considerable column of smoke, which rose near the foot of a hill, not far from the sea-side, indicated that this part of the island was inhabited. Passing to the north-west, some hills were observed almost destitute of vegetables, rising, in the form of an amphitheatre, to an enormous degree in perpendicular height, the direction of which was constantly to the north-west. The cold that is felt at these heights, no doubt subjects the inhabitants to the necessity of warming themselves. We perceived several large fires, which they kindled while we stood off from the land in the night.

"The ensuing morning afforded us a more pleasing prospect than the preceding day; we saw some trees rising from the bottom of the gullies, with which the hills were surrounded. We found, from a fire lighted on the coast, that these barren shores were not entirely destitute of inhabitants, and we soon perceived some of them. We had also a view of some mountains, covered with trees to their very summit; and six fires, which we perceived in the vicinity of the coast, announced a great concourse of savages; they were probably attracted by the sight of our ships, which contrary winds kept almost in the same place. We perceived near the beach a groupe of twelve of the natives, whose looks were turned towards us, and who seemed to behold with astonishment our ships at so short a distance

from their island. Three natives formed another groupe, and kept very near two fires, which they had just kindled. A good glass convinced us that they were entirely naked. They did not appear tempted to put a canoe into the water in order to approach us; besides the reefs opposed to them a barrier which they would have been unable to clear, so as to reach our ships. We made but a slow progress in our survey of the coast, on which we had seen several fires lighted, probably by the same natives who had kindled the others. The word *survey* is not here, nor in several parts of this narrative, to be understood in a literal sense. To survey a coast, according to my ideas, is to take a geometrical plan of it, in which every place is assigned its true signification. In my application of the word *survey*, I am justified by the authority of Captain Cook and other circumnavigators.

"In the direction of the lands of New Caledonia, we discovered several islands, surrounded by reefs, connected with each other by sand-banks and shoals. During the time we were endeavouring to explore the coast, the winds had set us so far to leeward, that we lost sight of the northern extremity of New Caledonia, which we found to be in the latitude of twenty-nine degrees fifty-eight minutes south, and longitude one hundred and sixty-one degrees ten minutes east.

"This island presents a chain of mountains, which occupy, from south-east to north-east, an immense extent. Captain Cook, who discovered it, saw only its north-east side. It was important to navigation to explore its south-east coast, as it is extremely dangerous at all times, but much more so with the south-east winds, which had singularly thwarted us in the survey of it. The small number of fires which we perceived on this land, and its apparent sterility, incline me to think that it is thinly inhabited. We saw not a canoe, although it is easy to navigate here under the reefs, where the sea is very smooth. When we quitted this coast, we congratulated ourselves on having terminated a dangerous and fatiguing navigation, in order to enter into an open sea, where we could prosecute our voyage with much more facility, and much less danger."

This island was again visited by Admiral D'Entrecasteaux, in the year 1793. The account of the country, and the incidents that occurred during the stay of the French navigators, is thus related:—"On our departure from the island of Tauna, we discovered, to the south-west, the high mountains of New Caledonia. Although we were near the coast, we did not perceive Observatory Island, which left us for some time uncertain whether we were opposite to the place where Captain Cook had cast anchor in 1774; but our observations at noon proved that we were very near; and it was not long before we discerned, the island, though it is extremely low; we then stood on to reach the anchorage. A double canoe got under sail to come off

to us: she was manned by a man, who, in such a manner, shewed us some knowledge in the use of the compass, and discourse to us, a which they waved upwards of two short time they rowed four canoes were ships: the people got near us. One coming on board, We were surprised than on nails or he they were acquainted the name of *pilio* employ render the than to many others shewed them some bringing us some; but they wished to pursue their darts and clubs hungry, at the same which was extremely seeing the hogs they presume that they d Captain Cook left w male; but, as soon the crowing of the doubt of their having "None of the w consent to come into make them a present ticles to them. to us: she was manned by eleven natives, who conducted her in such a manner as to give us no high idea of their knowledge in the art of navigation. They addressed their discourse to us, and held up some pieces of white cloth, which they waved about, still keeping at the distance of upwards of two hundred meters from our ship. In a short time they returned towards the coast. Next day, four canoes were under sail, and coming towards our ships: the people in them betrayed some fears when they got near us. One of the savages, who conducted them, coming on board, was followed by almost all the others. We were surprised that they set more value on our cloths than on nails or hatchets, which they called *toguee*. Yet they were acquainted with iron, which they designated by the name of *pition*; but the very hard stones which they employ render the use of it much less necessary to them than to many other islanders of the South Sea. We showed them some cocoa-nuts and yams, desiring them to bring us some; but, so far from going to fetch us any, they wished to purchase ours, and offered us in exchange their darts and clubs, letting us know that they were very hungry, at the same time putting their hand on their belly, which was extremely lank. They expressed some fear on seeing the hogs that we had on board; which made us presume that they did not possess this quadruped, although Captain Cook left with one of their chiefs a male and a female; but, as soon as they saw our poultry, they imitated the crowing of the cock sufficiently well to leave us no doubt of their having some in their island.

"None of the women who were in these canoes would consent to come into our ship; and, when we wished to make them a present, the men undertook to carry the articles to them. We weighed, in order to warp towards Observatory Island, and were immediately surrounded by canoes, conducted by the natives, who came on board, and sold us a variety of their articles. Some of them had brought a small number of cocoa-nuts and sugar-canes, which they persisted in not parting with, although we offered a great price for them. The inhabitants had no longer any occasion for their canoes to come and see us, most of them leaping into the water, loaded with the articles which they wished to sell us.

"When we went on shore, we were surrounded by a great number of inhabitants, who had just come out of the middle of the woods, through which we penetrated at different times without going far from the sea-shore. It was not long before we came to a few insulated huts, three or four hundred yards distant from each other, and shaded by a small number of cocoa-nut trees. We observed, near some of these dwellings, small heaps of earth, raised and covered towards the middle with a very open lattice-work. The savages call them *nhouet*, and gave us to understand that this was a burial-place. They in-

clined their head on one side, supporting it with the hand: they then shut their eyes, to express the repose enjoyed by the remains of the persons here deposited.

"On our return to the landing-place we found upwards of seven hundred natives. They asked us for cloth and iron in exchange for their goods, and some of them very soon proved that they were most audacious thieves. Among their different tricks, I shall mention one which was played me by two of these sharpers. The one offered to sell me a small bag, filled with oval stones, which he carried at his girdle. He immediately untied the bag, and pretended to give it to me with one hand, while with the other he received the value we had agreed on. At the same instant another savage, who was placed behind me, set up a loud cry, in order to make me turn my head towards him. Immediately the knave ran away with his bag and my property, endeavouring to hide himself in the crowd. We did not wish to punish him, although we were armed with muskets. Yet it was to be feared, that this act of lenity would be considered by these people only as a mark of weakness, and render them still more insolent. What happened shortly afterwards seemed to confirm this idea. Several of them were so audacious as to throw stones at an officer, who was not above two hundred yards distance from us. Still we did not wish to break with them; for Cook's narrative had prepossessed us so strongly in their favour, that we yet required further evidence to destroy the good opinion which we entertained of the mildness of their disposition; but we had soon uncontested proofs of their ferociousness. One of them having in his hand a bone newly broiled, and devouring the remains of the flesh which was still upon it, advanced towards one of the officers, and invited him to partake of his meal. The latter, supposing that the savage was offering him a piece of some quadruped, accepted the bone, which was then covered only with tendinous parts; and, having shewn it to me, I conceived that it had belonged to a youth of fourteen or fifteen years of age. The natives who surrounded us pointed out on a child the situation of these bones: they made no scruple to avow, that the flesh which had covered them had served as a meal, and they gave us to understand, that they considered it as a very choice dish. This discovery threw us into the greatest uneasiness respecting the fate of our people, who were still in the woods. However, we had, some time after, the pleasure to see ourselves all assembled in the same place, and we had no longer the smallest fear that any of us should fall a victim to the barbarity of these savages. When we came on board, few of the persons belonging to the expedition, who had remained in the ship, would believe the account which we gave them of the barbarous propensity of these islanders; for they could not be persuaded that these people, of whom Captain

Cook had drawn so flattering a picture, were degraded by such a horrible vice; but it was not difficult to convince the most incredulous. I had brought with me the bone, which our surgeon recognized to be that of a girl. I presented it to the two natives whom we had on board; and immediately one of these *anthropophagi* seized it with avidity, and tore with his teeth the ligaments and cartilages which yet remained: I then gave it to his countryman, who still found something to gnaw. 5

“ The different signs which were awkwardly made to them, to obtain a confession that they ate their fellow-creatures, were the cause of a great misunderstanding. Immediately an extreme consternation was depicted in their features; they no doubt conceived that we also were *anthropophagi*; and, supposing that their last hour was come, they wept bitterly. We were not able to remove their apprehensions completely, although we did every thing in our power to dispel this idea. One of them got out at a port-hole, and clung to the fore-chains, ready to drop into the water; the other jumped overboard, and swam to one of the boats that was lying the farthest astern: however, they soon recovered from their fright, and came again into the ship.

“ On the following day, we landed early in the morning on the nearest part of the coast, where we found some savages, who were already taking their meal. They invited us to partake with them some meat newly broiled, which we perceived to be human flesh. The skin that was on it still preserved its form entire, and, in several parts, even its colour. They signified to us, that they had cut off this joint from the middle of the arm, and gave us to understand, by very expressive signs, that, after having pierced with their darts the individual whose remains we saw in their hands, they had disatched him with their clubs. They no doubt wish to make us comprehend that they are only their enemies in fact, how could it be possible that we should have seen so many inhabitants in this country, if hunger was the sole inducement to devour each other ?

“ We proceeded towards the south-south-east, and for a little way passed over a rather low tract of country, in which we saw several plantations of yams and sweet potatoes. The heat was excessive, and we had not yet found any water. At length we saw a very limpid stream. We stopped at this place, and the natives came and sat down by us. We gave them some biscuit, which they readily ate, though it was worn-eaten; but they would not taste our cheese. They preferred water to brandy or wine, of which they drank in a whimsical manner. Stooping their head to within seven or eight decimeters of the surface of the water, with their hand they threw some seven or eight times successively towards their face, at each time opening their mouth wide to receive what reached it; thus they

soon quenched their thirst. It may be easily conceived that the most dexterous of these drinkers could not fail to wet a great part of their body. As they disturbed our water, we begged them to drink a little lower down, which they immediately did.

"Some of them came up to the most robust of us, and felt the muscular parts of our arms and thighs, exclaiming *Kapareek!* with an air of admiration, and even something more, which was not very pleasant to our feelings; they, however, gave us no cause of complaint.

"In these places I remarked a variety of plants belonging to the same genera as those of a great number of others which I had before collected in New Holland, although the distance that separates the two countries is very considerable.

“ At a third of the way up the mountain, we saw, with surprise, little walls, raised one above another by the natives, to prevent the soil from falling down in the lands which they cultivate. I have found this custom very general among the inhabitants of the mountains of Asia Minor.

“ When we had got half way up the mountain, the natives who followed us begged us not to proceed farther, informing us, that the inhabitants on the other side of that chain would eat us. We continued, however, to ascend as far as the summit; being well armed, we had nothing to fear from those cannibals. Doubtless those who accompanied us were at war with the others, for they would follow us no farther. The mountains over which we climbed rise in the form of an amphitheatre, and are a continuation of the great chain that runs the whole length of the island. Their perpendicular height is about two thousand four hundred feet above the level of the sea. We saw them rise gradually towards the east-south-east, and extend as far as a very high mountain, about twenty-four feet distant from our anchorage. We found the principal component parts of these masses to be quartz, mica, a steatite more or less hard, green schorl, granite, specular iron-ore, &c.

"We were extremely surprised at the rapidity with which one of the natives ascended the cocoa-nut tree; holding the trunk of the tree with his hands, he ran up all its length with almost as much ease as if he had been on a horizontal plane. I had never had an opportunity of remarking such agility among the other islanders whom we before visited.

“The children of these savages watched the moment when we had emptied the cocoa-nuts of their juice, to ask them of us, finding still means to make something of them. They tore with their teeth the fibrous husk of these young fruits, the nut of which was not yet formed; and they then ate the tender part which it enclosed, and which was much too sour for us to be able to relish.

"On our arrival on board, and night coming on, all our

boats were alongside: yet two of the officers were still on shore, with two of the ship's company; but they soon arrived on the beach, followed by a great many of the inhabitants. The admiral's barge was immediately sent for them, and brought them on board. They informed us, that the savages, who had assembled round them to the number of upwards of three hundred, had, on seeing that all the boats had left the shore, behaved towards them with the greatest effrontery. One of them having snatched from an officer his sabre, the latter attempted to pursue him; but the other natives instantly lifted up their clubs to defend the thief. Indeed, all our ship-mates were robbed in the most impudent manner. However, when our barge arrived to their assistance, two chiefs, who had probably prevented the other savages from proceeding to still greater excesses, requested to take a passage in her. They brought two small bundles of sugar-canes and some cocoa-nuts to the admiral, who made them a present of a hatchet and several pieces of cloth. These chiefs, who are called *Theabouma* in their language, had on their head a cap of a cylindrical form, ornamented with feathers, shells, &c. Being open at the top, it could not be worn to protect them from the rain.

"Lasseny, the astronomer, having gone on shore in order to make observations, had been obliged to return on board, almost immediately, not having been able to disperse a crowd of savages who appeared to be resolved to seize upon his instrument, notwithstanding he was armed, and was also accompanied by two assistants, and several of the boat's crew.

"The gunner of the *Espérance*, who landed with a part of the crew sent on shore to procure wood, went a shooting in the forest, and perceived, about noon, in a large glade, and at a short distance from the place where our people were cutting wood, upwards of two hundred natives practising to throw the dart, at the same time performing different evolutions. He fired, without having been discovered, and ran towards, to inform us of what he had just seen. Immediately an officer belonging to our ship set off with four marines, observe the motions of these savages; but the latter adieed upon him and his party as soon as they discovered em, and obliged them to return precipitately towards our wood-cutters. The savages soon arrived at the same spot, and made us sensible of the plan they had formed of getting possession of the hatchets, which had been placed in the middle of our people, while they were assembled to take their meal. The commanding officer immediately ordered these tools to be carried into the launch; but the sailor that had them on his shoulder was attacked by the islanders, who were on the point of taking them away from him, when he fired several balls at them. One of the most audacious having been brought to the ground, had yet strength enough left to crawl into

the woods. All the others fled immediately, and with their slings threw at us a shower of oval-cut stones, which they carried in small bags suspended to their girdle; but, as they kept a great distance, none of us were dangerously wounded. This is not always the case when they fight with each other, they then being doubtless not afraid to come closer. In their battles they frequently knock out each other's eyes in this manner, as we were informed by several of the inhabitants, who had lost an eye. When they throw stones with their slings, they make with them only half a turn above their head, which is as quick as if they threw them with their hand. These stones, being cut out of a pretty hard steatite, are very slippery; for which reason they take the precaution of wetting them with their saliva, in order that they may not slide off from within the two little cords, of which the bottom of their sling is formed.

"The different movements of the savages having been noticed from on board the *Recherche*, the admiral ordered two guns to be fired at them, which dispersed them immediately into the woods; but shortly after one of their chiefs advanced towards us, alone and unarmed, holding in his hand a piece of white cloth, made of the bark of a tree, which the commanding officer received as a pledge of peace and good understanding. Immediately four other natives came and sat down in the midst of us, with as much confidence as their chief, behind whom they placed themselves; but he appeared very much enraged at several who came afterwards, calling them robbers several times.

"Some of the inhabitants having approached our landing-place, two lines were drawn on the sand, beyond which they were forbidden to pass. We had the satisfaction to see that they were obedient to these orders. We gave most of them bits of hiscuit, which they asked of us, holding out one hand, while with the other they pointed to their belly, naturally very lank, but the muscles of which they contracted as much as they could, in order to draw it in still more. I saw, however, one of them, who already had his stomach well filled, but who, nevertheless, ate in our presence a lump of very soft steatite, (which is a mineral of a greenish colour,) as big as his two fists. We afterwards saw a number of others eat quantities of the same sort of earth: it serves to deaden the sense of hunger, by filling their stomach, thus supporting the viscera attached to the diaphragm: and although this substance does not afford any nutritious juice, it is yet very useful to these people, who must be often exposed to be long in want of food; for they apply themselves little to the culture of their lands, which are, besides, very sterile.

"The inhabitants of New Caledonia make choice of this earth from its great friability, as it does not remain long in their stomach and intestines. I should never have imagined that cannibals would have had recourse to such an expedient, when pressed by hunger.

“Three women, having come and joined the other savages who surrounded us, gave us no very favourable idea of their music: they sang a trio, keeping very good time; but the harshness and discordance of their voices excited in us very disagreeable sensations.

"The gardener sowed in the woods different sorts of seeds brought from Europe; he had some remaining, which he gave to a savage, under a promise that he would sow them.

"In an excursion into the country, we met with several huts, all separated from each other, and in which we were surprised to find no inhabitants. Farther on we found a heap of ashes; probably one of the dwellings had been recently burnt by the fire which these savages kindle in them to drive away the muskitoes. Two tombs, which were very near it, had received no damage. I saw there two human bones, each suspended by a string to a long stick, fixed in the ground; the one was a tibia, and the other a thigh-bone.

“A few fires, burning very near the top of the neighbouring mountain, apprised us that it was a place of retreat for some inhabitants. When we reached the landing-place, we found a great number of savages, who had assembled there since our departure. They informed us, that several of the inhabitants had been wounded in the contest which they had had with us the day before, and that one of them had already died in consequence of his wounds. A boat belonging to the *Espérance*, which was lying at some distance to the eastward, had been attacked a few hours before our return by another party of savages, who had thought that they were sufficiently strong to make themselves masters of it; but, fortunately, their attempt had not succeeded.

“ Having formed a plan, with several persons belonging to both ships, to go and visit the back of the mountains, which were situated to the south of our anchorage, we assembled on the beach early one morning, to the number of twenty-eight. We had agreed all to go armed, in order to be able reciprocally to assist each other, in case the savages should venture to attack us. We walked for a long time in paths well beaten, and were accompanied by a few of the inhabitants.

“The inhabitants of these mountains appeared to us to live in the greatest misery; they were all extremely meagre. They sleep in the open air, without being tormented by the muskitoes; for these insects are driven from the heights by the east-south-east winds, which blow here constantly. The same winds so materially obstruct the growth of trees, that they are to be met with only under the form of shrubs; the trees on the lower grounds grow very tall.

"On surveying from the summit of these mountains an immense extent of reefs, which bar all approach to this

land, we discovered another channel, not far distant, to the westward of that by which we had reached the anchorage where our ships then lay. To the south our view extended over a fine valley, surrounded by large plantations of cocoa-palms, whence we saw the smoke rising in columns from the fires lighted by the savages. Vast tracts of ground, which appeared cultivated in the lowest spots, announced a great population.

"In returning towards our ships, we passed through a little hamlet, the inhabitants of which came out unarmed from their huts. They let us examine the inside; and one of them made no difficulty in selling us the human bones which were suspended above one of their tombs. When we reached the sea-side, we found a group of natives, who followed us, asking for something to eat; but, our provisions being expended, I regaled them with pieces of green and very soft steatite, which I had brought from the summit of the mountains: of this some ate voraciously.

“When I came on board, I found we had received a visit from several of the natives, who swam off to the ship. They took care to assure us, that they were not on the number of those who had committed acts of hostility against us, and they told us that they had eaten two of those thieves, one of whom received a ball through the thigh, and the other through the belly, in the affray that had happened between them and us. We had not till now been able to learn the use of an instrument called *nbouet*; these savages informed us, that it served to cut off the limbs of their enemies, which they share after battle. One of them demonstrated its use on a man belonging to our ship, who lay down on his back at the other's request. He first represented a battle, in which he signified to us that the enemy fell under the stroke of his dart, and the blows of his club, which he wielded with violence; he then performed a sort of Pyrrhic dance, holding in his hand the instrument of murder; and he shewed us that they began by opening the belly of the vanquished with the *nbouet*, and that they threw away the intestines, having taken them out by means of another instrument, which is formed of two human *ulnae*, tapered, well polished, and fixed in a mat of very substantial tresses of bat's hair. He then shewed us, that the legs and arms were taken off at the joints, and distributed, as well as the other parts, to each of the combatants, who carried them to his family. It is difficult to depict the ferocious avidity with which he expressed to us, that the flesh of this unfortunate victim was devoured by them, after they had broiled it on the coals. This cannibal let us know, at the same time, that the flesh of the arms and legs was cut into thick slices, and that these people considered the most musculous parts a very agreeable dish. It was then easy for us to explain why they frequently felt our arms and legs, manifesting a violent

longing; they then uttered a faint whistling, which they produced by closing their teeth, and applying to them the tip of the tongue; afterwards, opening their mouth, they smacked their lips several times in succession.

"A party of us set off from the ship, to the number of twenty-eight, all well armed, with an intention of crossing over a very lofty mountain, situated to the south-south-east, in order to descend afterwards, if the weather proved favourable, into a fine valley, which we had already perceived very far behind this mountain.

"We proceeded till a heavy shower obliged us to seek a shelter in the cavities of the rocks, where we remained for some time. We invited the savages who accompanied us to partake of our repast; but we were very much surprised to see that these cannibals would not eat the salt pork which we offered them.

"I found on my arrival on board a chief, who had dined at the gun-room table. He had come in a canoe with his wife, whom he would not suffer to ascend the ship's side, notwithstanding the reiterated entreaties that had been made him.

"On landing on another excursion, we followed the beach, advancing towards the west, and penetrating occasionally into the woods; we saw the inhabitants abandon their huts on our approach, and leave behind them a net, which they had spread out to dry. It appears that this implement for fishing, which is commonly twenty-four feet long, by four wide, is very scarce among these people. They shewed us very few during the time we were in their island, and none of them would part with a net for any price. The women are principally engaged in catching the shell fish. We saw several of them wade into the sea up to the middle, and gather great quantities, which they found by means of a pointed stick that they thrust into the sand.

"We had not hitherto met with any tombs of these savages, except near their huts; but we now saw one which was far distant from any habitation, on the side of the road that we followed. It differed from the others in being built of stone from its foundation to the middle of its height.

"We had just caught two sea-adders, which we broiled on the coals and ate; but we found their flesh very tough, and by no means well-flavoured.

"We had not proceeded far from our ships, when fresh traces of devastation made us again lament the fate of these unfortunate inhabitants, whom revenge often hurries to the most horrible excesses. They had destroyed all the principal habitations, and topped all the cocoa-nut trees surrounding it.

"As the day was fast spent, we proceeded towards the south, in search of a convenient spot where we might pass the night, and we soon fixed upon an eminence, the

difficult access to which secured us from the danger of any surprise on the part of the savages. We lighted a fire; for on these heights it was piercing cold, and of this we were the more sensible, as we had experienced in the plain very intense heat during the day. We supped, and then went to sleep, two of us watching alternately, and keeping a good look-out, for it was to be feared that the light of our fire might attract some of the islanders towards us. Near the foot of the mountains we perceived the light of several torches, with which some savages were advancing eastward, and approaching our retreat. In an instant every one of us was on foot, to observe their motions; and we prepared to give them a warm reception, in case they should think proper to come and attack us; but, after crossing several hills, they went down towards the sea-side, marching to the eastward, and going farther from us. Probably these cannibals were proceeding to undertake some expedition against their enemies, whom they generally attack by night. As we did not seem to be the object of their search, we went to sleep again, relying on the vigilance of our sentries.

"The next morning, at day-break, we ascended towards the south-east, and soon reached the brow of the mountain, when we discovered, on the sea-shore, the great opening of the channel which runs through the plain that we proposed to visit.

"We had now only a few hills to cross, in order to arrive at the plain; when several of our party, being afraid that, should we proceed any farther, we might run short of provisions, and, perhaps, meet some numerous band of savages, left us, in order to return the same day on board of our ships. By this desertion our number was reduced to fifteen, but, nevertheless, we continued our journey.

"At length, we entered the plain, and presently the melancholy spectacle of a habitation entirely destroyed, and several cocoa-palms cut short off at the root, convinced us anew of the barbarity of the inhabitants.

"All our provisions being now expended, we felt the necessity of returning on board, and reached the ship about the middle of the day. Alongside I observed a double canoe, carrying two sails, constructed in the same manner as those of the inhabitants of New Caledonia; but the natives who were in her spoke the language of the inhabitants of the Friendly Islands. They were eight in number, seven men and a woman, all very muscular. They told us that the island from which they came was situated to the eastward, a day's sail from our anchorage, and was called *Aouvea*. It was undoubtedly the Island of Beupré they meant, which had been discovered by our engineer in our passage from the New Hebrides to this island. These islanders, who were entirely naked, were acquainted with the use of iron, and appeared much more intelligent than the savages of New Caledonia.

"I was not a little surprised to see one of the planks of their canoe paid with a coat of varnish. It appeared to have belonged to some European ship, and of this I had no doubt, when I discovered that white lead had formed a principal ingredient in the composition of the varnish. This plank undoubtedly came from a ship belonging to some civilized nation, which had been lost on their coasts. I requested these savages to relate to us what they knew on this subject; they immediately set sail to the westward, promising to return next day, and bring us back the information required, but did not keep their word, and we had not afterwards an opportunity of seeing them.

"We were informed, on our return, that on the day we left the ship to make the excursion which we had finished, some savages had attempted to carry off the hatchets of our wood-cutters, and had attacked them with stones; but that two musket-shots had been sufficient to disperse them.

"In a short time we reached a hut, whence came out a native, holding in his hand a mask, which he agreed to sell for two joiners' chisels. This mask was cut out of a cocoa-nut tree, but better carved than the different figures which we had seen at other places, on the planks at the entrance of their dwellings. He repeatedly covered his face with it, and looked through the holes which he had perforated in the upper part. It had no appearance at the eyes, but only at the mouth. These people are, probably, in the habit of making use of masks of this sort, that they may not be recognised by their enemies, when they undertake any hostilities against them.

"In a hut, which we entered, I observed a fire; and two children, who were regaling themselves with spiders, of a new species, which I have very frequently remarked in the woods, where they spin threads so strong that we were often exceedingly incommoded by them in our excursions. The children first killed them, by shutting them up in a large earthen vessel, which they were heating over a good fire; then they broiled them on the embers, and ate them. They swallowed, at least, a hundred of them. We found on the same island several other inhabitants searching eagerly for this sort of food.

"I perceived some of the inhabitants falling upon our fishermen, in order to take from them their net, with the fish which they had just caught. We were obliged to fire at least twenty muskets before we could succeed in dispersing them entirely. They stood firm on the beach during all this time, repelling the attack with their slings, and severely wounded the gunner of the *Espérance* in the arm with a stone; they then took to their heels, and in a few moments they again returned to the charge; however, when they saw two of their party brought to the ground by musket-shots, and wounded so as not to be able to crawl into the woods but with much difficulty, the panic

became general; they fled, and not one of them any longer thought of attacking us.

"The voracity of which the Caledonians had afforded us proof, prevented the admiral from giving them the he and she goat which he had intended for them. Doubtless they devoured the two hogs and the two dogs, of which Captain Cook made a present to one of their chiefs, before they suffered them to multiply. Scarcely did they pay the smallest attention to their fowls: I saw only three hens and a cock during our stay in the island.

"We did not observe in their possession any of the articles given to them by Captain Cook. Perhaps, these riches have occasioned the unhappiness of the inhabitants of this coast, by exciting their neighbours to come and plunder them.

"I remarked, with astonishment, that the authority of the chiefs had always seemed nugatory, in the different skirmishes we had had with these savages; but I was not less surprised to see them exercise a considerable share of power, when their personal interests were at stake; for they generally seized upon the articles which their subjects had received from us.

"The natives of this island are a strong, robust, active, and well-made people; some of them measuring six feet four inches. Their complexion is similar to that of the people of the New Hebrides, New Holland, and New Guinea; but they do not, like those of New Holland, cover themselves with charcoal-dust: some were remarked who had blackened part of their breast, by wearing on it broad stripes, disposed obliquely. They have thick lips, flat noses, and full cheeks, and, in some degree, the features and look of a negro. Two things contributed to the forming of such an idea; first, their rough mop-heads, and, secondly, their besmearing their faces with black pigment. Their hair and beards are generally black, and the former is very much frizzled; so that, at first sight, it appears like that of a negro, only that it is coarser, stronger, and rather longer. Some, who wear it long, tie it up on the crown of the head; others suffer only a large lock to grow on each side, which they tie up in clubs; many were observed, who, wishing to appear with very long hair, had fastened to it two or three braids made of grass, and covered with the hair of the bat, which reached down to the middle of the back.

"Some of these savages had tubercles behind the ears, in the shape of a sweet-bread, and as large as a man's fist. They made it grow by means of a caustic, which, no doubt, had for some time occasioned a considerable degree of irritation, the inferior lobe of their ears being down to their shoulders. Some had introduced in it leaves of trees, and others a piece of wood, to enlarge it still more. Several had the same lobe cut into shreds; it had probably been torn in battle, or in their excursions

through the forests. A man was seen by Captain Cook's people, both ashore and alongside the ship, as white as a European. They were given to understand, that his whiteness did not proceed from hereditary descent, but from chance or some disease.

"We saw coarse garments amongst them, made of a sort of matting, but they seemed never to wear them, except when out in their canoes and unemployed. Some had a kind of concave, cylindrical, black cap, which appeared to be a great ornament among them, and, we thought, was only worn by men of note, or warriors. A large sheet of strong paper, when they got one from us, was generally applied to this use.

"The women's dress is a short petticoat, made of the filaments of the plantain-tree, laid over a cord, to which they are fastened, and tied round the waist. The petticoat is made at least six or eight inches thick, but no longer than necessary for the use designed. The outer filaments are dyed black; and, as an additional ornament, the most of them have a few pearl oyster-shells fixed on the right side. The general ornaments of both sexes are ear-rings of tortoise-shell, necklaces, or amulets made both of large shells and stones, and bracelets, made of large shells, which they wear above the elbow. Their necklaces are mats of plaited hair, and they commonly suspend to them, by a string, a small piece of bone, rudely carved. Their bracelets are cut out of shells, or of quartz and other hard stones. They have punctures, or marks on the skin, on several parts of the body; but none are black, as at the eastern islands.

"With respect to the origin of this nation, they seem to be a race between the people of the New Hebrides and New Holland; their language, in some respects, being a mixture of both.

"Their offensive weapons are clubs, spears, darts, and slings for throwing stones. The clubs are about two feet and a half long, variously formed; some like a scythe, others like a pick-axe; some have a head like a hawk, and others have round heads; but all are neatly made. Many of their darts and spears are not less neat, and ornamented with carvings. The slings are simple, but they take some pains to form the stones they use into a proper shape, which is something like an egg, supposing both ends to be like the small one. They use a bucket, in throwing the dart, which is much used in striking fish, &c. In this they seemed very dexterous; nor, indeed, have they any other method of catching large fish; for I neither saw hooks nor lines among them.

"The ingenious method these people have invented for accelerating the velocity of their darts is admirable. For this purpose they use a very elastic piece of cord,

made of cocoa-nut bass and the hair of the bat. They fix one of the extremities to the end of the fore-finger, while the other, which is terminated by a sort of round button, embraces the dart on which it is disposed, in such a manner, that it flies off the weapon as soon as it is thrown. These warlike people pay the greatest attention to the manufacture of their weapons, which they polish remarkably well.

"Their houses are mostly circular, like a bee-hive. The entrance is by a small door, or long square hole, big enough to admit a man bent double. The side-walls are about four feet and a half high; but the roof is lofty, and peaked to a point at the top; above which is a post, which is generally ornamented either with carving or shells, or both. The framing is of small spars, reeds, &c.; and both the sides and roof are thick and closely covered with thatch, made of coarse long grass. In the inside of the house are posts, to which cross-spars are fastened, and platforms made, for the convenience of laying any thing on. The floor is laid with dry grass, and mats are spread for the principal inhabitants to sleep or sit on. In most of them we found two fire-places, and commonly a fire burning; and, as there was no vent for the smoke, but by the door, the whole house was both smoky and hot, inasmuch that we, who were not used to such an atmosphere, could hardly endure it a moment. This may be the reason why we found these people so chilly when in the open air, and without exercise. We frequently saw them make little fires, and hustle round them, with no other view than to warm themselves. Smoke within doors may be a necessary evil, as it prevents the mosquitoes from coming in, which are numerous here. In some respects their habitations are neat; for, besides the ornaments at the top, I saw some with carved door-posts. Upon the whole, their houses are better calculated for a cold than a hot climate.

"They have no great variety of household utensils; earthen jars being the only article worth notice. Each family has, at least, one of them, in which they bake their roots, and perhaps their fish, &c. The fire by which they cook their viands is on the outside of each house, in the open air. There are three or five pointed stones fixed in the ground, their pointed ends being about six inches above the surface. Those of three stones are only for one jar; those of five stones, for two. The jars do not stand on their bottoms, but lie inclined on their sides. The use of these stones is obviously to keep the jars from resting on the fire, in order that it may burn the better. They have a basket, which they fill with tubercles, which resemble those of the roots of a species of sun-flower.

### SECTION VI. NEW ZEALAND.

New Zealand was first discovered by Tasman, in the year 1642. He traversed the eastern coast, and entered the strait which divides the two islands, since called Cook's Strait; but, being attacked by the natives soon after he came to anchor in the place, to which he gave the name of Murderer's Bay, he never went on shore. Tasman gave the country the name of Staaten Land, or the Land of the States, in honour of the States-General; but it has since been distinguished by the name of New Zealand. As the whole of this country, except that part of the coast seen by Tasman, has, till the voyage in the Endeavour, undertaken by our renowned navigator, Cook, in 1769, remained totally unknown, it was supposed to be part of a southern continent: but it was found by him to consist of two large islands, divided from each other by a strait, which is about four or five leagues broad.

*Situation, Climate, Soil, &c.*] New Zealand is situated between thirty-four and forty-eight degrees of south latitude, and between one hundred and sixty-six and one hundred and eighty degrees of east longitude.

The climate is temperate and tolerably salubrious, and the weather in general is good, but sometimes windy, and attended with heavy rains, which, however, are never excessive nor of long continuance. From various observations, it appears, that the winds from the south-east are generally moderate, but attended with cloudy weather, or rain. The south-westerly winds blow very strong, and are also attended with rain, but they seldom last long. The north-west winds are the most prevailing, and are almost constantly attended with fine weather.

The land in the vicinity of Queen Charlotte's Sound is exceedingly mountainous, rising abruptly from the sea into large hills, with blunted tops. At considerable distances there are some valleys, each terminating toward the sea in a small cove, with a pebbly or sandy beach; and behind this are small flats, where the natives generally erect their huts. The bases of the mountains, toward the shore, are composed of a brittle sand-stone, which is naturally of a yellowish cast, but acquires a bluish tinge when washed by the sea. In some places it runs in horizontal, and at others in oblique, strata, being frequently divided by veins of coarse quartz, which generally follow the direction of the other, though they sometimes intersect it. The soil which covers this is also of a yellowish cast, somewhat like marl; and its quality is best indicated by the luxuriant growth of its productions.

*Vegetables.*] The noble trees which crown the mountains of New Zealand are chiefly of two sorts: one of them is of the size of our largest firs, and grows much after the same manner, but the leaves and small berries on their points have a nearer resemblance to those of the

yew. The other tree is somewhat like a maple, and frequently grows to a very great size, but it only served the Europeans for fuel, as the wood was found too heavy for masts, yards, &c.

On the small flat spots behind the beaches, there is a greater variety of trees, among which are two that bear plums, about the size of prunes; the one yellow, called *karracca*; and the other black, called *maïtao*, but neither of them have a very agreeable flavour. Those of the first sort grow on small trees near the sea; but the others are gathered from larger trees, that stand farther within the woods. On some of the eminences which jut out into the sea, there is a tree, bearing flowers almost like those of myrtle; and a species of *Philadelphus*, the leaves of which have a very pleasant smell, and are said to make an excellent substitute for tea.

Among a variety of edible plants, which grow plentifully in almost every cove, we must mention wild celery, and a sort of scurvy-grass, with jagged leaves, and small clusters of white flowers. A species of long pepper is found in great plenty, but it has little of the aromatic flavour that makes spices valuable. The flax-plant, of which the natives make their garments, grows every where near the sea, and, in some places, a considerable way up the hills, in tufts or bunches, with sedge-like leaves, bearing yellowish flowers, which are succeeded by a long roundish pod, filled with very thin black seeds. Here are also above twenty different sorts of ferns, entirely peculiar to the place; with several different kinds of mosses; besides a great variety of other plants, whose characters and uses are not yet accurately known.

*Animals.*] The birds, as well as the vegetable productions, are almost entirely peculiar to the country; and although it is very difficult to follow them, on account of the great quantity of underwood and climbing plants, which render travelling extremely fatiguing, yet a person, by remaining in one place, may shoot as many in a day as will serve six or eight others. The principal sorts are large brown parrots, with greyish heads, green parroquets, with red foreheads; and large wood-pigeons, brown above, with white bellies, and the bill and feet red.

Here also are two sorts of cuckoos, one as large as our common sort, of a brown colour, variegated with black; the other not larger than a sparrow, of a bright green hue above, and beautifully varied with waves of green, brown, white, and golden colours below. A goose-beak, about the size of a thrush, of a brown colour, with a reddish tail, is very frequently seen here; as is also a small greenish bird, whose notes are so varied and melodious, that an attentive auditor might suppose himself surrounded by a hundred different sorts of birds at once. Robins and kingfishers are sometimes seen, about the size of the English ones, but their plumage is somewhat different.

23. VOL. I.

The rocks about the shore are much frequented by sea-pies and red-bills; and crested shags, of a lead-colour, with the upper part of a velvet-black, tinged with green, and the wings prettily spotted. There are, also, about the shore, some blue herons, a few sea-gulls, small penguins, and some sand-larks.

Among the fish offered to sale by the natives, were large conger-eels; a sort of sea-bream, of a silver colour, with a black spot on the neck; and a fish somewhat like a bream, but so large as to weigh six or seven pounds. The principal fish caught by the Europeans were mullets, elephant-fish, soles, flounders, a sort of small salmon, skate, and a curious fish of a reddish colour, with a little bennil, which was called the *night-walker*, from the greatest number being caught in the night. Among the shell-fish, which abound on the rocks, there are periwinkles, limpets, wilks, sea-eels, oysters, cockles, and muscles, the latter of which will sometimes measure above a foot in length.

It is very remarkable, that in this extensive country there are no quadrupeds, excepting a few rats, and a sort of fox-dog, the latter of which seems to be, in some measure, domesticated by the natives. The insects most worthy of notice are two sorts of dragon-flies, small grasshoppers, several sorts of spiders, and great numbers of scorpion-flies, with whose chirping the woods frequently resound. The only reptiles are two or three sorts of lizards, one of which is said to be of a monstrous size.

*Minerals.*] New Zealand does not afford any mineral worthy of attention, except a green jasper, or serpent-stone, of which the natives fabricate their tools and personal ornaments; and it appears that they hold some superstitious notions respecting the method of its generation. It is sufficiently obvious, however, wherever it may be found, that it is disposed in the earth either in thin layers, or detached pieces, like our flints; for the edges of those pieces which have not been cut are covered with a whitish crust, like these. A piece of this sort has been seen about eighteen inches long, a foot broad, and nearly two inches thick; which yet appeared to be only the fragment of a larger piece.

*Language.*] The language of the New Zealanders, which nearly resembles that of the Otaheiteans, cannot be properly called harsh or disagreeable; for although the pronunciation is frequently guttural, it is certain that whatever qualities are requisite in any other language to make it musical, obtain to a considerable degree here. It is also sufficiently comprehensive, though in some respects deficient, if compared with the languages of Europe, which owe their perfection to long improvement.

The language of the northern and southern parts of New Zealand differs chiefly in the pronunciation, as the same English word is pronounced *gate* in Middlesex, and *gaite* in Yorkshire: and as the southern and northern words

were not written down by the same person, one might possibly use more letters to produce the same sound than the other.

It may also be observed, that it is the genius of the language, especially in the southern parts, to put some article before a noun, as we do *the* or *a*; the articles used here were generally *he* or *ko*; it is also common here to add the word *heia* after another word, as an iteration, especially if it is an answer to a question, as we say *yes indeed, certainly*; this sometimes led the officers into the formation of words of an enormous length, judging by the ear only, without being able to refer each sound into its signification.

*Government, Religion, &c.*] That some form of government prevails in this country is evident from the chart and information of Toogee, one of the natives who resided at Norfolk Island, as we have before observed. He informed the European visitors, that *Ea-hi-no-mawe*, the place of his residence, and the northern island of New Zealand, is divided into eight districts, governed by their respective chiefs, and others who are subordinate to them. The largest of these districts is *T' Souduckey*, the inhabitants of which are in a constant state of warfare with other tribes, in which they are sometimes joined by the people of three neighbouring districts, though the whole of them are oftener united against *T' Souduckey*, the bounds of which large district Governor King conceived to be from Captain Cook's Mount Egmont to Cape Runaway. They are not, however, without long intervals of peace, at which times they visit, and carry on a traffic for flax and the green tale-stone, of which latter they make axes and ornaments. As a further proof of the existence of a government, it appears, from Governor King's account, that Toogee's residence was on the north side of the Bay of Islands, in the district called by him *Ho-do-do*, which he said contained about a thousand fighting men, and was subject to seven chiefs, one of whom, *Tee-koo-roa*, was the principal chief's son. Governor King observes, that, according to the information of Toogee, the inferior classes were perfectly subordinate to their superiors; and such he supposed to be the case, by the great deference paid by Toogee himself to Hoodoo.

Of the religion of these people, it cannot be supposed that much could be learnt; they acknowledge the influence of superior beings, one of whom is supreme, and the rest subordinate; and give nearly the same account of the origin of the world, and the production of mankind, as the natives of Otaheite: Tupia, however, seemed to have a much more extensive knowledge of these subjects than any of the people here; and, whenever he was disposed to instruct them, which he sometimes did in a long discourse, he was sure of a numerous audience, who listened, in profound silence, with such reverence and

attention, that we could not but wish them a better teacher.

What homage they pay to the deities they acknowledge could not be learnt, but no place of public worship was seen, like the morais of the South-Sea Islands; yet, near a plantation of sweet potatoes, was a small area, of a square figure, surrounded with stones, in the middle of which one of the sharpened stakes, which they use as a spade, was set up, and upon it was hung a basket of fern-roots: upon enquiry, the natives said, it was an offering to the gods, by which the owner hoped to render them propitious, and obtain a plentiful crop.

The New Zealanders believe that, the third day after the interment, the heart separates itself from the corpse, and that this separation is announced by a general breeze of wind, which gives warning of its approach, by an inferior Eatooa, or divinity, that hovers over the grave, and who certainly carries it to the clouds. In this chart, Toogee has marked an imaginary road, which goes the lengthways of Ea-hei-mo-mawe, from Cook's Strait to the North Cape, which Toogee calls Tevey-inga. They believe, that while the soul is received by the god Eatooa, an evil spirit is also in readiness to carry it to Terry-inga, whence it is precipitated into the sea.

Whatever their principles of religion may be, its instructions appear to be very strongly inculcated into them from their very infancy. Of this there was a remarkable instance, in the youth who was first destined to accompany Taweharooa, in Captain Cook's second voyage. He refrained from eating the greatest part of the day, on account of his hair being cut, though every method was tried to induce him to break his resolution; and he was tempted with the offer of such victuals as he was known to esteem the most. He said, if he ate any thing that day, the Eatooa would kill him. However, towards evening, the cravings of nature got the better of the precepts of his religion, and he ate, though but sparingly. It had often been conjectured, before this, that they had some superstitious notions about their hair, quantities of it having been frequently observed tied to the branches of trees, near some of their habitations; but what those notions are could not be learned.

*Customs, Manners, &c.]* The inhabitants of New Zealand do not exceed the common stature of Europeans; and, for the most part, their limbs are not so well made. This, however, may probably be the effect of sitting on their hams, and of being confined, by the hilly nature of the country, from using that exercise which contributes to render the body straight and well-proportioned. Their complexions vary from a deep black to an olive tinge. Their faces, in general, are round, with full lips, remarkably broad teeth, and large eyes. Their noses are not flat, but they become rather thick toward the point. In the

young, the countenance is generally open and ingenuous; but in many of the elder men it is marked with a peculiar sullenness or reserve. Their hair is black, straight, and strong, generally cut short on the head part, with the rest tied on the crown of the head: in some individuals, however, it is of a brown colour, and seems naturally inclined to curl. The women are, for the most part, smaller than the men; but they have few peculiar graces, either in form or features, to distinguish them.

Their ordinary dress consists of an oblong garment, about five feet long and four broad, which is made from the flax-plant already mentioned. They bring two corners of this garment over the shoulders, and fasten it on the breast with the other part that covers the body. Sometimes they ornament it with large feathers, or with pieces of dog-skin, which seem to be wrought into the cloth when it is made. Over this garment, some of the natives wear mats, which reach from the shoulders almost to the heels; but, in general, the outer covering consists of a quantity of the flax-plant, badly dressed, which, being thrown about the shoulders, falls down, on all sides, as low as the middle of the thighs.

Their heads are commonly decorated with feathers, or combs of bone and wood; and in the ears, both of men and women, are hung bits of cloth, beads, or small pieces of jasper. They generally wear long beards, but seem to be fond of having them shaved. Some of them are stained in the face with curious figures, of a black, or deep blue colour; but the women, who are thus marked, have the puncture only on their lips, or a small spot on their chin. Both sexes besmear their heads and faces with a red paint, made of grease and martial ochre; and the females sometimes wear necklaces of shark's teeth, or bunches of long beads, which appear to be made from the leg-bones of small birds. A few, also, have little triangular aprons, fastened round the waist with two or three cords, and adorned with feathers, bits of pearl-shells, &c.

It appears that they subsist principally by fishing, making use either of nets, or of wooden fish-hooks, pointed with bone; but these last are so oddly made, that a stranger is at a loss to discover how they can answer such a purpose. When they dare not venture to sea, they supply the want of other fish with muscles, sea-ears, &c., and sometimes they contrive to kill a few penguins, shags, and rails, which help to vary their diet. Mr. Anderson informs us, that they are equally filthy in their persons and in their method of feeding. "They used to devour, with the greatest eagerness," says he, "large quantities of stinking train-oil, and blubber of seals, which we were melting at the tent, and had kept nearly two months; and, on board the ships, they were not satisfied with emptying the lamps, but actually swallowed the cotton and fragrant wick, with equal voracity. It is worthy of notice, that

open and ingenuous; marked with a peculiar black, straight, and part, with the rest some individuals, however, naturally inclined to the most part, smaller than the others, either in form

an oblong garment, which is made from the bark of the tree; they bring two corners together and fasten it on the back of the body. Sometimes, or with pieces of bark brought into the cloth, some of the natives make a garment almost to the waist, covering consists of a piece of bark, which, being folded, on all sides, as low

as the neck, and is decorated with feathers, or with the ears, both of men and of birds, or small pieces of bark, and beards, but seem to be of the same material. Some of them are stained with a black, or deep red, and thus marked, have a small spot on their forehead, and faces with a piece of ochre; and the females have their teeth, or bunches of hair, made from the leg-bone, and have little triangular pieces of two or three cords, or shells, &c.

principally by fishing, with fish-hooks, pointed with bone, and oddly made, that they can answer such a purpose to sea, they suppose, sea-ears, &c., and penguins, shags, and other birds. Anderson informs us that their persons and in general are devoted to devour, with large quantities of food, which we were only two months; and satisfied with emptying their stomachs of cotton and fragrant herbs, of notice, that

though the inhabitants of Van Diemen's Land appear to have but a scanty subsistence, they would not even taste our bread; whereas these people devoured it greedily, when both mouldy and rotten. This, however, must not be imputed to any defect in their sensations; for I have observed them throw away things which we eat, with evident disgust, after only smelling to them.

As they are totally ignorant of the art of boiling, they always bake their fish in a large hole, which is dug in the earth for that purpose, and serves instead of an oven. In the same manner they dress the root and part of the stalk of the large fern-tree, which, on being split open, yield a fine gelatinous substance, like boiled sago-powder, but somewhat firmer. A smaller fern-root, which seems to be their substitute for bread, is beaten with a stick till it becomes pretty soft, when they chew it sufficiently, and spit out the fibrous parts, the other having a mealy and very agreeable taste.

They shew as much ingenuity, both with respect to invention and execution, as any uncivilized nation under similar circumstances; for, although wholly destitute of metal tools, they fabricate their clothing, warlike weapons, and fishing implements, with a tolerable degree of neatness. Their chief mechanical tool is formed exactly after the manner of an English adze, and is made of the green jasper. Their substitute for a knife is a shell, or a bit of flint; and, in boring holes, they supply the want of an auger by fixing a shark's tooth in the end of a small piece of wood. They have also a small saw, made of some fishes' jagged teeth, and fixed on the convex edge of a piece of wood, nicely carved: but this is said to be only used for cutting up the bodies of the unfortunate prisoners whom they take in battle.

The warlike weapons of these people are spears, paddles, and halberts, or, sometimes, stones. The first of these are made of hard wood, pointed, and of different lengths, from five to twenty or even thirty feet. The short ones are used for throwing, as darts. The *patoe* is of an elliptical shape, about eighteen inches long, with a handle made of wood, green jasper, or the bone of some marine animal, and seems to be their principal dependance in battle. The halbert, or long club, is about five or six feet long, tapering at one end, with a carved head, and at the other broad or flat, with sharp edges.

Their cordage for fishing-lines is equal, in strength and evenness, to that made by Europeans; and their nets are not at all inferior. But they particularly excel in carving, which is found upon the most trifling things; and, in particular, the heads of their canoes are sometimes ornamented with it in such a manner, as not only shows much ingenuity of design, but also affords a striking example of their great labour and patience in execution. Their boats are well constructed, of planks raised upon each

other, and fastened with strong withes, which also bind a long narrow piece on the outside of the seams, to prevent their leaking. Some of these vessels are nearly fifty feet long, and of sufficient breadth to sail without an outrigger; but the smaller sort generally have one; and the natives sometimes fasten two together, by rafters, to form what is called a double canoe. These boats will carry from five to thirty men; and have frequently a large head, curiously carved and painted, with a figure, resembling a man whose features are distorted by rage. Their paddles are long and narrow, and with these, when they keep proper time, the canoe is pushed along pretty swiftly. The sail is made of a mat of a triangular shape, having the broadest part above; but this is seldom used.

No people have a quicker sense of injuries, and none are more ready to resent them, than the natives of New Zealand; but this may be rather regarded as the effect of a vindictive disposition, than of personal courage; for they will embrace every opportunity of being insolent, when they think themselves secure from punishment. They also appear to be naturally mistrustful and dishonest; for they were, at first, extremely loth to enter the European vessels; and they not only pilfer every thing they can lay their hands on, but also take every possible advantage in trading, and seem to exult when they think they have tricked the persons with whom they are dealing. This conduct, however, might, in some measure, be expected in a country where there is but little subordination, and few laws to punish transgressions; for no man's authority appears to extend beyond his own family; and when they have occasion to unite for mutual defence, or other purposes, the command is vested in those who are most eminent for their prudence and bravery.

Their public contentions are almost perpetual; for it appears, from the number of their weapons and their dexterity in using them, that war is their principal profession. "From my own observations," says Captain Cook, "and from the information of others, it appears that the New Zealanders must live under perpetual apprehensions of being destroyed by each other; there being few of their tribes that have not, as they think, sustained wrongs from some other tribe, which they are continually upon the watch to revenge; and, perhaps, the desire of a good meal may be no small incitement. I am told that many years will sometimes elapse before a favourable opportunity happens, and that the son never loses sight of an injury that has been done to his father. Their method of executing their horrible designs is by stealing upon the adverse party in the night; when, if they find them unguarded, they kill every one indiscriminately, not even sparing the women and children. When the massacre is completed, they either feast themselves on the spot, or carry off as many of the dead bodies as they can, and devour them at

home, with acts of brutality too shocking to be described. If they are discovered before they can accomplish their sanguinary purpose, they generally steal off again; and are sometimes pursued and attacked by the other party in their turn.

"Their perpetual state of war, and destructive method of conducting it, operate so strongly in producing habitual circumspection, that one hardly ever finds a New Zealander off his guard, either by night or by day. Indeed, no other men can have such powerful motives to be vigilant, as the preservation both of body and soul depends upon it; for, according to their system of belief, the soul of the man whose flesh is devoured by an enemy, is doomed to a perpetual fire; while the soul of the man, whose body has been rescued from those who killed him, as well as the souls of all who die a natural death, ascend to the habitations of the gods. I asked, whether they ate the flesh of such of their friends as had been killed in war, and whose bodies were saved from falling into the enemy's hands? But they answered in the negative, expressing some abhorrence at the very idea."

When preparing for battle, they join in a war-song, to which they all keep the most exact time, and soon raise their passion to a degree of frenzy, attended with the most horrid distortions of their features, which, to a stranger, makes them appear rather like demons than men, and might almost chill the boldest with emotions of terror. To this succeeds a circumstance, equally horrid and disgraceful to human nature, which is that of cutting in pieces the bodies of their enemies, and, after dressing them on fire, devouring the flesh, with a peculiar satisfaction.

It might be naturally supposed, that people capable of such brutal cruelty must be destitute of every humane feeling, even for their friends; and yet it is a remarkable fact that they lament the loss of their relatives with a violence of expression which seems to argue the most tender remembrance of them. Both sexes, upon the death of their friends, bewail them with the most doleful cries; at the same time cutting their cheeks and foreheads with shells or pieces of flint, until the blood flows plentifully, and mixes with their tears. They also carve little images out of their green stone, and hang them about their necks, as memorials of those for whom they had an affection.

The New Zealanders seem to be perfectly satisfied with the little knowledge they possess, without expressing the least desire to improve or augment it. Neither are they remarkably curious in their observations or their enquiries. New objects do not strike them with such a degree of surprise as might be naturally expected; nor are there many things capable of even fixing their attention for a moment.

Polygamy is allowed amongst these people; and it is not uncommon for a man to have two or three wives. The women are marriageable at a very early age; and it appears that those who are single can with great difficulty procure a subsistence, and are, in a great measure, unprotected, though they frequently stand in need of a very powerful protection.

Their children are initiated, at a very early age, into all the practices and customs of their fathers; so that a boy or girl of nine or ten years old is able to perform all the motions, and to imitate the horrid gestures, by which the more aged inspire their enemies with terror, keeping the strictest time in their war-song. They likewise sing, on certain occasions, the traditions of their ancestors, their military exploits, and other subjects, of which they are immoderately fond.

## SECTION VII.

### VAN DIEMEN'S LAND.

This country, which the Dutch navigator, Tasman, called Van Diemen's Land, in honour of the Dutch governor-general in the East-Indies, is the last great division of Australasia. It has been discovered to be an island, in the form of an oblong square, about a hundred and sixty miles in length, by half that breadth; being divided from New Holland by a channel, which, in modern maps, is called Bass's Strait.

For the following particulars we are indebted to Captain Furneaux, who accompanied Captain Cook in his second voyage round the world:

"Directing our course for Van Diemen's Land, on the 1st of March, 1773, we proceeded on till the 9th, when, being in the latitude of forty-three degrees thirty-seven minutes south, we saw the land, about eight or nine leagues distance. The morning of the 10th being calm, the ship four miles from the land, sent the great cutter on shore, with the second lieutenant, to find if there was any harbour or good bay. They landed, but with much difficulty, and saw several places where the Indians had been, and one they lately had left, where they had a fire, with a great number of pearl scallop-shells round it. The soil seems to be very rich; the country well clothed with wood, particularly on the lee-side of the hills; plenty of water, which falls from the rocks in beautiful cascades, for two or three hundred feet perpendicular into the sea; but they did not see the least sign of any place to anchor in with safety. Hoisted in the boat, and made sail for Frederick Henry Bay. From noon to three P. M. running along shore, at which time we were abreast of the westernmost point of a very deep bay, called, by Tasman Stormy Bay. From the west to the east point of this bay

# VAN DIEMEN'S LAND.]

there are several small islands and black rocks, which we called the Fryars. Being abreast of a fine bay, and having little wind, we came to anchor. We first took this bay to be that which Tasman called Frederick Henry Bay; but afterwards found that his is laid down five leagues to the northward of this.

"At day-break the next morning, I sent the master in-shore to sound the bay, and to find out a watering-place; at eight he returned, having found a most excellent harbour, clear ground from side to side. We weighed and turned up into the bay, and anchored in seven fathoms water, to the westward, the north point of the bay, which we supposed to be Tasman's Head, and the easternmost point, which we named Penguin Island, from a curious one we caught there; the watering-place, about one mile from the shore on each side; Maria's Island, which is about five or six leagues off, shut in with both points; so that we were quite land-locked, in a most spacious harbour.

"We found the country very pleasant; the soil black and rich, though thin; the sides of the hills covered with large trees, and very thick, growing to a great height before they branch off. They are, all of them, of the evergreen kind, different from any I ever saw. The land-birds we saw were a bird like a raven; some of the crow kind, black, with the tips of the feathers of the tail and wings white, their bill long and very sharp; some parquets; and several kinds of small birds. The sea-fowl were ducks, teal, and the sheldrake. I forgot to mention a large white bird, that one of the gentlemen shot, about the size of a large kite, of the eagle kind. As for beasts we saw but one, which was an *opossum*; but we observed the dung of some, which we judged to be of the deer kind. The fish in the bay are scarce; those we caught were mostly sharks, dog-fish, and a fish called, by the seamen, nurses, like the dog-fish, only full of small white spots; and some small fish, not unlike sprats. The lagoons, which are brackish, abound with trout; and several other sorts of fish, of which we caught a few with lines, but, being much encumbered with stumps of trees, we could not haul the seine.

"While we lay here, we saw several smokes and large fires, about eight or ten miles in-shore to the northward, but did not see any of the natives, though they frequently come into this bay, as there were several wigwags or huts. They seem to be quite ignorant of every sort of metal. The boughs, of which their huts are made, are either broken or split, and tied together, with grass, in a circular form, the largest end stuck in the ground, and the smaller parts meeting in a point at the top, and covered with fern and bark, so poorly done, that they will hardly keep out a shower of rain. In the middle is the fire-place, surrounded with heaps of muscle, pearl, scallop, and cray-fish shells, which are their chief food, though we could not

# A S I A.

269

find any of them. They lie on the ground, on dried grass, round the fire, and have no settled place of habitation, but wander about in small parties, from place to place, in search of food, and are actuated by no other motive. We never found more than three or four huts in a place, capable of containing three or four persons each only; and, what is remarkable, we never saw the least marks either of canoe or boat, and it is generally thought they have none, being altogether, from what we could judge, a very ignorant and wretched set of people, though natives of a country capable of producing every necessary of life, and a climate the finest in the world. We found not the least signs of any minerals or metals.

"Intending to coast it up along shore, till we should fall in with the land seen by Captain Cook, and discover whether Van Diemen's Land joined with New Holland, we passed Maria's Islands, so named by Tasman; they appeared to be the same as the main land. Having passed Schouten's Islands, we hauled in for the main land, and stood along shore, at the distance of two or three leagues off. The country here appeared to be very much inhabited, as there was a continual fire along shore as we sailed. The land hereabouts is much pleasanter, low, and even; but no signs of a harbour or bay where a ship might anchor with safety. The weather being bad, and blowing hard, we could not send a boat on shore to have any intercourse with the inhabitants."

Van Diemen's Land was visited by Captain Cook, in his last voyage, in 1777, and, in his passage from Kerguelen's Land to New Zealand, where he had instructions from the Board of Admiralty to ship provisions necessary for the prosecution of his voyage. The particulars are thus related:

"On the morning of the 24th of January, we discovered the coast of Van Diemen's Land. There are several islands and high rocks lying scattered along this part of the coast, the southernmost of which is the Mewstone. It is a round elevated rock, five or six leagues distant from the south-west cape.

"About a league to the eastward of Swilly is another elevated rock, that is not taken notice of by Captain Furneaux. I called it the Eddystone, from its very great resemblance to that light-house. Nature seems to have left these two rocks here for the same purpose that the Eddystone light-house was built by man, viz. to give navigators notice of the dangers around them. For they are the conspicuous summits of a ledge of rocks under water, on which the sea, in many places, breaks very high. Their surface is white with the dung of sea-fowls: so that they may be seen at some distance, even in the night. On the north-east side of Storm Bay, which lies between the South Cape and Tasman's Head, there are some coves or creeks, that seemed to be sheltered from the sea-winds;

3 Y

and I am of opinion, that, were this coast examined, there would be found some good harbours.

"A breeze springing up at south-east, put it in my power to carry into execution the design I had, upon due consideration, formed, of carrying the ships into Adventure Bay, where I might expect to get a fresh supply of wood, and of grass for the cattle, of both which articles we should, as I now found, have been in great want, if I had waited till our arrival in New Zealand. We therefore stood for the bay, and anchored. Wood and water we found in plenty, and in convenient situations. Next morning I sent Lieutenant King to the east side of the bay, with two parties, one to cut wood, and the other to cut grass, under the protection of the marines, whom I judged it prudent to land as a guard; for although, as yet, none of the natives had appeared, there could be no doubt that some were in our neighbourhood, as we had seen columns of smoke, from the time of our approaching the coast; and some now was observed at no great distance up in the woods.

"We were agreeably surprised, at the place where we were cutting wood, with a visit from some of the natives, eight men and a boy. They approached us from the woods, without betraying any marks of fear, or rather with the greatest confidence imaginable: for none of them had any weapons, except one, who held in his hand a stick, about two feet long, and pointed at one end.

"The natives received every present we made them, without the least appearance of satisfaction. When some bread was given, as soon as they understood that it was to be eaten, they either returned it, or threw it away, without even tasting it. They also refused some elephant-fish, both raw and dressed, which we offered to them. But upon giving some birds to them, they did not return these, and easily made us comprehend that they were fond of such food. I had brought two pigs ashore, with a view to leave them in the woods. The instant these came within their reach, they seized them, as a dog would have done, by the ears, and were for carrying them off immediately, with no other intention, as we could perceive, but to kill them.

"Being desirous of knowing the use of the stick which one of our visitors carried in his hand, I made signs to them to shew me, and so far succeeded, that one of them set up a piece of wood as a mark, and threw at it, at the distance of about twenty yards. But we had little reason to commend his dexterity; for, after repeated trials, he was still very wide from the object. Onai, who was returning to his native country, to shew them how superior our weapons were to theirs, then fired his musket at it, which alarmed them so much, that, notwithstanding all we could do or say, they ran immediately into the woods. One of them was so frightened, that he let drop an axe and two knives that

had been given to him. From us, however, they went to the place where some of the Discovery's people were employed in taking water into their boat. The officer of that party, not knowing that they had paid us so friendly a visit, nor what their intent might be, fired a musket in the air, which sent them off with the greatest precipitation.

"Thus ended our first interview with the natives. Immediately after their final retreat, judging that their fears would prevent their remaining near enough to observe what was passing, I ordered the two pigs, being a boar and sow, to be carried about a mile within the woods, at the head of the bay. I saw them left there, at the head of a fresh-water brook. A young bull and a cow, and some sheep and goats, were also, at first, intended to have been left by me, as an additional present to Van Diemen's Land. But I soon laid aside all thought of this, from a persuasion that the natives, incapable of entering into my views of improving their country, would destroy them. If ever they should meet with the pigs, I have no doubt this will be their fate. But as that race of animals soon becomes wild, and is fond of the thickest cover of the woods, there is great probability of their being preserved. An open place must have been chosen for the accommodation of the other cattle; and, in such a situation, they could not possibly have remained concealed many days.

"We had observed several of the natives sauntering along the shore, which proved that, though their consternation had made them leave us so abruptly the day before, they were convinced that we intended them no mischief, and were desirous of renewing the intercourse. It was natural that I should wish to be present on the occasion.

"We had not been long landed before about twenty of them, men and boys, joined us, without expressing the least sign of fear or distrust. There was one of this company conspicuously deformed; and who was not more distinguishable by the hump upon his back, than by the drollery of his gestures, and the seeming humour of his speeches, which he was very fond of exhibiting, as we supposed, for our entertainment; but, unfortunately, we could not understand him, the language spoken here being wholly unintelligible to us. It appeared to me to be different from that spoken by the inhabitants of the more northern parts of this country, whom I met with in my first voyage; which is not extraordinary, since those we now saw, and those we then visited, differ in many other respects. Nor did they seem to be such miserable wretches as the natives whom Dampier mentions to have seen on the western coast.

"Some of our present groupe wore, loose round their necks, three or four folds of small cord, made of the fur

re, loose round their cord, made of the fine

of some animal; and others of them had a narrow slip of the kangaroo skin tied round their ankles. I gave to each of them a string of beads, and a medal, which I thought they received with some satisfaction. They seemed to set no value on iron, or on iron tools. They were even ignorant of the use of fish-hooks, if we might judge from their manner of looking at some of ours, which we shewed to them.

"We cannot, however, suppose it to be possible, that a people who inhabit a sea-coast, and who seem to derive no part of their sustenance from the productions of the ground, should not be acquainted with some mode of catching fish, though we did not happen to see any of them thus employed; nor observe any canoe or vessel in which they could go upon the water.

"Many heaps of muscle-shells we saw in different parts near the shore, and about some deserted habitations near the head of the bay. These were little sheds or huts, built with sticks, and covered with bark. We could also perceive evident signs of their sometimes taking up their abode in the trunks of large trees, which had been hollowed out by fire, most probably for this very purpose. In or near all these habitations, and wherever there was a heap of shells, there remained the marks of fire, an indubitable proof that they do not eat their food raw.

"From Lieutenant King I learnt, that I had but just left the shore when several women and children made their appearance, and were introduced to him by some of the men who attended them. He gave presents to all of them, of such trifles as he had about him. These females

wore a kangaroo skin, in the same shape as it came from the animal, tied over the shoulders and round the waist. But its only use seemed to be to support their children, when carried on their backs; as they were, in all other respects, as naked as the men, and their bodies marked with scars in the same manner. But in this they differed from the men, that though their hair was of the same colour and texture, some of them had their heads completely shorn or shaven; in others, this operation had been performed only on one side, while the rest of them had all the upper part of the head shorn close, leaving a circle of hair all around.

"The land is, for the most part, of a good height, diversified with hills and valleys, and every where of a greenish hue. It is well wooded, and, if one may judge from appearances, and from what we met with in Adventure Bay, is not ill supplied with water. We found plenty of it in three or four places in this bay. Fire-wood is to be got with great ease in several places.

"The only wind to which this bay is exposed is the north-east. But as this wind blows from Maria's Islands, it can bring no very great sea along with it; and, therefore, upon the whole, this may be accounted a very safe road. The bottom is clean, good holding-ground; and the depth of water from twelve to five and four fathoms.

"Captain Furneaux's sketch of Van Diemen's Land, published with the narrative of my last voyage, appears to me to be without any material error, except with regard to Maria's Islands, which have a different situation from what is there represented."

## CHAPTER XII.

### POLYNESIA.

ACCORDING to the best and latest authorities, the following appear to be the principal divisions of the wide expanse of Polynesia:

1. The Pelew Isles.
2. The Ladrões, a chain extending in a northerly direction, the small islands in the Pacific seeming to be chiefly the summits of ranges of mountains.
3. The Carolines, a long range, extending from east to west.
4. The Sandwich Isles.
5. The Marquesas.
6. The Society Isles, so named in honour of the Royal Society; and

#### 7. The Friendly Isles.

There are, also, several isles scattered in different directions, which it would be difficult to class with any groupe, and indeed none of them seem to merit a particular description.

#### SECTION I.

##### THE PELEW ISLANDS.

[Discovery, &c.] Various conjectures have been formed respecting the first discovery of these islands by Europeans; but the only account on which we can safely rely was compiled

by Mr. Keate, from documents furnished by Captain Henry Wilson, of the *Antelope*, a packet belonging to the East-India company, which was wrecked upon one of these islands in August 1783. And, as by that accident a people have been brought to light, whose amiable manners and virtuous qualities evince no small progress in social refinement, and whose humane behaviour to our distressed countrymen is justly entitled to the warmest gratitude, we shall take the liberty of laying before our readers a brief account of the above-mentioned shipwreck, and the subsequent intercourse between the European mariners and the natives, which we flatter ourselves will be found particularly interesting.

The *Antelope* was fitted out in England by the court of East-India directors in the summer of 1782, as was then generally understood, for a secret expedition. But whatever may have been her destination, as she was proceeding homeward from Macao in squally weather, on the 10th of August, 1783, the man on watch suddenly called out breakers! and the sound of the word had scarcely reached the officer on deck, before the ship struck, and in less than an hour she bulged, and filled with water up to the lower deck hatchways.

During this scene of horror and dismay, the seamen intreated their commander to give them some directions, and assured him that his orders should be obeyed with the utmost alacrity. Accordingly, Captain Wilson desired them to secure the gunpowder and small arms, and to get on deck the bread, and such other provisions as were liable to be spoiled by the water. He also directed that the mizen mast, with the main and fore-top masts should be cut away, and the fore and main yards lowered, to prevent the vessel from oversetting.

The boats were now hoisted out, and loaded with provisions, small arms, and ammunition; and two men were put into each, with directions to keep them under the lee of the ship, and to be ready to receive their companions, in case the vessel should part by the violence of the wind and waves, as it then blew a very strong gale.

Every thing being at length done which prudence could dictate in so distressful a situation, the officers and people assembled on the quarter deck, (that part being highest out of the water, and best sheltered from the rain and sea by the quarter-boards,) and waited for day-light, in hopes of seeing land; for as yet they had not been able to discern any. During this dreadful interval, the anxiety and horror of which may be easier imagined than described, Captain Wilson endeavoured to revive the drooping spirits of his crew, by reminding them, that shipwreck was a misfortune to which navigators were always liable; and that although theirs was rendered peculiarly trying by its happening in an unknown sea, yet he wished to remind them, that this consideration should only rouse them to greater activity,

in endeavouring to extricate themselves: and, above all, he wished to impress on their minds, that whenever misfortunes such as theirs had happened, they had generally been rendered much more dreadful than they would otherwise have been, by the despair of the crew, and by their disagreement among themselves. To prevent such a circumstance, he most earnestly requested them not to taste any spirituous liquor, on any account whatever; and he had the satisfaction to find his salutary advice readily adopted.

As the crew, however, were almost worn out by the excessive labour they had undergone, two glasses of wine and some biscuit were given to every man aboard; and they waited for day-break with the utmost anxiety, in hopes of discovering land. Meanwhile they endeavoured to support each others spirits as much as possible, and, by the captain's direction, put on as many clothes as possible to carry with them, in the event of getting safe from the wreck. We have also the pleasure to add, to the honour of this crew, that the utmost cordiality prevailed amongst them. None attempted, in the hour of confusion, to touch his neighbour's property, nor to make free with what had been interdicted.

The dawn discovered to their view a small island, at the distance of about three or four leagues to the southward; and as the day-light increased, they saw more islands to the eastward.

They now began to feel apprehensions on account of the natives, to whose dispositions they were utter strangers. However, after manning the boats, and loading them in the best manner they were able, for the general good, they were dispatched to the island, under the direction of Mr. Benger, the chief-mate, who was earnestly requested to establish, if possible, a friendly intercourse with the natives, if he found any; and carefully to avoid all disagreement with them, unless reduced to it by the most urgent necessity. As soon as the boats were gone, those who were left in the ship began to get the booms over-board, and to make a raft for their security, if the ship should go to pieces, which was hourly expected. At the same time, they were under the most painful apprehensions for the safety of the boats, on which all depended, not only with respect to the natives, but also with regard to the weather, as it still continued to blow extremely hard.

In the afternoon, however, they were relieved from their fears on this head, by the return of the boats, with the welcome news of their having landed the stores in safety, and left five men to take care of them; and that there was no appearance of inhabitants being on the island where they landed: that they had found a secure harbour, well sheltered from the weather, and also some fresh water. This favourable account revived them, and they proceeded in completing the raft with fresh vigour, having been allowed

another glass of wine, with biscuit. A very distressing ac-  
cident, however, happened this day; the mizen-mast being  
found near the ship's stern, and part of the rigging entangled  
with the mizen-chains, one of the quarter-masters was  
employed to clear it, and, while he was thus employed,  
unluckily slipped overboard. The boats were immediately  
sent to his assistance, but without effect.

Having finished the raft, they loaded it, together with  
the jolly-boat and pinnace, with as many stores and provi-  
sions as they could bear, consistently with the safety of  
those who were to be carried off; and, as the day was  
advancing, the captain summoned all the people aboard.  
Indeed, so busily were they employed in bringing as much  
as possible with them, that it required some pains to get  
them all collected. The stoutest of the hands were put  
on board the pinnace, which took the raft in tow, and  
moved slowly on, till they had cleared the reef; while the  
jolly-boat, which was of little service to the raft, proceeded  
along to the shore, and joined their companions that had  
been left in the morning. They found a tent ready for  
their reception, and a spot of ground cleared for the stores.

The situation of those aboard the pinnace and the raft,  
till they cleared the reef, was extremely alarming; for the  
swelling of the sea was so violent, that they repeatedly  
lost sight of each other, and those on the raft were obliged  
to tie themselves to the planks with ropes, to prevent  
their being washed off; whilst the horror of the scene was  
increased by the screams of the Chinese mariners, who  
were not accustomed to the perils of the ocean.

When they had fairly cleared the reef, they got into  
deep smooth water, in the channel running between the  
reef and the islands; but, on approaching the land, they  
found a very strong current, which drove them consider-  
ably to leeward. They soon found that they could not resist  
its impetuosity, and therefore, having brought the raft to  
a grapple, all the hands got aboard the pinnace, to relieve  
the rowers; while Captain Wilson was returning in the  
jolly-boat, to assist those aboard the pinnace. The night  
was by this time dark, and the captain, overhearing them  
at a distance, hailed them. Those aboard the pinnace,  
overjoyed at the near prospect of relief, returned the hal-  
loo in a manner so unusual, that Captain Wilson imme-  
diately concluded they were natives. He was the readier to  
form this idea, as he had just learned from those on shore,  
that, from various circumstances, they had reason to con-  
clude there had been natives on that spot very lately; he  
therefore retreated to the shore with the utmost precipi-  
tation. Fortunately, however, they were soon relieved by  
the arrival of the pinnace, when all the company shook  
hands together with great cordiality; prepared a homely  
supper; and, having lighted a match by the discharge of  
a pistol, they kindled a fire in the cove, by which they  
dried their clothes, and warmed themselves. The night

proved very uncomfortable, as the weather was exceed-  
ingly tempestuous; while the fear of the ship going to  
pieces, before they could save other necessaries from the  
wreck, considerably heightened their distress.

Next forenoon they attempted to bring off the raft, but,  
as the weather proved very stormy, they were obliged to  
leave it, carrying with them, however, the sails and the  
remainder of the provisions. In the afternoon the wea-  
ther was more moderate, and the boats were dispatched  
to the ship to bring off what they could; while those  
on shore were employed in brushing up the small arms.

The evening set in very squally, and as the boats did not  
return from the ship till about ten o'clock, those on shore  
began to be alarmed for their safety; nor were they much  
easier, when, on their return, they learned that the ves-  
sel was in such a situation as made it exceedingly probable  
she could not hold together till morning.

Next morning it blew exceedingly strong, so that the  
boats could not go off to the wreck. The men, therefore,  
employed themselves in drying their provisions, and form-  
ing better tents from the materials which they had brought  
from the ship the day before. About eight o'clock, the  
people being employed as above, and in clearing the  
ground from the wood which was behind the tents, Cap-  
tain Wilson, with Thomas Rose, the linguist, being on the  
beach, saw two canoes, with men in them, coming round  
the point into the bay. This gave such alarm, that the  
people all ran to their arms; however, as there were but  
few of the natives, Captain Wilson desired them to keep  
out of sight, until they should perceive what reception  
he met with, but to be prepared for the worst. They soon  
perceived that the natives had seen the captain and his  
companion, for they conversed together, and kept their  
eyes stedfastly fixed on that part of the shore where the  
English were. The natives advanced very cautiously to-  
wards them; and, when they came near enough to be  
heard, Captain Wilson directed the linguist to speak to  
them in his own language, the Malay, which they, at first,  
did not seem to understand; but they stopped their can-  
oes, and soon after one of them asked, in the Malay  
tongue, who the strangers were, and whether they were  
friends or enemies? Rose was directed to reply, that  
they were Englishmen, who had lost their ship on the reef,  
but had saved their lives, and were friends. On this they  
seemed to confer together for a short time, and then  
stepped out of the canoes into the water, and went toward  
the shore. Captain Wilson instantly waded into the wa-  
ter to meet them, and embracing them in the most friendly  
manner, led them to the shore, and presented them to his  
officers and unfortunate companions. The natives were  
eight in number, two of whom, it was afterwards known,  
were brothers to the rupack, or king, of the neighbouring  
islands; and one was a Malay, who had been shipwrecked

in a vessel belonging to a Chinese, resident on the island of Ternate, one of the same groupe of islands: he had been kindly treated by the king, who, he said, was a good man; and that his people also were very courteous. He told them, also, that a canoe, having been out a fishing, had seen the ship's mast; and that the king, being informed of it, sent off these two canoes, at four o'clock that morning, to see what was become of the people who had belonged to her; and they, knowing of the harbour which the Englishmen were in, had come directly thither.

Being about breakfast-time, Captain Wilson, Thomas Roca, and only a few others, breakfasted with them, to prevent suspicion; and, in the course of their short conversation, a wish was hinted to be informed by what means the Malay they had brought with them had reached their islands. The Malay, who could indistinctly speak a few sentences both in broken Dutch and English, gave some farther account of himself; but, from his future conduct and behaviour, there was great reason to suspect his veracity. It was, however, peculiarly fortunate that they found a person with whom their linguist could converse.

From this first interview, as well as what happened afterwards, it was evident that the natives had never before seen a white man, and were ignorant of the existence of any such. The natural surprise at seeing them may, therefore, be easily conceived.

The appearance of clothes was quite new to them. At first, indeed, they were at a loss to determine, whether the man and his dress were not of the same substance.

Nothing afforded them greater surprise than the sight of two dogs belonging to the ship, which immediately on their approach set up a loud bark, to the great delight of the natives, who answered them in a shout almost as violent. In these animals they took great delight, as, except a few grey rats, there are no quadrupeds on the island.

They seemed very desirous that one of the English should go with them in their canoes to their sovereign, that he might see what sort of people they were. Every one agreed that this step would be advisable; but, as difficulties arose concerning who the person should be that should venture himself, the captain requested his brother, Mr. Matthias Wilson, to undertake the office. This proposal was readily acceded to; and about noon one of the canoes left the harbour, having Mr. Wilson with them. The other canoe, with four persons, among whom was Raa Kook, the elder of the king's brothers, and who was also general of his armies, remained with the English, until the canoe returned with Mr. Wilson.

The captain directed his brother to inform the king who they were; to relate to him, as well as he could, the nature of their misfortune; and to solicit his friend-

ship and permission to build a vessel to carry them back to their own country. He also sent a present by him, of a small remnant of blue broad cloth, a canister of tea, another of sugar-candy, and a jar of rusk. The last article was added at the particular request of the king's two brothers.

During the absence of Matthias Wilson, the Europeans had an opportunity of getting more intimately acquainted with Raa Kook, whom they found a most amiable character. Observing a piece of polished bone around his wrist, they took occasion to enquire into the meaning of it. He informed them, it was a mark of great distinction, conferred only on the blood royal and principal officers of state; and that he enjoyed it as being the king's brother, and commander in chief of the forces both by sea and land. Raa Kook's friendship was cultivated with all imaginable assiduity; and he, in return, shewed himself attached to them by a most attentive politeness: he imitated them in all their actions, and on every occasion evinced how high an opinion he had formed of them. The Malay, on his first arrival, had requested to be indulged with a jacket and trowsers, which were readily granted; and an uniform-coat, with trowsers, were at the same time given to Raa Kook, who put them on, but was soon wearied of them, as he found them cumbersome.

In the morning of the fourteenth, two canoes arrived, in which were Arra Kooker, the king's other brother, and one of the king's sons. They informed Captain Wilson, that his brother was on his way back; but that the canoe in which he was could not make so much speed against the wind as theirs, which occasioned the delay. The king, by their means, offered the strangers a hearty welcome to his territories, and assured them of his friendship and protection; he also gave them free permission to build a vessel, in any part of the island which they might think proper, and assured them, that he and his subjects would afford them every assistance in their power. Raa Kook then took his nephew, and introduced him particularly to the captain and his officers, and conducted him round the cove, explained every thing agreeable to the information he himself had just received, and seemed much pleased with his friend's astonishment. This young man was very well made, but had a slit in his nose, probably the consequence of a wound in battle, or a scrophulous taint, which was common among the natives.

In the forenoon two boats were dispatched to the wreck. They found a number of the natives, in about twenty canoes, busied in examining the vessel: these Raa Kook soon dispatched, and on this, as well as on every occasion, did every thing in his power to convince the English of his friendship and protection.

Meanwhile the Europeans were highly entertained with Arra Kooker, who proved to be a most facetious entertainer.

ing man, possessing uncommon talents for mimicry and humour. He described, by many diverting signs, the terror of Matthias Wilson, while at Pelew; who, it seems, had been under very great apprehension. But they were all revived with his appearance, and the account he gave them of his embassy, to the following effect:—

"On the approach of the canoe in which I went to the island where the king lives, a vast concourse of the natives ran out of their houses to see me come on shore. The king's brother took me by the hand, and led me up to the town, where a mat was spread for me, on a square pavement, and I was directed to sit down on it. In a little time the king appeared, and, being pointed out to me by his brother, I rose, and made my obeisance after the manner of eastern nations, by lifting my hands to my head, and bending my body forward; but he did not seem to pay any attention to it. I then offered him the presents which my brother had sent by me, and he received them in a very gracious manner. His brother now talked a great deal to him, the purport of which, as I conceived, was to acquaint him with our disaster, and the number of us; after which the king ate some of the sugar-candy, seemed to relish it, and distributed a little of it to several of his chiefs; and then directed all the things to be carried to his own house. This being done, he ordered refreshments to be brought for me.

"A great crowd of the natives had by this time surrounded me, who were curious and eager to examine my clothes and person. But, as it began to be dark, the king, his brother, myself, and several others, retired into a large house, where supper was brought in, consisting of yams, boiled whole, and others boiled and beaten together, as we sometimes do potatoes. There were, likewise, some shell-fish, but I could not determine what they were.

"I spent the next day in walking about the island, and observing its produce, which consisted chiefly of yams and cocoa-nuts; the former they cultivate with great care, in large plantations, which are all in swampy watery ground, such as the rice-fields in India. The cocoa-trees grow very near the houses, as do also the betel-nuts, which they chew as tobacco."

Matters proceeding in this favourable train, the captain suggested the propriety of staving the liquor casks on board the wreck, lest either the natives or marines, by indulging to excess, might be thrown off their guard, and give occasion to misunderstandings. This advice was instantly complied with; and nothing can give a higher idea of the regular conduct of the crew, and the affection they bore their commander, than their readiness to make so considerable a sacrifice, which they did without a murmur.

In a short time after this, the English were informed, that the king was coming; and, in less than an hour, they

saw a great number of canoes turning the point which formed the harbour. But the king stopped as soon as he got within the bay, and directed one squadron of the canoes, which were all armed, to retire to the back of the island; thinking, probably, that so great a number of armed people would create an alarm among the strangers. He then advanced with the rest in great form, and with much parade, as far as the tide would permit; and it was signified to Captain Wilson, by the king's brothers, that he should then go and meet him.

Accordingly, two of his own people took him on their shoulders, and carried him through the water to the king's canoe, which he was requested to enter; and he and the king, whose name was Abba Thulle, embraced each other with the utmost cordiality of friendship.

The captain then related the nature of their misfortune, by means of the two Malays, and repeated his request to be permitted to build a vessel to carry them home; and the king again, in a very courteous manner, gave his assent to the request to build it, either where they were, or at the island where he resided, but recommended the latter; adding, that the island on which they had landed was unhealthy, which was the reason it was not inhabited; and that he apprehended they would be ill, when another wind began to blow, which he said would be in two moons. The captain informed him, that they had a person with them, whose business it was to cure diseases; and that it would be very inconvenient to them, if they removed farther from the wreck of their vessel, because they could not then procure from her such things as they might want, without much trouble and loss of time. To these reasons the king assented; and, making signs that he wished to land, the captain was carried on shore by his people, and Abba Thulle, stepping into the water, followed him.

On his landing, he looked about him with a good deal of apparent suspicion, which, however, was soon removed. Raa Kook made up to him, and a sail being spread for him, according to the custom of the country, the chiefs of his company sat down, forming a square; and his other attendants, to the amount of about three hundred, enclosed them in a circle, squatting down, at the same time, in such a position, as that they could rise in an instant. Captain Wilson offered the king some tea, which he did not seem to relish, and then made him a present of a piece of cloth and some ribbons, which pleased him very much. He carried a hatchet of iron on his shoulder, which was so adapted to it, that it appeared to give him no inconvenience.

Abba Thulle was introduced by Captain Wilson to the officers and all his men; and upon being told that Mr. Benger, the chief mate, was second in command, he called him the kickaray rupack, supposing Captain Wilson to be the king of some country; but, when he was

made to understand that he belonged to a mighty sovereign, and that he was only his captain, he readily got hold of the word captain, by which name he constantly saluted him afterwards, and Mr. Benger he called kicknray captain, as second in command.

The king then enquired for Captain Wilson's badge of supremacy, which put him to a stand. Luckily, however, Mr. Benger slipped his ring into his hand, which being produced, and the manner of wearing it shown, pleased Abba Thulle not a little, as it carried some affinity to their own mark of dignity.

Raa Kook having examined every thing belonging to the English very minutely, took much pains in pointing them out to the king; they went through the tents, in which every thing surprised them; nor did the difference between the Chinese and English escape their observation. Raa Kook, at the same time, gave his brother to understand, that there were many different nations and classes of mankind on the earth, who were frequently at war with one another, as he often was with his neighbouring islanders.

But nothing seemed to strike Abba Thulle with more astonishment than the fire-arms, with which Raa Kook endeavoured to make him acquainted. He expressed much anxiety to see them used, which Captain Wilson ordered immediately to be done. He desired Mr. Benger to cause the sailors to go through their exercise, drawn up on the sea-beach, being then low water, while he explained their motions to the king. The men went through various evolutions, with great readiness, marching backwards and forwards, and concluded with three volleys, in different positions.

The astonishment of the natives on hearing the report of the muskets is not easily conceived; indeed, their hooting and hallooing produced a noise little inferior to it. Captain Wilson judged it expedient to be guilty of a little profusion of his powder on this occasion, in order to impress the minds of the natives with a more enlarged idea of the power of the English; a design which was fully answered by it. But, still farther to shew them the effects of their fire-arms, Mr. Benger ordered one of the live doves which they had to be let loose, at which he fired, and immediately brought it down, with a leg and a wing broken. This surpassed every thing, in their estimation; indeed, they now seemed to be completely absorbed in wonder and amazement.

Raa Kook was, by this time, pretty well acquainted with such articles as the English had about them, which he took great pains in pointing out to the king, his brother: that which seemed principally to attract their notice was a grindstone, which they turned round with great satisfaction, observing the effect it had upon pieces of iron; they also examined the tents and the culinary utensils. But

the dogs were the greatest fund of entertainment to them, with whose barking they were so much delighted, that they kept a continual uproar with them, and it was found necessary to confine them. The king examined the English as to provisions, and was presented with a piece of ham and a live goose, which had been saved.

Abba Thulle was highly gratified with what he had seen, and proposed going away. This was notified to his attendants by a loud shriek from one of his officers, which gave not a little alarm to the English. It was instantaneously obeyed. They all rushed to their canoes with great alacrity, and the king, with the greater part of the natives, took leave of them.

Raa Kook remained with the English all night, as did the king's son and a few of their attendants. Captain Wilson ordered two tents to be pitched, one for the principal people, and the other for the commonalty. He continued himself with Raa Kook and his party, after the guard was set for some hours. The natives in the distant tent, anxious to pay all attention to their visitors, prepared to sing a song, according to their country mode.

Their method of tuning their voices for this purpose was attended with sounds so very harsh and dissonant, that the English thought they were beginning their war-hoop, or giving a signal to the king and those with him to attack them. Impressed with this idea, every man seized his musket, and ran to the tent where Captain Wilson was, supposing him to be in the most imminent danger. But they were soon agreeably undeceived, and attended to the song, which was conducted in the following manner:—A chief gave out the line, which a company next him took up, and completed the verse. The last line they repeated; and it was taken up by the next party, who also sang a verse. They continued their song some time, and made signs for our people to repay them in kind, which was done by a lad, named Cobbledick, to their great satisfaction. The manner of this lad's singing was afterwards mentioned to the king, who, upon hearing him, was so much pleased, that he never met with him afterwards without desiring him to sing, which, of course, was complied with.

We come now to mention a circumstance which presents these natives of Pelew in a light that could not have been preconceived; a circumstance which discovers such nice feelings, as, on the one hand, displays human nature in a very pleasing attire, in her native dress; while, on the other, it may put to the blush many individuals possessing the blessings of Christian light and civilization. The English had no other means for again revisiting their native homes, but by constructing a small schooner; and, for this purpose, had only a few instruments saved from the wreck. These they carefully concealed from the natives, who had shown a particular attachment to iron, and instruments made of

that metal. were, and the captain was queences in c they went ou displeasure. Wilson.

that metal. Accidentally a chief had observed where they were, and requested a cutlass from Captain Wilson. The captain was loth to part with it, but, fearing worse consequences in case he refused, thought it best to give it. As they went out of the tent, Raa Kook observed it with great displeasure, took it from him, and returned it to Captain Wilson.

In a few hours the Malay coming ashore, told the captain he had given great offence by offering a cutlass to an inferior officer, and neglecting the king and his brothers. In order to make up matters, Captain Wilson thought it best to present each of the king's brothers with some cloth and ribands, which were very coolly received—they seemed to be unhappy. In the afternoon the king came round from the back part of the island, where he had spent the night, and Captain Wilson went out in the jolly-boat, with the linguist, to meet him. Now Abba Thulle, who had been so happy and pleased the day before, appeared with a gloomy reserve, and the poor Englishmen trembled in anticipating the effects of his displeasure, which they thought he was meditating. But the real cause of the uneasiness, which evidently depressed them all, was nothing more than a struggle in their own breasts, how they should ask a favour from strangers, almost wholly in their own power, without having the appearance of a command. This marks a delicacy of mind, which ranks the natives of Pelew high in refinement.

It appeared that a neighbouring nation had injured them; and, as they meant to attack them in battle in a few days, they very justly foresaw the advantages which would arise from the presence of a few of the English sailors with fire-arms. At length, with much evident confusion, Abba Thulle hinted it to Captain Wilson, who immediately assured him, he might at any time command his men, who were entirely at his service. No sooner was this answer notified by the interpreter, than every countenance brightened up, and cordiality and happiness were restored. The king immediately dubbed the captain a brother rupack, instructed him to send some of his people to the part of the island where he lived, to carry him whatever provisions they needed, and concluded with assuring him, that the natives were entirely at his service, to assist in constructing his vessel, or any thing else in their power.

He immediately retired to the opposite side of the island, promising to return next morning for the men. Nor was the happy settlement of this affair less agreeable to the English than the natives. The fear of having incurred the displeasure of those, whose favour was so necessary, had distressed them not a little; and each strove to evince his zeal by wishing to be selected for the expedition proposed. At length, five young men were chosen and properly equipped. They were headed by Mr. Cummin, the third mate. Meanwhile every preparation was made to build a

24. VOL. I.

schooner, in which they might return to China; and the sincerity every person showed to lend his assistance in this important business, was an earnest of their future success. Many necessaries were recovered from the wreck, and trees were felled to supply the rest.

On the 25th, the five English warriors returned in safety, after acquitting themselves to the satisfaction of the king, and putting his enemies to flight, by the effect and terror of their fire-arms. For this important service the island of Oroolong, where they then resided, was given to the English by Abba Thulle.

On the 31st of August, Captain Wilson paid a visit to Pelew. Mr. Devis, Mr. Sharp, and Henry Wilson, accompanied the captain on this visit. The English went in their jolly-boat, attended by Raa Kook, and other natives, in a canoe.

About one o'clock they reached Pelew, fired six muskets, and fixed their colours at the end of the causeway where they landed. Raa Kook conducted them to a house, where they waited the arrival of Abba Thulle. Menhime the natives thronged into the house, to have a view of the English, bringing along with them various refreshments and sweetmeats. In a little time the king's arrival was announced, when, notwithstanding the multitude then present, the greatest silence prevailed. Captain Wilson embraced the monarch, as at first meeting, and presented him with a few trinkets, which were very graciously received.

Abba Thulle now proposed to conduct them to the town, which is about a quarter of a mile from the landing-place where they were. The English, in order to assume some little formality, carried their colours before them. They passed through a wood, and then came to a fine pavement, or causeway. There are large broad stones laid in the middle, for the ease of walking, and lesser ones on the sides. This led them to the town, where they were conducted to a large square pavement, surrounded by houses. In the centre stood a larger house than the rest, which was allotted to the English for their accommodation. In it there was a number of women, of superior rank, being wives to the rupacks, or principal officers of state, who received them very politely, and presented them with cocoa-nuts and sweet drink, of which all partook.

In a little time, the king, after a suitable apology to Captain Wilson, retired to bathe; and a message was sent from the queen, expressing a wish to be favoured with their company at her house. Thither they all repaired, and were seated in a little square before the house. It appeared that this lady was the principal wife of Abba Thulle, and great attention was paid to her by all. The king resided almost constantly at her house. She appeared at the window, and, by means of Raa Kook, examined

into the various peculiarities in the appearance of the English, which struck her. She sent them a broiled pigeon, which is the greatest rarity the island produces, and is held in such particular estimation, that it is unlawful for any but rupacks and their wives to taste it.

After satisfying her curiosity, they were conducted by the general to his house, where they met with a most gracious reception, and had an opportunity of observing the benevolent heart of this worthy man in domestic life. In his house they were treated with the greatest kindness, and with the most expressive tokens of real welcome; but what particularly gratified them on this occasion, was the endearing behaviour of Raa Kook to his wife and children. These last he fondled on his knees, and caressed with all the genuine marks of parental affection. The night being now pretty far advanced, they retired to their house, where no pains had been spared to render their accommodation comfortable. Their kind friend, the general, procured plenty of mats for them to sleep on, kindled fires to defend them from the mosquitoes and damps, and ordered some of his own men to sleep at the other end, to protect them from any of the natives, who might be led to disturb them from motives of curiosity. Next morning they were attended, as usual, by Raa Kook, and, after walking about for some time, were ordered to attend the king to breakfast, in the queen's house, where they had been the day before.

They were received with a peculiar etiquette, which was never afterwards practised. The house was all in one apartment; at one end of which hung a screen of mats, which, when drawn up, discovered the king and queen seated. They breakfasted on yams and fish, very agreeably. After breakfast, Mr. Sharp, the surgeon, accompanied by Mr. Devis, set out to visit a child of Arra Kook's, which was sick. His house was about three miles distant. This gave them an opportunity of examining the country, which they had not before done. This visit was very acceptable, and the rupack thought he could not sufficiently repay them. Mr. Sharp examined the child's body, which was almost entirely covered with ulcers, but could not prescribe any thing, having no medicines. He approved of the mode of cure they had adopted, which was chiefly fomentation. Arra Kook then loaded several servants with provisions, &c. in baskets, to be sent to the boats, and assured them, when they left the island, they should have his whole roost of tame pigeons. This was the greatest compliment he could possibly offer them; and sufficiently shows the uncommon gratitude with which his bosom was warmed. Indeed, our readers, on many occasions, must have anticipated the remark, that the finer feelings and virtues which adorn humanity, shone in these natives in no common degree. They returned to Captain Wilson, at Pelew, the same evening.

The request which had been previously hinted by the king, was now formally made to Captain Wilson, by desire of a council of rupacks, that he would allow them ten men to accompany them to a second engagement at Artingall; which was readily complied with. Captain Wilson mentioned, at the same time, that it would be obliging were the men detained as short time as possible, not to hinder the progress of their schooner. To this Abba Thulle replied, "That it was not his wish to detain them longer than was absolutely necessary, but, after doing him so much service, he must at least keep them a day or two, to rejoice with him." The council had met in the forenoon on this business. Every rupack, or chief, was seated on a stone, that for the king being higher than the rest, and disputed from side to side as it happened, without any regular order of speakers. It appeared that every thing was decided by a majority, so that their government bears no small affinity to our own.

The remainder of the time the English spent at Pelew was very agreeably employed. One day, when in company with a great number of the natives, Mr. Devis, who was an excellent draughtsman, took out his pencil, and was busily employed in taking the likeness of a woman, who had attracted his attention. The lady no sooner observed him, than she retired in great confusion; but, on the drawing being shown to the king, he immediately ordered two women to come forward, and stand in a proper position for Mr. Devis to take their likeness. The sketches were soon finished, and presented to the king, who was highly entertained, and, calling the women, showed them their portraits, with which they were much pleased. Abba Thulle desired the artist to give him his pencil and paper, on which he scratched a few figures, very rudely, but sufficiently to show his conception of what had been done: so that, while he thus displayed his own inferiority to the artist, he, at the same time, gave evident proofs of the sense he had of it, and his wish to possess those qualifications, with which he was so highly delighted.

Captain Wilson and his companions were carried to see their method of building canoes, and observed some which were just returned from a skirmish, in which they had proved victorious. They had captured a canoe, which was considered as great a trophy as a first-rate man of war would be in Britain. On this occasion the English had an opportunity of observing their method of celebrating such exploits, or keeping a day of festivity. There was a great feast prepared for the warriors, previous to which they danced, in the following manner:—they ornamented themselves with plantain-leaves, nicely pared into stripes, which, being of a yellowish colour, had a good effect on their dark skins; then, forming themselves into circles, one within another, an elderly person began a song, or long sentence, and, on his coming to the end of it, all the

dancers joined in concert, dancing along at the same time; then a new sentence was pronounced and danced to, which continued till every one had sung, and his verse had been danced to.

Their manner of dancing does not consist so much in capering, leaping, or other feats of agility, as a certain method of reclining their bodies, and yet preserving their balance. During the dance, a pleasant beverage was handed about, and, when it was finished, an elegant supper was brought in.

Mr. Sharp carried Captain Wilson, one afternoon, to see his favourite, Arra Kook, who received them with great joy, and entertained them very kindly. They went through several plantations on their way, and were much surprised to find the country so highly cultivated. They observed a tree, named, by the natives, *ri'a'mall*, which the English supposed to be a species of the bread-fruit. After enjoying plentifully this good man's bounty, they returned to Pelew, highly delighted with their agreeable excursion. In the course of such observations as they had an opportunity of making, they found the employments of the men generally to be making darts, hewing trees, and building canoes; while the women looked after the yams, wrought the mats and baskets, nursed their children, and dressed the victuals.

On Thursday, the 4th of September, they left Pelew, loaded with presents, and amidst the loud acclamations of a vast number of the natives. They arrived safely at the cove, about nine in the evening, and found all their companions in good health, and proceeding in their work with the utmost alacrity. The captain immediately informed them of the request the natives had made for ten men, and every one was again anxious to be of the party. At length they were determined upon, and ordered to be in readiness on a call from the king.

Soon after, his majesty paid them another visit at Oroolong, and, after inspecting the progress they made in their vessel, he returned with the desired reinforcement of ten Englishmen.

As the king had, some days before, sent information to Artingall of his proposed attack, which is customary here, and, at the same time, terms of peace, he now ordered a canoe, with four men in it, to proceed to the island, and enquire whether they were to submit or to fight.

The messengers soon returned, informing him that they refused the offered terms. Immediately Abba Thulle ordered the conch to be sounded, and waved his stick in the air, the signal for forming the line of battle. Meantime the enemy collected their canoes, but kept close by the shore, showing an evident disinclination to come to battle.

Abba Thulle had dressed himself in the scarlet coat

which Captain Wilson had given him, and kept one of the Englishmen in his canoe. The other nine were dispersed through the fleet, in nine different canoes, armed with muskets, cutlasses, bayonets, and pistols.

As the enemy appeared unwilling to advance, and their present situation was very unfavourable for the attack, the king ordered a party of canoes to go round a neck of high land, and lie there concealed. He then ordered the remainder to exchange a few darts in their present position, and retreat with apparent precipitancy; by these means he expected to draw the enemy from their shores, and the concealed squadron could then get betwixt them and the land, and thus hem them in on all sides.

This stratagem took the effect as he wished. The enemy rushed out to pursue the apparent fugitives, and the canoes coming round the high land, surrounded them on all sides. The mistake, however, was soon discovered, for those who fled now turned about, and, by means of the fire-arms, threw the enemy into the utmost confusion. The noise of the muskets, their friends dropping they knew not how, and the triumphant shout which the natives of Pelew set up, totally discomfited them. They retreated with precipitation, rushed through the canoes that were betwixt them and the land, as there were but few of them, and by that means all escaped but six canoes, and nine natives, who were captured. The victory, however, was considered as very complete.

It is very seldom that any canoes are taken, and two or three prisoners are generally the greatest number. The dead bodies are carefully carried off the field of battle, lest they should fall into the hands of the conquerors to expose them. It is with pain we add, that the prisoners are invariably murdered. This is the only trait of inhumanity that disgraces a people otherwise remarkable for their mildness.

A little before this engagement, Mr. Sharp was requested by Raa Kook to go along with him to Pelew, to inspect his son's foot, which was very dangerously hurt by a spear, which, having sunk deep into the flesh, was broke off in attempting to pull it out; and the barb of the spear, having got in among the small bones, could not be extracted. Meantime, his foot swelled amazingly, to the great distress of the young man. One of the natives, reputed among them as a man of skill, began to cut away the flesh. But, after mangling his foot in a terrible manner, he was obliged to desist, as the effusion of blood became so great, that he could not continue the operation. They had recourse, therefore, to their fomentation, of which Mr. Sharp much approved, and desired it to be continued till he saw him, which he could not propose at that time, three of the ablest men being sick.

Mr. Sharp's account of his excursion to see this young man, some time after, is as follows:

Immediately on his landing, he went to his father's house, who met him with visible distress in his countenance. Mr. Sharp acquainted him, that he was come to see his son, and had brought such instruments with him as would enable him, he hoped, to administer relief. He smiled approbation, and conducted him to his house, where Abba Thulle and several of the principal people were assembled. After paying his respects to them, Mr. Sharp was informed, that during Raa Kook's stay at Oroolong, the swelling had subsided, by means of the fomentation, and they had forced the spear through his foot, as the only method of extracting it. At this time the whole army was setting out on a third expedition, which the young man hearing, could not bear the thoughts of being absent from. He, therefore, insisted upon being carried to his canoe, where, though he could not stand on his feet to fight, he could raise himself sufficiently to throw a spear. He, therefore, went along, and very early in the engagement fell a sacrifice to his magnanimity, a spear, entering through his throat, occasioned his immediate death. It is impossible to pass over in silence the unhappy fate of this gallant youth. A spirit more truly heroic, history has not left on record; nor need we hesitate to say, that there was more real valour displayed in this action, which accident only has brought on record, than in many feats which have attracted the admiration of ages. Success again crowned the natives of Pelew, by the assistance of the English, though the enemy behaved with great resolution.

Soon after, Raa Kook desired Mr. Sharp and the boatswain to accompany him to the water-side, where two canoes were waiting, into which they went, accompanied by about twenty rumpacks, whom they had not formerly seen, as they belonged to another island, though friendly to Abba Thulle. Mr. Sharp knew not whither they were going, but suffered himself to be conducted by his friend. They landed upon an island about four miles distant from Pelew, and proceeded to a small uninhabited village, where there were four or five houses, surrounded by a neat pavement.

After resting about an hour here, they set forward to a town about half a mile distant, where a great many people of both sexes were assembled, and an entertainment prepared. Immediately after this the women retired; and, soon after, their attention was drawn to the sound of distress at a little distance; the voices appeared to be principally those of women. Raa Kook immediately led Mr. Sharp from the company to the place whence the noise proceeded. They found a great multitude of women attending a dead corpse, which was neatly wrapped in a mat, and supported by four men. They kept up a constant lamentation, and were just about to lay it down, when the strangers joined them. The body was immedi-

ately deposited in the grave, without any ceremony, while the men who had borne it on their shoulders proceeded to cover it quickly with the dust. The women then kneeled down, and their cries became so much louder, that they appeared anxious to tear up the body again, which had been just interred.

A heavy shower of rain obliged Mr. Sharp to leave this interesting scene, to seek shelter; but he never could learn the cause of Raa Kook's behaviour on this occasion; as, notwithstanding the uncommon regard he had for his late son, whose body they were convinced it was, he preserved the most profound silence on the subject; nor did he appear particularly interested. The most probable conjecture they could form was, that he considered it below that dignity of mind, which he on all occasions wished to support, to appear concerned on an occasion which generally produces those feelings that betray what the Pelewites consider as human weakness.

As the night proved very stormy, they could not return to Pelew, but spent the evening with Raa Kook. In the morning, Raa Kook carried Mr. Sharp and the boatswain to a little hut, contiguous to the place where his son had been buried. Here they found only an old woman, to whom the general spoke for some time. She then went out, but soon returned, bringing with her two old cocoanuts, some red ochre, and a bundle of betel-nut, with the leaves. He took the cocoa-nuts, and crossed them with the ochre, placing them one on each side by him; after which he seemed to offer up a prayer. He then crossed the betel-nut in the same manner, and sat musing over it a little, when he gave them to the woman, who carried them out, as Mr. Sharp supposed, to the grave; he wished to follow her; but as Raa Kook appeared under great agitation, and not inclined to rise, he did not leave him, nor make any enquiries.

Mr. Sharp entertained his friends with the inspection of his watch and surgical instruments, with which they were greatly pleased, as well as with the description he gave them of the mode of performing various operations.

Meanwhile their countrymen, whom they had left at Pelew, were in great distress about their absence. They had been witnesses to the funeral of another young man, who had been slain in the same battle. As they were accidentally straggling through the fields, about two miles from Pelew, they observed a great number of the natives going towards a village, with Abba Thulle at their head. They came to a large pavement, where the king was seated, and a great concourse of people surrounded him. Those who bore the corpse moved slowly on before the king, who addressed them in a speech, probably recapitulating the qualifications of the deceased.

His oration was delivered with great solemnity; and the respectful silence of all the auditors added a considerable

degree of affection, then carried to the thither. Mr. N. aged woman, he supposed to be deceased, who properly prepared.

lemnity; and the ed a considerable

degree of affecting grandeur to the scene. The body was then carried to the grave, attended by women only, and thither Mr. Matthias Wilson followed. He observed an aged woman getting out of the new-made grave, whom he supposed to be the mother, or some near relation of the deceased, who had been examining if every thing was properly prepared to her mind.

The last offices they always commit to the women; as the men who are nearly interested, or relations, might be led to discover some exterior marks of grief, which they consider as derogatory to the dignity of manhood. Immediately on the body being deposited in the grave, the women set up loud lamentations, as in the case of Raa Kook's son, and Mr. Wilson left them.

The graves were formed in the same manner as in Europe; and some had a flat stone laid horizontally on the grave, to prevent any person from trampling upon it. It appears, also, that they have particular spots of ground set apart for the purpose of burying their dead.

As it would exceed our limits to relate all the various turns which took place during the contests between the natives of Pelew and those of Artingall, we shall merely observe on this head, that Captain Wilson lent every aid to his friends, and obtained and deserved their esteem. Soon after his return to Ooroolong, he found that the cook had misbehaved exceedingly, appropriating a great part of the small portion of meat they were allowed to himself and his assistant. And as it was requisite, in their present situation, that the strictest discipline should be exercised, Captain Wilson, by a court martial, ordered him a punishment called *cobbing*, which is inflicted by a thin flat piece of wood, something like a battledore.

The tenderness of Raa Kook's disposition, who was present, appeared eminently on this occasion. When he saw the man stripped to the waist, and his hands tied against a tree, to keep them extended, he intreated Captain Wilson to pardon him; but, when he saw the punishment inflicted, and the man bearing it patiently, he was reconciled, standing by and encouraging him all the time.

A Chinese was also punished in the same manner, for wounding one of his countrymen with a stone. But he set up such a hideous cry, that Raa Kook was greatly entertained with his cowardice, or rather despised him for his want of fortitude.

On the 17th of October, Abba Thulle arrived with the agreeable news, that the chief minister of Artingall had been at Pelew, with overtures of peace, which had been accepted, to the great joy of Raa Kook and the other natives. Abba Thulle brought his youngest daughter with him, named Erre Bess, of whom he appeared exceedingly fond. He conducted her through all the cove, and explained the use of every thing, with much attention. He also brought with him, on this visit, Ludee one of his

wives, a very beautiful woman, young, and greatly superior to any the Europeans had hitherto seen. She had with her eight or ten females, who were all escorted by Raa Kook, and were shown the forge, vessel, guns, tents, and other curiosities, with which they were greatly surprised. The king had also brought some of his artificers or tackle-hys, as he called them, to observe the progress of the vessel, and the manner of working. He seemed peculiarly anxious that they should pay attention to the schooner, which all ranks agreed in considering as the *plus ultra* of human mechanism.

After their curiosity had been fully satisfied, the captain prepared an entertainment for them in the tent, consisting principally of fish, and boiled rice, sweetened with molasses, of which they appeared very fond.

A good deal of conversation took place on this visit, between the king and Captain Wilson, on various subjects. Abba Thulle acknowledged that the English muskets had now procured him peace with almost all his neighbours; and at the same time requested, that the captain would leave ten muskets with him, when he left the island. The captain replied, that he could not oblige him in this respect, as Britain was at present engaged in war with several different nations, with whose vessels they might fall in on their return homeward, and so require defensive weapons; but he promised him five, which greatly pleased him.

Abba Thulle then enquired what quantity of powder they had; but, observing that Captain Wilson was not disposed to answer him readily, he very politely changed the subject.

The captain then desired he would assure his neighbouring islanders, that the English, deeply sensible of the kind usage they had received from the inhabitants of Pelew, were determined to return very soon, in a much larger ship, and with a greater number of men, and fully avenge any insult that might be offered, either by the people of Artingall or any other island.

Abba Thulle then informed him, that he had come, at this time, to get the guns from the wreck, which should either be placed at Ooroolong or Pelew, as the English pleased. Captain Wilson, having previously consulted his officers, desired him to take them all to Pelew, except one, which they might, perhaps, need in the schooner. Accordingly, next day, the king ordered some of his people to go to the wreck, in order to remove them. Having no tackle, they found it a very difficult job, and were forced to send for assistance from their friends. The Englishmen speedily lodged them in the canoes, to the surpris of the natives, who could not conceive it possible to handle these heavy pieces with such apparent ease.

The king lodged at the back of the island, carrying with him all his attendants, that the English might be as

little interrupted as possible. He had not been long there, when he sent for Captain Wilson, to give him ten large fish, part of a quantity his people had taken. Of these he would only receive four, which would fully serve all his people for supper; and such is the nature of the climate, that no fish will keep fresh above five or six hours. The king then ordered the remaining six to be dressed for keeping, and sent to the cove in the morning. Their method of cleaning and dressing them is as follows: the fish is first well cleaned, washed, and all the scales taken off; then two sticks are placed lengthways of the fish, in order to keep it straight, in the same manner as sticks are placed across salmon in this country, when kippering. It is then bound round with broad plantain-leaves, and smoked over a slow fire. In this state it will be catable for at least two days, though not very pleasant to those unaccustomed to such a mode of preserving.

Next morning the king went to the wreck, and returned to the cove, and breakfasted on tea with Captain Wilson, three Artingall people being also of the party. After breakfast, the strangers were led through the works, and their surprise was nothing inferior to any that had yet been expressed. The guns particularly interested them, as the means by which so many of their countrymen had died, in a manner then incomprehensible.

In a few days they had a farther opportunity of seeing the effects of the muskets, by Mr. Benger's killing some pigeons while on the wing; they ran to the carcasses, and examined them very attentively, and, upon noticing the wounds, observed, that it was with such holes as these their countrymen died. On this occasion the Pelewites seemed to exult a little over their neighbours, on the ignorance which they shewed of the use of fire-arms. The people of Artingall, however, retained no animosity on this account, but seemed perfectly happy and at ease.

The schooner being now nearly completed, a consultation was held, to fix on the safest method of launching her, which was agreed to be lay-ways. They had neither pitch nor rosin to pay her with. This want necessity taught them to supply, by burning coral-stone into lime; then, sifting it thoroughly, they mixed it up with grease, and found it an excellent succedaneum.

Some time before this, Madan Blanchard, one of the common sailors, about twenty years of age, who had accompanied the natives in their different expeditions, had expressed a desire, to some of his comrades, to be left behind. At first it was supposed he was not in earnest; but when the captain was apprised of his real inclination, he endeavoured to dissuade him from such an unaccountable step. Finding, however, that no arguments could make any impression on his mind, or shake his resolution, he determined to make a merit of necessity; and, therefore, when Abba Thulle came down to Oroolong, to attend the

launching of the vessel, he signified to his majesty, that, as a return for the hospitality with which the English had been treated, they would leave him one of their comrades, who was fully qualified to manage the great guns and other things that were to be presented to him at their departure. The idea was by no means thrown away; the king was gratified beyond measure.

All the crew were extremely sorry to part with Blanchard; and they lost no opportunity to speak in his behalf to the natives. It is, indeed, very difficult to conjecture what motives could urge him to forsake that class of mankind, among whom he had hitherto lived, and be separated from them, perhaps, for ever.

What rendered his resolution the more extraordinary was, its being known that he had formed no particular attachment on the island; but man often displays singular freaks, and, perhaps, his real motives will ever remain unknown. He certainly was courageous in an eminent degree, and no quality is more valued among the natives. Unfortunately, he could neither read nor write; therefore, should succeeding navigators fall in with him, he might have been able to furnish memoirs, which would have interested every admirer of simple nature; and every heart of sensibility must feel an anxious desire to know the fate of a man, who made himself a voluntary release from the rest of the world.

As Abba Thulle, Raa Kook, and the natives in general, considered his remaining among them as a very great compliment, they were resolved to render him happy; and promised to make him a rupaek; and to give him two wives, together with a house and plantations.

We come now to contemplate a scene peculiarly interesting. On the appointed day the English proceeded, at an early hour, to make ready for the launch: it need scarcely be mentioned, that uncommon pains were taken to put every thing in the most favourable train for getting the vessel afloat. About seven o'clock, the king and his attendants were desired to be present, and in a little time the schooner was safely launched, to the general joy of every spectator, and, by Abba Thulle's desire, was named the Oroolong. Never was there a more affecting happy scene. Every eye seemed to sparkle with a lustre borrowed for the occasion. Every countenance beamed with animating joy and heart-felt satisfaction; but few among them could utter their feelings. Looks of congratulation circulated around, while every one shook his comrade's hand with warmest fervor. Home, wives, parents, children, friends—all—all seemed as within grasp. But description is unequal to this task. The behaviour of their Pelew friends, however, must not be forgotten. In their joy, which was also unbounded, real philanthropy was to be seen. They saw, by this occurrence, those friends, whom they valued, about to leave them; those friends by

whom they had been so much benefited, and from whom they had learned so much.—But they saw them happy.—They knew their whole comfort depended upon the success of this event, and, therefore, their benevolent hearts participated in the general joy.

After a very happy breakfast, they proceeded to carry every thing aboard, with all possible expedition, and in the afternoon, the flood-tide coming in, the ship was hauled into the basin, a deep place of four or five fathoms water; and, in the course of the day, they got on board all the provisions and stores, such only excepted as were to be given in presents to the king; and in the morning they took on board their anchors, cables, and other necessities, making bits, and fitting a rail across the stern of the vessel.

The weather and wind appearing favourable, the captain informed Abba Thulle, that they purposed sailing the next day. This very much distressed him; for he had sent word to the neighbouring rupacks, that the day following that now mentioned by the captain was the day the English meant to sail; in consequence of which they were to come to Oroolong the next night, to furnish them with provisions, and bid them farewell. This information only seemed to strengthen the captain's resolution of setting sail in the forenoon, as the number of canoes, to be expected would greatly incommode them. He, therefore, apologized in the best manner he could to the king, who appeared greatly disappointed. Abba Thulle then begged that the captain and officers would dine with him and his brothers on shore. With this they cheerfully complied, and, after dinner, the king signified his intention of investing the captain with the order of the BONE, and making him a rupack of the first rank. The captain expressed his acknowledgments for the intended honour, when the bone was drawn over his left hand, with great solemnity, by the chief minister and Raa Kook, on which the whole assembly testified their joy. The king then, addressing the captain, told him, "that the bone should be rubbed bright every day, and preserved as a testimony of the rank he held among them; that this mark of dignity must, on every occasion, be valiantly defended, nor suffered to be torn from his arm, but with the loss of life."

Our readers may probably smile at this simple badge of dignity; but they may at the same time recollect, that the object and the end are every where the same; and that a star on the breast, or a bone on the arm, in themselves are equally insignificant. All public honours hold out a prize to merit, and in this light only should they be regarded.

As a farther proof of Abba Thulle's confidence, he proposed entrusting Captain Wilson with the care of his second son, Prince Lee Boo, whose affecting story will soon

be recorded. The king's object in this was to improve the young man in the knowledge which he saw the English possess in an eminent degree, and to render him useful to his native country in future. Raa Kook also solicited permission to accompany them; but this request was refused from motives of policy.

Arra Kook, who, from the first, seemed to have set his heart on the Newfoundland dog, so warmly importuned the captain for his favourite, that it was impossible to resist his solicitations. But the general's intention was far otherwise employed. He was already building a ship in imagination; and, to realize his design, wished them to leave their launching-ways, saying he would go to work in the same place.

The king had laughed at the insignificance of Arra Kook's request of the dog; but the subject of ship-building caught his most serious attention. It was of national importance, and of course demanded the patronage of a good prince.

In the midst of their discourse, a battle on board the ship, between two sailors, called for the presence of the captain. The damage proved no greater than a bloody nose, which being settled, Mr. Wilson again returned. When the circumstance was explained to the king, he observed that there were, no doubt, bad men in all countries.

Permission was now obtained to hoist an English pendant on a tree near the cove, with the following inscription, on copper, to be placed on another tree adjacent:

THE HONOURABLE  
ENGLISH EAST-INDIA COMPANY'S SHIP,  
THE ANTELOPE,  
HENRY WILSON, COMMANDER,  
WAS LOST UPON THE REEF NORTH OF  
THIS ISLAND,  
IN THE NIGHT  
BETWEEN THE 9TH AND 10TH OF AUGUST;  
WHO HERE BUILT A VESSEL,  
AND SAILED FROM HENCE  
THE 12TH OF NOVEMBER, 1783.

Captain Wilson explained the purport of this inscription to Abba Thulle, who was greatly pleased with it; and, having explained it to his people, he assured the English, that it should carefully be preserved in remembrance of their visit.

The conversation this day was principally confined to the approaching separation. "When you are gone," said the king, "I much dread that the Artingalls will redouble their attempts against me; and, deprived of your aid, I shall probably feel the effects of that animosity they have always had against my people, and, having no more the

English to support me, I shall not be a match for them, unless you leave the few muskets you promised me.

The captain was willing to comply with this request immediately; but most of the officers, who still had apprehensions, were extremely loth to give up the arms till the last moment. That unlucky suspicion of being detained, which had so ungenerously taken possession of them, had been so rivetted in their minds, that it was not easily dislodged. It is necessary, however, not to condemn our countrymen too hastily. They had been accustomed to see roguery so generally and so scientifically practised, that distrust and suspicion are naturally instilled among the first principles of education; and it was not easy for them to conceive that the same species should be so very different, even at opposite quarters of the globe; but here they saw the open undisguised actions of nature, knowing no deceit, and dreading none.

Abba Thulle was too quick-sighted not to observe their distrust; and it is not easy to express the agitation which laboured in his breast, on finding that doubts were harboured of his sincerity. "Why," said he, "should you distrust me? I never refused you my confidence. If my intentions had been hostile, you would have known it long ago, being entirely in my power. But, on the contrary, you have had my utmost assistance; and yet, at the very last, you suspect me of bad designs!"

The earnestness of his manner spoke his feelings more than his words; nor can we doubt that a little recollection brought the blush into the countenances of those whom he addressed. The man who had uniformly behaved with such disinterested unsuspecting benevolence—the man who had freely committed his own son to their care, to be doubted within a few hours of their parting, was a stab, which the sensibility of Abba Thulle could not support. The severity and truth of his reproach, and the noble dignity with which he supported himself, brought the daring thought, which some had entertained, of murdering him and his brothers, to view, and gave a most captivating picture of the mild, yet forcible, triumph of virtue. They found themselves guilty, and saw evidently, that virtue will flourish in whatever soil she is implanted. Without farther hesitation, they sent on board for all the arms that could be spared; and, on the boats' return, presented him with five muskets, five cutlasses, more than half a barrel of gunpowder, and flint and ball in proportion. Once more harmony was restored, and the generous Abba Thulle forgot, or seemed to forget, their unjust suspicions.

The king's second son, Lee Boo, arrived in the evening, under the care of his elder brother, and was presented by Abba Thulle to the captain and the officers. He advanced in so easy and polite a manner, having much good humour and forcible expression in his aspect, that every

one was immediately prepossessed in his favour. As it was now growing dark, the officers went on board, leaving the captain behind, at the king's request. Next day Mr. Wilson informed them, that neither he, the king, nor the rupacks, enjoyed much rest, the affectionate father employing the moments in giving advice to his son, and in recommending him to the care of the captain; not, however, from the smallest fear that he would be ill-treated: "I would wish you," said he, "to shew my son every thing that is useful, and make him an Englishman. The fine things he will see may probably induce him to slip away from you in search of less confined gratifications; but I beg that you will contrive to calm and subdue the rashness and impetuosity of his youth. I well know, from the different countries he must pass through, that he will be liable to dangers, and even to diseases, that we never heard of, which may kill him; but I also know that death is the common lot; and whether he dies with you, or at Pelew, is of no moment. I know you are a man of humanity, and am, therefore, confident, that if my son be sick, you will look on him with kindness. But should that happen, which your utmost care cannot prevent, let it not deter you or your brother, or any of your countrymen, from returning, for I shall rejoice at the sight."

The captain assured the king, that he might rest satisfied of the care and affection with which his son would be treated. Before Mr. Wilson came on board, he admonished Blanchard (the man who had resolved to renounce his country) as to his conduct among the natives. He desired him to be watchful of the arms and ammunition that would be left behind, that they might defend themselves from their enemies. He begged him not to go naked, like the natives, as it might lessen his importance with them as an Englishman, and countenance an evident indecency; and that he might have no excuse from the want of clothes, all that could be spared was left him, in order that, if he accepted the king's offer of wives, he might be enabled to dress them somewhat after his own custom. The captain did not forget to enforce on him the absolute necessity of continuing his religious duties, and to be particular in keeping the christian sabbath. After this, he was requested to ask any favour that might tend to his future comfort; on which he begged to have one of the ship's compasses, and the masts, sails, and oars, belonging to the pinnace, which also was intended to be left behind.

Early on Wednesday morning, an English jack was hoisted at the mast-head of the Oroolong, and a signal fired, as a signal for sailing; which being explained to the king, he ordered all the provisions on board which he had brought for the voyage. A great number of canoes surrounded the vessel, loaded with presents, so that it was with difficulty they could avoid being overstocked. When just ready for sea, a boat was sent on shore for the cap-

tain, who then took Blanchard and the men of the boat into a temporary hut that had been erected, and making them kneel, offered up thanksgivings to that Divine Being who had supported their fainting spirits through so many hazards and toils, and at last opened to them the door of deliverance. He repeated his advice to Blanchard, earnestly begging him not to forget his religion.

About eight o'clock the captain went on board, attended by Abba Thulle, Lee Boo, the rupacks, and Blanchard. It being doubtful, as the vessel was heavily laden with provision, whether she would be able to get over the reef, it was resolved to land the two six-pounders, and leave the jolly-boat behind, as they had nothing wherewith to repair her, and she was almost worn out. In her room Abba Thulle was at great pains to procure them a proper canoe.

Captain Wilson had recommended Mr. Sharp, the surgeon, to Lee Boo, as his *sucalic*, or friend, and the young man stuck by him with the greatest attention, attending him to whatever part of the vessel he moved, as his mentor on all occasions. Blanchard now got into his pinnace, in order to take the vessel in tow, and parted from his old ship-mates with as much composure as if conscious that they should meet again after a short absence. He shook hands with them with the same indifference as if they were to sail down the Thames on a coasting voyage—a striking contrast to what followed!

The vessel now proceeded towards the reef, laden with Abba Thulle's bounty, to a degree of superfluity, and surrounded by great numbers of the natives in their canoes, who had every man brought his present for their good friends the *Englees*. What a luxurious sight to a feeling heart!—There was no room for them, yet every one exclaimed, "Only this from me, only this from me;" and, if refused, they repeated their requests with supplicating countenances and tears in their eyes. Indeed, their generosity and affection were so urgent, that a few trifles from the nearest of them were accepted; while the others, unable to bear the seeming neglect, paddled a-head, and put their little presents into the pinnace.

Several canoes went before the vessel to point out the safest track; and others were waiting at the reef to shew them the deepest water; from all these precautions, which were directed by the king, the reef was fortunately cleared without any accident.

The king now came along-side, and gave Lee Boo his fervent blessing, which the youth received with great respect and tenderness. He next embraced the captain, in much apparent distress, and then cordially shook hands with all the officers, crying "You are happy because you are going home, and I am happy because you are so, but still very unhappy at your going away." Once more renewing his assurances of regard and good-will, he left the

vessel, and went into his canoe. The natives, who were to return with the king, looked up to the vessel eagerly, with the most expressive countenances, and half dissolved in tears. This proof of delicate sensibility, and of unfeigned affection, operated so strongly on the feelings of all aboard, that it was with much difficulty they summoned resolution enough to give three cheers at their final departure.

Raa Kook remained, with a few of his attendants, to see them out of danger beyond the reef; but he was so deeply dejected, that the vessel had gone a great way before he thought of summoning his canoes to return. As he had been their first friend, the captain gave him a brace of pistols, and a cartouch-box with cartridges; and the moment of separation being now come, he appeared so much affected, that it was some time before he could speak. Pointing to his heart, he said it was there he felt the pain of bidding them adieu. He endeavoured to converse with Lee Boo, his nephew; but, being unable to proceed, he precipitately went into the boat, and giving them an expressive glance, as if his mind was convulsed, he instantly dropped astern; and thus terminated the connection with the natives of Pelew, after a residence among them from Sunday the 10th of August, 1783, to Wednesday the 14th of November following.

*Situation, Climate, Soil, and Productions.*] The Pelew Islands are situated between five and nine degrees of north latitude, and between one hundred and thirty and one hundred and thirty-six degrees of east longitude from Greenwich, and lie in a north-east and south-west direction. From the description of the country it appears to be mountainous, but some of the valleys are represented as very beautiful, and affording many delightful prospects; and the climate is temperate and agreeable.

All that part of the country which Captain Wilson and his crew had an opportunity of seeing, was covered with trees of various kinds and sizes, some of which must have been extremely large, as the natives formed their trunks into canoes capable of carrying twenty-eight or thirty men. Among the timber-trees were noticed the ebony, and a tree which, on being pierced or otherwise wounded, yielded a white liquor, of the consistence of cream. Here was also a species of the manchineel-tree, the sap of which frequently blistered the skin of the Europeans, who were employed in felling it. This the natives reckoned among their unlucky trees, and advised the strangers not to use it.

But the most curious tree noticed at Pelew was one, in its size and manner of branching; not unlike the cherry-tree, but, in its leaves, resembling the myrtle. Its chief peculiarity was, that it had no bark, but only an outward coat, of about the thickness of a card, which was darker than the inside, though equally close in texture. Its colour was nearly that of mahogany, and the wood was so

extremely hard, that few of the tools belonging to the Europeans could work it. Besides the above-mentioned trees, the English found cabbage-trees, the wild bread-fruit, oranges, lemons, and a tree whose fruit bore some resemblance to an almond; but yams and cocoa-nuts, being their principal articles of sustenance, claimed their chief attention.

No quadrupeds were found in these islands except rats; but, with respect to birds, there were great numbers of common cocks and hens, which, though not domesticated, kept running about near the houses and plantations; and what appears extremely singular is, that the natives had never made any use of them till our people told them they were excellent eating. Pigeons they accounted a great delicacy; but none except those of a certain dignity were permitted to eat of them. The English left them two geese, which were the only remains of their live-stock. It seems, that no river was observed at Pelew; the supplies of fresh water being obtained from small streams and ponds, which are pretty numerous.

Few parts of the globe are better supplied with fish of all kinds, particularly mullets, crabs, oysters, muscles, &c.; but the fish most esteemed among the natives is the shark, the greater part of which they reckon extremely delicious. Several kinds of shell-fish they eat raw, in preference to dressed. They have no salt, and have but little conception of seasoning to any thing they eat. When they eat any thing raw, however, they generally squeeze a little orange or lemon juice upon it.

*Customs, Manners, Government, &c.*] The natives of the Pelew Islands are in general stout, well made, and athletic. Many of them appeared to be uncommonly strong. They are in general about the middle size, and universally of one tinge as to complexion, not wholly black, but of a very deep copper-colour. The men have their left ear bored, and the women both. They wear a particular leaf, and at times an ornament of shell in the perforated ear. Their noses are also ornamented by a flower or sweet shrub, stuck through the cartilage between the nostrils. This custom is not peculiar to Pelew, but is found in many oriental nations, and probably proceeds from their great desire for sweet scents; and though at first it appeared rather disagreeable from want of use, it is certainly a more pleasant and becoming refreshment to the nose than the use of tobacco, either in substance or in snuff.

Their teeth are dyed black; but the English could never learn the method by which it was done, nor farther than that it was accomplished by means of some herbs, when young, and that the operation was very painful. The tatooing the body is also done in youth, though not altogether in childhood.

The only appearance of any thing like dress among

these natives is in the female sex, who generally wear a piece of mat, or the husks of cocoa-nuts, dyed, about nine or ten inches deep, round their waist. Some of these aprons are very neatly made, and ornamented with a kind of beads. Abba Thulle's daughter, Erra Bess, gave Henry Wilson a present of a very neat one, to carry to his little sister.

From the most attentive observations and enquiries the English could make, they were able to collect that the inhabitants of Pelew believed in one Supreme Being, and a future state of rewards and punishments, but had few religious rites or ceremonies.

It was very clear that they had some strong fixed ideas of divination. When Lee Boo set out to sea, he was, for several days, uncommonly sick; and he then told Mr. Sharp, he was sure his father and friends were very sorry for him, for they knew what he underwent. He was also prepossessed with the same notion when near his dissolution.

That they understood the spirit existed after death, Lee Boo declared while he was in Britain. For when Captain Wilson informed him, that the intention of going to church was to reform men's lives, and that they might go to heaven; he replied, that, at Pelew, bad men stay on earth, and good men grow very beautiful, and ascend into the sky.

One particular mode of divination was observed, and considered to be peculiar to the king, as none of his subjects ever used it. There is a plant, not unlike the bulrush, by splitting the leaves of which, and applying them to the middle finger, he judged of the success of any occurrence of moment. Before the first expedition to Aringall, it was noticed that the answer was very favourable; but, when about to sail on the second, the oracle did not appear altogether so agreeable. Abba Thulle, therefore, would not suffer his people to enter their canoes until he had twisted his leaves in such a manner as he thought appeared more favourable.

As the general character of the natives of Pelew must be now pretty well imprinted on the reader's mind, a very few additional observations may suffice. Humanity is the prominent feature in the picture. The English were cast upon their territories, in a state the most helpless that can well be conceived; twenty-seven men, without even the common necessities of life, entirely dependent on their bounty; fed, supported, assisted in their labours, and every thing done for them that was in their power. Let us only for a moment consider the hourly bounty which was poured in upon them, not of their useless provender, but, as the English had many occasions to observe, their best provisions were cheerfully given to the strangers, while many, perhaps, were scanty enough at home. Only recollect the parting scene. See the crowding canoes

holding out presents, not the distant effects of complaisance, but the warm effusions of philanthropy!—Could ostentation, pride, or the hope of retribution, influence them? By no means; it was kindness to men they never expected to see again.

Here it may not be unseasonable to make a few general observations on the different characters of Abba Thulle and Raa Kook, to whom our countrymen owed so many obligations.

Never was a prince more formed to attract and retain the love and admiration of his subjects than Abba Thulle: his appearance was majestic, and he commanded with authority; while his affability and easy access rendered him almost an object of adoration to all his subjects. In his councils there was as much respect paid to his naked undressed person as to an European potentate, amidst all his trappings and pageantry, from the surrounding sycophants. His nice honour and quick feeling were very discernible on many occasions; never was there a reproof more delicate, and yet more poignant, than what he gave the English, on occasion of the affair with the muskets. He was far from one of those harmless beings who hurt nobody because they have not a sense of injuries; while the warmth and sensibility of his heart won the love of all around him, his dignity of manner, and propriety of conduct, taught them to approach him with respect. He possessed a contemplative mind, and few objects came within his observation without being attentively considered. The prosperity of his subjects was the principal object of his attention. It was this that led him to part with his son Lee Boo, whom he tenderly loved—for thus he was at so much pains in examining every thing about the English that might be serviceable to his people—in fine, his whole time was taken up in forming and executing plans for the good of the nation and individuals. In domestic life he appeared to peculiar advantage, and took a particular charge of all his own relations; the misbehaviour of his nephew, in an affair of some importance, seemed to give him the greatest pain; while, as the husband and parent, his heart seemed awake to every finer feeling which adorns humanity.

His brother, Raa Kook, was a prince of so universally engaging demeanour, and whose every action expressed something so truly valuable, that Englishmen or natives equally admired him. He was so much a friend to the English, that it may be suspected their account of him is partial; therefore, little shall here be said, and that little not exaggerated.

His natural temper was cheerful and pleasant, though without that mimicry and humour for which his brother Arra Kook was remarkable; at the same time he was far from averse to a hearty laugh, when a proper occasion offered. As commander-in-chief, he was beloved by all:

he dispensed his orders calmly and smoothly; but would not tolerate neglect. No man better understood the necessity of strict discipline: so that, while he encouraged his inferiors to use all becoming freedom with him, he kept them at that proper distance, which is the true key to cheerful obedience. In principles of honour he was by no means inferior to his brother; and not only wished that the English should hold him in an honourable point of view, but all the nation; thus it was that he could not bear the least idea of pilfering among them, and, if any thing were missing, Raa Kook soon discovered and punished the delinquent. One day, a chief rupack sought a cutlass from Captain Wilson, in his hearing; the frown instantly appeared, nor would he suffer it to be given. He was exceedingly delicate in receiving favours himself; and though, from his particular disposition, in enquiring after causes and effects, many things about the English were highly prized by him, he was particularly attentive that nothing should betray any desire for what he thought might not be proper to be given.

His deportment in his family was remarkably pleasant, even to a degree which many, in this age of dissipation and stoicism, might reckon silly; but let it be noticed, that, though the finer feelings shone in the natives of Pelew to a length many in Britain would call effeminate, yet, in fatigue, pain, distress, and death, they appeared as heroes indeed.

Their native politeness was constantly observable; and although they possessed a degree of curiosity beyond any of the South Sea islanders, they never knowingly intruded, when it was inconvenient. In them it was evident that good manners are the natural result of good sense.

The attention paid by the men of Pelew to their wives, is very uncommon in most parts of the world; and gives a very amiable idea of their domestic lives.

Their marriages seemed to consist in a serious solemn contract, without any formal ceremony; but they are strictly faithful to each other, and the utmost decency of behaviour is uniformly supported. A plurality of wives is allowed, though the common people generally confine themselves to two, a rupack to three, and the king to five. They name the children soon after they are born, without any ceremony. One of Abba Thulle's wives bore him a son while the English were there, which he named Captain, in honour of Captain Wilson. They are far from being naturally lascivious, and the utmost decency is preserved among them. One of the English, endeavouring to show a marked attention to a female, was repulsed in a manner that prevented any farther attempts.

They are, in general, an active laborious set of people, possessing the greatest resolution in cases of danger, patience under misfortunes, and resignation at their death.

Except a few rupacks, there was but little subordinate

tion of rank; consequently their employments were pretty much the same. Fencing their plantations, planting yams, making hatchets, building houses and canoes, mending and preparing fishing-tackle, forming darts and warlike weapons, with domestic utensils, and burning chinam, may be said to comprise the whole routine of their avocations.

Those who had a particular turn for mechanical operations, or any uncommon pieces of work, they called tackle-bys: it was to them the king often gave particular orders to observe the building of the schooner. Idleness was tolerated in none; the women were as laborious as the men, and the king and rupacks were as much employed as any. Abba Thulle was the best maker of hatchets in the island; and generally laboured at them when disengaged from affairs of state. They had no idea of unemployed time, and therefore it is, that, without the proper tools for finishing a fine piece of work, practice had taught them, even with their coarse implements, to execute what a British artist could not have conceived practicable. Their mats, baskets, and ornaments, are so curiously wrought, that, when their simple tools are considered, the ingenuity is more to be admired than much superior productions, executed under the advantages which are possessed by European mechanics.

That equality of station which appeared evidently among them, and ignorance of those luxuries which civilization introduces, proved no inconsiderable sources of their happiness. The one prevented that ambition which is too often destructive to society, and the other those cares which are generally awakened by affluence. In all the connection which the English had with them, robbery or rapine was never named. Nature, it is true, allowed them little, but that little they enjoyed with content. Human nature here shone in most amiable colours. Men appeared as brethren. Uninformed and unenlightened, they grasped at nothing more than competency and health. Linked together as in one common cause, they mutually supported each other. Courteous, affable, gentle, and humane, their little state was cemented in bonds of perfect harmony.

The king was the chief person in the state, and all the homage of royalty was accordingly paid to his person. He was supreme in the greater part of the islands which came within the observation of the English; but Artingall, Pelaw, Emungs, and Emellegree, appeared to be independent, though, from any thing that could be observed or heard, their form of government was exactly similar.

The general mode of making obeisance to the king, was by putting their hands behind them, and bowing towards the ground; and this custom prevailed, not only when passing him in the streets and fields, but when they passed the house in which they supposed him to be. His carriage and demeanour was stately and dignified, and he supported his station very becomingly. He devoted the forenoon to public business, and decided every matter of state in a

council of rupacks. They assembled on a square pavement in the open air; the king being placed in the centre, on a stone of larger size than those of the rupacks. They seemed to deliver their minds with freedom, as matters occurred; and the assembly was dissolved by the king rising up.

The afternoon was devoted to receiving petitions, hearing requests, and deciding controversies. These, it may easily be supposed, seldom occurred; for as their property was small and of little value, and as there were no lawyers nor their emissaries to foment disputes, the proper barriers of right and wrong were easily defined. Wrangles and fighting seldom happened, for even a dispute between children was checked by a severe frown, and their impetuosity bridled. When any real injury was done by any one to his neighbour, it was a pleasing sight to see how justice was administered. Their laws were the simple dictates of conscience, as to right and wrong between man and man. No artful eloquence, nor enticing words of wisdom, were used to mask vice under the cloak of virtue. None of these subtleties could be employed, by which fraud and oppression could be screened. Oaths were unknown, and the simple dictates of truth directed the judge; nor were there any punishments of a corporal kind. To be convicted of injuring a neighbour, was to them more gallant and disgraceful than any pillory yet invented by European ingenuity.

Messages were transmitted to the king with great ceremony. The messenger never was admitted into the presence, but delivered it to an inferior rupack, who reported the message to his majesty, and brought his answer.

The general was next in authority to the king, and acted for him in his absence. He summoned the rupacks to attend when needed, and had the chief command of all the forces; though, it was observed that, in actual engagement, when the king was present, he himself took the lead.

The general was to succeed the king in case of his death, and on his demise Arra Kook; when the sovereignty would again revert to Abba Thulle's eldest son, then to Lee Boo, and so on. The king had always an attendant, who, though not so high in office as the general, was more constantly about his person. He was considered as the principal minister, and a man of judgment. He never bore arms, nor went on military expeditions. It was remarked, that he had only one wife, and never invited any of the English to his house.

The rupacks were very numerous, and considered in the same light as the nobility are in Britain. They were of different orders. They all attended the king on command, every one bringing with him a certain number of dependants, with their canoes, spears, and darts.

Our readers may here trace a similitude to the feudal system; but as the knowledge the English acquired of these

matters was very certain. They were for time to deliver sent is, that, in the end, it was a

matters was very superficial, nothing conclusive can be ascertained. These, and many other things, must be left for time to develop. All that can be said farther at present is, that, whatever was their precise mode of government, it was admirably adapted for the people.

All the island appeared populous, but the number is not easily conjectured. There were four thousand active men in the expedition against their enemies; and, it was evident, many more were left at home, whose service was not deemed necessary.

The method they took for building houses, was very ingenious. They raised them three feet from the ground, in order to prevent damp. This space they filled up with solid stone, and overlaid it with thick planks, as a floor. The walls were built of wood, very closely interwoven with bamboos and palm-leaves, so that no cold or wet could possibly come through. The roof was pointed in the same manner as village-houses are in England. Their windows come down on a level with the floor, answering also the purpose of doors; and have a sort of shutters, which are occasionally used. Their fires are kindled in the centre of the room, for all the house is in one room, the fire-place being sunk lower than the floor.

Their canoes are made of the trunks of large trees, in the same manner as those throughout the South Seas, but with surprising neatness. They ornament them with shells, and paint them red. They are of different sizes, but the largest will not carry more than thirty people. The natives row with great ability, inasmuch that the canoes made on purpose for swift sailing seem scarcely to touch the water, moving with a velocity almost inconceivable.

Their domestic implements are few in number, and very simple. They are the evident productions of necessity, well calculated to answer the ends intended, without much ornament.

Their knives are made of shells, which they sharpen to such an edge as fully answers all common purposes. Their drinking cups are made of cocoa-shells, which they polish with great art.

Their articles for ornament were far from being numerous. The king had a very fine tureen, somewhat in shape of a bird, and finely ornamented with various devices, very neatly cut out upon it. This he presented to Captain Wilson. It held about thirty-six English quarts.

The tortoise-shell they wrought into various little dishes, spoons, trays, and other vessels. The shell they have in these islands is of a very beautiful kind, but their manner of working it the English could never get an opportunity of observing.

*Historical Account of Prince Lee Boo, a Native of the Pelew Islands.*

This amiable young prince had cheerfully thrown himself

into the protection of a handful of men, concerning whose existence he had, but a few weeks before, been utterly ignorant; deserting his native country, his friends, and his all, in order to obtain such knowledge among the Europeans as might probably enable him, on his return, to render some important services to his royal father and his beloved countrymen.

As the English were on their way to China, Captain Wilson instructed him as to decency in his appearance, and desired he would dress as they did. He did so; but soon threw off his coat and jacket, as insupportably cumbersome; though he retained the trowsers, as decency required, and would never afterwards part with them. As they began to advance into a colder climate, he soon resumed the coat and jacket.

His notions of delicacy, from what had been told him, and from what he observed among the English, gradually increased, so that he would not so much as change any part of his dress, unless when by himself. He washed himself several times a day, and kept his clothes, and everything about his person, remarkably clean.

On their arrival at Macao, the Portuguese governor paid Captain Wilson and his crew every possible attention, and sent plenty of provisions, of all kinds, to the men on board the ship; informing them, at the same time, that peace was re-established in Europe.

Captain Wilson, Lee Boo, and the officers, had lodgings appointed them on shore, except Mr. Benger, who took the command on board. An express was immediately forwarded to the company's supercargoes at Canton, informing them of their arrival and situation.

Mr. M'Intyre, an old acquaintance of Captain Wilson's, paid them uncommon attention, and insisted on their lodging in his house. He had a Portuguese gentleman in company with him, who invited them to his house, in their way to Mr. M'Intyre's, principally on Lee Boo's account, whom he wished to introduce into his family. His house was, therefore, the first into which Lee Boo entered, and his surprise on this occasion cannot be easily described. The rooms, the furniture, and ornaments, crowded so many new objects on his mind at once, that he was perfectly lost in amazement. It was remarkable, however, that, amidst all his confusion, his behaviour was perfectly easy and polite; and, as he observed that he excited the same curiosity in others that they did in him, he very politely permitted them to examine his hands, described the tattooing, and appeared highly gratified with the attention paid him.

On their way to Mr. M'Intyre's, Lee Boo displayed his native benevolence very remarkably. Observing the poor Tartar women, with their children tied to their backs, begging, he distributed among them all the oranges and other things he had about him.

When they reached Mr. McIntyre's, it was late, so that the table was covered for supper, and the room elegantly illuminated. A new scene here burst upon Lee Boo's attention, and the whole seemed to him as the effect of magic. A large mirror, at the upper end of the room, particularly attracted his notice. He saw his complete person, and supposed it to be somebody behind, very like himself. He looked, laughed, and looked again, not knowing what to think. Indeed, the mirror had a surprising effect on more than Lee Boo. The Englishmen had seen every one his neighbour's face, during all their distress, but no body had seen his own. The hollow-eyed long-visaged appearance they now made, to what they formerly recollected, cast rather a melancholy impression upon their minds.

The next day Lee Boo spent mostly in examining Mr. McIntyre's house, in which he found abundance of new objects to surprise him. The other gentlemen, in the mean time, went about purchasing such little commodities as they stood in need of, and every one bought some little trinket for Lee Boo. Among the rest was a string of large glass beads, which almost distracted the poor prince with surprise and admiration. He conceived himself possessed of greater treasures than all the Pelew Islands could afford: he ran to Captain Wilson, enraptured with his property, and begged that a small Chinese vessel might be hired to transport them to Pelew, and desired his father might be informed, the English had carried him to a fine country, from whence he would soon send him some other presents; at the same time adding, that if the persons Captain Wilson should employ faithfully and expeditiously executed their trust, he would reward them with two glass beads.

While at Macao, Lee Boo had frequent opportunities of seeing people of different nations, but soon gave a decided preference to the English, especially the ladies. It has been already mentioned that there are no quadrupeds at the Pelew Islands, and that the Newfoundland dog left there was the first of the species they had seen. They called him Sailor, which name Lee Boo now applied to every quadruped he saw. Horses were his great favourites, he called them clow sailor, or great sailor. He would often go to the stable, and stroke their mane and neck, and soon ventured to mount them. He intreated Captain Wilson to send a horse to his uncle, Raa Kook.

In a few days Captain Wilson received letters from Canton; the supercargoes desiring him to draw for what money he needed, and ordering the men to be supplied with every necessary in abundance. The kindness shewn them on this occasion, by all ranks, at Macao and Canton, all the officers and men acknowledged in the warmest terms. Captain Wilson and his company embarked for Whampoa, in the Walpole, Captain Churchill, leaving

Mr. Benger to take care of the Oroolong, and dispose of her.

In a few days they arrived at Canton, having been entertained all the way by Lee Boo, whose admiration of, and sensible remarks upon, every new object, astonished all who had an opportunity of conversing with him. He was greatly surprised at the various dishes of meat which he saw successively set before him, alledging, that his father, though a king, was happy to serve himself with a few yams and cocoa-nuts; while here the gentlemen had a great many dainties, and servants attending them while they were eating. Observing a sailor in a state of inebriety, he said he would not drink spirits, as they were not fit for a gentleman.

An instance of Lee Boo's strong attachment to those he knew may be here mentioned, which will serve to point out this striking feature, not in his character only, but in all his countrymen. One day, while sitting at a window, which looked towards the sea, he observed a boat making towards shore, in which were Mr. Benger and Mr. McIntyre. His joy was so great, that he did not take time to tell Captain Wilson or any other in the room the cause of his emotion; but, springing from his seat, flew to the shore in a twinkling. Immediately on their landing, he shook hands with them so heartily, and with such warm expressions of friendship, as sensibly affected them.

Lee Boo became a universal favourite wherever he appeared; as his good-natured and pleasant behaviour made him acceptable in every company. He one day surprised a company of gentlemen with his dexterity in throwing the dart. A party was formed to have a trial of skill in the factory-hall. They hung up a gauze cage, and a bird painted in the middle. They stood at a considerable distance, and with much difficulty hit even the cage. When Lee Boo's turn came, he took up his spear very carelessly, and, with the greatest ease, struck the little bird through the head. He had one day an opportunity of seeing some blue glass, which greatly delighted him. It was a colour he had not before seen. The gentleman, in whose house it was, made him a present of two jars, of the same colour, which greatly delighted him. "O! were it possible," he exclaimed, "that my friends at Pelew could see them!"

As the time was now near at hand when the company's ships would sail for England, Captain Wilson laid before his people an account of the produce from the Oroolong, and other articles, which had been sold, and, giving to every one an equitable share, he addressed the whole company nearly as follows: "Gentlemen, the moment being now arrived, when every one may advantageously follow his own inclination, I cannot part with you without testifying my approbation at the spirited, judicious, and manly conduct you have preserved amidst our trying difficulties;

and be assured present your regard, and I will be as faithful as I can."

toils."

If mutual adversity be supposed capable of reconciling  
the most inveterate enemies, surely the sufferings of friends  
must rivet a more forcible affection; and every one now  
appeared to feel the weight of the remark; for a tender  
concern was manifest in every countenance. The conduct  
of Mr. Wilson had been so mild and prudent, and his ex-  
ample so animating, that they still wished him for their  
commander. But it was not now a time for choice. Nec-  
essity and reason pointed out their course. Lee Boo  
and the captain came home in the *Morse*, and the sur-  
geon in the *Lascelles*; while others embarked in different  
vessels.

The *Morse* was commanded by Captain Elliot, with  
whom Lee Boo made himself very happy. His spirit of  
enquiry, concerning various objects which he saw, began  
now to be directed more to their utility than formerly;  
and he evinced no small anxiety to obtain as much know-  
ledge as possible, with regard to such articles as would  
be useful at Pelew. His method of keeping his journal  
was extremely singular. He had a string, on which he  
tied a knot for every remarkable object he wished to im-  
print on his memory. These knots he examined daily,  
and, by recollecting the circumstances which occasioned  
their being cast, he fixed the transactions firmly on his  
memory. The officers of the *Morse* humourously re-  
marked, when they saw him referring to his hempen  
tablet, that he was reading his journal.

Early in the voyage, he asked for a book, that, with  
assistance, he might learn the English alphabet, which  
was given him: and, on being taken to see a school at  
St. Helena, he appeared so conscious of his own defi-  
ciency, that he begged he might learn like the boys.  
While here, he had some opportunities of riding on horse-  
back, of which he was very fond. He galloped with  
great ease, and sat his horse very gracefully.

Before the *Morse* sailed from St. Helena, the *Lascelles*  
arrived there, so that he had an interview with his first  
friend, Mr. Sharp. He was exceedingly happy with that  
gentleman, for whom he had the most affectionate regard.

When the *Morse* approached the British Channel, the  
number of ships that passed confounded his journal, and  
he was obliged to discontinue his memorandums. But,  
on landing at Portsmouth, the objects which met his view  
were so stupendous and grand, that he was involved in si-  
lent astonishment, and ceased to ask questions.

The captain, being impatient to see his family, pro-  
ceeded immediately to London, and left Lee Boo under  
the protection of his brother; who, however, soon after,  
set off in a stage-coach with his charge. Describing his

journey, he said he had been put into a little house, which  
horses run away with, and that, though he went to sleep,  
he did not stop travelling.

On his arrival in the British metropolis, he appeared  
extremely happy to meet with his mentor, his new father,  
whom he was afraid he had lost. Being conducted to his  
chamber, he could not conceive the use of the bed, it  
being a four-post one, and, of course, different from what  
he had seen on board. Before he would repose himself,  
he jumped in and out of it several times, to admire its  
form, and intimated that in England there was a house  
for every thing. It was all fine country, fine streets, fine  
coach, and house upon house up to the sky; for, the huts  
at Pelew being only one story, he considered every floor in  
London as a distinct house.

Captain Wilson introduced Lee Boo to some of the  
East-India directors, and to most of his friends; and, at  
the same time, shewed him the most conspicuous public  
buildings; but his prudent conductor kept him from thea-  
trical and other exhibitions, lest the heat of the place  
might communicate the small-pox; but the sequel will  
shew that all precaution was unavailing.

He was sent to an academy at Rotherhithe, where he  
was very assiduous in learning to read and write; and his  
remarkable gentleness and affability soon rendered him the  
favourite of all his school-fellows. During the hours of  
recess, he amused his benefactor's family by mimicking  
such peculiarities as he observed in the boys at school.  
He said that, when he returned to Pelew, he would keep  
an academy himself; and he imagined the great men of  
his country would think him very wise, when he showed  
them their letters.

He always called his patron captain; but he would ad-  
dress Mrs. Wilson no otherwise than his mother, although  
he was told to the contrary, conceiving it a tender expres-  
sion.

When he saw the young asking charity, he was highly  
offended, saying they ought to work; but the supplications  
of the old and infirm met his natural benevolence.—"Must  
give poor old man;" said he, "old man no able to work."

At this time he appeared to be about twenty years of  
age, and of a middle size. His expressive countenance,  
great sensibility, and good humour, instantly prejudiced  
every one in his favour. His eyes were so strikingly ex-  
pressive, that, though he knew very little English, his  
meaning was easily understood.

His quickness of manner and readiness of apprehension  
were astonishing. A young lady, with whom he was one  
day in company, sat down to the harpsichord, in order to  
discover how it affected him. To the music he paid little  
attention, but he was greatly interested to discover how the  
sounds were produced. He at the same time sung a song  
in the Pelew style, but it was very harsh.

We have already observed, that he was naturally polite. One day, at dinner, Mrs. Wilson desired him to help her to some cherries, when Lee Boo very quickly proceeded to take them up with his fingers. She pleasantly hinted his error, when he immediately took up a spoon, his countenance at the same time being suffused with a blush.

Captain Wilson, one day, happening to rebuke his son for some trifling neglect, in the presence of Lee Boo, the generous prince was not happy till he had joined their hands, which he did with the tears of sensibility streaming from his eyes.

He was very fond of going to church, because he understood it was a religious duty, the object and final end being the same both at Pelew and in England.

He preferred riding in a coach to every other conveyance, as it allowed people, he said, an opportunity of talking together.

He was present at Lunardi's aerial ascension; and remarked, that it was a ridiculous mode of travelling, as it could be done so much easier in a coach.

He narrowly examined all plants and fruit-trees, and said he should take some seeds of each to Pelew. Indeed, in all his pursuits, he never lost sight of what might prove serviceable in his own country.

Being shown a miniature of Mr. Keate, to whom he was introduced, he immediately recognised the face; and, as a proof that he understood the intention of the mimic arts, he observed, "that when Misser Keate die, this Misser Keate live." His own likeness was taken by a daughter of that gentleman.

It is with extreme pain we add, that in the midst of Lee Boo's innocent researches, he was taken ill of the dreadful small-pox. Dr. Carmichael Smith immediately attended him, and, in the first stage of the disorder, predicted the fatal consequences which ensued. He cheerfully took the medicines that were administered, and willingly dispensed with the sight of Captain Wilson, when he was told that he never had the disorder, and that it was infectious. In the midst of his illness, hearing that Mrs. Wilson was confined to her chamber, he cried—"What, another bad?—Lee Boo get up to see her:" which he actually did.

Viewing himself in a glass just before his death, he turned his head away in disgust, at the appearance of his face, which was sadly swelled and disfigured. Getting worse, and sensible of his approaching fate, he fixed his eyes attentively on Mr. Sharp, the surgeon of the Antelope, and said:—"Good friend, when you go to my country, tell my father that Lee Boo take much drink to make the small-pox go away, but he die—that captain and mother very kind—all English very good men—was much sorry he could not tell Abba Thulle the great many fine

things the English got." He then enumerated all the presents he had received, which he begged the surgeon to distribute among his friends and the rupacks.

The dying discourse of this amiable prince so affected Tom Rose, who attended him, that he could not help sobbing most piteously, which Lee Boo observing, asked "Why he should cry so, because Lee Boo die?"

The dreadful moment of separation being at length arrived, he told Mr. Sharp he was going away; and yielded his last breath without apprehension, and with that native innocence and simplicity which had marked his every action.

The family, the servants, and those who knew him, could not withhold the tears of affectionate regard, when informed of the melancholy event.

The East-India Company ordered Lee Boo to be buried in Rotherhithe church-yard, with every possible mark of respect. The pupils at the academy, and all who knew him, attended the funeral; and the concourse was otherwise so great, that it might be supposed his good qualities had been publicly proclaimed, instead of being privately communicated. A tomb, with the following inscription, was, soon after, erected by the East-India Company:

To the Memory  
Of Prince Lee Boo,  
A Native of the Pelew, or Palos Islands;  
And Son to Abba Thulle, Rnpack or King  
Of the Island Cooroora; \*  
Who departed this Life on the 27th of December, 1784,  
Aged 30 Years,  
This Stone is inscribed,  
By the Honourable United East-India Company,  
As a Testimony of Esteem  
For the Humane and Kind Treatment  
Afforded by his Father to the Crew of their Ship,  
The Antelope, CAPT. WILSON,  
Which was wrecked off that Island  
In the Night of the 9th of August, 1783.  
  
Stop, Reader stop! Let Nature claim a tear;  
A Prince of mine, Lee Boo, lies buried here.

This amiable young prince, whose residence here was only five months, conformed himself to the English dress in every instance, except his hair, which he continued to wear after the fashion of his own country. His countenance was so expressive, that it depicted the best qualities of a virtuous mind. His eyes were lively and intelligent; and his whole manner gentle and interesting. He had the natural politeness of a gentleman, without the drudgery of study, or the observance of established forms of ceremony. After his death, it was found that he had carefully saved all the seeds or stones of fruit he had eaten after his arrival, with a view to plant them at Pelew.

\* Cooroora is the proper name of the Island, of which Pelew is the capital town.

Since the publication of Captain Wilson's voyage, we have received some further accounts of the Pelew Islands, tending to corroborate what has been already advanced. Two armed ships, under the command of Captain McCluer, were, by order of the court of directors, fitted out at Bombay, in 1790, for the purpose of surveying these islands, and furnishing the natives with domestic animals, and such other things as might add to the comforts of life.

The reception of the captain and his officers was highly gratifying, and the natives again vied with each other in expressions of friendship to the *Englees*. Abba Thulle, indeed, appeared grieved at the relation of his son's death; but, after a short pause, he exclaimed, "*Weel, weel, weel a trecoy!*" "Good, good, very good!" and observed, that he never doubted the goodness of the English, but rested assured that they would cherish and take care of his son. He said, that he had counted upon a line one hundred knots, or moons, and then, despairing of ever seeing his son or Captain Wilson again, he had caused the line to be buried. On his receiving the presents, consisting of hardware, swords, grindstones, shovels, saws, &c. he appeared lost in thought for upwards of an hour; but, at length, broke forth in expressions of gratitude to the English rupacks, as he styled the Honourable Company; and declared, that his whole country, if it were possible to send it, would not be a sufficient return for the articles before him.

Madan Blanchard was stated to have rendered himself contemptible, after the departure of the Oroolong, by his idleness and dissipation, and to have fallen, with several of Abba Thulle's family, in an engagement with the people of Artingall.

It only remains to observe, that an English fort has been erected upon one of the islands; and, although the benevolent Abba Thulle has paid the debt of nature, the most uninterupted harmony still subsists between the natives and our countrymen.

## SECTION II.

### THE LADRONE ISLANDS.

This appellation implies the Isles of Robbers, and was given by that distinguished navigator Magellan, who first discovered these islands in 1521, the natives shewing a great disposition to pilfer, and much address in the execution of their designs.

According to the Jesuit Gobien, who has published a particular history of these islands, the inhabitants, till the arrival of the Spaniards, regarded themselves as the only men in the world. When they were visited by the Spaniards and Dutch, they inferred that these strangers were brethren, who had lost the primitive Guamese language.

25. VOL. I.

In colour, speech, manners, and government, they considerably resemble the Tagals, or people of the Philippines, before the Spanish conquest. These isles were then very populous, Guam, in forty leagues of circuit, having thirty thousand inhabitants.

In the reign of Philip IV. of Spain, these islands were also called the *Marians*, in honour of his queen, Mary of Austria. The Ladronees are computed to be twelve or fourteen in number, but not above three or four are inhabited. That now deemed the principal is Guam, where a governor resides, and where there is a very strong garrison kept. At this island the Manila register-ship generally takes in fresh provisions and water, in her passage from Acapulco to the Philippines.

Guam is pleasantly situated, and affords a fine landscape, when viewed from the sea. Rice is produced but in small quantities, on account of the dryness of the soil; but there are several kinds of excellent fruit, particularly pine-apples, melons, and oranges. They have also plenty of cocoas, yams, and a fruit about the size of an apple, which, when baked, is exceeding good, and is used instead of bread.

Though Guam is the largest of the Ladronees, Tinian, for a considerable time after Anson's voyage round the world, attracted more of the public attention. This arose from the exaggerated accounts of the journalists of that voyage, as it is very reasonable to conceive that mariners, who have been long at sea, and suffered many diseases, and a privation not only of the comforts but even the necessities of life, would be infinitely delighted with any verdant land, and find beauties, at least in imagination, where none existed. That this was the case is evident from the observations of Byron, Wallis, and subsequent navigators. The ingenuity of these islanders in the construction of their vessels, called flying proas, is universally admitted by navigators, who acknowledge them to be singular specimens of naval architecture. It appears from M. de la Perouse's narrative of his voyages, that some of these islands are volcanic.

In these seas is the stupendous rock called Lot's Wife, rising in the form of a pyramid, and thus described by Mr. Meares, in his voyage: "The latitude was twenty-nine degrees twenty minutes north, the longitude was twenty and forty-two degrees twenty-three minutes east of Greenwich. The waves broke against its rugged front, with a fury proportioned to the immense distance they had to roll before they were interrupted by it. It rose almost perpendicular to the height of near three hundred and fifty feet. A small black rock appeared just above the water, at about forty or fifty yards from the western edge. There was a cavern on its south-eastern side, into which the waters rolled with an awful and tremendous noise. In regarding this stupendous rock, which stood alone in an

immense ocean, we could not but consider it as an object which had been able to resist one of those great convulsions of nature that change the very form of those parts of the globe which they are permitted to desolate."

The inhabitants of the Ladrone Islands are of a good stature, well-proportioned, and considerably fairer than those of the Philippines. Their food consists entirely of fish, roots, fruits, &c.; yet they are so remarkably fat, that, to strangers, they appear swelled; but this does not seem to render them less nimble and active. They are generally healthy, and instances of longevity are by no means rare among them; for they often live to the age of a hundred years, in full possession of all their faculties. The women wear their hair very long; but the men generally shave it close, excepting a single lock on the crown of the head, after the Japanese manner. They are remarkably ambitious of having black teeth and white hair; and hence one of their principal occupations is to keep their teeth black, by the help of certain herbs, and to whiten their hair, by sprinkling it with a particular liquid.

Their language is very agreeable to the ear, having a soft and easy pronunciation. One of its chief graces consists in the facility of transposing words, and even all the syllables of one word, and thus furnishing a variety of double meanings, with which these people are greatly delighted. A poet is, with them, a character of the first eminence; and they are said to have some fables in their possession, which serve them for history.

When the Ladrone Islands were first discovered, the natives were totally unacquainted with any country besides their own, and, having no account of their own origin, supposed that the author of their race was formed out of a rock on the little island of Funa. Many things, looked upon by us as absolutely necessary to our existence, were utterly unknown to them. They had no animals, but one species of birds, resembling turtle-doves; and these they never killed, but only tamed them, and taught them to speak. They were evidently astonished at the sight of a horse, which a Spanish captain left among them, in the year 1673. But, what is most astonishing, they seem to have been utterly unacquainted with fire, till Magellan, provoked by their repeated thefts, burned one of their villages. When they saw their huts enveloped in flames, they thought that the fire was a beast, which fed upon the timber; and some of them, who came too near, being burnt, the rest stood at a considerable distance, fearing lest they should be devoured, or poisoned by the breathings of that terrible animal.

### SECTION III.

#### THE CAROLINES.

This is the most extensive range of islands in the Pa-

cific Ocean, and appears to have been first discovered, in 1686, by the Spaniards, who named it after their monarch, Charles II. The isles are about thirty in number, and very populous, except three, which are uninhabited. The natives resemble those of the Philippines, and chiefly live upon fish and cocoa-nuts; and it is probable that their language only differs in a few particulars. According to the letters of the Jesuits, each isle was subject to its chief, but all respected a monarch, who resided at Lamurec.

They believe in certain celestial spirits, and think they descend to bathe in a sacred lake in Fallalo; but there are neither temples nor idols, nor any appearance of worship. The dead are sometimes thrown into the sea, and at others interred, the grave being surrounded with a stone-wall. It is said that those of Yap worship a kind of crocodile, and have their magicians. Polygamy is allowed, and the Tamul, or chief, of the large isle of Hogoleu had nine wives. Criminals are banished from one isle to another.

They do not appear to have any instruments of music, but their dances are accompanied with songs. Their only weapons are lances, armed with bone. Even in this distant quarter of the globe negro slaves are not unknown; and in one or two of the islands the breed is said to be mingled, twenty-nine Spaniards having been left on one of these islands, who are supposed to have married and settled. The people of Ulea are reported to be more civilized than the rest, and appear much to resemble those of the Pelews.

The most considerable of the Carolines is Hogoleu, about ninety miles in length by forty in breadth. Next is Yap, in the western extremity of this chain, but not above a third part of that size. The Caroline Islands have been little visited by recent navigators; but a few small groups have been discovered in their eastern extremities, which may properly be classed in the same range.

### SECTION IV.

#### THE SANDWICH ISLANDS.

*Discovery, &c.*] The voyage of discovery undertaken by M. de la Perouse, who touched at these islands in May, 1787, has confirmed the honour of their discovery to the Spaniards; and has established the certainty, that the islands called in the Spanish charts *Los Majas*, and *Santa Maria de la Gorda*, laid down in the map of Lieutenant Roberts from eighteen degrees thirty minutes to twenty-eight degrees north latitude, and from one hundred and thirty-five to one hundred and forty-nine degrees west longitude, are the same with those which have since received the name of the *Sandwich Islands*, in honour of the Earl of Sandwich, who was first Lord of the Admiralty at the time they were visited by Captain Cook.

"It appears that the islands were discovered in 1542. The westernmost isle, situated about twenty hundred leagues from the continent, was discovered by a group of These islands are situated with cocoa-nuts, neither gold, nor silver, nor Kings, nor nobles, nor any other very many, but about twenty. From this account it does not appear to place the same spot where the Sandwich Islands are situated, instead of the vigors must be tano.

"It appears certain," says La Perouse, "that these islands were discovered, for the first time, by Gaetano, in 1542. This navigator sailed from port La Natividad, on the western coast of Mexico, in twenty degrees north latitude, steering to the westward; and after having run nine hundred leagues on that point of the compass, (consequently without changing his latitude,) he fell in with a groupe of islands, inhabited by savages, almost naked. These islands were surrounded with coral, and stocked with cocoa-nuts, and several other fruits, but possessed neither gold nor silver: he called them the Islands of the Kings, probably on account of the day when the discovery was made; and he named that which he discovered about twenty leagues farther west, the Island of Gardens. From this account it would be impossible for geographers not to place the discoveries of Gaetano precisely in the same spot where Captain Cook afterwards found the Sandwich Islands. But the Spanish editor adds, that these islands are situated between nine and eleven degrees latitude, instead of between nineteen and twenty-one, as navigators must conclude from the track pursued by Gaetano.

"Was the omission of these ten degrees an error in the figures, or a contrivance of the policy of the Spanish court, which had a great interest, a century ago, in concealing the situation of all the islands in this ocean? I am inclined to believe, that it is an error in the figures, for it would have been very bad management to have published that Gaetano departed from twenty degrees latitude, and steered due west. Had it been their intention to have concealed the true latitude, they might, with as little difficulty, have ascribed his course to another point of the compass.

"However this may be, every thing coincides, except the ten degrees, which must be added to the latitude given them by Gaetano. The distance from the coast of Mexico, the people, their natural productions, the coast equally surrounded with coral, and, lastly, the extent from north to south, is the same: the bearing of the Sandwich Islands being nearly between nineteen and eleven degrees, as that of Gaetano is between nine and eleven degrees."

The discovery of these islands by the Spaniards, however, was of no essential service to the world, nor to those who have traversed the Southern Ocean. Having been inaccurately laid down in their maps, it was believed, till the time of Perouse, that they had no existence in reality; and it is not improbable that the Spaniards themselves had lost the remembrance of them, otherwise they would not have failed to avail themselves of the bay of *Kara hakoan*, as a convenient port in the traffic which they have so long carried on betwixt South America and their islands in the East-Indies. It is to Captain Cook we are indebted, if not for the original discovery, for almost the

whole of what is known relating to the Sandwich Islands; and although the stock of information respecting them has been increased by subsequent navigators, we only pay the tribute due to the talent and veracity of Cook, and of the men of science who accompanied him, when we assert that every thing they have recorded relative to this groupe has been confirmed by those who have since visited them. Ignorance, as La Perouse observes, may discover, by chance, a few islands; but it belongs to superior minds to leave unexplored nothing which pertains to them.

Having left the Society Islands, and crossed the equator, Captain Cook fell in with two small islands, on neither of which he landed. On the 18th of February, 1788, he discovered an island, not far distant from the two former, called, by the natives, *Atooi*. On approaching the shore, some of the inhabitants in their canoes made towards him, but could not be prevailed upon to come on board. They showed, however, by exchanging several articles, that they had some idea of barter. Proceeding along the coast, in search of an anchoring-place, he passed several villages, and on the 20th stood in for land. Some of the natives in their canoes ventured on board. "None of the inhabitants," says the captain, "we were ever conversant with in any other country or island, were so astonished as these people, upon entering our ship. Their eyes were incessantly rolling from one object to another; and the wildness of their looks and gestures fully indicated their ignorance with respect to every thing they beheld, and strongly proved to us, that they had never till the present time been visited by Europeans, nor been acquainted with any of our commodities, except iron. Of these they were so ignorant, that when some beads were shown them, they asked what they were, and whether they were to be eaten." In the end, they rejected them, as of no use, and refused a looking-glass for the same reason. In their behaviour they were naturally polite, or, at least, cautious of giving offence; for though, at first, they attempted to take away every thing they could lay hands on, from the supposition that their visitors would not resent such behaviour; yet, on being convinced of their mistake, they became less active in appropriating to themselves what did not belong to them.

The English vessels came to an anchorage in Wymoa Bay, on the south-west side of the island, and the captain, with twelve marines, went on shore. On his landing, the natives prostrated themselves on their faces; a ceremony, which afterwards, when he made an excursion up the country, was every where repeated. In their commercial transactions, they manifested little disposition to defraud; and they were very serviceable in assisting the mariners to take in a supply of water. After continuing for some days off and on *Atooi*, Captain Cook steered to the eastward, for *Oueehow*, which lies about five leagues from

the former island. The reception he met with at this place was similar to that shown him by the natives of Atooi; and he continued at it for some days, during the course of which he made excursions into the country.

Woahoo, Oreehoua, and a little uninhabited isle, called Tahoor, were at this time discovered. But it was not until the month of November of the same year, on the return of Captain Cook from Beering's Straits, that other islands were known to be connected with this groupe.

The first of these now touched at was Mowee. The English reached it on the 26th, and continued for four days trading with the natives. Having been apprised of the visit of the strangers to the neighbouring islands, they showed no symptom of surprise when Captain Cook appeared off their coast, but readily came on board, offering their hogs, fish, potatoes, bread-fruit, &c. in exchange for nails and iron.

Owhyhee was discovered on the evening of the 30th. The English, without landing, received supplies from the Indians, when the weather would permit; and it was not until the 17th of January, owing to very boisterous weather and the heavy surf which set in upon the shore, that the Resolution and Discovery came to an anchorage, in a bay on the west side of the island, called Karakakooa. They continued here till the 4th of February, receiving the most hospitable treatment, and presents of every thing which the island afforded. The natives, and particularly the priests, treated Captain Cook in the kindest manner, and heaped upon him honours of every kind, which we may probably have occasion to notice, in describing the manners of the inhabitants.

The British vessels having unmoored, bore away for Mowee; but owing to heavy gales of wind which they encountered upon the coast, and which carried away the foremast of the Resolution, Captain Cook resolved to return to Karakakooa Bay, which he reached on the 11th. The reception now met with was very different from that which the English experienced on their first arrival. Instead of the crowds upon the beach, which formerly welcomed them, canoes paddling, and young and old swimming towards their vessels in every direction, they now found themselves in a bay, solitary and deserted. Of the causes of this extraordinary appearance, various conjectures were formed. Some were of opinion that there was at this time somewhat very suspicious in the behaviour of the natives; and that the taboo, or interdiction of the bay, on account of the king's absence from the island, (a reason assigned by one of them for the unusual appearances,) was an artful contrivance to afford time for the king to consult in what manner the strangers should be received. The subsequent behaviour, however, of Tereoboo seemed to indicate that his friendly disposition towards the English had suffered no abatement. Caution on the part of the Eng-

lish might produce suspicion among the natives; and in this state of things, when circumstances in themselves trifling are generally magnified according to the impression of the moment, the mind, once set upon the defensive, naturally forebodes and prepares itself for the worst. On an impartial review of the transactions which took place from this period to the 14th of February, that memorable day which concluded with the murder of Captain Cook, we must confess it would be unjust to attribute to the natives the guilt of preconcerted assassination. The measures which they adopted may be fairly called measures of defence; and these the unusual caution of the English, and the steps taken to secure themselves from the supposed hostile plans of their former friends, may easily account for.
